stream	A PHP stream associated with the SQL commands IN-FILE
&buffer	A string buffer to store the rewritten input into
buflen	The maximum number of characters to be stored in the buffer
&errormsg	If an error occures you can store an error message in here

The callback function should return the number of characters stored in the *buffer* or a negative value if an error occured.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.126. Object oriented style

```
<?php
  $db = mysqli_init();
  $db->real_connect("localhost","root","","test");

  function callme($stream, &$buffer, $buflen, &$errmsg)
  {
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",", "\t", $buffer));

    return strlen($buffer);
  }

  echo "Input:\n";

  $db->set_local_infile_handler("callme");
  $db->query("LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
  $db->set_local_infile_default();

  $res = $db->query("SELECT * FROM t1");

  echo "\nResult:\n";
  while ($row = $res->fetch_assoc()) {
    echo join(",", $row)."\n";
  }
?>
```

Example 20.127. Procedural style

```
<?php
  $db = mysqli_init();
  mysqli_real_connect($db, "localhost","root","","test");

  function callme($stream, &$buffer, $buflen, &$errmsg)
  {
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",", "\t", $buffer));

    return strlen($buffer);
  }

  echo "Input:\n";

  mysqli_set_local_infile_handler($db, "callme");
  mysqli_query($db, "LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
  mysqli_set_local_infile_default($db);
```

```
  $res = mysqli_query($db, "SELECT * FROM t1");

  echo "\nResult:\n";
  while ($row = mysqli_fetch_assoc($res)) {
    echo join(",", $row)."\n";
  }
?>
```

The above example will output:

```

Input:
23,foo
42,bar

Output:
23,FOO
42,BAR
```

See Also

`mysqli_set_local_infile_default`

20.11.2.6.42. `mysqli->sqlstate`, `mysqli_sqlstate`

- `mysqli->sqlstate`

  `mysqli_sqlstate`

  Returns the SQLSTATE error from previous MySQL operation

Description

Object oriented style (property):

```
 mysqli {

  string sqlstate ;

}
```

Procedural style:

```
  string mysqli_sqlstate(mysqli link);
```

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. `'00000'` means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see http://dev.mysql.com/doc/mysql/en/error-handling.html.

> **Note**
>
> Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for unmapped errors.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. `'00000'` means no error.

Examples

Example 20.128. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!$mysqli->query("CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", $mysqli->sqlstate);
}

$mysqli->close();
?>
```

Example 20.129. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!mysqli_query($link, "CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", mysqli_sqlstate($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Error - SQLSTATE 42S01.
```

See Also

`mysqli_errno`
`mysqli_error`

20.11.2.6.43. `mysqli::ssl_set`, `mysqli_ssl_set`

- `mysqli::ssl_set`

  `mysqli_ssl_set`

Used for establishing secure connections using SSL

Description

Object oriented style (method):

```
bool mysqli::ssl_set(string key,
                     string cert,
                     string ca,
                     string capath,
                     string cipher);
```

Procedural style:

```
bool mysqli_ssl_set(mysqli link,
                    string key,
                    string cert,
                    string ca,
                    string capath,
                    string cipher);
```

Used for establishing secure connections using SSL. It must be called before `mysqli_real_connect`. This function does nothing unless OpenSSL support is enabled.

Parameters

link	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`
key	The path name to the key file.
cert	The path name to the certificate file.
ca	The path name to the certificate authority file.
capath	The pathname to a directory that contains trusted SSL CA certificates in PEM format.
cipher	A list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`

Return Values

This function always returns `TRUE` value. If SSL setup is incorrect `mysqli_real_connect` will return an error when you attempt to connect.

See Also

`mysqli_options`
`mysqli_real_connect`

20.11.2.6.44. `mysqli::stat`, `mysqli_stat`

- `mysqli::stat`

  `mysqli_stat`

  Gets the current system status

Description

Object oriented style (method):

```
string mysqli::stat();
```

Procedural style:

```
  string mysqli_stat(mysqli link);
```

`mysqli_stat` returns a string containing information similar to that provided by the 'mysqladmin status' command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A string describing the server status. `FALSE` if an error occurred.

Examples

Example 20.130. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("System status: %s\n", $mysqli->stat());

$mysqli->close();
?>
```

Example 20.131. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("System status: %s\n", mysqli_stat($link));

mysqli_close($link);
?>
```

The above example will output:

```
System status: Uptime: 272  Threads: 1  Questions: 5340  Slow queries: 0
Opens: 13  Flush tables: 1  Open tables: 0  Queries per second avg: 19.632
Memory in use: 8496K  Max memory used: 8560K
```

See Also

`mysqli_get_server_info`

20.11.2.6.45. `mysqli::stmt_init`, `mysqli_stmt_init`

- `mysqli::stmt_init`

  `mysqli_stmt_init`

  Initializes a statement and returns an object for use with mysqli_stmt_prepare

Description

Object oriented style (property):

```
 mysqli {
  mysqli_stmt stmt_init();
}
```

Procedural style :

```
  mysqli_stmt mysqli_stmt_init(mysqli link);
```

Allocates and initializes a statement object suitable for `mysqli_stmt_prepare`.

> **Note**
>
> Any subsequent calls to any mysqli_stmt function will fail until `mysqli_stmt_prepare` was called.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns an object.

See Also

`mysqli_stmt_prepare`

20.11.2.6.46. `mysqli::store_result`, `mysqli_store_result`

- `mysqli::store_result`

  `mysqli_store_result`

  Transfers a result set from the last query

Description

Object oriented style (method):

```
  mysqli_result store_result();
```

Procedural style:

```
  mysqli_result mysqli_store_result(mysqli link);
```

Transfers the result set from the last query on the database connection represented by the *`link`* parameter to be used with the

mysqli_data_seek function.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init

Return Values

Returns a buffered result object or FALSE if an error occurred.

> **Note**
>
> mysqli_store_result returns FALSE in case the query didn't return a result set (if the query was, for example an INSERT statement). This function also returns FALSE if the reading of the result set failed. You can check if you have got an error by checking if mysqli_error doesn't return an empty string, if mysqli_errno returns a non zero value, or if mysqli_field_count returns a non zero value. Also possible reason for this function returning FALSE after successfull call to mysqli_query can be too large result set (memory for it cannot be allocated). If mysqli_field_count returns a non-zero value, the statement should have produced a non-empty result set.

Notes

> **Note**
>
> Although it is always good practice to free the memory used by the result of a query using the mysqli_free_result function, when transfering large result sets using the mysqli_store_result this becomes particularly important.

Examples

See mysqli_multi_query.

See Also

mysqli_real_query
mysqli_use_result

20.11.2.6.47. mysqli::thread_id, mysqli_thread_id

- mysqli::thread_id

  mysqli_thread_id

  Returns the thread ID for the current connection

Description

Object oriented style (property):

```
mysqli {
  int thread_id ;
}
```

Procedural style:

```
  int mysqli_thread_id(mysqli link);
```

The mysqli_thread_id function returns the thread ID for the current connection which can then be killed using the mysqli_kill function. If the connection is lost and you reconnect with mysqli_ping, the thread ID will be other. Therefore you should get the thread ID only when you need it.

> **Note**

The thread ID is assigned on a connection-by-connection basis. Hence, if the connection is broken and then re-established a new thread ID will be assigned.

To kill a running query you can use the SQL command `KILL QUERY processid`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns the Thread ID for the current connection.

Examples

Example 20.132. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>
```

Example 20.133. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit;
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: MySQL server has gone away
```

See Also

`mysqli_kill`

20.11.2.6.48. `mysqli::thread_safe`, `mysqli_thread_safe`

- `mysqli::thread_safe`

  `mysqli_thread_safe`

  Returns whether thread safety is given or not

Description

Procedural style:

```
bool mysqli_thread_safe();
```

Tells whether the client library is compiled as thread-safe.

Return Values

`TRUE` if the client library is thread-safe, otherwise `FALSE` .

20.11.2.6.49. `mysqli::use_result`, `mysqli_use_result`

- `mysqli::use_result`

  `mysqli_use_result`

  Initiate a result set retrieval

Description

Object oriented style (method):

```
mysqli_result use_result();
```

Procedural style:

```
mysqli_result mysqli_use_result(mysqli link);
```

Used to initiate the retrieval of a result set from the last query executed using the `mysqli_real_query` function on the database connection.

Either this or the `mysqli_store_result` function must be called before the results of a query can be retrieved, and one or the other must be called to prevent the next query on that database connection from failing.

> **Note**
>
> The `mysqli_use_result` function does not transfer the entire result set from the database and hence cannot be used functions such as `mysqli_data_seek` to move to a particular row within the set. To use this functionality, the result set must be stored using `mysqli_store_result`. One should not use `mysqli_use_result` if a lot of processing on the client side is performed, since this will tie up the server and prevent other threads from updating

- any tables from which the data is being fetched.

Return Values

Returns an unbuffered result object or FALSE if an error occurred.

Examples

Example 20.134. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query  = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->use_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->close();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----------------\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Example 20.135. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query  = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_use_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----------------\n");
        }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
my_user@localhost
-----------------
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer
```

See Also

`mysqli_real_query`
`mysqli_store_result`

20.11.2.6.50. `mysqli::warning_count`, `mysqli_warning_count`

- `mysqli::warning_count`

  `mysqli_warning_count`

  Returns the number of warnings from the last query for the given link

Description

Object oriented style (property):

```
 mysqli {

  int warning_count ;

}
```

Procedural style:

```
  int mysqli_warning_count(mysqli link);
```

Returns the number of warnings from the last query in the connection.

> **Note**
>
> For retrieving warning messages you can use the SQL command `SHOW WARNINGS [limit row_count]`.

Parameters

`link`	Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Number of warnings or zero if there are no warnings.

Examples

Example 20.136. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
```

```
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* a remarkable city in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
        'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogogoch')";

$mysqli->query($query);

if ($mysqli->warning_count) {
    if ($result = $mysqli->query("SHOW WARNINGS")) {
        $row = $result->fetch_row();
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        $result->close();
    }
}

/* close connection */
$mysqli->close();
?>
```

Example 20.137. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* a remarkable long city name in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
        'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogogoch')";

mysqli_query($link, $query);

if (mysqli_warning_count($link)) {
    if ($result = mysqli_query($link, "SHOW WARNINGS")) {
        $row = mysqli_fetch_row($result);
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        mysqli_free_result($result);
    }
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Warning (1264): Data truncated for column 'Name' at row 1
```

```

```
  bool mysqli_stmt::reset();

  mysqli_result mysqli_stmt::result_metadata();

  bool mysqli_stmt::send_long_data(int param_nr,
                                   string data);

  string mysqli_stmt_sqlstate(mysqli_stmt stmt);

  bool mysqli_stmt::store_result();
}
```

20.11.2.7.1. `mysqli_stmt->affected_rows`, `mysqli_stmt_affected_rows`

- `mysqli_stmt->affected_rows`

  `mysqli_stmt_affected_rows`

  Returns the total number of rows changed, deleted, or inserted by the last executed statement

Description

Object oriented style (property):

```
 mysqli_stmt {
  int affected_rows ;
}
```

Procedural style :

```
  int mysqli_stmt_affected_rows(mysqli_stmt stmt);
```

Returns the number of rows affected by `INSERT`, `UPDATE`, or `DELETE` query.

This function only works with queries which update a table. In order to get the number of rows from a SELECT query, use `mysqli_stmt_num_rows` instead.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records where updated for an UPDATE/DELETE statement, no rows matched the WHERE clause in the query or that no query has yet been executed. -1 indicates that the query has returned an error. NULL indicates an invalid argument was supplied to the function.

> **Note**
>
> If the number of affected rows is greater than maximal PHP int value, the number of affected rows will be returned as a string value.

Examples

Example 20.138. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
```

```
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
$mysqli->query("CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = $mysqli->prepare($query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    $stmt->bind_param("s", $code);

    /* execute statement */
    $stmt->execute();

    printf("rows inserted: %d\n", $stmt->affected_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.139. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
mysqli_query($link, "CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = mysqli_prepare($link, $query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    mysqli_stmt_bind_param($stmt, "s", $code);

    /* execute statement */
    mysqli_stmt_execute($stmt);

    printf("rows inserted: %d\n", mysqli_stmt_affected_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
rows inserted: 17
```

See Also

mysqli_stmt_num_rows
mysqli_prepare

20.11.2.7.2. mysqli_stmt::attr_get, mysqli_stmt_attr_get

- mysqli_stmt::attr_get

  mysqli_stmt_attr_get

  Used to get the current value of a statement attribute

Description

Object oriented style (method):

```
int mysqli_stmt::attr_get(int attr);
```

Procedural style:

```
int mysqli_stmt_attr_get(mysqli_stmt stmt,
                         int attr);
```

Gets the current value of a statement attribute.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.
attr	The attribute that you want to get.

Return Values

Returns FALSE if the attribute is not found, otherwise returns the value of the attribute.

20.11.2.7.3. mysqli_stmt::attr_set, mysqli_stmt_attr_set

- mysqli_stmt::attr_set

  mysqli_stmt_attr_set

  Used to modify the behavior of a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::attr_set(int attr,
                           int mode);
```

Procedural style:

```
bool mysqli_stmt_attr_set(mysqli_stmt stmt,
                          int attr,
                          int mode);
```

Used to modify the behavior of a prepared statement. This function may be called multiple times to set several attributes.

Parameters

stmt Procedural style only: A statement identifier returned by mysqli_stmt_init.

attr The attribute that you want to set. It can have one of the following values:

Table 20.11. Attribute values

Character	Description
MYSQLI_STMT_ATTR_UPDATE_MAX_LENGTH	If set to 1, causes mysqli_stmt_store_result to update the metadata MYSQL_FIELD->max_length value.
MYSQLI_STMT_ATTR_CURSOR_TYPE	Type of cursor to open for statement when mysqli_stmt_execute is invoked. *mode* can be MYSQLI_CURSOR_TYPE_NO_CURSOR (the default) or MYSQLI_CURSOR_TYPE_READ_ONLY.
MYSQLI_STMT_ATTR_PREFETCH_ROWS	Number of rows to fetch from server at a time when using a cursor. *mode* can be in the range from 1 to the maximum value of unsigned long. The default is 1.

If you use the MYSQLI_STMT_ATTR_CURSOR_TYPE option with MYSQLI_CURSOR_TYPE_READ_ONLY, a cursor is opened for the statement when you invoke mysqli_stmt_execute. If there is already an open cursor from a previous mysqli_stmt_execute call, it closes the cursor before opening a new one. mysqli_stmt_reset also closes any open cursor before preparing the statement for re-execution. mysqli_stmt_free_result closes any open cursor.

If you open a cursor for a prepared statement, mysqli_stmt_store_result is unnecessary.

mode The value to assign to the attribute.

20.11.2.7.4. mysqli_stmt::bind_param, mysqli_stmt_bind_param

- mysqli_stmt::bind_param

  mysqli_stmt_bind_param

  Binds variables to a prepared statement as parameters

Description

Object oriented style (method):

```
bool mysqli_stmt::bind_param(string types,
                             mixed var1,
                             mixed ...);
```

Procedural style:

```
bool mysqli_stmt_bind_param(mysqli_stmt stmt,
                            string types,
                            mixed var1,
                            mixed ...);
```

Bind variables for the parameter markers in the SQL statement that was passed to mysqli_prepare.

> **Note**
>
> If data size of a variable exceeds max. allowed packet size (max_allowed_packet), you have to specify b in *types* and use mysqli_stmt_send_long_data to send the data in packets.

Parameters

stmt Procedural style only: A statement identifier returned by mysqli_stmt_init.

types A string that contains one or more characters which specify the types for the corresponding bind variables:

Table 20.12. Type specification chars

Character	Description
i	corresponding variable has type integer
d	corresponding variable has type double
s	corresponding variable has type string
b	corresponding variable is a blob and will be sent in packets

var1 The number of variables and length of string *types* must match the parameters in the statement.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.140. Object oriented style

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = $mysqli->prepare("INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
$stmt->bind_param('sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
$stmt->execute();

printf("%d Row inserted.\n", $stmt->affected_rows);

/* close statement and connection */
$stmt->close();

/* Clean up table CountryLanguage */
$mysqli->query("DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", $mysqli->affected_rows);

/* close connection */
$mysqli->close();
?>
```

Example 20.141. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = mysqli_prepare($link, "INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
mysqli_stmt_bind_param($stmt, 'sssd', $code, $language, $official, $percent);
```

```
$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
mysqli_stmt_execute($stmt);

printf("%d Row inserted.\n", mysqli_stmt_affected_rows($stmt));

/* close statement and connection */
mysqli_stmt_close($stmt);

/* Clean up table CountryLanguage */
mysqli_query($link, "DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", mysqli_affected_rows($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
1 Row inserted.
1 Row deleted.
```

`mysqli_stmt_errno`
`mysqli_stmt_error`

20.11.2.7.5. `mysqli_stmt::bind_result`, `mysqli_stmt_bind_result`

- `mysqli_stmt::bind_result`

  `mysqli_stmt_bind_result`

  Binds variables to a prepared statement for result storage

Description

Object oriented style (method):

```
  bool mysqli_stmt::bind_result(mixed var1,
                                mixed ...);
```

Procedural style:

```
  bool mysqli_stmt_bind_result(mysqli_stmt stmt,
                               mixed var1,
                               mixed ...);
```

Binds columns in the result set to variables.

When `mysqli_stmt_fetch` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified variables *`var1, ...`*.

Note

Note that all columns must be bound after `mysqli_stmt_execute` and prior to calling `mysqli_stmt_fetch`. Depending on column types bound variables can silently change to the corresponding PHP type.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysqli_stmt_fetch` is called.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
`var1`	The variable to be bound.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.142. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = $mysqli->prepare("SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    $stmt->execute();

    /* bind variables to prepared statement */
    $stmt->bind_result($col1, $col2);

    /* fetch values */
    while ($stmt->fetch()) {
        printf("%s %s\n", $col1, $col2);
    }

    /* close statement */
    $stmt->close();
}
/* close connection */
$mysqli->close();

?>
```

Example 20.143. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = mysqli_prepare($link, "SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    mysqli_stmt_execute($stmt);

    /* bind variables to prepared statement */
    mysqli_stmt_bind_result($stmt, $col1, $col2);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf("%s %s\n", $col1, $col2);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}
```

```
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
AFG Afghanistan
ALB Albania
DZA Algeria
ASM American Samoa
AND Andorra
```

20.11.2.7.6. `mysqli_stmt::close`, `mysqli_stmt_close`

- `mysqli_stmt::close`

  `mysqli_stmt_close`

  Closes a prepared statement

Description

Object oriented style (method):

```
  bool mysqli_stmt::close();
```

Procedural style:

```
  bool mysqli_stmt_close(mysqli_stmt stmt);
```

Closes a prepared statement. `mysqli_stmt_close` also deallocates the statement handle. If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_prepare`

20.11.2.7.7. mysqli_stmt::data_seek, mysqli_stmt_data_seek

- `mysqli_stmt::data_seek`

  `mysqli_stmt_data_seek`

  Seeks to an arbitrary row in statement result set

Description

Object oriented style (method):

```
  void mysqli_stmt::data_seek(int offset);
```

Procedural style:

```
  void mysqli_stmt_data_seek(mysqli_stmt stmt,
                             int offset);
```

Seeks to an arbitrary result pointer in the statement result set.

`mysqli_stmt_store_result` must be called prior to `mysqli_stmt_data_seek`.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
`offset`	Must be between zero and the total number of rows minus one (0.. `mysqli_stmt_num_rows` - 1).

Return Values

No value is returned.

Examples

Example 20.144. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* store result */
    $stmt->store_result();

    /* seek to row no. 400 */
    $stmt->data_seek(399);

    /* fetch values */
    $stmt->fetch();

    printf ("City: %s  Countrycode: %s\n", $name, $code);

    /* close statement */
    $stmt->close();
}
```

```
/* close connection */
$mysqli->close();
?>
```

Example 20.145. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* store result */
    mysqli_stmt_store_result($stmt);

    /* seek to row no. 400 */
    mysqli_stmt_data_seek($stmt, 399);

    /* fetch values */
    mysqli_stmt_fetch($stmt);

    printf ("City: %s  Countrycode: %s\n", $name, $code);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
City: Benin City  Countrycode: NGA
```

See Also

`mysqli_prepare`

20.11.2.7.8. `mysqli_stmt->errno`, `mysqli_stmt_errno`

- `mysqli_stmt->errno`

  `mysqli_stmt_errno`

  Returns the error code for the most recent statement call

Description

Object oriented style (property):

```
 mysqli_stmt {

  int errno ;

}
```

Procedural style :

```
  int mysqli_stmt_errno(mysqli_stmt stmt);
```

Returns the error code for the most recently invoked statement function that can succeed or fail.

Client error message numbers are listed in the MySQL `errmsg.h` header file, server error message numbers are listed in `mysqld_error.h`. In the MySQL source distribution you can find a complete list of error messages and error numbers in the file `Docs/mysqld_error.txt`.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An error code value. Zero means no error occurred.

Examples

Example 20.146. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %d.\n", $stmt->errno);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.147. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %d.\n", mysqli_stmt_errno($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```

Error: 1146.
```

See Also

`mysqli_stmt_error`
`mysqli_stmt_sqlstate`

20.11.2.7.9. `mysqli_stmt->error`, `mysqli_stmt_error`

- `mysqli_stmt->error`

  `mysqli_stmt_error`

  Returns a string description for last statement error

Description

Object oriented style (property):

```
 mysqli_stmt {

  string error ;

}
```

Procedural style:

```
  string mysqli_stmt_error(mysqli_stmt stmt);
```

Returns a containing the error message for the most recently invoked statement function that can succeed or fail.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 20.148. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->error);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.149. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_error($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```

```

```
Error: Table 'world.myCountry' doesn't exist.
```

See Also

`mysqli_stmt_errno`
`mysqli_stmt_sqlstate`

20.11.2.7.10. `mysqli_stmt->execute`, `mysqli_stmt_execute`

- `mysqli_stmt->execute`

  `mysqli_stmt_execute`

  Executes a prepared Query

Description

Object oriented style (method):

```
  bool mysqli_stmt::execute();
```

Procedural style:

```
  bool mysqli_stmt_execute(mysqli_stmt stmt);
```

Executes a query that has been previously prepared using the `mysqli_prepare` function. When executed any parameter markers which exist will automatically be replaced with the appropiate data.

If the statement is `UPDATE`, `DELETE`, or `INSERT`, the total number of affected rows can be determined by using the `mysqli_stmt_affected_rows` function. Likewise, if the query yields a result set the `mysqli_stmt_fetch` function is used.

> **Note**
>
> When using `mysqli_stmt_execute`, the `mysqli_stmt_fetch` function must be used to fetch the data prior to performing any additional queries.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.150. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");
```

```
/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?,?,?)";
$stmt = $mysqli->prepare($query);

$stmt->bind_param("sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
$stmt->execute();

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
$stmt->execute();

/* close statement */
$stmt->close();

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = $mysqli->query($query)) {
    while ($row = $result->fetch_row()) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    $result->close();
}

/* remove table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>
```

Example 20.151. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?,?,?)";
$stmt = mysqli_prepare($link, $query);

mysqli_stmt_bind_param($stmt, "sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
mysqli_stmt_execute($stmt);

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
mysqli_stmt_execute($stmt);

/* close statement */
mysqli_stmt_close($stmt);

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = mysqli_query($link, $query)) {
    while ($row = mysqli_fetch_row($result)) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    mysqli_free_result($result);
}

/* remove table */
mysqli_query($link, "DROP TABLE myCity");
```

```
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Stuttgart (DEU,Baden-Wuerttemberg)
Bordeaux (FRA,Aquitaine)
```

See Also

`mysqli_prepare`
`mysqli_stmt_bind_param`

20.11.2.7.11. `mysqli_stmt::fetch`, `mysqli_stmt_fetch`

- `mysqli_stmt::fetch`

  `mysqli_stmt_fetch`

  Fetch results from a prepared statement into the bound variables

Description

Object oriented style (method):

```
  bool mysqli_stmt::fetch();
```

Procedural style:

```
  bool mysqli_stmt_fetch(mysqli_stmt stmt);
```

Fetch the result from a prepared statement into the variables bound by `mysqli_stmt_bind_result`.

> **Note**
>
> Note that all columns must be bound by the application before calling `mysqli_stmt_fetch`.

> **Note**
>
> Data are transferred unbuffered without calling `mysqli_stmt_store_result` which can decrease performance (but reduces memory cost).

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Table 20.13. Return Values

Value	Description
`TRUE`	Success. Data has been fetched
`FALSE`	Error occured

Value	Description
NULL	No more rows/data exists or data truncation occurred

Examples

Example 20.152. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = $mysqli->prepare($query)) {

    /* execute statement */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* fetch values */
    while ($stmt->fetch()) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.153. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = mysqli_prepare($link, $query)) {

    /* execute statement */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```

```

```
Rockford (USA)
Tallahassee (USA)
Salinas (USA)
Santa Clarita (USA)
Springfield (USA)
```

  `mysqli_stmt_field_count`

  Returns the number of field in the given statement

Description

```
 mysqli_stmt {
  int field_count ;
}
```

```
  int mysqli_stmt_field_count(mysqli_stmt stmt);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

20.11.2.7.13. `stmt::free_result`, `mysqli_stmt_free_result`

- `stmt::free_result`

  `mysqli_stmt_free_result`

  Frees stored result memory for the given statement handle

Description

Object oriented style (method):

```
  void mysqli_stmt::free_result();
```

Procedural style:

```
  void mysqli_stmt_free_result(mysqli_stmt stmt);
```

Frees the result memory associated with the statement, which was allocated by `mysqli_stmt_store_result`.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

No value is returned.

20.11.2.7.15. mysqli_stmt->insert_id, mysqli_stmt_insert_id

- mysqli_stmt->insert_id

  mysqli_stmt_insert_id

  Get the ID generated from the previous INSERT operation

Description

```
mysqli_stmt {
  int insert_id ;
}
```

```
mixed mysqli_stmt_insert_id(mysqli_stmt stmt);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

20.11.2.7.16. mysqli_stmt::num_rows, mysqli_stmt_num_rows

- mysqli_stmt::num_rows

  mysqli_stmt_num_rows

  Return the number of rows in statements result set

Description

Object oriented style (property):

```
 mysqli_stmt {

  int num_rows ;

}
```

Procedural style :

```
  int mysqli_stmt_num_rows(mysqli_stmt stmt);
```

Returns the number of rows in the result set. The use of `mysqli_stmt_num_rows` depends on whether or not you used `mysqli_stmt_store_result` to buffer the entire result set in the statement handle.

If you use `mysqli_stmt_store_result`, `mysqli_stmt_num_rows` may be called immediately.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer representing the number of rows in result set.

Examples

Example 20.154. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.155. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```
$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Number of rows: 20.
```

`mysqli_stmt_affected_rows`
`mysqli_prepare`
`mysqli_stmt_store_result`

20.11.2.7.17. `mysqli_stmt->param_count`, `mysqli_stmt_param_count`

- `mysqli_stmt->param_count`

  `mysqli_stmt_param_count`

  Returns the number of parameter for the given statement

Description

Object oriented style (property):

```
 mysqli_stmt {

  int param_count ;

}
```

Procedural style:

```
  int mysqli_stmt_param_count(mysqli_stmt stmt);
```

Returns the number of parameter markers present in the prepared statement.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns an integer representing the number of parameters.

Examples

Example 20.156. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = $mysqli->prepare("SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = $stmt->param_count;
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.157. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = mysqli_prepare($link, "SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = mysqli_stmt_param_count($stmt);
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Statement has 2 markers.
```

See Also

`mysqli_prepare`

20.11.2.7.18. `mysqli_stmt::prepare`, `mysqli_stmt_prepare`

- `mysqli_stmt::prepare`

  `mysqli_stmt_prepare`

Prepare a SQL statement for execution

Description

Object oriented style (method)

```
mixed mysqli_stmt::prepare(string query);
```

Procedure style:

```
bool mysqli_stmt_prepare(mysqli_stmt stmt,
                         string query);
```

Prepares the SQL query pointed to by the null-terminated string query.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
`query`	The query, as a string. It must consist of a single SQL statement. You can include one or more parameter markers in the SQL statement by embedding question mark (`?`) characters at the appropriate positions.

> **Note**
>
> You should not add a terminating semicolon or `\g` to the statement.

> **Note**
>
> The markers are legal only in certain places in SQL statements. For example, they are allowed in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value.
>
> However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a SELECT statement), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Languange (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.158. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt =  $mysqli->stmt_init();
if ($stmt->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);
```

```
    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.159. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = mysqli_stmt_init($link);
if (mysqli_stmt_prepare($stmt, 'SELECT District FROM City WHERE Name=?')) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $district);

    /* fetch value */
    mysqli_stmt_fetch($stmt);

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Amersfoort is in district Utrecht
```

See Also

`mysqli_stmt_init`, `mysqli_stmt_execute`, `mysqli_stmt_fetch`, `mysqli_stmt_bind_param`, `mysqli_stmt_bind_result` `mysqli_stmt_close`.

20.11.2.7.19. `mysqli_stmt::reset`, `mysqli_stmt_reset`

- `mysqli_stmt::reset`

  `mysqli_stmt_reset`

  Resets a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::reset();
```

Procedural style:

```
bool mysqli_stmt_reset(mysqli_stmt stmt);
```

Resets a prepared statement on client and server to state after prepare.

For now this is mainly used to reset data sent with `mysqli_stmt_send_long_data`.

To prepare a statement with another query use function `mysqli_stmt_prepare`.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_prepare`

20.11.2.7.20. `mysqli_stmt::result_metadata`, `mysqli_stmt_result_metadata`

- `mysqli_stmt::result_metadata`

  `mysqli_stmt_result_metadata`

  Returns result set metadata from a prepared statement

Description

Object oriented style (method):

```
mysqli_result mysqli_stmt::result_metadata();
```

Procedural style:

```
mysqli_result mysqli_stmt_result_metadata(mysqli_stmt stmt);
```

If a statement passed to `mysqli_prepare` is one that produces a result set, `mysqli_stmt_result_metadata` returns the result object that can be used to process the meta information such as total number of fields and individual field information.

> **Note**
>
> This result set pointer can be passed as an argument to any of the field-based functions that process result set metadata, such as:

- mysqli_num_fields
- mysqli_fetch_field
- mysqli_fetch_field_direct
- mysqli_fetch_fields
- mysqli_field_count
- mysqli_field_seek
- mysqli_field_tell
- mysqli_free_result

The result set structure should be freed when you are done with it, which you can do by passing it to mysqli_free_result

Note

The result set returned by mysqli_stmt_result_metadata contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with mysqli_stmt_fetch.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

Returns a result object or FALSE if an error occured.

Examples

Example 20.160. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query("DROP TABLE IF EXISTS friends");
$mysqli->query("CREATE TABLE friends (id int, name varchar(20))");

$mysqli->query("INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = $mysqli->prepare("SELECT id, name FROM friends");
$stmt->execute();

/* get resultset for metadata */
$result = $stmt->result_metadata();

/* retrieve field information from metadata result set */
$field = $result->fetch_field();

printf("Fieldname: %s\n", $field->name);

/* close resultset */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Example 20.161. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
```

```
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = mysqli_prepare($link, "SELECT id, name FROM friends");
mysqli_stmt_execute($stmt);

/* get resultset for metadata */
$result = mysqli_stmt_result_metadata($stmt);

/* retrieve field information from metadata result set */
$field = mysqli_fetch_field($result);

printf("Fieldname: %s\n", $field->name);

/* close resultset */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

`mysqli_prepare`
`mysqli_free_result`

20.11.2.7.21. `mysqli_stmt::send_long_data`, `mysqli_stmt_send_long_data`

- `mysqli_stmt::send_long_data`

  `mysqli_stmt_send_long_data`

  Send data in blocks

Description

Object oriented style (method)

```
  bool mysqli_stmt::send_long_data(int param_nr,
                                   string data);
```

Procedural style:

```
  bool mysqli_stmt_send_long_data(mysqli_stmt stmt,
                                  int param_nr,
                                  string data);
```

Allows to send parameter data to the server in pieces (or chunks), e.g. if the size of a blob exceeds the size of `max_allowed_packet`. This function can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB datatypes.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
`param_nr`	Indicates which parameter to associate the data with. Parameters are numbered beginning with 0.
`data`	A string containing data to be sent.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.162. Object oriented style

```
<?php
$stmt = $mysqli->prepare("INSERT INTO messages (message) VALUES (?)");
$null = NULL;
$stmt->bind_param("b", $null);
$fp = fopen("messages.txt", "r");
while (!feof($fp)) {
    $stmt->send_long_data(0, fread($fp, 8192));
}
fclose($fp);
$stmt->execute();
?>
```

See Also

`mysqli_prepare`
`mysqli_stmt_bind_param`

20.11.2.7.22. `mysqli_stmt::sqlstate`, `mysqli_stmt_sqlstate`

- `mysqli_stmt::sqlstate`

  `mysqli_stmt_sqlstate`

  Returns SQLSTATE error from previous statement operation

Description

Object oriented style (property):

```
 mysqli_stmt {

  string sqlstate ;

}
```

Procedural style:

```
  string mysqli_stmt_sqlstate(mysqli_stmt stmt);
```

Returns a string containing the SQLSTATE error code for the most recently invoked prepared statement function that can succeed or fail. The error code consists of five characters. `'00000'` means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see http://dev.mysql.com/doc/mysql/en/error-handling.html.

Parameters

`stmt`	Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. `'00000'` means no error.

Notes

> **Note**
>
> Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for unmapped errors.

Examples

Example 20.163. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->sqlstate);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.164. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_sqlstate($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```

Error: 42S02.
```

See Also

mysqli_stmt_errno
mysqli_stmt_error

20.11.2.7.23. mysqli_stmt::store_result, mysqli_stmt_store_result

- mysqli_stmt::store_result

  mysqli_stmt_store_result

  Transfers a result set from a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::store_result();
```

Procedural style:

```
bool mysqli_stmt_store_result(mysqli_stmt stmt);
```

You must call mysqli_stmt_store_result for every query that successfully produces a result set (SELECT, SHOW, DESCRIBE, EXPLAIN), and only if you want to buffer the complete result set by the client, so that the subsequent mysqli_stmt_fetch call returns buffered data.

> **Note**
>
> It is unnecessary to call mysqli_stmt_store_result for other queries, but if you do, it will not harm or cause any notable performance in all cases. You can detect whether the query produced a result set by checking if mysqli_stmt_result_metadata returns NULL.

Parameters

stmt	Procedural style only: A statement identifier returned by mysqli_stmt_init.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 20.165. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
```

```
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* free result */
    $stmt->free_result();

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.166. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* free result */
    mysqli_stmt_free_result($stmt);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Number of rows: 20.
```

  int mysqli_num_rows(mysqli_result result);
}
```

20.11.2.8.1. `mysqli_result->current_field`, `mysqli_field_tell`

- `mysqli_result->current_field`

  `mysqli_field_tell`

  Get current field offset of a result pointer

Description

Object oriented style (property):

```
 mysqli_result {
  int current_field ;
}
```

Procedural style:

```
  int mysqli_field_tell(mysqli_result result);
```

Returns the position of the field cursor used for the last `mysqli_fetch_field` call. This value can be used as an argument to `mysqli_field_seek`.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns current offset of field cursor.

Examples

Example 20.167. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        /* get fieldpointer offset */
        $currentfield = $result->current_field;

        printf("Column %d:\n", $currentfield);
        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.168. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        /* get fieldpointer offset */
        $currentfield = mysqli_field_tell($result);
```

```
        printf("Column %d:\n", $currentfield);
        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Column 1:
Name:     Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254

Column 2:
Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

See Also

`mysqli_fetch_field`
`mysqli_field_seek`

20.11.2.8.2. `mysqli_result::data_seek`, `mysqli_data_seek`

- `mysqli_result::data_seek`

  `mysqli_data_seek`

  Adjusts the result pointer to an arbitary row in the result

Description

Object oriented style (method):

```
  bool mysqli_result::data_seek(int offset);
```

Procedural style:

```
  bool mysqli_data_seek(mysqli_result result,
                        int offset);
```

The `mysqli_data_seek` function seeks to an arbitrary result pointer specified by the *`offset`* in the result set.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.
`offset`	The field offset. Must be between zero and the total number of rows minus one

mysqli_num_rows - 1).

Return Values

Returns TRUE on success or FALSE on failure.

Notes

> **Note**
>
> This function can only be used with buffered results attained from the use of the mysqli_store_result or mysqli_query functions.

Examples

Example 20.169. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = $mysqli->query( $query)) {

    /* seek to row no. 400 */
    $result->data_seek(399);

    /* fetch row */
    $row = $result->fetch_row();

    printf ("City: %s  Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.170. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";

if ($result = mysqli_query($link, $query)) {

    /* seek to row no. 400 */
    mysqli_data_seek($result, 399);

    /* fetch row */
    $row = mysqli_fetch_row($result);

    printf ("City: %s  Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

```

```

The above example will output:

```
City: Benin City  Countrycode: NGA
```

mysqli_fetch_object
mysqli_query
mysqli_num_rows

20.11.2.8.3. mysqli_result::fetch_all, mysqli_fetch_all

- mysqli_result::fetch_all

  mysqli_fetch_all

  Fetches all result rows as an associative array, a numeric array, or both

Description

Object oriented style (method):

```
  mixed mysqli_result::fetch_all(int resulttype);
```

Procedural style:

```
  mixed mysqli_fetch_all(mysqli_result result,
                         int resulttype);
```

Available only with mysqlnd.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
resulttype	This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants MYSQLI_ASSOC , MYSQLI_NUM , or MYSQLI_BOTH . Defaults to MYSQLI_NUM .

Return Values

Returns an array of associative or numeric arrays holding result rows.

See Also

mysqli_fetch_array
mysqli_query

20.11.2.8.4. mysqli_result::fetch_array, mysqli_fetch_array

- mysqli_result::fetch_array

  mysqli_fetch_array

  Fetch a result row as an associative, a numeric array, or both

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_array(int resulttype);
```

Procedural style:

```
mixed mysqli_fetch_array(mysqli_result result,
                         int resulttype);
```

Returns an array that corresponds to the fetched row or NULL if there are no more rows for the resultset represented by the *result* parameter.

mysqli_fetch_array is an extended version of the mysqli_fetch_row function. In addition to storing the data in the numeric indices of the result array, the mysqli_fetch_array function can also store the data in associative indices, using the field names of the result set as keys.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

> **Note**
>
> This function sets NULL fields to the PHP NULL value.

If two or more columns of the result have the same field names, the last column will take precedence and overwrite the earlier data. In order to access multiple columns with the same name, the numerically indexed version of the row must be used.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
resulttype	This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants MYSQLI_ASSOC , MYSQLI_NUM , or MYSQLI_BOTH . Defaults to MYSQLI_BOTH . By using the MYSQLI_ASSOC constant this function will behave identically to the mysqli_fetch_assoc, while MYSQLI_NUM will behave identically to the mysqli_fetch_row function. The final option MYSQLI_BOTH will create a single array with the attributes of both.

Return Values

Returns an array of strings that corresponds to the fetched row or NULL if there are no more rows in resultset.

Examples

Example 20.171. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
```

```
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = $mysqli->query($query);

/* numeric array */
$row = $result->fetch_array(MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = $result->fetch_array(MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = $result->fetch_array(MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Example 20.172. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = mysqli_query($link, $query);

/* numeric array */
$row = mysqli_fetch_array($result, MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = mysqli_fetch_array($result, MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = mysqli_fetch_array($result, MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Kabul (AFG)
Qandahar (AFG)
Herat (AFG)
```

See Also

mysqli_fetch_assoc
mysqli_fetch_row
mysqli_fetch_object
mysqli_query

mysqli_data_seek

20.11.2.8.5. mysqli_result::fetch_assoc, mysqli_fetch_assoc

- mysqli_result::fetch_assoc

  mysqli_fetch_assoc

  Fetch a result row as an associative array

Description

Object oriented style (method):

```
  array mysqli_result::fetch_assoc();
```

Procedural style:

```
  array mysqli_fetch_assoc(mysqli_result result);
```

Returns an associative array that corresponds to the fetched row or NULL if there are no more rows.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

> **Note**
>
> This function sets NULL fields to the PHP NULL value.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.

Return Values

Returns an associative array of strings representing the fetched row in the result set, where each key in the array represents the name of one of the result set's columns or NULL if there are no more rows in resultset.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using mysqli_fetch_row or add alias names.

Examples

Example 20.173. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch associative array */
    while ($row = $result->fetch_assoc()) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    $result->close();
```

```
}

/* close connection */
$mysqli->close();
?>
```

Example 20.174. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_assoc($result)) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

20.11.2.8.6. `mysqli_result::fetch_field_direct`, `mysqli_fetch_field_direct`

- `mysqli_result::fetch_field_direct`

  `mysqli_fetch_field_direct`

  Fetch meta-data for a single field

Description

Object oriented style (method):

```
  object mysqli_result::fetch_field_direct(int fieldnr);
```

Procedural style:

```
  object mysqli_fetch_field_direct(mysqli_result result,
                                   int fieldnr);
```

Returns an object which contains field definition informations from specified resultset.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.
fieldnr	The field number. This value must be in the range from 0 to number of fields - 1.

Return Values

Returns an object which contains field definition information or FALSE if no field information for specified fieldnr is available.

Table 20.14. Object attributes

Attribute	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the tabl definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.175. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = $result->fetch_field_direct(1);

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);

    $result->close();
}

/* close connection */
```

```
$mysqli->close();
?>
```

Example 20.176. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = mysqli_fetch_field_direct($result, 1);

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

`mysqli_fetch_fields`

20.11.2.8.7. `mysqli_result::fetch_field`, `mysqli_fetch_field`

- `mysqli_result::fetch_field`

  `mysqli_fetch_field`

  Returns the next field in the result set

Description

Object oriented style (method):

```
  object mysqli_result::fetch_field();
```

Procedural style:

```
  object mysqli_fetch_field(mysqli_result result);
```

Returns the definition of one column of a result set as an object. Call this function repeatedly to retrieve information about all columns in the result set.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.

Return Values

Returns an object which contains field definition information or FALSE if no field information is available.

Table 20.15. Object properties

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.177. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.178. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        printf("Name:     %s\n", $finfo->name);
        printf("Table:    %s\n", $finfo->table);
        printf("max. Len: %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254

Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

`mysqli_field_seek`

20.11.2.8.8. `mysqli_result::fetch_fields`, `mysqli_fetch_fields`

- `mysqli_result::fetch_fields`

  `mysqli_fetch_fields`

  Returns an array of objects representing the fields in a result set

Description

Object oriented style (method):

```
  array mysqli_result::fetch_fields();
```

Procedural Style:

```
  array mysqli_fetch_fields(mysqli_result result);
```

This function serves an identical purpose to the `mysqli_fetch_field` function with the single difference that, instead of returning one object at a time for each field, the columns are returned as an array of objects.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an array of objects which contains field definition information or `FALSE` if no field information is available.

Table 20.16. Object properties

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.179. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    $finfo = $result->fetch_fields();

    foreach ($finfo as $val) {
        printf("Name:     %s\n", $val->name);
        printf("Table:    %s\n", $val->table);
        printf("max. Len: %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.180. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all columns */
    $finfo = mysqli_fetch_fields($result);

    foreach ($finfo as $val) {
        printf("Name:     %s\n", $val->name);
        printf("Table:    %s\n", $val->table);
        printf("max. Len: %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254

Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

`mysqli_num_fields`
`mysqli_fetch_field_direct`
`mysqli_fetch_field`

20.11.2.8.9. `mysqli_result::fetch_object`, `mysqli_fetch_object`

- `mysqli_result::fetch_object`

  `mysqli_fetch_object`

  Returns the current row of a result set as an object

Description

Object oriented style (method):

```
  object mysqli_result::fetch_object(string class_name,
                                     array params);
```

Procedural style:

```
  object mysqli_fetch_object(mysqli_result result,
                             string class_name,
                             array params);
```

The `mysqli_fetch_object` will return the current row result set as an object where the attributes of the object represent the names of the fields found within the result set.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.
`class_name`	The name of the class to instantiate, set the properties of and return. If not specified, a `stdClass` object is returned.
`params`	An optional array of parameters to pass to the constructor for *`class_name`* objects.

Return Values

Returns an object with string properties that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

> **Note**
>
> Field names returned by this function are *case-sensitive*.

> **Note**
>
> This function sets NULL fields to the PHP `NULL` value.

ChangeLog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 20.181. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch object array */
    while ($obj = $result->fetch_object()) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.182. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($obj = mysqli_fetch_object($result)) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

20.11.2.8.10. `mysqli_result::fetch_row`, `mysqli_fetch_row`

- `mysqli_result::fetch_row`

  `mysqli_fetch_row`

  Get a result row as an enumerated array

Description

Object oriented style (method):

```
  mixed mysqli_result::fetch_row();
```

Procedural style:

```
  mixed mysqli_fetch_row(mysqli_result result);
```

Fetches one row of data from the result set and returns it as an enumerated array, where each column is stored in an array offset

starting from 0 (zero). Each subsequent call to this function will return the next row within the result set, or NULL if there are no more rows.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query, mysqli_store_result or mysqli_use_result.

Return Values

mysqli_fetch_row returns an array of strings that corresponds to the fetched row or NULL if there are no more rows in result set.

> **Note**
>
> This function sets NULL fields to the PHP NULL value.

Examples

Example 20.183. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch object array */
    while ($row = $result->fetch_row()) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.184. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_row($result)) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

`mysqli_query`
`mysqli_data_seek`

20.11.2.8.11. `mysqli_result->field_count`, `mysqli_num_fields`

- `mysqli_result->field_count`

  `mysqli_num_fields`

  Get the number of fields in a result

Description

Object oriented style (property):

```
 mysqli_result {

  int field_count ;

}
```

Procedural style:

```
  int mysqli_num_fields(mysqli_result result);
```

Returns the number of fields from specified result set.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

The number of fields from a result set.

Examples

Example 20.185. Object oriented style

```
<?php
```

```
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = $result->field_count;

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.186. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = mysqli_num_fields($result);

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Result set has 5 fields.
```

See Also

`mysqli_fetch_field`

20.11.2.8.12. `mysqli_result::field_seek`, `mysqli_field_seek`

- `mysqli_result::field_seek`

  `mysqli_field_seek`

  Set result pointer to a specified field offset

Description

Object oriented style (method):

```
  bool mysqli_result::field_seek(int fieldnr);
```

Procedural style:

```
  bool mysqli_field_seek(mysqli_result result,
                         int fieldnr);
```

Sets the field cursor to the given offset. The next call to `mysqli_fetch_field` will retrieve the field definition of the column associated with that offset.

> **Note**
>
> To seek to the beginning of a row, pass an offset value of zero.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.
`fieldnr`	The field number. This value must be in the range from `0` to `number of fields - 1`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.187. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for 2nd column */
    $result->field_seek(1);
    $finfo = $result->fetch_field();

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n\n", $finfo->type);

    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.188. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
```

```
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for 2nd column */
    mysqli_field_seek($result, 1);
    $finfo = mysqli_fetch_field($result);

    printf("Name:     %s\n", $finfo->name);
    printf("Table:    %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

See Also

`mysqli_fetch_field`

20.11.2.8.13. `mysqli_result::free`, `mysqli_free_result`

- `mysqli_result::free`

  `mysqli_free_result`

  Frees the memory associated with a result

Description

Object oriented style (all methods are equivalent):

```
  void mysqli_result::free();
```

```
  void mysqli_result::close();
```

```
  void mysqli_result::free_result();
```

Procedural style:

```
  void mysqli_free_result(mysqli_result result);
```

Frees the memory associated with the result.

Note

You should always free your result with `mysqli_free_result`, when your result object is not needed anymore.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

No value is returned.

See Also

`mysqli_query`
`mysqli_stmt_store_result`
`mysqli_store_result`
`mysqli_use_result`

20.11.2.8.14. `mysqli_result->lengths`, `mysqli_fetch_lengths`

- `mysqli_result->lengths`

  `mysqli_fetch_lengths`

  Returns the lengths of the columns of the current row in the result set

Description

Object oriented style (property):

```
mysqli_result {
  array lengths ;
}
```

Procedural style:

```
  array mysqli_fetch_lengths(mysqli_result result);
```

The `mysqli_fetch_lengths` function returns an array containing the lengths of every column of the current row within the result set.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

An array of integers representing the size of each column (not including any terminating null characters). `FALSE` if an error occurred.

`mysqli_fetch_lengths` is valid only for the current row of the result set. It returns `FALSE` if you call it before calling mysqli_fetch_row/array/object or after retrieving all rows in the result.

Examples

Example 20.189. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = $mysqli->query($query)) {

    $row = $result->fetch_row();

    /* display column lengths */
    foreach ($result->lengths as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.190. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = mysqli_query($link, $query)) {

    $row = mysqli_fetch_row($result);

    /* display column lengths */
    foreach (mysqli_fetch_lengths($result) as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Field  1 has Length  3
Field  2 has Length  5
Field  3 has Length 13
Field  4 has Length  9
Field  5 has Length  6
Field  6 has Length  1
Field  7 has Length  6
Field  8 has Length  4
Field  9 has Length  6
Field 10 has Length  6
Field 11 has Length  5
Field 12 has Length 44
Field 13 has Length  7
Field 14 has Length  3
Field 15 has Length  2
```

20.11.2.8.15. `mysqli_result->num_rows`, `mysqli_num_rows`

- `mysqli_result->num_rows`

  `mysqli_num_rows`

  Gets the number of rows in a result

Description

Object oriented style (property):

```
 mysqli_result {

  int num_rows ;

}
```

Procedural style:

```
  int mysqli_num_rows(mysqli_result result);
```

Returns the number of rows in the result set.

The use of `mysqli_num_rows` depends on whether you use buffered or unbuffered result sets. In case you use unbuffered result-sets `mysqli_num_rows` will not correct the correct number of rows until all the rows in the result have been retrieved.

Parameters

`result`	Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns number of rows in the result set.

> **Note**
>
> If the number of rows is greater than maximal int value, the number will be returned as a string.

Examples

Example 20.191. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = $result->num_rows;

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.192. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = mysqli_num_rows($result);

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Result set has 239 rows.
```

`mysqli_stmt_result_metadata`

20.11.2.10.12. `mysqli_master_query`

- `mysqli_master_query`

  Enforce execution of a query on the master in a master/slave setup

Description

```
bool mysqli_master_query(mysqli link,
                         string query);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

> **Warning**

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.13. `mysqli_param_count`

- `mysqli_param_count`

  Alias for `mysqli_stmt_param_count`

Description

This function is an alias of `mysqli_stmt_param_count`.

Notes

Note

`mysqli_param_count` is deprecated and will be removed.

See Also

`mysqli_stmt_param_count`

20.11.2.10.14. `mysqli_report`

- `mysqli_report`

  Enables or disables internal report functions

Description

```
bool mysqli_report(int flags);
```

`mysqli_report` is a powerful function to improve your queries and code during development and testing phase. Depending on the flags it reports errors from mysqli function calls or queries which don't use an index (or use a bad index).

Parameters

`flags`

Table 20.17. Supported flags

Name	Description
`MYSQLI_REPORT_OFF`	Turns reporting off
`MYSQLI_REPORT_ERROR`	Report errors from mysqli function calls
`MYSQLI_REPORT_STRICT`	Report warnings from mysqli function calls
`MYSQLI_REPORT_INDEX`	Report if no index or bad index was used in a query
`MYSQLI_REPORT_ALL`	Set all options (report all)

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.193. Object oriented style

```
<?php
/* activate reporting */
mysqli_report(MYSQLI_REPORT_ALL);

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* this query should report an error */
$result = $mysqli->query("SELECT Name FROM Nonexistingtable WHERE population > 50000");

/* this query should report a warning */
$result = $mysqli->query("SELECT Name FROM City WHERE population > 50000");
$result->close();

$mysqli->close();
?>
```

See Also

`mysqli_debug`
`mysqli_dump_debug_info`

20.11.2.10.15. `mysqli_rpl_parse_enabled`

- `mysqli_rpl_parse_enabled`

  Check if RPL parse is enabled

Description

```
int mysqli_rpl_parse_enabled(mysqli link);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

> **Warning**
>
> This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.16. `mysqli_rpl_probe`

- `mysqli_rpl_probe`

  RPL probe

Description

```
bool mysqli_rpl_probe(mysqli link);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

> **Warning**
>
> This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.17. `mysqli_rpl_query_type`, `mysqli->rpl_query_type`

- `mysqli_rpl_query_type`

  `mysqli->rpl_query_type`

  Returns RPL query type

Description

Procedural style:

```
 int mysqli_rpl_query_type(mysqli link,
                           string query);
```

Object oriented style (method)

```
mysqli {

 int rpl_query_type(string query);

}
```

Returns `MYSQLI_RPL_MASTER` , `MYSQLI_RPL_SLAVE` or `MYSQLI_RPL_ADMIN` depending on a query type. `INSERT`, `UPDATE` and similar are *master* queries, `SELECT` is *slave*, and `FLUSH`, `REPAIR` and similar are *admin*.

> **Warning**
>
> This function is currently not documented; only its argument list is available.

> **Warning**
>
> This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.18. `mysqli_send_long_data`

- `mysqli_send_long_data`

  Alias for `mysqli_stmt_send_long_data`

Description

This function is an alias of `mysqli_stmt_send_long_data`.

Notes

> **Note**
>
> `mysqli_send_long_data` is deprecated and will be removed.

See Also

`mysqli_stmt_send_long_data`

20.11.2.10.19. `mysqli_send_query`, `mysqli->send_query`

- `mysqli_send_query`

  `mysqli->send_query`

  Send the query and return

Description

Procedural style:

```
 bool mysqli_send_query(mysqli link,
                        string query);
```

Object oriented style (method)

```
mysqli {

 bool send_query(string query);

}
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

> **Warning**
>
> This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.20. `mysqli_set_opt`

- `mysqli_set_opt`

  Alias of `mysqli_options`

Description

This function is an alias of `mysqli_options`.

20.11.2.10.21. `mysqli_slave_query`

- `mysqli_slave_query`

  Force execution of a query on a slave in a master/slave setup

Description

```
 bool mysqli_slave_query(mysqli link,
                         string query);
```

> **Warning**
>
> This function is currently not documented; only its argument list is available.

> **Warning**
>
> This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.3. MySQL Functions (PDO_MYSQL)

PDO_MYSQL is a driver that implements the PHP Data Objects (PDO) interface to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

> **Warning**
>
> Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using mysql-specific attributes with the postgres driver may result in unexpected behaviour. `PDO::getAttribute` may be used to obtain the `PDO_ATTR_DRIVER_NAME` attribute to check the driver, if your code can run against multiple drivers.

`PDO::MYSQL_ATTR_USE_BUFFERED_QUERY` (integer) — If this attribute is set to `TRUE` on a `PDOStatement`, the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use `PDOStatement::fetchAll` instead.

Example 20.194. Forcing queries to be buffered in mysql

```
<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
    $stmt = $db->prepare('select * from foo',
        array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
    die("my application only works with mysql; I should use \$stmt->fetchAll() instead
}
?>
```

`PDO::MYSQL_ATTR_LOCAL_INFILE` (integer) — Enable `LOAD LOCAL INFILE`.

`PDO::MYSQL_ATTR_INIT_COMMAND` (integer) — Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting.

`PDO::MYSQL_ATTR_READ_DEFAULT_FILE` (integer) — Read options from the named option file instead of from `my.cnf`.

`PDO::MYSQL_ATTR_READ_DEFAULT_GROUP` (integer) — Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE` .

`PDO::MYSQL_ATTR_MAX_BUFFER_SIZE` (integer) — Maximum buffer size. Defaults to 1 MiB.

`PDO::MYSQL_ATTR_DIRECT_QUERY` (integer) — Perform direct queries, don't use prepared statements.

20.11.3.1. `PDO_MYSQL DSN`

- `PDO_MYSQL DSN`

  Connecting to MySQL databases

Description

The PDO_MYSQL Data Source Name (DSN) is composed of the following elements:

DSN prefix — The DSN prefix is **`mysql:`**.

`host` — The hostname on which the database server resides.

`port`	The port number where the database server is listening.
`dbname`	The name of the database.
`unix_socket`	The MySQL Unix socket (shouldn't be used with `host` or `port`).

Examples

Example 20.195. PDO_MYSQL DSN examples

The following example shows a PDO_MYSQL DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

20.11.4. Connector/PHP

The MySQL Connector/PHP is a version of the `mysql` and `mysqli` extensions for PHP optimized for the Windows operating system. Later versions of the main PHP `mysql`/`mysqli` drivers are compatible with Windows and a separate, Windows specific driver is no longer required.

For PHP for all platforms, including Windows, you should use the `mysql` or `mysqli` extensions shipped with the PHP sources. See Section 20.11, “MySQL PHP API”.

20.11.5. Common Problems with MySQL and PHP

- `Error: Maximum Execution Time Exceeded`: This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- `Fatal error: Call to unsupported or undefined function mysql_connect() in ...`: This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- `Error: Undefined reference to 'uncompress'`: This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- `Error: Client does not support authentication protocol`: This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See Section B.1.2.4, “`Client does not support authentication protocol`”, for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: http://www.coggeshall.org/oss/mysql2i.

20.11.6. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

   ```
   ./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
   ```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

   Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2
```

3. Build and install PHP:

```
make
make install
```

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about the mysqli extension in the Knowledge Base articles found at mysqli. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.12. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD::mysql` module.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl DBI support are given in Section 2.14, “Perl Installation Notes”.

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

  You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, http://dbi.perl.org/. That site hosts a general DBI mailing list. Sun Microsystems, Inc. hosts a list specifically about `DBD::mysql`; see Section 1.5.1, “MySQL Mailing Lists”.

- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI Web site, http://dbi.perl.org/.

  For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is http://www.kitebird.com/mysql-perl/.

20.13. MySQL C++ API

`MySQL++` is a MySQL API for C++. Warren Young has taken over this project. More information can be found at http://tangentsoft.net/mysql++/doc.

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about using C++ with the MySQL API in the MySQL Knowledge Base. articles found at C++. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.14. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at http://sourceforge.net/projects/mysql-python/.

> **MySQL Enterprise**
> MySQL Enterprise subscribers will find more information about using Python with the MySQL API in the MySQL Knowledge Base articles found at Python. Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

20.15. MySQL Ruby APIs

Two APIs available for Ruby programmers. The MySQL/Ruby API is based on the `libmysql` API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver).

For more information on Ruby, see Ruby Programming Language.

For information on installing and using the MySQL/Ruby API, see Section 20.15.1, “The MySQL/Ruby API”.

For information on installing and using the Ruby/MySQL API, see Section 20.15.2, “The Ruby/MySQL API”.

20.15.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysql`.

For information on installing the module, and the functions exposed, see MySQL/Ruby.

20.15.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see Ruby/MySQL.

20.16. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at http://www.xdobry.de/mysqltcl/.

20.17. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at http://efsa.sourceforge.net/archive/ravits/mysql.htm.

Chapter 21. Extending MySQL

21.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in Section 2.9.3, "Installing from the Development Source Tree". If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see Section 1.5.1, "MySQL Mailing Lists". All developers at MySQL AB are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

21.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- The original thread model for handing client connections is that connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

  As of MySQL 6.0.4, an alternative thread model is available for dealing with the preceding issues that occur when scaling to large numbers of simultaneous connections. This model uses thread pooling:

  - Connection manager threads do not dedicate a thread to each client connection. Instead, the connection is added to the set of existing connection sockets. The server collects input from these sockets and when a complete request has been received from a given client, it is queued for service.
  - The server maintains a pool of service threads to process requests. When a queued request is waiting and there is an available (not busy) service thread in the pool, the request is given to the thread to be handled. After processing the request, the service thread becomes available to process other requests.

    Service threads are created at server startup and exist until the server terminates. A given service thread is not tied to a specific client connection and the requests that it processes over time may originate from different client connections.

  For information about choosing one thread model over the other and tuning the parameters that control thread resources, see Section 7.5.7, "How MySQL Uses Threads for Client Connections".
- On a master replication server, connections from slave servers are handled like client connections, using whichever thread model applies to the latter.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be 4 additional threads by default. Those are file I/O threads, controlled by the `innodb_file_io_threads` parameter. See Section 13.7.3, "`InnoDB` Startup Options and System Variables".
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every *`val`* seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See Section 12.2.5.2, "`INSERT DELAYED` Syntax".

- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See Section 18.4.1, “Event Scheduler Overview”.

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication, and event threads.

> **MySQL Enterprise**
> For expert advice on thread management subscribe to the MySQL Enterprise Monitor. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

21.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at http://dev.mysql.com/doc/.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See Section 1.6, “How to Report Bugs or Problems”.

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See Section 1.5.1, “MySQL Mailing Lists”. This list does not accept attachments, so you should FTP all the relevant files to: ftp://ftp.mysql.com/pub/mysql/upload/

21.2. The MySQL Plugin Interface

MySQL 5.1 and up supports a plugin API that allows the loading and unloading of server components at runtime, without restarting the server. The components supported by this operation include, but are not limited to, full-text parser plugins, storage-engines and server extensions. In MySQL 6.0, all of the storage engines can built as plugins, and fulltext examples and partitioning can also be included as plugins.

Full-text parser plugins can be used to replace or augment the built-in full-text parser. For example, a plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface. The plugin interface eventually will include an API for creating UDFs, and it is intended this plugin UDF API will replace the older non-plugin UDF API. After that point, it will be possible for UDFs to be revised for use as plugin UDFs so that they can take advantage of the better security and versioning capabilities of the plugin API. Eventually, support for the older UDF API will be phased out.

The plugin interface requires the `plugin` table in the `mysql` database. This table is created as part of the MySQL installation process. If you are upgrading from a version older than MySQL 5.1, you should run the `mysql_upgrade` command to create this table. See Section 4.4.8, “`mysql_upgrade` — Check Tables for MySQL Upgrade”.

For more information on the Plugin API and how it can be used with storage engines, see MySQL Internals: Custom Engine.

21.2.1. Characteristics of the Plugin Interface

In some respects, the plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface:

- The plugin framework is extendable to accommodate different kinds of plugins.

  Some aspects of the plugin API are common to all types of plugins, but the API also allows for type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

  Although only the interface for full-text parser plugins is implemented currently, others can be added, such as an interface for UDF plugins.

- The plugin API includes versioning information.

  The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

  There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- Plugin security is improved relative to the UDF interface.

  The older interface for writing non-plugin UDFs allowed libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively non-specific. The newer rules are more strict. A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

  The newer plugin interface eliminates the security issues of the older UDF interface. When a UDF plugin type is implemented, that will allow non-plugin UDFs to be brought into the plugin framework and the older interface to be phased out.

The plugin implementation includes the following components:

Source files (the locations given indicate where the files are found in a MySQL source distribution):

- `include/mysql/plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library.
- `sql/sql_plugin.h` and `sql/sql_plugin.cc` comprise the internal plugin implementation. These files need not be consulted by plugin writers. They may be of interest for those who want to know more about how the server handles plugins.

System table:

- The `plugin` table in the `mysql` database lists each installed plugin and is required for plugin use. For new MySQL installations, this table is created during the installation process. If you are upgrading from a version older than MySQL 5.1, you should run `mysql_upgrade` to update your system tables and create the `plugin` table (see Section 4.4.8, “`mysql_upgrade` — Check Tables for MySQL Upgrade”).

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about known plugins. The `PLUGINS` table in `INFORMATION_SCHEMA` also contains plugin information.

System variable:

- `plugin_dir` indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=path` option. As of MySQL 6.0.5, `mysql_config --plugindir` displays the default plugin directory path name.

21.2.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in Section 11.8, “Full-Text Search Functions”. These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

  One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_xxx` system variables and the stopword list.

  One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from non-plaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSER my_parser
);
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

21.2.3. Writing Plugins

This section describes the general and type-specific parts of the plugin API. It also provides a step-by-step guide to creating a plu-

gin library. For example plugin source code, see the `plugin/fulltext` directory of a MySQL source distribution.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins that were originally written for older servers. For information about these constraints, see Section 2.9.2, "Typical `configure` Options", and Section 2.9.4, "Dealing with Problems Compiling MySQL".

21.2.3.1. General Plugin Structures and Functions

Every plugin must have a general plugin declaration. The declaration corresponds to the `st_mysql_plugin` structure in the `plugin.h` file:

```
struct st_mysql_plugin
{
  int type;            /* the plugin type (a MYSQL_XXX_PLUGIN value)   */
  void *info;          /* pointer to type-specific plugin descriptor   */
  const char *name;    /* plugin name                                  */
  const char *author;  /* plugin author (for SHOW PLUGINS)             */
  const char *descr;   /* general descriptive text (for SHOW PLUGINS ) */
  int license;         /* the plugin license (PLUGIN_LICENSE_XXX)      */
  int (*init)(void *);  /* the function to invoke when plugin is loaded */
  int (*deinit)(void *);/* the function to invoke when plugin is unloaded */
  unsigned int version; /* plugin version (for SHOW PLUGINS)           */
  struct st_mysql_show_var *status_vars;
  void * __reserved1;   /* placeholder for system variables            */
  void * __reserved2;   /* placeholder for config options              */
};
```

The `st_mysql_plugin` structure is common to every type of plugin. Its members should be filled in as follows:

- `type`

  The plugin type. This must be one of the plugin-type values from `plugin.h`. For a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`

  A pointer to the descriptor for the plugin. Unlike the general plugin declaration structure, this descriptor's structure depends on the particular type of plugin. Each descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. The descriptor for full-text plugins is described in Section 21.2.3.2, "Type-Specific Plugin Structures and Functions".

- `name`

  The plugin name. This is the name that will be listed in the `plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`.

- `author`

  The plugin author. This can be whatever you like.

- `desc`

  A general description of the plugin. This can be whatever you like.

- `license`

  The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- `init`

  A once-only initialization function. This is executed when the plugin is loaded, which happens for `INSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server startup. The function takes no arguments. It returns zero for success and nonzero for failure. If an `init` function is unneeded for a plugin, it can be specified as 0.

- `deinit`

A once-only deinitialization function. This is executed when the plugin is unloaded, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server shutdown. The function takes no arguments. It returns zero for success and nonzero for failure. If a `deinit` function is unneeded for a plugin, it can be specified as 0.

- `version`

  The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0x`*`MMNN`*, where *`MM`* and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- `status_vars`

  A pointer to a structure for status variables associated with the plugin, or 0 if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

- `__reserved1`, `__reserved2`

  These are placeholders for the future. Currently, they should be set to `NULL`.

The `init` and `deinit` functions in the general plugin declaration are invoked only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

The `status_vars` member, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
  const char *name;
  char *value;
  enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the allowable status variable `type` values and what the corresponding variable should be.

Type	Meaning
`SHOW_BOOL`	Pointer to a boolean variable
`SHOW_INT`	Pointer to an integer variable
`SHOW_LONG`	Pointer to a long integer variable
`SHOW_LONGLONG`	Pointer to a longlong integer variable
`SHOW_CHAR`	A string
`SHOW_CHAR_PTR`	Pointer to a string
`SHOW_ARRAY`	Pointer to another `st_mysql_show_var` array
`SHOW_FUNC`	Pointer to a function

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024

typedef int (*mysql_show_var_func) (void *thd,
                                    struct st_mysql_show_var *out,
                                    char *buf);
```

Plugins should consider the `thd` parameter to be read only.

21.2.3.2. Type-Specific Plugin Structures and Functions

In the `st_mysql_plugin` structure that defines a plugin's general declaration, the `info` member points to a type-specific plugin descriptor. For a full-text parser plugin, the descriptor corresponds to the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
  int interface_version;
```

```
  int (*parse)(MYSQL_FTPARSER_PARAM *param);
  int (*init)(MYSQL_FTPARSER_PARAM *param);
  int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has a version number (`MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins) and contains pointers to three functions. The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

Note that the plugin declaration in the plugin library descriptor has initialization and deinitialization functions, and so does the plugin descriptor to which it points. These pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the plugin library descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
  int (*mysql_parse)(struct st_mysql_ftparser_param *,
                     char *doc, int doc_len);
  int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
  void *ftparser_state;
  void *mysql_ftparam;
  struct charset_info_st *cs;
  char *doc;
  int length;
  int flags;
  enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

> **Note**
>
> The definition shown is current as of MySQL 5.1.12. It is incompatible with versions of MySQL 6.0 older than 5.1.12.

The structure members are used as follows:

- `mysql_parse`

  A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_parse(param, ...);
  ```

  A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks

between them.

- `mysql_add_word`

  A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

  The first parameter for this callback function should be the `param` value itself:

  ```
  param->mysql_add_word(param, ...);
  ```

- `ftparser_state`

  This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- `mysql_ftparam`

  This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- `cs`

  A pointer to information about the character set of the text, or 0 if no information is available.

- `doc`

  A pointer to the text to be parsed.

- `length`

  The length of the text to be parsed, in bytes.

- `flags`

  Parser flags. This is zero if there are no special flags. Currently, the only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

  This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`

  The parsing mode. This value will be one of the folowing constants:

  - `MYSQL_FTPARSER_SIMPLE_MODE`

    Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

  - `MYSQL_FTPARSER_WITH_STOPWORDS`

    Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

  - `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`

    Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens via the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
  enum enum_ft_token_type type;
  int yesno;
  int weight_adjust;
```

```
  bool wasign;
  bool trunc;
  /* These are parser state and must be removed. */
  byte prev;
  byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`

  The token type. This should be one of values shown in the following table.

Type	Meaning
`FT_TOKEN_EOF`	End of data
`FT_TOKEN_WORD`	A regular word
`FT_TOKEN_LEFT_PAREN`	The beginning of a group or subexpression
`FT_TOKEN_RIGHT_PAREN`	The end of a group or subexpression
`FT_TOKEN_STOPWORD`	A stopword

- `yesno`

  Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- `weight_adjust`

  A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at Section 11.8.2, “Boolean Full-Text Searches”, that use the `<` and `>` operators illustrate how weighting works.

- `wasign`

  The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.

- `trunc`

  Whether matching should be done as if the boolean-mode `*` truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

21.2.3.3. Creating a Plugin Library

This section provides a step-by-step procedure for creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are non-empty runs of whitespace characters.

Each plugin library has the following contents:

- A plugin library descriptor that indicates the version number of the general plugin API that the library uses and that contains a general declaration for each plugin in the library.
- Each plugin general declaration contains information that is common to all types of plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.
- The plugin general declaration also contains a pointer to a type-specific plugin descriptor. The structure of these descriptors can vary from one plugin type to another, because each type of plugin can have its own API. A plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

- The plugin library contains the interface functions that are referenced by the library descriptor and by the plugin descriptors.

The easiest way to follow the instructions in this section is to use the source code in the `plugin/fulltext` directory of a MySQL source distribution. The instructions assume that you make a copy of that directory and use it to build the plugin library. To make a copy of the directory, use the following commands, which assume that the MySQL source tree is in a directory named `mysql-6.0` under your current directory:

```
shell> mkdir fulltext_plugin
shell> cp mysql-6.0/plugin/fulltext/* fulltext_plugin
```

If you are copying files from a Bazaar source tree, `cp` will display an error message about the `SCCS` directory, which you can ignore.

After copying the source files, use the following procedure to create a plugin library:

1. Change location into the `fulltext_plugin` directory:

   ```
   shell> cd fulltext_plugin
   ```

2. The plugin source file should include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

   ```
   #include <stdlib.h>
   #include <ctype.h>
   #include <mysql/plugin.h>
   ```

3. Set up the plugin library file descriptor.

   Every plugin library must include a library descriptor that must define two symbols:

   - `_mysql_plugin_interface_version_` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
   - `_mysql_plugin_declarations_` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

   If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

   The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

   ```
   mysql_declare_plugin
    ... one or more plugin declarations here ...
   mysql_declare_plugin_end;
   ```

   For example, the library descriptor for a library that contains a single plugin named `simple_parser` looks like this:

   ```
   mysql_declare_plugin
   {
     MYSQL_FTPARSER_PLUGIN,      /* type                            */
     &simple_parser_descriptor,  /* descriptor                      */
     "simple_parser",            /* name                            */
     "MySQL AB",                 /* author                          */
     "Simple Full-Text Parser",  /* description                     */
     PLUGIN_LICENSE_GPL,         /* plugin license                  */
     simple_parser_plugin_init,  /* init function (when loaded)     */
     simple_parser_plugin_deinit,/* deinit function (when unloaded) */
     0x0001,                     /* version                         */
     simple_status               /* status variables                */
   }
   mysql_declare_plugin_end;
   ```

   For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

   The `mysql_declare_plugin` and `mysql_declare_plugin_end` macros are defined in `plugin.h` like this:

   ```
   #ifndef MYSQL_DYNAMIC_PLUGIN
   #define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS)          \
   int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION;                         \
   int PSIZE= sizeof(struct st_mysql_plugin);                           \
   ```

```
struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS)          \
int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; \
int _mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin);  \
struct st_mysql_plugin _mysql_plugin_declarations_[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
                builtin_ ## NAME ## _plugin_interface_version, \
                builtin_ ## NAME ## _sizeof_struct_st_plugin, \
                builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0}}
```

One point to note about those definitions is that the `_mysql_plugin_interface_version_` symbol is defined only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you'll need to provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version_` and `_mysql_plugin_declarations_`):

```
int _mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION;
struct st_mysql_plugin _mysql_plugin_declarations_[]= {
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "MySQL AB",                 /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status               /* status variables                */
}
  ,{0,0,0,0,0,0,00,0}
};
```

The preceding example declares a single plugin in the library descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. See the discussion at the end of this section that describes some legal and illegal initializers for plugins.

4. Set up the plugin descriptor.

   Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

   ```
   static struct st_mysql_ftparser simple_parser_descriptor=
   {
     MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version      */
     simple_parser_parse,              /* parsing function       */
     simple_parser_init,               /* parser init function   */
     simple_parser_deinit              /* parser deinit function */
   };
   ```

5. Set up the plugin interface functions.

   The general plugin declaration in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

   ```
   static int simple_parser_plugin_init(void)
   {
     return(0);
   }

   static int simple_parser_plugin_deinit(void)
   {
     return(0);
   }
   ```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param)
{
  return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param)
{
  return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers non-empty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
  char *end, *start, *docend= param->doc + param->length;

  for (end= start= param->doc;; end++)
  {
    if (end == docend)
    {
      if (end > start)
        add_word(param, start, end - start);
      break;
    }
    else if (isspace(*end))
    {
      if (end > start)
        add_word(param, start, end - start);
      start= end + 1;
    }
  }
  return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
  MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
    { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };

  param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in Section 21.2.3.2, “Type-Specific Plugin Structures and Functions”.

6. Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
  {"static", (char *)"just a static text", SHOW_CHAR},
  {"called", (char *)&number_of_calls,     SHOW_LONG},
  {0,0,0}
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+----------------------+--------------------+
| Variable_name        | Value              |
```

```
+----------------------+--------------------+
| simple_parser_static | just a static text |
| simple_parser_called | 0                  |
+----------------------+--------------------+
```

7. Compile the plugin library as a shared library and install it in the plugin directory.

   > **Note**
   >
   > As mentioned earlier, be sure to specify `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

   The procedure for compiling shared objects varies from system to system. If you build your library using the GNU autotools, `libtool` should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The file name might have a different extension on your system.)

   To use the autotools, you'll need to make a few changes to the configuration files at this point to enable the plugin to be compiled and installed. Assume that your MySQL distribution is installed at a base directory of `/usr/local/mysql` and that its header files are located in the `include` directory under the base directory.

   Edit `Makefile.am`, which should look something like this:

   ```
   #Makefile.am example for a plugin

   pkglibdir=$(libdir)/mysql
   INCLUDES= -I$(top_builddir)/include -I$(top_srcdir)/include
   #noinst_LTLIBRARIES= mypluglib.la
   pkglib_LTLIBRARIES= mypluglib.la
   mypluglib_la_SOURCES= plugin_example.c
   mypluglib_la_LDFLAGS= -module -rpath $(pkglibdir)
   mypluglib_la_CFLAGS= -DMYSQL_DYNAMIC_PLUGIN
   ```

   The `mypluglib_la_CFLAGS` line takes care of passing the `-DMYSQL_DYNAMIC_PLUGIN` flag to the compilation command.

   Adjust the `INCLUDES` line to specify the path name to the installed MySQL header files. Edit it to look like this:

   ```
   INCLUDES= -I/usr/local/mysql/include
   ```

   Make sure that the `noinst_LTLIBRARIES` line is commented out or remove it. Make sure that the `pkglib_LTLIBRARIES` line is not commented out; it enables the `make install` command.

   Set up the files needed for the `configure` command, invoke it, and run `make`:

   ```
   shell> autoreconf --force --install --symlink
   shell> ./configure --prefix=/usr/local/mysql
   shell> make
   ```

   The `--prefix` option to `configure` indicates the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

   ```
   mysql> SHOW VARIABLES LIKE 'basedir';
   +---------------+-----------------+
   | Variable_name | Value           |
   +---------------+-----------------+
   | base          | /usr/local/mysql |
   +---------------+-----------------+
   ```

   The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

   ```
   mysql> SHOW VARIABLES LIKE 'plugin_dir';
   +---------------+-----------------------------------+
   | Variable_name | Value                             |
   +---------------+-----------------------------------+
   | plugin_dir    | /usr/local/mysql/lib/mysql/plugin |
   +---------------+-----------------------------------+
   ```

   To install the plugin library, use `make`:

   ```
   shell> make install
   ```

   Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library

permissions allow it to be executed by the server.

8. Register the plugin with the server.

   The `INSTALL PLUGIN` statement causes the server to list the plugin in the `plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+--------------+-----------------+
| name         | dl              |
+--------------+-----------------+
| simple_parser | libmypluglib.so |
+--------------+-----------------+
1 row in set (0.00 sec)
```

9. Try the plugin.

   Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
    ->   FULLTEXT (c) WITH PARSER simple_parser);
Query OK, 0 rows affected (0.01 sec)
```

   Insert some text into the table and try some searches. These should verify that the parser plugin treats all non-whitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
    ->   ('latin1_general_cs is a case-sensitive collation'),
    ->   ('I\'d like a case of oranges'),
    ->   ('this is sensitive information'),
    ->   ('another row'),
    ->   ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0

mysql> SELECT c FROM t;
+-------------------------------------------------+
| c                                               |
+-------------------------------------------------+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges                      |
| this is sensitive information                   |
| another row                                     |
| yet another row                                 |
+-------------------------------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-------------------------+
| MATCH(c) AGAINST('case') |
+-------------------------+
|                       0 |
|         1.2968142032623 |
|                       0 |
|                       0 |
|                       0 |
+-------------------------+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----------------------------+
| MATCH(c) AGAINST('sensitive') |
+-----------------------------+
|                           0 |
|                           0 |
|              1.3253291845322 |
|                           0 |
|                           0 |
+-----------------------------+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+---------------------------------+
| MATCH(c) AGAINST('case-sensitive') |
+---------------------------------+
|                   1.3109166622162 |
|                                 0 |
|                                 0 |
|                                 0 |
|                                 0 |
+---------------------------------+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-------------------------+
```

```
| MATCH(c) AGAINST('I\'d') |
+--------------------------+
|                        0 |
|          1.2968142032623 |
|                        0 |
|                        0 |
|                        0 |
+--------------------------+
5 rows in set (0.01 sec)
```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. The `simple_parser` descriptor shown earlier is allowable in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  "simple_parser",            /* name                            */
  "MySQL AB",                 /* author                          */
  "Simple Full-Text Parser",  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status               /* status variables                */
}
mysql_declare_plugin_end;
```

Here is another valid way to write the descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "MySQL AB";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  simple_parser_name,         /* name                            */
  simple_parser_author,       /* author                          */
  simple_parser_description,  /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status               /* status variables                */
}
mysql_declare_plugin_end;
```

However, the following descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```
typedef struct
{
  const char *name;
  const char *author;
  const char *description;
} plugin_info;

plugin_info parser_info = {
  "simple_parser",
  "MySQL AB",
  "Simple Full-Text Parser"
};

mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN,      /* type                            */
  &simple_parser_descriptor,  /* descriptor                      */
  parser_info.name,           /* name                            */
  parser_info.author,         /* author                          */
  parser_info.description,    /* description                     */
  PLUGIN_LICENSE_GPL,         /* plugin license                  */
  simple_parser_plugin_init,  /* init function (when loaded)     */
  simple_parser_plugin_deinit,/* deinit function (when unloaded) */
  0x0001,                     /* version                         */
  simple_status               /* status variables                */
}
mysql_declare_plugin_end;
```

21.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See Section 12.5.4.1, “`CREATE FUNCTION` Syntax”.
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See Section 18.2, “Using Stored Routines (Procedures and Functions)”.

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See Section 8.2.4, “Function Name Parsing and Resolution”, for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

21.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

21.3.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. The MySQL source distribution includes a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the `include/mysql_com.h` header file. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.9.2, “Typical

`configure` Options", and Section 2.9.4, "Dealing with Problems Compiling MySQL".

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `--with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `--with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name "xxx" is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

  The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
`STRING`	`char *`
`INTEGER`	`long long`
`REAL`	`double`

  It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

  The initialization function for `xxx()`. It can be used for the following purposes:

  - To check the number of arguments to `XXX()`.
  - To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
  - To allocate any memory required by the main function.
  - To specify the maximum length of the result.
  - To specify (for `REAL` functions) the maximum number of decimal places in the result.
  - To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

  The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

  Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

  Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

21.3.2.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. Section 21.3.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);

void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

  `xxx_init()` should set `maybe_null` to `1` if `xxx()` can return `NULL`. The default value is `1` if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

  The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

  For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals allowed for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types. As of MySQL 6.0.6, this value is available as

the constant `NOT_FIXED_DEC` in the `mysql_com.h` header file.

A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other non-number arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `NOT_FIXED_DEC` for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

  The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

  If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

  A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

  ```
  initid->ptr = allocated_memory;
  ```

  In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

  `xxx_init()` should set `const_item` to `1` if `xxx()` always returns the same value and to `0` otherwise.

21.3.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. Section 21.3.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

- `xxx_reset()`

  This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

  ```
  void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
                 char *is_null, char *error);
  ```

  `xxx_reset()` is not needed or used in MySQL 6.0, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

  This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

  ```
  void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
  ```

  `is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

  If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

  `xxx_clear()` is required by MySQL 6.0.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See Section 21.3.2.1, "UDF Calling Sequences for Simple Functions".

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See Section 21.3.2.4, "UDF Return Values and Error Handling".

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate UDFs. See Section 21.3.2.3, "UDF Argument Processing".

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

21.3.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

  The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

  ```
  if (args->arg_count != 2)
  {
      strcpy(message,"XXX() requires two arguments");
      return 1;
  }
  ```

  For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count` – 1.

- `enum Item_result *arg_type`

  A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

  To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

  ```
  if (args->arg_type[0] != STRING_RESULT ||
      args->arg_type[1] != INT_RESULT)
  {
      strcpy(message,"XXX() requires a string and an integer");
      return 1;
  }
  ```

  Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

  As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

  ```
  args->arg_type[0] = STRING_RESULT;
  args->arg_type[1] = INT_RESULT;
  ```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

  `args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to access the value properly.) For a non-constant argument, `args->args[i]` is `0`. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

  For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

  If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

  - An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
  - For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

    ```
    long long int_val;
    int_val = *((long long*) args->args[i]);
    ```

  - For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

    ```
    double    real_val;
    real_val = *((double*) args->args[i]);
    ```

  - For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
  - `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

  For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

  For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

  `args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

  By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is *`alias_name`*. The `attributes` value for each argument thus depends on whether an alias was given.

  Suppose that a UDF `my_udf()` is invoked as follows:

  ```
  SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
  ```

  In this case, the `attributes` and `attribute_lengths` arrays will have these values:

  ```
  args->attributes[0] = "expr1"
  args->attribute_lengths[0] = 5
  ```

```
args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

  The `attribute_lengths` array indicates the length of each argument name.

21.3.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function via the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multi-byte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to `1`:

```
*error = 1;
```

If `xxx()` sets `*error` to `1` for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

21.3.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a host name.
- `reverse_lookup()` returns the host name for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the Bazaar source repository for MySQL 6.0. See Section 2.9.3, “Installing from the Development Source Tree”.
2. You must obtain the CMake build utility from http://www.cmake.org. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` (`CMakeLists.txt`) with these contents:

   ```
   PROJECT(udf_example)

   # Path for MySQL include directory
   INCLUDE_DIRECTORIES("c:/mysql/include")

   ADD_DEFINITIONS("-DHAVE_DLOPEN")
   ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
   TARGET_LINK_LIBRARIES(udf_example wsock32)
   ```

5. Create the VC project and solution files:

   ```
   cmake -G "<Generator>"
   ```

   Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

   ```
   devenv udf_example.sln /build Release
   ```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION reverse_lookup
    ->        RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE AGGREGATE FUNCTION avgcost
    ->        RETURNS REAL SONAME 'udf_example.dll';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The func-

tion's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

21.3.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

21.3.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:

   - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.

   - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.

2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

   ```
   static Native_func_registry func_array[]
   ```

   You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.

4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

   ```
   double   Item_func_newname::val()
   ```

```
longlong Item_func_newname::val_int()
String  *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is non-deterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is non-deterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

21.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

Additionally, we recommend that you take a look at `mylua`. With this you can use the LUA language to load a procedure at runtime into `mysqld`.

21.4.1. PROCEDURE ANALYSE

`analyse([max_elements[,max_memory]])`

This procedure is defined in the `sql/sql_analyse.cc` file. It examines the result from a query and returns an analysis of the results that suggests optimal data types for each column. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- *`max_elements`* (default 256) is the maximum number of distinct values that `analyse` notices per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`; if there are more than *`max_elements`* distinct values, then `ENUM` is not a suggested type.
- *`max_memory`* (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to find all distinct values.

21.4.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

21.5. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See Section 2.1.1, “Operating Systems Supported by MySQL Community Server”. If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (http://www.mysql.com/), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, `<Xavier.Leroy@inria.fr>`.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See `mit-pthreads/README` and Programming POSIX Threads (http://www.humanfactor.com/pthreads/).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at http://www.mit.edu/afs/sipb/project/pthreads/ and a programming introduction at http://www.mit.edu:8001/people/proven/IAP_2000/). These can be used for some operating systems that do not have POSIX threads. See Section 2.9.5, “MIT-pthreads Notes”.

It is also possible to use another user level thread package named FSU Pthreads (see http://moss.csc.ncsu.edu/~mueller/pthreads/). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are SPARCworks, Sun Forte, Irix `cc`, HP-UX `aCC`, IBM AIX `xlC_r`), Intel `ecc/icc` and Compaq `cxx`).

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See Section 2.9.3, “Installing from the Development Source Tree”.

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'
```

```
# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See Section 21.5.1, “Debugging a MySQL Server”.

> **Note**
>
> Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

21.5.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See Section B.1.4.2, “What to Do If MySQL Keeps Crashing”.

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`.

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See Chapter 5, *MySQL Server Administration*. You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See Section 2.12, “Operating System-Specific Notes”.

21.5.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \
   -fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \
   --with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See Section 1.5.1, “MySQL Mailing Lists”. If you believe that you have found a bug, please use the instructions at Section 1.6, “How to Report Bugs or Problems”.

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

21.5.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big**! If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to ftp://ftp.mysql.com/pub/mysql/upload/ so that a MySQL developer can take a look at it.

The trace file is made with the **DBUG** package by Fred Fish. See Section 21.5.3, “The DBUG Package”.

21.5.1.3. Using pdb to create a Windows crashdump

Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see Microsoft Knowledge Base Article 121366. For more information on the debugging options available, see Debugging Tools for Windows.

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with WinDbg, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

   ```
   C:\> drwtsn32 -i
   ```

2. Set the **Log File Path** to the directory where you want to store trace files.
3. Make sure **Dump All Thread Contexts** and **Append To Existing Log File**.
4. Uncheck **Dump Symbol Table**, **Visual Notification**, **Sound Notification** and **Create Crash Dump File**.
5. Set the **Number of Instructions** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

   > **Caution**
   >
   > Note that the file generated can be very large.

The dump file generated can be used within Microsoft Visual Studio to debug the application and determine what caused the prob-

lem.

21.5.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. We recommend you to upgrade to gdb 5.1 ASAP as thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections` + 1. In most cases just using `--thread_cache_size=5'` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a SIGSEGV signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb>   backtrace full
gdb>   quit
```

See Section B.1.4.2, “What to Do If MySQL Keeps Crashing”.

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download gdb 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug mysqld:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in Section 1.6, “How to Report Bugs or Problems”.

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

21.5.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See Section 5.2.2, “The Error Log”. To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See Section 21.5.1.1, “Compiling MySQL for Debugging”.

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

   ```
   0x9da402
   0x6648e9
   0x7f1a5af000f0
   0x7f1a5a10f0f2
   0x7412cb
   0x688354
   0x688494
   0x67a170
   0x67f0ad
   0x67fdf8
   0x6811b6
   0x66e05e
   ```

2. Make a symbol file for the `mysqld` server:

   ```
   shell> nm -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If `mysqld` is not linked statically, use the following command instead:

   ```
   shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this op-

tion, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
```

If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
```

This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See Section 1.6, “How to Report Bugs or Problems”.

21.5.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See Chapter 5, *MySQL Server Administration*.

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See Section 5.2.3, “The General Query Log”. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as *`host_name`*`.log` In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See Section 12.3.2, “`EXPLAIN` Syntax”.

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See Section 5.2.5, “The Slow Query Log”.

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see Chapter 5, *MySQL Server Administration*), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at http://lists.mysql.com/, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See Section 5.1.2, “Server Command Options”.

As of MySQL 6.0.4, when the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368` . This is useful information to include in bug reports.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

21.5.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/`*`table`*`.MYI`.
- Make a second backup of the tables.

- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with the binary log enabled. If you want to find a query that crashes `mysqld`, you should start the server with both the general query log enabled as well. See Section 5.2.3, “The General Query Log”, and Section 5.2.4, “The Binary Log”.
- When you have gotten a crashed table, stop the `mysqld server`.
- Restore the backup.
- Restart the `mysqld` server **without** the binary log enabled.
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to ftp://ftp.mysql.com/pub/mysql/upload/ and report it in our bugs database using the instructions given in Section 1.6, “How to Report Bugs or Problems”. (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center https://support.mysql.com/ to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

21.5.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See Section 2.9.2, “Typical `configure` Options”.

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.6, “How to Report Bugs or Problems”.

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

21.5.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See Section 21.5.1.2, “Creating Trace Files”.

This section summaries the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional “`,`” and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The following table shows the currently recognized flag characters.

Flag	Description
d	Enable output from DBUG_<N> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
D	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, `-#D,20` specifies a delay of two seconds.
f	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate `d` or `t` flags must still be given; this flag only limits their actions if they are enabled.
F	Identify the source file name for each line of debug or trace output.
i	Identify the process with the PID or thread ID for each line of debug or trace output.
g	Enable profiling. Create a file called `dbugmon.out` containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
L	Identify the source file line number for each line of debug or trace output.
n	Print the current function nesting depth for each line of debug or trace output.
N	Number each line of debug output.
o	Redirect the debugger output stream to the specified file. The default output is `stderr`.
O	Like `o`, but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
p	Limit debugger actions to specified processes. A process must be identified with the `DBUG_PROCESS` macro and match one in the list for debugger actions to occur.
P	Print the current process name for each line of debug or trace output.
r	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
S	Do function `_sanity(_file_,_line_)` at each debugged function until `_sanity()` returns something that differs from 0. (Mostly used with `safemalloc` to find memory leaks)
t	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:O,\\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

21.5.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See `mysys/my_pthread.c` for more info.

At least the following should be changed:

`pthread_get_specific` should use one argument. `sigwait` should take two arguments. A lot of functions (at least `pthread_cond_wait`, `pthread_cond_timedwait()`) should return the error code on error. Now they return -1 and set `errno`.

Another problem is that user-level threads use the `ALRM` signal and this aborts a lot of functions (`read`, `write`, `open`...). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed `mysys/thr_alarm.c` to wait between alarms with `pthread_cond_timedwait()`, but this aborts with error `EINTR`. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.
- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```
Main thread: 1
Thread 0 (5) started
Thread: 5  Waiting
process_alarm
Thread 1 (6) started
Thread: 6  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 1 (1) sec
Thread: 6  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 2 (2) sec
Thread: 6  Simulation of no alarm needed
Thread: 6  Slept for 0 (3) sec
Thread: 6  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 4 (4) sec
Thread: 6  Waiting
process_alarm
thread_alarm
Thread: 5  Slept for 10 (10) sec
Thread: 5  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 5 (5) sec
Thread: 6  Waiting
process_alarm
process_alarm

...
thread_alarm
Thread: 5  Slept for 0 (1) sec
end
```

21.5.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all non-thread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it is quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.

- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really “thread aware.”

Appendix A. MySQL 6.0 Frequently Asked Questions

A.1. MySQL 6.0 FAQ — General

Questions

Questions and Answers

22.1.1: Which version of MySQL is production-ready (GA)?

Currently, both MySQL 5.0 and MySQL 5.1 are supported for production use.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008.

Development work on MySQL 5.4 has started; currently, MySQL 5.4 is in beta status.

Development work on MySQL 6.0 has started; currently, MySQL 6.0 is in alpha status.

22.1.2: Can MySQL 6.0 do subqueries?

Yes. See Section 12.2.10, “Subquery Syntax”.

22.1.3: Can MySQL 6.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see Section 12.2.12, “`UPDATE` Syntax”; for that required to perform multiple-table deletes, see Section 12.2.2, “`DELETE` Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See Section 18.3, “Using Triggers”.

22.1.4: Does MySQL 6.0 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See Section 7.5.5, “The MySQL Query Cache”.

22.1.5: Does MySQL 6.0 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 6.0 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

22.1.6: Does MySQL 6.0 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See Section 10.3.2, “The `TIME` Type”.

22.1.7: Does MySQL 6.0 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

22.1.8: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?

This is currently under development for a future MySQL release.

22.1.9: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in `InnoDB` has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

22.1.10: Can MySQL 6.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, non-locking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

A.2. MySQL 6.0 FAQ — Storage Engines

Questions

Questions and Answers

22.2.1: Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?

See Chapter 13, *Storage Engines*. That chapter contains information about all MySQL storage engines except for the `NDB` storage engine used for MySQL Cluster; `NDB` is covered in MySQL Cluster NDB 6.X/7.X.

> **MySQL Enterprise**
> For expert advice about the storage engine(s) most suitable to your circumstances subscribe to the MySQL Enterprise Monitor. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

22.2.2: Are there any new storage engines in MySQL 6.0?

MySQL 6.0 introduces an alpha version of the new Falcon storage engine.

For information about the Falcon storage engine, see Section 13.8, “The `Falcon` Storage Engine”.

There have also been significant improvements in existing storage engines, in particular for the `NDB` storage engine that forms the basis for MySQL Cluster.

22.2.3: Have any storage engines been removed in MySQL 6.0?

Yes. MySQL 6.0 no longer supports the `BDB` storage engine. Any existing `BDB` tables should be converted to another storage engine before upgrading to MySQL 6.0.

22.2.4: What are the unique benefits of the `ARCHIVE` storage engine?

The `ARCHIVE` storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See Section 13.13, "The ARCHIVE Storage Engine", for details.

22.2.5: Do the new features in MySQL 6.0 apply to all storage engines?

The general new features such as views, stored procedures, triggers, `INFORMATION_SCHEMA`, precision math (`DECIMAL` column type), and the `BIT` column type, apply to all storage engines. There are also additions and changes for specific storage engines.

A.3. MySQL 6.0 FAQ — Server SQL Mode

Questions

Questions and Answers

22.3.1: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see Section 5.1.7, "Server SQL Modes".

22.3.2: How many server SQL modes are there?

Each mode can be independently switched on and off. See Section 5.1.7, "Server SQL Modes", for a complete list of available modes.

22.3.3: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

22.3.4: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

22.3.5: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add additional restrictions to a mode. See Section 5.1.7, "Server SQL Modes", for more information.

22.3.6: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However — if you do require it — strict mode can provide such validation.

22.3.7: What is the default server SQL mode when My SQL 6.0 is installed?

By default, no special modes are enabled. See Section 5.1.7, "Server SQL Modes", for information about all available modes and MySQL's default behavior.

A.4. MySQL 6.0 FAQ — Stored Procedures and Functions

Questions

Questions and Answers

22.4.1: Does MySQL 6.0 support stored procedures and functions?

Yes. MySQL 6.0 supports two types of stored routines — stored procedures and stored functions.

22.4.2: Where can I find documentation for MySQL stored procedures and stored functions?

See Section 18.2, “Using Stored Routines (Procedures and Functions)”.

22.4.3: Is there a discussion forum for MySQL stored procedures?

Yes. See http://forums.mysql.com/list.php?98.

22.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including coverage of stored procedures.

22.4.5: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see Section 19.14, "The `INFORMATION_SCHEMA ROUTINES` Table").

22.4.6: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named *`dbname`*, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
    FROM INFORMATION_SCHEMA.ROUTINES
    WHERE ROUTINE_SCHEMA='dbname';
```

For more information, see Section 19.14, "The `INFORMATION_SCHEMA ROUTINES` Table".

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See Section 12.5.6.11, "`SHOW CREATE PROCEDURE` Syntax", for more information.

22.4.7: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See Section 12.5.6.11, "`SHOW CREATE PROCEDURE` Syntax", for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database — see Section 19.14, "The `INFORMATION_SCHEMA ROUTINES` Table", for information about this table.

22.4.8: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 6.0.

22.4.9: Can a stored procedure call another stored procedure?

Yes.

22.4.10: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

22.4.11: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

22.4.12: Do stored procedures have a statement for raising application errors?

Yes. As of MySQL 6.0.11, MySQL implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See Section 12.8.8, "`SIGNAL` and `RESIGNAL`".

22.4.13: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See Section 12.8.4.2, "`DECLARE` for Handlers", for details.

22.4.14: Can MySQL 6.0 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

22.4.15: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 6.0.

22.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 6.0.

22.4.17: Can I pass an array as input to a stored procedure?

Not in MySQL 6.0.

22.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 6.0, cursors are available inside stored procedures only.

22.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 6.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See Section 12.2.9, "`SELECT` Syntax".

22.4.20: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

22.4.21: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

22.4.22: Do MySQL 6.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in Section 18.6, "Binary Logging of Stored Programs".

22.4.23: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

22.4.24: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

22.4.25: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

22.4.26: What limitations exist for replicating stored procedure and function actions?

Non-deterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, non-transactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

22.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

22.4.28: What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

The default format, *mixed* replication, is also available (by starting the server with `--binlog-format=mixed`). This hybrid, "smart" form of replication "knows" whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see Section 16.1.2, "Replication Formats".

A.5. MySQL 6.0 FAQ — Triggers

Questions

Questions and Answers

22.5.1: Where can I find the documentation for MySQL 6.0 triggers?

See Section 18.3, "Using Triggers".

22.5.2: Is there a discussion forum for MySQL Triggers?

Yes. It is available at http://forums.mysql.com/list.php?99.

22.5.3: Does MySQL 6.0 have statement-level or row-level triggers?

In MySQL 6.0, all triggers are `FOR EACH ROW` — that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 6.0 does not support triggers using `FOR EACH STATEMENT`.

22.5.4: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

22.5.5: How are triggers managed in MySQL?

In MySQL 6.0, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See Section 12.1.15, "`CREATE TRIGGER` Syntax", and Section 12.1.24, "`DROP TRIGGER` Syntax", for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See Section 19.16, "The `INFORMATION_SCHEMA TRIGGERS` Table".

22.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
    FROM INFORMATION_SCHEMA.TRIGGERS
    WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see Section 19.16, "The `INFORMATION_SCHEMA TRIGGERS` Table".

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See Section 12.5.6.38, "`SHOW TRIGGERS` Syntax".

22.5.7: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

22.5.8: Can a trigger call a stored procedure?

Yes.

22.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

22.5.10: Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF available at MySQL Forge here: http://forge.mysql.com/projects/project.php?id=211

22.5.11: Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See Section 13.12, "The `FEDERATED` Storage Engine").

22.5.12: Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's "classic" statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see Section 16.3.1.26, "Replication and Triggers".

22.5.13: How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

Statement-based replication. First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.

3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

Row-based replication. When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and — in addition — the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see Section 16.3.1.26, “Replication and Triggers”.

A.6. MySQL 6.0 FAQ — Views

Questions

Questions and Answers

22.6.1: Where can I find documentation covering MySQL Views?

See Section 18.5, “Using Views”.

22.6.2: Is there a discussion forum for MySQL Views?

Yes. See http://forums.mysql.com/list.php?100

22.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See Section 12.5.2.2, “`CHECK TABLE` Syntax”.)

22.6.4: Does MySQL 6.0 have table snapshots?

No.

22.6.5: Does MySQL 6.0 have materialized views?

No.

22.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7. MySQL 5.0 FAQ — `INFORMATION_SCHEMA`

Questions

Questions and Answers

22.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See Chapter 19, *`INFORMATION_SCHEMA` Tables*

22.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See http://forums.mysql.com/list.php?101.

22.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

22.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

22.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data*.

A.8. MySQL 6.0 FAQ — Migration

Questions

Questions and Answers

22.8.1: Where can I find information on how to migrate from MySQL 5.1 to MySQL 6.0?

For detailed upgrade information, see Section 2.11.1, “Upgrading MySQL”. We recommend that you do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble — if you encounter problems during the upgrade, their origin will be easier to identify, either by you or — if you have a MySQL Enterprise subscription — by MySQL support.

22.8.2: How has storage engine (table type) support changed in MySQL 6.0 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table *`tblname`* from `ISAM` to `MyISAM`, simply issue a statement such as this one:

  ```
  ALTER TABLE tblname ENGINE=MYISAM;
  ```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file sys-

tems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.

- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

A.9. MySQL 6.0 FAQ — Security

Questions

Questions and Answers

22.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is Section 5.3, “General Security Issues”.

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- Section 5.3.1, “General Security Guidelines”.
- Section 5.3.2, “Making MySQL Secure Against Attackers”.
- Section B.1.4.1, “How to Reset the Root Password”.
- Section 5.3.5, “How to Run MySQL as a Normal User”.
- Section 21.3.2.6, “User-Defined Function Security Precautions”.
- Section 5.3.3, “Security-Related `mysqld` Options”.
- Section 5.3.4, “Security Issues with `LOAD DATA LOCAL`”.
- Section 2.10, “Post-Installation Setup and Testing”.
- Section 2.12.1.11, “SELinux Notes”.
- Section 5.5.7.1, “Basic SSL Concepts”.

22.9.2: Does MySQL 6.0 have native support for SSL?

Most 6.0 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it is still quite new and does not compile on all platforms yet. See Section 5.5.7, “Using SSL for Secure Connections”.

You can also tunnel a connection via SSH, if (for instance) if the client application doesn't support SSL connections. For an example, see Section 5.5.8, “Connecting to MySQL Remotely from Windows with SSH”.

22.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 6.0 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL lib-

rary currently does not compile on all platforms. See Section 5.5.7, “Using SSL for Secure Connections”, for a complete listing of supported and unsupported platforms.

22.9.4: Does MySQL 6.0 have built-in authentication against LDAP directories?

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

22.9.5: Does MySQL 6.0 include support for Roles Based Access Control (RBAC)?

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

A.10. MySQL 6.0 FAQ — MySQL Cluster

Beginning with MySQL 6.0.5, MySQL Cluster is no longer supported in MySQL Server 6.0 releases. Instead, MySQL Cluster is now released as a separate product, available in 2 release series — MySQL Cluster NDB 6.2 and MySQL Cluster NDB 6.3. You should use one of these for new deployments, and plan to upgrade to one of them if you are using a previous version of MySQL with clustering support. For an overview of improvements in MySQL Cluster NDB 6.2 and 6.3, see Features Added in MySQL Cluster NDB 6.2, and Features Added in MySQL Cluster NDB 6.3.

For answers to frequently asked questions about MySQL Cluster, see MySQL 5.1 FAQ — MySQL Cluster. For detailed information about deploying and using MySQL Cluster, see MySQL Cluster NDB 6.X/7.X.

A.11. MySQL 6.0 FAQ — MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- 22.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- 22.11.20: Where can I get help with CJK and related issues in MySQL?

Questions and Answers

22.11.1: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `eucjpms` character set was not supported prior to MySQL 5.0.3. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
    -> FROM INFORMATION_SCHEMA.CHARACTER_SETS
    -> WHERE DESCRIPTION LIKE '%Chinese%'
    -> OR DESCRIPTION LIKE '%Japanese%'
    -> OR DESCRIPTION LIKE '%Korean%'
    -> ORDER BY CHARACTER_SET_NAME;
+--------------------+--------------------------+
| CHARACTER_SET_NAME | DESCRIPTION              |
+--------------------+--------------------------+
| big5               | Big5 Traditional Chinese |
| cp932              | SJIS for Windows Japanese |
| eucjpms            | UJIS for Windows Japanese |
| euckr              | EUC-KR Korean            |
| gb2312             | GB2312 Simplified Chinese |
| gbk                | GBK Simplified Chinese   |
| sjis               | Shift-JIS Japanese       |
| ujis               | EUC-JP Japanese          |
+--------------------+--------------------------+
8 rows in set (0.01 sec)
```

(See Section 19.9, “The `INFORMATION_SCHEMA CHARACTER_SETS` Table”, for more information.)

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312` — but eventually they try to insert a rarer Chinese character and it doesn't work. (See Bug#16072 for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs.

- For a complete listing of the `gb2312` characters, ordered according to the `gb2312_chinese_ci` collation: gb2312
- MySQL's `gbk` is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0-A6F5`, and `A8BB-A8C0`. For a listing of the differences, see http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h.
- For a listing of `gbk`/Unicode mappings, see http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT.
- For MySQL's listing of `gbk` characters, see gbk.

22.11.2: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

  Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

  People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or — better — yet by using this statement:

  ```
  SELECT character_set_name, collation_name
      FROM information_schema.columns
      WHERE table_schema = your_database_name
          AND table_name = your_table_name
          AND column_name = your_column_name;
  ```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

  You can obtain this information for a column *`column_name`* in the table *`table_name`* using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

  `3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip possible — that is, when you select `literal` (or `_introducer hexadecimal-value`), you obtain `literal` as a result.*

  For example, the Japanese *Katakana* character *Pe* (`ペ`) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ペ' AS `ペ`;         /* or SELECT _ucs2 0x30da; */
```

  If the result is not also ペ, then the round trip has failed.

  For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ペ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

  Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

  To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+---------------------------------------+
| Variable_name            | Value                                 |
+--------------------------+---------------------------------------+
| character_set_client     | utf8                                  |
| character_set_connection | utf8                                  |
| character_set_database   | latin1                                |
| character_set_filesystem | binary                                |
| character_set_results    | utf8                                  |
| character_set_server     | latin1                                |
| character_set_system     | utf8                                  |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+---------------------------------------+
8 rows in set (0.03 sec)
```

  These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

  Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

  If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

  Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

  It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

22.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of Bug#12476). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+------+
| big5 |
+------+
| 嬛   |
+------+

```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug#13577 to be of interest.

22.11.4: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and eucjpms character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations — that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark ("?") — this is what is always used when the conversion cannot be performed.

22.11.5: What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: "?". There are serious complaints about this: many people would prefer a "loose" conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`. We are considering a change to this behavior.

22.11.6: How does MySQL represent the Yen (`¥`) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (`\` — also known as a backslash), and others treat it as a yen sign (`¥`).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, *`5C` is always the reverse solidus (`\`)*.

22.11.7: Do MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 6.0.

22.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the "ASCII" variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the "KS-Roman" variant of EUC-KR, in which the code point `0x5c` is `WON SIGN`(`₩`). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
    ->     CONVERT('₩' USING euckr) AS euckr,
    ->     HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-------+----------+
| euckr | hexeuckr |
+-------+----------+
| ?     | 3F       |
+-------+----------+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: euckr.

22.11.9: Why do I get `DATA TRUNCATED` error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
    -> (ucs2 CHAR(3) CHARACTER SET ucs2,
    -> gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character 汃 in both columns.

```
mysql> INSERT INTO ch VALUES ('A汃B','A汃B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there is a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS;
+---------+------+-----------------------------------------------+
| Level   | Code | Message                                       |
+---------+------+-----------------------------------------------+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1 |
+---------+------+-----------------------------------------------+
1 row in set (0.00 sec)
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-------+--------------+--------+-------------+
| ucs2  | HEX(ucs2)    | gb2312 | HEX(gb2312) |
+-------+--------------+--------+-------------+
| A汃B | 00416C4C0042 | A?B    | 413F42      |
+-------+--------------+--------+-------------+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it is a "warning" rather than an "error" is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.

2. The 刂川 character isn't in the `gb2312` character set. We described that problem earlier.

3. Admittedly the message is misleading. We didn't "truncate" in this case, we replaced with a question mark. We've had a complaint about this message (See Bug#9337). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.

4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1`.

22.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check Section 20.1.4, "Connector/ODBC Configuration". If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
              & "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See Section 20.2.4.2, "Connecting to MySQL Using Connector/NET", for more information.

If you are using PHP, try this:

```
<?php
  $link = mysql_connect($host, $usr, $pwd);

  mysql_select_db($db);

  if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
  mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
  $link = new mysqli($host, $usr, $pwd, $db);

  if( mysqli_connect_errno() )
  {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
  }

  $link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see Section 20.4.4.4, "Using Character Sets and Unicode".

22.11.11: I've upgraded to MySQL 6.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single "global" character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a "handshake", as described in Section 9.1.4, "Connection Character Sets and Collations":

> When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use — however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | utf8                                   |
| character_set_connection | utf8                                   |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | utf8                                   |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+--------------------------+----------------------------------------+
| Variable_name            | Value                                  |
+--------------------------+----------------------------------------+
| character_set_client     | latin1                                 |
| character_set_connection | latin1                                 |
| character_set_database   | latin1                                 |
| character_set_filesystem | binary                                 |
| character_set_results    | latin1                                 |
| character_set_server     | latin1                                 |
| character_set_system     | utf8                                   |
| character_sets_dir       | /usr/local/mysql/share/mysql/charsets/ |
+--------------------------+----------------------------------------+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

22.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `ペ` requires three bytes, as shown here:

```
+-------------------------+--------------------------+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 'ペ') |
+-------------------------+--------------------------+
|                       1 |                        3 |
+-------------------------+--------------------------+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of non-existent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary — the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a compre-

hensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

22.11.13: How do I know whether character *X* is available in all character sets?

The majority of simplified Chinese and basic non-halfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
            (ucs2 CHAR(1) character set ucs2,
             utf8 CHAR(1) character set utf8,
             big5 CHAR(1) character set big5,
             cp932 CHAR(1) character set cp932,
             eucjpms CHAR(1) character set eucjpms,
             euckr CHAR(1) character set euckr,
             gb2312 CHAR(1) character set gb2312,
             gbk CHAR(1) character set gbk,
             sjis CHAR(1) character set sjis,
             ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
              big5=ucs2,
              cp932=ucs2,
              eucjpms=ucs2,
              euckr=ucs2,
              gb2312=ucs2,
              gbk=ucs2,
              sjis=ucs2,
              ujis=ucs2;

/* If there is a conversion problem, UPDATE will produce a warning. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//
```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (http://www.unicode.org/Public/UNIDATA/UnicodeData.txt), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(0x30da)//
+------+--------+------+-------+---------+-------+--------+------+------+------+
| ucs2 | utf8   | big5 | cp932 | eucjpms | euckr | gb2312 | gbk  | sjis | ujis |
+------+--------+------+-------+---------+-------+--------+------+------+------+
| 30DA | E3839A | C772 | 8379  | A5DA    | ABDA  | A5DA   | A5DA | 8379 | A5DA |
+------+--------+------+-------+---------+-------+--------+------+------+------+
1 row in set (0.04 sec)
```

Since none of the column values is `3F` — that is, the question mark character (`?`) — we know that every conversion worked.

22.11.14: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt. This is not the first table you will find by navigating from the `unicode.org` home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in Bug#16526, illustrated as follows:

```
mysql< CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'),('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2  Duplicates: 0  Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+------+
```

```
| s1   |
+------+
| が   |
| か   |
+------+
2 rows in set (0.00 sec)
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+------+-----------------------------+
| s1   | HEX(CONVERT(s1 USING ucs2)) |
+------+-----------------------------+
| が   | 304C                        |
| か   | 304B                        |
+------+-----------------------------+
2 rows in set (0.03 sec)
```

Now we search for `304B` and `304C` in the `4.0.0 allkeys` table, and find these lines:

```
304B  ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C  ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QQCM
```

The official Unicode names (following the "#" mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA` or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting が and か correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct "according to Unicode" isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like `KA`/`GA` are distinguishable for ordering purposes.

22.11.15: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see Section A.11, "MySQL 6.0 FAQ — MySQL Chinese, Japanese, and Korean Character Sets"), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
*********************** 1. row ***********************
Table: t
Create Table: CREATE TABLE `t` (
`s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
    -> FROM INFORMATION_SCHEMA.COLUMNS
    -> WHERE COLUMN_NAME = 's1'
    -> AND TABLE_NAME = 't';
+-------------+--------------------+-----------------+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME  |
+-------------+--------------------+-----------------+
| s1          | ucs2               | ucs2_general_ci |
+-------------+--------------------+-----------------+
1 row in set (0.01 sec)
```

(See Section 19.3, "The `INFORMATION_SCHEMA COLUMNS` Table", for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+---------+---------------+-------------------+--------+
| Charset | Description   | Default collation | Maxlen |
+---------+---------------+-------------------+--------+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   |      2 |
+---------+---------------+-------------------+--------+
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is "general". To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

22.11.16: Why are my supplementary characters rejected by MySQL?

Before MySQL 6.0.4, MySQL does not support supplementary characters — that is, characters which need more than 3 bytes — for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in Bug#12600, which we rejected as "not a bug". With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't

know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

As of MySQL 6.0.4, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: `utf16`, `utf32`, and 4-byte `utf8`. These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

22.11.17: Shouldn't it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

Bug#4745 is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

22.11.18: Does MySQL allow CJK characters to be used in database and table names?

This issue was fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named 楮 on a server whose operating system does not support CJK in directory names, MySQL creates a directory named `@0w@00a5@00ae`. which is just a fancy way of encoding `E6A5AE` — that is, the Unicode hexadecimal representation for the 楮 character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as 楮.

22.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at http://dev.mysql.com/doc/. The Japanese translation of the MySQL 4.1 manual can be downloaded from http://dev.mysql.com/doc/.

22.11.20: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at http://dev.mysql.com/user-groups/.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

```
Tel: +81(0)3-5326-3133
Fax: +81(0)3-5326-3001
Email: dsaito@mysql.com
```

- View feature requests relating to character set issues at http://tinyurl.com/y6xcuf.
- Visit the MySQL Character Sets, Collation, Unicode Forum. We are also in the process of adding foreign-language forums at http://forums.mysql.com/.

A.12. MySQL 6.0 FAQ — Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- Section 20.10.10, “Common Questions and Problems When Using the C API”
- Section 20.11.5, “Common Problems with MySQL and PHP”
- Section 20.1.7, “Connector/ODBC Notes and Tips”
- Section 20.2.4, “Connector/NET Programming”
- Section 20.4.5, “Connector/J Notes and Tips”
- Section 20.5.6, “Connector/MXJ Notes and Tips”

A.13. MySQL 6.0 FAQ — Replication

For answers to common queries and question regarding Replication within MySQL, see Section 16.3.4, “Replication FAQ”.

A.14. MySQL 6.0 FAQ — MySQL, DRBD, and Heartbeat

A.14.1. Distributed Replicated Block Device (DRBD) Basics

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

Questions and Answers

22.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by LINBIT.

22.14.1.2: What are “Block Devices”?

A *block device* is the type of device used to represent storage in the Linux Kernel. All physical disk devices present a block device interface. Additionally, virtual disk systems like LVM or DRBD present a block device interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

22.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

22.14.1.4: Where can I download DRBD?

Please see http://www.drbd.org/download/packages/.

22.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see http://lists.linbit.com/.

22.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit http://mysql.com/drbd/.

A.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

Questions and Answers

22.14.2.1: What is Linux Heartbeat?

The Linux-HA project (http://www.linux-ha.org/) offers a high availability solution commonly referred to as Linux Heartbeat. Linux Heartbeat ships as part of several Linux distributions, as well as within several embedded high availability systems. This solution can also be used for other applications besides databases servers, such as mail servers, web servers, file servers, and DNS servers.

Linux Heartbeat implements a heartbeat-protocol. A heartbeat-protocol means that messages are sent at regular intervals between two or more nodes. If a message is not received from a node within a given interval, then it is assumed the node has failed and some type of failover or recovery action is required. Linux Heartbeat is typically configured to send these heartbeat messages over standard Ethernet interfaces, but it does also support other methods, such as serial-line links.

22.14.2.2: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

22.14.2.3: Where can I download Linux Heartbeat?

Please see http://linux-ha.org/download/index.html.

22.14.2.4: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to http://www.linux-ha.org/ClusterResourceManager/BugReports.

A.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

Questions and Answers

22.14.3.1: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

22.14.3.2: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

22.14.3.3: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

22.14.3.4: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

22.14.3.5: Are there any situations where you shouldn't use DRBD?

See When Not To Use DRBD.

22.14.3.6: Are there any limitations to DRBD?

See DRBD limitations (or are they?).

22.14.3.7: Where can I find more information on sample architectures?

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see DRBD User's Guide.

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see DRBD User's Guide.

A.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- 22.14.4.1: What is the difference between MySQL Cluster and DRBD?
- 22.14.4.2: What is the difference between MySQL Replication and DRBD?
- 22.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

Questions and Answers

22.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the "stack", at the disk I/O level. For a comparison of various high availability features between these two options, please refer to Chapter 14, *High Availability and Scalability*.

> **Note**
>
> MySQL Cluster is currently not supported in MySQL 6.0. If you are interested in using MySQL Cluster, see MySQL Cluster NDB 6.X/7.X, which provides information about MySQL Cluster NDB 6.2 and 6.3 (based on MySQL 5.1 but containing the latest improvements and fixes for the `NDBCLUSTER` storage engine).

22.14.4.2: What is the difference between MySQL Replication and DRBD?

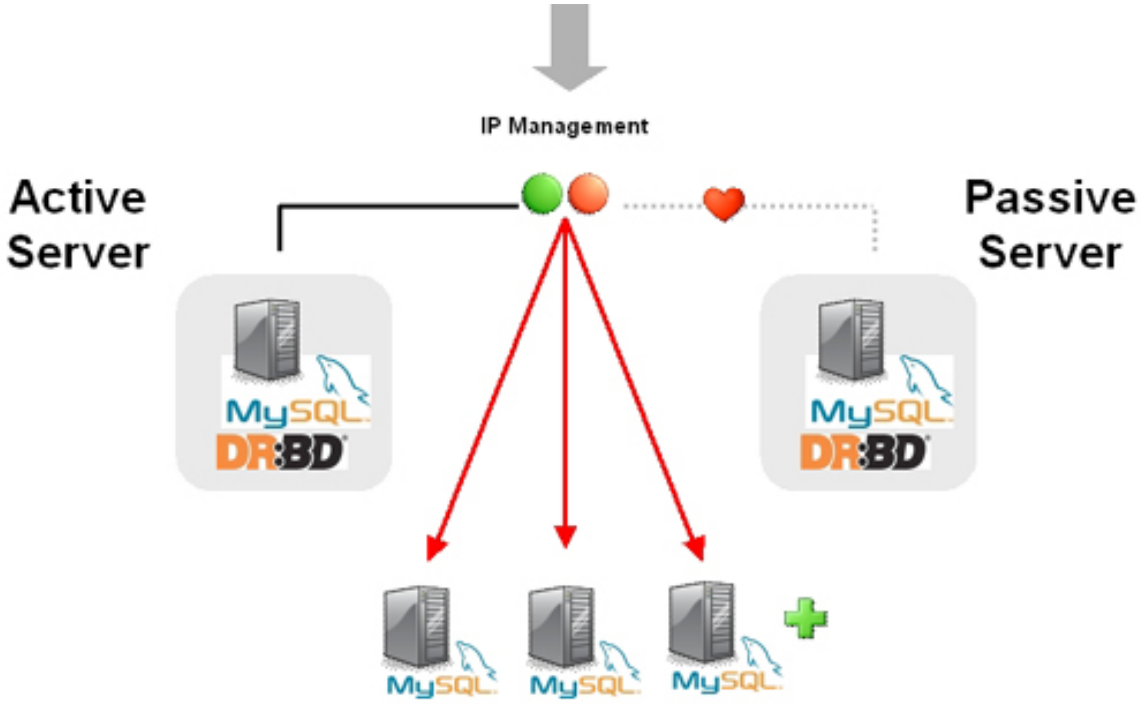
MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, Chapter 14, *High Availability and Scalability*.

22.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL "read-slaves" off of the Active-Master MySQL Server, shown in Figure A.1, "Active-Master MySQL server". Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure A.1. Active-Master MySQL server



A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- 22.14.5.1: Can XFS be used with DRBD?

Questions and Answers

22.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- 22.14.6.1: Can I use DRBD on top of LVM?
- 22.14.6.2: Can I use LVM on top of DRBD?
- 22.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

Questions and Answers

22.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

22.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your dis-

tribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

22.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

A.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- 22.14.7.1: Can I use DRBD with OpenVZ?
- 22.14.7.2: Can I use DRBD with Xen and/or KVM?

Questions and Answers

22.14.7.1: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

22.14.7.2: Can I use DRBD with Xen and/or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (http://www.linbit.com).

A.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- 22.14.8.1: Can I encrypt/compress the exchanged data?
- 22.14.8.2: Does DRBD do mutual node authentication?

Questions and Answers

22.14.8.1: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

22.14.8.2: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

A.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- 22.14.9.1: What other packages besides DRBD are required?
- 22.14.9.2: How many machines are required to set up DRBD?
- 22.14.9.3: Does DRBD only run on Linux?

Questions and Answers

22.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for `glibc` and your favorite shell. When

compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI
- libnet

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

22.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

22.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

A.14.10. DBRD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- 22.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?
- 22.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Questions and Answers

22.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: http://www.mysql.com/consulting/packaged/scaleout.html.

22.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD and Linux Heartbeat is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: http://mysql.com/products/enterprise/features.html.

For the list of supported Linux distributions, please see: http://www.mysql.com/support/supportedplatforms/enterprise.html.

> **Note**
>
> DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HPUX, AIX, FreeBSD, or other non-Linux platforms.

22.14.10.3: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: http://mysql.com/products/enterprise/features.html.

22.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

For MySQL-specific DRBD documentation, see Section 14.1, “Using MySQL with DRBD”.

For general DRBD documentation, see DRBD User's Guide.

22.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, http://forums.mysql.com/list.php?144.

22.14.10.6: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: DRBD for MySQL High Availability.

Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

B.1. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.1.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer doesn't move.
  - The machine doesn't answer to a remote machine's pings.
  - Other programs that are not related to MySQL don't behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

  In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

  It is always good to use a machine with ECC memory to discover memory problems early.
- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See Section 5.2, "MySQL Server Logs".
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the "copy and paste" method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only "the system doesn't work." This doesn't provide us with any information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in Section 1.6, "How to Report Bugs or Problems".

B.1.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.1.2.1. `Access denied`

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See Section 5.4, "The MySQL Access Privilege System", and Section 5.4.7, "Causes of Access-Denied Errors".

B.1.2.2. `Can't connect to [local] MySQL server`

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect via TCP/IP. If the server is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Section 2.10.2.3, "Starting and Troubleshooting the MySQL Server".

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: Section B.1.2.2.1, "`Connection to MySQL Server Failing on Windows`".
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See Section 2.1.1, "Operating Systems Supported by MySQL Community Server". However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the host name explicitly when connecting to the server. Try using this command to check the connection to the server:

  ```
  shell> mysqladmin -h `hostname` version
  ```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File".
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

  ```
  shell> netstat -ln | grep mysql
  ```

  See Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File".
- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See Section B.1.4.2, "What to Do If MySQL Keeps Crashing".
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

B.1.2.2.1. `Connection to MySQL Server Failing on Windows`

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a

`TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: http://support.microsoft.com/kb/256986/EN-US/.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

   ```
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
   ```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: MaxUserPort
   Data Type: REG_DWORD
   Value: 65534
   ```

   This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: TcpTimedWaitDelay
   Data Type: REG_DWORD
   Value: 30
   ```

   This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.1.2.3. `Lost connection to MySQL server`

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

B.1.2.4. Client does not support authentication protocol

MySQL 6.0 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

  ```
  mysql> SET PASSWORD FOR
      -> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
  ```

  Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

  ```
  mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
      -> WHERE Host = 'some_host' AND User = 'some_user';
  mysql> FLUSH PRIVILEGES;
  ```

  Substitute the password you want to use for "*newpwd*" in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:

  1. Start `mysqld` with the `--old-passwords` option.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

     ```
     mysql> SELECT Host, User, Password FROM mysql.user
         -> WHERE LENGTH(Password) > 16;
     ```

     For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

> **Note**
>
> In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for "MySQL, Improved"; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see http://php.net/mysqli.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our MySQL with PHP forum.

For additional background on password hashing and authentication, see Section 5.5.6.3, "Password Hashing in MySQL".

B.1.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when

you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.1.2.6. `Host 'host_name' is blocked`

If you get the following error, it means that `mysqld` has received many connect requests from the host `'host_name'` that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See Section 5.1.3, “Server System Variables”.

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

B.1.2.7. `Too many connections`

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

> **MySQL Enterprise**
> Subscribers to the MySQL Enterprise Monitor receive advice on dynamically configuring the `max_connections` variable — avoiding failed connection attempts. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See Section 12.5.6.30, “`SHOW PROCESSLIST` Syntax”.

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by Sun Microsystems, Inc. can support up to 4000 connections.

B.1.2.8. `Out of memory`

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.1.2.9. `MySQL server has gone away`

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
CR_SERVER_GONE_ERROR	The client couldn't send a question to the server.
CR_SERVER_LOST	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See Section 5.1.3, “Server System Variables”.

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

  The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

  The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.
- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in Section B.1.2.10, “`Packet too large`”.

  An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.
- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

  You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

  Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.
- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason

for the crash. Start by checking whether issuing the query again kills the server again. See Section B.1.4.2, “What to Do If MySQL Keeps Crashing”.

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See Section 5.2.2, “The Error Log”.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See Section B.1.4.2, “What to Do If MySQL Keeps Crashing”.
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See MySQL Internals: Porting.
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See Section 5.2.3, “The General Query Log”.)

See also Section B.1.2.11, “Communication Errors and Aborted Connections”, and Section 1.6, “How to Report Bugs or Problems”.

B.1.2.10. `Packet too large`

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 6.0 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.1.2.11. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See Section 5.2.2, “The Error Log”. If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23  Aborted connection 854 to db: 'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `ABORTED CONNECTION` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See Section 5.1.3, “Server System Variables”.
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connect attempts can occur for the following reasons:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See Section 5.1.3, “Server System Variables”.

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

> **MySQL Enterprise**
> For reasons of security and performance the advisors provided by the MySQL Enterprise Monitor pay special attention to the `Aborted_connects` status variable. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See Section B.1.2.10, “`Packet too large`”.

See also Section B.1.2.9, “`MySQL server has gone away`”.

B.1.2.12. `The table is full`

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB

MacOS X w/ HFS+	2TB
NetWare w/NSS file system	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get `MyISAM` tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The `InnoDB` storage engine maintains `InnoDB` tables within a tablespace that can be created from several files. This allows a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which allows extremely large tables. The maximum tablespace size is 64TB.

  If you are using `InnoDB` tables and run out of room in the `InnoDB` tablespace. In this case, the solution is to extend the `InnoDB` tablespace. See Section 13.7.5, “Adding, Removing, or Resizing `InnoDB` Data and Log Files”.

- You are using `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.

- You are using a `MyISAM` table and the space required for the table exceeds what is allowed by the internal pointer size. `MyISAM` allows data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum allowable size of 65,536TB ($256^7 - 1$ bytes).

  If you need a `MyISAM` table that is larger than the default limit and your operating system supports large files, the `CREATE TABLE` statement supports `AVG_ROW_LENGTH` and `MAX_ROWS` options. See Section 12.1.14, “`CREATE TABLE` Syntax”. The server uses these options to determine how large a table to allow.

  If the pointer size is too small for an existing table, you can change the options with `ALTER TABLE` to increase a table's maximum allowable size. See Section 12.1.6, “`ALTER TABLE` Syntax”.

  ```
  ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
  ```

  You have to specify `AVG_ROW_LENGTH` only for tables with `BLOB` or `TEXT` columns; in this case, MySQL can't optimize the space required based only on the number of rows.

  To change the default size limit for `MyISAM` tables, set the `myisam_data_pointer_size`, which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the `MAX_ROWS` option. The value of `myisam_data_pointer_size` can be from 2 to 7. A value of 4 allows tables up to 4GB; a value of 6 allows tables up to 256TB.

  You can check the maximum data and index sizes by using this statement:

  ```
  SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
  ```

  You also can use `myisamchk -dv /path/to/table-index-file`. See Section 12.5.6, “`SHOW` Syntax”, or Section 4.6.3, “`myisamchk` — MyISAM Table-Maintenance Utility”.

  Other ways to work around file-size limits for `MyISAM` tables are as follows:

  - If your large table is read only, you can use `myisampack` to compress it. `myisampack` usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. `myisampack` also can merge multiple tables into a single table. See Section 4.6.5, “`myisampack` — Generate Compressed, Read-Only MyISAM Tables”.

  - MySQL includes a `MERGE` library that allows you to handle a collection of `MyISAM` tables that have identical structure as a single `MERGE` table. See Section 13.9, “The `MERGE` Storage Engine”.

- You are using the `MEMORY` (`HEAP`) storage engine; in this case you need to increase the value of the `max_heap_table_size` system variable. See Section 5.1.3, “Server System Variables”.

B.1.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See Section 4.2.3.2, "Using Option Files".

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code  28:  No space left on device
```

If you get an error of the following type during startup, it indicates that the file system and/or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.1.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.1.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

`Found wrong password for user 'some_user'@'some_host'; ignoring user`

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

  ```
  mysql> UPDATE user SET Password=PASSWORD('newpwd')
      -> WHERE User='some_user' AND Host='some_host';
  ```

B.1.2.16. Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
```

```
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See Section 12.5.6, “SHOW Syntax”.

B.1.2.17. `Can't initialize character set`

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` or `role="configure"--with-extra-charsets=charset_name` option. See Section 2.9.2, “Typical `configure` Options”.

  All standard MySQL binaries are compiled with `--with-extra-charsets=complex`, which enables support for all multi-byte character sets. See Section 9.2, “The Character Set Used for Data and Sorting”.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

  In this case, you need to use one of the following methods to solve the problem:

  - Recompile the client with support for the character set. See Section 2.9.2, “Typical `configure` Options”.
  - Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
  - Copy the character definition files to the path where the client expects them to be.

B.1.2.18. `'FILE' NOT FOUND` and Similar Errors

If you get `ERROR '...' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code  23:  File table overflow
shell> perror 24
OS error code  24:  Too many open files
shell> perror 11
OS error code  11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See Section 5.1.3, “Server System Variables”. The easiest way to set these values is to add an option to your option file. See Section 4.2.3.2, “Using Option Files”. If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the “`#`” character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

> **Note**
>
> If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.1.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

As of MySQL 6.0.4, when the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368` . This is useful information to include in bug reports.

See also Section 5.1.2, “Server Command Options”, and Section 21.5.1.7, “Making a Test Case If You Experience Table Corruption”.

B.1.3. Installation-Related Issues

B.1.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See Section 2.9, “MySQL Installation Using a Source Distribution”.

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

B.1.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384  # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504  # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero.

See Section 2.13, “Environment Variables”.

B.1.4. Administration-Related Issues

B.1.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it is recommended to set a password for each account. See Section 5.3.1, “General Security Guidelines”.

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The next two sections show procedures for Windows and Unix systems, respectively.

B.1.4.1.1. Resetting the Root Password on Windows Systems

Use the following procedure for resetting the password for any MySQL `root` accounts on Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

   ```
   Start Menu -> Control Panel -> Administrative Tools -> Services
   ```

   Then find the MySQL service in the list, and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.
3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

   ```
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```

   The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.
4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.

5. Open a console window to get to the command prompt:

```
Start Menu -> Run -> cmd
```

6. Start the MySQL server with the special `--init-file` option:

```
C:\> C:\mysql\bin\mysqld --init-file=C:\mysql-init.txt
```

   If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

   The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

   You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

   If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 6.0\bin\mysqld.exe"
        --defaults-file="C:\Program Files\MySQL\MySQL Server 6.0\my.ini"
        --init-file=C:\mysql-init.txt
```

   The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

   Find the MySQL service in the list, right-click on it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

8. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

You should now be able to connect to MySQL as `root` using the new password.

B.1.4.1.2. Resetting the Root Password on Unix Systems

Use the following procedure for resetting the password for any MySQL `root` accounts on Unix. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. (Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.)

1. Log on to your system as the Unix `mysql` user that the `mysqld` server runs as.

2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

   You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

   Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
```

```
FLUSH PRIVILEGES;
```

The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users.

5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to MySQL as `root` using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option.

2. Connect to the `mysqld` server with this command:

```
shell> mysql
```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

```
mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
    -> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

You should now be able to connect to MySQL as `root` using the new password.

B.1.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See Section 5.2.2, “The Error Log”.

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See MySQL Internals: Porting. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.

- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all `MyISAM` tables, and restart `mysqld`. This ensures that you are running from a clean state. See Chapter 5, *MySQL Server Administration*.
- Start `mysqld` with the general query log enabled (see Section 5.2.3, "The General Query Log"). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See Section 5.2.3, "The General Query Log". If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See Section 1.6, "How to Report Bugs or Problems".
- Try to make a test case that we can use to repeat the problem. See MySQL Internals: Porting.
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See Section 21.1.2, "MySQL Test Suite". They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to `configure` and then recompile. See MySQL Internals: Porting.
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:

  1. Start `mysqld` from `gdb` (or another debugger). See MySQL Internals: Porting.
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

     ```
     backtrace
     info local
     up
     info local
     up
     info local
     ```

     With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where *`N`* is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See Section 1.6, "How to Report Bugs or Problems". Be even more detailed than usual. Because

MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).

- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

  The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

B.1.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

> **MySQL Enterprise**
> For early notification of possible problems with your MySQL configuration subscribe to the MySQL Enterprise Monitor. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

B.1.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If you don't have `TMPDIR` set, MySQL uses the system default, which is normally `/tmp`, `/var/tmp`, or `/usr/tmp`. If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 6.0, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“`:`”) on Unix and semicolon characters (“`;`”) on Windows, NetWare, and OS/2.

> **Note**
>
> To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file direct-

ory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file directory is located.

> **MySQL Enterprise**
> Advisors provided by the MySQL Enterprise Monitor automatically detect excessive temporary table storage to disk. For more information, see http://www.mysql.com/products/enterprise/advisors.html.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

B.1.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

  ```
  [mysqld]
  socket=/path/to/socket

  [client]
  socket=/path/to/socket
  ```

  See Section 4.2.3.2, “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See Section 2.9.2, “Typical `configure` Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.1.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Section 2.13, “Environment Variables”.

You can set the time zone for the server with the `--timezone=`*`timezone_name`* option to `mysqld_safe`. You can also set it

by setting the TZ environment variable before you start mysqld.

The allowable values for --timezone or TZ are system-dependent. Consult your operating system documentation to see what values are acceptable.

B.1.5. Query-Related Issues

B.1.5.1. Case Sensitivity in String Searches

For nonbinary strings (CHAR, VARCHAR, TEXT), string searches use the collation of the comparison operands. For binary strings (BINARY, VARBINARY, BLOB), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (>=, >, =, <, <=, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if "e" and "é" have the same sort value in a given collation, they compare as equal.

The default character set and collation are latin1 and latin1_swedish_ci, so nonbinary string comparisons are case insensitive by default. This means that if you search with *col_name* LIKE 'a%', you get all column values that start with A or a. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the latin1 character set, you can use the COLLATE operator to cause either operand to have the latin1_general_cs or latin1_bin collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See Section 12.1.14, "CREATE TABLE Syntax".

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use COLLATE to name a case-insensitive collation. The strings in the following example normally are case sensitive, but COLLATE changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
    ->     @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----------+
| @s1 = @s2 |
+-----------+
|         0 |
+-----------+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-------------------------------------+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-------------------------------------+
|                                   1 |
+-------------------------------------+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use COLLATE to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+--------------+
| @s = 'mysql' |
+--------------+
|            0 |
+--------------+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-------------------------------------------------------------------+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-------------------------------------------------------------------+
|                                                                 1 |
+-------------------------------------------------------------------+
```

To determine whether a value will compare as a nonbinary or binary string, use the COLLATION() function. This example shows that VERSION() returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+----------------------+
| COLLATION(VERSION()) |
+----------------------+
| utf8_general_ci      |
+----------------------+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-------------------------+----------------------+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-------------------------+----------------------+
| binary                  | binary               |
+-------------------------+----------------------+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See Section 11.4, “String Functions”.

B.1.5.2. Problems Using `DATE` Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When using a `'0000-00-00'` date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to

store a birthdate in a DATE column and you know only part of the date.

If you are not using the NO_ZERO_DATE SQL mode, MySQL also allows you to store '0000-00-00' as a "dummy date." This is in some cases more convenient than using NULL values.

If the date cannot be converted to any reasonable value, a 0 is stored in the DATE column, which is retrieved as '0000-00-00'. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by IGNORE), you should set sql_mode to "NO_ZERO_IN_DATE,NO_ZERO_DATE".

B.1.5.3. Problems with NULL Values

The concept of the NULL value is a common source of confusion for newcomers to SQL, who often think that NULL is the same thing as an empty string ''. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the phone column, but the first inserts a NULL value and the second inserts an empty string. The meaning of the first can be regarded as "phone number is not known" and the meaning of the second can be regarded as "the person is known to have no phone, and thus no phone number."

To help with NULL handling, you can use the IS NULL and IS NOT NULL operators and the IFNULL() function.

In SQL, the NULL value is never true in comparison to any other value, even NULL. An expression that contains NULL always produces a NULL value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return NULL:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are NULL, you cannot use an expr = NULL test. The following statement returns no rows, because expr = NULL is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for NULL values, you must use the IS NULL test. The following statements show how to find the NULL phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See Section 3.3.4.6, "Working with NULL Values", for additional information and examples.

You can add an index on a column that can have NULL values if you are using the MyISAM, InnoDB, or MEMORY storage engine. Otherwise, you must declare an indexed column NOT NULL, and you cannot insert NULL into the column.

When reading data with LOAD DATA INFILE, empty or missing columns are updated with ''. If you want a NULL value in a column, you should use \N in the data file. The literal word "NULL" may also be used under some circumstances. See Section 12.2.6, "LOAD DATA INFILE Syntax".

When using DISTINCT, GROUP BY, or ORDER BY, all NULL values are regarded as equal.

When using ORDER BY, NULL values are presented first, or last if you specify DESC to sort in descending order.

Aggregate (summary) functions such as COUNT(), MIN(), and SUM() ignore NULL values. The exception to this is COUNT(*), which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-NULL values in the age column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles NULL values specially. If you insert NULL into a TIMESTAMP column, the current date and time is inserted. If you insert NULL into an integer or floating-point column that has the AUTO_INCREMENT attribute, the next number in the sequence is inserted.

B.1.5.4. Problems with Column Aliases

You can use an alias to refer to a column in GROUP BY, ORDER BY, or HAVING clauses. Aliases can also be used to give

columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

B.1.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See Section 12.5.6.36, “`SHOW TABLE STATUS` Syntax”, and Section 12.5.6.12, “`SHOW CREATE TABLE` Syntax”.

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See Section 12.5.6.17, “`SHOW ENGINES` Syntax”, and Section 12.5.6.39, “`SHOW VARIABLES` Syntax”.

B.1.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

B.1.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See Section 12.3.2, “`EXPLAIN` Syntax”.

2. Select only those columns that are used in the `WHERE` clause.

3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.

4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.

5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See Section B.1.5.8, "Problems with Floating-Point Comparisons".

6. If you still can't figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

   Verify that the test file demonstrates the problem by executing these commands:

   ```
   shell> mysqladmin create test2
   shell> mysql test2 < query.sql
   ```

   Attach the test file to a bug report, which you can file using the instructions in Section 1.6, "How to Report Bugs or Problems".

B.1.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example demonstrates the problem using `DOUBLE`. It shows that are calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
    -> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
    -> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
    -> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
    -> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
    -> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
    -> FROM t1 GROUP BY i HAVING a <> b;

+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    1 |  21.4 | 21.4 |
|    2 |  76.8 | 76.8 |
|    3 |   7.4 |  7.4 |
|    4 |  15.4 | 15.4 |
|    5 |   7.2 |  7.2 |
|    6 | -51.4 |    0 |
+------+-------+------+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row — the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) > 0.0001;
+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    6 | -51.4 |    0 |
```

```
+------+-------+------+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+------+------+------+
| i    | a    | b    |
+------+------+------+
|    1 | 21.4 | 21.4 |
|    2 | 76.8 | 76.8 |
|    3 |  7.4 |  7.4 |
|    4 | 15.4 | 15.4 |
|    5 |  7.2 |  7.2 |
+------+------+------+
5 rows in set (0.03 sec)
```

B.1.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

  ```
  mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
  ```

  `EXPLAIN` is discussed in more detail in Section 12.3.2, “`EXPLAIN` Syntax”.

- Use `ANALYZE TABLE` *`tbl_name`* to update the key distributions for the scanned table. See Section 12.5.2.1, “`ANALYZE TABLE` Syntax”.

- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

  ```
  SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
  WHERE t1.col_name=t2.col_name;
  ```

  `USE INDEX` and `IGNORE INDEX` may also be useful. See Section 12.2.9.2, “Index Hint Syntax”.

- Global and table-level `STRAIGHT_JOIN`. See Section 12.2.9, “`SELECT` Syntax”.

- You can tune global or thread-specific system variables. For example, Start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See Section 5.1.3, “Server System Variables”.

B.1.7. Table Definition-Related Issues

B.1.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-`*`xxx`* or `B-`*`xxx`* lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.1.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the following statements returns columns in the order `col_name1`, `col_name2`, `col_name3`, whereas the second returns them in the order `col_name1`, `col_name3`, `col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

   ```
   mysql> INSERT INTO new_table
       -> SELECT columns-in-new-order FROM old_table;
   ```

3. Drop or rename `old_table`.
4. Rename the new table to the original name:

   ```
   mysql> ALTER TABLE new_table RENAME old_table;
   ```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

B.1.7.3. `TEMPORARY` Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.
- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

  ```
  mysql> SELECT * FROM temp_table, temp_table AS t2;
  ERROR 1137: Can't reopen table: 'temp_table'
  ```

  This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.
- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See Section 16.3.1, “Replication Features and Issues”, for more information.

B.1.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in Section 2.12, “Operating System-Specific Notes”, and MySQL Internals: Porting.

B.1.8.1. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and 2^{64}–1) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

  It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

  For example:

  - `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
  - `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
  - `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

  If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

  For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

  A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log file names are based on the server host name (if you don't specify a file name with the startup option). You have to use options such as `--log-bin=`*`old_host_name`*`-bin` if you change your host name to something else. Another option is to rename the old files to reflect your host name change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See Section 5.1.2, “Server Command Options”.
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` command. See Section 4.6.8, “`mysqlbinlog` — Utility for Processing Binary Log Files”.
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “`_`” or “`%`” with `ESCAPE` in `LIKE ... ESCAPE`.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See Section 2.9.5, “MIT-pthreads Notes”.
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use the general query log extensively, you should edit `mysqld_safe` to log to *`host_name`*`.err` instead of *`host_name`*`.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by `2`, **not** `1`:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a

join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
       WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
       FROM band_downloads,band_mp3
       WHERE band_downloads.userid = 9
       AND band_mp3.id = band_downloads.mp3id
       ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

B.2. Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.
- An SQLSTATE value. The value is a five-character string (for example, `'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized.

When an error occurs, you can access the MySQL error code, the SQLSTATE value, and a string containing an error message using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in Section 20.10, “MySQL C API”.

The first two characters of an SQLSTATE value indicate the error class:

- `'00'` indicates success.
- `'01'` indicates a warning.
- `'02'` indicates “not found.” These values are relevant only within the context of cursors and are used to control what happens when a cursor reaches the end of a data set.
- Other values indicate an exception.

B.3. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code (`1146`). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (`'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at http://dev.mysql.com/doc/.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ername.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `1000` SQLSTATE: `HY000` (`ER_HASHCHK`)

  Message: hashchk
- Error: `1001` SQLSTATE: `HY000` (`ER_NISAMCHK`)

  Message: isamchk
- Error: `1002` SQLSTATE: `HY000` (`ER_NO`)

  Message: NO
- Error: `1003` SQLSTATE: `HY000` (`ER_YES`)

  Message: YES
- Error: `1004` SQLSTATE: `HY000` (`ER_CANT_CREATE_FILE`)

  Message: Can't create file '%s' (errno: %d)
- Error: `1005` SQLSTATE: `HY000` (`ER_CANT_CREATE_TABLE`)

  Message: Can't create table '%s' (errno: %d)
- Error: `1006` SQLSTATE: `HY000` (`ER_CANT_CREATE_DB`)

  Message: Can't create database '%s' (errno: %d)
- Error: `1007` SQLSTATE: `HY000` (`ER_DB_CREATE_EXISTS`)

  Message: Can't create database '%s'; database exists
- Error: `1008` SQLSTATE: `HY000` (`ER_DB_DROP_EXISTS`)

  Message: Can't drop database '%s'; database doesn't exist
- Error: `1009` SQLSTATE: `HY000` (`ER_DB_DROP_DELETE`)

Message: Error dropping database (can't delete '%s', errno: %d)

- Error: `1010` SQLSTATE: `HY000` (`ER_DB_DROP_RMDIR`)

  Message: Error dropping database (can't rmdir '%s', errno: %d)

- Error: `1011` SQLSTATE: `HY000` (`ER_CANT_DELETE_FILE`)

  Message: Error on delete of '%s' (errno: %d)

- Error: `1012` SQLSTATE: `HY000` (`ER_CANT_FIND_SYSTEM_REC`)

  Message: Can't read record in system table

- Error: `1013` SQLSTATE: `HY000` (`ER_CANT_GET_STAT`)

  Message: Can't get status of '%s' (errno: %d)

- Error: `1014` SQLSTATE: `HY000` (`ER_CANT_GET_WD`)

  Message: Can't get working directory (errno: %d)

- Error: `1015` SQLSTATE: `HY000` (`ER_CANT_LOCK`)

  Message: Can't lock file (errno: %d)

- Error: `1016` SQLSTATE: `HY000` (`ER_CANT_OPEN_FILE`)

  Message: Can't open file: '%s' (errno: %d)

- Error: `1017` SQLSTATE: `HY000` (`ER_FILE_NOT_FOUND`)

  Message: Can't find file: '%s' (errno: %d)

- Error: `1018` SQLSTATE: `HY000` (`ER_CANT_READ_DIR`)

  Message: Can't read dir of '%s' (errno: %d)

- Error: `1019` SQLSTATE: `HY000` (`ER_CANT_SET_WD`)

  Message: Can't change dir to '%s' (errno: %d)

- Error: `1020` SQLSTATE: `HY000` (`ER_CHECKREAD`)

  Message: Record has changed since last read in table '%s'

- Error: `1021` SQLSTATE: `HY000` (`ER_DISK_FULL`)

  Message: Disk full (%s); waiting for someone to free some space...

- Error: `1022` SQLSTATE: `23000` (`ER_DUP_KEY`)

  Message: Can't write; duplicate key in table '%s'

- Error: `1023` SQLSTATE: `HY000` (`ER_ERROR_ON_CLOSE`)

  Message: Error on close of '%s' (errno: %d)

- Error: `1024` SQLSTATE: `HY000` (`ER_ERROR_ON_READ`)

  Message: Error reading file '%s' (errno: %d)

- Error: `1025` SQLSTATE: `HY000` (`ER_ERROR_ON_RENAME`)

  Message: Error on rename of '%s' to '%s' (errno: %d)

- Error: `1026` SQLSTATE: `HY000` (`ER_ERROR_ON_WRITE`)

  Message: Error writing file '%s' (errno: %d)

- Error: `1027` SQLSTATE: `HY000` (`ER_FILE_USED`)

Message: '%s' is locked against change

- Error: 1028 SQLSTATE: HY000 (ER_FILSORT_ABORT)

  Message: Sort aborted

- Error: 1029 SQLSTATE: HY000 (ER_FORM_NOT_FOUND)

  Message: View '%s' doesn't exist for '%s'

- Error: 1030 SQLSTATE: HY000 (ER_GET_ERRNO)

  Message: Got error %d from storage engine

- Error: 1031 SQLSTATE: HY000 (ER_ILLEGAL_HA)

  Message: Table storage engine for '%s' doesn't have this option

- Error: 1032 SQLSTATE: HY000 (ER_KEY_NOT_FOUND)

  Message: Can't find record in '%s'

- Error: 1033 SQLSTATE: HY000 (ER_NOT_FORM_FILE)

  Message: Incorrect information in file: '%s'

- Error: 1034 SQLSTATE: HY000 (ER_NOT_KEYFILE)

  Message: Incorrect key file for table '%s'; try to repair it

- Error: 1035 SQLSTATE: HY000 (ER_OLD_KEYFILE)

  Message: Old key file for table '%s'; repair it!

- Error: 1036 SQLSTATE: HY000 (ER_OPEN_AS_READONLY)

  Message: Table '%s' is read only

- Error: 1037 SQLSTATE: HY001 (ER_OUTOFMEMORY)

  Message: Out of memory; restart server and try again (needed %d bytes)

- Error: 1038 SQLSTATE: HY001 (ER_OUT_OF_SORTMEMORY)

  Message: Out of sort memory; increase server sort buffer size

- Error: 1039 SQLSTATE: HY000 (ER_UNEXPECTED_EOF)

  Message: Unexpected EOF found when reading file '%s' (errno: %d)

- Error: 1040 SQLSTATE: 08004 (ER_CON_COUNT_ERROR)

  Message: Too many connections

- Error: 1041 SQLSTATE: HY000 (ER_OUT_OF_RESOURCES)

  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error: 1042 SQLSTATE: 08S01 (ER_BAD_HOST_ERROR)

  Message: Can't get hostname for your address

- Error: 1043 SQLSTATE: 08S01 (ER_HANDSHAKE_ERROR)

  Message: Bad handshake

- Error: 1044 SQLSTATE: 42000 (ER_DBACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' to database '%s'

- Error: 1045 SQLSTATE: 28000 (ER_ACCESS_DENIED_ERROR)

  Message: Access denied for user '%s'@'%s' (using password: %s)
- Error: 1046 SQLSTATE: 3D000 (ER_NO_DB_ERROR)

  Message: No database selected
- Error: 1047 SQLSTATE: 08S01 (ER_UNKNOWN_COM_ERROR)

  Message: Unknown command
- Error: 1048 SQLSTATE: 23000 (ER_BAD_NULL_ERROR)

  Message: Column '%s' cannot be null
- Error: 1049 SQLSTATE: 42000 (ER_BAD_DB_ERROR)

  Message: Unknown database '%s'
- Error: 1050 SQLSTATE: 42S01 (ER_TABLE_EXISTS_ERROR)

  Message: Table '%s' already exists
- Error: 1051 SQLSTATE: 42S02 (ER_BAD_TABLE_ERROR)

  Message: Unknown table '%s'
- Error: 1052 SQLSTATE: 23000 (ER_NON_UNIQ_ERROR)

  Message: Column '%s' in %s is ambiguous
- Error: 1053 SQLSTATE: 08S01 (ER_SERVER_SHUTDOWN)

  Message: Server shutdown in progress
- Error: 1054 SQLSTATE: 42S22 (ER_BAD_FIELD_ERROR)

  Message: Unknown column '%s' in '%s'
- Error: 1055 SQLSTATE: 42000 (ER_WRONG_FIELD_WITH_GROUP)

  Message: '%s' isn't in GROUP BY
- Error: 1056 SQLSTATE: 42000 (ER_WRONG_GROUP_FIELD)

  Message: Can't group on '%s'
- Error: 1057 SQLSTATE: 42000 (ER_WRONG_SUM_SELECT)

  Message: Statement has sum functions and columns in same statement
- Error: 1058 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT)

  Message: Column count doesn't match value count
- Error: 1059 SQLSTATE: 42000 (ER_TOO_LONG_IDENT)

  Message: Identifier name '%s' is too long
- Error: 1060 SQLSTATE: 42S21 (ER_DUP_FIELDNAME)

  Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER_HOST_NOT_PRIVILEGED)

  Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER_PASSWORD_ANONYMOUS_USER)

  Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER_PASSWORD_NOT_ALLOWED)

  Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER_PASSWORD_NO_MATCH)

  Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER_UPDATE_INFO)

Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER_CANT_CREATE_THREAD)

  Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT_ON_ROW)

  Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER_CANT_REOPEN_TABLE)

  Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 22004 (ER_INVALID_USE_OF_NULL)

  Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER_REGEXP_ERROR)

  Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER_MIX_OF_GROUP_FUNC_AND_FIELDS)

  Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER_NONEXISTING_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER_TABLEACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER_COLUMNACCESS_DENIED_ERROR)

  Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER_ILLEGAL_GRANT_FOR_TABLE)

  Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used

- Error: 1145 SQLSTATE: 42000 (ER_GRANT_WRONG_HOST_OR_USER)

  Message: The host or user argument to GRANT is too long

- Error: 1146 SQLSTATE: 42S02 (ER_NO_SUCH_TABLE)

  Message: Table '%s.%s' doesn't exist

- Error: 1147 SQLSTATE: 42000 (ER_NONEXISTING_TABLE_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- Error: 1148 SQLSTATE: 42000 (ER_NOT_ALLOWED_COMMAND)

  Message: The used command is not allowed with this MySQL version

- Error: 1149 SQLSTATE: 42000 (ER_SYNTAX_ERROR)

  Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- Error: 1150 SQLSTATE: HY000 (ER_DELAYED_CANT_CHANGE_LOCK)

  Message: Delayed insert thread couldn't get requested lock for table %s

- Error: 1151 SQLSTATE: HY000 (ER_TOO_MANY_DELAYED_THREADS)

Message: Too many delayed threads in use

- Error: 1152 SQLSTATE: 08S01 (ER_ABORTING_CONNECTION)

  Message: Aborted connection %ld to db: '%s' user: '%s' (%s)

- Error: 1153 SQLSTATE: 08S01 (ER_NET_PACKET_TOO_LARGE)

  Message: Got a packet bigger than 'max_allowed_packet' bytes

- Error: 1154 SQLSTATE: 08S01 (ER_NET_READ_ERROR_FROM_PIPE)

  Message: Got a read error from the connection pipe

- Error: 1155 SQLSTATE: 08S01 (ER_NET_FCNTL_ERROR)

  Message: Got an error from fcntl()

- Error: 1156 SQLSTATE: 08S01 (ER_NET_PACKETS_OUT_OF_ORDER)

  Message: Got packets out of order

- Error: 1157 SQLSTATE: 08S01 (ER_NET_UNCOMPRESS_ERROR)

  Message: Couldn't uncompress communication packet

- Error: 1158 SQLSTATE: 08S01 (ER_NET_READ_ERROR)

  Message: Got an error reading communication packets

- Error: 1159 SQLSTATE: 08S01 (ER_NET_READ_INTERRUPTED)

  Message: Got timeout reading communication packets

- Error: 1160 SQLSTATE: 08S01 (ER_NET_ERROR_ON_WRITE)

  Message: Got an error writing communication packets

- Error: 1161 SQLSTATE: 08S01 (ER_NET_WRITE_INTERRUPTED)

  Message: Got timeout writing communication packets

- Error: 1162 SQLSTATE: 42000 (ER_TOO_LONG_STRING)

  Message: Result string is longer than 'max_allowed_packet' bytes

- Error: 1163 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_BLOB)

  Message: The used table type doesn't support BLOB/TEXT columns

- Error: 1164 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_AUTO_INCREMENT)

  Message: The used table type doesn't support AUTO_INCREMENT columns

- Error: 1165 SQLSTATE: HY000 (ER_DELAYED_INSERT_TABLE_LOCKED)

  Message: INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES

- Error: 1166 SQLSTATE: 42000 (ER_WRONG_COLUMN_NAME)

  Message: Incorrect column name '%s'

- Error: 1167 SQLSTATE: 42000 (ER_WRONG_KEY_COLUMN)

  Message: The used storage engine can't index column '%s'

- Error: 1168 SQLSTATE: HY000 (ER_WRONG_MRG_TABLE)

  Message: Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist

- Error: 1169 SQLSTATE: 23000 (ER_DUP_UNIQUE)

Message: Can't write, because of unique constraint, to table '%s'

- Error: 1170 SQLSTATE: 42000 (ER_BLOB_KEY_WITHOUT_LENGTH)

  Message: BLOB/TEXT column '%s' used in key specification without a key length

- Error: 1171 SQLSTATE: 42000 (ER_PRIMARY_CANT_HAVE_NULL)

  Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead

- Error: 1172 SQLSTATE: 42000 (ER_TOO_MANY_ROWS)

  Message: Result consisted of more than one row

- Error: 1173 SQLSTATE: 42000 (ER_REQUIRES_PRIMARY_KEY)

  Message: This table type requires a primary key

- Error: 1174 SQLSTATE: HY000 (ER_NO_RAID_COMPILED)

  Message: This version of MySQL is not compiled with RAID support

- Error: 1175 SQLSTATE: HY000 (ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE)

  Message: You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column

- Error: 1176 SQLSTATE: 42000 (ER_KEY_DOES_NOT_EXITS)

  Message: Key '%s' doesn't exist in table '%s'

- Error: 1177 SQLSTATE: 42000 (ER_CHECK_NO_SUCH_TABLE)

  Message: Can't open table

- Error: 1178 SQLSTATE: 42000 (ER_CHECK_NOT_IMPLEMENTED)

  Message: The storage engine for the table doesn't support %s

- Error: 1179 SQLSTATE: 25000 (ER_CANT_DO_THIS_DURING_AN_TRANSACTION)

  Message: You are not allowed to execute this command in a transaction

- Error: 1180 SQLSTATE: HY000 (ER_ERROR_DURING_COMMIT)

  Message: Got error %d during COMMIT

- Error: 1181 SQLSTATE: HY000 (ER_ERROR_DURING_ROLLBACK)

  Message: Got error %d during ROLLBACK

- Error: 1182 SQLSTATE: HY000 (ER_ERROR_DURING_FLUSH_LOGS)

  Message: Got error %d during FLUSH_LOGS

- Error: 1183 SQLSTATE: HY000 (ER_ERROR_DURING_CHECKPOINT)

  Message: Got error %d during CHECKPOINT

- Error: 1184 SQLSTATE: 08S01 (ER_NEW_ABORTING_CONNECTION)

  Message: Aborted connection %ld to db: '%s' user: '%s' host: '%s' (%s)

- Error: 1185 SQLSTATE: HY000 (ER_DUMP_NOT_IMPLEMENTED)

  Message: The storage engine for the table does not support binary table dump

- Error: 1186 SQLSTATE: HY000 (ER_FLUSH_MASTER_BINLOG_CLOSED)

  Message: Binlog closed, cannot RESET MASTER

- Error: 1187 SQLSTATE: HY000 (ER_INDEX_REBUILD)

Message: Failed rebuilding the index of dumped table '%s'

- Error: 1188 SQLSTATE: HY000 (ER_MASTER)

  Message: Error from master: '%s'

- Error: 1189 SQLSTATE: 08S01 (ER_MASTER_NET_READ)

  Message: Net error reading from master

- Error: 1190 SQLSTATE: 08S01 (ER_MASTER_NET_WRITE)

  Message: Net error writing to master

- Error: 1191 SQLSTATE: HY000 (ER_FT_MATCHING_KEY_NOT_FOUND)

  Message: Can't find FULLTEXT index matching the column list

- Error: 1192 SQLSTATE: HY000 (ER_LOCK_OR_ACTIVE_TRANSACTION)

  Message: Can't execute the given command because you have active locked tables or an active transaction

- Error: 1193 SQLSTATE: HY000 (ER_UNKNOWN_SYSTEM_VARIABLE)

  Message: Unknown system variable '%s'

- Error: 1194 SQLSTATE: HY000 (ER_CRASHED_ON_USAGE)

  Message: Table '%s' is marked as crashed and should be repaired

- Error: 1195 SQLSTATE: HY000 (ER_CRASHED_ON_REPAIR)

  Message: Table '%s' is marked as crashed and last (automatic?) repair failed

- Error: 1196 SQLSTATE: HY000 (ER_WARNING_NOT_COMPLETE_ROLLBACK)

  Message: Some non-transactional changed tables couldn't be rolled back

- Error: 1197 SQLSTATE: HY000 (ER_TRANS_CACHE_FULL)

  Message: Multi-statement transaction required more than 'max_binlog_cache_size' bytes of storage; increase this mysqld variable and try again

- Error: 1198 SQLSTATE: HY000 (ER_SLAVE_MUST_STOP)

  Message: This operation cannot be performed with a running slave; run STOP SLAVE first

- Error: 1199 SQLSTATE: HY000 (ER_SLAVE_NOT_RUNNING)

  Message: This operation requires a running slave; configure slave and do START SLAVE

- Error: 1200 SQLSTATE: HY000 (ER_BAD_SLAVE)

  Message: The server is not configured as slave; fix with CHANGE MASTER TO

- Error: 1201 SQLSTATE: HY000 (ER_MASTER_INFO)

  Message: Could not initialize master info structure; more error messages can be found in the MySQL error log

- Error: 1202 SQLSTATE: HY000 (ER_SLAVE_THREAD)

  Message: Could not create slave thread; check system resources

- Error: 1203 SQLSTATE: 42000 (ER_TOO_MANY_USER_CONNECTIONS)

  Message: User %s already has more than 'max_user_connections' active connections

- Error: 1204 SQLSTATE: HY000 (ER_SET_CONSTANTS_ONLY)

  Message: You may only use constant expressions with SET

- Error: 1205 SQLSTATE: HY000 (ER_LOCK_WAIT_TIMEOUT)

  Message: Lock wait timeout exceeded; try restarting transaction
- Error: 1206 SQLSTATE: HY000 (ER_LOCK_TABLE_FULL)

  Message: The total number of locks exceeds the lock table size
- Error: 1207 SQLSTATE: 25000 (ER_READ_ONLY_TRANSACTION)

  Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction
- Error: 1208 SQLSTATE: HY000 (ER_DROP_DB_WITH_READ_LOCK)

  Message: DROP DATABASE not allowed while thread is holding global read lock
- Error: 1209 SQLSTATE: HY000 (ER_CREATE_DB_WITH_READ_LOCK)

  Message: CREATE DATABASE not allowed while thread is holding global read lock
- Error: 1210 SQLSTATE: HY000 (ER_WRONG_ARGUMENTS)

  Message: Incorrect arguments to %s
- Error: 1211 SQLSTATE: 42000 (ER_NO_PERMISSION_TO_CREATE_USER)

  Message: '%s'@'%s' is not allowed to create new users
- Error: 1212 SQLSTATE: HY000 (ER_UNION_TABLES_IN_DIFFERENT_DIR)

  Message: Incorrect table definition; all MERGE tables must be in the same database
- Error: 1213 SQLSTATE: 40001 (ER_LOCK_DEADLOCK)

  Message: Deadlock found when trying to get lock; try restarting transaction
- Error: 1214 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_FT)

  Message: The used table type doesn't support FULLTEXT indexes
- Error: 1215 SQLSTATE: HY000 (ER_CANNOT_ADD_FOREIGN)

  Message: Cannot add foreign key constraint
- Error: 1216 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW)

  Message: Cannot add or update a child row: a foreign key constraint fails
- Error: 1217 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED)

  Message: Cannot delete or update a parent row: a foreign key constraint fails
- Error: 1218 SQLSTATE: 08S01 (ER_CONNECT_TO_MASTER)

  Message: Error connecting to master: %s
- Error: 1219 SQLSTATE: HY000 (ER_QUERY_ON_MASTER)

  Message: Error running query on master: %s
- Error: 1220 SQLSTATE: HY000 (ER_ERROR_WHEN_EXECUTING_COMMAND)

  Message: Error when executing command %s: %s
- Error: 1221 SQLSTATE: HY000 (ER_WRONG_USAGE)

  Message: Incorrect usage of %s and %s
- Error: 1222 SQLSTATE: 21000 (ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT)

  Message: The used SELECT statements have a different number of columns

- Error: 1223 SQLSTATE: HY000 (ER_CANT_UPDATE_WITH_READLOCK)

  Message: Can't execute the query because you have a conflicting read lock
- Error: 1224 SQLSTATE: HY000 (ER_MIXING_NOT_ALLOWED)

  Message: Mixing of transactional and non-transactional tables is disabled
- Error: 1225 SQLSTATE: HY000 (ER_DUP_ARGUMENT)

  Message: Option '%s' used twice in statement
- Error: 1226 SQLSTATE: 42000 (ER_USER_LIMIT_REACHED)

  Message: User '%s' has exceeded the '%s' resource (current value: %ld)
- Error: 1227 SQLSTATE: 42000 (ER_SPECIFIC_ACCESS_DENIED_ERROR)

  Message: Access denied; you need the %s privilege for this operation
- Error: 1228 SQLSTATE: HY000 (ER_LOCAL_VARIABLE)

  Message: Variable '%s' is a SESSION variable and can't be used with SET GLOBAL
- Error: 1229 SQLSTATE: HY000 (ER_GLOBAL_VARIABLE)

  Message: Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL
- Error: 1230 SQLSTATE: 42000 (ER_NO_DEFAULT)

  Message: Variable '%s' doesn't have a default value
- Error: 1231 SQLSTATE: 42000 (ER_WRONG_VALUE_FOR_VAR)

  Message: Variable '%s' can't be set to the value of '%s'
- Error: 1232 SQLSTATE: 42000 (ER_WRONG_TYPE_FOR_VAR)

  Message: Incorrect argument type to variable '%s'
- Error: 1233 SQLSTATE: HY000 (ER_VAR_CANT_BE_READ)

  Message: Variable '%s' can only be set, not read
- Error: 1234 SQLSTATE: 42000 (ER_CANT_USE_OPTION_HERE)

  Message: Incorrect usage/placement of '%s'
- Error: 1235 SQLSTATE: 42000 (ER_NOT_SUPPORTED_YET)

  Message: This version of MySQL doesn't yet support '%s'
- Error: 1236 SQLSTATE: HY000 (ER_MASTER_FATAL_ERROR_READING_BINLOG)

  Message: Got fatal error %d: '%s' from master when reading data from binary log
- Error: 1237 SQLSTATE: HY000 (ER_SLAVE_IGNORED_TABLE)

  Message: Slave SQL thread ignored the query because of replicate-*-table rules
- Error: 1238 SQLSTATE: HY000 (ER_INCORRECT_GLOBAL_LOCAL_VAR)

  Message: Variable '%s' is a %s variable
- Error: 1239 SQLSTATE: 42000 (ER_WRONG_FK_DEF)

  Message: Incorrect foreign key definition for '%s': %s
- Error: 1240 SQLSTATE: HY000 (ER_KEY_REF_DO_NOT_MATCH_TABLE_REF)

  Message: Key reference and table reference don't match

- Error: 1241 SQLSTATE: 21000 (ER_OPERAND_COLUMNS)

  Message: Operand should contain %d column(s)
- Error: 1242 SQLSTATE: 21000 (ER_SUBQUERY_NO_1_ROW)

- Error: 1397 SQLSTATE: XAE04 (ER_XAER_NOTA)

  Message: XAER_NOTA: Unknown XID
- Error: 1398 SQLSTATE: XAE05 (ER_XAER_INVAL)

  Message: XAER_INVAL: Invalid arguments (or unsupported command)
- Error: 1399 SQLSTATE: XAE07 (ER_XAER_RMFAIL)

  Message: XAER_RMFAIL: The command cannot be executed when global transaction is in the %s state
- Error: 1400 SQLSTATE: XAE09 (ER_XAER_OUTSIDE)

  Message: XAER_OUTSIDE: Some work is done outside global transaction
- Error: 1401 SQLSTATE: XAE03 (ER_XAER_RMERR)

  Message: XAER_RMERR: Fatal error occurred in the transaction branch - check your data for consistency

- Error: 1402 SQLSTATE: XA100 (ER_XA_RBROLLBACK)

  Message: XA_RBROLLBACK: Transaction branch was rolled back

- Error: 1403 SQLSTATE: 42000 (ER_NONEXISTING_PROC_GRANT)

  Message: There is no such grant defined for user '%s' on host '%s' on routine '%s'

- Error: 1404 SQLSTATE: HY000 (ER_PROC_AUTO_GRANT_FAIL)

  Message: Failed to grant EXECUTE and ALTER ROUTINE privileges

- Error: 1405 SQLSTATE: HY000 (ER_PROC_AUTO_REVOKE_FAIL)

  Message: Failed to revoke all privileges to dropped routine

- Error: 1406 SQLSTATE: 22001 (ER_DATA_TOO_LONG)

  Message: Data too long for column '%s' at row %ld

- Error: 1407 SQLSTATE: 42000 (ER_SP_BAD_SQLSTATE)

  Message: Bad SQLSTATE: '%s'

- Error: 1408 SQLSTATE: HY000 (ER_STARTUP)

  Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d %s

- Error: 1409 SQLSTATE: HY000 (ER_LOAD_FROM_FIXED_SIZE_ROWS_TO_VAR)

  Message: Can't load value from file with fixed size rows to variable

- Error: 1410 SQLSTATE: 42000 (ER_CANT_CREATE_USER_WITH_GRANT)

  Message: You are not allowed to create a user with GRANT

- Error: 1411 SQLSTATE: HY000 (ER_WRONG_VALUE_FOR_TYPE)

  Message: Incorrect %s value: '%s' for function %s

- Error: 1412 SQLSTATE: HY000 (ER_TABLE_DEF_CHANGED)

  Message: Table definition has changed, please retry transaction

- Error: 1413 SQLSTATE: 42000 (ER_SP_DUP_HANDLER)

  Message: Duplicate handler declared in the same block

- Error: 1414 SQLSTATE: 42000 (ER_SP_NOT_VAR_ARG)

  Message: OUT or INOUT argument %d for routine %s is not a variable or NEW pseudo-variable in BEFORE trigger

- Error: 1415 SQLSTATE: 0A000 (ER_SP_NO_RETSET)

  Message: Not allowed to return a result set from a %s

- Error: 1416 SQLSTATE: 22003 (ER_CANT_CREATE_GEOMETRY_OBJECT)

  Message: Cannot get geometry object from data you send to the GEOMETRY field

- Error: 1417 SQLSTATE: HY000 (ER_FAILED_ROUTINE_BREAK_BINLOG)

  Message: A routine failed and has neither NO SQL nor READS SQL DATA in its declaration and binary logging is enabled; if non-transactional tables were updated, the binary log will miss their changes

- Error: 1418 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_ROUTINE)

  Message: This function has none of DETERMINISTIC, NO SQL, or READS SQL DATA in its declaration and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)

- Error: 1419 SQLSTATE: HY000 (ER_BINLOG_CREATE_ROUTINE_NEED_SUPER)

Message: You do not have the SUPER privilege and binary logging is enabled (you *might* want to use the less safe log_bin_trust_function_creators variable)

- Error: 1420 SQLSTATE: HY000 (ER_EXEC_STMT_WITH_OPEN_CURSOR)

  Message: You can't execute a prepared statement which has an open cursor associated with it. Reset the statement to re-execute it.

- Error: 1421 SQLSTATE: HY000 (ER_STMT_HAS_NO_OPEN_CURSOR)

  Message: The statement (%lu) has no open cursor.

- Error: 1422 SQLSTATE: HY000 (ER_COMMIT_NOT_ALLOWED_IN_SF_OR_TRG)

  Message: Explicit or implicit commit is not allowed in stored function or trigger.

- Error: 1423 SQLSTATE: HY000 (ER_NO_DEFAULT_FOR_VIEW_FIELD)

  Message: Field of view '%s.%s' underlying table doesn't have a default value

- Error: 1424 SQLSTATE: HY000 (ER_SP_NO_RECURSION)

  Message: Recursive stored functions and triggers are not allowed.

- Error: 1425 SQLSTATE: 42000 (ER_TOO_BIG_SCALE)

  Message: Too big scale %d specified for column '%s'. Maximum is %lu.

- Error: 1426 SQLSTATE: 42000 (ER_TOO_BIG_PRECISION)

  Message: Too big precision %d specified for column '%s'. Maximum is %lu.

- Error: 1427 SQLSTATE: 42000 (ER_M_BIGGER_THAN_D)

  Message: For float(M,D), double(M,D) or decimal(M,D), M must be >= D (column '%s').

- Error: 1428 SQLSTATE: HY000 (ER_WRONG_LOCK_OF_SYSTEM_TABLE)

  Message: You can't combine write-locking of system tables with other tables or lock types

- Error: 1429 SQLSTATE: HY000 (ER_CONNECT_TO_FOREIGN_DATA_SOURCE)

  Message: Unable to connect to foreign data source: %s

- Error: 1430 SQLSTATE: HY000 (ER_QUERY_ON_FOREIGN_DATA_SOURCE)

  Message: There was a problem processing the query on the foreign data source. Data source error: %s

- Error: 1431 SQLSTATE: HY000 (ER_FOREIGN_DATA_SOURCE_DOESNT_EXIST)

  Message: The foreign data source you are trying to reference does not exist. Data source error: %s

- Error: 1432 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID_CANT_CREATE)

  Message: Can't create federated table. The data source connection string '%s' is not in the correct format

- Error: 1433 SQLSTATE: HY000 (ER_FOREIGN_DATA_STRING_INVALID)

  Message: The data source connection string '%s' is not in the correct format

- Error: 1434 SQLSTATE: HY000 (ER_CANT_CREATE_FEDERATED_TABLE)

  Message: Can't create federated table. Foreign data src error: %s

- Error: 1435 SQLSTATE: HY000 (ER_TRG_IN_WRONG_SCHEMA)

  Message: Trigger in wrong schema

- Error: 1436 SQLSTATE: HY000 (ER_STACK_OVERRUN_NEED_MORE)

  Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld -O thread_stack=#' to

specify a bigger stack.

- Error: 1437 SQLSTATE: 42000 (ER_TOO_LONG_BODY)

  Message: Routine body for '%s' is too long

- Error: 1438 SQLSTATE: HY000 (ER_WARN_CANT_DROP_DEFAULT_KEYCACHE)

  Message: Cannot drop default keycache

- Error: 1439 SQLSTATE: 42000 (ER_TOO_BIG_DISPLAYWIDTH)

  Message: Display width out of range for column '%s' (max = %lu)

- Error: 1440 SQLSTATE: XAE08 (ER_XAER_DUPID)

  Message: XAER_DUPID: The XID already exists

- Error: 1441 SQLSTATE: 22008 (ER_DATETIME_FUNCTION_OVERFLOW)

  Message: Datetime function: %s field overflow

- Error: 1442 SQLSTATE: HY000 (ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG)

  Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.

- Error: 1443 SQLSTATE: HY000 (ER_VIEW_PREVENT_UPDATE)

  Message: The definition of table '%s' prevents operation %s on table '%s'.

- Error: 1444 SQLSTATE: HY000 (ER_PS_NO_RECURSION)

  Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner

- Error: 1445 SQLSTATE: HY000 (ER_SP_CANT_SET_AUTOCOMMIT)

  Message: Not allowed to set autocommit from a stored function or trigger

- Error: 1446 SQLSTATE: HY000 (ER_MALFORMED_DEFINER)

  Message: Definer is not fully qualified

- Error: 1447 SQLSTATE: HY000 (ER_VIEW_FRM_NO_USER)

  Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!

- Error: 1448 SQLSTATE: HY000 (ER_VIEW_OTHER_USER)

  Message: You need the SUPER privilege for creation view with '%s'@'%s' definer

- Error: 1449 SQLSTATE: HY000 (ER_NO_SUCH_USER)

  Message: The user specified as a definer ('%s'@'%s') does not exist

- Error: 1450 SQLSTATE: HY000 (ER_FORBID_SCHEMA_CHANGE)

  Message: Changing schema from '%s' to '%s' is not allowed.

- Error: 1451 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED_2)

  Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)

- Error: 1452 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW_2)

  Message: Cannot add or update a child row: a foreign key constraint fails (%s)

- Error: 1453 SQLSTATE: 42000 (ER_SP_BAD_VAR_SHADOW)

  Message: Variable '%s' must be quoted with `...`, or renamed

- Error: 1454 SQLSTATE: HY000 (ER_TRG_NO_DEFINER)

  Message: No definer attribute for trigger '%s'.'%s'. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.

- Error: 1455 SQLSTATE: HY000 (ER_OLD_FILE_FORMAT)

  Message: '%s' has an old format, you should re-create the '%s' object(s)

- Error: 1456 SQLSTATE: HY000 (ER_SP_RECURSION_LIMIT)

  Message: Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s

- Error: 1457 SQLSTATE: HY000 (ER_SP_PROC_TABLE_CORRUPT)

  Message: Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)

- Error: 1458 SQLSTATE: 42000 (ER_SP_WRONG_NAME)

  Message: Incorrect routine name '%s'

- Error: 1459 SQLSTATE: HY000 (ER_TABLE_NEEDS_UPGRADE)

  Message: Table upgrade required. Please do "REPAIR TABLE `%s`" or dump/reload to fix it!

- Error: 1460 SQLSTATE: 42000 (ER_SP_NO_AGGREGATE)

  Message: AGGREGATE is not supported for stored functions

- Error: 1461 SQLSTATE: 42000 (ER_MAX_PREPARED_STMT_COUNT_REACHED)

  Message: Can't create more than max_prepared_stmt_count statements (current value: %lu)

- Error: 1462 SQLSTATE: HY000 (ER_VIEW_RECURSIVE)

  Message: `%s`.`%s` contains view recursion

- Error: 1463 SQLSTATE: 42000 (ER_NON_GROUPING_FIELD_USED)

  Message: non-grouping field '%s' is used in %s clause

- Error: 1464 SQLSTATE: HY000 (ER_TABLE_CANT_HANDLE_SPKEYS)

  Message: The used table type doesn't support SPATIAL indexes

- Error: 1465 SQLSTATE: HY000 (ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA)

  Message: Triggers can not be created on system tables

- Error: 1466 SQLSTATE: HY000 (ER_REMOVED_SPACES)

  Message: Leading spaces are removed from name '%s'

- Error: 1467 SQLSTATE: HY000 (ER_AUTOINC_READ_FAILED)

  Message: Failed to read auto-increment value from storage engine

- Error: 1468 SQLSTATE: HY000 (ER_USERNAME)

  Message: user name

- Error: 1469 SQLSTATE: HY000 (ER_HOSTNAME)

  Message: host name

- Error: 1470 SQLSTATE: HY000 (ER_WRONG_STRING_LENGTH)

  Message: String '%s' is too long for %s (should be no longer than %d)

- Error: 1471 SQLSTATE: HY000 (ER_NON_INSERTABLE_TABLE)

  Message: The target table %s of the %s is not insertable-into

- Error: 1472 SQLSTATE: HY000 (ER_ADMIN_WRONG_MRG_TABLE)

  Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist

- Error: 1473 SQLSTATE: HY000 (ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT)

  Message: Too high level of nesting for select

- Error: 1474 SQLSTATE: HY000 (ER_NAME_BECOMES_EMPTY)

  Message: Name '%s' has become ''

- Error: 1475 SQLSTATE: HY000 (ER_AMBIGUOUS_FIELD_TERM)

  Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY

- Error: 1476 SQLSTATE: HY000 (ER_FOREIGN_SERVER_EXISTS)

  Message: The foreign server, %s, you are trying to create already exists.

- Error: 1477 SQLSTATE: HY000 (ER_FOREIGN_SERVER_DOESNT_EXIST)

  Message: The foreign server name you are trying to reference does not exist. Data source error: %s

- Error: 1478 SQLSTATE: HY000 (ER_ILLEGAL_HA_CREATE_OPTION)

  Message: Table storage engine '%s' does not support the create option '%s'

- Error: 1479 SQLSTATE: HY000 (ER_PARTITION_REQUIRES_VALUES_ERROR)

  Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition

- Error: 1480 SQLSTATE: HY000 (ER_PARTITION_WRONG_VALUES_ERROR)

  Message: Only %s PARTITIONING can use VALUES %s in partition definition

- Error: 1481 SQLSTATE: HY000 (ER_PARTITION_MAXVALUE_ERROR)

  Message: MAXVALUE can only be used in last partition definition

- Error: 1482 SQLSTATE: HY000 (ER_PARTITION_SUBPARTITION_ERROR)

  Message: Subpartitions can only be hash partitions and by key

- Error: 1483 SQLSTATE: HY000 (ER_PARTITION_SUBPART_MIX_ERROR)

  Message: Must define subpartitions on all partitions if on one partition

- Error: 1484 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_PART_ERROR)

  Message: Wrong number of partitions defined, mismatch with previous setting

- Error: 1485 SQLSTATE: HY000 (ER_PARTITION_WRONG_NO_SUBPART_ERROR)

  Message: Wrong number of subpartitions defined, mismatch with previous setting

- Error: 1486 SQLSTATE: HY000 (ER_CONST_EXPR_IN_PARTITION_FUNC_ERROR)

  Message: Constant/Random expression in (sub)partitioning function is not allowed

- Error: 1487 SQLSTATE: HY000 (ER_NO_CONST_EXPR_IN_RANGE_OR_LIST_ERROR)

  Message: Expression in RANGE/LIST VALUES must be constant

- Error: 1488 SQLSTATE: HY000 (ER_FIELD_NOT_FOUND_PART_ERROR)

  Message: Field in list of fields for partition function not found in table

- Error: 1489 SQLSTATE: HY000 (ER_LIST_OF_FIELDS_ONLY_IN_HASH_ERROR)

  Message: List of fields is only allowed in KEY partitions

- Error: 1490 SQLSTATE: HY000 (ER_INCONSISTENT_PARTITION_INFO_ERROR)

  Message: The partition info in the frm file is not consistent with what can be written into the frm file
- Error: 1491 SQLSTATE: HY000 (ER_PARTITION_FUNC_NOT_ALLOWED_ERROR)

  Message: The %s function returns the wrong type
- Error: 1492 SQLSTATE: HY000 (ER_PARTITIONS_MUST_BE_DEFINED_ERROR)

  Message: For %s partitions each partition must be defined
- Error: 1493 SQLSTATE: HY000 (ER_RANGE_NOT_INCREASING_ERROR)

  Message: VALUES LESS THAN value must be strictly increasing for each partition
- Error: 1494 SQLSTATE: HY000 (ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR)

  Message: VALUES value must be of same type as partition function
- Error: 1495 SQLSTATE: HY000 (ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR)

  Message: Multiple definition of same constant in list partitioning
- Error: 1496 SQLSTATE: HY000 (ER_PARTITION_ENTRY_ERROR)

  Message: Partitioning can not be used stand-alone in query
- Error: 1497 SQLSTATE: HY000 (ER_MIX_HANDLER_ERROR)

  Message: The mix of handlers in the partitions is not allowed in this version of MySQL
- Error: 1498 SQLSTATE: HY000 (ER_PARTITION_NOT_DEFINED_ERROR)

  Message: For the partitioned engine it is necessary to define all %s
- Error: 1499 SQLSTATE: HY000 (ER_TOO_MANY_PARTITIONS_ERROR)

  Message: Too many partitions (including subpartitions) were defined
- Error: 1500 SQLSTATE: HY000 (ER_SUBPARTITION_ERROR)

  Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
- Error: 1501 SQLSTATE: HY000 (ER_CANT_CREATE_HANDLER_FILE)

  Message: Failed to create specific handler file
- Error: 1502 SQLSTATE: HY000 (ER_BLOB_FIELD_IN_PART_FUNC_ERROR)

  Message: A BLOB field is not allowed in partition function
- Error: 1503 SQLSTATE: HY000 (ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF)

  Message: A %s must include all columns in the table's partitioning function
- Error: 1504 SQLSTATE: HY000 (ER_NO_PARTS_ERROR)

  Message: Number of %s = 0 is not an allowed value
- Error: 1505 SQLSTATE: HY000 (ER_PARTITION_MGMT_ON_NONPARTITIONED)

  Message: Partition management on a not partitioned table is not possible
- Error: 1506 SQLSTATE: HY000 (ER_FOREIGN_KEY_ON_PARTITIONED)

  Message: Foreign key clause is not yet supported in conjunction with partitioning
- Error: 1507 SQLSTATE: HY000 (ER_DROP_PARTITION_NON_EXISTENT)

  Message: Error in list of partitions to %s

- Error: 1508 SQLSTATE: HY000 (ER_DROP_LAST_PARTITION)

  Message: Cannot remove all partitions, use DROP TABLE instead

- Error: 1509 SQLSTATE: HY000 (ER_COALESCE_ONLY_ON_HASH_PARTITION)

  Message: COALESCE PARTITION can only be used on HASH/KEY partitions

- Error: 1510 SQLSTATE: HY000 (ER_REORG_HASH_ONLY_ON_SAME_NO)

  Message: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers

- Error: 1511 SQLSTATE: HY000 (ER_REORG_NO_PARAM_ERROR)

  Message: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONs

- Error: 1512 SQLSTATE: HY000 (ER_ONLY_ON_RANGE_LIST_PARTITION)

  Message: %s PARTITION can only be used on RANGE/LIST partitions

- Error: 1513 SQLSTATE: HY000 (ER_ADD_PARTITION_SUBPART_ERROR)

  Message: Trying to Add partition(s) with wrong number of subpartitions

- Error: 1514 SQLSTATE: HY000 (ER_ADD_PARTITION_NO_NEW_PARTITION)

  Message: At least one partition must be added

- Error: 1515 SQLSTATE: HY000 (ER_COALESCE_PARTITION_NO_PARTITION)

  Message: At least one partition must be coalesced

- Error: 1516 SQLSTATE: HY000 (ER_REORG_PARTITION_NOT_EXIST)

  Message: More partitions to reorganize than there are partitions

- Error: 1517 SQLSTATE: HY000 (ER_SAME_NAME_PARTITION)

  Message: Duplicate partition name %s

- Error: 1518 SQLSTATE: HY000 (ER_NO_BINLOG_ERROR)

  Message: It is not allowed to shut off binlog on this command

- Error: 1519 SQLSTATE: HY000 (ER_CONSECUTIVE_REORG_PARTITIONS)

  Message: When reorganizing a set of partitions they must be in consecutive order

- Error: 1520 SQLSTATE: HY000 (ER_REORG_OUTSIDE_RANGE)

  Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range

- Error: 1521 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_FAILURE)

  Message: Partition function not supported in this version for this handler

- Error: 1522 SQLSTATE: HY000 (ER_PART_STATE_ERROR)

  Message: Partition state cannot be defined from CREATE/ALTER TABLE

- Error: 1523 SQLSTATE: HY000 (ER_LIMITED_PART_RANGE)

  Message: The %s handler only supports 32 bit integers in VALUES

- Error: 1524 SQLSTATE: HY000 (ER_PLUGIN_IS_NOT_LOADED)

  Message: Plugin '%s' is not loaded

- Error: 1525 SQLSTATE: HY000 (ER_WRONG_VALUE)

  Message: Incorrect %s value: '%s'

- Error: 1526 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE)

  Message: Table has no partition for value %s

- Error: 1527 SQLSTATE: HY000 (ER_FILEGROUP_OPTION_ONLY_ONCE)

  Message: It is not allowed to specify %s more than once

- Error: 1528 SQLSTATE: HY000 (ER_CREATE_FILEGROUP_FAILED)

  Message: Failed to create %s

- Error: 1529 SQLSTATE: HY000 (ER_DROP_FILEGROUP_FAILED)

  Message: Failed to drop %s

- Error: 1530 SQLSTATE: HY000 (ER_TABLESPACE_AUTO_EXTEND_ERROR)

  Message: The handler doesn't support autoextend of tablespaces

- Error: 1531 SQLSTATE: HY000 (ER_WRONG_SIZE_NUMBER)

  Message: A size parameter was incorrectly specified, either number or on the form 10M

- Error: 1532 SQLSTATE: HY000 (ER_SIZE_OVERFLOW_ERROR)

  Message: The size number was correct but we don't allow the digit part to be more than 2 billion

- Error: 1533 SQLSTATE: HY000 (ER_ALTER_FILEGROUP_FAILED)

  Message: Failed to alter: %s

- Error: 1534 SQLSTATE: HY000 (ER_BINLOG_ROW_LOGGING_FAILED)

  Message: Writing one row to the row-based binary log failed

- Error: 1535 SQLSTATE: HY000 (ER_BINLOG_ROW_WRONG_TABLE_DEF)

  Message: Table definition on master and slave does not match: %s

- Error: 1536 SQLSTATE: HY000 (ER_BINLOG_ROW_RBR_TO_SBR)

  Message: Slave running with --log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events

- Error: 1537 SQLSTATE: HY000 (ER_EVENT_ALREADY_EXISTS)

  Message: Event '%s' already exists

- Error: 1538 SQLSTATE: HY000 (ER_EVENT_STORE_FAILED)

  Message: Failed to store event %s. Error code %d from storage engine.

- Error: 1539 SQLSTATE: HY000 (ER_EVENT_DOES_NOT_EXIST)

  Message: Unknown event '%s'

- Error: 1540 SQLSTATE: HY000 (ER_EVENT_CANT_ALTER)

  Message: Failed to alter event '%s'

- Error: 1541 SQLSTATE: HY000 (ER_EVENT_DROP_FAILED)

  Message: Failed to drop %s

- Error: 1542 SQLSTATE: HY000 (ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG)

  Message: INTERVAL is either not positive or too big

- Error: 1543 SQLSTATE: HY000 (ER_EVENT_ENDS_BEFORE_STARTS)

  Message: ENDS is either invalid or before STARTS

- Error: 1544 SQLSTATE: HY000 (ER_EVENT_EXEC_TIME_IN_THE_PAST)

  Message: Event execution time is in the past. Event has been disabled

- Error: 1545 SQLSTATE: HY000 (ER_EVENT_OPEN_TABLE_FAILED)

  Message: Failed to open mysql.event

- Error: 1546 SQLSTATE: HY000 (ER_EVENT_NEITHER_M_EXPR_NOR_M_AT)

  Message: No datetime expression provided

- Error: 1547 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_CORRUPTED)

  Message: Column count of mysql.%s is wrong. Expected %d, found %d. The table is probably corrupted

- Error: 1548 SQLSTATE: HY000 (ER_CANNOT_LOAD_FROM_TABLE)

  Message: Cannot load from mysql.%s. The table is probably corrupted

- Error: 1549 SQLSTATE: HY000 (ER_EVENT_CANNOT_DELETE)

  Message: Failed to delete the event from mysql.event

- Error: 1550 SQLSTATE: HY000 (ER_EVENT_COMPILE_ERROR)

  Message: Error during compilation of event's body

- Error: 1551 SQLSTATE: HY000 (ER_EVENT_SAME_NAME)

  Message: Same old and new event name

- Error: 1552 SQLSTATE: HY000 (ER_EVENT_DATA_TOO_LONG)

  Message: Data for column '%s' too long

- Error: 1553 SQLSTATE: HY000 (ER_DROP_INDEX_FK)

  Message: Cannot drop index '%s': needed in a foreign key constraint

- Error: 1554 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX_WITH_VER)

  Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead

- Error: 1555 SQLSTATE: HY000 (ER_CANT_WRITE_LOCK_LOG_TABLE)

  Message: You can't write-lock a log table. Only read access is possible

- Error: 1556 SQLSTATE: HY000 (ER_CANT_LOCK_LOG_TABLE)

  Message: You can't use locks with log tables.

- Error: 1557 SQLSTATE: 23000 (ER_FOREIGN_DUPLICATE_KEY)

  Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

- Error: 1558 SQLSTATE: HY000 (ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE)

  Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.

- Error: 1559 SQLSTATE: HY000 (ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR)

  Message: Cannot switch out of the row-based binary log format when the session has open temporary tables

- Error: 1560 SQLSTATE: HY000 (ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT)

  Message: Cannot change the binary logging format inside a stored function or trigger

- Error: 1561 SQLSTATE: HY000 (ER_NDB_CANT_SWITCH_BINLOG_FORMAT)

  Message: The NDB cluster engine does not support changing the binlog format on the fly yet

- Error: 1562 SQLSTATE: HY000 (ER_PARTITION_NO_TEMPORARY)

  Message: Cannot create temporary table with partitions
- Error: 1563 SQLSTATE: HY000 (ER_PARTITION_CONST_DOMAIN_ERROR)

  Message: Partition constant is out of partition function domain
- Error: 1564 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_IS_NOT_ALLOWED)

  Message: This partition function is not allowed
- Error: 1565 SQLSTATE: HY000 (ER_DDL_LOG_ERROR)

  Message: Error in DDL log
- Error: 1566 SQLSTATE: HY000 (ER_NULL_IN_VALUES_LESS_THAN)

  Message: Not allowed to use NULL value in VALUES LESS THAN
- Error: 1567 SQLSTATE: HY000 (ER_WRONG_PARTITION_NAME)

  Message: Incorrect partition name
- Error: 1568 SQLSTATE: 25001 (ER_CANT_CHANGE_TX_ISOLATION)

  Message: Transaction isolation level can't be changed while a transaction is in progress
- Error: 1569 SQLSTATE: HY000 (ER_DUP_ENTRY_AUTOINCREMENT_CASE)

  Message: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'
- Error: 1570 SQLSTATE: HY000 (ER_EVENT_MODIFY_QUEUE_ERROR)

  Message: Internal scheduler error %d
- Error: 1571 SQLSTATE: HY000 (ER_EVENT_SET_VAR_ERROR)

  Message: Error during starting/stopping of the scheduler. Error code %u
- Error: 1572 SQLSTATE: HY000 (ER_PARTITION_MERGE_ERROR)

  Message: Engine cannot be used in partitioned tables
- Error: 1573 SQLSTATE: HY000 (ER_CANT_ACTIVATE_LOG)

  Message: Cannot activate '%s' log
- Error: 1574 SQLSTATE: HY000 (ER_RBR_NOT_AVAILABLE)

  Message: The server was not built with row-based replication
- Error: 1575 SQLSTATE: HY000 (ER_BASE64_DECODE_ERROR)

  Message: Decoding of base64 string failed
- Error: 1576 SQLSTATE: HY000 (ER_EVENT_RECURSION_FORBIDDEN)

  Message: Recursion of EVENT DDL statements is forbidden when body is present
- Error: 1577 SQLSTATE: HY000 (ER_EVENTS_DB_ERROR)

  Message: Cannot proceed because system tables used by Event Scheduler were found damaged at server start
- Error: 1578 SQLSTATE: HY000 (ER_ONLY_INTEGERS_ALLOWED)

  Message: Only integers allowed as number here
- Error: 1579 SQLSTATE: HY000 (ER_UNSUPORTED_LOG_ENGINE)

  Message: This storage engine cannot be used for log tables"

- Error: 1580 SQLSTATE: HY000 (ER_BAD_LOG_STATEMENT)

  Message: You cannot '%s' a log table if logging is enabled

- Error: 1581 SQLSTATE: HY000 (ER_CANT_RENAME_LOG_TABLE)

  Message: Cannot rename '%s'. When logging enabled, rename to/from log table must rename two tables: the log table to an archive table and another table back to '%s'

- Error: 1582 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_NATIVE_FCT)

  Message: Incorrect parameter count in the call to native function '%s'

- Error: 1583 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_NATIVE_FCT)

  Message: Incorrect parameters in the call to native function '%s'

- Error: 1584 SQLSTATE: 42000 (ER_WRONG_PARAMETERS_TO_STORED_FCT)

  Message: Incorrect parameters in the call to stored function '%s'

- Error: 1585 SQLSTATE: HY000 (ER_NATIVE_FCT_NAME_COLLISION)

  Message: This function '%s' has the same name as a native function

- Error: 1586 SQLSTATE: 23000 (ER_DUP_ENTRY_WITH_KEY_NAME)

  Message: Duplicate entry '%s' for key '%s'

- Error: 1587 SQLSTATE: HY000 (ER_BINLOG_PURGE_EMFILE)

  Message: Too many files opened, please execute the command again

- Error: 1588 SQLSTATE: HY000 (ER_EVENT_CANNOT_CREATE_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immediately after creation.

- Error: 1589 SQLSTATE: HY000 (ER_EVENT_CANNOT_ALTER_IN_THE_PAST)

  Message: Event execution time is in the past and ON COMPLETION NOT PRESERVE is set. The event was dropped immediately after creation.

- Error: 1590 SQLSTATE: HY000 (ER_SLAVE_INCIDENT)

  Message: The incident %s occured on the master. Message: %s

- Error: 1591 SQLSTATE: HY000 (ER_NO_PARTITION_FOR_GIVEN_VALUE_SILENT)

  Message: Table has no partition for some existing values

- Error: 1592 SQLSTATE: HY000 (ER_BINLOG_UNSAFE_STATEMENT)

  Message: Statement is not safe to log in statement format.

- Error: 1665 SQLSTATE: HY000 (ER_BACKUP_WRITE_DATA)

  Message: Error when writing data from %s backup driver (data block for table #%d)

- Error: 1666 SQLSTATE: HY000 (ER_BACKUP_READ_DATA)

  Message: Error when reading data from backup stream

- Error: 1667 SQLSTATE: HY000 (ER_BACKUP_NEXT_CHUNK)

  Message: Can't go to the next chunk in backup stream

- Error: 1668 SQLSTATE: HY000 (ER_BACKUP_INIT_BACKUP_DRIVER)

  Message: Can't initialize %s backup driver

- Error: 1669 SQLSTATE: HY000 (ER_BACKUP_INIT_RESTORE_DRIVER)

Message: Can't initialize %s restore driver

- Error: 1670 SQLSTATE: HY000 (ER_BACKUP_STOP_BACKUP_DRIVER)

  Message: Can't shut down %s backup driver

- Error: 1671 SQLSTATE: HY000 (ER_BACKUP_STOP_RESTORE_DRIVERS)

  Message: Can't shut down %s restore driver(s)

- Error: 1672 SQLSTATE: HY000 (ER_BACKUP_PREPARE_DRIVER)

  Message: %s backup driver can't prepare for synchronization

- Error: 1673 SQLSTATE: HY000 (ER_BACKUP_CREATE_VP)

  Message: %s backup driver can't create its validity point

- Error: 1674 SQLSTATE: HY000 (ER_BACKUP_UNLOCK_DRIVER)

  Message: Can't unlock %s backup driver after creating the validity point

- Error: 1675 SQLSTATE: HY000 (ER_BACKUP_CANCEL_BACKUP)

  Message: %s backup driver can't cancel its backup operation

- Error: 1676 SQLSTATE: HY000 (ER_BACKUP_CANCEL_RESTORE)

  Message: %s restore driver can't cancel its restore operation

- Error: 1677 SQLSTATE: HY000 (ER_BACKUP_GET_DATA)

  Message: Error when polling %s backup driver for its data

- Error: 1678 SQLSTATE: HY000 (ER_BACKUP_SEND_DATA)

  Message: Error when sending data (for table #%d) to %s restore driver

- Error: 1679 SQLSTATE: HY000 (ER_BACKUP_SEND_DATA_RETRY)

  Message: After %d attempts %s restore driver still can't accept next block of data

- Error: 1680 SQLSTATE: HY000 (ER_BACKUP_OPEN_TABLES)

  Message: Open and lock tables failed in %s

- Error: 1681 SQLSTATE: HY000 (ER_BACKUP_THREAD_INIT)

  Message: Backup driver's table locking thread can not be initialized.

- Error: 1682 SQLSTATE: HY000 (ER_BACKUP_PROGRESS_TABLES)

  Message: Can't open the backup logs as tables. Check 'mysql.backup_history' and 'mysql.backup_progress' or run mysql_upgrade to repair.

- Error: 1683 SQLSTATE: HY000 (ER_TABLESPACE_EXIST)

  Message: Tablespace '%s' already exists

- Error: 1684 SQLSTATE: HY000 (ER_NO_SUCH_TABLESPACE)

  Message: Tablespace '%s' doesn't exist

- Error: 1685 SQLSTATE: HY000 (ER_SLAVE_IGNORE_SERVER_IDS)

  Message: The requested server id %d clashes with the slave startup option --replicate-same-server-id

- Error: 1686 SQLSTATE: HY000 (ER_BACKUP_CANT_FIND_SE)

  Message: Backup image contains data created by a native driver of %s storage engine but this engine can not be found on this server

- Error: 1687 SQLSTATE: HY000 (ER_BACKUP_NO_NATIVE_BE)

  Message: Backup image contains data created by a native driver of %s storage engine but it has no native backup support on this server

- Error: 1688 SQLSTATE: HY000 (ER_BACKUP_UNKNOWN_BE)

  Message: Backup engine #%d needed for restoring from backup image has unknown type

- Error: 1689 SQLSTATE: HY000 (ER_BACKUP_WRONG_TABLE_BE)

  Message: Backup image specifies wrong backup engine #%d for one of the tables

- Error: 1690 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_DB)

  Message: Could not restore database %s

- Error: 1691 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_TABLE)

  Message: Could not restore table %s

- Error: 1692 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_VIEW)

  Message: Could not restore view %s. Please check the view definition for possible missing dependencies.

- Error: 1693 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_SROUT)

  Message: Could not restore stored routine %s

- Error: 1694 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_EVENT)

  Message: Could not restore event %s

- Error: 1695 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_TRIGGER)

  Message: Could not restore trigger %s

- Error: 1696 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_DB)

  Message: Failed to add database `%s` to the catalog

- Error: 1697 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_TABLE)

  Message: Failed to add table `%s`.`%s` to the catalog

- Error: 1698 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_VIEW)

  Message: Failed to add view `%s`.`%s` to the catalog

- Error: 1699 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_SROUT)

  Message: Failed to add stored routine `%s`.`%s` to the catalog

- Error: 1700 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_EVENT)

  Message: Failed to add event `%s`.`%s` to the catalog

- Error: 1701 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_TRIGGER)

  Message: Failed to add trigger `%s`.`%s` to the catalog

- Error: 1702 SQLSTATE: HY000 (ER_BACKUP_UNKNOWN_OBJECT)

  Message: Backup image refers to an object which could not be found in the catalog

- Error: 1703 SQLSTATE: HY000 (ER_BACKUP_UNKNOWN_OBJECT_TYPE)

  Message: Backup image refers to an object of unknown type

- Error: 1704 SQLSTATE: HY000 (ER_BACKUP_OPEN_WR)

  Message: Cannot open backup stream for writing

- Error: 1705 SQLSTATE: HY000 (ER_BACKUP_OPEN_RD)

  Message: Cannot open backup stream for reading
- Error: 1706 SQLSTATE: HY000 (ER_BACKUP_BAD_MAGIC)

  Message: Could not find correct signature at the beginning of backup stream
- Error: 1707 SQLSTATE: HY000 (ER_BACKUP_CONTEXT_CREATE)

  Message: Cannot create backup/restore execution context
- Error: 1708 SQLSTATE: HY000 (ER_BACKUP_CONTEXT_REMOVE)

  Message: Error when cleaning up after backup/restore operation
- Error: 1709 SQLSTATE: HY000 (ER_BAD_PATH)

  Message: Malformed file path '%s'
- Error: 1710 SQLSTATE: HY000 (ER_DDL_BLOCK)

  Message: Erorr when attempting to block DDLs
- Error: 1711 SQLSTATE: HY000 (ER_BACKUP_LOGGER_INIT)

  Message: Could not initialize logging and reporting services
- Error: 1712 SQLSTATE: HY000 (ER_BACKUP_WRITE_SUMMARY)

  Message: Error when writing summary section of backup image
- Error: 1713 SQLSTATE: HY000 (ER_BACKUP_READ_SUMMARY)

  Message: Error when reading summary section of backup image
- Error: 1714 SQLSTATE: HY000 (ER_BACKUP_GET_META_DB)

  Message: Failed to obtain meta-data for database %s
- Error: 1715 SQLSTATE: HY000 (ER_BACKUP_GET_META_TABLE)

  Message: Failed to obtain meta-data for table %s
- Error: 1716 SQLSTATE: HY000 (ER_BACKUP_GET_META_VIEW)

  Message: Failed to obtain meta-data for view %s
- Error: 1717 SQLSTATE: HY000 (ER_BACKUP_GET_META_SROUT)

  Message: Failed to obtain meta-data for stored routine %s
- Error: 1718 SQLSTATE: HY000 (ER_BACKUP_GET_META_EVENT)

  Message: Failed to obtain meta-data for event %s
- Error: 1719 SQLSTATE: HY000 (ER_BACKUP_GET_META_TRIGGER)

  Message: Failed to obtain meta-data for trigger %s
- Error: 1720 SQLSTATE: HY000 (ER_BACKUP_CREATE_BE)

  Message: Cannot create backup engine for storage engine %s
- Error: 1721 SQLSTATE: HY000 (ER_BACKUP_LIST_PERDB)

  Message: Can't enumerate per database objects
- Error: 1722 SQLSTATE: HY000 (ER_BACKUP_LIST_DB_VIEWS)

  Message: Can't enumerate views in database `%s`

- Error: 1723 SQLSTATE: HY000 (ER_BACKUP_LIST_DB_SROUT)

  Message: Can't enumerate stored routines in database `%s`

- Error: 1724 SQLSTATE: HY000 (ER_BACKUP_LIST_DB_EVENTS)

  Message: Can't enumerate events in database `%s`

- Error: 1725 SQLSTATE: HY000 (ER_BACKUP_LIST_DB_TRIGGERS)

  Message: Can't enumerate triggers in database `%s`

- Error: 1726 SQLSTATE: HY000 (ER_BACKUP_LOG_WRITE_ERROR)

  Message: Can't write to the online backup progress log %s.

- Error: 1727 SQLSTATE: HY000 (ER_TABLESPACE_NOT_EMPTY)

  Message: Tablespace '%s' not empty

- Error: 1728 SQLSTATE: HY000 (ER_BACKUP_CAT_ENUM)

  Message: Could not access the contents of the backup catalog when writing backup image preamble

- Error: 1729 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_TS)

  Message: Could not create tablespace %s needed by tables being restored.

- Error: 1730 SQLSTATE: HY000 (ER_BACKUP_TS_CHANGE)

  Message: Tablespace %s needed by tables being restored, but the current tablespace definition differs from how it was when backup was made.

- Error: 1731 SQLSTATE: HY000 (ER_BACKUP_GET_META_TS)

  Message: Failed to obtain meta-data for tablespace %s.

- Error: 1732 SQLSTATE: HY000 (ER_TABLESPACE_DATAFILE_EXIST)

  Message: Tablespace data file '%s' already exists

- Error: 1733 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_TS)

  Message: Failed to add tablespace `%s` to the catalog

- Error: 1734 SQLSTATE: HY000 (ER_DEBUG_SYNC_TIMEOUT)

  Message: debug sync point wait timed out

- Error: 1735 SQLSTATE: HY000 (ER_DEBUG_SYNC_HIT_LIMIT)

  Message: debug sync point hit limit reached

- Error: 1736 SQLSTATE: HY000 (ER_BACKUP_FAILED_TO_INIT_COMPRESSION)

  Message: Could not initialize compression of backup image (function deflateInit2 returned error code %d: %s)

- Error: 1737 SQLSTATE: HY000 (ER_BACKUP_OBTAIN_NAME_LOCK_FAILED)

  Message: Restore failed to obtain the name locks on the tables.

- Error: 1738 SQLSTATE: HY000 (ER_BACKUP_RELEASE_NAME_LOCK_FAILED)

  Message: Restore failed to release the name locks on the tables.

- Error: 1739 SQLSTATE: HY000 (ER_BACKUP_BACKUPDIR)

  Message: The path specified for the system variable backupdir cannot be accessed or is invalid. ref: %s

- Error: 1740 SQLSTATE: HY000 (ER_DDL_TIMEOUT)

  Message: The backup wait timeout has expired for query '%s'.

- Error: 1741 SQLSTATE: HY000 (ER_BACKUP_LIST_DB_PRIV)

  Message: Can't enumerate grants in database '%s'.
- Error: 1742 SQLSTATE: HY000 (ER_BACKUP_CATALOG_ADD_PRIV)

  Message: Failed to add grant '%s' to the catalog
- Error: 1743 SQLSTATE: HY000 (ER_BACKUP_GET_META_PRIV)

  Message: Failed to obtain meta-data for grant '%s'.
- Error: 1744 SQLSTATE: HY000 (ER_BACKUP_CANT_RESTORE_PRIV)

  Message: Could not execute grant '%s'.
- Error: 1745 SQLSTATE: HY000 (ER_BACKUP_GRANT_SKIPPED)

  Message: The grant '%s' for the user %s was skipped because the user does not exist.
- Error: 1746 SQLSTATE: HY000 (ER_BACKUP_GRANT_WRONG_DB)

  Message: The grant '%s' failed. Database not included in the backup image.
- Error: 1747 SQLSTATE: HY000 (ER_BACKUP_LOGPATHS)

  Message: The log names for backup_history and backup_progress must be unique.
- Error: 1748 SQLSTATE: HY000 (ER_BACKUP_LOGPATH_INVALID)

  Message: The path specified for the %s is invalid. ref: %s
- Error: 1749 SQLSTATE: HY000 (ER_BACKUP_SEND_REPLY)

  Message: Failed to send reply to client after successful %s operation
- Error: 1750 SQLSTATE: HY000 (ER_BACKUP_CLOSE)

  Message: Backup/Restore: Error on close of backup stream
- Error: 1751 SQLSTATE: HY000 (ER_BACKUP_BINLOG)

  Message: Error on accessing binlog during BACKUP
- Error: 1752 SQLSTATE: HY000 (ER_BACKUP_LOG_OUTPUT)

  Message: Removing backup log entries by date or backup_id requires logging to tables.
- Error: 1753 SQLSTATE: HY000 (ER_BACKUP_PURGE_DATETIME)

  Message: The datetime specified is invalid for the '%s' command.
- Error: 1754 SQLSTATE: HY000 (ER_BACKUP_LOGS_DELETED)

  Message: Backup log entries deleted:
- Error: 1755 SQLSTATE: HY000 (ER_BACKUP_LOGS_TRUNCATED)

  Message: All backup log entries have been deleted
- Error: 1756 SQLSTATE: HY000 (ER_MASTER_BLOCKING_SLAVES)

  Message: The master is not allowing slave connections.
- Error: 1757 SQLSTATE: HY000 (ER_RESTORE_ON_MASTER)

  Message: A restore operation was initiated on the master.
- Error: 1758 SQLSTATE: HY000 (ER_RESTORE_ON_SLAVE)

  Message: A restore operation was attempted on a slave during replication. You must stop the slave prior to running a restore.

- Error: 1759 SQLSTATE: 42000 (ER_NONUNIQ_DB)

  Message: Not unique database: '%s'

- Error: 1760 SQLSTATE: HY000 (ER_RESTORE_DB_EXISTS)

  Message: Database \'%s\' already exists. Use OVERWRITE flag to overwrite.

- Error: 1761 SQLSTATE: HY000 (ER_QUERY_CACHE_DISABLED)

  Message: Query cache is disabled; restart the server with query_cache_type=1 to enable it

- Error: 1762 SQLSTATE: HY000 (ER_BACKUP_UNEXPECTED_DATA)

  Message: Backup image contains no tables, but table data was found in it

- Error: 1763 SQLSTATE: HY000 (ER_BACKUP_BACKUP_DBS)

  Message: Backing up %u database(s) %s

- Error: 1764 SQLSTATE: HY000 (ER_BACKUP_RESTORE_DBS)

  Message: Restoring %u database(s) %s

- Error: 1765 SQLSTATE: HY000 (ER_COM_UNSUPPORTED)

  Message: %s doesn't support %s

- Error: 1766 SQLSTATE: HY000 (ER_BACKUP_SYNCHRONIZE)

  Message: Backup failed to synchronize table images.

- Error: 1767 SQLSTATE: HY000 (ER_RESTORE_CANNOT_START_SLAVE)

  Message: Cannot start slave. SLAVE START is blocked by %s.

- Error: 1768 SQLSTATE: HY000 (ER_OPERATION_ABORTED)

  Message: Operation aborted

- Error: 1769 SQLSTATE: HY000 (ER_OPERATION_ABORTED_CORRUPTED)

  Message: Operation aborted - data might be corrupted

- Error: 1770 SQLSTATE: 42000 (ER_DUP_SIGNAL_SET)

  Message: Duplicate condition information item '%s'

- Error: 1771 SQLSTATE: 01000 (ER_SIGNAL_WARN)

  Message: Unhandled user-defined warning condition

- Error: 1772 SQLSTATE: 02000 (ER_SIGNAL_NOT_FOUND)

  Message: Unhandled user-defined not found condition

- Error: 1773 SQLSTATE: HY000 (ER_SIGNAL_EXCEPTION)

  Message: Unhandled user-defined exception condition

- Error: 1774 SQLSTATE: 0K000 (ER_RESIGNAL_WITHOUT_ACTIVE_HANDLER)

  Message: RESIGNAL when handler not active

- Error: 1775 SQLSTATE: HY000 (ER_SIGNAL_BAD_CONDITION_TYPE)

  Message: SIGNAL/RESIGNAL can only use a CONDITION defined with SQLSTATE

- Error: 1776 SQLSTATE: HY000 (WARN_COND_ITEM_TRUNCATED)

  Message: Data truncated for condition item '%s'

- Error: 1777 SQLSTATE: HY000 (ER_COND_ITEM_TOO_LONG)

  Message: Data too long for condition item '%s'

- Error: 1778 SQLSTATE: HY000 (ER_PATH_LENGTH)

  Message: The path specified for %s is too long.

- Error: 1779 SQLSTATE: HY000 (ER_BACKUP_INTERRUPTED)

  Message: Operation has been interrupted.

B.4. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the include/errmsg.h MySQL source file.
- The Message values correspond to the error messages that are listed in the libmysql/errmsg.c file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 2000 (CR_UNKNOWN_ERROR)

  Message: Unknown MySQL error

- Error: 2001 (CR_SOCKET_CREATE_ERROR)

  Message: Can't create UNIX socket (%d)

- Error: 2002 (CR_CONNECTION_ERROR)

  Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: 2003 (CR_CONN_HOST_ERROR)

  Message: Can't connect to MySQL server on '%s' (%d)

- Error: 2004 (CR_IPSOCK_ERROR)

  Message: Can't create TCP/IP socket (%d)

- Error: 2005 (CR_UNKNOWN_HOST)

  Message: Unknown MySQL server host '%s' (%d)

- Error: 2006 (CR_SERVER_GONE_ERROR)

  Message: MySQL server has gone away

- Error: 2007 (CR_VERSION_ERROR)

  Message: Protocol mismatch; server version = %d, client version = %d

- Error: 2008 (CR_OUT_OF_MEMORY)

  Message: MySQL client ran out of memory

- Error: 2009 (CR_WRONG_HOST_INFO)

  Message: Wrong host info

- Error: 2010 (CR_LOCALHOST_CONNECTION)

  Message: Localhost via UNIX socket

- Error: 2011 (CR_TCP_CONNECTION)

Message: %s via TCP/IP

- Error: 2012 (CR_SERVER_HANDSHAKE_ERR)

  Message: Error in server handshake

- Error: 2013 (CR_SERVER_LOST)

  Message: Lost connection to MySQL server during query

- Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)

  Message: Commands out of sync; you can't run this command now

- Error: 2015 (CR_NAMEDPIPE_CONNECTION)

  Message: Named pipe: %s

- Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)

  Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

- Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)

  Message: Can't open named pipe to host: %s pipe: %s (%lu)

- Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)

  Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error: 2019 (CR_CANT_READ_CHARSET)

  Message: Can't initialize character set %s (path: %s)

- Error: 2020 (CR_NET_PACKET_TOO_LARGE)

  Message: Got packet bigger than 'max_allowed_packet' bytes

- Error: 2021 (CR_EMBEDDED_CONNECTION)

  Message: Embedded server

- Error: 2022 (CR_PROBE_SLAVE_STATUS)

  Message: Error on SHOW SLAVE STATUS:

- Error: 2023 (CR_PROBE_SLAVE_HOSTS)

  Message: Error on SHOW SLAVE HOSTS:

- Error: 2024 (CR_PROBE_SLAVE_CONNECT)

  Message: Error connecting to slave:

- Error: 2025 (CR_PROBE_MASTER_CONNECT)

  Message: Error connecting to master:

- Error: 2026 (CR_SSL_CONNECTION_ERROR)

  Message: SSL connection error

- Error: 2027 (CR_MALFORMED_PACKET)

  Message: Malformed packet

- Error: 2028 (CR_WRONG_LICENSE)

  Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 (CR_NULL_POINTER)

Message: Invalid use of null pointer

- Error: 2030 (CR_NO_PREPARE_STMT)

  Message: Statement not prepared

- Error: 2031 (CR_PARAMS_NOT_BOUND)

  Message: No data supplied for parameters in prepared statement

- Error: 2032 (CR_DATA_TRUNCATED)

  Message: Data truncated

- Error: 2033 (CR_NO_PARAMETERS_EXISTS)

  Message: No parameters exist in the statement

- Error: 2034 (CR_INVALID_PARAMETER_NO)

  Message: Invalid parameter number

- Error: 2035 (CR_INVALID_BUFFER_USE)

  Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)

  Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR_SHARED_MEMORY_CONNECTION)

  Message: Shared memory: %s

- Error: 2038 (CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR)

  Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR)

  Message: Can't open shared memory; no answer event received from server (%lu)

- Error: 2040 (CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR)

  Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: 2041 (CR_SHARED_MEMORY_CONNECT_MAP_ERROR)

  Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: 2042 (CR_SHARED_MEMORY_FILE_MAP_ERROR)

  Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: 2043 (CR_SHARED_MEMORY_MAP_ERROR)

  Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: 2044 (CR_SHARED_MEMORY_EVENT_ERROR)

  Message: Can't open shared memory; client could not create %s event (%lu)

- Error: 2045 (CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR)

  Message: Can't open shared memory; no answer from server (%lu)

- Error: 2046 (CR_SHARED_MEMORY_CONNECT_SET_ERROR)

  Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: 2047 (CR_CONN_UNKNOW_PROTOCOL)

Message: Wrong or unknown protocol

- Error: `2048` (`CR_INVALID_CONN_HANDLE`)

  Message: Invalid connection handle

- Error: `2049` (`CR_SECURE_AUTH`)

  Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error: `2050` (`CR_FETCH_CANCELED`)

  Message: Row retrieval was canceled by mysql_stmt_close() call

- Error: `2051` (`CR_NO_DATA`)

  Message: Attempt to read column without prior row fetch

- Error: `2052` (`CR_NO_STMT_METADATA`)

  Message: Prepared statement contains no metadata

- Error: `2053` (`CR_NO_RESULT_SET`)

  Message: Attempt to read a row while there is no result set associated with the statement

- Error: `2054` (`CR_NOT_IMPLEMENTED`)

  Message: This feature is not implemented yet

- Error: `2055` (`CR_SERVER_LOST_EXTENDED`)

  Message: Lost connection to MySQL server at '%s', system error: %d

- Error: `2056` (`CR_STMT_CLOSED`)

  Message: Statement closed indirectly because of a preceeding %s() call

- Error: `2057` (`CR_NEW_STMT_METADATA`)

  Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, re-bind the result set columns, and execute the statement again

- Error: `2058` (`CR_ALREADY_CONNECTED`)

  Message: This handle is already connected. Use a separate handle for each connection.

Appendix C. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 6.0, which is currently MySQL 6.0.12. Starting with MySQL 5.0, we began offering a new version of the Manual for each new series of MySQL releases (5.0, 5.1, and so on). For information about changes in previous release series of the MySQL database software, see the corresponding version of this Manual. For information about legacy versions of the MySQL software through the 4.1 series, see *MySQL 3.23, 4.0, 4.1 Reference Manual*.

We update this section as we add new features in the 6.0 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (http://dev.mysql.com/downloads/), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar commit on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

C.1. Changes in release 6.0.x (Development)

An overview of which features were added in MySQL 6.0 can be found here: Section 1.4.1, “What Is New in MySQL 6.0”.

For a full list of changes, please refer to the changelog sections for each individual 6.0.x release.

C.1.1. Changes in MySQL 6.0.12 (Not yet released)

Functionality added or changed:

- The time zone tables for Windows available at http://dev.mysql.com/downloads/timezones.html have been updated. (Bug#39923)
- The `mysqltest` program now has a `move_file from_file to_file` command for renaming files. This should be used in test cases rather than invoking an external command that might be platform specific. (Bug#39542)

Bugs fixed:

- **Important Change**: **Replication**: The `CHANGE MASTER TO` statement required the value for `RELAY_LOG_FILE` to be an absolute path, while the `MASTER_LOG_FILE` path could be relative.

  The inconsistent behavior is resolved by allowing relative paths for `RELAY_LOG_FILE`, and by using the same basename for `RELAY_LOG_FILE` as for `MASTER_LOG_FILE`. For more information, see Section 12.6.2.1, “`CHANGE MASTER TO` Syntax”. (Bug#12190)

- **Important Change**: **Replication**: The transactional behavior of `STOP SLAVE` has changed. Formerly, it took effect immediately, even inside a transaction; now, it waits until the current replication event group (if any) has finished executing, or until the user issues a `KILL QUERY` or `KILL CONNECTION` statement.

  This was done in order to solve the problem encountered when replication was stopped while a non-transactional slave was replicating a transaction on the master. (It was impossible to roll back a mixed-engines transaction when one of the engines was non-transactional, which meant that the slave could not safely re-apply any transaction that had been interrupted by `STOP SLAVE`.) (Bug#319, Bug#38205)

  See also Bug#43217.

- **Important Change**: An option that requires a value, when specified in an option file without a value, was assigned the text of the next line in the file as the value. Now, if you fail to specify a required value in an option file, the server aborts with an error.

  This change does not effect how options are handled by the server when they are used on the command line. For example, starting the server using `mysqld_safe --relay-log --relay-log-index &` causes the server to create relay log files named `--relay-log-index.000001`, `--relay-log-index.000002`, and so on, because the `--relay-log` option expects an argument. (Bug#25192)

- **Partitioning**: When a value was equal to a `PARTITION ... VALUES LESS THAN (value)` value other than `MAXVALUE`, the corresponding partition was not pruned. (Bug#42944)

- **Replication**: Issuing the following statements, in the order shown, could cause a deadlock between the user thread and I/O thread:

  ```
  START SLAVE;
  STOP SLAVE SQL_THREAD;
  START SLAVE;
  ```

  (Bug#44312)

  See also Bug#38715, Bug#38716.

- **Replication**: Unrelated errors occurring during the execution of `RESET SLAVE` could cause the slave to crash. (Bug#44179)

- **Replication**: When using semi-synchronous replication:

  - `KILL` statements were not always obeyed for a session blocked by a semi-synchronous `ACK` signal.

  - `SHOW PROCESSLIST` did not provide any indication that a session was blocked by the `ACK` signal.

  (Bug#44058)

  See also Bug#40935.

- **Replication**: Replicating `TEXT` or `VARCHAR` columns declared as `NULL` on the master but `NOT NULL` on the slave caused the slave to crash. (Bug#43789)

  See also Bug#38850, Bug#43783, Bug#43785.

- **Replication**: Executing the sequence of statements `RESET SLAVE`, `RESET MASTER`, and `FLUSH LOGS`, when binary log or relay log files listed in the index file could not be found, could cause the server to crash. This could happen, for example, when these files had been moved or deleted manually. (Bug#41902)

- **Replication**: MySQL creates binary logs in a numbered sequence, with a maximum possible 4294967295 concurrent log files, 4294967295 being the maximum value for an unsigned long integer. However, binary log file extensions were turned into negative numbers once the variable used to hold the value reached the maximum value for a signed long integer (2147483647). Consequently, when the sequence value was incremented to the next (negative) number, this caused MySQL to try to create the file using a `.000000` extension, causing the server to fail since this file already existed.

  Negative file extensions are now disallowed, and an error is returned when the limit is reached. In addition, `FLUSH LOGS` now also reports warnings to the user, if the extension number has reached the limit, and warnings are printed to the error log when the limit is approaching. (Bug#40611)

- **Replication**: Updating a table having no primary key, using an unindexed CHAR column as the key, caused row-based replication to fail. (Bug#40045)

- **Replication**: The `--slave-skip-errors` option had no effect when using row-based logging format. (Bug#39393)

- **Replication**: Issuing concurrent `STOP SLAVE`, `START SLAVE`, and `RESET SLAVE` statements using different connections caused the replication slave to crash. (Bug#38716)

  See also Bug#38715, Bug#44312.

- **Replication**: The following erors were not correctly reported:

  - Failures during slave thread initialization

  - Failures while initializing the relay log position (immediately following the starting of the slave thread)

  - Failures while processing queries passed through the `--init_slave` option.

  Information about these types of failures can now be found in the output of `SHOW SLAVE STATUS`. (Bug#38197)

- **Replication**: Killing the thread executing a DDL statement, after it had finished its execution but before it had written the binlog event, caused the error code in the binlog event to be set (incorrectly) to `ER_SERVER_SHUTDOWN` or `ER_QUERY_INTERRUPTED`, which caused replication to fail. (Bug#37145)

  See also Bug#27571, Bug#22725.

- **Replication**: Column alises used inside subqueries were ignored in the binary log. (Bug#35515)

- For settings of `lower_case_table_names` greater than 0, some queries for `INFORMATION_SCHEMA` tables left entries with incorrect lettercase in the table definition cache. (Bug#44738)
- Valgrind warnings for the `DECODE()`, `ENCRYPT()`, and `FIND_IN_SET()` functions were corrected. (Bug#44358, Bug#44365, Bug#44367)
- On Windows, entries for `build-vs9.bat` and `build-vs9_x64.bat` were missing in `win/Makefile.am`. (Bug#44353)
- Not all lock types had proper descriptive strings, resulting in garbage output from `mysqladmin debug`. (Bug#44164)
- Use of `HANDLER` statements with `INFORMATION_SCHEMA` tables caused a server crash. Now `HANDLER` is prohibited with such tables. (Bug#44151)
- On Windows, if the `mysql` client was reading input from a pipe, it could crash attempting to read after EOF. (Bug#44133)
- Invoking `SHOW TABLE STATUS` from within a stored procedure could cause a `Packets out of order` error. (Bug#43962)
- `myisamchk` could display a negative `Max keyfile length` value. (Bug#43950)
- On 64-bit systems, a `key_buffer_size` value larger than 4GB could couse `MyISAM` index corruption. (Bug#43932)
- `mysqld_multi` incorrectly passed `--no-defaults` to `mysqld_safe`. (Bug#43876)
- `SHOW VARIABLES` did not properly display the value of `slave_skip_errors`. (Bug#43835)
- On Windows, a server crash occurred for attempts to insert a floating-point value into a `CHAR` column with a maximum length less than the converted floating-point value length. (Bug#43833)
- Incorrect initialization of `MyISAM` table indexes could cause incorrect query results. (Bug#43737)
- `libmysqld` crashed when it was reinitialized. (Bug#43706, Bug#44091)
- `UNION` of floating-point numbers did unnecessary rounding. (Bug#43432)
- `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed when the database contained views. (Bug#43385)
- Certain statements might open a table and then wait for an impending global read lock without noticing whether they hold a table being waiting for by the global read lock, causing a hang. Affected statements are `SELECT ... FOR UPDATE`, `LOCK TABLES ... WRITE`, `TRUNCATE TABLE`, and `LOAD DATA INFILE`. (Bug#43230)
- Using an XML function such as `ExtractValue()` more than once in a single query could produce erroneous results. (Bug#43183)

  See also Bug#43937.
- `DROP DATABASE` did not clear the message list. (Bug#43138)
- Full-text prefix searches could hang the connection and cause 100% CPU consumption. (Bug#42907)
- Comparison of `TIME` values could lose the sign of operands. (Bug#42664)
- `MAKETIME()` could lose the sign of negative arguments. (Bug#42662)
- `SEC_TO_TIME()` could lose the sign of negative arguments. (Bug#42661)
- `InnoDB` had excessive contention for a character set mutex. (Bug#42649)
- Incorrect elevation of warning messages to error messages for unsafe statements caused a server crash. (Bug#42640)
- `CHECK TABLE` suggested use of `REPAIR TABLE` for corrupt tables for storage engines not supported by `REPAIR TABLE`. Now `CHECK TABLE` suggests that the user dump and reload the table. (Bug#42563)
- The `InnoDB` `btr_search_drop_page_hash_when_freed()` function had a race condition. (Bug#42279)
- There was a race condition when changing `innodb_commit_concurrency` at runtime from zero to nonzero or from nonzero to zero. Now this variable cannot be changed at runtime from zero to nonzero or vice versa. The value can still be changed from one nonzero value to another. (Bug#42101)
- The state of a thread for the embedded server was always displayed as `Writing to net`, which is incorrect because there is no network connection for the embedded server. (Bug#41971)

- Compressing a table with the `myisampack` utility caused the server to produce Valgrind warnings when it opened the table. (Bug#41541)
- For a `MyISAM` table with `DELAY_KEY_WRITE` enabled, the index file could be corrupted without the table being marked as crashed if the server was killed. (Bug#41330)
- Killing an `INSERT ... SELECT` statement for a `MyISAM` table could cause table corruption if the table had indexes. (Bug#40827)
- `mysqld_safe` did not treat dashes and underscores as equivalent in option names. (Bug#40368)
- If a transaction was implicitly committed by a `START TRANSACTION` or `BEGIN` statement, metadata locks held by the transaction incorrectly could be released before the commit actually occurred. (Bug#40188)
- A multiple-table `DELETE IGNORE` statement involving a foreign key constraint caused an assertion failure. (Bug#40127)
- Multiple-table `UPDATE` statements did not properly activate triggers. (Bug#39953)
- The `mysql_setpermission` operation for removing database privileges removed global privileges instead. (Bug#39852)
- A stored routine contain a C-style comment could not be dumped and reloaded. (Bug#39559)
- In an `UPDATE` or `DELETE` via a secondary index, `InnoDB` did not store the cursor position. This made `InnoDB` crash in semi-consistent read while attempting to unlock a non-matching record. (Bug#39320)
- The functions listed in Section 11.13.4.2.3, “Creating Geometry Values Using MySQL-Specific Functions”, previously accepted WKB arguments and returned WKB values. They now accept WKB or geometry arguments and return geometry values.

  The functions listed in Section 11.13.4.2.2, “Creating Geometry Values Using WKB Functions”, previously accepted WKB arguments and returned geometry values. They now accept WKB or geometry arguments and return geometry values. (Bug#38990)
- On WIndows, running the server with `myisam_use_mmap` enabled caused `MyISAM` table corruption. (Bug#38848)
- `mysqlbinlog` had a memory leak in its option-processing code. (Bug#38468)
- Setting the `general_log_file` or `slow_query_log_file` system variable to a non-constant expression caused the variable to become unset. (Bug#38124)
- `CHECK TABLE` did not properly check whether `MyISAM` tables created by servers from MySQL 4.0 or older needed to be upgraded. This could cause problems upgrading to MySQL 5.1 or higher. (Bug#37631)
- `mysql_install_db` failed if run as `root` and the root directory (`/`) was not writable. (Bug#36462)
- An `UPDATE` statement that updated a column using the same `DES_ENCRYPT()` value for each row actually updated different rows with different values. (Bug#35087)
- Inserting the result of `CONCAT()` invoked with a `utf32` string and a number for arguments caused a server crash. (Bug#34021)
- For shared-memory connections, the read and write methods did not properly handle asynchronous close events, which could lead to the client locking up waiting for a server response. For example, a call to `mysql_real_query()` would block forever on the client side if the executed statement was aborted on the server side. Thanks to Armin Schöffmann for the bug report and patch. (Bug#33899)
- The following statements generated an incorrect and confusing error message when used with `ENGINE=MyISAM`:
  - `CREATE TABLESPACE`
  - `ALTER TABLESPACE`
  - `DROP TABLESPACE`
  - `CREATE LOGFILE GROUP`
  - `ALTER LOGFILE GROUP`
  - `DROP LOGFILE GROUP`

  Such statements now fail with Error 1478, `TABLE STORAGE ENGINE 'MyISAM' DOES NOT SUPPORT THE CREATE OPTION 'TABLESPACE OR LOGFILE GROUP'`. (Bug#31293)

- `myisamchk` and `myisampack` were not being linked with the library that enabled support for `*` filename pattern expansion. (Bug#29248)
- `COMMIT` did not delete savepoints if there were no changes in the transaction. (Bug#26288)
- Several memory allocation functions were not being checked for out-of-memory return values. (Bug#25058)
- Previously, the server handled character data types for a routine parameter, local routine variable created with `DECLARE`, or function return value as follows: If there was no `CHARACTER SET` attribute, the database character set and its default collation were used. If the `CHARACTER SET` attribute was present, the `COLLATE` attribute was not supported, so the character set's default collation was used. (This includes use of `BINARY`, because in this context `BINARY` specifies the binary collation of the character set.)

  Now for character data types, if there is a `CHARACTER SET` attribute in the declaration, the specified character set and its default collation is used. If the `COLLATE` is also present, that collation is used rather than the default collation. If there is no `CHARACTER SET` attribute, the database character set and collation in effect at routine creation time are used. (The database character set and collation are given by the value of the `character_set_database` and `collation_database` system variables.) (Bug#24690)
- Several data-modification statements were not being counted toward the `MAX_UPDATES_PER_HOUR` user resource limit. (Bug#21793)

C.1.2. Changes in MySQL 6.0.11 (11 May 2009)

Functionality added or changed:

- **Incompatible Change**: The `optimizer_switch` system variable controls optimizations that can be switched on and off. The syntax for flags in its value has changed from `'no_opt_name'` to `'opt_name={on|off|default}'`. For information about the new syntax, see Section 7.2.22, “Using `optimizer_switch` to Control the Optimizer”.
- **Replication**: The global server variables `sync_master_info` and `sync_relay_log_info` are introduced for use on replication slaves to control synchronization of, respectively, the `master.info` and `relay.info` files.

  In each case, setting the variable to a nonzero integer value *`N`* causes the slave to synchonize the corresponding file to disk after every *`N`* events. Setting its value to 0 allows the operation system to handle syncronization of the file instead.

  The actions of these variables, when enabled, are analogous to how the `sync_binlog` variable works with regard to binary logs on a replication master.

  These variables can also be set in `my.cnf`, or by using the server options `--sync-master-info` and `--sync-relay-log-info` respectively.

  An additional system variable `relay_log_recovery` is also now available. When enabled, this variable causes a replication slave to discard relay log files obtained from the replication master following a crash.

  This variable can also be set in `my.cnf`, or by using the `--relay-log-recovery` server option.

  This fix improves and expands upon one made in MySQL 6.0.10 which introduced the `sync_relay_log` variable. For more information about all of the server system variables introduced by these fixes, see Section 16.1.3.3, “Replication Slave Options and Variables”. (Bug#31665, Bug#35542, Bug#40337)
- `mysql-test-run.pl` now supports an `--experimental=file_name` option. It enables you to specify a file that contains a list of test cases that should be displayed with the `[ exp-fail ]` code rather than `[ fail ]` if they fail. (Bug#42888)
- The MD5 algorithm now uses the Xfree implementation. (Bug#42434)
- The `RESTORE` statement now has a `SKIP_GAP_EVENT` option that causes the restore operation not to write the gap event to the binary log that causes any replication slaves to stop replication. This is useful when `RESTORE` is run on a master server and the backup image does not contain databases that are replicated to the slaves. (Bug#39780)
- Previously, the `--secure-file-priv` option and `secure_file_priv` system variable, if set to a directory, limited `BACKUP DATABASE` and `RESTORE` operations to files in the given directory. Now the `--secure-backup-file-priv` option and `secure_backup_file_priv` system variable apply instead. (Bug#39581)
- The query cache now checks whether a `SELECT` statement begins with `SQL_NO_CACHE` to determine whether it can skip checking for the query result in the query cache. This is not supported when `SQL_NO_CACHE` occurs within a comment. (Bug#37416)

- A new program, `mysqlbackup`, displays information from backups created with the `BACKUP DATABASE` statement.
- MySQL now implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See Section 12.8.8, “`SIGNAL` and `RESIGNAL`”.

Bugs fixed:

- **Incompatible Change**: For system variables that take values of `ON` or `OFF`, `OF` was accepted as a legal variable. Now system variables that take “enumeration” values must be assigned the full value. This affects some other variables that previously could be assigned using unambiguous prefixes of allowable values, such as `tx_isolation`. (Bug#34828)
- **Incompatible Change**: If a data definition language (DDL) statement occurred for a table that was being used by another session in an active transaction, statements could be written to the binary log in the wrong order. For example, this could happen if `DROP TABLE` occurred for a table being used in a transaction. This is now prevented by deferring release of metadata locks on tables used within a transaction until the transaction ends.

  This bug fix results in some incompatibilities with previous versions:

  - A table that is being used by a transaction within one session cannot be used in DDL statements by other sessions until the transaction ends.
  - `FLUSH TABLES WITH READ LOCK` blocks for active transactions that hold metadata locks until those transactions end. The same is true for attempts to set the global value of the `read_only` system variable.

  (Bug#989)
- **Important Change**: **Replication**: `CHANGE MASTER TO ... MASTER_HOST=''` — explicitly setting `MASTER_HOST` equal to an empty string — created a `master.info` file with an empty `host` field. This led to a `THE SERVER IS NOT CONFIGURED AS SLAVE` error when attempting to execute a `START SLAVE` statement. Now, if `MASTER_HOST` is set to an empty string, the `CHANGE MASTER TO` statement fails with an error. (Bug#28796)
- **Replication**: **Important Note**: Binary logging with `--binlog_format=ROW` failed when a change to be logged included more than 251 columns. This issue was not known to occur with mixed-format or statement-based logging. (Bug#42977)

  See also Bug#42914.
- **Replication**: The `SHOW SLAVE STATUS` connection thread competed with the slave SQL thread for use of the error message buffer. As a result, the connection thread sometimes received incomplete messages. This issue was uncovered with `valgrind` when message strings were passed without `NULL` terminators, causing the error `CONDITIONAL JUMP OR MOVE DEPENDS ON UNINITIALISED VALUE(S)`. (Bug#43076)
- **Replication**: This fix handles 2 issues encountered on replication slaves during startup:

  1. A failure while allocating the master info structure caused the slave to crash.
  2. A failure during recovery caused the relay log file not to be properly initialized which led to a crash on the slave.

  (Bug#43075)
- **Replication**: Assigning an invalid directory for the `--slave-load-tmpdir` caused the replication slave to crash. (Bug#42861)
- **Replication**: The `mysql.procs_priv` system table was not replicated. (Bug#42217)
- **Replication**: When `--binlog_format` was set to `STATEMENT`, a statement unsafe for statement-based logging caused an error or warning to be issued even if `sql_log_bin` was set to 0. (Bug#41980)
- **Replication**: An `INSERT DELAYED` into a `TIMESTAMP` column issued concurrently with an insert on the same column not using `DELAYED`, but applied after the other insert, was logged using the same timestamp as generated by the other (non-`DELAYED`) insert. (Bug#41719)
- **Replication**: When using `MIXED` replication format and temporary tables were created in statement-based mode, but a later operation in the same session caused a switch to row-based mode, the temporary tables were not dropped on the slave at the end of the session. (Bug#40013)

  See also Bug#43046.

  This regression was introduced by Bug#20499.

- **Replication**: When using the `MIXED` replication format, `UPDATE` and `DELETE` statements that searched for rows where part of the key had nullable `BIT` columns failed. This occurred because operations that inserted the data were replicated as statements, but `UPDATE` and `DELETE` statements affecting the same data were replicated using row-based format.

  This issue did not occur when using statement-based replication (only) or row-based replication (only). (Bug#39753)

  See also Bug#39648.

- **Replication**: The `MIXED` binary logging format did not switch to row-based mode for statements containing the `LOAD_FILE()` function. (Bug#39701)

- **Replication**: The server SQL mode in effect when a stored procedure was created was not retained in the binary log. This could cause a `CREATE PROCEDURE` statement that succeeded on the master to fail on the slave.

  This issue was first noticed when a stored procedure was created when `ANSI_QUOTES` was in effect on the master, but could possibly cause failed `CREATE PROCEDURE` statements and other problems on the slave when using other server SQL modes as well. (Bug#39526)

- **Replication**: If `--secure-file-priv` was set on the slave, it was unable to execute `LOAD DATA INFILE` statements sent from the master when using mixed-format or statement-based replication.

  As a result of this fix, this security restriction is now ignored on the slave in such cases; instead the slave checks whether the files were created and should be read by the slave in its `--slave-load-tmpdir`. (Bug#38174)

- **Replication**: When using row-based format, replication failed with the error `COULD NOT EXECUTE WRITE_ROWS EVENT ON TABLE ...; FIELD '...' DOESN'T HAVE A DEFAULT VALUE` when an `INSERT` was made on the master without specifying a value for a column having no default, even if strict server SQL mode was not in use and the statement would otherwise have succeeded on the master. Now the SQL mode is checked, and the statement is replicated unless strict mode is in effect. For more information, see Section 5.1.7, “Server SQL Modes”. (Bug#38173)

  See also Bug#38262, Bug#43992.

- **Replication**: Server IDs greater than 2147483647 ($2^{32} - 1$) were represented by negative numbers in the binary log. (Bug#37313)

- **Replication**: The value of `Slave_IO_running` in the output of `SHOW SLAVE STATUS` did not distinguish between all 3 possible states of the slave I/O thread (not running; running but not connected; connected). Now the value `Connecting` (rather than `No`) is shown when the slave I/O thread is running but the slave is not connected to a replication master.

  The server system variable `Slave_running` also reflects this change, and is now consistent with what is shown for `Slave_IO_running`. (Bug#30703, Bug#41613)

- **Replication**: Queries which were written to the slow query log on the master were not written to the slow query log on the slave. (Bug#23300)

- **Replication**: When the server SQL mode included `IGNORE_SPACE`, statement-based replication of `LOAD DATA INFILE ... INTO tbl_name` failed because the statement was read incorrectly from the binary log; a trailing space was omitted, causing the statement to fail with a syntax error when run on the slave. (Bug#22504)

  See also Bug#43746.

- **Replication**: When its disk becomes full, a replication slave may wait while writing the binary log, relay log or `MyISAM` tables, continuing after space has been made available. The error message provided in such cases was not clear about the frequency with which checking for free space is done (once every 60 seconds), and how long the server waits after space has been freed before continuing (also 60 seconds); this caused users to think that the server had hung.

  These issues have been addressed by making the error message clearer, and dividing it into two separate messages:

  1. The error message `DISK IS FULL WRITING 'FILENAME' (ERRCODE: ERROR_CODE). WAITING FOR SOMEONE TO FREE SPACE... (EXPECT UP TO 60 SECS DELAY FOR SERVER TO CONTINUE AFTER FREEING DISK SPACE)` is printed only once.

  2. The warning `RETRY IN 60 SECS, MESSAGE REPRINTED IN 600 SECS` is printed once every for every 10 times that the check for free space is made; that is, the check is performed once each 60 seconds, but the reminder that space needs to be freed is printed only once every 10 minutes (600 seconds).

  (Bug#22082)

- Memory corruption of join buffers could occur when using the Batched Key Access algorithm with incremental join buffers to execute join operations for a query over several tables that selects `BLOB` values. (Bug#44250)

- The server could crash at startup when initializing plugins listed in the plugin table. (Bug#44137)
- A `RESTORE` operation that restored a `MyISAM` table using the native `MyISAM` restore driver could cause the `MyISAM` key cache to be disabled. (Bug#44068)
- In some cases, when the Batched Key Access algorithm is used with `join_cache_level` equal to 6, multi-join queries could return incorrect results. (Bug#44019)
- `valgrind` would report errors for the `StorageInterface`, `StorageHAndler` and `CmdGen` portions of `Falcon`. (Bug#43995)
- On 64-bit debug builds, code in `safemalloc` resulted in errors due to use of a 32-bit value for 64-bit allocations. (Bug#43885)
- When performing a high number of concurrent index updates on a `Falcon` table, `mysqld` could crash due to an assertion. (Bug#43765)
- An attempt by a user who did not have the `SUPER` privilege to kill a system thread could cause a server crash. (Bug#43748)
- On Windows, incorrectly specified link dependencies in `CMakeLists.txt` resulted in link errors for `mysql_embedded`, `mysqltest_embedded`, and `mysql_client_test_embedded`. (Bug#43715)
- `make distcheck` failed to properly handle subdirectories of `storage/ndb`. (Bug#43614)
- Incorrect use of parser information could lead to acquisition of incorrect lock types. (Bug#43568)
- Upgrading MySQL to 6.0.10 from 6.0.9 when using `Falcon` tables and the `mysql_upgrade` tool would cause `mysqld` to crash during start up. (Bug#43562)
- Running a `SELECT` using a range query on `FLOAT` on a `Maria` table could return invalid result sets. (Bug#43552)
- Running a `SELECT` using a range query on with `<>` or `<` with a negative values on a `Maria` table could return invalid result sets. (Bug#43530)
- Running a `SELECT` on a multi-range query with a `LIMIT` clause on a `Maria` table could return invalid result sets. (Bug#43527)
- Executing a `LIMIT ... FOR UPDATE` statement on a `Falcon` table when using transactions with concurrent threads could cause a crash because the record information cannot be accessed correctly. (Bug#43488)
- When performing `SELECT` statements on a `Falcon` table using an indexed `INTEGER` column could return incorrect row matches. (Bug#43452)
- `RESTORE` on a case-insensitive server failed if the backup image contained databases or tables with uppercase names. Now, `RESTORE` handles this case by converting the names to lowercase in the restore catalog, as long as there are no duplicate names after the conversion. (Bug#43363)
- Use of `USE INDEX` hints could cause `EXPLAIN EXTENDED` to crash. (Bug#43354)
- `BACKUP DATABASE` stored incorrect table counts in the backup image. (Bug#43324)
- Assigning a value to the `backupdir` system variable resulted in Valgrind errors. (Bug#43303)
- `mysql` crashed if a request for the current database name returned an empty result, such as after the client has executed a preceding `SET sql_select_limit=0` statement. (Bug#43254)
- If the value of the `version_comment` system variable was too long, the `mysql` client displayed a truncated startup message. (Bug#43153)
- Compilation failures on Windows Vista using Visual Studio 2008 Professional were corrected. (Bug#43120)
- Recovering a `Falcon` table from a failure when the table contains `BLOB` columns could cause an assertion failure. (Bug#43106)
- On 32-bit Windows, `mysqld` could not use large buffers due to a 2GB user mode address limit. (Bug#43082)
- `mysqld` would crash when using `Falcon` tables during shutdown if the server was running in embedded mode. (Bug#43048)
- The MySQL Backup library had incorrect logic and error reporting for metadata saving. (Bug#42959)
- Queries of the following form returned an empty result:

```
SELECT ... WHERE ... (col=col AND col=col) OR ... (false expression)
```

(Bug#42957)

- A two-way join query with a `GROUP BY` or `ORDER BY` clause could produce incorrect results when rows of the first table are accessed by an index compatible with the `GROUP BY` or `ORDER BY` list while the second table is joined using the Batched Key Access algorithm. (Bug#42955)
- The `strings/CHARSET_INFO.txt` file was not included in source distributions. (Bug#42937)
- When running `REPAIR` on a crashed `Falcon` table can crash `mysqld` if pages have been incorrectly marked dirty, but not locked, during write. (Bug#42824)
- `stderr` should be unbuffered, but when the server redirected `stderr` to a file, it became buffered. (Bug#42790)
- The `DATA_TYPE` column of the `INFORMATION_SCHEMA.COLUMNS` table displayed the `UNSIGNED` attribute for floating-point data types. (The column should contain only the data type name.) (Bug#42758)
- Recovery of `Falcon` tables while there were active transaction during the crash may fail to recover completely. (Bug#42743)
- Use of semijoin optimization could cause a server crash. (Bug#42740)
- When `Falcon` is populating the `INFORMATION_SCHEMA.TABLESPACES` table, an exception can be raised because required result set has been closed before the resultset has been completed. This can happen during a `BACKUP` operation. (Bug#42725, Bug#42830)
- Assigning a value to the `backupdir` system variable resulted in a memory leak. (Bug#42695)
- Assigning an incorrect value to the `backup_progress_log_file` system variable resulted in Valgrind errors. (Bug#42685)
- When performing `SELECT` queries on tables containing `TIMESTAMP` or `DATETIME` colums with indexes using a `WHERE` clause comparing the field value to `NULL` using the `<=` or `<>` operators, the wrong information would be returned. (Bug#42683, Bug#43623, Bug#43620, Bug#42681)
- A dangling pointer in `mysys/my_error.c` could lead to client crashes. (Bug#42675)
- `mysqldump` included views that were excluded with the `--ignore-table` option. (Bug#42635)
- An earlier bug fix resulted in the problem that the `InnoDB` plugin could not be used with a server that was compiled with the built-in `InnoDB`. To handle this two changes were made:

  - The server now supports an `--ignore-builtin-innodb` option that causes the server to behave as if the built-in `InnoDB` is not present. This option causes other `InnoDB` options not to be recognized.
  - For the `INSTALL PLUGIN` statement, the server reads option (`my.cnf`) files just as during server startup. This enables the plugin to pick up any relevant options from those files. Consequently, a plugin no longer is started with each option set to its default value.

    Because of this change, it is possible to add plugin options to an option file even before loading a plugin (if the `loose` prefix is used). It is also possible to uninstall a plugin, edit `my.cnf`, and install the plugin again. Restarting the plugin this way enables it to the new option values without a server restart.

  > **Note**
  >
  > `InnoDB` Plugin versions 1.0.4 and higher will take advantage of this bug fix. Although the `InnoDB` Plugin is source code compatible with multiple MySQL releases, a given binary `InnoDB` Plugin can be used only with a specific MySQL release. When `InnoDB` Plugin 1.0.4 is released, it is expected to be compiled for MySQL 5.1.34. For 5.1.33, you can use `InnoDB` Plugin 1.0.3, but you must build from source.

  (Bug#42610)

  This regression was introduced by Bug#29263.
- With the `ONLY_FULL_GROUP_BY` SQL mode enabled, some legal queries failed. (Bug#42567)
- Recovery of a `Falcon` table with a large number of rows can cause a failure in the page type written for the internal `FALCON_USER` and `FALCON_TEMPORARY` tablespaces. (Bug#42560)
- Passing an unknown time zone specification to `CONVERT_TZ()` resulted in a memory leak. (Bug#42502)

- Tables could enter open table cache for a thread without being properly cleaned up, leading to a server crash. (Bug#42419)
- Previously, `RESTORE` would crash if the backup image contained tables originally stored in a tablespace that no longer existed at `RESTORE` time. Now the tablespace is recreated like it was at `BACKUP DATABASE` time if it does not exist when `RESTORE` is executed. (Bug#42402)
- If the server was started with `--thread_handling=pool-of-threads`, the `MAX_QUERIES_PER_HOUR` user resource limit. (Bug#42384)
- Recovery of `Falcon` tables with indexes can fail because the index page information has not been recorded properly. (Bug#42344)
- Using a `LIKE` clause on a `Maria` table using an index and the `CP1251` collation would return invalid data. (Bug#42299)
- Running a `SELECT` using a `JOIN` on a `Maria` table could return invalid result sets. (Bug#42298)
- Running multi-range queries on `Maria` tables could cause a crash. (Bug#42297)
- Using a `falcon-scavenge-schedule` of `* * * * *` would cause `Falcon` to never execute the required threads to operate. (Bug#42275)
- If the server was started with an option that had a missing or invalid value, a subsequent error that would cause normally the server to shut down could cause it to crash instead. (Bug#42244)
- Using `ORDER BY` and or `LIMIT` on `Falcon` tables could give inconsistent results for rows that contain `NULL` columns in the corresponding `ORDER BY` clause. (Bug#42208)
- For `InnoDB` tables, there was a race condition for `ALTER TABLE`, `OPTIMIZE TABLE`, `CREATE INDEX`, and `DROP INDEX` operations when periodically checking whether table copying can be committed. (Bug#42152)
- In `InnoDB` recovery after a server crash, table lookup could fail and corrupt the data dictionary cache. (Bug#42075)
- `mysqldumpslow` parsed the `--debug` and `--verbose` options incorrectly. (Bug#42027)
- `BACKUP DATABASE` and `RESTORE` did not implement backup and restore of privileges for stored procedures and stored functions. (Bug#41979)
- Recovering a `Falcon` table that uses `BLOB` columns could cause unbounded tablespace growth before recovery completes. (Bug#41840)
- Recovery of `Falcon` tables could fail with an indicating that a `wrong page type` was identified in the `Falcon` serial log. (Bug#41837, Bug#42745, Bug#44114)
- `RESTORE` crashed for `Falcon` tables. (Bug#41722)
- With more than two arguments, `LEAST()`, `GREATEST()`, and `CASE` could unnecessarily return `Illegal mix of collations` errors. (Bug#41627)
- Queries that used the loose index scan access method could return no rows. (Bug#41610)
- `RESTORE` failed if it tried to restore a privilege for a non-existent object. (Bug#41578)
- In `InnoDB` recovery after a server crash, rollback of a transaction that updated a column from `NULL` to `NULL` could cause another crash. (Bug#41571)
- The `mysql` client could misinterpret its input if a line was longer than an internal buffer. (Bug#41486)
- The error message for a too-long column comment was `Unknown error` rather than a more appropriate message. (Bug#41465)
- The `Falcon` CycleManager has been updated, which addresses a number of issues when examining records in various transaction states and their visisbility/isolation in relation to other threads. (Bug#41391, Bug#41478, Bug#41742, Bug#41850, Bug#42459, Bug#41661, Bug#42185, Bug#43146, Bug#43298, Bug#43299, Bug#34624, Bug#42189)
- Use of `SELECT *` allowed users with rights to only some columns of a view to access all columns. (Bug#41354)
- If the tables underlying a `MERGE` table had a primary key but the `MERGE` table itself did not, inserting a duplicate row into the `MERGE` table caused a server crash. (Bug#41305)
- In the `help` command output displayed by `mysql`, the description for the `\c` (`clear`) command was misleading. (Bug#41268)

- Several resource leaks were corrected in the error-handling code for the MySQL Backup library. (Bug#41250, Bug#41294)
- The server did not robustly handle problems hang if a table opened with `HANDLER` needed to be re-opened because it had been altered to use a different storage engine that does not support `HANDLER`. The server also failed to set an error if the re-open attempt failed. These problems could cause the server to crash or hang. (Bug#41110, Bug#41112)
- `SELECT` statements executed concurrently with `INSERT` statements for a `MyISAM` table could cause incorrect results to be returned from the query cache. (Bug#41098)
- For prepared statements, multibyte character sets were not taking into account when calculating `max_length` for string values and `mysql_stmt_fetch()` could return truncated strings. (Bug#41078)
- For user-defined variables in a query result, incorrect length values were returned in the result metadata. (Bug#41030)
- Using `RESTORE` to restore a database through a named pipe resulted in corrupt data. (Bug#40975)
- Performing `SELECT` operations on `Falcon` tables using the maximum `BIG INT` value would fail to return matching rows. (Bug#40950)
- For some queries, an equality propagation problem could cause `a = b` and `b = a` to be handled differently. (Bug#40925)
- With strict SQL mode enabled, setting a system variable to an out-of-bounds value caused an assertion failure. (Bug#40657)
- Table temporary scans were slower than necessary due to use of mmap rather than caching, even with the `myisam_use_mmap` system variable disabled. (Bug#40634)
- Indexes on `Falcon` tables using numeric columns could return incorrect information. (Bug#40607, Bug#41582, Bug#40950)
- The `load_defaults()`, `my_search_option_files()` and `my_print_default_files()` functions in the C client library were subject to a race condition in multi-threaded operation. (Bug#40552)
- For a view that references a table in another database, `mysqldump` wrote the view name qualified with the current database name. This makes it impossible to reload the dump file into a different database. (Bug#40345)
- On platforms where long and pointer variables have different sizes, `MyISAM` could copy key statistics incorrectly, resulting in a server crash or incorrect cardinality values. (Bug#40321)
- `Falcon` could cause an assertion when the system has run out of memory and tries to report the memory allocation failure. (Bug#40155)
- `DELETE` tried to acquire write (not read) locks for tables accessed within a subquery of the `WHERE` clause. (Bug#39843)
- `mysql_upgrade` did not remove the `online_backup` and `online_backup_progress` tables from the `mysql` database. (These are what the `backup_history` and `backup_progress` tables were called previously.) (Bug#39655)
- With row-based binary logging, replication of `InnoDB` tables containing `NULL`-valued `BIT` columns could fail. (Bug#39648)
- When using `Falcon` and the system runs out of all memory and swap space, `mysqld` could hang while attempting to write an error message. (Bug#39552)
- The `mysql_stmt_close()` C API function did not flush all pending data associated with the prepared statement. (Bug#39519)
- Updating `Falcon` tables after an online `ALTER ADD COLUMN` operation could fail. (Bug#39445)
- Following `ALTER TABLE ... DISCARD TABLESPACE` for an `InnoDB` table, an attempt to determine the free space for the table before the `ALTER TABLE` operation had completely finished could cause a server crash. (Bug#39438)
- `perror` did not produce correct output for error codes 153 to 163. (Bug#39370)
- If `--basedir` was specified, `mysqld_safe` did not use it when attempting to locate `my_print_defaults`. (Bug#39326)
- Several functions in `libmysqld` called `exit()` when an error occurred rather than returning an error to the caller. (Bug#39289)
- Performing an online `ALTER TABLE` statement against a `Falcon` table, the Falcon serial log could grow beyond the maximum permitted size for a serial log, ignoring both the rotation and truncation. (Bug#39130)
- Previously, the `num_objects` column in the `backup_history` table showed only the number of tables in the backup image. It now shows the number of objects with names (tablespaces, databases, tables, views, stored programs). (Bug#39109)

- `BACKUP DATABASE` treated the database list in case-sensitive fashion, even on case-insensitive file systems. (Bug#39063)
- The `ALTER ROUTINE` privilege incorrectly allowed `SHOW CREATE TABLE`. (Bug#38347)
- `BACKUP DATABASE` crashed if there was no default database. (Bug#38294)
- Setting a savepoint with the same name as an existing savepoint incorrectly deleted any other savepoints that had been set in the meantime. For example, setting savepoints named `a`, `b`, `c`, `b` resulted in savepoints `a`, `b`, rather than the correct savepoints `a`, `c`, `b`. (Bug#38187)
- Locking of `myisam.log` did not work correctly on Windows. (Bug#38133, Bug#41224)
- `--help` output for `myisamchk` did not list the `--HELP` option. (Bug#38103)
- Setting the session value of the `debug` system variable also set the global value. (Bug#38054)
- Comparisons between row constructors, such as `(a, b) = (c, d)` resulted in unnecessary `Illegal mix of collations` errors for string columns. (Bug#37601)
- A workload consisting of `CREATE TABLE ... SELECT` and DML operations could cause deadlock. (Bug#37433)
- If a user created a view that referenced tables for which the user had disjoint privileges, an assertion failure occurred. (Bug#37191)
- Trying to recover `Falcon` tables after a crash when the corresponding tables and tablespaces have not been created before the crash could cause a recovery failure. (Bug#36993)
- When MySQL was configured with the `--with-max-indexes=128` option, `mysqld` crashed. (Bug#36751)
- The `event`, `general_log`, and `slow_log` tables in the `mysql` database store `server_id` values, but did not use an `UNSIGNED` column and thus were not able to store the full range of ID values. (Bug#36540)
- Setting the `join_buffer_size` variable to its minimum value produced spurious warnings. (Bug#36446)
- The audit plugin was not receiving `MYSQL_AUDIT_GENERAL_ERROR` events. (Bug#36098)
- The use of `NAME_CONST()` can result in a problem for `CREATE TABLE ... SELECT` statements when the source column expressions refer to local variables. Converting these references to `NAME_CONST()` expressions can result in column names that are different on the master and slave servers, or names that are too long to be legal column identifiers. A workaround is to supply aliases for columns that refer to local variables.

  Now a warning is issued in such cases that indicate possible problems. (Bug#35383)
- `SHOW CREATE EVENT` output did not include the `DEFINER` clause. (Bug#35297)
- `mysqld` would crash in a concurrent workload with `INSERT`/`CREATE TABLE`/`DROP TABLE` or `INSERT`/`ALTER TABLE` combinations on `Falcon` tables. (Bug#35255)
- It was not possible to interrupt a long running `BACKUP DATABASE` or `RESTORE` operation. (Bug#35079)
- Several deprecated or obsolete settings were removed from the sample option files. (Bug#34521)
- Searching for `0x00` in `Falcon` tables using the `VARBINARY` column type would fail to return the correct rows. In addition, a crash could be encountered when modifying a column to the `VARBINARY` type. (Bug#34478, Bug#33190, Bug#23692)
- A subquery using `SELECT ... FOR UPDATE` on a `Falcon` table fails to lock table correctly during the `UPDATE`. (Bug#34182)
- With `Falcon` tables running concurrent transactions, some transactions may not be rolled back correctly, leading to an infinite loop. (Bug#34174)
- `INSTALL PLUGIN` and `UNINSTALL PLUGIN` did not handle plugin identifiers consistently with respect to lettercase. (Bug#33731)
- `RESTORE` often would not correctly identify the tablespace into which a `Falcon` table should be restored. (Bug#33569)
- `mysqldump --compatible=mysql40` emitted statements referring to the `character_set_client` system variable, which is unknown before MySQL 4.1. Now the statements are enclosed in version-specific comments. (Bug#33550)
- If `Falcon` runs out of memory while inserting records and you try to alter the affected table, you may get a `record memory is exhausted` error, and the table can no longer be used or accessed. (Bug#33177)

- The DDL blocker for `BACKUP DATABASE` and `RESTORE` did not block all statements that it should. The blocker is now called the Backup Metadata Lock and blocks statements that change database metadata. (Bug#32702)
- Detection by `configure` of several functions such as `setsockopt()`, `bind()`, `sched_yield()`, and `gtty()` could fail. (Bug#31506)
- Use of MBR spatial functions such as `MBRTouches()` with columns of `InnoDB` tables caused a server crash rather than an error. (Bug#31435)
- When an `InnoDB` tablespace filled up, an error was logged to the client, but not to the error log. Also, the error message was misleading and did not indicate the real source of the problem. (Bug#31183)
- The `mysql` client mishandled input parsing if a `delimiter` command was not first on the line. (Bug#31060)
- `SHOW PRIVILEGES` listed the `CREATE ROUTINE` privilege as having a context of `Functions,Procedures`, but it is a database-level privilege. (Bug#30305)
- `CHECK TABLE`, `REPAIR TABLE`, `ANALYZE TABLE`, and `OPTIMIZE TABLE` erroneously reported a table to be corrupt if the table did not exist or the statement was terminated with `KILL`. (Bug#29458)
- For `InnoDB` tables that have their own `.ibd` tablespace file, a superfluous `ibuf cursor restoration fails!` message could be written to the error log. This warning has been suppressed. (Bug#27276)
- Internal `base64_xxx()` functions were renamed to have a prefix of `my_` to avoid conflicts with other libraries. (Bug#26818)
- The `Time` column for `SHOW PROCESSLIST` output and the value of the `TIME` column of the `INFORMATION_SCHEMA.PROCESSLIST` table now can have negative values. Previously, the column was unsigned and negative values were displayed incorrectly as large positive values. Negative values can occur if a thread alters the time into the future with `SET TIMESTAMP = value` or the thread is executing on a slave and processing events from a master that has its clock set ahead of the slave. (Bug#22047)
- Restoring a `mysqldump` dump file containing `FEDERATED` tables failed because the file contained the data for the table. Now only the table definition is dumped (because the data is located elsewhere). (Bug#21360)
- `SHOW CREATE DATABASE` did not account for the value of the `lower_case_table_names` system variable. (Bug#21317)
- Incorrect length metadata could be returned for `LONG TEXT` columns when a multibyte server character set was used. (Bug#19829)
- `ROUND()` sometimes returned different results on different platforms. (Bug#15936)

C.1.3. Changes in MySQL 6.0.10 (03 March 2009)

Functionality added or changed:

- **Important Change**: **Replication**: `RESET MASTER` and `RESET SLAVE` now reset the values shown for `Last_IO_Error`, `Last_IO_Errno`, `Last_SQL_Error`, and `Last_SQL_Errno` in the output of `SHOW SLAVE STATUS`. (Bug#34654)
- **Replication**: A new global server variable `sync_relay_log` is introduced for use on replication slaves. Setting this variable to a nonzero integer value *`N`* causes the slave to synchonize the relay log to disk after every *`N`* events. Setting its value to 0 allows the operation system to handle syncronization of the file. The action of this variable, when enabled, is analogous to how the `sync_binlog` variable works with regard to binary logs on a replication master.

  This variable can also be set in `my.cnf`, or by using the server option `--sync-relay-log`.

  For more information, see Section 16.1.3.3, “Replication Slave Options and Variables”. (Bug#31665, Bug#35542, Bug#40337)
- **Replication**: In circular replication, it was sometimes possible for an event to propagate such that it would be reapplied on all servers. This could occur when the originating server was removed from the replication circle and so could no longer act as the terminator of its own events, as normally happens in circular replication.

  In order to prevent this from occurring, a new `IGNORE_SERVER_IDS` option is introduced for the `CHANGE MASTER TO` statement. This option takes a list of replication server IDs; events having a server ID which appears in this list are ignored and not applied. For more information, see Section 12.6.2.1, “`CHANGE MASTER TO` Syntax”. (Bug#25998)

  See also Bug#27808.
- The `libedit` library was upgraded to version 2.11. (Bug#42433)

- A new status variable, `Queries`, indicates the number of statements executed by the server. This includes statements executed within stored programs, unlike the `Questions` variable which includes only statements sent to the server by clients. (Bug#41131)
- Columns that provide a catalog value in `INFORMATION_SCHEMA` tables (for example, `TABLES.TABLE_CATALOG`) now have a value of `def` rather than `NULL`. (Bug#35427)
- `mysql-test-run.pl` now supports `--client-bindir` and `--client-libdir` options for specifying the directory where client binaries and libraries are located. (Bug#34995)

Bugs fixed:

- **Security Fix**: Using an XPath expression employing a scalar expression as a FilterExpr with `ExtractValue()` or `UpdateXML()` caused the server to crash. Such expressions now cause an error instead. (Bug#42495)
- **Incompatible Change**: The fix for Bug#33699 introduced a change to the `UPDATE` statement such that assigning `NULL` to a `NOT NULL` column caused an error even when strict SQL mode was not enabled. The original behavior before was that such assignments caused an error only in strict SQL mode, and otherwise set the column to the implicit default value for the column data type and generated a warning. (For information about implicit default values, see Section 10.1.4, "Data Type Default Values".)

  The change caused compatibility problems for applications that relied on the original behavior. It also caused replication problems between servers that had the original behavior and those that did not, for applications that assigned `NULL` to `NOT NULL` columns in `UPDATE` statements without strict SQL mode enabled. This change has been reverted so that `UPDATE` again had the original behavior. Problems can still occur if you replicate between servers that have the modified `UPDATE` behavior and those that do not. (Bug#39265)
- **Incompatible Change**: `Falcon` supported case-sensitive tablespace names. The code has been changed so that all tablespace names are converted to uppercase names during creation. Because of this change:

  - It is not possible to drop existing tablespace created by previous versions, if it's name wasn't in upper case.
  - It is not possible to create tables using tablespace created by previous versions, if tablespace name wasn't in upper case.

  (Bug#35257, Bug#33719)
- **Important Change**: **Replication**: If a trigger was defined on an `InnoDB` table and this trigger updated a non-transactional table, changes performed on the `InnoDB` table were replicated and were visible on the slave before they were committed on the master, and were not rolled back on the slave after a successful rollback of those changes on the master.

  As a result of the fix for this issue, the semantics of mixing non-transactional and transactional tables in a transaction in the first statement of a transaction have changed. Previously, if the first statement in a transaction contained non-transactional changes, the statement was written directly to the binary log. Now, any statement appearing after a `BEGIN` (or immediately following a `COMMIT` if `AUTOCOMMIT` = 0) is always considered part of the transaction and cached. This means that non-transactional changes do not propagate to the slave until the transaction is committed and thus written to the binary log.

  See Section 16.3.1.25, "Replication and Transactions", for more information about this change in behavior. (Bug#40116)
- **Important Change**: **Replication**: `MyISAM` transactions replicated to a transactional slave left the slave in an unstable condition. This was due to the fact that, when replicating from a non-transactional storage engine to a transactional engine with `AUTOCOMMIT` turned off, no `BEGIN` and `COMMIT` statements were written to the binary log; thus, on the slave, a never-ending transaction was started.

  The fix for this issue includes enforcing `AUTOCOMMIT` mode on the slave by replicating all `AUTOCOMMIT=1` statements from the master. (Bug#29288)
- **Partitioning**: A comparison with an invalid `DATE` value in a query against a partitioned table could lead to a crash of the MySQL server.

  > **Note**
  >
  > Invalid `DATE` and `DATETIME` values referenced in the `WHERE` clause of a query on a partitioned table are treated as `NULL`. See Section 17.4, "Partition Pruning", for more information.

  (Bug#40972)
- **Partitioning**: A query that timed out when run against a partitioned table failed silently, without providing any warnings or errors, rather than returning `LOCK WAIT TIMEOUT EXCEEDED`. (Bug#40515)

- **Partitioning**: `ALTER TABLE ... REORGANIZE PARTITION` could crash the server when the number of partitions was not changed. (Bug#40389)

  See also Bug#41945.

- **Partitioning**: `ALTER TABLE ... ADD PARTITION` and `ALTER TABLE ... DROP PARTITION` could cause the MySQL server to crash. This was only known to occur on Windows platforms where MySQL had been built with the `EXTRA_DEBUG` option. (Bug#38784)

- **Partitioning**: `SHOW TABLE STATUS` could show a nonzero value for the `Mean record length` of a partitioned `InnoDB` table, even if the table contained no rows. (Bug#36312)

- **Partitioning**: Several error messages relating to partitioned tables were incorrect or missing. (Bug#36001)

- **Partitioning**: Unnecessary calls were made in the server code for performing bulk inserts on partitions for which no inserts needed to be made. (Bug#35845)

  See also Bug#35843.

- **Partitioning**: For partitioned tables with more than ten partitions, a full table scan was used in some cases when only a subset of the partitions were needed. (Bug#33730)

- **Replication**: On Windows, `RESET MASTER` failed in the event of a missing binlog file rather than issuing a warning and completing the rest of the statement. (Bug#42150, Bug#42288)

- **Replication**: Per-table `AUTO_INCREMENT` option values were not replicated correctly for `InnoDB` tables. (Bug#41986)

- **Replication**: Some `log_event` types did not skip the post-header when reading. (Bug#41961)

- **Replication**: Attempting to read a binary log containing an `Incident_log_event` having an invalid incident number could cause the debug server to crash. (Bug#40482)

- **Replication**: When `CHANGE MASTER TO ... SET MASTER_HEARTBEAT_PERIOD ...` failed, no error code was set. (Bug#40459)

- **Replication**: When using row-based replication, an update of a primary key that was rolled back on the master due to a duplicate key error was not rolled back on the slave. (Bug#40221)

- **Replication**: When rotating relay log files, the slave deletes relay log files and then edits the relay log index file. Formerly, if the slave shut down unexpectedly between these two events, the relay log index file could then reference relay logs that no longer existed. Depending on the circumstances, this could when restarting the slave cause either a race condition or the failure of replication. (Bug#38826, Bug#39325)

- **Replication**: `START SLAVE UNTIL` did not work correctly with `--replicate-same-server-id` enabled; when started with this option, the slave did not perform events recorded in the relay log and that originated from a different master.

  Log rotation events are automatically generated and written when rotating the binary log or relay log. Such events for relay logs are usually ignored by the slave SQL thread because they have the same server ID as that of the slave. However, when `--replicate-same-server-id` was enabled, the rotation event for the relay log was treated as if it originated on the master, because the log's name and position were incorrectly updated. This caused the `MASTER_POS_WAIT()` function always to return `NULL` and thus to fail. (Bug#38734, Bug#38934)

- **Replication**: A slave compiled using `--with-libevent` and run with `--thread-handling=pool-of-threads` could sometimes crash. (Bug#36929)

- **Replication**: `TRUNCATE` statements failed to replicate when statement-based binary logging mode was not available. The issue was observed when using `InnoDB` with the transaction isolation level set to `READ UNCOMMITTED` (thus forcing `InnoDB` not to allow statement-based logging). However, the same behavior could be reproduced using any transactional storage engine supporting only row-based logging, regardless of the isolation level. This was due to two separate problems:

  1. An error was printed by `InnoDB` for `TRUNCATE` when using statement-based logging mode where the transaction isolation level was set to `READ COMMITTED` or `READ UNCOMMITTED`, because `InnoDB` permits statement-based replication for DML statements. However, `TRUNCATE` is not transactional; since it is the equivalent of `DROP TABLE` followed by `CREATE TABLE`, it is actually DDL, and should therefore be allowed to be replicated as a statement.

  2. `TRUNCATE` was not logged in mixed mode because of the error just described; however, this error was not reported to the client.

  As a result of this fix, `TRUNCATE` is now treated as DDL for purposes of binary logging and replication; that is, it is always logged as a statement and so no longer causes an error when replicated using a transactional storage engine such as `InnoDB`. (Bug#36763)

See also Bug#42643.

- **Replication**: `mysqlbinlog` replay of `CREATE TEMPORARY TABLE ... LIKE` statements and of `TRUNCATE` statements used on temporary tables failed with Error 1146 (`TABLE ... DOESN'T EXIST`). (Bug#35583)
- **Replication**: `mysqlbinlog` sometimes failed when trying to create temporary files; this was because it ignored the specified temp file directory and tried to use the system `/tmp` directory instead. (Bug#35546)

  See also Bug#35543.
- **Replication**: In statement mode, `mysqlbinlog` failed to issue a `SET @@autommit` statement when the autocommit mode was changed. (Bug#34541)
- **Replication**: `LOAD DATA INFILE` statements did not replicate correctly from a master running MySQL 4.1 to a slave running MySQL 5.1 or later. (Bug#31240)
- **Replication**: The statements `DROP PROCEDURE IF EXISTS` and `DROP FUNCTION IF EXISTS` were not written to the binary log if the procedure or function to be dropped did not exist. (Bug#13684)

  See also Bug#25705.
- The optimizer could underestimate the memory required for column descriptors during join processing and cause memory corruption or a server crash. (Bug#42744)
- A `'%'` character in SQL statements could cause the server to crash. (Bug#42634)
- For the batched-key access method, numbers of records were being specified rather than numbers of ranges. (Bug#42593)
- Certain queries could result in Valgrind warnings in the optimizer. (Bug#42534)
- An optimization introduced for Bug#37553 required an explicit cast to be added for some uses of `TIMEDIFF()` because automatic casting could produce incorrect results. (It was necessary to use `TIME(TIMEDIFF(...))`.) (Bug#42525)
- On the IBM i5 platform, the MySQL configuration process caused the system version of `pthread_setschedprio()` to be used. This function returns `SIGILL` on i5 because it is not supported, causing the server to crash. Now the `my_pthread_setprio()` function in the `mysys` library is used instead. (Bug#42524)
- Performing a `BACKUP` and `RESTORE` on a `Maria` table while an existing workload is in progress could lead to a corrupted table and possible crash. (Bug#42519)
- The default `Falcon` memory parameters have been updated, which should help to improve performance. The new settings for all the memory parameters are as follows:

  - `falcon_record_memory_max` is now 250 MB
  - `falcon_page_cache_size` is now 250 MB
  - `falcon_record_scavenge_threshold` is 90% (of record memory max)
  - `falcon_record_scavenge_floor` is 80% (of scavenge threshold)
  - `falcon_record_chill_threshold` is 5 MB
  - `falcon_index_chill_threshold` is now 4MB

  (Bug#42510, Bug#36442)
- When running `Falcon` during a very high concurrency workload, `mysqld` could fail. (Bug#42475)
- `Falcon` would fail to create a table in a `TABLESPACE` that had not already been opened by a previous operation. (Bug#42414, Bug#42743)
- The recovery of `Falcon` tablespaces could fail because the tablespace information had become corrupt. (Bug#42392)
- The SSL certficates included with MySQL distributions were regenerated because the previous ones had expired. (Bug#42366)
- A deadlocked `Maria` table would incorrectly be marked as crashed. (Bug#42201)
- `INSERT` operations to a `Falcon` table involving `BIT` columns with an index would fail to find the correct rows to update. (Bug#42196)

- User variables within triggers could cause a crash if the `mysql_change_user()` C API function was invoked. (Bug#42188)
- Parsing of the optional microsecond component of `DATETIME` values did not fail gracefully when that component width was larger than the allowed six places. (Bug#42146)
- For `Falcon` tables, range queries using an index prefix were slow when Multi-Range Read index scans were disabled. (Bug#42136, Bug#41890)
- The `ALTER ONLINE TABLE` statement for `Falcon` tables would not include support for add a primary key. (Bug#42099)
- Sequences and auto increment values in `Falcon` tables would not reset, even when a `TRUNCATE TABLE` operation was executed. The behavior has now been updated to reset the values to the original table definition when `TRUNCATE TABLE` is applied. (Bug#42079)
- Dependent subqueries such as the following caused a memory leak proportional to the number of outer rows:

```
SELECT COUNT(*) FROM t1, t2 WHERE t2.b
  IN (SELECT DISTINCT t2.b FROM t2 WHERE t2.b = t1.a);
```

  (Bug#42037)
- Queries executed using a join buffer could return incorrect results. (Bug#42020)
- Some queries using `NAME_CONST(.. COLLATE ...)` led to a server crash due to a failed type cast. (Bug#42014)
- The MAP file was not included in Windows distribution, but is needed by the `InnoDB` plugin. MAP file generation has again been enabled. (Bug#42001)
- The optimizer underestimated the number of field descriptors for the join buffer in some cases. (Bug#41919)
- Internal misconfiguration of the hash table used for the join buffer could cause a server crash. (Bug#41894)
- String reallocation could cause memory overruns. (Bug#41868)
- Queries executed using semi-join materialization could cause a crash if the outer query has a `HAVING` clause. (Bug#41842)
- Running concurrent non-transactional queries on a `Falcon` table could cause a crash. (Bug#41835)
- `mysql_install_db` did not pass some relevant options to `mysqld`. (Bug#41828)
- A Valgrind warning in `open_tables()` was corrected. (Bug#41759)
- A Valgrind warning in `setup_wild()` was corrected. (Bug#41729)
- For `Falcon` tables, concurrent execution of a statement which in the general case should acquire a `TL_READ_NO_INSERT` lock on the table (for example multiple-table update, DML with subqueries, or statements involving new foreign key checks) and a statement that modifies the table might lead to warnings in the error log or even to deadlocks. (Bug#41688, Bug#42069)
- Setting `innodb_locks_unsafe_for_binlog` should be equivalent to setting the transaction isolation level to `READ COMMITTED`. However, if both of those things were done, non-matching semi-consistently read rows were not unlocked when they should have been. (Bug#41671)
- `resolve_stack_dump` was unable to resolve the stack trace format produced by `mysqld` in MySQL 5.1 and up (see Section 21.5.1.5, “Using a Stack Trace”). (Bug#41612)
- In example option files provided in MySQL distributions, the `thread_stack` value was increased from 64K to 128K. (Bug#41577)
- `REPAIR TABLE` crashed for compressed `MyISAM` tables. (Bug#41574)
- The `ALTER TABLESPACE` statement would fail on `Falcon` tablespaces because of incorrect assumption about `TABLESPACE` support for the `Falcon` engine. (Bug#41548)
- When opening a `Falcon TABLESPACE`, the server could crash if the tablespace header could not be read correctly, including if the tablespace had become corrupt or deleted. Now an error will be thrown and reported to the error log. (Bug#41545)
- The optimizer could ignore an error and rollback request during a filesort, causing an assertion failure. (Bug#41543)
- Recovery of `Maria` tables with `BLOB` columns could fail to complete correctly. (Bug#41493)

- `DATE_FORMAT()` could cause a server crash for year-zero dates. (Bug#41470)
- `BACKUP DATABASE` and `RESTORE` did not reset the message list displayed by `SHOW WARNINGS`. (Bug#41468, Bug#41359)
- `SET PASSWORD` caused a server crash if the account name was given as `CURRENT_USER()`. (Bug#41456)
- When substituting system constant functions with a constant result, the server was not expecting `NULL` function return values and could crash. (Bug#41437)
- The `mysql-test/include/UnicodeData.txt` file, if present, was not included in MySQL distributions. (Bug#41436)
- When using `TRUNCATE` on a `Falcon` table, the sequence value for auto increment columns would not be reset correctly. (Bug#41411)
- For a `TIMESTAMP NOT NULL DEFAULT ...` column, storing `NULL` as the return value from some functions caused a "cannot be NULL" error. `NULL` returns now correctly cause the column default value to be stored. (Bug#41370)
- Queries such as `SELECT ... CASE AVG(...) WHEN ...` that used aggregate functions in a `CASE` expression crashed the server. (Bug#41363)
- `INSERT INTO .. SELECT ... FROM` and `CREATE TABLE ... SELECT ... FROM` a TEMPORARY table could inadvertently change the locking type of the temporary table from a write lock to a read lock, causing statement failure. (Bug#41348)
- Recovery of `Falcon` tables after a crash if `falcon_page_size` had been set to 32K and `BLOB` columns were used in the `Falcon` tables. (Bug#41227)
- On Windows, the server could not be started with the `--thread-handling=pool-of-threads` option. (Bug#41218)
- Transactions in `Falcon` tables could be recorded incorrectly, leading other waiting transactions to complete even though the original transaction information had not been successfully made durable. (Bug#41194)
- For a query that is executed using a range access method over an index that matches the ordering and there is an `ORDER BY` clause, `EXPLAIN` showed `Using MRR` even though Multi-Range Read access was not used. (Bug#41136)
- The server cannot execute `INSERT DELAYED` statements when statement-based binary logging is enabled, but the error message displayed only the table name, not the entire statement. (Bug#41121)
- `FULLTEXT` indexes did not work for Unicode columns that used a custom UCA collation. (Bug#41084)
- The `INFORMATION_SCHEMA.SCHEMA_PRIVILEGES` table was limited to 7680 rows. (Bug#41079)
- In debug builds, obsolete debug code could be used to crash the server. (Bug#41041)
- When a storage engine plugin failed to initialize before allocating a slot number, it would acidentally unplug the engine in slot 0. (Bug#41013)
- Some queries that used a "range checked for each record" scan could return incorrect results. (Bug#40974)
- For `BACKUP DATABASE`, errors from the commit blocker were not logged. (Bug#40970)
- Certain `SELECT` queries could fail with a `Duplicate entry` error. (Bug#40953)
- For debug servers, `OPTIMIZE TABLE` on a compressed table caused a server crash. (Bug#40949)
- The Windows installer displayed incorrect product names in some images. (Bug#40845)
- The CSV engine did not parse '\X' characters when they occurred in unquoted fields. (Bug#40814)
- Comparison of empty strings for the `latin2_czech_cs` character set could hang. (Bug#40805)
- The `Falcon` storage engine has been updated to incorporate new code for the built-in scavenger service, which handles the caching of records in memory. This fixes a number of different issues related to the visibility of different records during certain operations and improves the memory usage. The same fix also corrects the behavior where the space allocated for `BLOB` records would not be recovered correctly, causing the size of the `Falcon` table space files to increase with each `BLOB INSERT` or `UPDATE` operation. (Bug#40801, Bug#34893, Bug#36700, Bug#40342, Bug#41831, Bug#41870)
- `IF(..., CAST(longtext_val AS UNSIGNED), signed_val)` as an argument to an aggregate function could cause an assertion failure. (Bug#40761)
- Changing `innodb_thread_concurrency` at runtime could cause errors. (Bug#40760)

- On Windows, starting the server with an invalid value for `innodb_flush_method` caused a crash. (Bug#40757)
- When archive tables were joined on their primary keys, a query returned no result if the optimizer chose to use this index. (Bug#40677)
- MySQL 5.1 crashed with index merge algorithm and merge tables.

  A query in the MyISAM merge table caused a crash if the index merge algorithm was being used. (Bug#40675)
- `SELECT` statements could be blocked by `INSERT DELAYED` statements that were waiting for a lock, even with `low_priority_updates` enabled. (Bug#40536)
- If a `RESTORE` operation was in progress on a master server, slaves were not prohibited from starting replication of the master. (Bug#40434)
- `TRUNCATE TABLE` for an `InnoDB` table did not flush cached queries for the table. (Bug#40386)
- For `InnoDB` tables that used `ROW_FORMAT=REDUNDANT`, storage size of `NULL` columns could be determined incorrectly. (Bug#40369)
- When building `Falcon` as a plugin, the plugin would be installed into the wrong directory and would fail to be located when trying to install the plugin. (Bug#40336)
- “Backup completed” was logged for non-successful `BACKUP DATABASE` operations. “Restore completed” was logged for non-successful `RESTORE` operations. (Bug#40305)
- The internal dependency mechanism for handling records and transactions within `Falcon` has been updated. This fixes a number of issues with transactions and concurrent workloads within `Falcon` tables. (Bug#40274, Bug#36410)
- The query cache stored only partial query results if a statement failed while the results were being sent to the client. This could cause other clients to hang when trying to read the cached result. Now if a statement fails, the result is not cached. (Bug#40264)
- The `':'` character was incorrectly disallowed in table names. (Bug#40104)
- For an `InnoDB` table, `DROP TABLE` or `ALTER TABLE ... DISCARD TABLESPACE` could take a long time or cause a server crash. (Bug#39939)
- Threads were set to the `Table lock` state in such a way that use of this state by other threads to check for a lock wait was subject to a race condition. (Bug#39897)
- When a `MEMORY` table became full, the error generated was returned to the client but was not written to the error log. (Bug#39886)
- For a server started with the `--temp-pool` option on Windows, temporary file creation could fail. This option now is ignored except on Linux systems, which was its original intended scope. (Bug#39750)
- The implementation of the `backup_wait_timeout` system variable was machine dependent and did not work correctly on big-endian machines. (Bug#39749, Bug#40808)
- `ALTER TABLE` on a table with `FULLTEXT` index that used a pluggable `FULLTEXT` parser could cause debug servers to crash. (Bug#39746)
- When performing concurrent `DROP INDEX` and `INSERT` or `UPDATE` operations on a `Falcon` table, an assertion could occur when recovering from a crashed instance. (Bug#39678)
- The server crashed if an integer field in a CSV file did not have delimiting quotes. (Bug#39616)
- `InnoDB` could hang trying to open an adaptive hash index. (Bug#39483)
- Queries with that end with `... WHERE condition ORDER BY index_columns LIMIT N` could produce rows that did not match the `WHERE` clause for certain kinds of conditions and table data distributions. (Bug#39447)
- The internal buffering logic for `BACKUP DATABASE` had a problem that could lead to corrupt backup images. (Bug#39375)
- A bad pointer dereference caused `BACKUP DATABASE` to crash. (Bug#39361)
- `INFORMATION_SCHEMA` access optimizations did not work properly in some cases. (Bug#39270)
- Cardinality for merge tables kept approaching zero in `myrg_attach_children()` because `m_info->rec_per_key_part` was initialized to 0 only when the function was first called. (Bug#39185)

- The expression `ROW(...) IN (SELECT ... FROM DUAL)` always returned `TRUE`. (Bug#39069)
- When the `Falcon` storage engine encountered an I/O error, `mysqld` would crash. Errors now raise an exception, which is reported to the error log and `Falcon` will fail to initialize. (Bug#38970, Bug#41545)
- `SELECT * FROM INFORMATION_SCHEMA.ROUTINES` could fail if there was no default database. (Bug#38916)
- `InnoDB` could fail to generate `AUTO_INCREMENT` values after an `UPDATE` statement for the table. (Bug#38839)
- The greedy optimizer could cause a server crash due to improper handling of nested outer joins. (Bug#38795)
- Use of `COUNT(DISTINCT)` prevented `NULL` testing in the `HAVING` clause. (Bug#38637)
- Building MySQL on FreeBSD would result in a failure during the `gen_lex_hash` phase of the build. (Bug#38364)
- A mix of `TRUNCATE TABLE` with `LOCK TABLES` and `UNLOCK TABLES` for an `InnoDB` could cause a server crash. (Bug#38231)
- The `ExtractValue()` function did not work correctly with XML documents containing a `DOCTYPE` declaration. (Bug#38227)
- The `innodb_stats_on_metadata` system variable was not displayed by `SHOW VARIABLES` and was not settable at runtime. (Bug#38189)
- Enabling the `sync_frm` system variable had no effect on the handling of `.frm` files for views. (Bug#38145)
- Use of spatial data types in prepared statements could cause memory leaks or server crashes. (Bug#37956, Bug#37671)
- An error in a debugging check caused crashes in debug servers. (Bug#37936)
- An initialization procedure for materialized subquery execution was not called due to an early optimization of `MIN()`/`MAX()` queries. (Bug#37896)
- The presence of a `/* ... */` comment preceding a query could cause `InnoDB` to use unnecessary gap locks. (Bug#37885)
- An assertion failure could occur when trying to execute a query with a subquery such that one of the subquery's tables was accessed using the DS-MRR access method. (Bug#37842)
- For comparison of `NULL` to a subquery result inside `IS NULL`, the comparison could evaluate to `NULL` rather than to `TRUE` or `FALSE`. This occurred for expressions such as:

  ```
  SELECT ... WHERE NULL IN (SELECT ...) IS NULL
  ```

  (Bug#37822)
- When using `ALTER TABLE` on an `InnoDB` table, the `AUTO_INCREMENT` value could be changed to an incorrect value. (Bug#37788)
- Setting `myisam_repair_threads` greater than 1 caused a server crash for table repair or alteration operations for `MyISAM` tables with multiple `FULLTEXT` indexes. (Bug#37756)
- Primary keys were treated as part of a covering index even if only a prefix of a key column was used. (Bug#37742)
- The `MONTHNAME()` and `DAYNAME()` functions returned a binary string, so that using `LOWER()` or `UPPER()` had no effect. Now `MONTHNAME()` and `DAYNAME()` return a value in `character_set_connection` character set. (Bug#37575)
- The internal-use-only `filename` character set was visible in the output of some `SHOW` statements and in the contents of the `COLLATION_CHARACTER_SET_APPLICABILITY` table of `INFORMATION_SCHEMA`. (Bug#37554)
- Storing `TIMESTAMP` values in `Falcon` tables on a machine supporting big endian storage (for example SPARC), the time stamp information returned would be incorrect. (Bug#37281)
- Certain boolean-mode `FULLTEXT` searches that used the truncation operator did not return matching records and calculated relevance incorrectly. (Bug#37245)
- Previously, `InnoDB` performed `REPLACE INTO T SELECT ... FROM S WHERE ...` by setting shared next-key locks on rows from `S`. Now `InnoDB` selects rows from from `S` with shared locks or as a consistent read, as for `INSERT ... SELECT`. This reduces lock contention between sessions. (Bug#37232)
- When creating an index on a `Falcon` table with a very large dataset, `mysqld` would crash. (Bug#37056)

- For an `InnoDB` table with a `FOREIGN KEY` constraint, `TRUNCATE TABLE` may be performed using row by row deletion. If an error occurred during this deletion, the table would be only partially emptied. Now if an error occurs, the truncation operation is rolled back and the table is left unchanged. (Bug#37016)

- Subquery materialization produced incorrect results when comparing different types. (Bug#36752)

- An argument to the `MATCH()` function that was an alias for an expression other than a column name caused a server crash. (Bug#36737)

- Previously, statements inside a stored program did not clear the warning list. For example, warnings or errors generated by statements within a trigger or stored function would be accumulated and added to the message list for the statement that activated the trigger or invoked the function, "polluting" the output of `SHOW WARNINGS` or `SHOW ERRORS` for the outer statement. Normally, messages for a statement that can generate messages replace messages from the previous such statement. The effect was that a statement could have a different effect on the message list depending on whether it executed inside or outside of a stored program.

  Now within a stored program, successive statements that can generate messages update the message list and replace messages from the previous such statement. Only messages from the last of these statements is copied to the message list for the outer statement. (Bug#36649)

- `myisampack --join` did not create the destination table `.frm` file. (Bug#36573)

- When parsing or formatting interval values of `DAY_MICROSECOND` type, fractional seconds were not handled correctly when more-significant fields were implied or omitted. (Bug#36466)

- `comp_err` sometimes crashed due to improper mutex use. (Bug#36428)

- The `mysql` client sometimes improperly interpreted string escape sequences in non-string contexts. (Bug#36391)

- The query cache stored packets containing the server status of the time when the cached statement was run. This might lead to an incorrect transaction status on the client side if a statement was cached during a transaction and later served outside a transaction context (or vice versa). (Bug#36326)

- Some error numbers were incorrect. (Bug#36062)

- For upgrades to MySQL 5.1 or higher, `mysql_upgrade` did not re-encode database or table names that contained non-alphanumeric characters. (They would still appear after the upgrade with the `#mysql50#` prefix described in Section 8.2.3, "Mapping of Identifiers to File Names".) To correct this problem, it was necessary to run `mysqlcheck --all-databases --check-upgrade --fix-db-names --fix-table-names` manually. `mysql_upgrade` now runs that command automatically after performing the initial upgrade. (Bug#35934)

- `SHOW CREATE TABLE` did not display a printable value for the default value of `BIT` columns. (Bug#35796)

- The `max_length` metadata value was calculated incorrectly for the `FORMAT()` function, which could cause incorrect result set metadata to be sent to clients. (Bug#35558)

- `InnoDB` could fail to generate `AUTO_INCREMENT` values if rows previously had been inserted containing literal values for the `AUTO_INCREMENT` column. (Bug#35498, Bug#36411, Bug#39830)

- Result set metadata for columns retrieved from `INFORMATION_SCHEMA` tables did not have the `db` or `org_table` members of the `MYSQL_FIELD` structure set. (Bug#35428)

- If the system time was adjusted backward during query execution, the apparent execution time could be negative. But in some cases these queries would be written to the slow query log, with the negative execution time written as a large unsigned number. Now statements with apparent negative execution time are not written to the slow query log. (Bug#35396)

- The `CREATE_OPTIONS` column for `INFORMATION_SCHEMA.TABLES` did not display the `KEY_BLOCK_SIZE` option. (Bug#35275)

- On Windows, the `_PC` macro in `my_global.h` was causing problems for modern compilers. It has been removed because it is no longer used. (Bug#34309)

- For `DROP FUNCTION` with names that were qualified with a database name, the database name was handled in case-sensitive fashion even with `lower_case_table_names` set to 1. (Bug#33813)

- The `mysql` client incorrectly parsed statements containing the word "delimiter" in mid-statement. (Bug#33812)

  See also Bug#38158.

- `Falcon` would allow you to explicitly create a table within the internal `FALCON_TEMPORARY` tablespace. You can no longer explicitly select the `FALCON_TEMPORARY` tablespace. (Bug#33720)

- It was possible to set `Falcon` memory parameters to values larger than the maximum memory supported by the supported by the host environment. (Bug#33583)
- The `mysqldump` command would not include the `TABLESPACE` information for `Falcon` tables within the dump information. (Bug#33148)
- Three conditions were discovered that could cause an upgrade from MySQL 5.0 to 5.1 to fail: 1) Triggers associated with a table that had a `#mysql50#` prefix in the name could cause assertion failure. 2) `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed for databases that had a `#mysql50#` prefix if there were triggers in the database. 3) `mysqlcheck --fix-table-name` didn't use UTF8 as the default character set, resulting in parsing errors for tables with non-latin symbols in their names and trigger definitions. (Bug#33094, Bug#41385)
- `libmysqld` was not built with all character sets. (Bug#32831)
- Queries with dependent subqueries were slow. (Bug#32665)
- `Falcon` would allow you to create a `Falcon TABLESPACE` with the same filename as existing datafiles (including datafiles of other engines). All `Falcon` tablespaces are now created with a `.fts` extension, regardless of the specified filename. (Bug#32398)
- For `mysqld_multi`, using the `--mysqld=mysqld_safe` option caused the `--defaults-file` and `--defaults-extra-file` options to behave the same way. (Bug#32136)
- Attempts to open a valid MERGE table sometimes resulted in a `ER_WRONG_MRG_TABLE` error. This happened after failure to open an invalid MERGE table had also generated an `ER_WRONG_MRG_TABLE` error. (Bug#32047)
- Queries executed using join buffering of `BIT` columns could produce incorrect results. (Bug#31399)
- `ALTER TABLE CONVERT TO CHARACTER SET` did not convert `TINYTEXT` or `MEDIUMTEXT` columns to a longer text type if necessary when converting the column to a different character set. (Bug#31291)
- Server variables could not be set to their current values on Linux platforms. (These fixes are in addition to those made in MySQL 6.0.5 and 6.0.9.) (Bug#31177)

  See also Bug#6958.
- `ALTER TABLE` statements that added a column and added a non-partial index on the column failed to add the index. (Bug#31031)
- `mysqld --help` did not work as `root`. (Bug#30261)
- Static storage engines and plugins that were disabled and dynamic plugins that were installed but disabled were not listed in the `INFORMATION_SCHEMA` appropriate `PLUGINS` or `ENGINES` table. (Bug#29263)
- On Windows, Visual Studio does not take into account some x86 hardware limitations, which led to incorrect results converting large `DOUBLE` values to unsigned `BIGINT` values. (Bug#27483)
- If the default database was dropped, the value of `character_set_database` was not reset to `character_set_server` as it should have been. (Bug#27208)
- SSL support was not included in some “generic” RPM packages. (Bug#26760)
- `SHOW TABLE STATUS` could fail to produce output for tables with non-ASCII characters in their name. (Bug#25830)
- `DROP TABLE` for `INFORMATION_SCHEMA` tables produced an `Unknown table` error rather than the more appropriate `Access denied`. (Bug#24062)
- Allocation of stack space for error messages could be too small on HP-UX, leading to stack overflow crashes. (Bug#21476)
- For the `DIV` operator, incorrect results could occur for non-integer operands that exceed `BIGINT` range. Now, if either operand has a non-integer type, the operands are converted to `DECIMAL` and divided using `DECIMAL` arithmetic before converting the result to `BIGINT`. If the result exceeds `BIGINT` range, an error occurs. (Bug#8457)

C.1.4. Changes in MySQL 6.0.9 (10 January 2009)

Functionality added or changed:

- `BACKUP DATABASE` and `RESTORE` now indicate in the server's error log which databases are being backed up or restored. (Bug#40307)

- Performance of `SELECT *` retrievals from `INFORMATION_SCHEMA.COLUMNS` was improved slightly. (Bug#38918)

- Previously, index hints did not work for `FULLTEXT` searches. Now they work as follows:

  For natural language mode searches, index hints are silently ignored. For example, `IGNORE INDEX(i)` is ignored with no warning and the index is still used.

  For boolean mode searches, index hints with `FOR ORDER BY` or `FOR GROUP BY` are silently ignored. Index hints with `FOR JOIN` or no `FOR` modifier are honored. In contrast to how hints apply for non-`FULLTEXT` searches, the hint is used for all phases of query execution (finding rows and retrieval, grouping, and ordering). This is true even if the hint is given for a non-`FULLTEXT` index. (Bug#38842)

- MySQL support for adding collations using LDML specifications did not support the `<i>` identity rule that indicates one character sorts identically to another. The `<i>` rule now is supported. (Bug#37129)

- Previously, `RESTORE` overwrote any databases with information from the backup image. Now, `RESTORE` aborts with an error if the backup image contains any databases that currently exist on the server, unless the optional keyword `OVERWRITE` is given following the image file name. (Bug#34579)

- A new statement, `PURGE BACKUP LOGS`, enables the contents of the MySQL Backup logs to be culled. See Section 12.5.3.2, “`PURGE BACKUP LOGS` Syntax”. (Bug#33364)

- A new algorithm that uses both index access to the joined table and a join buffer has been implemented. It is called the Batched Key Access (BKA) Join algorithm. The algorithm supports inner join, outer join and semi-join operations, including nested outer joins and nested semi-joins. Also, the Block Nested-Loop (BNL) Join algorithm previously used only for inner joins has been extended and can be employed for outer join and semi-join operations, including nested nested outer joins and nested semi-joins. For more information, see Section 7.2.15, “Block Nested-Loop and Batched Key Access Joins”.

  In conjunction with this work, there is a new system variable, `join_cache_level`, that controls how join buffering is done.

Bugs fixed:

- **Security Enhancement**: When the `DATA DIRECTORY` or `INDEX DIRECTORY` clause of a `CREATE TABLE` statement referred to a subdirectory of the data directory via a symlinked component of the data directory path, it was accepted, when for security reasons it should be rejected. (Bug#39277)

- **Incompatible Change**: `CHECK TABLE ... FOR UPGRADE` did not check for collation changes made in MySQL 6.0.1 to `latin2_czech_cs` (Bug#25420) or collation changes made in MySQL 6.0.6 to `big5_chinese_ci`, `cp866_general_ci`, `gb2312_chinese_ci`, and `gbk_chinese_ci`. This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See Section 2.11.3, “Checking Whether Table Indexes Must Be Rebuilt”. (Bug#40054)

- **Partitioning**: **Replication**: Changing the transaction isolation level while replicating partitioned `InnoDB` tables could cause statement-based logging to fail. (Bug#39084)

- **Partitioning**: This bug was introduced in MySQL 6.0.5. (Bug#40954)

  This regression was introduced by Bug#30573, Bug#33257, Bug#33555.

- **Partitioning**: With `READ COMMITTED` transaction isolation level, `InnoDB` uses a semi-consistent read that releases non-matching rows after MySQL has evaluated the `WHERE` clause. However, this was not happening if the table used partitions. (Bug#40595)

- **Partitioning**: A `SELECT` using a range `WHERE` condition with an `ORDER BY` on a partitioned table caused a server crash. (Bug#40494)

- **Partitioning**: For a partitioned table having an `AUTO_INCREMENT` column: If the first statement following a start of the server or a `FLUSH TABLES` statement was an `UPDATE` statement, the `AUTO_INCREMENT` column was not incremented correctly. (Bug#40176)

- **Partitioning**: The server attempted to execute the statements `ALTER TABLE ... ANALYZE PARTITION`, `ALTER TABLE ... CHECK PARTITION`, `ALTER TABLE ... OPTIMIZE PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION` on tables that were not partitioned. (Bug#39434)

  See also Bug#20129.

- **Partitioning**: The value of the `CREATE_COLUMNS` column in `INFORMATION_SCHEMA.TABLES` was not `partitioned` for partitioned tables. (Bug#38909)

- **Partitioning**: When executing an `ORDER BY` query on a partitioned `InnoDB` table using an index that was not in the partition expression, the results were sorted on a per-partition basis rather than for the table as a whole. (Bug#37721)
- **Partitioning**: Partitioned table checking sometimes returned a warning with an error code of 0, making proper response to errors impossible. The fix also renders the error message subject to translation in non-English deployments. (Bug#36768)
- **Partitioning**: When `SHOW CREATE TABLE` was used on a partitioned table, all of the table's `PARTITION` and `SUBPARTITION` clauses were output on a single line, making it difficult to read or parse. (Bug#14326)
- **Replication**: Row-based replication failed with non-partitioned `MyISAM` tables having no indexes. (Bug#40004)
- An assertion failure occurred for a join query when a small size of the join buffer was set and the value of `record_per_key` for the index used for a `ref` access with this join buffer was big enough. (Bug#41204)
- Unique indexes on `FALCON` tables can not be created when the column is `NOT NULL`. (Bug#40994)
- Accessing user variables within triggers could cause a server crash. (Bug#40770)
- For single-table `UPDATE` statements, an assertion failure resulted from a runtime error in a stored function (such as a recursive function call or an attempt to update the same table as in the `UPDATE` statement). (Bug#40745)
- Date values of `000-00-00` inserted into a `FALCON` table were incorrectly recognized and returned when performing a `SELECT` on a field with an index. (Bug#40614)
- Several MySQL Backup-related memory-use issues identified by Valgrind were corrected. (Bug#40480)
- When executing concurrent `CREATE TABLE ... SELECT` statements on a `Maria` table, the error `Error: Memory allocated at trnman.c:129 was underrun, discovered at ma_close.c:65` error would be logged in the error file, and the server would eventually crash. (Bug#40416)
- Prepared statements allowed invalid dates to be inserted when the `ALLOW_INVALID_DATES` SQL mode was not enabled. (Bug#40365)
- With statement-based binary logging format and a transaction isolation level of `READ COMMITTED` or stricter, `InnoDB` printed an error because statement-based logging might lead to inconsistency between master and slave databases. However, this error was printed even when binary logging was not enabled (in which case, no such inconsistency can occur). (Bug#40360)
- A query with an outer join where the `ON` expression evaluated to the constant `FALSE` could return incorrect results when a join buffer was used for the outer join operation. (Bug#40317)
- Errors from a `BACKUP DATABASE` or `RESTORE` operation were shown by `SHOW WARNINGS` as warnings, not errors. (Bug#40304)
- If several errors occurred during a `BACKUP DATABASE` or `RESTORE` operation, the final error was returned to the client, even though the first error is usually more pertinent. (Bug#40303)
- Creation of a tablespace file within `FALCON` could create a tablespace entry in the `INFORMATION_SCHEMA.FALCON_TABLESPACE_IO` even the underlying data file had not been created. (Bug#40302)
- Specifying the `--log-backup-output` option without an argument set the destination for the backup logs to `FILE` rather than to the default of `TABLE`. (Bug#40282)
- `mc.exe` is no longer needed to compile MySQL on Windows. This makes it possible to build MySQL from source using Visual Studio Express 2008. (Bug#40280)
- The server could generate extra rows in the result set for a query with a nested outer join if the inner tables of the outer join were joined using join buffers. (Bug#40268)
- If `BACKUP DATABASE` was used to back up an empty database and binary logging enabled, the backup image was flagged as containing binary log information even though it did not. Using `RESTORE` with the backup image then crashed trying to parse the binary log file name. (Bug#40262)
- The `backup_history_log_file` and `backup_progress_log_file` system variables were not settable at server startup. Now they are. (Bug#40219)
- The default value of the `backup_history_log` and `backup_progress_log` system variables is `ON`, but explicitly setting them to `DEFAULT` set them to `OFF`. (Bug#40218)
- When an outer join employed a join buffer to join the first inner table by the Blocked Nested-Loop algorithm, extra `NULL`-complemented rows could be generated if the `WHERE` clause contained conditions that can be pushed down to this table. (Bug#40192)

- When the optimizer joined an inner table of an outer join using both “not exists” optimization and a join buffer, an incorrect result set could be returned. (Bug#40134)

- Support for the `revision` field in `.frm` files has been removed. This addresses the downgrading problem introduced by the fix for Bug#17823. (Bug#40021)

- The MySQL Backup message logger caused an assertion failure. (Bug#39997)

- Retrieval speed from the following `INFORMATION_SCHEMA` tables was improved by shortening the `VARIABLE_VALUE` column to 1024 characters: `GLOBAL_VARIABLES`, `SESSION_VARIABLES`, `GLOBAL_STATUS`, and `SESSION_STATUS`.

  As a result of this change, any variable value longer than 1024 characters will be truncated with a warning. This affects only the `init_connect` system variable. (Bug#39955)

- If the operating system is configured to return leap seconds from OS time calls or if the MySQL server uses a time zone definition that has leap seconds, functions such as `NOW()` could return a value having a time part that ends with `:59:60` or `:59:61`. If such values are inserted into a table, they would be dumped as is by `mysqldump` but considered invalid when reloaded, leading to backup/restore problems.

  Now leap second values are returned with a time part that ends with `:59:59`. This means that a function such as `NOW()` can return the same value for two or three consecutive seconds during the leap second. It remains true that literal temporal values having a time part that ends with `:59:60` or `:59:61` are considered invalid.

  For additional details about leap-second handling, see Section 9.7.2, “Time Zone Leap Second Support”. (Bug#39920)

- The server could crash during a sort-order optimization of a dependent subquery. (Bug#39844)

- Recovery of a tablespace for `FALCON` tables could fail if the tablespace was already in use. (Bug#39789)

- Creating a `FALCON` table while specifying a specific tablespace and partition to be used for the table will fail if the specified tablespace does not already exist, returning a error indicating general table creation failure. The message has been updated to indicate that the failure is due to non-existent tablespace. (Bug#39702)

- With the `ONLY_FULL_GROUP_BY` SQL mode enabled, the check for non-aggregated columns in queries with aggregate functions, but without a `GROUP BY` clause was treating all the parts of the query as if they were in the select list. This is fixed by ignoring the non-aggregated columns in the `WHERE` clause. (Bug#39656)

- Concurrent execution of `BACKUP DATABASE` and DML operations on `MyISAM` tables could produce a deadlock. (Bug#39602)

- The `do_abi_check` program run during the build process depends on `mysql_version.h` but that file was not created first, resulting in build failure. (Bug#39571)

- `CHECK TABLE` failed for `MyISAM INFORMATION_SCHEMA` tables. (Bug#39541)

- On 64-bit Windows systems, the server accepted `key_buffer_size` values larger than 4GB, but allocated less. (For example, specifying a value of 5GB resulted in 1GB being allocated.) (Bug#39494)

- Compiling MySQL with `FALCON` support enabled with a compiler that does not support exceptions would fail to complete successfully. `configure` has been updated to switch off `FALCON` support if the specified compiler does not support exceptions. (Bug#39419)

- Use of the `PACK_KEYS` or `MAX_ROWS` table option in `ALTER TABLE` should have triggered table reconstruction but did not. (Bug#39372)

- The server returned a column type of `VARBINARY` rather than `DATE` as the result from the `COALESCE()`, `IFNULL()`, `IF()`, `GREATEST()`, or `LEAST()` functions or `CASE` expression if the result was obtained using `filesort` in an anonymous temporary table during the query execution. (Bug#39283)

- Starting MySQL with `FALCON` support when MySQL has not been compiled with a compiler supporting exceptions would lead to strange errors and results. MySQL will now fail to initialize if you have compiled without exceptions enabled with the following message:

  ```
  081116 12:21:12 [ERROR] Falcon must be compiled with C++ exceptions enabled to work. Please adjust your compile fla
  [Falcon] Error: Falcon exiting process
  ```

  (Bug#39260)

- A server built using yaSSL for SSL support would crash if configured to use an RSA key and a client sent a cipher list containing a non-RSA key as acceptable. (Bug#39178)

- When built with Valgrind, the server failed to access tables created with the `DATA DIRECTORY` or `INDEX DIRECTORY` table option. (Bug#39102)
- With binary logging enabled `CREATE VIEW` was subject to possible buffer overwrite and a server crash. (Bug#39040)
- The fast mutex implementation was subject to excessive lock contention. (Bug#38941)
- Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. (Bug#38883)
- Column names constructed due to wild-card expansion done inside a stored procedure could point to freed memory if the expansion was performed after the first call to the stored procedure. (Bug#38823)
- If delayed insert failed to upgrade the lock, it did not free the temporary memory storage used to keep newly constructed `BLOB` values in memory, resulting in a memory leak. (Bug#38693)
- The server unnecessarily acquired a query cache mutex even with the query cache disabled, resulting in a small performance decrement. (Bug#38551)
- On Windows, a five-second delay occurred at shutdown of applications that used the embedded server. (Bug#38522)
- On Solaris, a scheduling policy applied to the main server process could be unintentionally overwritten in client-servicing threads. (Bug#38477)
- `BACKUP DATABASE` failed to use the native driver for a `Falcon` table if the table was partitioned. (Bug#38426)
- On Windows, the embedded server would crash in `mysql_library_init()` if the language file was missing. (Bug#38293)
- The Event Scheduler no longer logs “started in thread” or “executed” successfully messages to the error log. (Bug#38066)
- Setting the `debug` system variable and executing a `SELECT` statement resulted in a Valgrind warning. (Bug#38023)
- An incorrectly checked `XOR` subquery optimization resulted in an assertion failure. (Bug#37899)
- A `SELECT` with a `NULL NOT IN` condition containing a complex subquery from the same table as in the outer select caused an assertion failure. (Bug#37894)
- Use of an uninitialized constant in `EXPLAIN` evaluation caused an assertion failure. (Bug#37870)
- The server did not shut down upon receipt of a `SIGINT` signal unless it was run within a debugger. (Bug#37869)
- A query that could use one index to produce the desired ordering and another index for range access with index condition pushdown could cause a server crash. (Bug#37851)
- Renaming an `ARCHIVE` table to the same name with different lettercase and then selecting from it could cause a server crash. (Bug#37719)
- For queries executed with the batched-key access method, an incorrect value of an internal parameter caused a server crash if `join_buffer_size` was less then 256. (Bug#37690)
- Compiling MySQL with `FALCON` support enabled on Solaris 9 using the Sun Studio compiler would fail with error:

  ```
  "Interlock.h", line 149: Error: #error cas not defined. We need>= Solaris 10.
  ```

  (Bug#37622)
- `TIMEDIFF()` was erroneously treated as always returning a positive result. Also, `CAST()` of `TIME` values to `DECIMAL` dropped the sign of negative values. (Bug#37553)

  See also Bug#42525.
- `mysqlcheck` used `SHOW FULL TABLES` to get the list of tables in a database. For some problems, such as an empty `.frm` file for a table, this would fail and `mysqlcheck` then would neglect to check other tables in the database. (Bug#37527)
- Updating a view with a subquery in the `CHECK` option could cause an assertion failure. (Bug#37460)
- Statements that displayed the value of system variables (for example, `SHOW VARIABLES`) expect variable values to be encoded in `character_set_system`. However, variables set from the command line such as `basedir` or `datadir` were encoded using `character_set_filesystem` and not converted correctly. (Bug#37339)
- On a 32-bit server built without big tables support, the offset argument in a `LIMIT` clause might be truncated due to a 64-bit to

32-bit cast. (Bug#37075)

- Specifying a database name twice to `BACKUP DATABASE` caused a server crash. Now `BACKUP DATABASE` ignores duplicate names. (Bug#36933)
- If a non-directory file `f` without an extension was created in the data directory, the server would allow clients to execute a `USE f` statement even though `f` could not be a database. The server now verifies that that the named database corresponds to a directory. (Bug#36897)
- The `FALCON` storage would silently recreate missing tablespace files if they did not exist. Errors are now written to the MySQL error log when the `FALCON` system tablespace files are found to be missing. Warnings are produce in the log file when attempting to access data tablespace files that do not exist. (Bug#36804)
- Use of `CONVERT()` with `GROUP BY` to convert numeric values to `CHAR` could return truncated results. (Bug#36772)
- The `mysql` client, when built with Visual Studio 2005, did not display Japanese characters. (Bug#36279)
- Setting the `slave_compressed_protocol` system variable to `DEFAULT` failed in the embedded server. (Bug#35999)
- Processing for `NULL`-complemented rows in the result sets of queries with nested outer joins could be incorrect. (Bug#35835)
- The columns that store character set and collation names in several `INFORMATION_SCHEMA` tables were lengthened because they were not long enough to store some possible values: `SCHEMATA`, `TABLES`, `COLUMNS`, `CHARACTER_SETS`, `COLLATIONS`, and `COLLATION_CHARACTER_SET_APPLICABILITY`. (Bug#35789)
- Queries executed using the batched-key access method could cause an assertion fail when key expressions for a `ref` access depended on columns not only from the previous join table. (Bug#35685)
- Selecting from an `INFORMATION_SCHEMA` table into an incorrectly defined `MERGE` table caused an assertion failure. (Bug#35068)
- `perror` on Windows did not know about Win32 system error codes. (Bug#34825)
- `EXPLAIN EXTENDED` evaluation of aggregate functions that required a temporary table caused a server crash. (Bug#34773)
- `BACKUP DATABASE` produced an incorrect error message when the backup image file name contained a non-existent directory. (Bug#34754)
- `SHOW GLOBAL STATUS` shows values that aggregate the session status values for all threads. This did not work correctly for the embedded server. (Bug#34517)
- There were spurious warnings about `"Truncated incorrect DOUBLE value"` in queries with `MATCH ... AGAINST` and `>` or `<` with a constant (which was reported as an incorrect `DOUBLE` value) in the `WHERE` condition. (Bug#34374)
- `mysqldumpslow` did not aggregate times. (Bug#34129)
- `mysql_config` did not output `-ldl` (or equivalent) when needed for `--libmysqld-libs`, so its output could be insufficient to build applications that use the embedded server. (Bug#34025)
- For a stored procedure containing a `SELECT * ... RIGHT JOIN` query, execution failed for the second call. (Bug#33811)
- The CSV storage engine had been modified to require columns to be explicitly specified as `NOT NULL` in `CREATE TABLE` statements.

  However, adding columns via the `ALTER TABLE` command allowed nullable columns to be added to an existing CSV table. (Bug#33696)
- The `ROUTINES.DATA_TYPE`, `REFERENTIAL_CONSTRAINTS.SPECIFIC_SCHEMA`, `REFERENTIAL_CONSTRAINTS.SPECIFIC_NAME`, `REFERENTIAL_CONSTRAINTS.PARAMETER_NAME`, `REFERENTIAL_CONSTRAINTS.DATA_TYPE` columns were declared longer than the maximum allowed identifier length. (Bug#33649)
- If a `TEMPORARY` table existed with the same name as a regular table, `BACKUP DATABASE` saved the temporary table, causing a subsequent `RESTORE` to fail. (Bug#33574)
- Previously, use of index hints with views (which do not have indexes) produced the error `ERROR 1221 (HY000): INCORRECT USAGE OF USE/IGNORE INDEX AND VIEW`. Now this produces `ERROR 1176 (HY000): KEY '...' DOESN'T EXIST IN TABLE '...'`, the same error as for base tables without an appropriate index. (Bug#33461)
- Execution of a prepared statement that referred to a system variable caused a server crash. (Bug#32124)

- Some division operations produced a result with incorrect precision. (Bug#31616)
- Server variables could not be set to their current values on Linux platforms. (These fixes are in addition to those made in MySQL 6.0.5; additional fixes were made in MySQL 6.0.10.) (Bug#31177)

  See also Bug#6958.
- For Solaris package installation using `pkgadd`, the postinstall script failed, causing the system tables in the `mysql` database not to be created. (Bug#31164)
- For installation on Solaris using `pkgadd` packages, the `mysql_install_db` script was generated in the `scripts` directory, but the temporary files used during the process were left there and not deleted. (Bug#31052)
- Searching for text values on a column using a character set that provides multi-weight characters and sequences on an `INNODB` or `FALCON` table with an index would fail to find the expanded value. (Bug#29246)
- Some `SHOW` statements and retrievals from the `INFORMATION_SCHEMA` `TRIGGERS` and `EVENTS` tables used a temporary table and incremented the `Created_tmp_disk_tables` status variable, due to the way that `TEXT` columns are handled. The `TRIGGERS.SQL_MODE`, `TRIGGERS.DEFINER`, and `EVENTS.SQL_MODE` columns now are `VARCHAR` to avoid this problem. (Bug#29153)
- XA transaction rollbacks could result in corrupted transaction states and a server crash. (Bug#28323)
- There were cases where string-to-number conversions would produce warnings for `CHAR` values but not for `VARCHAR` values. (Bug#28299)
- For several read only system variables that were viewable with `SHOW VARIABLES`, attempting to view them with `SELECT @@var_name` or set their values with `SET` resulted in an `unknown system variable` error. Now they can be viewed with `SELECT @@var_name` and attempting to set their values results in a message indicating that they are read only. (Bug#28234)
- `ALTER TABLE` for an `ENUM` column could change column values. (Bug#23113)
- Setting the session value of the `max_allowed_packet` or `net_buffer_length` system variable was allowed but had no effect. The session value of these variables is now read only. (Bug#22891)
- A race condition between the `mysqld.exe` server and the Windows service manager could lead to inability to stop the server from the service manager. (Bug#20430)

C.1.5. Changes in MySQL 6.0.8 (03 November 2008)

Functionality added or changed:

- **Incompatible Change**: The tables for MySQL Backup logging have been renamed, and the logging capabilities now are more flexible, similar to the capabilities provided for the general query log and slow query log.
  - The names of the MySQL Backup log tables in the `mysql` database have been changed from `online_backup` and `online_backup_progress` to `backup_history` and `backup_progress`.
  - Logging now can be enabled or disabled, it is possible to log to tables or to files, and the names of the log files can be changed. For details, see Section 6.3.3.1, “MySQL Backup Log Control”.
  - A new statement, `FLUSH BACKUP LOGS`, closes and reopens the backup log files. A new option for `mysql_refresh()`, `REFRESH_BACKUP_LOG`, performs the same operation.
- **Important Change**: The `--skip-thread-priority` option is now deprecated in MySQL 5.1 and is removed in MySQL 6.0 such that the server won't change the thread priorities by default. Giving threads different priorities might yield marginal improvements in some platforms (where it actually works), but it might instead cause significant degradation depending on the thread count and number of processors. Meddling with the thread priorities is a not a safe bet as it is very dependent on the behavior of the CPU scheduler and system where MySQL is being run. (Bug#35164, Bug#37536)
- **Important Change**: The `--log` option now is deprecated and will be removed (along with the `log` system variable) in the future. Instead, use the `--general_log` option to enable the general query log and the `--general_log_file=file_name` option to set the general query log file name. The values of these options are available in the `general_log` and `general_log_file` system variables, which can be changed at runtime.

  Similar changes were made for the `--log-slow-queries` option and `log_slow_queries` system variable. You should use the `--slow_query_log` and `--slow_query_log_file=file_name` options instead (and the

`slow_query_log` and `slow_query_log_file` system variables).

- The `BUILD/compile-solaris-*` scripts now compile MySQL with the `mtmalloc` library rather than `malloc`. (Bug#38727)
- Binary distributions for Solaris, Linux, and Mac OS X now are built with support for the `pool-of-threads` value of `thread_handling`. (Bug#38636)
- `BACKUP DATABASE` now performs an implicit commit, like `RESTORE`. (Bug#38261)
- The deprecated `--default-table-type` server option has been removed. (Bug#34818)
- On WIndows, use of POSIX I/O interfaces in `mysys` was replaced with Win32 API calls (`CreateFile()`, `WriteFile()`, and so forth) and the default maximum number of open files has been increased to 16384. The maximum can be increased further by using the `--open-files-limit=N` option at server startup. (Bug#24509)
- Previously, prepared `CALL` statements could be used via the C API only for stored procedures that produce at most one result set, and applications could not use placeholders for `OUT` or `INOUT` parameters. For prepared `CALL` statements used via `PREPARE` and `EXECUTE`, placeholders could not be used for `OUT` or `INOUT` parameters.

  For the C API, prepared `CALL` support now is expanded in the following ways:

  - A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.
  - The final values of `OUT` and `INOUT` parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the `OUT` and `INOUT` parameters in the order in which they are declared in the procedure parameter list.
  - A new C API function, `mysql_stmt_next_result()`, is available for processing stored procedure results. See Section 20.10.15, “C API Support for Prepared `CALL` Statements”.
  - The `CLIENT_MULTI_RESULTS` flag now is enabled by default. It no longer needs to be enabled when you call `mysql_real_connect()`. (This flag is necessary for executing stored procedures because they can produce multiple result sets.)

  For `PREPARE` and `EXECUTE`, placeholder support for `OUT` and `INOUT` parameters is now available. See Section 12.2.1, “`CALL` Syntax”. (Bug#11638, Bug#17898)
- MySQL now supports an interface for semisynchronous replication: A commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowleges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through an optional plugin component. See Section 16.2.9, “Semisynchronous Replication”
- Most statements that previously caused an implicit commit before executing now also cause an implicit commit after executing. Also, the `FLUSH` statement and `mysql_refresh()` C API function now cause an implicit commit. See Section 12.4.3, “Statements That Cause an Implicit Commit”.
- The `FILES` and `TABLESPACES` tables have been added to `INFORMATION_SCHEMA` for tracking the individual files and tablespace details for `Falcon`. In addition, the `TABLES` table has been extended to incorporate the `TABLESPACE_NAME` field to specify the tablespace name that a specific table belongs to.

Bugs fixed:

- **Incompatible Change**: `CHECK TABLE ... FOR UPGRADE` did not check for incompatible collation changes made in MySQL 5.1.21 (Bug#29499) and 5.1.23 (Bug#27562, Bug#29461). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See Section 2.11.3, “Checking Whether Table Indexes Must Be Rebuilt”. (Bug#39585)

  See also Bug#40984.
- **Incompatible Change**: In connection with view creation, the server created `arc` directories inside database directories and maintained useless copies of `.frm` files there. Creation and renaming procedures of those copies as well as creation of `arc` directories has been discontinued.

  This change does cause a problem when downgrading to older server versions which manifests itself under these circumstances:

  1. Create a view `v_orig` in MySQL 6.0.8 or higher.

2. Rename the view to `v_new` and then back to `v_orig`.
3. Downgrade to an older 6.0.x server and run `mysql_upgrade`.
4. Try to rename `v_orig` to `v_new` again. This operation fails.

As a workaround to avoid this problem, use either of these approaches:

- Dump your data using `mysqldump` before downgrading and reload the dump file after downgrading.
- Instead of renaming a view after the downgrade, drop it and recreate it.

The downgrade problem introduced by the fix for this bug has been addressed as Bug#40021. (Bug#17823)

- **Important Change**: **Replication**: The `SUPER` privilege is now required to change the session value of `binlog_format` as well as its global value. For more information about `binlog_format`, see Section 16.1.2, “Replication Formats”. (Bug#39106)
- **Partitioning**: **Replication**: Replication to partitioned `MyISAM` tables could be slow with row-based binary logging. (Bug#35843)
- **Partitioning**: A duplicate key error raised when inserting into a partitioned table used a different error code from that returned by such an error raised when inserting into a table that was not partitioned. (Bug#38719)

  See also Bug#28842.
- **Partitioning**: If an error occurred when evaluating a column of a partitioned table for the partitioning function, the row could be inserted anyway. (Bug#38083)
- **Partitioning**: Using `INSERT ... SELECT` to insert records into a partitioned `MyISAM` table could fail if some partitions were empty and others are not. (Bug#38005)
- **Replication**: Issuing the statement `CHANGE MASTER TO ... MASTER_HEARTBEAT_PERIOD = period` using a value for *`period`* outside the permitted range caused the slave to crash. (Bug#39077)
- **Replication**: Replication of `BLACKHOLE` tables did not work with row-based binary logging. (Bug#38360)
- **Replication**: In some cases, a replication master sent a special event to a reconnecting slave to keep the slave's temporary tables, but they still had references to the “old” slave SQL thread and used them to access that thread's data. (Bug#38269)
- **Replication**: Replication filtering rules were inappropiately applied when executing `BINLOG` pseudo-queries. One way in which this problem showed itself was that, when replaying a binary log with `mysqlbinlog`, RBR events were sometimes not executed if the `--replicate-do-db` option was specified. Now replication rules are applied only to those events executed by the slave SQL thread. (Bug#36099)
- **Replication**: For a `CREATE TABLE ... SELECT` statement that creates a table in a database other than the current one, the table could be created in the wrong database on replication slaves if row-based binary logging is used. (Bug#34707)
- **Replication**: A statement did not always commit or roll back correctly when the server was shut down; the error could be triggered by having a failing `UPDATE` or `INSERT` statement on a transactional table, causing an implicit rollback. (Bug#32709)

  See also Bug#38262.
- Compiling using `--with-falcon` on Mac OS X fails if you use `CXX=gcc`. You must specify that the `g++` compiler should be used for C++ using `CXX=g++`. (Bug#41270)
- When building `Falcon` support on Solaris 10 on the SPARC platform, falcon would not be compiled even when explicitly enabled. (Bug#40390)
- Running an online `DROP INDEX` operation on an index using the same key on a `Falcon` table would fail with an assertion. (Bug#40265)
- With `innodb_autoinc_lock_mode` set to 0 (“traditional” locking), deadlock and lock-wait timeout errors encountered while reading `AUTO_INCREMENT` values were being reported as a generic `AUTO_INCREMENT` value allocation failure. (The actual error encountered was printed in the error log.) The transaction was being rolled back but all the user saw was an `AUTO_INCREMENT` failure code. Now the actual locking error code is returned to the user. (Bug#40224)
- Optimized builds of `mysqld` crashed when built with Sun Studio on SPARC platforms. (Bug#40224)
- Creating a table, or selecting from a table using the `FALCON` storage engine and with a double quote in the name would cause

an assertion failure. (Bug#40158, Bug#39388)

- Windows builds were missing the MySQL Backup log tables. (Bug#40126)
- The maximum value for `falcon-serial-log-buffer` has been reduced to 1000. (Bug#40123)
- The indexes and record contents of a `FALCON` table could get out of synchronization during a lrge number of updates. Because `FALCON` returns data only if it matches both the index and record data the result sets returned could be invalid when comparing the results of an index and non-index based `SELECT`. (Bug#40112, Bug#40130)
- The `CHECK TABLE ... FOR UPGRADE` statement did not check for incompatible collation changes made in MySQL 5.1.24 (Bug#27877). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See Section 2.11.3, “Checking Whether Table Indexes Must Be Rebuilt”.

  Prior to this fix, a binary upgrade (performed without dumping tables with `mysqldump` before the upgrade and reloading the dump file after the upgrade) would corrupt tables that have indexes that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain `'ß'` LATIN SMALL LETTER SHARP S (German). After the fix, `CHECK TABLE ... FOR UPGRADE` properly detects the problem and warns about tables that need repair.

  However, the fix is not backward compatible and can result in a downgrading problem under these circumstances:

  1. Perform a binary upgrade to a version of MySQL that includes the fix.
  2. Run `CHECK TABLE ... FOR UPGRADE` (or `mysqlcheck` or `mysql_upgrade`) to upgrade tables.
  3. Perform a binary downgrade to a version of MySQL that does not include the fix.

  The solution is to dump tables with `mysqldump` before the downgrade and reload the dump file after the downgrade. Alternatively, drop and recreate affected indexes. (Bug#40053)
- MySQL may crash during the recover of `Falcon` tables if the server was shutdown after a large data load. (Bug#39951)
- Non-ASCII error messages were corrupted. (Bug#39949)
- The `Threads_created` status variable was not correctly incremented when the server was started with the `--thread-handling=pool-of-threads` option. (Bug#39916)
- When the `Falcon` serial log reaches a state where the serial log can no longer be written to, for example when the disk is full, or when permissions have been changed on an open log, then MySQL could crash. (Bug#39912)
- On Windows Vista, `RESTORE` did not correctly calculate the validity point from the backup stream. (Bug#39825)
- `Falcon` did not support online add/drop index creation on tables using a `NOT NULL` column. (Bug#39795)
- When creating a table with the `FALCON` engine where the size of the key in the index was larger than supported (the error message did not signify the severity of the problem. The message and error has been updated. (Bug#39708)
- Recovery of `Falcon` tables could crash because of an invalid or unrecognised tablespace ID. (Bug#39706)
- Performing an `INSERT` on `Maria` table with a `UNIQUE` column, MySQL could deadlock. (Bug#39697)
- Memory would be allocated for the `Falcon` sector cache even if the cache had been disabled (`falcon_use_sectorcache`). (Bug#39692)
- The MySQL Backup `backup_history` log now contains a `backup_file_path` column. `backup_file` contains the basename and `backup_file_path` contains the directory of the image file path name. (Bug#39690)
- Some MySQL Backup-related memory-use warnings detected by Valgrind were corrected. (Bug#39598)
- Creating a table with a comment of 62 characters or longer caused a server crash. (Bug#39591)
- When loading very large datasets into a `Falcon` table, MySQL may crash because the size of the Falcon serial log exceeds 4GB. The maximum supported size of the serial log file has been increased from a 32-bit to a 64-bit integer to handle larger log file sizes. (Bug#39575)
- When recovering a crashed `Falcon` table when the page size had been set to 32K, MySQL could crash with an assertion. (Bug#39574)
- The Sun Studio compiler failed to build debug versions of the server due to use of features specific to `gcc`. (Bug#39451)
- When performing a recovery of a crashed `Falcon` table on Windows, MySQL would report an exception when then recovery

process completed, even though the recovery may have completed successfully. (Bug#39421)

- Performing an `ALTER TABLE` on a `Maria` table where you are changing the column name but not the type, a full table rebuild may be triggered, instead of just a simple rename. (Bug#39399)
- Dropping a locked `Maria` table leads to an assertion failure. (Bug#39395)
- For a `TIMESTAMP` column in an `InnoDB` table, testing the column with multiple conditions in the `WHERE` clause caused a server crash. (Bug#39353)
- When using a `Falcon` table, equals (=) comparison of values of columns of type `YEAR` does not work when an index is present on the `YEAR` column(s). (Bug#39342)
- When running `TRUNCATE` on a table where other threads are also trying to access the same `Falcon` table, a deadlock could occur between the two executing threads. (Bug#39321)
- Performing a `INSERT INTO ... ON DUPLICATE KEY UPDATE` statement on a `Maria` table would fail with the error `1178: The storage engine for the table doesn't support UPDATE in WRITE CONCURRENT`. (Bug#39248)
- `Maria` could fail to find data in a table with an index on a `char` column. (Bug#39243)
- Running `ALTER TABLE PARTITION` on a `Maria` table would lead to a crash. (Bug#39227)
- Using `Maria`, executing `FLUSH TABLES WITH READ LOCK` after a `LOCK TABLES` statement would lead to a crash. (Bug#39226)
- When using `Falcon` on ReiserFS file systems, the initial size of the serial log could cause problems during recovery if the size of the log file was less than 4KB. The minimum size of the serial log file has now been increased to 8KB to address the problem. (Bug#39212)
- Running multiple `SELECT`, `INSERT`, `UPDATE` and `DELETE` queries on the `Maria` table could lead to a deadlock. (Bug#39210)
- For `BACKUP DATABASE`, the server could add a `/` character to the end of the backup path, even when the path ended with a file name rather than a directory name. (Bug#39189)
- The server could crash when attempting to insert duplicate empty strings into a `utf8 SET` column. (Bug#39186)
- References to local variables in stored procedures are replaced with `NAME_CONST(name, value)` when written to the binary log. However, an “illegal mix of collation” error might occur when executing the log contents if the value's collation differed from that of the variable. Now information about the variable collation is written as well. (Bug#39182)
- Building MySQL with `Falcon` support using Sun Studio 10 would fail due to GNU CC specific code within `MemoryManager.h`. (Bug#39181)
- `BACKUP DATABASE` failed on PowerMac platforms due to type casting problems. (Bug#39127)
- MySQL Backup was not handling several errors. (Bug#39089)
- When performing online `ALTER` operations that change the indexes on `Falcon` tables, the indexes could get out of synchronization, leading to a crash. (Bug#39081)
- Some warnings were being reported as errors. (Bug#39059)
- Queries of the form `SELECT ... REGEXP BINARY NULL` could lead to a hung or crashed server. (Bug#39021)
- Statements of the form `INSERT ... SELECT .. ON DUPLICATE KEY UPDATE col_name = DEFAULT` could result in a server crash. (Bug#39002)
- Repeated `CREATE TABLE ... SELECT` statements, where the created table contained an `AUTO_INCREMENT` column, could lead to an assertion failure. (Bug#38821)
- `RESTORE` crashed if a trigger and an event had the same name. (Bug#38810)
- For deadlock between two transactions that required a timeout to resolve, all server tables became inaccessible for the duration of the deadlock. (Bug#38804)
- Running multiple `SELECT` operations on the same `Falcon` table could lead to an assertion within the `Transaction::initialize`. The same operation could also lead to a deadlock situation on the specified table. (Bug#38739, Bug#38748)

- When inserting a string into a duplicate-key error message, the server could improperly interpret the string, resulting in a crash. (Bug#38701)
- A race condition between threads sometimes caused unallocated memory to be addressed. (Bug#38692)
- A server crash resulted from concurrent execution of a multiple-table `UPDATE` that used a `NATURAL` or `USING` join together with `FLUSH TABLES WITH READ LOCK` or `ALTER TABLE` for the table being updated. (Bug#38691)
- On ActiveState Perl, `mysql-test-run.pl --start-and-exit` started but did not exit. (Bug#38629)
- Executing a light `INSERT` and `UPDATE` workload with `falcon_index_chill_threshold` set to 4K and `falcon_record_chill_threshold` set to to 4K, MySQL could crash. (Bug#38566)
- A server crash resulted from execution of an `UPDATE` that used a derived table together with `FLUSH TABLES`. (Bug#38499)
- Stored procedures involving substrings could crash the server on certain platforms due to invalid memory reads. (Bug#38469)
- The binary log file name stored in the `binlog_file` column of the `mysql.backup_history` MySQL Backup table now is the file basename (the final component). Previously, the full path name was stored, but this could be too long for the column width. (Bug#38462)
- On Windows, starting the server with the `--external-locking=1` option caused `BACKUP DATABASE` to fail. (Bug#38342)
- Inserting data into columns within a `Falcon` table that contains columns with names containing accented characters would cause the data to be null (empty). (Bug#38304)
- The `innodb_log_arch_dir` system variable is no longer available but was present in some of the sample option files included with MySQL distributions (such as `my-huge.cnf`). The line was present as a comment but uncommenting it would cause server startup failure so the line has been removed. (Bug#38249)
- Errors during server startup caused destruction of an uninitialized mutex and assertion failure. (Bug#37961)
- The handlerton-to-plugin mapping implementation did not free handler plugin references when the plugin was uninstalled, resulting in a server crash after several install/uninstall cycles. Also, on Mac OS X, the server crashed when trying to access an `EXAMPLE` table after the `EXAMPLE` plugin was installed. (Bug#37958)
- The server crashed if an argument to a stored procedure was a subquery that returned more than one row. (Bug#37949)
- When analyzing the possible index use cases, the server was incorrectly reusing an internal structure, leading to a server crash. (Bug#37943)
- Access checks were skipped for `SHOW PROCEDURE STATUS` and `SHOW FUNCTION STATUS`, which could lead to a server crash or insufficient access checks in subsequent statements. (Bug#37908)
- Comparisons could hang for `SET` or `ENUM` columns that used `latin2_czech_cs` collation. (Bug#37854)
- It was possible to create a tasblespace using the name of one of the `Falcon` system tablespaces, `FALCON_MASTER`, `FALCON_TEMPORARY`, or `FALCON_BACKLOG` without an error message being raised. A suitable error is now produced when an attempt is made to create a table with the same name as a `Falcon` system tablespace. (Bug#37668)
- `SHOW PROCESSLIST` displayed “copy to tmp table” when no such copy was occurring. (Bug#37550)
- The `<=>` operator could return incorrect results when comparing `NULL` to `DATE`, `TIME`, or `DATETIME` values. (Bug#37526)
- MySQL Backup was not consistently checking for `BSTREAM_ERROR` errors. (Bug#37522)
- The combination of a subquery with a `GROUP BY`, an aggregate function calculated outside the subquery, and a `GROUP BY` on the outer `SELECT` could cause the server to crash. (Bug#37348)
- Incorrect `BLOB` handling by `RESTORE` could result in a server crash. (Bug#37212)
- The `NO_BACKSLASH_ESCAPES` SQL mode was ignored for `LOAD DATA INFILE` and `SELECT INTO ... OUTFILE`. The setting is taken into account now. (Bug#37114)
- If thread-pooling was used and a connection attempt was denied on the grounds of exceeding the user limits, the number of active connections for that user was erroneously decreased twice. The difference between the actual number connections and the internal count could then cause debug builds of the server to raise an assertion. (Bug#36970)
- Long error messages for `RESTORE` could be truncated. (Bug#36854)

- Running in strict mode, with a `auto_increment_increment` and `auto_increment_offset` set to a value larger than supportedf by the specified auto increment column within a `Falcon` table, a crash would occur. (Bug#36473)
- In some cases, references to views were confused with references to anonymous tables and privilege checking was not performed. (Bug#36086)
- For crash reports on Windows, symbol names in stack traces were not correctly resolved. (Bug#35987)
- `ALTER EVENT` changed the `PRESERVE` attribute of an event even when `PRESERVE` was not specified in the statement. (Bug#35981)
- Host name values in SQL statements were not being checked for `'@'`, which is illegal according to RFC952. (Bug#35924)
- `mysql_install_db` failed on machines that had the host name set to `localhost`. (Bug#35754)
- Dynamic plugins failed to load on i5/OS. (Bug#35743)
- With the `PAD_CHAR_TO_FULL_LENGTH` SQL mode enabled, a `ucs2 CHAR` column returned additional garbage after trailing space characters. (Bug#35720)
- `RESTORE` did not set the `validity_point_time`, `binlog_pos`, and `binlog_file` fields of the `backup_history` log table row. (Bug#35240)
- With binary logging enabled, `CREATE TABLE ... SELECT` failed if the source table was a log table. (Bug#34306)
- If `BACKUP DATABASE` and `RESTORE` were done in a session with autocommit disabled, a later `DROP TABLE` or `RESTORE` in the same session failed. (Bug#34204)
- The `secure_file_priv` system variable now applies to `BACKUP DATABASE` and `RESTORE` operations: If the value is nonempty, backup and restore operations can read and write files only in the given directory. (Bug#34171)
- `mysql_real_connect()` did not check whether the `MYSQL` connection handler was already connected and connected again even if so. Now an `CR_ALREADY_CONNECTED` error occurs. (Bug#33831)
- Shutting down the MySQL Server immediately following the execution of a `BACKUP DATABASE` statement caused the server to crash if the database to be backed up contained any `Falcon` tables. (Bug#33575)
- The server crashed for `BACKUP DATABASE` if the backup progress tables in the `mysql` database were missing or created incorrectly. (Bug#33352)
- `CHECKSUM TABLE` was not killable with `KILL QUERY`. (Bug#33146)
- A trigger for an `InnoDB` table activating multiple times could lead to `AUTO_INCREMENT` gaps. (Bug#31612)
- `mysqldump` could fail to dump views containing a large number of columns. (Bug#31434)
- The server could improperly type user-defined variables used in the select list of a query. (Bug#26020)
- For access to the `INFORMATION_SCHEMA.VIEWS` table, the server did not check the `SHOW VIEW` and `SELECT` privileges, leading to inconsistency between output from that table and the `SHOW CREATE VIEW` statement. (Bug#22763)
- `mysqld_safe` would sometimes fail to remove the pid file for the old `mysql` process after a crash. As a result, the server would fail to start due to a false `A mysqld process already exists...` error. (Bug#11122)

C.1.6. Changes in MySQL 6.0.7 (29 September 2008)

Functionality added or changed:

- **Important Change**: `mysqlbinlog` now supports `--verbose` and `--base64-output=DECODE-ROWS` options to display row events as commented SQL statements. (The default otherwise is to display row events encoded as base-64 strings using `BINLOG` statements.) See Section 4.6.8.2, “`mysqlbinlog` Row Event Display”. (Bug#31455)
- `Falcon` builds on AMD64 platforms now. (Bug#38535)
- `mysqltest` now installs signal handlers and generates a stack trace if it crashes. (Bug#37003)
- A new system variable, `backupdir`, enables the default directory to be specified for `BACKUP DATABASE` and `RESTORE` operations when the image file path name is not a full path name. The default value for this variable is the data directory. (Bug#35230)

- The `mysql.online_backup` and `mysql.online_backup_progress` tables now have a default character set of `utf8` rather than `latin1`. (Bug#33836)

- `mysqltest` was changed to be more robust in the case of a race condition that can occur for rapid disconnect/connect sequences with the server. The account used by `mysqltest` could reach its allowed simultaneous-sessions user limit if the connect attempt occurred before the server had fully processed the preceding disconnect. `mysqltest` now checks specificaly for a user-limits error when it connects; if that error occurs, it delays briefly before retrying. (Bug#23921)

- Previously, `BACKUP DATABASE` did not back up privileges and `RESTORE` did not restore them. Now privileges for backed-up databases are saved. This includes privileges at the database level and below (table, column, routine). Global privileges are not saved. For additional information about how privileges are backed up, see Section 6.3.1, “Quick Guide to MySQL Backup”.

- A new session system variable, `backup_wait_timeout`, controls the number of seconds a `BACKUP DATABASE` or `RESTORE` operation waits for a blocked DDL statements before aborting with an error.

- The `CREATE TABLESPACE` privilege has been introduced. This privilege exists at the global (superuser) level and enables you to create, alter, and drop tablespaces and logfile groups.

- Improvements made to MySQL Backup (the `BACKUP DATABASE` and `RESTORE` statements):

  - A native driver for the `MyISAM` storage engine is included. This results in faster times for backup and restore operations, although the size of backup image files is larger.

Bugs fixed:

- **Security Enhancement**: The server consumed excess memory while parsing statements with hundreds or thousands of nested boolean conditions (such as `OR (OR ... (OR ... ))`). This could lead to a server crash or incorrect statement execution, or cause other client statements to fail due to lack of memory. The latter result constitutes a denial of service. (Bug#38296)

- **Incompatible Change**: There were some problems using `DllMain()` hook functions on Windows that automatically do global and per-thread initialization for `libmysqld.dll`:

  - Per-thread initialization: MySQL internally counts the number of active threads, which causes a delay in `my_end()` if not all threads have exited. But there are threads that can be started either by Windows internally (often in TCP/IP scenarios) or by users. Those threads do not necessarily use `libmysql.dll` functionality but still contribute to the open-thread count. (One symptom is a five-second delay in times for PHP scripts to finish.)

  - Process-initialization: `my_init()` calls `WSAStartup` that itself loads DLLs and can lead to a deadlock in the Windows loader.

  To correct these problems, DLL initialization code now is not invoked from `libmysql.dll` by default. (Bug#37226, Bug#33031)

- **Incompatible Change**: Some performance problems of `SHOW ENGINE INNODB STATUS` were reduced by removing `used cells` and `Total number of lock structs in row lock hash table` from the output. Now these values are present only if the `UNIV_DEBUG` symbol is defined at MySQL build time. (Bug#36941, Bug#36942)

- **Important Change**: The `INFORMATION_SCHEMA.FALCON_TABLES` table has been removed. (Bug#29211, Bug#34705, Bug#34706)

- **Partitioning**: When a partitioned table had a `TIMESTAMP` column defined with `CURRENT_TIMESTAMP` as the default but with no `ON UPDATE` clause, the column's value was incorrectly set to `CURRENT_TIMESTAMP` when updating across partitions. (Bug#38272)

- **Partitioning**: A `LIST` partitioned `MyISAM` table returned erroneous results when an index was present on a column in the `WHERE` clause and `NOT IN` was used on that column.

  Searches using the index were also much slower then if the index were not present. (Bug#35931)

- **Partitioning**: `SELECT COUNT(*)` was not correct for some partitioned tables using a storage engine that did not support `HA_STATS_RECORDS_IS_EXACT`. Tables using the `ARCHIVE` storage engine were known to be affected.

  This was because `ha_partition::records()` was not implemented, and so the default `handler::records()` was used in its place. However, this is not correct behavior if the storage engine does not support `HA_STATS_RECORDS_IS_EXACT`.

  The solution was to implement `ha_partition::records()` as a wrapper around the underlying partition records.

  As a result of this fix, the rows column in the output of `EXPLAIN PARTITIONS` now includes the total number of records in

the partitioned table. (Bug#35745)

- **Replication**: Server code used in binary logging could in some cases be invoked even though binary logging was not actually enabled, leading to asserts and other server errors. (Bug#38798)
- **Replication**: Row-based replication broke for `utf8 CHAR` columns longer than 85 characters. (Bug#37426)
- **Replication**: When `autocommit` was set equal to `1` after starting a transaction, the binary log did not commit the outstanding transaction. The reason this happened was that the binary log commit function saw only the values of the new settings, and decided that there was nothing to commit.

  This issue was first observed when using the `Falcon` storage engine, but it is possible that it affected other storage engines as well. (Bug#37221)
- **Replication**: Some kinds of internal errors, such as `OUT OF MEMORY` errors, could cause the server to crash when replicating statements with user variables.

  certain internal errors. (Bug#37150)
- **Replication**: Row-based replication did not correctly copy `TIMESTAMP` values from a big-endian storage engine to a little-endian storage engine. (Bug#37076)
- **Replication**: The `--replicate-*-table` options were not evaluated correctly when replicating multi-table updates.

  As a result of this fix, replication of multi-table updates no longer fails when an update references a missing table but does not update any of its columns. (Bug#37051)
- **Replication**: Performing an insert on a table having an `AUTO_INCREMENT` column and an `INSERT` trigger that was being replicated from a master running MySQL 5.0 or any version of MySQL 5.1 up to and including MySQL 5.1.11 to a slave running MySQL 5.1.12 or later caused the replication slave to crash. (Bug#36443)

  See also Bug#33029.
- Multiple concurrent inserts to a `Maria` table could lead to a deadlock situation. (Bug#39363)
- When renaming a `Falcon` table the corresponding indexes could become corrupt or unavailable. (Bug#39354)
- When performing an online `DROP INDEX` on a `Falcon` table, the operation may conflict with other index operations such as including index scans. When one client drops an index, another client may initiate a concurrent index operation that accesses the mapping object of the index being dropped, and this can cause a crash. (Bug#39349, Bug#39350, Bug#39845, Bug#39846)
- Explicitly running an online index operation on a `Falcon` table using `ALTER ONLINE TABLE ...` would fail with an error specifying that the specified operation was not supported. (Bug#39347)
- Running `LOAD DATA INFILE` on a large source data into a `Falcon` table with millions of rows, a crash could occur. (Bug#39296)
- Compiling `Falcon` on Solaris SPARC or x86 using the Sun Studio 12 compiler would lead to exceptions being disabled. Exceptions are required by Falcon and the build and binary would ultimately fail during execution. (Bug#39241)
- Host name lookup failure could lead to a server crash. (Bug#39153)
- When recovering from a serial log containing many `CREATE TABLESPACE` and `DROP TABLESPACE` statements, `Falcon` could lose data from tablespaces not referenced by these statements. (Bug#39138)

  See also Bug#39789.
- When specifying an alternative log directory for `FALCON` using `serial_log_directory` the operation would fail silently if the directory did not exist. MySQL will now fail to start if the serial log in the specified directory cannot be opened or created, or if the `falcon_master.fts` cannot be opened or created. (Bug#39098, Bug#38377)
- `Falcon` key pages were written to the serial log in the wrong order. This had the potential to cause problems if a failure of the server occurred during recovery. (Bug#39025)
- `Falcon` could hang trying to perform an `UPDATE` in one transaction while waiting for another transaction to be committed or rolled back. (Bug#38947)
- It was not possible to build the server with `Falcon` support on SPARC when using the Sun Studio compiler. (Bug#38891)
- On Solaris platforms, when the server was built with `Falcon` support and the data directory set in user's home directory, `mysql_install_db` failed. (Bug#38843)

- `Falcon` did not honor the `--datadir` option and created its files in the current directory instead. This error was apparent only when running the embedded version of MySQL. (Bug#38770)
- When built with `Falcon` support on 64-bit SPARC platforms, `mysqld` hung on startup. This occurred whether Sun Studio or `gcc` was used to compile the server. (Bug#38766)
- `Falcon` did not build on Linux with Valgrind enabled. (Bug#38746)
- Performing a `DELETE` on a `Maria` table where the table has been locked using `LOCK TABLE ... WRITE CONCURRENT` would result in an assertion failure. (Bug#38606)
- When using `mysql_install_db` on MySQL built with Sun Studio 12 with the `--with-debug` option enabled, the server would crash. (Bug#38594)
- Server-side cursors were not initialized properly, which could cause a server crash. (Bug#38486)
- A server crash or Valgrind warnings could result when a stored procedure selected from a view that referenced a function. (Bug#38291)
- A failure to clean up binary log events was corrected (detected by Valgrind). (Bug#38290)
- Queries containing a subquery with `DISTINCT` and `ORDER BY` could cause a server crash. (Bug#38191)
- `CREATE TABLESPACE` failed when invoked immediately following a `DROP TABLESPACE` statement that used the same tablespace name. (Bug#38186, Bug#38743)
- Over-aggressive lock acquisition by `InnoDB` when calculating free space for tablespaces could result in performance degradation when multiple threads were executing statements on multi-core machines. (Bug#38185)
- The fix for Bug#20748 caused a problem such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/.my.cnf`. (Bug#38180)
- `UUID()` values could have hyphens in the wrong place. (Bug#38160)
- Queries with a `HAVING` clause could return a spurious row. (Bug#38072)
- `MyISAM` tables with non-ASCII characters in their names could not be backed up because the `MyISAM` native backup driver did not handle them properly. (Bug#38045)
- Dropping and re-creating a `Falcon` table, then adding indexes to the re-created table, could cause spurious errors or possibly a crash of the server. (Bug#38039)
- If the table definition cache contained tables with many `BLOB` columns, much memory could be allocated to caching `BLOB` values. Now a size limit on the cached `BLOB` values is enforced. (Bug#38002)
- The server returned incorrect results for `WHERE ... OR ... GROUP BY` queries against `InnoDB` tables. (Bug#37977)
- `SUM(DISTINCT)` and `AVG(DISTINCT)` for an empty result set in a subquery were not properly handled as being able to return `NULL`. (Bug#37891)
- For `InnoDB` tables, `ORDER BY ... DESC` sometimes returned results in ascending order. (Bug#37830)
- The server returned unexpected results if a right side of the `NOT IN` clause consisted of the `NULL` value and some constants of the same type. For example, this query might return 3, 4, 5, and so forth if a table contained those values:

  ```
  SELECT * FROM t WHERE NOT t.id IN (NULL, 1, 2);
  ```

  (Bug#37761)
- Executing large numbers of SQL statements using `LIMIT` on `Falcon` tables eventually led to a crash of the server. (Bug#37726)
- Setting the session value of the `innodb_table_locks` system variable caused a server crash. (Bug#37669)
- Nesting of `IF()` inside of `SUM()` could cause an extreme server slowdown. (Bug#37662)
- For `BACKUP DATABASE`, if the `WITH COMPRESSION` clause was not used, an uninitialized variable could cause unpredictable results. (Bug#37654)
- Killing a query that used an `EXISTS` subquery as the argument to `SUM()` or `AVG()` caused a server crash. (Bug#37627)

- mysqld failed to build using the Sun Studio compiler. (Bug#37603)
- When using indexed `ORDER BY` sorting, incorrect query results could be produced if the optimizer switched from a covering index to a non-covering index. (Bug#37548)
- After `TRUNCATE TABLE` for an `InnoDB` table, inserting explicit values into an `AUTO_INCREMENT` column could fail to increment the counter and result in a duplicate-key error for subsequent insertion of `NULL`. (Bug#37531)
- For a `MyISAM` table with `CHECKSUM = 1` and `ROW_FORMAT = DYNAMIC` table options, a data consistency check (maximum record length) could fail and cause the table to be marked as corrupted. (Bug#37310)
- The `max_length` result set metadata value was calculated incorrectly under some circumstances. (Bug#37301)
- The `optimizer_switch` system variable takes a comma-separated list of values, but only the first value in the list was used. (Bug#37120)
- Executing `ALTER TABLE ADD PARTITION` followed by `ALTER TABLE DROP PARTITION` on a Falcon table, and then killing the thread performing these statements could cause the server to crash. (Bug#37072)
- `NOT IN` subqueries that selected `MIN()` or `MAX()` values but produced an empty result could cause a server crash. (Bug#37004)
- A server crash resulted from attempts at semi-join and materialization optimizations for subqueries with a parent of `SELECT ... FROM DUAL`. (Bug#36896)
- Server crashed when starting a new `BACKUP DATABASE` or `RESTORE` statement while a `BACKUP DATABASE` or `RESTORE` was ongoing. (Bug#36795)
- The `CSV` storage engine returned success even when it failed to open a table's data file. (Bug#36638)
- `SELECT DISTINCT` from a simple view on an `InnoDB` table, where all selected columns belong to the same unique index key, returned incorrect results. (Bug#36632)
- `RESTORE` could fail if the server on which the restore operation took place had enabled triggers or events. (Bug#36530)
- The parser incorrectly allowed MySQL error code 0 to be specified for a condition handler. (This is incorrect because the condition must be a failure condition and 0 indicates success.) (Bug#36510)
- `CHAR(256 USING utf32)` could generate a result with an incorrect length and result in a server crash. (Bug#36418)
- If initialization of an `INFORMATION_SCHEMA` plugin failed, `INSTALL PLUGIN` freed some internal plugin data twice. (Bug#36399)
- When the fractional part in a multiplication of `DECIMAL` values overflowed, the server truncated the first operand rather than the longest. Now the server truncates so as to produce more precise multiplications. (Bug#36270)
- The server could crash with an assertion failure (or cause the client to get a “Packets out of order” error) when the expected query result was that it should terminate with a “Subquery returns more than 1 row” error. (Bug#36135)
- Executing `TRUNCATE` statements with interleaving transactions could cause `mysqld` to crash. (Bug#35991)

  See also Bug#22165.
- When using both an `INSERT BEFORE` trigger to create a row and `AFTER INSERT` trigger to delete the same row on a `FALCON` table, the record count as reported by `SHOW TABLE STATUS` could get out of sync with the actual record contents. This was caused by the changes now being correctly updated in the table status information. (Bug#35939)
- Multiple threads executing repeated queries on the same `Falcon` table led eventually to a crash of the server. (Bug#35932, Bug#36410)
- The `UUID()` function returned UUIDs with the wrong time; this was because the offset for the time part in UUIDs was miscalculated. (Bug#35848)
- The `configure` script did not allow `utf8_hungarian_ci` to be specified as the default collation. (Bug#35808)
- For `CREATE TABLE`, the parser did not enforce that parentheses were present in a `CHECK (expr)` clause; now it does. The parser did not enforce that `CONSTRAINT [symbol]` without a following `CHECK` clause was illegal; now it does. (Bug#35578, Bug#11714, Bug#38696)
- Freeing of an internal parser stack during parsing of complex stored programs caused a server crash. (Bug#35577, Bug#37269, Bug#37228)

- `mysqlbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqlbinlog` to fail. This caused problems in testing and other situations where `mysqlbinlog` might be invoked many times in a relatively short period of time. (Bug#35543)
- The code for detecting a byte order mark (BOM) caused `mysql` to crash for empty input. (Bug#35480)
- Index scans performed with the `sort_union()` access method returned wrong results, caused memory to be leaked, and caused temporary files to be deleted when the limit set by `sort_buffer_size` was reached. (Bug#35477, Bug#35478)
- For uncorrelated subqueries without a `WHERE` clause, use of semi-join or materialization options could result in slow performance, or use of the LooseScan strategy could produce incorrect results. (Bug#35468)
- `CSV` tables with `CHAR` columns caused `BACKUP DATABASE` to produce a server crash. (Bug#35117)
- If a view depended on a base table that had been dropped, `BACKUP DATABASE` caused a server crash. (Bug#34902)
- If a view was altered before backing up a database, `BACKUP DATABASE` caused a server crash. (Bug#34867)
- Table checksum calculation could cause a server crash for `FEDERATED` tables with `BLOB` columns containing `NULL` values. (Bug#34779)
- `BACKUP DATABASE` caused a server crash if it attempted to back up a view that depended on another view. (Bug#34758, Bug#35347)
- A significant slowdown occurred when many `SELECT` statements that return many rows from `InnoDB` tables were running concurrently. (Bug#34409)
- `mysql_install_db` failed if the server was running with an SQL mode of `TRADITIONAL`. This program now resets the SQL mode internally to avoid this problem. (Bug#34159)
- Changes to build files were made to enable the MySQL distribution to compile on Microsoft Visual C++ Express 2008. (Bug#33907)
- Fast `ALTER TABLE` operations were not fast for columns that used multibyte character sets. (Bug#33873)
- `ORDER BY` failed to take into account accents and lettercases in multi-level collations (`latin2_czech_cs` and `cp1250_czech_cs`). (Bug#33791, Bug#30462)
- The internal functions `my_getsystime()`, `my_micro_time()`, and `my_micro_time_and_time()` did not work correctly on Windows. One symptom was that uniqueness of `UUID()` values could be compromised. (Bug#33748)
- The `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements are not present in non-debug builds, but attempting to use them resulted in a “syntax error” message. Now the error message indicates that the statements are disabled and that you must use a debug build. (Bug#33637)
- If a large number of databases were named in the `BACKUP DATABASE` statement, the server crashed. (Bug#33568)
- Cached queries that used 256 or more tables were not properly cached, so that later query invalidation due to a `TRUNCATE TABLE` for one of the tables caused the server to hang. (Bug#33362)
- `BACKUP DATABASE` did not properly set the flags in the first two bytes of the backup image. (Bug#33120)
- Unindexed `ORDER BY` did not work on short `utf32` columns, or on `utf16` columns with a short `max_sort_length` value. (Bug#33073)
- `BACKUP DATABASE` followed by `RESTORE` could mangle object names if a non-standard charset was used. (Bug#33023)
- After an upgrade to MySQL 6.0.4 or higher, columns that used the old 3-byte Unicode `utf8` character set are treated as having the `utf8mb3` character set. `mysql_upgrade` did not convert all system tables in the `mysql` database to use the new 4-byte Unicode `utf8` character set rather than `utf8mb3`. This caused problems such as that the event scheduler would not start. `mysql_upgrade` now performs the `utf8mb3` to `utf8` conversion for system tables. (Bug#33002, Bug#33053)
- It was possible to insert invalid Unicode characters (with code point values greater than U+10FFFF) into `utf8` and `utf32` columns. (Bug#32914)
- `UNION` constructs cannot contain `SELECT ... INTO` except in the final `SELECT`. However, if a `UNION` was used in a subquery and an `INTO` clause appeared in the top-level query, the parser interpreted it as having appeared in the `UNION` and raised an error. (Bug#32858)
- Inserting `CURRENT_TIME`, `CURRENT_DATE`, or `CURRENT_TIMESTAMP` into a `VARCHAR` column didn't work for non-ASCII character sets such as `ucs2`, `utf16`, or `utf32`. (Bug#32390)

- `mysql_upgrade` attempted to use the `/proc` file system even on systems that do not have it. (Bug#31605)
- `mysql_install_db` failed if run with the default table type set to `NDB`. (Bug#31315)
- Making `INFORMATION_SCHEMA` the default database caused the `DROP TABLESPACE` statement to be disabled. (Bug#31302)
- Several MySQL programs could fail if the `HOME` environment variable had an empty value. (Bug#30394)
- The Serbian translation for the `ER_INCORRECT_GLOBAL_LOCAL_VAR` error was corrected. (Bug#29738)
- The `BUILD/check-cpu` build script failed if `gcc` had a different name (such as `gcc.real` on Debian). (Bug#27526)
- `ALTER TABLE` could not be used to add columns to a table if the table had an index on a `utf8` column with a `TEXT` data type. (Bug#26180)
- The XPath `boolean()` function did not cast string and nodeset values correctly in some cases. It now returns `TRUE` for any non-empty string or nodeset and 0 for a `NULL` string, as specified in the XPath standard.. (Bug#26051)
- Using `ALTER TABLE` with interleaving transactions could cause `mysqld` to crash. (Bug#22165)
- The `FLUSH PRIVILEGES` statement did not produce an error when it failed. (Bug#21226)
- After executing a prepared statement that accesses a stored function, the next execution would fail to find the function if the stored function cache was flushed in the meantime. (Bug#12093, Bug#21294)
- `perror` did not work for errors described in the `sql/share/errmsg.txt` file. (Bug#10143)

C.1.7. Changes in MySQL 6.0.6 (11 August 2008)

Functionality added or changed:

- **Important Change**: **Incompatible Change**: The `FEDERATED` storage engine is now disabled by default in binary distributions. The engine is still available and can be enabled by starting the server with the `--federated` option. (Bug#37069)
- **Incompatible Change**: The `engines` column in the `mysql.online_backup` table has been renamed to `drivers` to better reflect its contents. (Bug#34965)
- **Incompatible Change**: A change has been made to the way that the server handles prepared statements. This affects prepared statements processed at the SQL level (using the `PREPARE` statement) and those processed using the binary client-server protocol (using the `mysql_stmt_prepare()` C API function).

  Previously, changes to metadata of tables or views referred to in a prepared statement could cause a server crash when the statement was next executed, or perhaps an error at execute time with a crash occurring later. For example, this could happen after dropping a table and recreating it with a different definition.

  Now metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. Metadata changes occur for DDL statements such as those that create, drop, alter, rename, or truncate tables, or that analyze, optimize, or repair tables. Repreparation also occurs after referenced tables or views are flushed from the table definition cache, either implicitly to make room for new entries in the cache, or explicitly due to `FLUSH TABLES`.

  Repreparation is automatic, but to the extent that it occurs, performance of prepared statements is diminished.

  Table content changes (for example, with `INSERT` or `UPDATE`) do not cause repreparation, nor do `SELECT` statements.

  An incompatibility with previous versions of MySQL is that a prepared statement may now return a different set of columns or different column types from one execution to the next. For example, if the prepared statement is `SELECT * FROM t1`, altering `t1` to contain a different number of columns causes the next execution to return a number of columns different from the previous execution.

  Older versions of the client library cannot handle this change in behavior. For applications that use prepared statements with the new server, an upgrade to the new client library is strongly recommended.

  Along with this change to statement repreparation, the default value of the `table_definition_cache` system variable has been increased from 128 to 256. The purpose of this increase is to lessen the chance that prepared statements will need repreparation due to referred-to tables/views having been flushed from the cache to make room for new entries.

  A new status variable, `Com_stmt_reprepare`, has been introduced to track the number of repreparations. (Bug#27420,

Bug#27430, Bug#27690)

- **Important Change**: Some changes were made to `CHECK TABLE ... FOR UPGRADE` and `REPAIR TABLE` with respect to detection and handling of tables with incompatible `.frm` files (files created with a different version of the MySQL server). These changes also affect `mysqlcheck` because that program uses `CHECK TABLE` and `REPAIR TABLE`, and thus also `mysql_upgrade` because that program invokes `mysqlcheck`.

  - If your table was created by a different version of the MySQL server than the one you are currently running, `CHECK TABLE ... FOR UPGRADE` indicates that the table has an `.frm` file with an incompatible version. In this case, the result set returned by `CHECK TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Table upgrade required. Please do "REPAIR TABLE` *`tbl_name`*`" to fix it!`

  - `REPAIR TABLE` without `USE_FRM` upgrades the `.frm` file to the current version.

  - If you use `REPAIR TABLE ...USE_FRM` and your table was created by a different version of the MySQL server than the one you are currently running, `REPAIR TABLE` will not attempt to repair the table. In this case, the result set returned by `REPAIR TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Failed repairing incompatible .FRM file`.

    Previously, use of `REPAIR TABLE ...USE_FRM` with a table created by a different version of the MySQL server risked the loss of all rows in the table.

  (Bug#36055)

- **Important Change**: The `Maria` Storage Engine is now available as standard. `Maria` is a crash safe version of `MyISAM`. `Maria` supports all of the main functionality of the `MyISAM` engine, but includes recovery support (in the event of a system crash), full logging (including `CREATE`, `DROP`, `RENAME`, and `TRUNCATE` operations), all `MyISAM` row formats and a new `Maria`-specific row format. `Maria` is documented at Section 13.6, “The `Maria` Storage Engine”.

- **Important Note**: When MySQL is built with the `Maria` engine, all internal temporary on disk tables will use the `Maria` engine. Using `Maria` temporary tables in plkace of `MyISAM` tables should result in a performance gain.

- On Unix, it is now possible for the output file for `BACKUP DATABASE` to be an existing FIFO. (Bug#37012)

- `mysql_upgrade` now has a `--tmpdir` option to enable the location of temporary files to be specified. (Bug#36469)

- `mysqldump` now adds the `LOCAL` qualifier to the `FLUSH TABLES` statement that is sent to the server when the `--master-data` option is enabled. This prevents the `FLUSH TABLES` statement from replicating to slaves, which is disadvantageous because it would cause slaves to block while the statement executes. (Bug#35157)

  See also Bug#38303.

- The use of the `SQL_CACHE` and `SQL_NO_CACHE` options in `SELECT` statements now is checked more restrictively: 1) Previously, both options could be given in the same statement. This is no longer true; only one can be given. 2) Previously, these options could be given in `SELECT` statements that were not at the top-level. This is no longer true; the options are disallowed in subqueries (including subqueries in the `FROM` clause, and `SELECT` statements in unions other than the first `SELECT`. (Bug#35020)

- MySQL source distributions are now available in Zip format. (Bug#27742)

- The undocumented, deprecated, and not useful `SHOW COLUMN TYPES` statement has been removed. (Bug#5299)

- The server now supports a Debug Sync facility for thread synchronization during testing and debugging. To compile in this facility, configure MySQL with the `--enable-debug-sync` option. The `debug_sync` system variable provides the user interface Debug Sync. `mysqld` and `mysql-test-run.pl` support a `--debug-sync-timeout` option to enable the facility and set the default synchronization point timeout.

- `mysql-test-run.pl` now supports a `--mysqltest` option for specifying options to the `mysqltest` program.

- Several improvements were made to MySQL Backup (the `BACKUP DATABASE` and `RESTORE` statements):

  - Drivers are now included for storage engines that do not store any data or rely on other storage engines for data storage: `MERGE`, `FEDERATED`, `BLACKHOLE`, `EXAMPLE`.

  - The backup kernel better determines the dependency ordering of objects to be backed up so that they can be restored in the proper order.

  - Restored events and triggers are not reactivated until the restore operation completes.

- `BACKUP DATABASE` now has a `WITH COMPRESSION` clause. This causes the image file to be compressed, which reduces its size. Compression also may result in improved backup time by reducing writes to disk.

- When reading from FALCON tables, FALCON can take advantage of reading from the disk in larger blocks. When enabled, disk reads are in blocks of 64KB. When switched off, disk reads are based on the page size as set by falcon_page_size.

Bugs fixed:

- **Important Change**: **Security Fix**: Additional corrections were made for the symlink-related privilege problem originally addressed in MySQL 6.0.5. The original fix did not correctly handle the data directory path name if it contained symlinked directories in its path, and the check was made only at table-creation time, not at table-opening time later. (Bug#32167, CVE-2008-2079)

  See also Bug#39277.

- **Incompatible Change**: SHOW STATUS took a lot of CPU time for calculating the value of the Innodb_buffer_pool_pages_latched status variable. Now this variable is calculated and included in the output of SHOW STATUS only if the UNIV_DEBUG symbol is defined at MySQL build time. (Bug#36600)

- **Incompatible Change**: Access privileges for several statements are more accurately checked:

  - CHECK TABLE requires some privilege for the table.
  - CHECKSUM TABLE requires SELECT for the table.
  - CREATE TABLE ... LIKE requires SELECT for the source table and CREATE for the destination table.
  - SHOW COLUMNS displays information only for those columns you have some privilege for.
  - SHOW CREATE TABLE requires some privilege for the table (previously required SELECT).
  - SHOW CREATE VIEW requires SHOW VIEW and SELECT for the view.
  - SHOW INDEX requires some privilege for any column.
  - SHOW OPEN TABLES displays only tables for which you have some privilege on any table column.

  (Bug#27145)

- **Incompatible Change**: Certain characters were sorted incorrectly for the following collations: TILDE and GRAVE ACCENT in big5_chinese_ci; LATIN SMALL LETTER J in cp866_general_ci; TILDE in gb2312_chinese_ci; and TILDE in gbk_chinese_ci.

  As a result of this fix, any indexes on columns that use these collations and contain the affected characters must be rebuilt when upgrading to 6.0.6 or higher. To do this, use ALTER TABLE to drop and re-add the indexes, or mysqldump to dump the affected tables and mysql to reload the dump file. (Bug#25420)

- **Incompatible Change**: An additional correction to the original MySQL 6.0.4 fix was made to normalize directory names before adding them to the list of directories. This prevents /etc/ and /etc from being considered different, for example. (Bug#20748)

  See also Bug#38180.

- **Important Change**: Previously, Falcon failed silently when attempting to read incompatible datafiles created by an earlier version of the storage engine. Now, when Falcon encounters such datafiles, it refuses to start, and an appropriate error is issued instead. (Bug#35190)

- **Important Change**: The server no longer issues warnings for truncation of excess spaces for values inserted into CHAR columns. This reverts a change in the previous release that caused warnings to be issued. (Bug#30059)

- **Partitioning**: **Important Note**: The statements ANALYZE TABLE, CHECK TABLE, OPTIMIZE TABLE, and REPAIR TABLE are now supported for partitioned tables.

  Also as a result of this fix, the following statements which were disabled in MySQL 6.0.5 have been re-enabled:

  - ALTER TABLE ... ANALYZE PARTITION
  - ALTER TABLE ... CHECK PARTITION
  - ALTER TABLE ... OPTIMIZE PARTITION
  - ALTER TABLE ... REPAIR PARTITION

(Bug#20129)

See also Bug#39434.

- **Partitioning**: `myisamchk` failed with an assertion error when analyzing a partitioned `MyISAM` table. (Bug#37537)
- **Partitioning**: When an attempt is made to change a table to an unsupported storage engine, the server normally uses the default storage engine in place of the requested engine while issuing a warning. However, if the table was partitioned, the same `ALTER TABLE` statement failed with the error, `THE MIX OF HANDLERS IN THE PARTITIONS IS NOT ALLOWED IN THIS VERSION OF MySQL`. This happened even if the server was not running in `NO_ENGINE_SUBSTITUTION` mode. Now the behavior for partitioned tables is the same as for other MySQL tables; the substitution is made, and a warning is issued. (Bug#35765)
- **Partitioning**: `MyISAM` recovery enabled with the `--myisam-recover` option did not work for partitioned `MyISAM` tables. (Bug#35161)
- **Partitioning**: When one user was in the midst of a transaction on a partitioned table, a second user performing an `ALTER TABLE` on this table caused the server to hang. (Bug#34604)
- **Partitioning**: Inserts failed on partitioned tables containing user-supplied values for an `AUTO_INCREMENT` column. (Bug#33479)
- **Partitioning**: Partition-level `TABLESPACE` options were ignored for `Falcon` tables. (Bug#33404)
- **Partitioning**: For `InnoDB` tables, there was a race condition involving the data dictionary and repartitioning. (Bug#33349)
- **Replication**: `CREATE PROCEDURE` and `CREATE FUNCTION` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. (Bug#36570)

  See also Bug#32575.
- **Replication**: When flushing tables, there was a slight chance that the flush occurred between the processing of one table map event and the next. Since the tables were opened one by one, subsequent locking of tables would cause the slave to crash. This problem was observed when replicating `NDBCLUSTER` or `InnoDB` tables, when executing multi-table updates, and when a trigger or a stored routine performed an (additional) insert on a table so that two tables were effectively being inserted into in the same statement. (Bug#36197)
- **Replication**: `INSTALL PLUGIN` and `UNINSTALL PLUGIN` caused row-based replication to fail.

  > **Note**
  >
  > These statements are not replicated; however, when using row-based logging, the changes they introduce in the `mysql` system tables are written to the binary log.

  (Bug#35807)
- **Replication**: `CREATE VIEW` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. Now, all comments are stripped from such statements before being written to the binary log. (Bug#32575)

  See also Bug#36570.
- The minimum page size accepted by `FALCON` has been increased from 1K to 2K. (Bug#39707)
- Trying to execute a DDL statement on a `Falcon` table while a transaction was being rolled back could cause the server to crash. (Bug#38933)
- When building `FALCON` using the Sun Studio 12 compiler, a requirement for the GNU Standard C++ (`libstdc++`) library would be added to the build requirements, causing the build to fail. (Bug#38556)
- The `Falcon` memory manager did not always perform initialization of internal objects correctly. (Bug#38519)

  See also Bug#38770.
- Disconnecting a session where you have a applied a `WRITE CONCURRENT` lock on `Maria` tables would lead to a crash. (Bug#38492)
- Range queries on a `Maria` table could fail to return the correct rows. (Bug#38466)
- The Windows `my-template.ini` template file contained a reference to the `myisam_max_extra_sort_file_size` system variable, which no longer exists, causing the installed server to fail upon startup. (Bug#38371)

- Incorrect handling of aggregate functions when loose index scan was used caused a server crash. (Bug#38195)
- The fix for Bug#33812 had the side effect of causing the `mysql` client not to be able to read some dump files produced with `mysqldump`. To address this, that fix was reverted. (Bug#38158)
- The `MyISAM` backup driver was subject to a race condition that allowed multiple `RESTORE` operations to occur simultaneously. This could result in locking conflicts, incorrect entries in the progress tables, or other problems. (Bug#38108)
- Concurrent adding or dropping of indexes and execution of DML statements on a `Falcon` table could cause the server to crash. (Bug#38044)
- Executing `ALTER TABLE` and DML statements concurrently on `Falcon` tables could cause the server to hang. (Bug#38043)
- `ALTER TABLE ... ADD KEY` and `ALTER TABLE ... DROP KEY` were not always handled correctly for `Falcon` tables, resulting in spurious duplicate key and other errors. (Bug#38041)
- If a table has a `BIT NOT NULL` column `c1` with a length shorter than 8 bits and some additional `NOT NULL` columns `c2`, ..., and a `SELECT` query has a `WHERE` clause of the form `(c1 = constant) AND c2 ...`, the query could return an unexpected result set. (Bug#37799)
- MySQL server binaries built using `gcc4.3` could crash when running large numbers of DML statements on `Falcon` tables. (Bug#37725)
- When building `FALCON` using the Sun Studio 12 compiler on OpenSolaris the build would fail due to a missing header file, `Interlock.h`. (Bug#37679)
- Building MySQL with SSL and `Falcon` enabled would lead to a build failure. (Bug#37517)
- A large number of updates on a `Falcon` table followed by a query of the form `SELECT AVG(int_non_key_column) FROM table WHERE int_non_key_column < constant GROUP BY int_key_column LIMIT limit` could crash the server. (Bug#37344)
- Queries with complex conditions in the `WHERE` clause on `Falcon` tables when `falcon_page_size` was set to a low value could cause the server to crash. (Bug#37343)
- Within stored programs or prepared statements, `REGEXP` could return incorrect results due to improper initialization. (Bug#37337)
- When running a concurrent scenario involving transactions, each executing a small number of `DELETE` and `UPDATE` operations on a small number of records on `FALCON` tables, a deadlock could occur. (Bug#37251)
- When performing operations on a table in one client while a different client is performing a `TRUNCATE` operation on the same `FALCON` table a deadlock could be introduced. (Bug#37080)
- The `falcon_max_transaction_backlog` has been removed. The option was originally introduced to ensure that the backlog of transactions did not exceed a certain level with the gopher thread. `FALCON` now uses multiple gopher threads. The transaction backlog is handled internally by `FALCON`. (Bug#36991)
- The `falcon_initial_allocation` has been removed. The option created new tablespace files with the specified size to force allocation on disk of specified block of contiguous space. The option had little effect on the performance of the tablespace files, and has therefore been removed. (Bug#36990)
- The `falcon_index_chill_threshold` and `falcon_record_chill_threshold` options have been modified so that the specification for the size can be specified in bytes, and support the KB, MB, and GB modifiers. (Bug#36825)
- The code for the `ut_usectime()` function in `InnoDB` did not handle errors from the `gettimeofday()` system call. Now it retries `gettimeofday()` several times and updates the value of the `Innodb_row_lock_time_max` status variable only if `ut_usectime()` was successful. (Bug#36819)
- If the length of a field was 3, internal `InnoDB` to integer type conversion didn't work on big-endian machines in the `row_search_autoinc_column()` function. (Bug#36793)
- For a view that referred to a `MyISAM` table, the contents of the table could be empty after `BACKUP DATABASE` followed by `RESTORE`. (Bug#36782)
- Data loss could be caused by attempts to read data from a database being restored by a `RESTORE` operation. (Bug#36778)
- Some warnings were being reported as errors. (Bug#36777)
- Data loss could be caused by activation of a trigger for a `MyISAM` table being restored by a `RESTORE` operation. (Bug#36749)

- `mysql_install_db` from a `Falcon`-enabled build crashed on Solaris/SPARC. (Bug#36745)
- On Windows 64-bit systems, temporary variables of `long` types were used to store `ulong` values, causing key cache initialization to receive distorted parameters. The effect was that setting `key_buffer_size` to values of 2GB or more caused memory exhaustion to due allocation of too much memory. (Bug#36705)
- Multiple-table `UPDATE` statements that used a temporary table could fail to update all qualifying rows or fail with a spurious duplicate-key error. (Bug#36676)
- A query which had an `ORDER BY DESC` clause that is satisfied with a reverse range scan could cause a server crash for some specific CPU/compiler combinations. (Bug#36639)
- The online backup stream library failed to parse the backup stream on 64-bit systems. (Bug#36624)
- `FALCON` would try to open a number of files during startup that are not required by the MySQL storage engine implmentation. These operations have been removed. (Bug#36620)
- On 64-bit platforms, `BACKUP DATABASE` hung for backups of more than 32KB. (Bug#36586)
- Dumping information about locks in use by sending a `SIGHUP` signal to the server or by invoking the `mysqladmin debug` command could lead to a server crash in debug builds or to undefined behavior in production builds. (Bug#36579)
- A `REGEXP` match could return incorrect rows when the previous row matched the expression and used `CONCAT()` with an empty string. (Bug#36488)
- The server could not be compiled with `Falcon` support on Solaris/x86. (Bug#36486)
- `mysqltest` ignored the value of `--tmpdir` in one place. (Bug#36465)
- The `ER_TRUNCATED_WRONG_VALUE` warning condition was sometimes raised as an error. (Bug#36457)
- When one MySQL client application committed a transaction affecting a `Falcon` table at the same time that another client dropped this table, the `DROP TABLE` statement did not “see” that transaction. This led to a situation such that a row affected by the transaction was later accessed in a manner that referred to the deleted table, resulting in a crash of the server. (Bug#36438)
- `ha_innodb.so` was incorrectly installed in the `lib/mysql` directory rather than in `lib/mysql/plugin`. (Bug#36434)
- Compiling the server with `Falcon` support failed on Solaris 10 due to problems with DTrace. This occurred even when the build was configured using `--disable-dtrace`. (Bug#36403)
- Compiling the server with `Falcon` support failed on Solaris 10 for x86 platforms failed due to use of assembler code specific to `gcc`. (Bug#36400)
- Dropping a `Falcon` tablespace concurrently with dropping a table using that tablespace caused the server to crash. (Bug#36396)
- Attempting to compile the server with Falcon support using the Sun Studio 12 compiler failed with the error `"VALUE.H", LINE 185: ERROR: A UNION MEMBER CANNOT HAVE A USER-DEFINED ASSIGNMENT OPERATOR`. (Bug#36368)
- The default drivers for `BACKUP DATABASE` and `RESTORE` now support a cancel operation, which also allows better cleanup if a driver error occurs. (Bug#36323)
- The server crashed while parsing large floating-point numbers such as `1e37` or `-1e15`. (Bug#36320)
- When updating an existing instance (for example, from MySQL 5.0 to 5.1, or 5.1 to 6.0), the Instance Configuration Wizard unnecessarily prompted for a `root` password when there was an existing `root` password. (Bug#36305)
- Following a number of `INSERT ... SELECT` statements on a `Falcon` table, creating a second `Falcon` table using the same tablespace as the table into which the inserts were made and then performing a simple `INSERT` on the new table caused the server to crash. (Bug#36294, Bug#36367)

  See also Bug#29648.
- For `InnoDB` tables, the `DATA_FREE` column of the `INFORMATION_SCHEMA.TABLES` displayed free space in kilobytes rather than bytes. Now it displays bytes. (Bug#36278)
- `BACKUP DATABASE` failed to back up views that depend on tables in a different database. (Bug#36265)
- The project files created for Windows were missing the `GenError` project dependency. (Bug#36257)
- The `mysql` client failed to recognize comment lines consisting of `--` followed by a newline. (Bug#36244)

- `CREATE INDEX` for `InnoDB` tables could under very rare circumstances cause the server to crash.. (Bug#36169)
- A read past the end of the string could occur while parsing the value of the `--innodb-data-file-path` option. (Bug#36149)
- Conversion of a `FLOAT ZEROFILL` value to string could cause a server crash if the value was `NULL`. (Bug#36139)
- The combination of semi-join and materialization both being enabled could lead to assertion failure during subquery processing. (Bug#36137)
- Range optimizer evaluation of `IN` subqueries to be handled with the materialization strategy could lead to assertion failure. (Bug#36133)
- A server crash could occur during the cleanup phase of subquery execution. (Bug#36128)
- On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. (Bug#36103)
- A `SELECT ... LIKE` query issued following a number of `INSERT` statements on a `Falcon` table failed to return all matching records. (Bug#36097)
- `mysqltest` was performing escape processing for the `--replace_result` command, which it should not have been. (Bug#36041)
- An error in calculation of the precision of zero-length items (such as `NULL`) caused a server crash for queries that employed temporary tables. (Bug#36023)
- For `EXPLAIN EXTENDED`, execution of an uncorrelated `IN` subquery caused a crash if the subquery required a temporary table for its execution. (Bug#36011)
- The `MERGE` storage engine did a table scan for `SELECT COUNT(*)` statements when it could calculate the number of records from the underlying tables. (Bug#36006)
- The server crashed inside `NOT IN` subqueries with an impossible `WHERE` or `HAVING` clause, such as `NOT IN (SELECT ... FROM t1, t2, ... WHERE 0)`. (Bug#36005)
- `mysql_stmt_prepare()` did not reset the list of messages (those messages available via `SHOW WARNINGS`). (Bug#36004)
- The Event Scheduler was not designed to work under the embedded server. It is now disabled for the embedded server, and the `event_scheduler` system variable is not displayed. (Bug#35997)
- Grouping or ordering of long values in unindexed `BLOB` or `TEXT` columns with the `gbk` or `big5` character set crashed the server. (Bug#35993)
- `SET GLOBAL debug=''` resulted in a Valgrind warning in `DbugParse()`, which was reading beyond the end of the control string. (Bug#35986)
- If a `SELECT` table list contained at least one `INFORMATION_SCHEMA` table, the required privileges for accessing the other tables were reduced. (Bug#35955)
- Some syntactically invalid statements could cause the server to return an error message containing garbage characters. (Bug#35936)
- MySQL could not be built using Sun Studio due to the use of compiler options specific to `gcc`. (Bug#35929)
- The “prefer full scan on clustered primary key over full scan of any secondary key” optimizer rule introduced by Bug#26447 caused a performance regression for some queries, so it has been disabled. (Bug#35850)
- The server ignored any covering index used for `ref` access of a table in a query with `ORDER BY` if this index was incompatible with the `ORDER BY` list and there was another covering index compatible with this list. As a result, suboptimal execution plans were chosen for some queries that used an `ORDER BY` clause. (Bug#35844)
- `mysql_upgrade` did not properly update the `mysql.event` table. (Bug#35824)
- The current system time (as returned by `NOW()` or synonyms) became constant after a `RESTORE` operation. (Bug#35806)
- Processing of an uncorrelated subquery using semi-join could cause incorrect results or a server crash. (Bug#35767)
- An incorrect error and message was produced for attempts to create a `MyISAM` table with an index (`.MYI`) file name that was

already in use by some other MyISAM table that was open at the same time. For example, this might happen if you use the same value of the INDEX DIRECTORY table option for tables belonging to different databases. (Bug#35733)

- Enabling the read_only system variable while autocommit mode was enabled caused SELECT statements for transactional storage engines to fail. (Bug#35732)
- The range optimizer ignored conditions on inner tables in semi-join IN subqueries, causing the optimizer to miss good query execution plans. (Bug#35674)
- An empty bit-string literal (b'') caused a server crash. Now the value is parsed as an empty bit value (which is treated as an empty string in string context or 0 in numeric context). (Bug#35658)
- On 64-bit systems, assigning values of $2^{63} - 1$ or larger to key_buffer_size caused memory overruns. (Bug#35616)
- For InnoDB tables, REPLACE statements used "traditional" style locking, regardless of the setting of innodb_autoinc_lock_mode. Now REPLACE works the same way as "simple inserts" instead of using the old locking algorithm. (REPLACE statements are treated in the same way as as INSERT statements.) (Bug#35602)
- Different invocations of CHECKSUM TABLE could return different results for a table containing columns with spatial data types. (Bug#35570)
- A semi-join subquery in the ON clause in the absence of a WHERE clause caused a server crash. (Bug#35550)
- InnoDB was not updating the Handler_delete or Handler_update status variables. (Bug#35537)
- The method for enumerating view dependencies could cause the server to deadlock. (Bug#35395)
- If the server crashed with an InnoDB error due to unavailability of undo slots, errors could persist during rollback when the server was restarted: There are two UNDO slot caches (for INSERT and UPDATE). If all slots end up in one of the slot caches, a request for a slot from the other slot cache would fail. This can happen if the request is for an UPDATE slot and all slots are in the INSERT slot cache, or vice versa. (Bug#35352)
- Simultaneous inserts and updates on an updateable view referencing a Falcon table could sometimes cause duplicate key errors. (Bug#35322)
- The combination of GROUP_CONCAT(), DISTINCT, and LEFT JOIN could crash the server when the right table is empty. (Bug#35298)
- Accessing a MERGE table with an empty underlying table list incorrectly resulted in a "wrong index" error message rather than "end of file." (Bug#35274)
- BACKUP DATABASE caused a server crash upon encountering a table row that has been marked for deletion but not removed. (Bug#35249)
- For InnoDB tables, ALTER TABLE DROP failed if the name of the column to be dropped began with "foreign". (Bug#35220)
- The table pullout strategy was not reflected in EXPLAIN EXTENDED output if not all of the subquery tables were pulled out. (Bug#35160)
- Access-denied messages for INFORMATION_SCHEMA incorrectly showed the name of the default database instead. (Bug#35096)
- Passing an invalid parameter to CHAR() in an ORDER BY clause caused the server to hang. (Bug#34949)
- Some binaries produced stack corruption messages due to being built with versions of bison older than 2.1. Builds are now created using bison 2.3. (Bug#34926)
- Concurrent execution of FLUSH TABLES along with SHOW FUNCTION STATUS or SHOW PROCEDURE STATUS could cause a server crash. (Bug#34895)
- Creating a new Falcon table using CREATE TABLE ... SELECT where the table uses a primary key, and rows contain duplicate keys, could lead to a table being created but not populated. Because the pending (bad) record was not committed, the table remains in a state that means it cannot be dropped or recreated. (Bug#34892)
- The log_output system variable could be set to an illegal value. (Bug#34820)
- A server crash or memory overrun could occur with a dependent subquery and joins. (Bug#34799)
- An assertion could be raised when the dependencies on a transaction could not be released after a specified time when using FALCON tables. (Bug#34602)

- `InnoDB` could crash if overflow occurred for an `AUTO_INCREMENT` column. (Bug#34335)
- On Windows 64-bit builds, an apparent compiler bug caused memory overruns for code in `innobase/mem/*`. Removed optimizations so as not to trigger this problem. (Bug#34297)
- Several additional configuration scripts in the `BUILD` directory now are included in source distributions. These may be useful for users who wish to build MySQL from source. (See Section 2.9.3, "Installing from the Development Source Tree", for information about what they do.) (Bug#34291)
- For `InnoDB` tables, loss of data resulted from performing inserts concurrently with a `RESTORE` operation. (Bug#34210)
- In some cases, concurrent `INSERT` and `DELETE` statements on the same `Falcon` table could cause the server to crash, due to a failure to find a record that should have been in the table. (Bug#33933)
- A number of problems in new subquery optimization code meant that MySQL could pick an incorrect query plan when using InsideOut and/or FirstMatch subquery optimizations, which in turn would cause wrong query results. (Bug#33743)
- If `CREATE TABLE` or `ALTER TABLE` of a `Falcon` table failed, it was not possible to create another table in the same database having the same name unless the server was restarted. In some cases, subsequent `CREATE TABLE` statements could cause the server to crash. (Bug#33723)
- Attempts to access a `FEDERATED` table using a non-existent server did not reliably return a proper error. (Bug#33702)
- It was possible for multiple `mysqld` instances to use the same `Falcon` tablespace and metadata files, which could lead to corruption of the tablespace files, metadata files, or both. (Bug#33607)
- `TIMESTAMP` columns were restored to the current date and time (not their actual values) by a `RESTORE` operation. (Bug#33573)
- Use of 61 nested subqueries caused a server crash. (Bug#33509)
- An `ALTER TABLE ... TABLESPACE` statement referencing a non-existant tablespace on a `Falcon` table failed with an inappropriate error message the first time it was executed. A second attempt to execute the statement led to a crash of the MySQL server. (Bug#33397)
- Executing a `FLUSH PRIVILEGES` statement after creating a temporary table in the `mysql` database with the same name as one of the MySQL system tables caused the server to crash.

  Note

  While it is possible to shadow a system table in this way, the temporary table exists only for the current user and connection, and does not effect any user privileges.

  (Bug#33275)
- Selecting from a view that referenced the same table in the `FROM` clause and an `IN` clause caused a server crash. (Bug#33245)
- When creating a new tablespace and specifying the name of an existing tablespace file, an incorrect error message would be reported specifying that the tablespace already existed. The error message has been updated to reflect the actual error. (Bug#33213)
- There was a race condition between the event scheduler and the server shutdown thread. (Bug#32771)
- Assignment of relative path names to `general_log_file` or `slow_query_log_file` did not always work. (Bug#32748)
- Deeply nested subqueries could cause stack overflow or a server crash. (Bug#32680)
- Query results from a `FEDERATED` table were corrupt if the query included an `ORDER BY` on a `TEXT` column. (Bug#32426)
- Conversion of binary values to multi-byte character sets could fail to left-pad values to the correct length. This could result in a server crash. (Bug#32394)
- On all x86 platforms, the default was to attempt to build the server with the `Falcon` storage engine, even if `Falcon` was not supported for a given platform. (Bug#32287)
- Killing a statement that invoked a stored function could return an incorrect error message indicating table corruption rather than that the statement had been interrupted. (Bug#32140)
- Occurrence of an error within a stored routine did not always cause immediate statement termination. (Bug#31881)
- For `DROP FUNCTION db_name.func_name` (that is, when the function name is qualified with the database name), the

statement should apply only to a stored function named `func_name` in the given database. However, if a UDF with the same name existed, the statement dropped the UDF instead. (Bug#31767)

- On NetWare, `mysql_install_db` could appear to execute normally even if it failed to create the initial databases. (Bug#30129)
- A problem related to HP-UX compilers that caused incorrect `WEIGHT_STRING()` results was fixed. (Bug#29825)
- `TRUNCATE TABLE` for `InnoDB` tables returned a count showing too many rows affected. Now the statement returns 0 for `InnoDB` tables. (Bug#29507)
- `InnoDB` could return an incorrect rows-updated value for `UPDATE` statements. (Bug#29157)
- The `mysql.servers` table was not created during installation on Windows. (Bug#28680, Bug#32797)
- The `jp` test suite was not working. (Bug#28563)
- The internal `init_time()` library function was renamed to `my_init_time()` to avoid conflicts with external libraries. (Bug#26294)
- In some cases, the parser interpreted the `;` character as the end of input and misinterpreted stored program definitions. (Bug#26030)
- Statements to create, alter, or drop a view were not waiting for completion of statements that were using the view, which led to incorrect sequences of statements in the binary log when statement-based logging was enabled. (Bug#25144)
- The `Questions` status variable is intended as a count of statements sent by clients to the server, but was also counting statements executed within stored routines. (Bug#24289)
- `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug#22868)
- `DROP DATABASE` did not drop orphaned `FOREIGN KEY` constraints. (Bug#18942)
- Delayed-insert threads were counted as connected but not as created, incorrectly leading to a `Threads_connected` value greater than the `Threads_created` value. (Bug#17954)
- The parser used signed rather than unsigned values in some cases that caused legal lengths in column declarations to be rejected. (Bug#15776)
- Stored procedure exception handlers were catching fatal errors (such as out of memory errors), which could cause execution not to stop to due a continue handler. Now fatal errors are not caught by exception handlers and a fatal error is returned to the client. (Bug#15192)
- On Windows, moving an `InnoDB .ibd` file and then symlinking to it in the database directory using a `.sym` file caused a server crash. (Bug#11894)
- If a connection was waiting for a `GET_LOCK()` lock or a `SLEEP()` call, and the connection aborted, the server did not detect this and thus did not close the connection. This caused a waste of system resources allocated to dead connections. Now the server checks such a connection every five seconds to see whether it has been aborted. If so, the connection is killed (and any lock request is aborted). (Bug#10374)

C.1.8. Changes in MySQL 6.0.5 (12 June 2008)

Functionality added or changed:

- **Incompatible Change**: In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using `TABLE` logging, use the `--log-output=TABLE` option explicitly to preserve your server's table-logging behavior.

  In MySQL 5.1.x, this bug was addressed twice because it turned out that the default was set in two places, only one of which was fixed the first time. (Bug#29993)

- **Incompatible Change**: The server now includes `dtoa`, a library for conversion between strings and numbers by David M. Gay. In MySQL, this library provides the basis for improved conversion between string or `DECIMAL` values and approximate-value (`FLOAT`/`DOUBLE`) numbers:

  - Consistent conversion results across platforms, which eliminates, for example, Unix versus Windows conversion differences.
  - Accurate representation of values in cases where results previously did not provide sufficient precision, such as for values close to IEEE limits.
  - Conversion of numbers to string format with the best possible precision. The precision of `dtoa` is always the same or bettter than that of the standard C library functions.

  Because the conversions produced by this library differ in some cases from previous results, the potential exists for incompatibilities in applications that rely on previous results. For example, applications that depend on a specific exact result from previous conversions might need adjustment to accommodate additional precision.

  For additional information about the properties of `dtoa` conversions, see Section 11.2.2, "Type Conversion in Expression Evaluation".

  See also Bug#12860, Bug#21497, Bug#26788, Bug#24541, Bug#34015.

- **Important Change**: **MySQL Cluster**: **Packaging**: Beginning with this release, standard MySQL 6.0 binaries are no longer built with support for the `NDBCLUSTER` storage engine, and the `NDBCLUSTER` code included in 6.0 mainline sources is no longer guaranteed to be maintained or supported. Those using MySQL Cluster in MySQL 6.0.4 and earlier MySQL 6.0 mainline releases should upgrade to MySQL Cluster NDB 6.2.15 or a later MySQL Cluster NDB 6.2 or 6.3 release. (Bug#36193)

- **Important Change**: Added a `ROUTINE_TYPE` column to the `INFORMATION_SCHEMA.PARAMETERS` table, to make it possible to distinguish like-named parameters of stored routines and stored functions having the same names. See Section 19.27, "The `INFORMATION_SCHEMA PARAMETERS` Table", for more information. (Bug#33106)

- **Replication**: Introduced the `slave_exec_mode` system variable to control whether idempotent or strict mode is used for replication conflict resolution. Idempotent mode suppresses duplicate-key, no-key-found, and some other errors, and is needed for circular replication, multi-master replication, and some other complex replication setups when using MySQL Cluster. Strict mode is the default. (Bug#31609)

- **Replication**: When running the server with `--binlog-format=MIXED` or `--binlog-format=STATEMENT`, a query that referred to a system variable used the slave's value when replayed on the slave. This meant that, if the value of a system variable was inserted into a table, the slave differed from the master. Now, statements that refer to a system variable are marked as "unsafe", which means that:

  - When the server is using `--binlog-format=MIXED`, the row-based format is used automatically to replicate these statements.
  - When the server is using `--binlog-format=STATEMENT`, these statements produce a warning.

  (Bug#31168)

  See also Bug#34732.

- In the `INFORMATION_SCHEMA` database, the `FALCON_DATABASE_IO` table was renamed to `FALCON_TABLESPACE_IO`. (Bug#35490)

- For boolean options, the option-processing library now prints additional information in the `--help` message: If the option is enabled by default, the message says so and indicates that the `--skip` form of the option disables the option. This affects all compiled MySQL programs that use the library. (Bug#35224)

- The `PROCESS` privilege now is required to start or stop the `InnoDB` monitor tables (see Section 13.7.13.2, "`SHOW ENGINE INNODB STATUS` and the `InnoDB` Monitors"). Previously, no privilege was required. (Bug#34053)

- For binary `.tar.gz` packages, `mysqld` and other binaries now are compiled with debugging symbols included to enable easier use with a debugger. If you do not need debugging symbols and are short on disk space, you can use `strip` to remove the symbols from the binaries. (Bug#33252)

- Several undocumented C API functions were removed: `mysql_manager_close()`, `mysql_manager_command()`, `mysql_manager_connect()`, `mysql_manager_fetch_line()`, and `mysql_manager_init()`. (Bug#31954)

- The C API contained several undocumented functions that have been removed: `mysql_disable_reads_from_master()`, `mysql_disable_rpl_parse()`, `mysql_enable_reads_from_master()`, `mysql_enable_rpl_parse()`, `mysql_master_query()`, `mysql_master_send_query()`, `mysql_reads_from_master_enabled()`, `mysql_rpl_parse_enabled()`, `mysql_rpl_probe()`, `mysql_rpl_query_type()`, `mysql_set_master()`, `mysql_slave_query()`, and `mysql_slave_send_query()`. (Bug#31952)

- Formerly, when the MySQL server crashed, the generated stack dump was numeric and required external tools to properly re-

solve the names of functions. This is not very helpful to users having a limited knowledge of debugging techniques. In addition, the generated stack trace contained only the names of functions and was formatted differently for each platform due to different stack layouts.

Now it is possible to take advantage of newer versions of the GNU C Library provide a set of functions to obtain and manipulate stack traces from within the program. On systems that use the ELF binary format, the stack trace contains important information such as the shared object where the call was generated, an offset into the function, and the actual return address. Having the function name also makes possible the name demangling of C++ functions.

The library generates meaningful stack traces on the following platforms: i386, x86_64, PowerPC, IA64, Alpha, and S390. On other platforms, a numeric stack trace is still produced, and the use of the `resolve_stack_dump` utility is still required. (Bug#31891)

- `mysqltest` now has `mkdir` and `rmdir` commands for creating and removing directories. (Bug#31004)
- The `LAST_EXECUTED` column of the `INFORMATION_SCHEMA.EVENTS` table now indicates when the event started executing rather than when it finished executing. As a result, the `ENDS` column is never less than `LAST_EXECUTED`. (Bug#29830)
- The `mysql_odbc_escape_string()` C API function has been removed. It has multi-byte character escaping issues, doesn't honor the `NO_BACKSLASH_ESCAPES` SQL mode and is not needed anymore by Connector/ODBC as of 3.51.17. (Bug#29592)
- The server uses less memory when loading privileges containing table grants. (Patch provided by Google.) (Bug#25175)
- Added the `Uptime_since_flush_status` status variable, which indicates the number of seconds since the most recent `FLUSH STATUS` statement. (Community contribution by Jeremy Cole) (Bug#24822)
- Added the `SHOW PROFILES` and `SHOW PROFILE` statements to display statement profile data, and the accompanying `INFORMATION_SCHEMA.PROFILING` table. Profiling is controlled via the `profiling` and `profiling_history_size` session variables. see Section 12.5.6.32, “`SHOW PROFILES` Syntax”, and Section 19.28, “The `INFORMATION_SCHEMA PROFILING` Table”. (Community contribution by Jeremy Cole)

  The profiling feature is enabled via the `--enable-community-features` and `--enable-profiling` options to `configure`. These options are enabled by default; to disable them, use `--disable-community-features` and `--disable-profiling`. (Bug#24795)
- The performance of internal functions that trim multiple spaces from strings when comparing them has been improved. (Bug#14637)
- Added the `SHA2()` function, which calculates the SHA-2 family of hash functions (SHA-224, SHA-256, SHA-384, and SHA-512). (Contributed by Bill Karwin) (Bug#13174)
- The new read-only global system variables `report_host`, `report_password`, `report_port`, and `report_user` system variables provide runtime access to the values of the corresponding `--report-host`, `--report-password`, `--report-port`, and `--report-user` options.
- Formerly it was possible to specify an `innodb_flush_method` value of `fdatasync` to obtain the default flush behavior of using `fdatasync()` for flushing. This is no longer possible because it can be confusing that a value of `fdatasync` causes use of `fsync()` rather than `fdatasync()`.
- The use of `InnoDB` hash indexes now can be controlled by setting the new `innodb_adaptive_hash_index` system variable at server startup. By default, this variable is enabled. See Section 13.7.10.4, “Adaptive Hash Indexes”.
- The argument for the `mysql-test-run.pl --do-test` and `--skip-test` options is now interpreted as a Perl regular expression if there is a pattern metacharacter in the argument value. This allows more flexible specification of which tests to perform or skip.
- The Instance Manager (`mysqlmanager`) has been discontinued and is no longer provided in MySQL releases.
- For `Falcon`, supernodes have been added to index pages. Supernodes are an array of 16 vectors into each index page to keys that are fully expanded with noprefix compression. This allows the page to be searched quicker using a binary search of supernode keys followed by the normal sequential search. Without enabling supernodes, the whole page has to be searched sequentially.
- Two new statements, `BACKUP DATABASE` and `RESTORE`, have been added for backup and restore operations. See Section 6.3, “Using MySQL Backup”.

Bugs fixed:

- **Important Change**: **Security Fix**: It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` is now disallowed. This is now also true of these options when used with partitioned tables and individual partitions of such tables.

  > **Note**
  >
  > Additional fixes were made in MySQL 6.0.6.

  (Bug#32167, CVE-2008-2079)

  See also Bug#39277.

- **Security Fix**: A client that connects to a malicious server could be tricked by the server into sending files from the client host to the server. This occurs because the `libmysqlclient` client library would respond to a `FETCH LOCAL FILE` request from the server even if the request is sent for statements from the client other than `LOAD DATA LOCAL INFILE`. The client library has been modified to respond to a `FETCH LOCAL FILE` request from the server only if is is sent in response to a `LOAD DATA LOCAL INFILE` statement from the client.

  The client library now also checks whether `CLIENT_LOCAL_FILE` is set and refuses to send a local file if not.

  > **Note**
  >
  > Binary distributions ship with the `local-infile` capability enabled. Applications that do not use this functionality should disable it to be safe.

  (Bug#29605)

- **Important Change**: **Security Enhancement**: On Windows Vista and Windows Server 2008, a user without administrative privileges does not have write permissions to the `Program Files` directory where MySQL and the associated data files are normally installed. Using data files located in the standard `Program Files` installation directory could therefore cause MySQL to fail, or lead to potential security issues in an installed instance.

  To address the problem, on Windows XP, Windows Vista and Windows Server 2008, the datafiles and data file configuration are now set to the Microsoft recommended `AppData` folder. The `AppData` folder is typically located within the user's home directory.

  > **Important**
  >
  > When upgrading an existing 5.1.23 or 6.0.4 installation of MySQL you must take a backup of your data and configuration file (`my.ini` before installing the new version. To migrate your data, either extract the data and re-import (using `mysqldump`, then upgrade and re-import using `mysql`), or back up your data, upgrade to the new version, and copy your existing data files from your old `datadir` directory to the new directory located within `AppData`.
  >
  > Failure to back up your data and follow these procedures may lead to data loss.

  (Bug#34593)

- **Security Enhancement**: It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. (Bug#32707)

- **Incompatible Change**: In MySQL 5.1.23, the `last_errno` and `last_error` members of the `NET` structure in `mysql_com.h` were renamed to `client_last_errno` and `client_last_error`. This was found to cause problems for connectors that use the internal `NET` structure for error handling. The change has been reverted. (Bug#34655)

  See also Bug#12713.

- **Incompatible Change**: The parser accepted illegal syntax in a `FOREIGN KEY` clause:

  - Multiple `MATCH` clauses.
  - Multiple `ON DELETE` clauses.
  - Multiple `ON UPDATE` clauses.
  - `MATCH` clauses specified after `ON UPDATE` or `ON DELETE`. In case of multiple redundant clauses, this leads to confusion, and implementation-dependent results.

  These illegal syntaxes are now properly rejected. Existing applications that used them will require adjustment. (Bug#34455)

- **Incompatible Change**: It was possible to use `FRAC_SECOND` as a synonym for `MICROSECOND` with `DATE_ADD()`,

DATE_SUB(), and INTERVAL; now, using FRAC_SECOND with anything other than TIMESTAMPADD() or TIMESTAMPDIFF() produces a syntax error.

It is now possible (and preferable) to use MICROSECOND with TIMESTAMPADD() and TIMESTAMPDIFF(), and FRAC_SECOND is now deprecated. (Bug#33834)

- **Incompatible Change**: The UPDATE statement allowed NULL to be assigned to NOT NULL columns (the implicit default value for the column data type was assigned). This was changed so that on error occurs.

  This change was reverted, because the original report was determined not to be a bug: Assigning NULL to a NOT NULL column in an UPDATE statement should produce an error only in strict SQL mode and set the column to the implicit default with a warning otherwise, which was the original behavior. See Section 10.1.4, "Data Type Default Values", and Bug#39265. (Bug#33699)

- **Incompatible Change**: It is no longer possible to create CSV tables with NULL columns. However, for backwards compatibility, you can continue to use such tables that were created in previous MySQL releases. (Bug#32050)

- **Incompatible Change**: For packages that are built within their own prefix (for example, /usr/local/mysql) the plugin directory will be lib/plugin. For packages that are built to be installed into a system-wide prefix (such as RPM packages with a prefix of /usr), the plugin directory will be lib/mysql/plugin to ensure a clean /usr/lib hierarchy. In both cases, the $pkglibdir configuration setting is used at build time to set the plugin directory.

  The current plugin directory location is available as the value of the plugin_dir system variable as before, but the mysql_config script now has a --plugindir option that can be used externally to the server by third-party plugin writers to obtain the default plugin directory path name and configure their installation directory appropriately. (Bug#31736)

- **Incompatible Change**: Inserting a row with a NULL value for a DATETIME column results in a CSV file that the storage engine cannot read.

  All CSV tables now need to be defined with each column marked as NOT NULL. An error is raised if you try to create a CSV table with columns that are not defined with NOT NULL. (Bug#31473, Bug#32817)

- **Incompatible Change**: The utf8_general_ci and ucs2_general_ci collations did not sort the letter "U+00DF SHARP S" equal to 's'.

  As a result of this fix, any indexes on columns that use these collations (but only columns that use SHARP S) must be rebuilt when upgrading to 6.0.5 or higher. To do this, use ALTER TABLE to drop and re-add the indexes, or use mysqldump to dump the affected tables and mysql to reload the dump file. (Bug#27877)

  See also Bug#37046.

- **Incompatible Change**: Several changes were made to the processing of multiple-table DELETE statements:

  - Statements could not perform cross-database deletes unless the tables were referred to without using aliases. This limitation has been lifted and table aliases now are allowed.

  - Previously, alias declarations could be given for tables elsewhere than in the *table_references* part of the syntax. This could lead to ambiguous statements that have unexpected results such as deleting rows from the wrong table. Example:

    ```
    DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
    ```

    Now alias declarations can be declared only in the *table_references* part. Elsewhere in the statement, alias references are allowed but not alias declarations.

  - Alias resolution was improved so that it is no longer possible to have inconsistent or ambiguous aliases for tables.

  Statements containing alias constructs that are no longer allowed must be rewritten. (Bug#27525)

  See also Bug#30234.

- **Important Change**: **Replication**: When the master crashed during an update on a transactional table while in autocommit mode, the slave failed. This fix causes every transaction (including autocommit transactions) to be recorded in the binlog as starting with a BEGIN and ending with a COMMIT or ROLLBACK. (Bug#26395)

- **Important Change**: InnoDB free space information is now shown in the Data_free column of SHOW TABLE STATUS and in the DATA_FREE column of the INFORMATION_SCHEMA.TABLES table. (Bug#32440)

  See also Bug#11379.

- **Important Change**: The server handled truncation of values having excess trailing spaces into CHAR, VARCHAR, and TEXT columns in different ways. This behavior has now been made consistent for columns of all three of these types, and now fol-

lows the existing behavior of VARCHAR columns in this regard; that is, a Note is always issued whenever such truncation occurs.

This change does not affect columns of these three types when using a binary encoding; BLOB columns are also unaffected by the change, since they always use a binary encoding. (Bug#30059)

- **Important Change**: An AFTER UPDATE trigger was not invoked when the UPDATE did not make any changes to the table for which the trigger was defined. Now AFTER UPDATE triggers behave the same in this regard as do BEFORE UPDATE triggers, which are invoked whether the UPDATE makes any changes in the table or not. (Bug#23771)

- **Partitioning**: **Important Note**: The following statements did not function correctly with corrupted or crashed tables and have been disabled:

  - ALTER TABLE ... ANALYZE PARTITION
  - ALTER TABLE ... CHECK PARTITION
  - ALTER TABLE ... OPTIMIZE PARTITION
  - ALTER TABLE ... REPAIR PARTITION

  ALTER TABLE ... REBUILD PARTITION is unaffected by this change and continues to be available. This statement and ALTER TABLE ... REORGANIZE PARTITION may be used to analyze and optimize partitioned tables, since these operations cause the partition files to be rebuilt. (Bug#20129)

  See also Bug#39434.

- **Replication**: **Important Note**: Network timeouts between the master and the slave could result in corruption of the relay log. This fix rectifies a long-standing replication issue when using unreliable networks, including replication over wide area networks such as the Internet. If you experience reliability issues and see many YOU HAVE AN ERROR IN YOUR SQL SYNTAX errors on replication slaves, we strongly recommend that you upgrade to a MySQL version which includes this fix. (Bug#26489)

- **MySQL Cluster**: When all data and SQL nodes in the cluster were shut down abnormally (that is, other than by using STOP in the cluster management client), ndb_mgm used excessive amounts of CPU. (Bug#33237)

- **MySQL Cluster**: There was a short interval during the startup process prior to the beginning of heartbeat detection such that, were an API or management node to reboot or a network failure to occur, data nodes could not detect this, with the result that there could be a lingering connection. (Bug#28445)

- **Partitioning**: In some cases, matching rows from a partitioned MyISAM using a BIT column as the primary key were not found by queries. (Bug#34358)

- **Partitioning**: Enabling innodb_file_per_table produced problems with partitioning and tablespace operations on partitioned InnoDB tables, in some cases leading to corrupt partitions or causing the server to crash. (Bug#33429)

- **Partitioning**: A table defined using PARTITION BY KEY and having a BIT column referenced in the partitioning key did not behave correctly; some rows could be inserted into the wrong partition, causing wrong results to be returned from queries. (Bug#33379)

- **Partitioning**: It was possible to partition a table to which a foreign key referred. (Bug#32948)

- **Partitioning**: When ALTER TABLE DROP PARTITION was executed on a table on which there was a trigger, the statement failed with an error. This occurred even if the trigger did not reference any tables. (Bug#32943)

- **Partitioning**: A query of the form SELECT *col1* FROM *table* GROUP BY (SELECT *col2* FROM *table* LIMIT 1); against a partitioned *table* having a SET column crashed the server. (Bug#32772)

- **Partitioning**: SHOW CREATE TABLE misreported the value of AUTO_INCREMENT for partitioned tables using either of the InnoDB or ARCHIVE storage engines. (Bug#32247)

- **Partitioning**: Selecting from INFORMATION_SCHEMA.PARTITIONS while partition management statements (for example, ALTER TABLE ... ADD PARTITION) were executing caused the server to crash. (Bug#32178)

- **Partitioning**: An error in the internal function mysql_unpack_partition() led to a fatal error in subsequent calls to open_table_from_share(). (Bug#32158)

- **Partitioning**: Currently, all partitions of a partitioned table must use the same storage engine. One may optinally specify the storage engine on a per-partition basis; however, where this is the done, the storage engine must be the same as used by the table as a whole. ALTER TABLE did not enforce these rules correctly, the result being that incaccurate error messages were shown when trying to use the statement to change the storage engine used by an individual partition or partitions. (Bug#31931)

- **Partitioning**: `ORDER BY ... DESC` did not always work correctly when selecting from partitioned tables. (Bug#31890)

  See also Bug#31001.

- **Partitioning**: `ALTER TABLE ... COALESCE PARTITION` on a table partitioned by `[LINEAR] HASH` or `[LINEAR] KEY` caused the server to crash. (Bug#30822)

- **Partitioning**: When the `range` access method was used on a partitioned `Falcon` table, the entire index was scanned. For partitioned tables using other storage engines, a related issue caused an ordered range scan to return some rows twice. (Bug#30573, Bug#33257, Bug#33555)

- **Partitioning**: `LIKE` queries on tables partitioned by `KEY` could return incomplete results. The problem was observed with the `Falcon` storage engine, but could affect third-party storage engines as well. (Bug#30480)

  See also Bug#29320, Bug#29493, Bug#30563.

- **Partitioning**: Using the DATA DIRECTORY and INDEX DIRECTORY options for partitions with CREATE TABLE or ALTER TABLE statements appeared to work on Windows, although they are not supported by MySQL on Windows systems, and subsequent attempts to use the tables referenced caused errors. Now these options are disabled on Windows, and attempting to use them generates a warning. (Bug#30459)

- **Partitioning**: It was not possible to insert the greatest possible value for a given data type into a partitioned table. For example, consider a table defined as shown here:

  ```
  CREATE TABLE t (c BIGINT UNSIGNED)
      PARTITION BY RANGE(c) (
        PARTITION p0 VALUES LESS THAN MAXVALUE
      );
  ```

  The largest possible value for a `BIGINT UNSIGNED` column is 18446744073709551615, but the statement `INSERT INTO t VALUES (18446744073709551615);` would fail, even though the same statement succeeded were `t` not a partitioned table.

  In other words, `MAXVALUE` was treated as being equal to the greatest possible value, rather than as a least upper bound. (Bug#29258)

- **Replication**: Replicating a Falcon table that contained a `TEXT` or `BLOB` column would fail during a `DELETE` operation with the error `HA_ERR_END_OF_FILE`. (Bug#36468)

- **Replication**: When using row-based replication, a slave could crash at startup because it received a row-based replication event that `InnoDB` could not handle due to an incorrect test of the query string provided by MySQL, which was `NULL` for row-based replication events. (Bug#35226)

- **Replication**: `insert_id` was not written to the binary log for inserts into `BLACKHOLE` tables. (Bug#35178)

- **Replication**: When using statement-based replication and a `DELETE`, `UPDATE`, or `INSERT ... SELECT` statement using a `LIMIT` clause is encountered, a warning that the statement is not safe to replicate in statement mode is now issued; when using `MIXED` mode, the statement is now replicated using the row-based format. (Bug#34768)

- **Replication**: `mysqlbinlog` did not output the values of `auto_increment_increment` and `auto_increment_offset` when both were equal to their default values (for both of these variables, the default is 1). This meant that a binary log recorded by a client using the defaults for both variables and then replayed on another client using its own values for either or both of these variables produced erroneous results. (Bug#34732)

  See also Bug#31168.

- **Replication**: A `CHANGE MASTER TO` statement with no `MASTER_HEARTBEAT_PERIOD` option failed to reset the heartbeat period to its default value. (Bug#34686)

- **Replication**: `SHOW SLAVE STATUS` failed when slave I/O was about to terminate. (Bug#34305)

- **Replication**: The character sets and collations used for constant identifiers in stored procedures were not replicated correctly. (Bug#34289)

- **Replication**: `mysqlbinlog` from a 5.1 or later MySQL distribution could not read binary logs generated by a 4.1 server when the logs contained `LOAD DATA INFILE` statements. (Bug#34141)

  This regression was introduced by Bug#32407.

- **Replication**: A `CREATE USER`, `DROP USER`, or `RENAME USER` statement that fails on the master, or that is a duplicate of any of these statements, is no longer written to the binlog; previously, either of these occurrences could cause the slave to fail.

(Bug#33862)

See also Bug#29749.

- **Replication**: `SHOW BINLOG EVENTS` could fail when the binlog contained one or more events whose size was close to the value of `max_allowed_packet`. (Bug#33413)
- **Replication**: `mysqlbinlog` failed to release all of its memory after terminating abnormally. (Bug#33247)
- **Replication**: When a stored routine or trigger, running on a master that used MySQL 5.0 or MySQL 5.1.11 or earlier, performed an insert on an `AUTO_INCREMENT` column, the `insert_id` value was not replicated correctly to a slave running MySQL 5.1.12 or later (including any MySQL 6.0 release). (Bug#33029)

  See also Bug#19630.
- **Replication**: The error message generated due to lack of a default value for an extra column was not sufficiently informative. (Bug#32971)
- **Replication**: When a user variable was used inside an `INSERT` statement, the corresponding binlog event was not written to the binlog correctly. (Bug#32580)
- **Replication**: When using row-based replication, deletes from a table with a foreign key constraint failed on the slave. (Bug#32468)
- **Replication**: The `--base64-output` option for `mysqlbinlog` was not honored for all types of events. This interfered in some cases with performing point-in-time recovery. (Bug#32407)
- **Replication**: SQL statements containing comments using `--` syntax were not replayable by `mysqlbinlog`, even though such statements replicated correctly. (Bug#32205)
- **Replication**: When using row-based replication from a master running MySQL 6.0.3 or earlier to a slave running 6.0.4 or later, updates of integer columns failed on the slave with `Error in Unknown event: row application failed`. (Bug#31583)

  This regression was introduced by Bug#21842.
- **Replication**: Replicating write, update, or delete events from a master running MySQL 5.1.15 or earlier to a slave running 5.1.16 or later caused the slave to crash. (Bug#31581)
- **Replication**: When using row-based replication, the slave stopped when attempting to delete non-existent rows from a slave table without a primary key. In addition, no error was reported when this occurred. (Bug#31552)
- **Replication**: Errors due to server ID conflicts were reported only in the slave's error log; now these errors are also shown in the `Server_IO_State` column in the output of `SHOW SLAVE STATUS`. (Bug#31316)
- **Replication**: `STOP SLAVE` did not stop connection attempts properly. If the IO slave thread was attempting to connect, `STOP SLAVE` waited for the attempt to finish, sometimes for a long period of time, rather than stopping the slave immediately. (Bug#31024)

  See also Bug#30932.
- **Replication**: Issuing a `DROP VIEW` statement caused replication to fail if the view did not actually exist. (Bug#30998)
- **Replication**: Replication of `LOAD DATA INFILE` could fail when `read_buffer_size` was larger than `max_allowed_packet`. (Bug#30435)
- **Replication**: Replication crashed with the `NDB` storage engine when `mysqld` was started with `--character-set-server=ucs2`. (Bug#29562)
- **Replication**: The effects of scheduled events were not always correctly reproduced on the slave when using row-based replication. (Bug#29020)
- **Replication**: Setting `server_id` did not update its value for the current session. (Bug#28908)
- **Replication**: Some older servers wrote events to the binary log using different numbering from what is currently used, even though the file format number in the file is the same. Slaves running MySQL 5.1.18 and later could not read these binary logs properly. Binary logs from these older versions now are recognized and event numbers are mapped to the current numbering so that they can be interpreted properly. (Bug#27779, Bug#32434)

  This regression was introduced by Bug#22583.

- **Replication**: `MASTER_POS_WAIT()` did not return `NULL` when the server was not a slave. (Bug#26622)
- **Replication**: The inspecific error message `WRONG PARAMETERS TO FUNCTION REGISTER_SLAVE` resulted when `START SLAVE` failed to register on the master due to excess length of any the slave server options `--report-host`, `--report-user`, or `--report-password`. An error message specific to each of these options is now returned in such cases. The new error messages are:

  - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-HOST'`
  - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-USER'`
  - `FAILED TO REGISTER SLAVE; TOO LONG 'REPORT-PASSWORD'`

  (Bug#22989)

  See also Bug#19328.
- **Replication**: `PURGE BINARY LOGS TO` and `PURGE BINARY LOGS BEFORE` did not handle missing binary log files correctly or in the same way. Now for both of these statements, if any files listed in the `.index` file are missing from the file system, the statement fails with an error.
- **API**: When the language option was not set correctly, API programs calling `mysql_server_init()` crashed. This issue was observed only on Windows platforms. (Bug#31868)
- Corrected a typecast involving `bool` on Mac OS X 10.5 (Leopard), which evaluated differently from earlier Mac OS X versions. (Bug#38217)
- Queries could return different results depending on whether the join buffer was or was not used. (Bug#37131)
- `BACKUP DATABASE` did not correctly determine dependency ordering of backed-up objects, which could cause a `RESTORE` operation to fail. (Bug#36531)
- Concurrent `LOAD DATA INFILE` statements inserting data into `Falcon` tables could crash the server. (Bug#35982)
- Following a server crash, recovery of `Falcon` tables containing `BLOB` or `TEXT` columns could lose data. (Bug#35688)
- Manually replacing a binary log file with a directory having the same name caused an error that was not handled correctly. (Bug#35675)
- Using `LOAD DATA INFILE` with a view could crash the server. (Bug#35469)
- Selecting from `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` could cause a server crash. (Bug#35406)

  See also Bug#35108.
- For a `TEMPORARY` table, `DELETE` with no `WHERE` clause could fail when preceded by `DELETE` statements with a `WHERE` clause. (Bug#35392)
- In some cases, when too many clients tried to connect to the server, the proper `SQLSTATE` code was not returned. (Bug#35289)
- Memory-allocation failures for attempts to set `key_buffer_size` to large values could result in a server crash. (Bug#35272)
- Queries could return different results depending on whether `ORDER BY` columns were indexed. (Bug#35206)
- When a view containing a reference to `DUAL` was created, the reference was removed when the definition was stored, causing some queries against the view to fail with invalid SQL syntax errors. (Bug#35193)
- `SELECT ... FROM INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` caused the server to crash if the table referenced by a foreign key had been dropped. This issue was observed on Windows platforms only. (Bug#35108)

  See also Bug#35406.
- Debugging symbols were missing for some executables in Windows binary distributions. (Bug#35104)
- Non-connection threads were being counted in the value of the `Max_used_connections` status variable. (Bug#35074)
- Two different threads could obtain the same record number for concurrent inserts into the same `Falcon` table. (Bug#34990)
- A query that performed a `ref_or_null` join where the second table used a key having one or columns that could be `NULL` and had a column value that was `NULL` caused the server to crash. (Bug#34945)

  This regression was introduced by Bug#12144.

- For some queries, the optimizer used an ordered index scan for `GROUP BY` or `DISTINCT` when it was supposed to use a loose index scan, leading to incorrect results. (Bug#34928)
- Creating a foreign key on an `InnoDB` table that was created with an explicit `AUTO_INCREMENT` value caused that value to be reset to 1. (Bug#34920)
- `mysqldump` failed to return an error code when using the `--master-data` option without binary logging being enabled on the server. (Bug#34909)
- Under some circumstances, the value of `mysql_insert_id()` following a `SELECT ... INSERT` statement could return an incorrect value. This could happen when the last `SELECT ... INSERT` did not involve an `AUTO_INCREMENT` column, but the value of `mysql_insert_id()` was changed by some previous statements. (Bug#34889)
- Logging to the progress tables used by `BACKUP DATABASE` and `RESTORE` caused a server crash. (Bug#34858)
- Table and database names were mixed up in some places of the subquery transformation procedure. This could affect debugging trace output and further extensions of that procedure. (Bug#34830)
- If `fsync()` returned `ENOLCK`, `InnoDB` could treat this as fatal and cause abnormal server termination. `InnoDB` now retries the operation. (Bug#34823)
- `CREATE SERVER` and `ALTER SERVER` could crash the server if out-of-memory conditions occurred. (Bug#34790)
- `DROP SERVER` does not release memory cached for server structures created by `CREATE SERVER`, so repeated iterations of these statements resulted in a memory leak. `FLUSH PRIVILEGES` now releases the memory allocated for `CREATE SERVER`. (Bug#34789)
- A malformed URL used for a `FEDERATED` table's `CONNECTION` option value in a `CREATE TABLE` statement was not handled correctly and could crash the server. (Bug#34788)
- Repeated `UPDATE` operations on a `Falcon` table could cause a memory leak. (Bug#34778)
- Queries such as `SELECT ROW(1, 2) IN (SELECT t1.a, 2) FROM t1 GROUP BY t1.a` (combining row constructors and subqueries in the `FROM` clause) could lead to assertion failure or unexpected error messages. (Bug#34763)
- Using `NAME_CONST()` with a negative number and an aggregate function caused MySQL to crash. This could also have a negative impact on replication. (Bug#34749)
- A memory-handling error associated with use of `GROUP_CONCAT()` in subqueries could result in a server crash. (Bug#34747)
- For an indexed integer column *`col_name`* and a value *`N`* that is one greater than the maximum value allowed for the data type of *`col_name`*, conditions of the form `WHERE col_name < N` failed to return rows where the value of *`col_name`* is `N - 1`. (Bug#34731)
- A server running with the `--debug` option could attempt to dereference a null pointer when opening tables, resulting in a crash. (Bug#34726)
- Assigning an “incremental” value to the `debug` system variable did not add the new value to the current value. For example, if the current `debug` value was `'T'`, the statement `SET debug = '+P'` resulted in a value of `'P'` rather than the correct value of `'P:T'`. (Bug#34678)
- For debug builds, reading from `INFORMATION_SCHEMA.TABLES` or `INFORMATION_SCHEMA.COLUMNS` could cause assertion failures. This could happen under rare circumstances when `INFORMATION_SCHEMA` fails to get information about a table (for example, when a connection is killed). (Bug#34656)
- Executing a `TRUNCATE` statement on a table having both a foreign key reference and a `DELETE` trigger crashed the server. (Bug#34643)
- Some subqueries using an expression that included an aggregate function could fail or in some cases lead to a crash of the server. (Bug#34620)
- Dangerous pointer arithmetic crashed the server on some systems. (Bug#34598)
- Creating a view inside a stored procedure could lead to a crash of the MySQL Server. (Bug#34587)
- Concurrent `ALTER TABLE` operations on temporary and non-temporary `Falcon` tables caused the server to hang. (Bug#34567)

  This regression was introduced by Bug#33634.
- A server crash could occur if `INFORMATION_SCHEMA` tables built in memory were swapped out to disk during query execu-

tion. (Bug#34529)

- `CAST(AVG(arg) AS DECIMAL)` produced incorrect results for non-`DECIMAL` arguments. (Bug#34512)
- `SET GLOBAL falcon_record_chill_threshold` and `SET GLOBAL falcon_index_chill_threshold` did not work. (Bug#34486)
- The per-thread debugging settings stack was not being deallocated before thread termination, resulting in a stack memory leak. (Bug#34424)
- Client applications could not connect to the server on Windows Vista because the server was creating an IPv6-only TCP/IP socket. (Bug#34381)
- Inserting a unique record into a `Falcon` table, then performing a `DELETE` on the same record resulted in the error `RECORD HAS CHANGED SINCE LAST READ`. (Bug#34351)

  See also Bug#29151, Bug#35321.
- Executing an `ALTER VIEW` statement on a table crashed the server. (Bug#34337)
- For `InnoDB`, exporting and importing a table could corrupt `TINYBLOB` columns, and a subsequent `ALTER TABLE` could corrupt `TINYTEXT` columns as well. (Bug#34300)
- On Windows, client programs generated assertion failures. (Bug#34298)
- `DEFAULT 0` was not allowed for the `YEAR` data type. (Bug#34274)
- Under some conditions, a `SET GLOBAL innodb_commit_concurrency` or `SET GLOBAL innodb_autoextend_increment` statement could fail. (Bug#34223)
- `mysqldump` attempts to set the `character_set_results` system variable after connecting to the server. This failed for pre-4.1 servers that have no such variable, but `mysqldump` did not account for this and 1) failed to dump database contents; 2) failed to produce any error message alerting the user to the problem. (Bug#34192)
- Use of stored functions in the `WHERE` clause for `SHOW OPEN TABLES` caused a server crash. (Bug#34166)
- Compilation failed on Solaris for the `ARCHIVE` storage engine due to inclusion of `getopt.h` in the `ARCHIVE` code. (Bug#34094)
- `CREATE TABLE ... ENGINE=Falcon` failed with an unhelpful error message when the `Falcon` storage engine had failed to allocate the page cache properly on server startup. Now, `Falcon` is initialized on server startup, and is not loaded if the allocation fails. (Bug#34085)
- Updates of floating-point columns in `FEDERATED` tables could produce incorrect results. (Bug#34015)
- For a `FEDERATED` table with an index on a nullable column, accessing the table could crash a server, return an incorrect result set, or return `ERROR 1030 (HY000): Got error 1430 from storage engine`. (Bug#33946)
- Passing anything other than a integer to a `LIMIT` clause in a prepared statement would fail. (This limitation was introduced to avoid replication problems; for example, replicating the statement with a string argument would cause a parse failure in the slave). Now, arguments to the `LIMIT` clause are converted to integer values, and these converted values are used when logging the statement. (Bug#33851)
- An internal buffer in `mysql` was too short. Overextending it could cause stack problems or segmentation violations on some architectures. (This is not a problem that could be exploited to run arbitrary code.) (Bug#33841)
- A query using `WHERE (column1='string1' AND column2=constant1) OR (column1='string2' AND column2=constant2)`, where `col1` used a binary collation and `string1` matched `string2` except for case, failed to match any records even when matches were found by a query using the equivalent clause `WHERE column2=constant1 OR column2=constant2`. (Bug#33833)
- Large unsigned integers were improperly handled for prepared statements, resulting in truncation or conversion to negative numbers. (Bug#33798)
- Reuse of prepared statements could cause a memory leak in the embedded server. (Bug#33796)
- The server crashed when executing a query that had a subquery containing an equality X=Y where Y referred to a named select list expression from the parent select. The server crashed when trying to use the X=Y equality for `ref`-based access. (Bug#33794)
- Some queries using a combination of `IN`, `CONCAT()`, and an implicit type conversion could return an incorrect result.

Bug#33764)

- In some cases a query that produced a result set when using `ORDER BY ASC` did not return any results when this was changed to `ORDER BY DESC`. (Bug#33758)
- Disabling concurrent inserts caused some cacheable queries not to be saved in the query cache. (Bug#33756)
- `ORDER BY ... DESC` sorts could produce misordered results. (Bug#33697)
- Use of uninitialized memory for `filesort` in a subquery caused a server crash. (Bug#33675)
- The `WEIGHT_STRING()` function returned incorrect results for column values when earlier column values were `NULL`. (Bug#33663)
- The server could crash when `REPEAT` or another control instruction was used in conjunction with labels and a `LEAVE` instruction. (Bug#33618)
- The parser allowed control structures in compound statements to have mismatched beginning and ending labels. (Bug#33618)
- `make_binary_distribution` passed the `--print-libgcc-file` option to the C compiler, but this does not work with the `ICC` compiler. (Bug#33536)
- Threads created by the event scheduler were incorrectly counted against the `max_connections` thread limit, which could lead to client lockout. (Bug#33507)
- `CREATE TABLE ... ENGINE=Falcon` failed on kernel 2.4 based Linux systems when using `O_DIRECT` with an NFS file system. (Bug#33484)
- Dropping a function after dropping the function's creator could cause the server to crash. (Bug#33464)
- For the `latin2_czech_cs` collation, the primary weights for all variants of capital letters `U` and `O` were incorrect (were not equal to the corresponding small letters).

  As a result of this bug fix, indexes must be rebuilt for columns that use the `latin2_czech_cs collation`. See Section 2.11.3, “Checking Whether Table Indexes Must Be Rebuilt”. (Bug#33452)
- Certain combinations of views, subselects with outer references and stored routines or triggers could cause the server to crash. (Bug#33389)
- `SET GLOBAL myisam_max_sort_file_size=DEFAULT` set `myisam_max_sort_file_size` to an incorrect value. (Bug#33382)

  See also Bug#31177.
- `ENUM`- or `SET`-valued plugin variables could not be set from the command line. (Bug#33358)
- If the `mysql` database was named in the `BACKUP DATABASE` statement, the backup operation hung. (Bug#33355)
- Loading plugins via command-line options to `mysqld` could cause an assertion failure. (Bug#33345)
- `SLEEP(0)` failed to return on 64-bit Mac OS X due to a bug in `pthread_cond_timedwait()`. (Bug#33304)
- `CREATE TABLE ... SELECT` created tables that for date columns used the obsolete `Field_date` type instead of `Field_newdate`. (Bug#33256)
- For `MyISAM` tables, `CHECK TABLE` (non-`QUICK`) and any form of `REPAIR TABLE` incorrected treated rows as corrupted under the combination of the following conditions:

  - The table had dynamic row format
  - The table had a `CHAR` (not `VARCHAR`) column longer than 127 bytes (for multi-byte character sets this could be less than 127 characters)
  - The table had rows with a signifcant length of more than 127 bytes significant length in that `CHAR` column (that is, a byte beyond byte position 127 must be a non-space character)

  This problem affected `CHECK TABLE`, `REPAIR TABLE`, `OPTIMIZE TABLE`, `ALTER TABLE`. `CHECK TABLE` reported and marked the table as crashed if any row was present that fulfilled the third condition. The other statements deleted these rows. (Bug#33222)
- The error message was vague for attempts to drop a `Falcon` tablespace that contained tables. Now the message `TABLESPACE`

BUSY is returned. (Bug#33216)

- When creating temporary tables within Falcon, the tables are automatically created in the FALCON_TEMPORARY tablespace. If you specify an alternate tablespace to the CREATE TABLE statement a warning will now be issued to that effect. (Bug#33211)
- Granting the UPDATE privilege on one column of a view caused the server to crash. (Bug#33201)
- For DECIMAL columns used with the ROUND(*X*,*D*) or TRUNCATE(*X*,*D*) function with a non-constant value of *D*, adding an ORDER BY for the function result produced misordered output. (Bug#33143)

  See also Bug#33402, Bug#30617.
- Some valid SELECT statements could not be used as views due to incorrect column reference resolution. (Bug#33133)
- The weight for supplementary Unicode characters should be 0xFFFD, but the WEIGHT_STRING() function returned 0x0DC6 instead. (Bug#33077)
- The CSV engine did not honor update requests for BLOB columns when the new column value had the same length as the value to be updated. (Bug#33067)
- After receiving a SIGHUP signal, the server could crash, and user-specified log options were ignored when reopening the logs. (Bug#33065)
- Repeatedly executing a query with a semi-join subquery could cause a server crash. (Bug#33062)
- The fix for Bug#11230 and Bug#26215 introduced a significant input-parsing slowdown for the mysql client. This has been corrected. (Bug#33057)
- When MySQL was built with OpenSSL, the SSL library was not properly initialized with information of which endpoint it was (server or client), causing connection failures. (Bug#33050)
- Under some circumstances a combination of aggregate functions and GROUP BY in a SELECT query over a view could lead to incorrect calculation of the result type of the aggregate function. This in turn could lead to incorrect results, or to crashes on debug builds of the server. (Bug#33049)
- It was not possible to set the value of falcon_consistent_read within the local scope. You can now set the global value, using SET GLOBAL, but this affects only the current local scope and all new connections made after the global variable was set. (Bug#33041)
- The new index condition pushdown optimization could cause a server crash when used with the range access method over an InnoDB table. (Bug#33033)
- For DISTINCT queries, 4.0 and 4.1 stopped reading joined tables as soon as the first matching row was found. However, this optimization was lost in MySQL 5.0, which instead read all matching rows. This fix for this regression may result in a major improvement in performance for DISTINCT queries in cases where many rows match. (Bug#32942)
- Repeated creation and deletion of views within prepared statements could eventually crash the server. (Bug#32890)

  See also Bug#34587.
- The correct data type for a NULL column resulting from a UNION could be determined incorrectly in some cases: 1) Not correctly inferred as NULL depending on the number of selects; 2) Not inferred correctly as NULL if one select used a subquery. (Bug#32848)
- For queries containing GROUP_CONCAT(DISTINCT *col_list* ORDER BY *col_list*), there was a limitation that the DISTINCT columns had to be the same as ORDER BY columns. Incorrect results could be returned if this was not true. (Bug#32798)
- Incorrect assertions could cause a server crash for DELETE triggers for transactional tables. (Bug#32790)
- SHOW EVENTS and selecting from the INFORMATION_SCHEMA.EVENTS table failed if the current database was INFORMATION_SCHEMA. (Bug#32775)
- In some cases where setting a system variable failed, no error was sent to the client, causing the client to hang. (Bug#32757)
- Enabling the PAD_CHAR_TO_FULL_LENGTH SQL mode caused privilege-loading operations (such as FLUSH PRIVILEGES) to include trailing spaces from grant table values stored in CHAR columns. Authentication for incoming connections failed as a result. Now privilege loading does not include trailing spaces, regardless of SQL mode. (Bug#32753)
- Use of the cp932 character set with CAST() in an ORDER BY clause could cause a server crash. (Bug#32726)

- The `SHOW ENGINE INNODB STATUS` and `SHOW ENGINE INNODB MUTEX` statements incorrectly required the `SUPER` privilege rather than the `PROCESS` privilege. (Bug#32710)
- Inserting strings with a common prefix into a table that used the `ucs2` character set corrupted the table. (Bug#32705)
- A subquery using an `IS NULL` check of a column defined as `NOT NULL` in a table used in the `FROM` clause of the outer query produced an invalid result. (Bug#32694)
- Specifying a non-existent column for an `INSERT DELAYED` statement caused a server crash rather than producing an error. (Bug#32676)
- Tables in the `mysql` database that stored the current `sql_mode` value as part of stored program definitions were not updated with newer mode values (`NO_ENGINE_SUBSTITUTION`, `PAD_CHAR_TO_FULL_LENGTH`). This causes various problems defining stored programs if those modes were included in the current `sql_mode` value. (Bug#32633)
- Use of `CLIENT_MULTI_QUERIES` caused `libmysqld` to crash. (Bug#32624)
- A `SELECT ... GROUP BY bit_column` query failed with an assertion if the length of the `BIT` column used for the `GROUP BY` was not an integer multiple of 8. (Bug#32556)
- A view created with a string literal for one of the columns picked up the connection character set, but not the collation. Comparison to that field therefore used the default collation for that character set, causing an error if the connection collation was not compatible with the default collation. The problem was caused by text literals in a view being dumped with a character set introducer even when this was not necessary, sometimes leading to a loss of collation information. Now the character set introducer is dumped only if it was included in the original query. (Bug#32538)

  See also Bug#21505.
- Using `SELECT INTO OUTFILE` with 8-bit `ENCLOSED BY` characters led to corrupted data when the data was reloaded using LOAD DATA INFILE. This was because `SELECT INTO OUTFILE` failed to escape the 8-bit characters. (Bug#32533)
- For `FLUSH TABLES WITH READ LOCK`, the server failed to properly detect write-locked tables when running with low-priority updates, resulting in a crash or deadlock. (Bug#32528)
- Queries using `LIKE` on tables having indexed `CHAR` columns using either of the `eucjpms` or `ujis` character sets did not return correct results. (Bug#32510)
- A query of the form `SELECT @user_variable := constant AS alias FROM table GROUP BY alias WITH ROLLUP` crashed the server. (Bug#32482)
- Sending several `KILL QUERY` statements to target a connection running `SELECT SLEEP()` could freeze the server. (Bug#32436)
- `ssl-cipher` values in option files were not being read by `libmysqlclient`. (Bug#32429)
- Repeated execution of a query containing a `CASE` expression and numerous `AND` and `OR` relations could crash the server. The root cause of the issue was determined to be that the internal `SEL_ARG` structure was not properly initialized when created. (Bug#32403)
- Referencing within a subquery an alias used in the `SELECT` list of the outer query was incorrectly permitted. (Bug#32400)
- If a global read lock acquired with `FLUSH TABLES WITH READ LOCK` was in effect, executing `ALTER TABLE` could cause a server crash. (Bug#32395)
- `utf16` columns allowed incorrect Unicode characters inserted through conversion from another Unicode character set. (Bug#32393)
- An `ORDER BY` query on a view created using a `FEDERATED` table as a base table caused the server to crash. (Bug#32374)
- The `mysqldump` utility did not print enough version information about itself at the top of its output. The output now shows the same information as `mysqldump` invoked with the `-V` option, namely the `mysqldump` version number, the MySQL server version, and the distribution. (Bug#32350)
- Comparison of a `BIGINT NOT NULL` column with a constant arithmetic expression that evaluated to NULL mistakenly caused the error `Column '...' cannot be null` (error 1048). (Bug#32335)
- Assigning a 65,536-byte string to a `TEXT` column (which can hold a maximum of 65,535 bytes) resulted in truncation without a warning. Now a truncation warning is generated. (Bug#32282)
- The `LAST_DAY()` function returns a `DATE` value, but internally the value did not have the time fields zeroed and calculations involving the value could return incorrect results. (Bug#32270)

- `MIN()` and `MAX()` could return incorrect results when an index was present if a loose index scan was used. (Bug#32268)

- Executing a prepared statement associated with a materialized cursor sent to the client a metadata packet with incorrect table and database names. The problem occurred because the server sent the name of the temporary table used by the cursor instead of the table name of the original table.

  The same problem occured when selecting from a view, in which case the name of the table name was sent, rather than the name of the view. (Bug#32265)

- Memory corruption could occur due to large index map in `Range checked for each record` status reported by `EXPLAIN SELECT`. The problem was based in an incorrectly calculated length of the buffer used to store a hexadecimal representation of an index map, which could result in buffer overrun and stack corruption under some circumstances. (Bug#32241)

- Various test program cleanups were made: 1) `mytest` and `libmysqltest` were removed. 2) `bug25714` displays an error message when invoked with incorrect arguments or the `--help` option. 3) `mysql_client_test` exits cleanly with a proper error status. (Bug#32221)

- The default grant tables on Windows contained information for host `production.mysql.com`, which should not be there. (Bug#32219)

- For comparisons of the form *`date_col OP datetime_const`* (where *`OP`* is `=`, `<`, `>`, `<=`, or `>=`), the comparison is done using `DATETIME` values, per the fix for Bug#27590. However that fix caused any index on *`date_col`* not to be used and compromised performance. Now the index is used again. (Bug#32198)

- `DATETIME` arguments specified in numeric form were treated by `DATE_ADD()` as `DATE` values. (Bug#32180)

- When `configure` was run with `--with-libevent`, `libevent` was not linked statically with `mysqld`, preventing `mysqld` from being run with a debugger. (Bug#32156)

- `InnoDB` adaptive hash latches could be held too long, resulting in a server crash. This fix may also provide significant performance improvements on systems on which many queries using filesorts with temporary tables are being performed. (Bug#32149)

- Killing a statement could lead to a race condition in the server. (Bug#32148)

- String-to-double conversion was performed differently when the prepared-statement protocol was used from when it was not. (Bug#32095)

- With `lower_case_table_names` set, `CREATE TABLE LIKE` was treated differently by `libmysqld` than by the non-embedded server. (Bug#32063)

- On Windows, `mysqltest_embedded.exe` did not properly execute the `send` command. (Bug#32044)

- Within a subquery, `UNION` was handled differently than at the top level, which could result in incorrect results or a server crash. (Bug#32036, Bug#32051)

- `HOUR()`, `MINUTE()`, and `SECOND()` could return nonzero values for `DATE` arguments. (Bug#31990)

- A variable named `read_only` could be declared even though that is a reserved word. (Bug#31947)

- On Windows, the build process failed with four parallel build threads. (Bug#31929)

- Changing the SQL mode to cause dates with “zero” parts to be considered invalid (such as `'1000-00-00'`) could result in indexed and non-indexed searches returning different results for a column that contained such dates. (Bug#31928)

- The server used unnecessarily large amounts of memory when user variables were used as an argument to `CONCAT()` or `CONCAT_WS()`. (Bug#31898)

- Queries testing numeric constants containing leading zeroes against `ZEROFILL` columns were not evaluated correctly. (Bug#31887)

- `mysql-test-run.pl` sometimes set up test scenarios in which the same port number was passed to multiple servers, causing one of them to be unable to start. (Bug#31880)

- Using `ORDER BY` led to the wrong result when using the `ARCHIVE` on a table with a `BLOB` when the table cache was full. The table could also be reported as crashed after the query had completed, even though the table data was intact. (Bug#31833)

- Name resolution for correlated subqueries and `HAVING` clauses failed to distinguish which of two was being performed when there was a reference to an outer aliased field. This could result in error messages about a `HAVING` clause for queries that had no such clause. (Bug#31797)

- If an error occurred during file creation, the server sometimes did not remove the file, resulting in an unused file in the file system. (Bug#31781)
- The `mysqld` crash handler failed on Windows. (Bug#31745)
- `mysqlslap` failed to commit after the final record load. (Bug#31704)
- `ucs2` does not work as a client character set, but attempts to use it as such were not rejected. Now `character_set_client` cannot be set to `ucs2`. This also affects statements such as `SET NAMES` and `SET CHARACTER SET`. (Bug#31615)
- The server returned the error message `Out of memory; restart server and try again` when the actual problem was that the sort buffer was too small. Now an appropriate error message is returned in such cases. (Bug#31590)
- For a table that had been opened with `HANDLER` and marked for reopening after being closed with `FLUSH TABLES`, `DROP TABLE` did not properly discard the handler. (Bug#31397)
- A table having an index that included a `BLOB` or `TEXT` column, and that was originally created with a MySQL server using version 4.1 or earlier, could not be opened by a 5.1 or later server. (Bug#31331)
- The `-`, `*`, and `/` operators and the functions `POW()` and `EXP()` could misbehave when used with floating-point numbers. Previously they might return `+INF`, `-INF`, or `NaN` in cases of numeric overflow (including that caused by division by zero) or when invalid arguments were used. Now `NULL` is returned in all such cases. (Bug#31236)
- The `mysql_change_user()` C API function caused global `Com_xxx` status variable values to be incorrect. (Bug#31222)
- When sorting privilege table rows, the server treated escaped wildcard characters (`\%` and `\_`) the same as unescaped wildcard characters (`%` and `_`), resulting in incorrect row ordering. (Bug#31194)
- Server variables could not be set to their current values on Linux platforms. (Additional fixes were made in MySQL 6.0.9 and 6.0.10.) (Bug#31177)

  See also Bug#6958.
- Data in `BLOB` or `GEOMETRY` columns could be cropped when performing a `UNION` query. (Bug#31158)
- The server crashed in the parser when running out of memory. Memory handling in the parser has been improved to gracefully return an error when out-of-memory conditions occur in the parser. (Bug#31153)
- MySQL declares a `UNIQUE` key as a `PRIMARY` key if it doesn't have `NULL` columns and is not a partial key, and the `PRIMARY` key must alway be the first key. However, in some cases, a non-first key could be reported as `PRIMARY`, leading to an assert failure by `InnoDB`. This is fixed by correcting the key sort order. (Bug#31137)
- Many nested subqueries in a single query could led to excessive memory consumption and possibly a crash of the server. (Bug#31048)
- An assertion failure occurred for queries containing two subqueries if both subqueries were evaluated using a semi-join strategy. (Bug#31040)
- On Windows, `SHOW PROCESSLIST` could display process entries with a `State` value of `*** DEAD ***`. (Bug#30960)
- `ROUND(X,D)` or `TRUNCATE(X,D)` for non-constant values of `D` could crash the server if these functions were used in an `ORDER BY` that was resolved using `filesort`. (Bug#30889)
- Resetting the query cache by issuing a `SET GLOBAL query_cache_size=0` statement caused the server to crash if it concurrently was saving a new result set to the query cache. (Bug#30887)
- Manifest problems prevented `MySQLInstanceConfig.exe` from running on Windows Vista. (Bug#30823)
- The optimizer incorrectly optimized conditions out of the `WHERE` clause in some queries involving subqueries and indexed columns. (Bug#30788)
- If an alias was used to refer to the value returned by a stored function within a subselect, the outer select recognized the alias but failed to retrieve the value assigned to it in the subselect. (Bug#30787)
- Improper calculation of `CASE` expression results could lead to value truncation. (Bug#30782)
- The `thread_handling` system variable was treated as having a `SESSION` value and as being settable at runtime. Now it has only a `GLOBAL` read-only value. (Bug#30651)
- If the optimizer used a Multi-Range Read access method for index lookups, incorrect results could occur for rows that con-

tained any of the `BLOB` or `TEXT` data types. (Bug#30622)

- Binary logging for a stored procedure differed depending on whether or not execution occurred in a prepared statement. (Bug#30604)
- When casting a string value to an integer, cases where the input string contained a decimal point and was long enough to overrun the `unsigned long long` type were not handled correctly. The position of the decimal point was not taken into account which resulted in miscalculated numbers and incorrect truncation to appropriate SQL data type limits. (Bug#30453)
- With `libmysqld`, use of prepared statements and the query cache at the same time caused problems. (Bug#30430)
- For `CREATE ... SELECT ... FROM`, where the resulting table contained indexes, adding `SQL_BUFFER_RESULT` to the `SELECT` part caused index corruption in the table. (Bug#30384)
- An orphaned PID file from a no-longer-running process could cause `mysql.server` to wait for that process to exit even though it does not exist. (Bug#30378)
- The optimizer made incorrect assumptions about the value of the `is_member` value for user-defined functions, sometimes resulting in incorrect ordering of UDF results. (Bug#30355)
- The `Table_locks_waited` waited variable was not incremented in the cases that a lock had to be waited for but the waiting thread was killed or the request was aborted. (Bug#30331)
- Simultaneous `ALTER TABLE` statements for `BLACKHOLE` tables caused 100% CPU use due to locking problems. (Bug#30294)
- Tables with a `GEOMETRY` column could be marked as corrupt if you added a non-`SPATIAL` index on a `GEOMETRY` column. (Bug#30284)
- Flushing a merge table between the time it was opened and its child table were actually attached caused the server to crash. (Bug#30273)

  This regression was introduced by Bug#26379.
- The `Com_create_function` status variable was not incremented properly. (Bug#30252)
- For Multi-Range Read scans used to resolve `LIMIT` queries, failure to close the scan caused file descriptor leaks for `MyISAM` tables. (Bug#30221)
- View metadata returned from `INFORMATION_SCHEMA.VIEWS` was changed by the fix for Bug#11986, causing the information returned in MySQL 5.1 to differ from that returned in 5.0. (Bug#30217)
- If the server crashed during an `ALTER TABLE` statement, leaving a temporary file in the database directory, a subsequent `DROP DATABASE` statement failed due to the presence of the temporary file. (Bug#30152)
- The parser accepted an `INTO` clause in nested `SELECT` statements, which is invalid because such statements must return their results to the outer context. (Bug#30105, Bug#33204)
- For tables with `FLOAT` or `DOUBLE` columns, `CHECKSUM TABLE` could report different results on master and slave servers. (Bug#30041)
- `mysqld` displayed the `--enable-pstack` option in its help message even if MySQL was configured without `--with-pstack`. (Bug#29836)
- The `mysql_config` command would output `CFLAGS` values that were incompatible with C++ for the HP-UX platform. (Bug#29645)
- Views were treated as insertable even if some base table columns with no default value were omitted from the view definition. (This is contrary to the condition for insertability that a view must contain all columns in the base table that do not have a default value.) (Bug#29477)
- `myisamchk` always reported the character set for a table as `latin1_swedish_ci (8)` regardless of the table' actual character set. (Bug#29182)
- Denormalized double-precision numbers cannot be handled properly by old MIPS pocessors. For IRIX, this is now handled by enabling a mode to use a software workaround. (Bug#29085)
- When doing a `DELETE` on a table that involved a `JOIN` with `MyISAM` or `MERGE` tables and the `JOIN` referred to the same table, the operation could fail reporting `ERROR 1030 (HY000): Got error 134 from storage engine`. This was because scans on the table contents would change because of rows that had already been deleted. (Bug#28837)

- `SHOW VARIABLES` did not correctly display the value of the `thread_handling` system variable. (Bug#28785)

- When running the MySQL Instance Configuration Wizard, a race condition could exist that would fail to connect to a newly configured instance. This was because `mysqld` had not completed the startup process before the next stage of the installation process. (Bug#28628)

- For upgrading to a new major version using RPM packages (such as 4.1 to 5.0), if the installation procedure found an existing MySQL server running, it could fail to shut down the old server, but also erroneously removed the server's socket file. Now the procedure checks for an existing server package from a different vendor or major MySQL version. In such case, it refuses to install the server and recommends how to safely remove the old packages before installing the new ones. (Bug#28555)

- `mysqlhotcopy` silently skipped databases with names consisting of two alphanumeric characters. (Bug#28460)

- No information was written to the general query log for the `COM_STMT_CLOSE`, `COM_STMT_RESET`, and `COM_STMT_SEND_LONG_DATA` commands. (These occur when a client invokes the `mysql_stmt_close()`, `mysql_stmt_reset()` and `mysql_stmt_send_long_data()` C API functions.) (Bug#28386)

- Previously, the parser accepted the ODBC `{ OJ ... LEFT OUTER JOIN ...}` syntax for writing left outer joins. The parser now allows `{ OJ ... }` to be used to write other types of joins, such as `INNER JOIN` or `RIGHT OUTER JOIN`. This helps with compatibility with some third-party applications, but is not official ODBC syntax. (Bug#28317)

- The `FEDERATED` storage engine did not perform identifier quoting for column names that are reserved words when sending statements to the remote server. (Bug#28269)

- The SQL parser did not accept an empty `UNION=()` clause. This meant that, when there were no underlying tables specified for a `MERGE` table, `SHOW CREATE TABLE` and `mysqldump` both output statements that could not be executed.

  Now it is possible to execute a `CREATE TABLE` or `ALTER TABLE` statement with an empty `UNION=()` clause. However, `SHOW CREATE TABLE` and `mysqldump` do not output the `UNION=()` clause if there are no underlying tables specified for a `MERGE` table. This also means it is now possible to remove the underlying tables for a `MERGE` table using `ALTER TABLE ... UNION=()`. (Bug#28248)

- An `ORDER BY` at the end of a `UNION` affected individual `SELECT` statements rather than the overall query result. (Bug#27848)

- It was possible to exhaust memory by repeatedly running `index_merge` queries and never performing any `FLUSH TABLES` statements. (Bug#27732)

- When `utf8` was set as the connection character set, using `SPACE()` with a non-Unicode column produced an error. (Bug#27580)

  See also Bug#23637.

- A race condition between killing a statement and the thread executing the statement could lead to a situation such that the binary log contained an event indicating that the statement was killed, whereas the statement actually executed to completion. (Bug#27571)

- Some queries using the `NAME_CONST()` function failed to return either a result or an error to the client, causing it to hang. This was due to the fact that there was no check to insure that both arguments to this function were constant expressions. (Bug#27545, Bug#32559)

- Evaluation of an `IN()` predicate containing a decimal-valued argument caused a server crash. (Bug#27513, Bug#27362, CVE-2007-2583)

- With the `read_only` system variable enabled, `CREATE DATABASE` and `DROP DATABASE` were allowed to users who did not have the `SUPER` privilege. (Bug#27440)

- The parser rules for the `SHOW PROFILE` statement were revised to work with older versions of `bison`. (Bug#27433)

- `resolveip` failed to produce correct results for host names that begin with a digit. (Bug#27427)

- In `ORDER BY` clauses, mixing aggregate functions and non-grouping columns is not allowed if the `ONLY_FULL_GROUP_BY` SQL mode is enabled. However, in some cases, no error was thrown because of insufficient checking. (Bug#27219)

- For the `--record_log_pos` option, `mysqlhotcopy` now determines the slave status information from the result of `SHOW SLAVE STATUS` by using the `Relay_Master_Log_File` and `Exec_Master_Log_Pos` values rather than the `Master_Log_File` and `Read_Master_Log_Pos` values. This provides a more accurate indication of slave execution relative to the master. (Bug#27101)

- Memory corruption, a crash of the MySQL server, or both, could take place if a low-level I/O error occurred while an `ARCHIVE` table was being opened. (Bug#26978)

- `SHOW PROFILE` hung if executed before enabling the `@@profiling` session variable. (Bug#26938)
- The `mysql_insert_id()` C API function sometimes returned different results for `libmysqld` and `libmysqlclient`. (Bug#26921)
- Symbolic links on Windows could fail to work. (Bug#26811)
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. (Bug#26788)

  See also Bug#12860.
- The default database is no longer changed to `NULL` ("no database") if `DROP DATABASE` for that database failed. (Bug#26704)
- `DROP DATABASE` failed for attempts to drop databases with names that contained the legacy `#mysql50#` name prefix. (Bug#26703)
- `config-win.h` unconditionally defined `bool` as `BOOL`, causing problems on systems where `bool` is 1 byte and `BOOL` is 4 bytes. (Bug#26461)
- It makes no sense to attempt to use `ALTER TABLE ... ORDER BY` to order an `InnoDB` table if there is a user-defined clustered index, because rows are always ordered by the clustered index. Such attempts now are ignored and produce a warning.

  Also, in some cases, `InnoDB` incorrectly used a secondary index when the clustered index would produce a faster scan. `EXPLAIN` output now indicates use of the clustered index (for tables that have one) as lines with a `type` value of `index`, a `key` value of `PRIMARY`, and without `Using index` in the `Extra` value. (Bug#26447)

  See also Bug#35850.
- On Windows, for distributions built with debugging support, `mysql` could crash if the user typed Control-C. (Bug#26243)
- When symbolic links were disabled, either with a server startup option or by enabling the `NO_DIR_IN_CREATE` SQL mode, `CREATE TABLE` silently ignored the `DATA DIRECTORY` and `INDEX DIRECTORY` table options. Now the server issues a warning if symbolic links are disabled when these table options are used. (Bug#25677)
- `CREATE TABLE LIKE` did not work when the source table was an `INFORMATION_SCHEMA` table. (Bug#25629)
- Attempting to create an index with a prefix on a `DECIMAL` column appeared to succeed with an inaccurate warning message. Now, this action fails with the error `INCORRECT PREFIX KEY; THE USED KEY PART ISN'T A STRING, THE USED LENGTH IS LONGER THAN THE KEY PART, OR THE STORAGE ENGINE DOESN'T SUPPORT UNIQUE PREFIX KEYS`. (Bug#25426)
- `mysqlcheck -A -r` did not correctly identify all tables that needed repairing. (Bug#25347)
- On Windows, an error in `configure.js` caused installation of source distributions to fail. (Bug#25340)
- The `Qcache_free_blocks` status variable did not display a value of 0 if the query cache was disabled. (Bug#25132)
- The client library had no way to return an error if no connection had been established. This caused problems such as `mysql_library_init()` failing silently if no `errmsg.sys` file was available. (Bug#25097)
- For Windows 64-bit builds, enabling shared-memory support caused client connections to fail. (Bug#24992)
- If the expected precision of an arithmetic expression exceeded the maximum precision supported by MySQL, the precision of the result was reduced by an unpredictable or arbitrary amount, rather than to the maximum precision. In some cases, exceeding the maximum supported precision could also lead to a crash of the server. (Bug#24907)
- `mysql` did not use its completion table. Also, the table contained few entries. (Bug#24624)
- `Data truncated for column` *`col_num`* `at row` *`row_num`* warnings were generated for some (constant) values that did not have too high precision. (Bug#24541)
- If a user installed MySQL Server and set a password for the `root` user, and then uninstalled and reinstalled MySQL Server to the same location, the user could not use the MySQL Instance Config wizard to configure the server because the uninstall operation left the previous data directory intact. The config wizard *assumed* that any new install (not an upgrade) would have the default data directory where the `root` user has no password. The installer now writes a registry key named `FoundExistingDataDir`. If the installer finds an existing data directory, the key will have a value of 1, otherwise it will have a value of 0. When `MySQLInstanceConfig.exe` is run, it will attempt to read the key. If it can read the key, and the value is 1 and there is no existing instance of the server (indicating a new installation), the Config Wizard will allow the user to input the old password so the server can be configured. (Bug#24215)

- Logging of statements to log tables was incorrect for statements that contained `utf8`-incompatible binary strings. Incompatible sequences are hex-encoded now. (Bug#23924)
- The MySQL header files contained some duplicate macro definitions that could cause compilation problems. (Bug#23839)
- A `CREATE TRIGGER` statement could cause a deadlock or server crash if it referred to a table for which a table lock had been acquired with `LOCK TABLES`. (Bug#23713)
- `SHOW COLUMNS` on a `TEMPOARY` table caused locking issues. (Bug#23588)
- For distributions compiled with the bundled `libedit` library, there were difficulties using the `mysql` client to enter input for non-ASCII or multi-byte characters. (Bug#23097)
- `perror` reported incomplete or inaccurate information. (Bug#23028, Bug#25177)
- After stopping and starting the event scheduler, disabled events could remain in the execution queue. (Bug#22738)
- The server produced a confusing error message when attempting to open a table that required a storage engine that was not loaded. (Bug#22708)
- The parser treated the `INTERVAL()` function incorrectly, leading to situations where syntax errors could result depending on which side of an arithmetic operator the function appeared. (Bug#22312)
- For views or stored programs created with an invalid `DEFINER` value, the error message was confusing (did not tie the problem to the `DEFINER` clause) and has been improved. (Bug#21854)
- Warnings for deprecated syntax constructs used in stored routines make sense to report only when the routine is being created, but they were also being reported when the routine was parsed for loading into the execution cache. Now they are reported only at routine creation time. (Bug#21801)
- On Mac OS X, `mysqld` did not react to Ctrl-C when run under `gdb`, even when run with the `--gdb` option. (Bug#21567)
- When inserting an extraordinarly large value into a `DOUBLE` column, the value could be truncated in such a way that the new value cannot be reloaded manually or from the output of `mysqldump`. (Bug#21497)
- `CREATE ... SELECT` did not always set `DEFAULT` column values in the new table. (Bug#21380)
- `mysql_config` output did not include `-lmygcc` on some platforms when it was needed. (Bug#21158)
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. (Bug#21023, Bug#25486)
- It was possible to execute `CREATE TABLE t1 ... SELECT ... FROM t2` with the `CREATE` privilege for `t1` and `SELECT` privilege for `t2`, even in the absence of the `INSERT` privilege for `t1`. (Bug#20901)
- The `BENCHMARK()` function, invoked with more than 2147483648 iterations (the size of a signed 32-bit integer), terminated prematurely. (Bug#20752)
- `mysqldumpslow` returned a confusing error message when no configuration file was found. (Bug#20455)
- `MySQLInstanceConfig.exe` could lose the `innodb_data_home_dir` setting when reconfiguring an instance. (Bug#19797)
- Issuing an SQL `KILL` of the active connection caused an error on Mac OS X. (Bug#19723)
- `CREATE TABLE` allowed 0 as the default value for a `TIMESTAMP` column when the server was running in `NO_ZERO_DATE` mode. (Bug#18834)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- Use of `GRANT` statements with grant tables from an old version of MySQL could cause a server crash. (Bug#16470)
- A `SET` column whose definition specified 64 elements could not be updated using integer values. (Bug#15409)
- Zero-padding of exponent values was not the same across platforms. (Bug#12860)
- If a `SELECT` calls a stored function in a transaction, and a statement within the function fails, that statement should roll back. Furthermore, if `ROLLBACK` is executed after that, the entire transaction should be rolled back. Before this fix, the failed statement did not roll back when it failed (even though it might ultimately get rolled back by a `ROLLBACK` later that rolls back the

entire transaction). (Bug#12713)

See also Bug#34655.

- The grammar for `GROUP BY`, when used with `WITH CUBE` or `WITH ROLLUP`, caused a conflict with the grammar for view definitions that included `WITH CHECK OPTION`. (Bug#9801)
- The parser incorrectly allowed `SQLSTATE '00000'` to be specified for a condition handler. (This is incorrect because the condition must be a failure condition and `'00000'` indicates success.) (Bug#8759)
- `MySQLInstanceConfig.exe` did not save the `innodb_data_home_dir` value to the `my.ini` file under certain circumstances. (Bug#6627)
- `RESTORE` failed for databases or tables with names that contain certain non-alphanumeric characters, such as spaces. (Bug#3353)
- Grant table checks failed in `libmysqld`.

C.1.9. Changes in MySQL 6.0.4 (12 February 2008)

Functionality added or changed:

- **Important Change**: **Partitioning**: **Security Fix**: It was possible, by creating a partitioned table using the `DATA DIRECTORY` and `INDEX DIRECTORY` options to gain privileges on other tables having the same name as the partitioned table. As a result of this fix, any table-level `DATA DIRECTORY` or `INDEX DIRECTORY` options are now ignored for partitioned tables. (Bug#32091, CVE-2007-5970)

  See also Bug#29325, Bug#32111.

- **Incompatible Change**: The Unicode implementation has been extended to provide support for supplementary characters that lie outside the Basic Multilingual Plane (BMP). Noteworthy features:

  - `utf16` and `utf32` character sets have been added. These correspond to the UTF-16 and UTF-32 encodings of the Unicode character set, and they both support supplementary characters.
  - The `utf8` character set from previous versions of MySQL has been renamed to `utf8mb3`, to reflect that its encoding uses a maximum of three bytes for multi-byte characters. (Old tables that previously used `utf8` will be reported as using `utf8mb3` after an in-place upgrade to MySQL 6.0, but otherwise work as before.)
  - The new `utf8` character set in MySQL 6.0 is similar to `utf8mb3`, but its encoding allows up to four bytes per character to enable support for supplementary characters.
  - The `ucs2` character set is essentially unchanged except for the inclusion of some newer BMP characters.

  In most respects, upgrading from MySQL 5.1 to 6.0 should present few problems with regard to Unicode usage, although there are some potential areas of incompatibility. Some examples:

  - For the variable-length character data types (`VARCHAR` and the `TEXT` types), the maximum length in characters for `utf8` columns is less in MySQL 6.0 than previously.
  - For all character data types (`CHAR`, `VARCHAR`, and the `TEXT` types), the maximum number of characters for `utf8` columns that can be indexed is less in MySQL 6.0 than previously.

  Consequently, if you want to upgrade tables from the old `utf8` (now `utf8mb3`) to the current `utf8`, it may be necessary to change some column or index definitions.

  For additional details about the new Unicode character sets and potential incompatibilities, see Section 9.1.9, “Unicode Support”, and Section 9.1.10, “Upgrading from Previous to Current Unicode Support”.

  If you use events, a known issue is that if you upgrade from MySQL 5.1 to 6.0.4 though 6.0.6, the event scheduler will not work, even after you run `mysql_upgrade`. (This is an issue only for an upgrade, not for a new installation of MySQL 6.0.x.) As of MySQL 6.0.7, `mysql_upgrade` handles upgrading the system tables properly. If you upgrade to 6.0.4 through 6.0.6, you can work around this upgrading problem by using these instructions:

  1. In MySQL 5.1, before upgrading, create a dump file containing your `mysql.event` table:

     ```
     shell> mysqldump -uroot -p mysql event > event.sql
     ```

2. Stop the server, upgrade to MySQL 6.0, and start the server.

3. Recreate the `mysql.event` table using the dump file:

```
shell> mysql -uroot -p mysql < event.sql
```

4. Run `mysql_upgrade` to upgrade the other system tables in the `mysql` database:

```
shell> mysql_upgrade -uroot -p
```

5. Restart the server. The event scheduler should run normally.

- **Incompatible Change**: Because of a change in the format of the `Falcon` pages stored within `Falcon` database files, `Falcon` databases created in MySQL 6.0.4 (or later) are not compatible with previous releases, and existing `Falcon` databases are incompatible with MySQL 6.0.4 (and later versions. You should dump `Falcon` databases using `mysqldump` before upgrading, and then reload them after the upgrade. For more information, see Section 4.5.4, "`mysqldump` — A Database Backup Program".

- **MySQL Cluster**: Introduced the `Ndb_execute_count` status variable, which measures the number of round trips made by queries to the `NDB` kernel.

- **Partitioning**: Error messages for partitioning syntax errors have been made more descriptive. (Bug#29368)

- **Cluster Replication**: **Replication**: A replication heartbeat mechanism has been added to facilitate monitoring. This provides an alternative to checking log files, making it possible to detect in real time when a slave has failed.

  Configuration of heartbeats is done via a new `MASTER_HEARTBEAT_PERIOD = interval` clause for the `CHANGE MASTER TO` statement (see Section 12.6.2.1, "`CHANGE MASTER TO` Syntax"); monitoring can be done by checking the values of the status variables `Slave_heartbeat_period` and `Slave_received_heartbeats` (see Section 5.1.6, "Server Status Variables").

  The addition of replication heartbeats addresses a number of issues:

  - Relay logs were rotated every `slave_net_timeout` seconds even if no statements were being replicated.
  - `SHOW SLAVE STATUS` displayed an incorrect value for `seconds_behind_master` following a `FLUSH LOGS` statement.
  - Replication master-slave connections used `slave_net_timeout` for connection timeouts.

  (Bug#20435, Bug#29309, Bug#30932)

- **Replication**: Replication of the following SQL functions now switches to row-based logging in `MIXED` mode, and generates a warning in `STATEMENT` mode:

  - `USER()`
  - `CURRENT_USER()` and its alias `CURRENT_USER`
  - `FOUND_ROWS()`
  - `ROW_COUNT()`

  See Section 5.2.4.3, "Mixed Binary Logging Format", for more information. (Bug#12092, Bug#28086, Bug#30244)

- The (undocumented) `configure` script previously included with binary distributions is no longer included. (Bug#35011)

- The `--event-scheduler` option without a value disabled the event scheduler. Now it enables the event scheduler. (Bug#31332)

- `mysqldump` produces a `-- Dump completed on DATE` comment at the end of the dump if `--comments` is given. The date causes dump files for identical data take at different times to appear to be different. The new options `--dump-date` and `--skip-dump-date` control whether the date is added to the comment. `--skip-dump-date` suppresses date printing. The default is `--dump-date` (include the date in the comment). (Bug#31077)

- MySQL now can be compiled with `gcc` 4.2.x. There was a problem involving a conflict with the `min()` and `max()` macros in `my_global.h`. (Bug#28184)

- Added the `--auto-vertical-output` option to `mysql` which causes result sets to be displayed vertically if they are too wide for the current window, and using normal tabular format otherwise. (This applies to statements terminated by `;` or `\G`.)

Bug#26780)

- It is now possible to set `long_query_time` in microseconds or to 0. Setting this value to 0 causes all queries to be recorded in the slow query log.

  Currently, fractional values can be used only when logging to files. We plan to provide this functionality for logging to tables when time-related data types are enhanced to support microsecond resolution. (Bug#25412)

- `INFORMATION_SCHEMA` implementation changes were made that optimize certain types of queries for `INFORMATION_SCHEMA` tables so that they execute more quickly. Section 7.2.24, “`INFORMATION_SCHEMA` Optimization”, provides guidelines on how to take advantage of these optimizations by writing queries that minimize the need for the server to access the file system to obtain the information contained in `INFORMATION_SCHEMA` tables. By writing queries that enable the server to avoid directory scans or opening table files, you will obtain better performance. (Bug#19588)

- Three options were added to `mysqldump` make it easier to generate a dump from a slave server. `--dump-slave` is similar to `--master-data`, but the `CHANGE MASTER TO` statement contains binary log coordinates for the slave's master host, not the slave itself. `--apply-slave-statements` causes `STOP SLAVE` and `START SLAVE` statements to be added before the `CHANGE MASTER TO` statement and at the end of the output, respectively. `--include-master-host-port` causes the `CHANGE MASTER TO` statement to include `MASTER_PORT` and `MASTER_HOST` options for the slave's master. (Bug#8368)

- `mysql-test-run.pl` now supports a `--combination` option for specifying options to the `mysqld` server. This option is similar to `--mysqld` but should be given two or more times. `mysql-test-run.pl` executes multiple test runs, using the options for each instance of `--combination` in successive runs.

  For test runs specific to a given test suite, an alternative to the use of `--combination` is to create a `combinations` file in the suite directory. The file should contain a section of options for each test run.

- An alternative thread model is available for dealing with the issues that occur with the original one-thread-per-client model when scaling to large numbers of simultaneous connections. This model uses thread pooling:

  - Connection manager threads do not dedicate a thread to each client connection. Instead, the connection is added to the set of existing connection sockets. The server collects input from these sockets and when a complete request has been received from a given client, it is queued for service.

  - The server maintains a pool of service threads to process requests. When a queued request is waiting and there is an available (not busy) service thread in the pool, the request is given to the thread to be handled. After processing the request, the service thread becomes available to process other requests.

    Service threads are created at server startup and exist until the server terminates. A given service thread is not tied to a specific client connection and the requests that it processes over time may originate from different client connections.

  - The pool of service threads has a fixed size, so the amount of memory required for it does not increase as the number of client connections increases.

  For information about choosing one thread model over the other and tuning the parameters that control thread resources, see Section 7.5.7, “How MySQL Uses Threads for Client Connections”.

- When the server detects `MyISAM` table corruption, it now writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

- Two options relating to slow query logging have been added for `mysqld`. `--log-slow-slave-statements` causes slow statements executed by a replication slave to be written to the slow query log; `min_examined_row_limit` can be used to cause queries which examine fewer than the stated number of rows not to be logged.

Bugs fixed:

- **Security Fix**: **Replication**: It was possible for any connected user to issue a `BINLOG` statement, which could be used to escalate privileges.

  Use of the `BINLOG` statement now requires the `SUPER` privilege. (Bug#31611, CVE-2007-6313)

- **Security Fix**: Three vulnerabilities in yaSSL versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with yaSSL enabled and TCP/IP connections enabled, but does not require valid MySQL account credentials. The exploit does not apply to OpenSSL.

  Note

> The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable MySQL configuration is advised to upgrade *immediately*.

(Bug#33814, CVE-2008-0226, CVE-2008-0227)

- **Security Fix**: Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

  MySQL will now return an error when the file to which the symlink points already exists. (Bug#32111, CVE-2007-5969)

- **Security Fix**: `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could allow that user to gain the access rights of the view. Now `ALTER VIEW` is allowed only to the original definer or users with the `SUPER` privilege. (Bug#29908)

- **Security Fix**: When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. (Bug#29801)

- **Incompatible Change**: The `falcon_lock_timeout` system variable, which had a value in milliseconds, has been replaced with `falcon_lock_wait_timeout`, which has a value in seconds. The default value of `falcon_lock_wait_timeout` is 50 seconds. This has been done for better name and unit consistency with the `innodb_lock_wait_timeout` system variable. Uses of the old variable should be converted to use the new variable. (Bug#33474, Bug#33072)

- **Incompatible Change**: With `ONLY_FULL_GROUP_BY` SQL mode enabled, queries such as `SELECT a FROM t1 HAVING COUNT(*)>2` were not being rejected as they should have been.

  This fix results in the following behavior:

  - There is a check against mixing group and non-group columns *only* when `ONLY_FULL_GROUP_BY` is enabled.
  - This check is done both for the select list and for the `HAVING` clause if there is one.

  This behavior differs from previous versions as follows:

  - Previously, the `HAVING` clause was not checked when `ONLY_FULL_GROUP_BY` was enabled; now it is checked.
  - Previously, the select list was checked even when `ONLY_FULL_GROUP_BY` was not enabled; now it is checked only when `ONLY_FULL_GROUP_BY` is enabled.

  (Bug#31794)

- **Incompatible Change**: `SET PASSWORD` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. (Bug#30904)

- **Incompatible Change**: The `mysql_install_db` script could fail to locate some components (including `resolveip`) during execution if the `--basedir` option was specified on the command-line or within the `my.cnf` file. This was due to a conflict when comparing the compiled-in values and the supplied values.

  The `--source-install` command-line option to the script has been removed and replaced with the `--srcdir` option. `mysql_install_db` now locates components either using the compiled-in options, the `--basedir` option or `--srcdir` option. (Bug#30759)

- **Incompatible Change**: It was possible to create a view having a column whose name consisted of an empty string or space characters only.

  One result of this bug fix is that aliases for columns in the view `SELECT` statement are checked to ensure that they are legal column names. In particular, the length must be within the maximum column length of 64 characters, not the maximum alias length of 256 characters. This can cause problems for replication or loading dump files. For additional information and workarounds, see Section D.5, “Restrictions on Views”. (Bug#27695)

  See also Bug#31202.

- **Incompatible Change**: It was possible for option files to be read twice at program startup, if some of the standard option file locations turned out to be the same directory. Now duplicates are removed from the list of files to be read.

  Also, users could not override system-wide settings using `~/.my.cnf` because *`SYSCONFDIR`*`/my.cnf` was read last. The latter file now is read earlier so that `~/.my.cnf` can override system-wide settings.

  The fix for this problem had a side effect such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/.my.cnf`. That problem was addressed as Bug#38180. (Bug#20748)

- **Incompatible Change**: A number of problems existed in the implementation of `MERGE` tables that could cause problems. The problems are summarized below:

  - Bug#26379 - Combination of `FLUSH TABLE` and `REPAIR TABLE` corrupts a `MERGE` table. This was caused in a number of situations:

    1. A thread trying to lock a `MERGE` table performs busy waiting while `REPAIR TABLE` or a similar table administration task is ongoing on one or more of its MyISAM tables.

    2. A thread trying to lock a `MERGE` table performs busy waiting until all threads that did `REPAIR TABLE` or similar table administration tasks on one or more of its MyISAM tables in LOCK TABLES segments do UNLOCK TABLES. The difference against problem #1 is that the busy waiting takes place after the administration task. It is terminated by `UNLOCK TABLES` only.

    3. Two `FLUSH TABLES` within a `LOCK TABLES` segment can invalidate the lock. This does not require a `MERGE` table. The first `FLUSH TABLES` can be replaced by any statement that requires other threads to reopen the table. In 5.0 and 5.1 a single `FLUSH TABLES` can provoke the problem.

  - Bug#26867 - Simultaneously executing `LOCK TABLES` and `REPAIR TABLE` on a `MERGE` table would result in memory/cpu hogging.

    Trying DML on a `MERGE` table, which has a child locked and repaired by another thread, made an infinite loop in the server.

  - Bug#26377 - Deadlock with `MERGE` and `FLUSH TABLE`

    Locking a MERGE table and its children in parent-child order and flushing the child deadlocked the server.

  - Bug#25038 - Waiting `TRUNCATE`

    Truncating a MERGE child, while the MERGE table was in use, let the truncate fail instead of waiting for the table to become free.

  - Bug#25700 - `MERGE` base tables get corrupted by `OPTIMIZE/ANALYZE/REPAIR TABLE`

    Repairing a child of an open `MERGE` table corrupted the child. It was necessary to `FLUSH` the child first.

  - Bug#30275 - `MERGE` tables: `FLUSH TABLES` or `UNLOCK TABLES` causes server to crash.

    Flushing and optimizing locked `MERGE` children crashed the server.

  - Bug#19627 - temporary merge table locking

    Use of a temporary `MERGE` table with non-temporary children could corrupt the children.

    Temporary tables are never locked. Creation of tables with non-temporary children of a temporary `MERGE` table is now prohibited.

  - Bug#27660 - `Falcon`: `MERGE` table possible

    It was possible to create a `MERGE` table with non-`MyISAM` children.

  - Bug#30273 - `MERGE` tables: Can't lock file (errno: 155)

    This was a Windows-only bug. Table administration statements sometimes failed with "Can't lock file (errno: 155)".

  The fix introduces the following changes in behavior:

  - This patch changes the behavior of temporary `MERGE` tables. Temporary `MERGE` must have temporary children. The old behavior was wrong. A temporary table is not locked. Hence even non-temporary children were not locked. See Bug#19627.

  - You cannot change the union list of a non-temporary `MERGE` table when LOCK TABLES is in effect. The following does *not* work:

    ```
    CREATE TABLE m1 ... ENGINE=MRG_MYISAM ...;
    LOCK TABLES t1 WRITE, t2 WRITE, m1 WRITE;
    ALTER TABLE m1 ... UNION=(t1,t2) ...;
    ```

    However, you can do this with a temporary `MERGE` table.

  - You cannot create a `MERGE` table with `CREATE ... SELECT`, neither as a temporary `MERGE` table, nor as a non-temporary `MERGE` table. For example, `CREATE TABLE m1 ... ENGINE=MRG_MYISAM ... SELECT ...;`

causes the error message: `TABLE IS NOT BASE TABLE`.

(Bug#19627, Bug#25038, Bug#25700, Bug#26377, Bug#26379, Bug#26867, Bug#27660, Bug#30275, Bug#30491)

- **Partitioning**: **Important Note**: An apostrophe or single quote character (`'`) used in the `DATA DIRECTORY`, `INDEX DIRECTORY`, or `COMMENT` for a `PARTITION` clause caused the server to crash. When used as part of a `CREATE TABLE` statement, the crash was immediate. When used in an `ALTER TABLE` statement, the crash did not occur until trying to perform a `SELECT` or DML statement on the table. In either case, the server could not be completely restarted until the `.FRM` file corresponding to the newly created or altered table was deleted.

  > **Note**
  >
  > Upgrading to the current (or later) release solves this problem only for tables that are newly created or altered. Tables created or altered in previous versions of the server to include `'` characters in `PARTITION` options must still be removed by deleting the corresponding `.FRM` files and re-creating them afterwards.

  (Bug#30695)

- **Partitioning**: **MySQL Cluster**: `EXPLAIN PARTITIONS` reported partition usage by queries on `NDB` tables according to the standard MySQL hash function than the hash function used in the `NDB` storage engine. (Bug#29550)

- **Replication**: **MySQL Cluster**: Row-based replication from or to a big-endian machine where the table used the `NDB` storage engine failed, if the same table on the other machine was either non-`NDB` or the other machine was little-endian. (Bug#29549, Bug#30790)

  See also Bug#24231, Bug#30024, Bug#30133, Bug#30134.

- **MySQL Cluster**: **Replication**: (Replication): Inconsistencies could occur between the master and the slave when replicating Disk Data tables. (Bug#19259, Bug#19227)

- **MySQL Cluster**: An insert or update with combined range and equality constraints failed when run against an `NDB` table with the error `GOT UNKNOWN ERROR FROM NDB`. An example of such a statement would be `UPDATE t1 SET b = 5 WHERE a IN (7,8) OR a >= 10;`. (Bug#31874)

- **MySQL Cluster**: An error with an `if` statement in `sql/ha_ndbcluster.cc` could potentially lead to an infinite loop in case of failure when working with `AUTO_INCREMENT` columns in `NDB` tables. (Bug#31810)

- **MySQL Cluster**: The `NDB` storage engine code was not safe for strict-alias optimization in `gcc` 4.2.1. (Bug#31761)

- **MySQL Cluster**: Following an upgrade, `ndb_mgmd` would fail with an *`ArbitrationError`*. (Bug#31690)

- **MySQL Cluster**: It was possible in some cases for a node group to be “lost” due to missed local checkpoints following a system restart. (Bug#31525)

- **MySQL Cluster**: A query against a table with `TEXT` or `BLOB` columns that would return more than a certain amount of data failed with `GOT ERROR 4350 'TRANSACTION ALREADY ABORTED' FROM NDBCLUSTER`. (Bug#31482)

  This regression was introduced by Bug#29102.

- **MySQL Cluster**: `NDB` tables having names containing non-alphanumeric characters (such as “ `$` ”) were not discovered correctly. (Bug#31470)

- **MySQL Cluster**: A node failure during a local checkpoint could lead to a subsequent failure of the cluster during a system restart. (Bug#31257)

- **MySQL Cluster**: A cluster restart could sometimes fail due to an issue with table IDs. (Bug#30975)

- **MySQL Cluster**: In some cases, the cluster managment server logged entries multiple times following a restart of `mgmd`. (Bug#29565)

- **MySQL Cluster**: `ndb_mgm --help` did not display any information about the `-a` option. (Bug#29509)

- **MySQL Cluster**: An interpreted program of sufficient size and complexity could cause all cluster data nodes to shut down due to buffer overruns. (Bug#29390)

- **MySQL Cluster**: Performing `DELETE` operations after a data node had been shut down could lead to inconsistent data following a restart of the node. (Bug#26450)

- **MySQL Cluster**: `UPDATE IGNORE` could sometimes fail on `NDB` tables due to the use of unitialized data when checking for duplicate keys to be ignored. (Bug#25817)

- **MySQL Cluster**: The cluster log was formatted inconsistently and contained extraneous newline characters. (Bug#25064)
- **Partitioning**: An `INSERT` into a `Falcon` table with partitions and an auto-increment column would fail. (Bug#33661)
- **Partitioning**: Multiple simultaneous inserts into a partitioned `Falcon` table could deadlock. (Bug#33480, Bug#33735)
- **Partitioning**: Repeated updates of a table that was partitioned by `KEY` on a `TIMESTAMP` column eventually crashed the server. (Bug#32067)
- **Partitioning**: Selecting from a table partitioned by `KEY` on a `VARCHAR` column whose size was greater than 65530 caused the server to crash. (Bug#31705)
- **Partitioning**: `INSERT DELAYED` on a partitioned table crashed the server. The server now rejects the statement with an error. (Bug#31210)
- **Partitioning**: Using `ALTER TABLE` to partition an existing table having an `AUTO_INCREMENT` column could crash the server. (Bug#30878)

  This regression was introduced by Bug#27405.
- **Partitioning**: `Falcon` cannot drop a table for which there is a pending transaction, but the error message for such attempts was misleading. (Bug#22972)
- **Cluster Replication**: **Replication**: A node failure during replication could lead to buckets out of order; now active subscribers are checked for, rather than empty buckets. (Bug#31701)
- **Replication**: When using a transactional storage engine not using statement-based logging, a duplicate key error on the master caused replication to fail. This issue was first observed when using the `Falcon` storage engine. (Bug#33688)
- **Replication**: When updating columns for a row when using a `Falcon` table, the values for columns that were not updated were replicated as `NULL`. (Bug#33055)
- **Replication**: When dropping a database containing a stored procedure while using row-cased replication, the delete of the stored procedure from the `mysql.proc` table was recorded in the binary log following the `DROP DATABASE` statement. To correct this issue, `DROP DATABASE` now uses statement-based replication. (Bug#32435)
- **Replication**: `DELETE FROM` *`tbl_name`* (no `WHERE` clause) for a `Falcon` table caused replication to fail on the slave. (Bug#32150)
- **Replication**: It was possible for the name of the relay log file to exceed the amount of memory reserved for it, possibly leading to a crash of the server. (Bug#31836)

  See also Bug#28597.
- **Replication**: Corruption of log events caused the server to crash on 64-bit Linux systems having 4 GB of memory or more. (Bug#31793)
- **Replication**: Trying to replicate an update of a row that was missing on the slave led to a failure on the slave. (Bug#31702)
- **Replication**: `Falcon` tables would fail during replication if ROW-based replication was specified. (Bug#31671)
- **Replication**: Table names were displayed as binary “garbage” characters in slave error messages. The issue was observed on 64-bit Windows but may have effected other platforms. (Bug#30854)
- **Replication**: One thread could read uninitialized memory from the stack of another thread. This issue was only known to occur in a `mysqld` process acting as both a master and a slave. (Bug#30752)
- **Replication**: A new configuration option, `falcon_support_xa` has been added. The option specifies whether `Falcon` should report itself as a two-phase commit storage engine, and therefore take part in XA transactions. (Bug#29371)
- **Replication**: It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of an event group, including possibly a transaction. (Bug#28618)

  See also Bug#12691.
- **Replication**: Due a previous change in how the default name and location of the binary log file were determined, replication failed following some upgrades. (Bug#28597, Bug#28603)

  See also Bug#31836.

  This regression was introduced by Bug#20166.

- **Replication**: Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug#26664)

  See also Bug#29083.

- **Replication**: Stored procedures having `BIT` parameters were not replicated correctly. (Bug#26199)

- **Replication**: Issuing `SHOW SLAVE STATUS` as `mysqld` was shutting down could cause a crash. (Bug#26000)

- **Replication**: If a temporary error occured inside an event group on an event that was not the first event of the group, the slave could get caught in an endless loop because the retry counter was reset whenever an event was executed successfully. (Bug#24860)

  See also Bug#12691, Bug#23171.

- **Replication**: An `UPDATE` statement using a stored function that modified a non-transactional table was not logged if it failed. This caused the copy of the non-transactional table on the master have a row that the copy on the slave did not.

  In addition, when an `INSERT ... ON DUPLICATE KEY UPDATE` statement encountered a duplicate key constraint, but the `UPDATE` did not actually change any data, the statement was not logged. As a result of this fix, such statements are now treated the same for logging purposes as other `UPDATE` statements, and so are written to the binary log. (Bug#23333)

  See also Bug#12713.

- **Replication**: A replication slave sometimes failed to reconnect because it was unable to run `SHOW SLAVE HOSTS`. It was not necessary to run this statement on slaves (since the master should track connection IDs), and the execution of this statement by slaves was removed. (Bug#21132)

  See also Bug#13963, Bug#21869.

- **Replication**: A replication slave sometimes stopped for changes that were idempotent (that is, such changes should have been considered “safe”), even though it should have simply noted that the change was already done, and continued operation. (Bug#19958)

- **Cluster Replication**: A replication slave could return “garbage” data that was not in recognizable row format due to a problem with the internal `all_set()` method. (Bug#33375)

- **Cluster Replication**: Replicating `NDB` tables with extra `VARCHAR` columns on the master caused the slave to fail. (Bug#31646)

  See also Bug#29549.

- **Cluster Replication**: In some cases, not all tables were properly initialized before the binary log thread was started. (Bug#31618)

- **Cluster API**: A buffer overrun in `NdbBlob::setValue()` caused erroneous results on Mac OS X. (Bug#31284)

- Setting `falcon_consistent_read` to a value of 1 or `ON` resulted in a value of –1 being assigned. (Bug#34331)

- Compiling MySQL on FreeBSD would fail due to missing definitions for certain network constants. (Bug#34292)

- The `INFORMATION_SCHEMA.FALCON_TRANSACTIONS` had two columns named `STATE`. (Bug#34241)

- For `Falcon`, under some circumstances, a rolled back record could appear not to be removed. (Bug#34174)

- Attempting to set the isolation level to a value not supported by `Falcon` caused a `Falcon` assertion failure. (Bug#34164)

- `Falcon` did not compile on Mac OS X/Intel or Mac OS X/PPC. (Bug#34095)

- When inserting very large data sets into table using `INSERT INTO ... SELECT FROM` on a `Falcon` table when the value of `falcon_page_cache_size` is higher than the available memory. Instead of returning an error, `mysqld` would crash in this instance. (Bug#34086)

- For `Falcon`, an initializing transaction created a dependency on a commitNoUpdate transaction releasing transaction dependencies, which caused an assertion failure. (Bug#33759)

- The output from `SHOW CREATE TABLE` on a `Falcon` table would not include the `AUTO_INCREMENT` value parameters. (Bug#33662)

- For table creation, `Falcon` did not handle identifiers with embedded double quotes. (Bug#33657, Bug#33667)

- Contention between concurrent `Falcon` transactions could cause some queries to be starved for a long time. (Bug#33634)

- Incomplete `Falcon` recovery after server restarts eventually resulted in tablespace corruption. (Bug#33608, Bug#33665)
- Using `falcon_debug_mask` to enable debugging messages could lead to some messages not being correctly flushed to the log file. (Bug#33531)
- Table recovery failed repeatedly after starting the server with a corrupted `Falcon` tablespace, causing the server to crash. (Bug#33517)
- After a server restart, `Falcon` mishandled metadata, resulting in apparent corruption of `BLOB` data. (Bug#33492)
- Dropping a tablespace for the `Falcon` storage engine when the specified tablespace did not exist would silently succeed, instead of generating a suitable error message. (Bug#33212)
- Multiple concurrent delete operations on a `Falcon` table were serialized rather than executing concurrently, resulting in poor performance. (Bug#33191)
- Inserting millions of rows into a `Falcon` table could cause the insert operation to hang. (Bug#33175)
- The columns in the `INFORMATION_SCHEMA` table for `FALCON_SERIAL_LOG_INFO`, `FALCON_TRANSACTIONS`, and `FALCON_TRANSACTION_SUMMARY` contained a reference to the databae of tablespace, but the column information was actually showing instances of the `Falcon` engine. The tables have been updated to a different structure. (Bug#33141)
- Using `ALTER TABLE` to convert a `CHAR` column using the `ucs2` character set to `VARBINARY` when using a `Falcon` table would cause a crash. (Bug#33081)
- Multiple `Falcon` gopher threads attempting to update the same index could result in failure to add new index entries. (Bug#33080)
- `Falcon` tried to delete a record from an empty record locator page, which could cause a server crash. (Bug#33068)
- `Falcon` failed to rebuild a Section page during recovery, causing a server crash. (Bug#32921)
- Using `Falcon` when accessing multiple versions of the same record, certain records could fail to be retrieved from the record cache, causing an assertion failure. (Bug#32862)
- Creating an index on a `Falcon` table with a column using UTF32 that has been converted to UTF8 would cause a server crash. (Bug#32833)
- Using `ALTER TABLE` on a `Falcon` table it would be possible to create two tables with the same name but different case. (Bug#32830)
- Converting a table from `InnoDB` to `Falcon`, where the `Falcon` table with the same name (but different case) would cause a server crash. (Bug#32829)
- Concurrent `TRUNCATE TABLE` operations for `Falcon` tables caused `Falcon` to crash. (Bug#32730)
- `mysqld_safe` looked for error messages in the wrong location. (Bug#32679)
- An issue with the `NO_ENGINE_SUBSTITUTION` `sql_mode` database can cause the creation of stored routines to fail. If you are having problems with creating stored routines while using this `sql_mode` value, remove this value from your `sql_mode` setting. (Bug#32633)
- Repeatedly creating and dropping `Falcon` tablespaces failed because the old tablespace was not dropped before the new tablespace file was created. (Bug#32621)
- `Falcon` did not properly handle quoted column name or tablespace name identifiers. (Bug#32620)
- The `INTERVAL()` function incorrectly handled `NULL` values in the value list. (Bug#32560)
- Use of a `NULL`-returning `GROUP BY` expression in conjunction with `WITH ROLLUP` could cause a server crash. (Bug#32558)

  See also Bug#31095.
- `ORDER BY UpdateXML(...)` caused the server to crash in queries where `UpdateXML()` returned `NULL`. (Bug#32557)
- `Falcon` used a fixed index key size which was too small to cope with some `Falcon` page sizes, leading to a crash. `Falcon` now supports variable-length index keys according to the supported page sizes. See `falcon_page_size`. (Bug#32554)
- The rules for valid column names were being applied differently for base tables and views. (Bug#32496)
- `Falcon` options to set the limits of memory usage would not be honored. This could lead to crashes and assertions during nor-

mal usage, instead of generating a suitable warning. (Bug#32413)

- `Falcon` would incorrectly return the supported repeatable-read level when queried by the Online Backup system, preventing the ability to create a consistent snapshot backup. (Bug#32301)
- Some uses of user variables in a query could result in a server crash. (Bug#32260)
- Under certain conditions, the presence of a `GROUP BY` clause could cause an `ORDER BY` clause to be ignored. (Bug#32202)
- On Mac OS X, creating a `Falcon` table using a new `Falcon` installation caused a crash. (Bug#32201)
- Altering a `Falcon` table to support an auto increment column on a column with existing data and null values would incorrectly update the table and return an incorrect count of the altered rows. (Bug#32194)
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. (Bug#32125)
- The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE` clause. (Bug#32103)
- `mysql-test-run.pl` used the `--user` option when starting `mysqld`, which produces warnings if the current user is not `root`. Now `--user` is added only for `root`. (Bug#32078)
- Inserting, updating and deleting a large number of `BLOB` records in a `Falcon` table would take significant amount of time and may prevent shutdown. (Bug#32062)
- On 64-bit platforms, assignments of values to enumeration-valued storage engine-specific system variables were not validated and could result in unexpected values. (Bug#32034)
- A `DELETE` statement with a subquery in the `WHERE` clause would sometimes ignore an error during subquery evaluation and proceed with the delete operation. (Bug#32030)
- Using dates in the range `'0000-00-01'` to `'0000-00-99'` range in the `WHERE` clause could result in an incorrect result set. (These dates are not in the supported range for `DATE`, but different results for a given query could occur depending on position of records containing the dates within a table.) (Bug#32021)
- User-defined functions are not loaded if the server is started with the `--skip-grant-tables` option, but the server did not properly handle this case and issued an `OUT OF MEMORY` error message instead. (Bug#32020)
- If a user-defined function was used in a `SELECT` statement, and an error occurred during UDF initialization, the error did not terminate execution of the `SELECT`, but rather was converted to a warning. (Bug#32007)
- In debug builds, testing the result of an `IN` subquery against `NULL` caused an assertion failure. (Bug#31884)
- `SHOW CREATE TRIGGER` caused a server crash. (Bug#31866)
- The server crashed after insertion of a negative value into an `AUTO_INCREMENT` column of an `InnoDB` table. (Bug#31860)
- For `libmysqld` applications, handling of `mysql_change_user()` calls left some pointers improperly updated, leading to server crashes. (Bug#31850)
- Comparison results for `BETWEEN` were different from those for operators like `<` and `>` for `DATETIME`-like values with trailing extra characters such as `'2007-10-01 00:00:00 GMT-6'`. `BETWEEN` treated the values as `DATETIME`, whereas the other operators performed a binary-string comparison. Now they all uniformly use a `DATETIME` comparison, but generate warnings for values with trailing garbage. (Bug#31800)
- The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` or `OCT()` if those functions returned `NULL`. (Bug#31758)
- For a fatal error during a filesort in `find_all_keys()`, the error was returned without the necessary handler uninitialization, causing an assertion failure. (Bug#31742)
- The examined-rows count was not incremented for `const` queries. (Bug#31700)
- The `mysql_change_user()` C API function was subject to buffer overflow. (Bug#31669)
- For `SELECT ... INTO OUTFILE`, if the `ENCLOSED BY` string is empty and the `FIELDS TERMINATED BY` string started with a special character (one of `n`, `t`, `r`, `b`, `0`, `Z`, or `N`), every occurrence of the character within field values would be duplicated. (Bug#31663)
- `SHOW COLUMNS` and `DESCRIBE` displayed `null` as the column type for a view with no valid definer. This caused `mysql-`

`dump` to produce a non-reloadable dump file for the view. (Bug#31662)

- The `mysqlbug` script did not include the correct values of `CFLAGS` and `CXXFLAGS` that were used to configure the distribution. (Bug#31644)
- For queries for which loose index scan is applicable, the optimizer could choose the wrong execution plan for correlated subqueries. (Bug#31639)
- Queries that include a comparison of an `INFORMATION_SCHEMA` table column to `NULL` caused a server crash. (Bug#31633)
- `EXPLAIN EXTENDED` for `SELECT` from `INFORMATION_SCHEMA` tables caused an assertion failure. (Bug#31630)
- A buffer used when setting variables was not dimensioned to accommodate the trailing `'\0'` byte, so a single-byte buffer overrun was possible. (Bug#31588)
- For semi-join processing, pullout of functionally dependent tables was not handled transitively. (Bug#31563)
- `HAVING` could treat lettercase of table aliases incorrectly if `lower_case_table_names` was enabled. (Bug#31562)
- Spurious duplicate-key errors could occur for multiple-row inserts into an `InnoDB` table that activate a trigger. (Bug#31540)
- When inserting dates into a `DATETIME` column with a `Falcon`, the values would automatically be converted with values between 70 and 99 converted to 1970-1999, and values from 00 to 69 converted to 2000 to 2069. These dates are now correctly handled. (Bug#31490)
- The length of the result from `IFNULL()` could be calculated incorrectly because the sign of the result was not taken into account. (Bug#31471)
- Queries that used the `ref` access method or index-based subquery execution over indexes that have `DECIMAL` columns could fail with an error `Column col_name cannot be null`. (Bug#31450)
- `InnoDB` now tracks locking and use of tables by MySQL only after a table has been successfully locked on behalf of a transaction. Previously, the locked flag was set and the table in-use counter was updated before checking whether the lock on the table succeeded. A subsequent failure in obtaining a lock on the table led to an inconsistent state as the table was neither locked nor in use. (Bug#31444)
- `SELECT 1 REGEX NULL` caused an assertion failure for debug servers. (Bug#31440)
- `INFORMATION_SCHEMA.TABLES` was returning incorrect information. (Bug#31381)
- `DROP USER` caused an increase in memory usage. (Bug#31347)
- `mysql_install_db` failed if the default storage engine was `NDB`. Now it explicitly uses `MyISAM` as the storage engine when running `mysqld --bootstrap`. (Bug#31315)
- `TABLESPACE` names within `Falcon` did not support characters outside the alpha-numeric ASCII character set. (Bug#31311)
- For `InnoDB` tables with `READ COMMITTED` isolation level, semi-consistent reads used for `UPDATE` statements skipped rows locked by another transaction, rather than waiting for the locks to be released. Consequently, rows that possibly should have been updated were never examined. (Bug#31310)
- For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. (Bug#31305)
- When dropping Falcon tablespaces the associated tablespace file was not deleted. (Bug#31296)
- `Falcon` could crash when the maximum record size was exceeded. (Bug#31286)
- `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. (Bug#31277)
- Building a 64-bit binary with support for the `Falcon` storage engine using `gcc` on Solaris could fail. See Section 2.9, “MySQL Installation Using a Source Distribution”, for more information. (Bug#31268, Bug#33126)
- When a `TIMESTAMP` with a nonzero time part was converted to a `DATE` value, no warning was generated. This caused index lookups to assume that this is a valid conversion and was returning rows that match a comparison between a `TIMESTAMP` value and a `DATE` keypart. Now a warning is generated so that `TIMESTAMP` with a nonzero time part will not match `DATE` values. (Bug#31221)
- If `MAKETIME()` returned `NULL` when used in an `ORDER BY` that was evaluated using `filesort`, a server crash could result. (Bug#31160)
- `LAST_INSERT_ID()` execution could be handled improperly in subqueries. (Bug#31157)

- An assertion designed to detect a bug in the `ROLLUP` implementation would incorrectly be triggered when used in a subquery context with non-cacheable statements. (Bug#31156)
- When creating a `TABLESPACE` that uses the same name as an existing `TABLESPACE`, Falcon returned `Unknown error -103`. MySQL now returns an error stating that the specified tablespace already exists. (Bug#31114)
- `mysqldump` failed to handle databases containing a '`-`' character in the name. (Bug#31113)
- Starting the server using `--read-only` and with the Event Scheduler enabled caused it to crash.

  > **Note**
  >
  > This issue occurred only when the server had been built with certain nonstandard combinations of `configure` options.

  (Bug#31111)
- Dropping a tablespace and specifying an engine type that does not support tablespaces reported a warning. The response has now been updated to report an error. (Bug#31110)
- `GROUP BY NULL WITH ROLLUP` could cause a server crash. (Bug#31095)

  See also Bug#32558.
- A rule to prefer `filesort` over an indexed `ORDER BY` when accessing all rows of a table was being used even if a `LIMIT` clause was present. (Bug#31094)
- `REGEXP` operations could cause a server crash for character sets such as `ucs2`. Now the arguments are converted to `utf8` if possible, to allow correct results to be produced if the resulting strings contain only 8-bit characters. (Bug#31081)
- Expressions of the form `WHERE col NOT IN (col, ...)`, where the same column was named both times, could cause a server crash in the optimizer. (Bug#31075)
- `Falcon` failed to compile on FreeBSD. (Bug#31045)
- Using `ORDER BY` with `ARCHIVE` tables caused a server crash. (Bug#31036)
- The `MOD()` function and the `%` operator crashed the server for a divisor less than 1 with a very long fractional part. (Bug#31019)
- Using `falcon_serial_log_dir` to set the location of the `Falcon` serial log would have no effect. (Bug#31005)
- The LooseScan subquery optimization strategy could produce duplicate rows in query results. (Bug#30993)
- A character set introducer followed by a hexadecimal or bit-value literal did not check its argument and could return an ill-formed result for invalid input. (Bug#30986)
- `CHAR(str USING charset)` did not check its argument and could return an ill-formed result for invalid input. (Bug#30982)
- The result from `CHAR(str USING ucs2)` did not add a leading 0x00 byte for input strings with an odd number of bytes. (Bug#30981)
- The `GeomFromText()` function could cause a server crash if the first argument was `NULL` or the empty string. (Bug#30955)
- When invoked with constant arguments, `STR_TO_DATE()` could use a cached value for the format string and return incorrect results. (Bug#30942)
- `GROUP_CONCAT()` returned `','` rather than an empty string when the argument column contained only empty strings. (Bug#30897)
- A server crash could occur if a stored function that contained a `DROP TEMPORARY TABLE` statement was invoked by a `CREATE TEMPORARY TABLE` statement that created a table of the same name. (Bug#30882)
- Calling `NAME_CONST()` with non-constant arguments triggered an assertion failure. Non-constant arguments are now disallowed. (Bug#30832)
- Running `ALTER TABLE ... OPTIMIZE PARTITION` on a `Falcon` table, a 'divide by zero' error would be reported during a server crash. (Bug#30826)
- For a spatial column with a regular (non-`SPATIAL`) index, queries failed if the optimizer tried to use the index. (Bug#30825)

- `INFORMATION_SCHEMA.SCHEMATA` was returning incorrect information. (Bug#30795)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the query cache could cause a server crash. (Bug#30768)
- A multiple-table `UPDATE` involving transactional and non-transactional tables caused an assertion failure. (Bug#30763)
- Under some circumstances, `CREATE TABLE ... SELECT` could crash the server or incorrectly report that the table row size was too large. (Bug#30736)
- Using the `MIN()` or `MAX()` function to select one part of a multi-part key could cause a crash when the function result was `NULL`. (Bug#30715)
- `INFORMATION_SCHEMA.VIEWS.VIEW_DEFINITION` was incorrect for views that were defined to select from other `INFORMATION_SCHEMA` tables. (Bug#30689)
- Issuing an `ALTER SERVER` statement to update the settings for a `FEDERATED` server would cause the `mysqld` to crash. (Bug#30671)
- The optimizer could ignore `ORDER BY` in cases when the result set is ordered by `filesort`, resulting in rows being returned in incorrect order. (Bug#30666)
- A different execution plan was displayed for `EXPLAIN` than would actually have been used for the `SELECT` because the test of sort keys for `ORDER BY` did not consider keys mentioned in `IGNORE KEYS FOR ORDER BY`. (Bug#30665)
- `MyISAM` tables could not exceed 4294967295 (2^32 - 1) rows on Windows. (Bug#30638)
- `mysql-test-run.pl` could not run `mysqld` with `root` privileges. (Bug#30630)
- Using `GROUP BY` on an expression of the form *`timestamp_col`* `DIV` *`number`* caused a server crash due to incorrect calculation of number of decimals. (Bug#30587)
- The options available to the `CHECK TABLE` statement were also allowed in `OPTIMIZE TABLE` and `ANALYZE TABLE` statements, but caused corruption during their execution. These options were never supported for these statements, and an error is now raised if you try to apply these options to these statements. (Bug#30495)
- When expanding a `*` in a `USING` or `NATURAL` join, the check for table access for both tables in the join was done using only the grant information of the first table. (Bug#30468)
- Compared to MySQL 5.1, the 6.0 optimizer failed to use join buffering for certain queries, resulting in slower performance for those queries. (Bug#30363)
- A table-access check was performed improperly by `libmysqld`, causing a crash. (Bug#30329)
- Some valid `euc-kr` characters having the second byte in the ranges `[0x41..0x5A]` and `[0x61..0x7A]` were rejected. (Bug#30315)
- When loading a dynamic plugin on FreeBSD, the plugin would fail to load. This was due to a build error where the required symbols would be not exported correctly. (Bug#30296)
- Setting certain values on a table using a spatial index could cause the server to crash. (Bug#30286)
- It was not possible for client applications to distinguish between auto-set and auto-updated `TIMESTAMP` column values.

  To rectify this problem, a new `ON_UPDATE_NOW_FLAG` flag is set by Field_timestamp constructors whenever a column should be set to `NOW` on `UPDATE`, and the `get_schema_column_record()` function now reports whether a timestamp column is set to `NOW` on `UPDATE`. In addition, such columns now display `on update CURRENT_TIMESTAMP` in the `Extra` column in the output from `SHOW COLUMNS`. (Bug#30081)
- Some `INFORMATION_SCHEMA` tables are intended for internal use, but could be accessed by using `SHOW` statements. (Bug#30079)
- On some 64-bit systems, inserting the largest negative value into a `BIGINT` column resulted in incorrect data. (Bug#30069)
- `mysqlslap` did not properly handle multiple result sets from stored procedures. (Bug#29985)
- Running the `sqlbench` test suite against `Falcon` would cause a crash. (Bug#29870)
- When accessing the statistics in `INFORMATION_SCHEMA.FALCON_DATABASE_IO`, the information related only to the `Falcon` database, and not to user tablespaces. The output has been updated to report on all tablespaces, and the `DATABASE` column has been renamed to `TABLESPACE` to reflect the fact that these statistics are now reported by tablespace, not by data-

base. (Bug#29823)

- Whitespace characters other than spaces within XML tags, such as linefeeds or tabs, caused `LOAD XML INFILE` to skip rows. (Bug#29752)
- `configure` did not find `nss` on some Linux platforms. (Bug#29658)
- Compilation failed on systems where a native `log2()` implementation was unavailable. (Bug#29640)
- Use of the `latin2_czech_cs` collation caused a server crash. (Bug#29459)
- Using two simultaneous connections it was possible to create a deadlock situation between two different active transactions on the same `Falcon` table. There is no way to prevent this, but a new parameter, `falcon_lock_timeout` can set the timeout for deadlocked transactions. The default timeout is 0 (timeouts are disabled). (Bug#29452)
- The `mysql` client program now ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error.

  Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8`. (Bug#29323)
- Inserting information into the same table from multiple threads could cause duplicate key errors. This was related to the changes made to allow compatibility with the `InnoDB` repeatable-read isolation level. The option, `falcon_innodb_compatibility`, has been renamed to `falcon_consistent_read`, but with the opposite effect. The default is for this option to be on. When set to off, the behavior of `Falcon` is similar to that in `InnoDB`. (Bug#29151)
- For transactional tables, an error during a multiple-table `DELETE` statement did not roll back the statement. (Bug#29136)
- The `log` and `log_slow_queries` system variables were displayed by `SHOW VARIABLES` but could not be accessed in expressions as `@@log` and `@@log_slow_queries`. Also, attempting to set them with `SET` produced an incorrect `Unknown system variable` message. Now these variables are treated as synonyms for `general_log` and `slow_query_log`, which means that they can be accessed in expressions and their values can be changed with `SET`. (Bug#29131)
- When loading large data sets using `LOAD DATA INFILE` into a `Falcon` table, the server could crash. (Bug#29081)
- `SHOW VARIABLES` did not display the `relay_log`, `relay_log_index`, or `relay_log_info_file` system variables. (Bug#28893)
- Index hints specified in view definitions were ignored when using the view to select from the base table. (Bug#28702)
- Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is now disallowed. (Bug#28701)
- After changing the SQL mode to a restrictive value that would make already-inserted dates in a column be considered invalid, searches returned different results depending on whether the column was indexed. (Bug#28687)
- The result from `CHAR()` was incorrectly assumed in some contexts to return a single-byte result. (Bug#28550)
- Using a temporary table within `Falcon` that is created in a directory where the path contains a mixture of upper and lower letters would fail. (Bug#28541)
- Under heavy load when updating `Falcon` tables, a race condition could occur that would ultimately result in a crash. (Bug#28519)
- The result of a comparison between `VARBINARY` and `BINARY` columns differed depending on whether the `VARBINARY` column was indexed. (Bug#28076)
- The metadata in some `MYSQL_FIELD` members could be incorrect when a temporary table was used to evaluate a query. (Bug#27990)
- `ALTER TABLE` *`tbl_name`* `ROW_FORMAT=`*`format_type`* did not cause the table to be rebuilt. (Bug#27610)
- Searching a `Falcon` table that uses `DATETIME` columns with an index could return incorrect results. (Bug#27426)
- Removing a partition on a `Falcon` table when there are two tables with the same name, but different case, would cause a crash during normal shutdown. (Bug#27425)
- Mixing differently cased tables between `MyISAM` and `Falcon` tables would cause a crash. (Bug#27424)
- The `ExtractValue()` and `UpdateXML()` functions performed extremely slowly for large amounts of XML data (greater than 64 KB). These functions now execute approximately 2000 times faster than previously. (Bug#27287)

- On Windows, writes to the debug log were using `freopen()` instead of `fflush()`, resulting in slower performance. (Bug#27099)
- The MySQL Instance Configuration Wizard would not allow you to choose a service name, even though the criteria for the service name were valid. The code that checks the name has been updated to support the correct criteria of any string less than 256 character and not containing either a forward or backward slash character. (Bug#27013)
- `LOAD DATA INFILE` ran very slowly when reading large files into partitioned tables. (Bug#26527)
- Threads that were calculating the estimated number of records for a range scan did not respond to the `KILL` statement. That is, if a `range` join type is possible (even if not selected by the optimizer as a join type of choice and thus not shown by `EXPLAIN`), the query in the `statistics` state (shown by the `SHOW PROCESSLIST`) did not respond to the `KILL` statement. (Bug#25421)
- For `mysql --show-warnings`, warnings were in some cases not displayed. (Bug#25146)
- Using `CREATE UNIQUE INDEX` on a `Falcon` table where rows contain duplicate values could result in pending transactions to the table being deleted. (Bug#22842)
- Creating a `Falcon` table with an auto-increment column that is not indexed as the first column in a multi-column index would auto-increment. This behavior was different to the behavior in both `MyISAM` and `InnoDB`. `Falcon` now rejects such tables during creation in the same way `InnoDB` does. (Bug#22564)
- For storage engines that do not redefine `handler::index_next_same()` and are capable of indexes, statements that include a `WHERE` clause might select incorrect data. (Bug#22351)
- Creating a new table or dropping a database on a newly created `Falcon` database or tablespace raised an error. (Bug#22199)
- Using `TRUNCATE` on a `Falcon` table did not reset the auto-increment counters and used an inefficient method of deleting existing data. (Bug#22173)
- Creating a `DATE` outside the normal range within a `Falcon` table would result in a zero `DATE` value being returned, even though normally invalid values would be stored correctly in other storage engines. (Bug#22168)
- Selecting information from a `Falcon` table using a `DOUBLE` column with an index would produce incorrect results. (Bug#22125)
- The `readline` library has been updated to version 5.2. This addresses issues in the `mysql` client where history and editing within the client would fail to work as expected. (Bug#18431)
- `mysql` stripped comments from statements sent to the server. Now the `--comments` or `--skip-comments` option can be used to control whether to retain or strip comments. The default is `--skip-comments`. (Bug#11230, Bug#26215)
- Executing `DISABLE KEYS` and `ENABLE KEYS` on a non-empty table would cause the size of the index file for the table to grow considerable. This was because the `DISABLE KEYS` operation would only mark the existing index, without deleting the index blocks. The `ENABLE KEYS` operation would re-create the index, adding new blocks, while the previous index blocks would remain. Existing indexes are now dropped and recreated when the `ENABLE KEYS` statement is executed. (Bug#4692)

C.1.10. Changes in MySQL 6.0.3 (16 November 2007)

Functionality added or changed:

- **Incompatible Change**: Aliases for wildcards (as in `SELECT t.* AS 'alias' FROM t`) are no longer accepted and result in an error. Previously, such aliases were ignored silently. (Bug#27249)
- Sinhala collations `utf8_sinhala_ci` and `ucs2_sinhala_ci` were added for the `utf8` and `ucs2` character sets. (Bug#26474)
- If the value of the `--log-warnings` option is greater than 1, the server now writes access-denied errors for new connection attempts to the error log (for example, if a client user name or password is incorrect). (Bug#25822)
- Added the `PARAMETERS` table to `INFORMATION_SCHEMA`. The `PARAMETERS` table provides information about stored function and procedure parameters, and about return values for stored functions.

Bugs fixed:

- **Incompatible Change**: `DROP TABLE` now is allowed only if you have acquired a `WRITE` lock with `LOCK TABLES`, or if you

hold no locks, or if the table is a `TEMPORARY` table.

Previously, if other tables were locked, you could drop a table with a read lock or no lock, which could lead to deadlocks between clients. The new stricter behavior means that some usage scenarios will fail when previously they did not. (Bug#25858)

- **Incompatible Change**: `GRANT` and `REVOKE` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. (Bug#21975, Bug#21422, Bug#17244)
- **MySQL Cluster**: Adding a new `TINYTEXT` column to an `NDB` table which used `COLUMN_FORMAT = DYNAMIC`, and when binary logging was enabled, caused all cluster `mysqld` processes to crash. (Bug#30213)
- **MySQL Cluster**: After adding a new column of one of the `TEXT` or `BLOB` types to an `NDB` table which used `COLUMN_FORMAT = DYNAMIC`, it was no longer possible to access or drop the table using SQL. (Bug#30205)
- The server crashed on optimization of queries that compared an indexed `DECIMAL` column with a string value. (Bug#32262)
- The server crashed on optimizations that used the `range checked for each record` access method. (Bug#32229)
- When comparing a `BLOB` value that was null, memory corruption could occur casuing the server to crash. (Bug#32191)
- Deleting a large number of records could sometimes take a significant amount of time. (Bug#27946)
- Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
  - For `key_buffer_size`, values larger than 4GB are allowed on 64-bit platforms.
  - For `join_buffer_size`, `sort_buffer_size`, and `myisam_sort_buffer_size`, values larger than 4GB are allowed on 64-bit platforms (except Windows, for which large values are truncated to 4GB with a warning).

  In addition, settings for `read_buffer_size` and `read_rnd_buffer_size` are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. (Bug#5731, Bug#29419, Bug#29446)

C.1.11. Changes in MySQL 6.0.2 (04 September 2007)

Functionality added or changed:

- Mac OS X (Intel) support has been added. To build on Mac OS X from the repository sources you must have the most recent versions of `bison`, `automake`, `autoconf` and `libtool` installed.

  There are known issues with the Falcon on Mac OS X build. (Bug#30564)
- The Falcon record cache parameters have been altered. The `falcon_max_record_memory` and `falcon_min_record_memory` are no longer supported.

  Instead, the `falcon_record_memory_max`, `falcon_record_scavenge_threshold`, `falcon_record_scavenge_floor` and `falcon_inital_allocation` parameters are now used to control the caching of records in memory within Falcon. See Section 13.8.2, “Configuration Parameters”. (Bug#30083)
- 64-bit Windows support.
- Support for tablespaces.
- New performance settings, `falcon_log_windows`, `falcon_index_chill_threshold`, and `falcon_record_chill_threshold`.
- The option `falcon_disable_fsync` has been added. If set to true, then the periodic fsync operation is disabled.
- The option `falcon_initial_allocation` has been added to control the initial size of a Falcon tablespace on disk.

Bugs fixed:

- An assertion could be thrown during high number of concurrent updates of `BLOB` fields. (Bug#30463)
- When loading large data sets into a Falcon table `mysqld` could crash. An Out of memory error will now be raised in this situ-

ation. (Bug#30251, Bug#30074)

- Falcon would incorrectly allow creation of two tables with the same name but different case sensitivity, without raising an error, but treat the two tables as the same during further queries. . (Bug#30210)
- Updating a large table without an index would lock all the records during a transaction and unlock the records individually. (Bug#30124)
- Creating a tablespace with a unique name but using the same data file as an existing tablespace results in the re-initialization of the tablespace and the loss of the data contained in it. Falcon now reports an error if the data file already exists. (Bug#29511)
- Using `SELECT` on a table that uses two `INT` columns with a single index would fail to return rows that queried both columns and complex comparison operators. (Bug#29319)
- Falcon could occasionally report a problem with a duplicate key error during `INSERT` when inserting the same data into a unique column on two or more connections simultaneously. (Bug#29240)
- Inserting into a table with a unique index simultaneously on two connections in a way that would cause a deadlock would cause MySQL to hang. The deadlock situation is now identified and an error will be raised. (Bug#29206)
- Wide `DECIMAL` columns would show rounding errors during `SELECT`. (Bug#29201)
- Some Falcon variables were marked as status variables. (Bug#29169)
- Accessing an `INFORMATION_SCHEMA` table generated by Falcon, when Falcon has not been enabled would cause `mysqld` to crash. (Bug#29014)
- For debug builds, the server crashed when inserting a negated `DECIMAL` value of maximum precision (65 digits), such as for `INSERT INTO ... SELECT -col_val ...`. (Bug#28810)
- Accessing data within `DECIMAL` columns wider than 18 digits would cause a crash. (Bug#28725)
- `mysqld` would crash after a high number of `ALTER TABLE`, `INSERT` and `UPDATE`statements. (Bug#28515, Bug#22154)
- Unique indexes on `VARCHAR` columns are not identified correctly. (Bug#28500)
- Under certain situations the Falcon tables and log could become corrupt and prevent recovery from a crashed version of the files. (Bug#28351)
- The value for `FALCON_SYSTEM_MEMORY_SUMMARY.TOTAL_SPACE` in `INFORMATION_SCHEMA` would be reported incorrectly. (Bug#28197)
- Searching for rows within a table with some non-western character sets would fail to return the right results if the `SELECT` relied on an index. (Bug#27697)
- Inserting large numbers of identical columns into a table, followed by a `SELECT` or `UPDATE` could cause a hang or crash. (Bug#27277)
- Loading certain data sets through a direct import could cause index problems and crash. (Bug#26930)
- `DECIMAL` columns with large widths did not work, either during `INSERT` or `SELECT`. (Bug#26607)
- `DELETE` statements could cause a crash when many simultaneous threads are running. (Bug#26475)
- Falcon would fail to build under Mac OS X/Intel. A preliminary patch is available to allow building under Mac OS X/Intel only (PowerPC support is not yet available). Note that Mac OS X/Intel is still an unsupported platform. (Bug#26466)
- Queries could fail with a `Can't find record in ...` error. (Bug#26328)
- Under certain situations, shutting down MySQL using `mysqladmin` could cause Falcon to corrupt the database tables and fail to restart properly. (Bug#26296)
- Searches for accented characters in a UTF8 table fail if an index exists for the column. (Bug#26057)
- Searches using `LIKE` on a UTF8 table fail if the search relies an indexed column. (Bug#24921)
- Searches for data on a partial index for a column using the UTF8 character set would fail. (Bug#24858)
- Searches for data using exotic collation/character sets fail if the search relies on an indexed column. (Bug#23689)
- Inserting rows to a table with a unique index where the unique index value is identical on two separate connections would block the second transaction. (Bug#22847)

- Renaming a database would raise error `ERROR 1030 (HY000): Got error 157 from storage engine`. (Bug#22182)
- Large inserts to a table within a single transaction trigger high memory usage and may ultimately crash. (Bug#22169)
- Renaming tables to or from Falcon tablespaces raised an error. (Bug#22155)

C.1.12. Changes in MySQL 6.0.1 (Not released)

This was an internal release only, and no binaries were published.

C.1.13. Changes in MySQL 6.0.0 (30 April 2007 Alpha)

Functionality added or changed:

- `SELECT ... FOR UPDATE` is now supported.
- Uncommitted record scavenging has been implemented.
- Performance diagnostics are available through `INFORMATION_SCHEMA`.

Bugs fixed:

- Using `SELECT ... FOR UPDATE` and `ROLLBACK` could cause `mysqld` to hang indefinitely. (Bug#28165)
- Concurrent updates on two different connections could lead to an assertion failure. (Bug#28090)
- Updating a row within a table that has a unique compound index to a non-unique value would not raise an error. (Bug#27997)
- Rolling back an inserted row while accessing the same on a different connection would cause a crash. (Bug#27993)
- Creating a table with a 19 digit `DECIMAL` column would cause incorrect data to be stored. This is due to current limitation in Falcon where you cannot create a table with a column with greater than 18 digits precision (i.e. `DECIMAL(18,9)`). Creating a column with larger than this specification will fail and raise an error. (Bug#27962)
- Executing `INSERT INTO ... SELECT FROM` could cause a crash on large data sets. (Bug#27951)
- Inserting data into the same table on two different connections with autocommit disabled would cause a crash. (Bug#27895)
- Creating a Falcon table immediately after creating a new database could cause a crash. (Bug#27768)
- Executing `SELECT ... FOR UPDATE` in a second connection on a newly created and populated table could cause a crash. (Bug#27767)
- Continually updating a `BLOB` column would cause MySQL server to crash. (Bug#27719)
- Using a trigger on an `UPDATE` to a Falcon table when autocommit is disabled would cause MySQL server to crash. (Bug#27574)
- Interrupting a stored procedure during execution could cause a crash. (Bug#27539)
- Opening the same database with Falcon tables on a different connection could cause a crash. (Bug#27428)
- Using `ROLLBACK` after a `DELETE` does not restore the deleted row. (Bug#27357)
- Two simultaneous `SELECT ... FOR UPDATE` statements with `READ COMMITTED` isolation level would result in the wrong error message being returned. (Bug#26871)
- Row insertions to a table with long `VARCHAR` columns and large compound indexes would cause MySQL to crash. (Bug#26850)
- Falcon could consume large amounts of memory during a high number of continuous `INSERT` statements. (Bug#26843)
- Updating a partitioned table in two sessions simultaneously would cause MySQL to crash. (Bug#26828)
- Locking between sessions when using `SELECT ... FOR UPDATE` would not work. (Bug#26826)

- Tables with `UNIQUE` key constraints would not be enforced. (Bug#26803)
- When updating a table with a unique key constraint the constraint would not be enforced. (Bug#26802)
- Searching for records in a table with a `DECIMAL(6,6)` column would fail to find the value. (Bug#26469)
- Rows with a numeric column may fail to find records with zero values. (Bug#26468)
- Retrieving rows from a table that used an index would sometimes fail to return the row. (Bug#26452)
- Continue handlers in stored procedures could cause a crash. (Bug#26433)
- Tables with a long multi-column index may fail to find a record for `UPDATE`. (Bug#26420)
- Updating `BLOB` columns could result in a crash. (Bug#26324)
- Deleting a large quantity of rows in a single table may result in `ERROR 1020`. (Bug#26055)
- A `DROP TABLE` statement on a table created using `CREATE TABLE ... SELECT ...` crashed the server. (Bug#25564)
- Random updates of `LONG VARCHAR` columns would fail. (Bug#23818)
- Running `SELECT` after a changing the table contents does not result in a new data set. (Bug#22181)
- Using `ALTER TABLE` with interleaving transactions could cause `mysqld` to crash. (Bug#22165)

C.2. Changes in release 5.2.x (Development)

MySQL 5.2 was merged into MySQL 6.0. An overview of which features were added in MySQL 5.2 and MySQL 6.0 can be found here: Section 1.4.1, “What Is New in MySQL 6.0”.

For a full list of changes, please refer to the changelog sections for each individual 5.2.x release.

C.2.1. Changes in MySQL 5.2.5 (08 August 2007)

This is a new Alpha development release, fixing recently discovered bugs.

> **Note**
>
> This Alpha release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see http://www.mysql.com/products/enterprise/advisors.html.

Functionality added or changed:

- **Incompatible Change**: The obsolete constructs in the following table have been removed. Use the equivalents shown in the table's second column instead. Existing applications that depend on the obsolete constructs should be converted to make use of the current equivalents as soon as possible.

Obsolete:	**Current**:
`@@table_type`	`@@storage_engine`
`@@log_bin_trust_routine_creators`	`@@log_bin_trust_function_creators`
`TIMESTAMP(N)`	See Section 11.6, “Date and Time Functions”.
`TYPE=`	`ENGINE=`
`BACKUP TABLE`	`mysqldump`, `mysqlhotcopy`, or MySQL Administrator
`RESTORE TABLE`, `LOAD TABLE FROM MASTER`	`mysqldump`, `mysql`, or MySQL Administrator
`SHOW TABLE TYPES`	`SHOW [STORAGE] ENGINES`

`SHOW INNODB STATUS`	`SHOW ENGINE INNODB STATUS`
`SHOW MUTEX STATUS`	`SHOW ENGINE INNODB MUTEX`
`--master-xxx` options to set replication parameters: `--master-host`, `--master-user`, `--master-password` , `--master-port`, `--master-connect-retry`, `--master-ssl`, `--master-ssl-ca`, `--master-ssl-capath`, `--master-ssl-cert`, `--master-ssl-cipher`, `--master-ssl-key`	`CHANGE MASTER TO`

- **MySQL Cluster**: It is now possible to control whether fixed-width or variable-width storage is used for a given column of an `NDB` table by means of the `COLUMN_FORMAT` specifier as part of the column's definition in a `CREATE TABLE` or `ALTER TABLE` statement.

  It is also possible to control whether a given column of an `NDB` table is stored in memory or on disk, using the `STORAGE` specifier as part of the column's definition in a `CREATE TABLE` or `ALTER TABLE` statement.

  For permitted values and other information about `COLUMN_FORMAT` and `STORAGE`, see Section 12.1.14, "`CREATE TABLE` Syntax".

- The `INFORMATION_SCHEMA.COLUMNS` table now has `STORAGE` and `FORMAT` columns. For `NDB` tables, `STORAGE` indicates whether a column is stored on disk or memory, and `FORMAT` indicates the column storage format (`FIXED`, `DYNAMIC`, or `DEFAULT`).

- The `INFORMATION_SCHEMA.STATISTICS` table now has an `INDEX_COMMENT` column to indicate any comment string provided for the column. The `SHOW INDEX` statement now displays an `Index_comment` column that provides the same information.

- The `LOAD XML INFILE` statement was added. This statement makes it possible to read data directly from XML files into database tables. For more information, see Section 12.2.7, "`LOAD XML` Syntax".

Bugs fixed:

- Use of the `latin2_czech_cs` collation caused a server crash. (Bug#29459)

C.2.2. Changes in MySQL 5.2.4 (Not released)

This is a new Alpha development release, fixing recently discovered bugs.

> **Note**
>
> This Alpha release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see http://www.mysql.com/products/enterprise/advisors.html.

Functionality added or changed:

- **Incompatible Change**: Added the `optimizer_use_mrr` system variable to enable control over whether Multi-Range Read optimization is used. This replaces the `multi_range_count` system variable, which has been removed.

- The syntax for the `LOCK TABLES` statement has been extended to support transactional table locks that do not commit transactions automatically. Following `LOCK TABLES ... IN SHARE MODE` or `LOCK TABLES ... IN EXCLUSIVE MODE`, you can access tables not mentioned in the `LOCK TABLES` statement. You can now also issue these extended `LOCK TABLES` statements many times in succession, adding additional tables to the locked set, and without unlocking any tables that were locked previously. When using `LOCK TABLES` with `IN SHARE MODE` or `IN EXCLUSIVE MODE`, tables are not unlocked until the transaction is committed.

The behavior of `LOCK TABLES` when not using `IN SHARE MODE` or `IN EXCLUSIVE MODE` remains unchanged.

- A new SQL function, `WEIGHT_STRING()`, returns the weight string for an input string. The weight string represents the sorting and comparison value of the input string.
- Added the `optimizer_switch` system variable to enable control over individual optimizations.
- The maximum length of table comments was extended from 60 to 2048 characters. The maximum length of column comments was extended from 255 to 1024 characters. Index definitions now can include a comment of up to 1024 characters.
- Parser performance was improved for identifier scanning and conversion of ASCII string literals.

C.2.3. Changes in MySQL 5.2.3 (15 February 2007)

Bugs fixed:

- MySQL would crash with an assertion on startup during recovery referring to `tc.log`. (Bug#26161)
- A crash would occur when running `UPDATE` within a loop inside a stored procedure. (Bug#25537)

C.2.4. Changes in MySQL 5.2.2 (Not released)

Bugs fixed:

- MySQL would fail with an assertion on startup. (Bug#25835)

C.2.5. Changes in MySQL 5.2.1 (Not released Alpha)

Functionality added or changed:

- Performance improvements: thread bottlenecks have been reduced when a larger number of parallel auto-commit threads executed a trivial query in a hard loop.

Bugs fixed:

- Falcon compound primary key problem. (Bug#25828)
- Assertion when killing a `CREATE TABLE ... SELECT` statement. (Bug#25565)
- A `DROP TABLE` statement on a table created using `CREATE TABLE ... SELECT ...` crashed the server. (Bug#25564)
- Crash if create index on nullable `utf8` column. (Bug#25555)
- Between fails with Unicode field. (Bug#24511)

C.3. MySQL Enterprise Monitor Change History

This appendix lists the changes to the MySQL Enterprise Monitor, beginning with the most recent release. Each release section covers added or changed functionality, bug fixes, and known issues, if applicable. All bug fixes are referenced by bug number and include a link to the bug database. Bugs are listed in order of resolution. To find a bug quickly, search by bug number.

C.3.1. Changes in MySQL Enterprise Monitor 2.1.0 (Not yet released)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.6.

Functionality added or changed:

- The agent should be able to run as a non-root user. However, the startup scripts always started it as root.

  The agent chassis now has a new option `--user` to drop privileges after being started as root. Note, this does not work when not started as superuser, nor on Windows.

  A new dialog box has also been added to the agent installer. The dialog has the following text: “The agent does not need to run with root user privileges. The agent will switch to the user account provided below when started by the root user.”

  The dialog also has a text field to allow the entry of the user account.

  A new parameter was also added to the `mysql-monitor-agent.ini` file. The parameter has the format `user=xxx`, where xxx is the user account to be used. (Bug#33778)

Bugs fixed:

- The recommendation for the rule `Table Cache Not Optimal` says:

  ```
  Recommended Action
  SET GLOBAL table_cache = (64 + 16);
  ```

  But an error was generated on executing that query:

  ```
  mysql> SET GLOBAL table_cache = (64 + 16);
  ERROR 1193 (HY000): Unknown system variable 'table_cache'

  mysql> select version();
  +------------+
  | version()  |
  +------------+
  | 5.1.31-log |
  +------------+
  1 row in set (0.01 sec)
  ```

  (Bug#44602)

- The Mac OS X version of the Service Manager uses the system JRE. The system JRE loads the libraries located in `/Library/Java/Extensions`. As libraries in the extensions directory take precedence over other libraries, this caused conflicts when user extension libraries were installed there, as these would be used by the JRE when running Service Manager, instead of the shipped libraries. This happened when Java-related products were installed such as Connector/J, Spring, and Hibernate.

  This fix stops user-installed extension libraries from being used when the JRE runs the Service Manager, thus giving a “pristine” environment with no library collisions. (Bug#44157)

- Accessing the Query Analyzer tab caused a full table scan to take place on the MySQL Enterprise Monitor database. (Bug#43989)

- The Replication Group was renamed back to its default name after a new topology was discovered. (Bug#43816)

- A new topology was not discovered after the previous replication group was renamed. (Bug#43815)

- On Unix systems, executing the command:

  ```
  ./mysqlmonitorctl.sh stop
  ```

  did not make sure that `mysqld` was shutdown before finishing.

  This resulted in a situation such as the following:

  ```
  # /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
  Using CATALINA_BASE:   /opt/mysql/enterprise/monitor/apache-tomcat
  Using CATALINA_HOME:   /opt/mysql/enterprise/monitor/apache-tomcat
  Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
  Using JRE_HOME:       /opt/mysql/enterprise/monitor-2.0.0.7092/java
  Stopping tomcat service ... [ OK ]
  /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
  ```

  However, running the following command a few minutes later showed that the MySQL server was still running:

  ```
  # /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
  MySQL Network MySQL is running
  MySQL Network Tomcat is not running
  ```

(Bug#43803)

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. (Bug#43773)

- The SNMP trap source IP was always set to 127.0.0.1. (Bug#43738)

- The installer exited with a return code `0`, even if an error was detected and reported to the user during the installation.

```
.../mysqlmonitor-2.1.0.1015-linux-x86-64bit-installer.bin --mode unattended --installdir
/data0/merlin/monitoring/2.1.0.1015/host/38080 --tomcatport 38080 --tomcatshutdownport

Error running /data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/bin/mysql
--defaults-file=/data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/my.cnf -S
/data0/merlin/monitoring/2.1.0.1015/qa-merlin/38080/mysql/tmp/mysql.sock -u root -D mysql
-e "update user set Password = PASSWORD('**pwd**') where User = 'root'; update user set
User = '**user**' where User = 'root';delete from user where User = '';flush privileges;"
: ERROR 2002 (HY000): Can't connect to local MySQL server through socket
'/data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/tmp/mysql.sock' (2)
```

(Bug#43676)

- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. (Bug#43551)

- When a trailing space, or tab character, was added at the end of a parameter in the `config.properties` file, MySQL Enterprise Monitor failed to start and generated the following errors in log:

```
ERROR [Thread-1:org.springframework.web.context.ContextLoader] Context initialization
failed
...
Caused by: java.sql.SQLException: Illegal connection port value '13306'
...
```

  Resolving the problem required detailed log analysis because the configuration file did not show any apparent problems. (Bug#43540)

- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

  This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. (Bug#42997)

- Heat Chart rules could not be disabled or unscheduled. (Bug#42932)

- There were four columns added to the `SHOW SLAVE STATUS` query in MySQL Server 5.1: `Last_IO_Errno`, `Last_IO_Error`, `Last_SQL_Errno`, and `Last_SQL_Error`.

  However, these were not displayed within the Replication tab. (Bug#42811)

- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. (Bug#42452)

- Sun multi-core processors caused all cores to be reported on the meta information page.

  The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. (Bug#42355)

- The username field for new users was populated by the last username used.

  When creating a new user for the second time in Dashboard, the previously created username appeared in the dialog. (Bug#42314)

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

```
innodb_autoextend_increment = 50M
```

  This generated the error:

```
16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
adjusted to 1000
```

This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

The value in the configuration file should be:

```
innodb_autoextend_increment = 50
```

(Bug#42096)

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. (Bug#42067)

- `COM_REFRESH` was not supported by MySQL Proxy, it caused an `abort()`.

```
shell>  ./mysql-proxy --proxy-backend-addresses=192.168.250.3:3306
network-mysqld-proxy.c.3524: COM_(0x07) is not handled

```

(Bug#41991)

- The MySQL Enterprise Monitor file `my.cnf` specified an initial size of 500M for the central tablespace. However, `innodb_file_per_table` was used as well, resulting in approximately 500M of space being potentially wasted. (Bug#41967)

- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

```
U0002 You must log in to access the requested resource
```

(Bug#41384)

- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to allow the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. (Bug#41361)

- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. (Bug#41312)

- Graphs were incorrect for data that did not change. The graphs appeared as if no data had been gathered.

  The Hit Ratios graph had gaps in it where there had not been any activity on the parameters being monitored. For instance, if MyISAM tables were not used, then no Key Cache hit ratio series was plotted, even though the variables were still being collected. (Bug#41232)

- When creating a new Database Administrator user in FireFox 2 the following error message was generated:

```
U0002 You must log in to access the requested resource.
```

  This occurred in a new installation using the default administrator account. No Query Analysis permissions were given. However, the operation worked correctly using the Safari web browser. (Bug#41032)

- The **MANAGE SERVERS** page did not refresh in a manner consistent with other pages. This meant that changes to configuration made by others would not be reflected on the page. Also, changes in the status of the servers were not displayed automatically. (Bug#40792)

- The agent installer for Solaris 8 x86 32-bit was missing. (Bug#40248)

- Even though Query Analysis was disabled through the user interface, the queries that go through the agent were still being collected.

When Query Analysis was turned back on in the user interface, those queries were then displayed. (Bug#40032)

- Alerts sent from MySQL Enterprise Monitor used the GMT timezone, for example:

```
Time: 2008-09-17 19:41:08 GMT
```

That was not convenient for users, as their timezones may not have been GMT. (Bug#39504)

- The MySQL Enterprise Monitor upgrade installer replaced the `my.cnf` file. This resulted in the loss of any changes that had been made to the configuration file. (Bug#36528)
- If the "On Save send test trap" checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. (Bug#32069)

C.3.2. Changes in MySQL Enterprise Monitor 2.0.6 (Not yet released)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.5.

Bugs fixed:

- An error was generated when an attempt was made to rename a Replication Group to one that had previously been deleted. (Bug#43846)
- A new topology was not discovered after the previous replication group was renamed. (Bug#43815)
- On Unix systems, executing the command:

```
./mysqlmonitorctl.sh stop
```

did not make sure that `mysqld` was shutdown before finishing.

This resulted in a situation such as the following:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME:       /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [ OK ]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

(Bug#43803)

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. (Bug#43773)
- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. (Bug#43551)
- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

  This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. (Bug#42997)

C.3.3. Changes in MySQL Enterprise Monitor 2.0.5 (18th March 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version

2.0.4.

Bugs fixed:

- The FreeBSD 7 Agent was inadvertently a Linux binary.

```
shell> file mysqlmonitoragent-2.0.5.7153-freebsd7-x86-32bit-installer.bin
mysqlmonitoragent-2.0.5.7153-freebsd7-x86-32bit-installer.bin: ELF 32-bit LSB executable,
Intel 80386, version 1 (SYSV), for GNU/Linux 2.2.5, dynamically linked (uses shared libs),
stripped
```

  (Bug#44263)

- Calling the Agent with the option `--agent-run-os-tests` resulted in a crash. This happened on Linux x86-64 systems. The resultant stack trace was:

```
(qa-merlin)
2009-03-04 16:39:42: (critical) chassis.c:1097: could not raise RLIMIT_NOFILE to 8192,
Invalid argument (22). Current limit still 1024.
sigar-test-all.c.124 (test_sigar_pid_get):

  fs.dirname = /
  fs.devname = /dev/mapper/vg00-root
  fs.typename = local
  fs.sys-type-name = ext3
  fs.type = 2
  fsusage.total = 15481840
  fsusage.free = 14116140
  fsusage.used = 1365700
  fsusage.avail = 13329708
  fsusage.files = 1966080
  fsusage.use_percent = 0.100000
[0]
  diskusage.reads = 315302
  diskusage.writes = 6318240
  diskusage.write_bytes = 25879511040
  diskusage.read_bytes = 6561092608
  diskusage.queue = 47457530080206
Segmentation fault
```

  On some systems no output was shown, other than the message “Segmentation fault”. (Bug#43381)

- Following a change in the replication configuration, MySQL Enterprise Monitor did not display the new topology correctly. (Bug#43240)

- When a data collection became invalid, the agent sent NULLs for those collection values. However, the timestamps that it sent with the values were the timestamps from the last valid value that was collected.

  Due to key constraints on the Service Manager side, MySQL Enterprise Monitor disregarded anything sent with duplicate timestamps, thus the NULLs received from the agent were never processed. Some mechanisms, such as replication discovery, depend on the NULLs to identify a situation where data has become invalid. (Bug#43239)

- MySQL Enterprise Monitor did not add a log entry each time data was purged. The log entry should have noted how many rows of each type of data were purged (historical data, logs, quan data). (Bug#43159)

- MySQL Enterprise Monitor generated a stack overflow. This was as a result of a bug in Hibernate, which caused Hibernate to enter infinite recursion while trying to load a relationship. (Bug#43107)

- The “Table Cache Set Too Low For Startup” and “Table Cache Not Optimal” rules were not supported on MySQL 5.1 because the `table_cache` system variable was deprecated and replaced with `table_open_cache`. (Bug#42663)

- Migrated server was not completely deleted.

  In a Monitor that had been updated from 1.3.2 to 2.0.4, with 2 database servers queued for migration, if a server being migrated was deleted, or a migrated server was deleted, this would not be reflected in the user interface or in the license count, until Tomcat was restarted. (Bug#42604)

- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. (Bug#42452)

- Sun multi-core processors caused all cores to be reported on the meta information page.

  The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. (Bug#42355)

- If an attempt was made to disable a rule using the link next to the rule, the following error message was generated:

```
U0002 You must log in to access the requested resource. Go to login page.
```

  However, clicking on the link did not prompt the user to login again. (Bug#42313)

- Changing `ssh-agent` from OpenSSH or specifying a malevolent value of `agent-host-id`, could inject data into the monitored MySQL Server.

  For example, setting `agent-host-id` to the value “I'm a test” would result in the following message in the error log:

```
2009-01-23 15:45:11: ((error)) agent_mysqld.c:281: mysql_real_query('INSERT INTO
mysql.inventory  (name, value) VALUES ( 'hostid', 'I'm a test' )') on 'mysql' failed: You
have an error in your SQL syntax; check the manual that corresponds to your MySQL server
version for the right syntax to use near 'm a test' )' at line 1 (mysql-errno = 1064)
```

  (Bug#42306)

- When `SHOW GLOBAL STATUS` returned a value greater than 214748364, it was sent to the Service Manager as 214748364. (Bug#42245)

- The Agent failed to identify local sockets as local on Mac OS X 10.4.

  If the Agent was configured to use a Unix domain socket on Mac OS X 10.4, it did not treat the connection as local and failed to provide CPU and memory information to MySQL Enterprise Monitor. This is shown in the log file:

```
2009-01-20 18:15:02: (message) network-socket.c:752: is-local family 0 != 1
2009-01-20 18:15:02: (message) agent_mysqld.c:322: [mysql] mysqld is not local or not
directly connected
```

  However, this problem did not happen on Mac OS X 10.5. (Bug#42220)

- Some graphs on the **GRAPH** tab were not updated after the page was refreshed, or UPDATE was clicked.

  The only way to get an updated graph was to change the graph size (in pixels) and then click UPDATE. (Bug#42162)

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

```
innodb_autoextend_increment = 50M
```

  This generated the error:

```
16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
adjusted to 1000
```

  This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

  The value in the configuration file should be:

```
innodb_autoextend_increment = 50
```

  (Bug#42096)

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. (Bug#42067)

- The Service Manager did not handle the case where the agent failed to supply a valid `master_ip`. The Service Manager would then not restart. The logs contained the following:

```
2009-01-09 14:39:50,472 ERROR [main:org.springframework.web.context.ContextLoader] Context
initialization failed
org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with
name 'serverConnectionMonitor' defined in ServletContext resource
[/WEB-INF/applicationContext.xml]: Unsatisfied dependency expressed through constructor
argument with index 2 of type [com.mysql.etools.monitor.bo.Manager]: Error creating bean
with name 'manager' defined in ServletContext resource [/WEB-INF/applicationContext.xml]:
Invocation of init method failed; nested exception is
com.mysql.etools.monitor.pom.UnsupportedAttributeException:
101c6b5b-15eb-49aa-916c-843c51b28d38: mysql.slavestatus.Master_ip
```

  (Bug#42005)

- Having too many users with strong privileges generated Service Manager errors and events failed to be triggered.

  If there were approximately 1000 users with full privileges and the value of `group_concat_max_len` was set to 100001, the size of the data that the agent sent to the Service Manager was too large and caused Service Manager errors. Also, the Security event “Account has Strong MySQL privileges” did not trigger. (Bug#41987)

- Query Analyzer's Query Type filter for `SELECT` ignored statements starting with parenthesis.

  If you sent a statement through Query Analyzer starting with parenthesis, such as:

  ```
  (SELECT 1 FROM dual);
  ```

  and then attempted to filter for `SELECT` queries only, queries starting with parenthesis were not displayed. (Bug#41968)

- The agent angel process was spawning too soon, which caused a duplicate UUID error.

  `g_error()` logged a fatal error, and called `abort()`. This terminated the program. Then the angel respawned with the same UUID, but with a -1 session resync request, which the MEM server denied because the old session was still active. This resulted in a permissions denied error (1142) on the `mysql.inventory table`.

  ```
  2008-12-17 18:58:58: (message) agent_mysqld.c:313: [mysql] mysqld is local and directly connected
  2008-12-17 18:58:58: ((error)) agent_mysqld.c:444: [mysql] mysql_real_query("SELECT value
  FROM mysql.inventory WHERE name = 'uuid'") failed: SELECT command denied to user
  'ent_agent'@'127.0.0.1' for table 'inventory' (errno=1142)
  2008-12-17 18:58:58: (debug) chassis.c:282: 15134 returned: 15134

  2008-12-17 18:59:00: (message) mysql-proxy 0.7.0 started
  2008-12-17 18:59:00: (message) MySQL Monitor Agent 2.0.0.7111 started.
  ```

  (Bug#41600)

- `master_uuid` discovery did not work with MySQL Server versions prior to 5.1. `master_uuid` did not show in any Agent to Monitor communications, and no log or error messages were generated.

  However, now the bug has been fixed, an Agent monitoring a 5.0 MySQL Server would register the following in its logs:

  ```
  ...
   <classname>slavestatus</classname>
   <instance>12515cdc-8c00-4223-9d2a-2666a403512c</instance>
   <attribute>Master_uuid</attribute>
  </target>
  <utc>2009-03-03T19:58:05.700Z</utc>
  <value>b2fd9f86-6e42-49f2-b930-e8fb3e728179</value>
  ```

  Note the presence of `master_uuid`. (Bug#41525)

- The `master_uuid` was not used for replication topology discovery.

  The agent collected `master_uuid` by reading the `master.info` file, and then running a `SELECT` directly against its master. This was to try and read the `mysql.inventory` table on the master to obtain the instance `master_uuid`.

  However, this was not being used correctly by the replication topology discovery within the server. (Bug#41519)

- Queries such as `SELECT` against the master `mysql.inventory` was not logged on slave-based agents. This made diagnosing topology discovery issues difficult. (Bug#41518)

- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

  ```
  U0002 You must log in to access the requested resource
  ```

  (Bug#41384)

- Agent startup failed on Solaris 10. The error generated was:

  ```
  # ./mysql-monitor-agent start
  Bad string
  ERROR! /opt/mysql/enterprise/agent/etc/mysql-monitor-agent.ini has to have a
  [mysql-proxy].pid-file setting
  ```

This was caused by unexpected behavior of the `tr` command. (Bug#41260)

- On the Query Analysis page, if a query was clicked the minimum displayed was greater than the average. (Bug#41259)
- In some circumstances the agent/proxy ran out of file descriptors, causing secondary failures. It could not recover from that state. The relevant part of the log file is shown here:

```
2008-11-27 11:11:00: (critical) last message repeated 2 times

```

  (Bug#41068)

- If an installation of Service Manager 2.0.0.7102 included a `backup` directory, due to a previous upgrade, and was upgraded using at least Service Manager 2.0.0.7103, then the installer displayed an error message and exited.

  The error message displayed was:

```
There has been an error.
Error renaming /Applications/mysql/enterprise/monitor/apache-tomcat to
/Applications/mysql/enterprise/monitor/backup/apache-tomcat
The application will exit now
```

  (Bug#40996)

- The Agent started without problems and connected to the master. But it was unable to perform a `SELECT` from the table `mysql.inventory` in order to obtain server information. (Bug#40933)
- Canonical Query Text for `Select -1` was displayed as `SELECT -?` instead of `SELECT ?` on the Query Analyzer tab. (Bug#40435)
- The agent installer for Solaris 8 x86 32-bit was missing. (Bug#40248)
- The startup scripts supplied with MySQL Network Monitoring and Advisory tool did not supply all of the LSB `init.d` script options required. A list of the required options can be found at the following website http://refspecs.freestandards.org/LSB_3.1.0/LSB-Core-generic/LSB-Core-generic/iniscrptact.html

  The required options missing include `status` and `force-reload`. The option `status` is used by monitoring tools and cluster software such as Red Hat Cluster, to ensure that the service is still running. The `force-reload` option is an alias for restart. (Bug#29848)

- Multiple errors showed in the agent log after issuing a `SHOW INNODB STATUS` statement. The `InnoDB Buffer Pool`graph also went blank. (Bug#27372)

C.3.4. Changes in MySQL Enterprise Monitor 2.0.4 (5th February 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.3.

Bugs fixed:

- The Service Agent did not log connections to, and disconnects from, the monitored database.

  This meant it was not possible to check if the Agent was connected to the database by simply looking at the log file. (Bug#42403)

- The Service Agent failed to create the `mysql.inventory` table. The logs displayed the following error message:

```
(critical) (share/mysql-proxy/quan.lua:711) [proxy] please add SELECT permissions for
this user on mysql.inventory to enable the QUAN feature, got Table 'mysql.inventory'
```

```
doesn't exist
```

This happened even though the Service Agent used the `root` account. (Bug#42389)

- After installing Service Agent 2.0.4.7138 and then starting it with `--version`, the incorrect version was displayed. Although 2.0.4.7138 was installed, the Service Agent displayed the version number as 2.0.2.7138. (Bug#42263)
- An invalid path was shown in the error message if the upgrade installer failed to find the previous install location.

  The error message is shown below, note that the error message displays a different path to that provided by the user:

```
Please specify the directory that contains the previous installation of the MySQL
Enterprise Monitor Agent

Installation directory [/home/mysql/mysql/enterprise/agent]: /var/lib/mysql/agent

Warning: The directory /home/mysql/mysql/enterprise/agent does not contain a a
previous installation. Please select the right installation directory.
Press [Enter] to continue :
--------------------------------------------------------------------------------
Please specify the directory that contains the previous installation of the MySQL
Enterprise Monitor Agent
```

  (Bug#42200)

- The agent password error in the Service Manager did not log the originating host, making it impossible to determine the agent that failed to log in:

```
ErrorJan 5, 2009 4:56:08 PM<?xml version='1.0'?><exceptions><error><![CDATA[E1702:
IncorrectPasswordException: [agent]]]></error></exceptions>
```

  (Bug#42139)

- The Service Manager's JDBC connections did not have `sql_mode` set to include `NO_ENGINE_SUBSTITUTION`. This resulted in the failure of Data Definition Language (DDL) if the Service Manager was inadvertently pointed to an incorrect `mysqld` instance. (Bug#42137)
- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. (Bug#42067)
- Service Agent configuration files had global read privileges on the filesystem. (Bug#41794)
- When the log files rotated to the maximum allowed by the `log4j` configuration, the metadata contained in the `FileAppender` became out of synchronization due to a logic bug. This caused an assertion error on any subsequent request for the logs tab or data. (Bug#41593)
- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to allow the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. (Bug#41361)
- On all available test systems, including SUSE Linux Enterprise Server (SLES) 9 and 10 x86-32, x86-64, IA64, and Ubuntu 6.10 x86-64, the agent memory grew incrementally within ~3 hours to ~25M.

  The agents then switched to the 'red' condition on the dashboard and no more data was reported. The agent processes were still alive.

  This was also present in MySQL Enterprise Monitor version 2.0.0.7111 on Suse 7.3, with the glibc2.2 x86 agent.

  There was no load on the monitored servers, and the problem also occurred when the “self-quan” was not configured. (Bug#41244)
- Although the **MONITOR** tab loaded initially, after a 64-bit MySQL server running a 32-bit MySQL Monitor Agent was clicked, a Null Pointer Exception was generated. (Bug#41164)
- The Service Agent startup configuration did not seem to work and did not generate a log file. (Bug#40583)
- An error generated by a rule failed to clear.

  When a rule was created with the `os:disk:fs_used` data item, if the instance was not a valid mount point then the Service Agent reported the error:

```
2008-08-11 17:57:00: (critical) disk-get failed for all: 2
```

Note the above instance was for “all”, and similar results occurred for instance “disk”.

The issue was that upon editing the rule, or even deleting the rule, the agent still showed the above error type. Restarting the agent and the monitoring service failed to remove the error. (Bug#38709)

- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. (Bug#32069)

C.3.5. Changes in MySQL Enterprise Monitor 2.0.3 (23rd January 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.2.

Bugs fixed:

- The Service Agent failed to connect to the server, and no error message was displayed in the log file.

  However, when the log verbosity level was set to `message`, the following message was recorded:

  ```
  2009-01-12 13:34:43: (warning) agent_mysqld.c:600: agent connecting to mysql-server
  failed: mysql_real_connect(host = '127.0.0.1', port = 3306, socket = ''): Lost connection
  to MySQL server at 'reading initial communication packet', system error: 0 (mysql-errno =
  2013)
  ```

  (Bug#42044)

- There was a mismatch between the contents of an SNMP Trap from MySQL Enterprise Monitor and the definition given in the file `MONITOR.MIB`. (Bug#41912)

- If a copy was made of a standard rule, the resulting Wiki markup was incorrect, resulting in the display of user-interface text containing HTML markup. (Bug#41375)

- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. (Bug#41312)

- When a custom rule requiring disk information was created, for example:

  ```
  [Expression]
  %disk_reads% > THRESHOLD

  [Thresholds]
  Critical Alert: 9000
  Warning Alert: 3000
  Info Alert: 1000

  [Variable Assignment]
  variables: %disk_reads%
  Data Item: os:disk:disk_reads
  Instance: /
  ```

  The following error was written to the file `mysql-service-agent.log`:

  ```
  2007-09-05 17:11:00: (critical) disk-get failed for c0d0p1: 2
  ```

  It therefore appeared that the Service Agent was not able to obtain the required information. (Bug#30820)

C.3.6. Changes in MySQL Enterprise Monitor 2.0.2 (14th January 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.1.

Bugs fixed:

- The COMPLETE SETUP button was missing from the **SETUP** page you were taken to after the current subscription expired. (Bug#41685)

- If the `host-id` of the monitored instance and the `host-id` of the current agent did not match, the agent generated the following error message:

```
Please TRUNCATE TABLE mysql.inventory on this mysql-instance and restart the agent.
```

However, it did not suggest using `sql_log_bin = 0`. This is used for all other actions against this table so that they are not replicated to slaves, each of which has their own copy of this table. (Bug#41673)

- The Agent did not start up when the monitored server had many databases and tables, and was under heavy load. This was because the `trigger_schema` query was taking too long on agent start up. (Bug#41555)
- The Service Agent failed to install on Solaris 10 x86. The following error was generated:

```
Installing
0% _______________ 50% _______________ 100%
########################################
Warning: Problem running post-install step.
Installation may not complete correctly
Error running /usr/local/mysqlagent/bin/mysql-monitor-agent
--defaults-file=/usr/local/mysqlagent/etc/mysql-monitor-agent.ini
--plugins=agent --agent-generate-uuid=true : 2008-12-12 13:06:02: (critical)
Conversion from character set '646' to 'UTF-8' is not supported
2008-12-12 13:06:02: (message) shutting down normally
```

(Bug#41445)

- The console/stdout appender remained in the log4j configuration, which meant that all the MySQL Enterprise Monitor server logs were duplicated to Catalina's stdout, and thus `catalina.out`, which was wasteful, especially as that file was not rotated or managed. (Bug#41439)
- When creating new multiple user accounts, the first attempt worked fine. However, following attempts to create new users did not show the **Query Analyzer Options** in the **Create User** popup until the role field was changed. (Bug#41430)
- When login privileges were required the Service Manager did not redirect the user to the login page. This resulted in error messages being displayed rather than simply redirecting the user to the login page. This problem typically occurred if it was necessary to restart Tomcat. (Bug#41320)
- The monitor 2.0.0.7105 and 2.0.0.7122 Solaris Intel update installer quits unexpectedly. The installer exits from the GUI in the **Backup of Previous Installation** screen, when OpenSolaris is running on top of Sun xVM.

  The console output for both installer versions is given below:

```
shell> ./mysqlmonitor-2.0.0.7105-solaris-intel-update-installer.bin
X Error of failed request:  BadMatch (invalid parameter attributes)
  Major opcode of failed request:  73 (X_GetImage)
  Serial number of failed request:  21161
  Current serial number in output stream:  21161
```

```
shell> ./mysqlmonitor-2.0.0.7122-solaris-intel-update-installer.bin
X Error of failed request:  BadMatch (invalid parameter attributes)
  Major opcode of failed request:  73 (X_GetImage)
  Serial number of failed request:  21148
  Current serial number in output stream:  21148
```

(Bug#41315)

- The **Rename Group** function failed if the new group name was different to the current one only in the case used; for example, if “Merlin” was changed to “MERLIN”.

  The error generated was:

```
U0105 This group name is already in use. Enter a different name.
```

(Bug#41266)

- The Agent returned an inventory list of all databases and tables. This information was not used by MySQL Enterprise Monitor, other than to populate the `inv_databases` and `inv_tables` tables. For large-scale deployments, where there were many databases and tables, this resulted in redundant XML messages being sent from the Agent to the Service Manager. (Bug#33150)

C.3.7. Changes in MySQL Enterprise Monitor 2.0.1 (15th December 2008)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.0.

Bugs fixed:

- Having an installation with over 420 master binlogs resulted in the `mysql::status` graph not being plotted. (Bug#41314)
- The MySQL Enterprise Monitor installer generated a segfault on RedHat Fedora 10:

```
shell> ./mysqlmonitor-2.0.0.7105-linux-x86-installer.bin
Segmentation fault
```

(Bug#41196)

C.3.8. Changes in MySQL Enterprise Monitor 2.0.0 (11th December 2008)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 1.3.3.

Functionality added or changed:

- **Important Change**: The `server-name` configuration parameter is deprecated. For compatibility, during an upgrade, the information will be migrated to a `displayname` configuration parameter within the individual instance configuration files. This configuration parameter is provided only for compatibility, as display name information is now stored within the main repository. Support for `displayname` is also deprecated and will be removed in a future release.
- **Important Note**: The rules "32-Bit Binary Running on 64-Bit AMD Or Intel System" and "Key Buffer Size Greater Than 4 GB" occasionally do not evaluate correctly due to timing issues. This causes them to be displayed with the **SEVERITY** level of "Unknown". This is a known issue and will be resolved in future versions of MySQL Enterprise Monitor.
- **Important Note**: When you start the Merlin 2.0 agent from the command line on Windows, you get the following error dialog:

```
"mysql-proxy.exe - Entry Point Not Found"
"The procedure entry point libiconv_set_relocation_prefix could not be located in the
dynamic link library iconv.dll"
```

  If you click OK the agent works fine after that.

  This only occurs when starting the agent from the command line, and only when there is another version of one of the DLLs that the agent uses somewhere on the current path. This error can be avoided by opening a command prompt, typing `SET PATH=` to clear the path, and then starting the agent.
- **Important Note**: If you are monitoring one instance of MySQL server (mysqld) and then upgrade that MySQL server, the correct version of the MySQL server is not displayed in the Dashboard. This is a known issue that will be fixed in future versions of MySQL Enterprise Monitor.
- The following has been added to the Tomcat `config.properties` properties file:

```
    # max connections in the pool for the repository
    default.maxActive=70
```

  (Bug#40652)
- The dashboard could be used to change the agent password to one containing the `@` character, or other special characters, which subsequently caused errors. To fix this problem, special characters in passwords are now prevented by the dashboard. The list of disallowed special characters can be found at the following location: http://en.wikipedia.org/wiki/Percent-encoding#Types_of_URI_characters (Bug#37172)
- The **QUERY ANALYSIS** page was missing the **REFRESH** dropdown control that the **MONITOR**, **EVENTS**, and **GRAPHS** pages had at the top. (Bug#36831)
- The User Interface only returned error strings, without any associated error codes. This meant that if the error string was in a language that the user did not understand, it would be very difficult to determine which error actually occurred.

  The User Interface now supports error codes, as well as error strings. This change allows easier testing of multiple locales. (Bug#32131)
- The wording was changed on the fading popup subscription alert. The text "account" was changed to "subscription". (Bug#31492)
- The alert thresholds for the Query Cache Advisor were changed:

	Information	Warning	Critical
From	95	85	75
To	60	50	40

(Bug#30969)

- The agent log file name has changed from `mysql-service-agent.log` to `mysql-monitor-agent.log`. The old log file will be retained during a upgrade install.

Bugs fixed:

- Starting a new agent against an instance that contained many databases broke up the initial discovery packet, causing collections such as CPU usage and their graphs to fail. See also Bug#33150 and Bug#41314. (Bug#41933)
- When altering an existing rule you had to add an empty string, `""`, to any threshold level that was empty. Otherwise, the rule failed to run and the resulting exceptions caused the **EVENTS** page to be unusable due to duplicate key exceptions. (Bug#41310)
- After installing the 2.0.0.7119 Dashboard the following error was generated in the logs:

```
com.opensymphony.xwork2.util.OgnlValueStack  Warning  Dec 5, 2008 10:41:26 AM  Caught
an Ognl exception while getting property titleAddition
```

(Bug#41252)

- The `dc_ng_long_now` table became very large partly due to an unused column `begin_time`. (Bug#41093)
- Although there was a unique constraint on the user name, it was not enforced during first-time setup. This resulted in a stack trace being produced, rather than a more user-friendly error message, if the same name was used for the `admin` and `agent` accounts. (Bug#40870)
- MySQL Enterprise Monitor server had stopped sending up/down SNMP traps. (Bug#40861)
- The Query Analyzer's **EXPLAIN QUERY** tab did not have pop up text or a link to the documentation regarding `SELECT` queries. (Bug#40841)
- When you tried to import a Trial-level advisor JAR using a Trial user account, one of the following error messages was generated:

```
U0009 The uploaded Advisor jar was invalid
```

```
U0161 Please import a Platinum level Advisor .jar to use with this Platinum level product key
```

(Bug#40834)

- Meta Info on the Dashboard did not display information for the meta data `os_description`. (Bug#40830)
- Attempting to create an alias of statements such as `COMMIT`, `ROLLBACK`, `BEGIN`, resulted in the error:

```
Can't find template commitTnx.st; group hierarchy is [HTMLFormatting]
org.antlr.stringtemplate.StringTemplateGroup.lookupTemplate(StringTemplateGroup.java:507)
```

(Bug#40736)

- Trying to upgrade from 2.0.0.7088 to 2.0.0.7092 failed as there was a missing file. When the update program `mysqlmonitor-2.0.0.7092-solaris-intel-update-installer.bin` was run, the file `/tmp/com/mysql/merlin/server/version.props` could not be found. (Bug#40692)
- On OS X with Java 1.5, Tomcat crashed on launch with the error:

```
Invalid memory access of location 00000007 eip=013df179
```

(Bug#40689)

- When the agent was installed using the command line installer and `--enableproxy 0` was specified, the installer should have removed `quan.lua` from the `agent-item-files` option in the INI file. (Bug#40551)

- The Agent could not connect to a database with the `hostname` set to `localhost`. Doing so resulted in the error:

  ```
  (critical) the MySQL server could not be reached at socket '(null)', we will check in 10 seconds
  ```

  (Bug#40530)

- The update installer for the 2.0 Monitor did not have an **Is SSL support required?** checkbox. Therefore, the appropriate SSL connector definition was commented out in the `conf/server.xml` file. (Bug#40414)

- The Service Manager installer did not uninstall or wipe out the previous installation if you answered "Yes" to the question:

  "The directory you selected already contains a MySQL installation. If you continue installation all data will be lost. Do you wish to continue?" (Bug#40410)

- If you unchecked the **Enable Proxy** checkbox on the **Query Analysis Configuration** screen, the agent's INI file still contained proxy configuration data and was not commented out. (Bug#40272)

- As different queries were sent through the agent it used increasing amounts of memory. (Bug#40260)

- The Service Manager installer set the Java Virtual Machine option `HeapDumpPath` to `<install_root>\temp` on Windows and `/tmp` on other platforms. For consistency the `HeapDumpPath` directory should have been set to `<install_root>\tmp` on Windows. (Bug#40215)

- When using the command line agent setup program, a socket file was not accepted for the monitored instance. (Bug#40085)

- The language option when installing the MySQL Enterprise Monitor in Japanese using the command-line instllaer has been changed from `jp` to `ja`. (Bug#40082)

- When monitoring MySQL 5.1.24 and above, the user used by the agent to connect to the MySQL server for monitoring must have the `PROCESS` privilege. (Bug#40050)

- The check box option string "Is SSL support required?", on the Tomcat Server Option dialog of the Monitor installation, was not correctly translated into Japanese. (Bug#39814)

- The base application directory for the MySQL Enterprise Dashboard has been updated from `http://localhost:18080/merlin` to `http://localhost:18080/`. (Bug#39403)

- If the Service Manager or the MySQL Server running the Repository crashed, they did not restart automatically. (Bug#39377)

- If the agent crashed, there was no watchdog, angel or keep-alive mechanism to restart the agent and keep it running. (Bug#39374)

- If the MySQL client libraries were located in a non-standard location, the agent 2.0.0.7042 installer failed with a "library not found" error. (Bug#39317)

- For the rule "Server-Enforced Data Integrity Checking Not Strict", the Recommended Action did not display correctly. It displayed as `SET sql_mode=modes`, rather than `SET [GLOBAL|SESSION] sql_mode=modes`. (Bug#39261)

- A query that was issued through the proxy, and that had an auto-explain performed on that query, did not give the correct response to a subsequent query of `SELECT FOUND_ROWS()`. (Bug#39223)

- It was not possible to establish a connection with the Dashboard using the SSL protocol (https://). (Bug#39198)

- When a 1.3 MySQL Enterprise Monitor installation with many rules scheduled was upgraded to 2.0, the upgraded installation was then found to have only the heat chart rules scheduled. (Bug#39043)

- The agent installer did not allow a second agent to be installed on Windows. (Bug#38976)

- The Dashboard incorrectly diplayed that insufficient licenses were available, even though sufficient licenses had been purchased. (Bug#38514)

- After running the MySQL Service Agent uninstall program, the file `/etc/init.d/mysql-service-agent` remained present on the server. (Bug#38490)

- The notice fader continued to display English text after you changed the locale to Japanese. (Bug#38460)

- The **Subscription Expired** pop-up window referred to the "Global Preferences" page, instead of the "Global Settings" page. (Bug#38358)

- An inappropriate time zone was used to parse user-entered date and time strings. (Bug#38323)

- A sigar network stats error was generated on the Solaris platform:

```
# /opt/mysql/enterprise/agent/bin/mysql-service-agent --version
MySQL Service Agent - 1.2.0.7879, (glib lib=2.8.5, headers=2.8.5)

SunOS mysqlprd01 5.10 Generic_127127-11 sun4v sparc SUNW,T5240

2008-07-21 10:07:24: (critical) sigar_net_interface_config_primary_get() failed: 6
2008-07-21 10:08:00: (critical) sigar_net_interface_config_primary_get() failed: 6

# /opt/mysql/enterprise/agent/bin/sigar-test-all >/tmp/test.txt
sigar_net_interface_stat_get(e1000g0:2) failed#
```

  (Bug#38302)

- After deleting a server from the **Settings**, **Manage Servers** tab, at the very bottom of the page the **Monitoring x instances on x host** values did not reflect the deletion. (Bug#38225)

- The MySQL Enterprise Monitor alert “INFO Alert - Users Can View All Databases On MySQL Server (v 1.5 *)” from the Security advisor was incorrect. This is because the default server behavior allows users to see databases for which they have privileges, not “all databases on server” as suggested by the alert. (Bug#38052)

- The “Maximum Connection Limit Nearing Or Reached” advisor did not generate a new Critical Alert event when there was an open info success event. (Bug#37816)

- The Linux IA64 installer appeared to crash. The installer appeared to crash on RH4_IA64 if called with option "--version":

```
--------------------------------------------------------------------------------
<INSTALLER> --version
mysqlmonitorage(30704): unaligned access to 0x6000000000a8413c, ip=0x2000000003ddd5f0
mysqlmonitorage(30704): unaligned access to 0x6000000000a84144, ip=0x2000000003ddd5f1
mysqlmonitorage(30704): unaligned access to 0x6000000000a8414c, ip=0x2000000003ddd600
mysqlmonitorage(30704): unaligned access to 0x6000000000a84154, ip=0x2000000003ddd601
MySQL Enterprise Monitor Agent 0.7.0.1737 --- Built on 2008-06-25 19:31:53

--------------------------------------------------------------------------------
```

  However, this warning is harmless and will not impact the operation of the agent. (Bug#37496)

- If the log-level option in the agent configuration file was set to an unknown level by mistake, the `init.d` script appeared to enter an infinite loop. (Bug#37108)

- Malformatted server meta information appeared on the Dashboard; **RAM** and **Disk Space** appeared under the **CPU** category. (Bug#36740)

- A “rename” link incorrectly appeared next to the **Upgrade** category on the **Manage Rules** page. (Bug#36584)

- In the case where exceptions were passed through to the User Interface, the substituted arguments in the message contained developer-only information. (Bug#36580)

- **Agent Version**, **Last MySQL Contact**, **OS Info**, **CPU Info**, and **IP Addresses** were all blank on the dashboard when the agent for the selected server was not functioning. (Bug#36301)

- `mysql-monitor-agent` became confused by the `.DS_Store` files that are created on Mac OS X. (Bug#36216)

- The rule “Key Buffer Size Greater Than 4 GB” incorrectly triggered the following alert:

  ```
  CRITICAL Alert - Key Buffer Size Greater Than 4 GB
  ```

  However, on non-Windows systems, a key buffer size greater than 4 GB is supported. (Bug#36143)

- Since the repository database for MySQL Enterprise Monitor uses InnoDB there was no way to reduce the size of the data files after an old log/event data purge operation. Further, the purge data operation executed once per day, and had no option to trigger the purge operation manually. (Bug#35971)

- On the Graphs page, if all graphs were expanded, then the Time Display interval updated, the page was refreshed with the Expand All button displayed, even though all the graphs were already expanded. (Bug#35917, Bug#35133)

- The Meta Info area of the Monitor page incorrectly reported the operating system version number for the MySQL version. (Bug#35836)

- The rule “XA Distributed Transaction Support Enabled For InnoDB” incorrectly sent a warning when the binary log was on. (Bug#35786)

- On the Monitor page, the time displayed for `Last MySQL Contact` lagged behind that for `Last Agent Contact` by a

large amount. (Bug#35774)

- MySQL Enterprise Monitor did not update replication settings correctly. After a slave became the master, the Adviser still referred to it as a slave. (Bug#35771)
- The Adviser email suggested using the `--log-queries-not-using-indexes` option. However, this option is not available in MySQL Server versions prior to 4.1. (Bug#35770)
- Thumbnail graphs did not update properly after a time zone change. (Bug#35756)
- If a system had a global `wait_timeout` lower than the general activity of the agent, the agent was disconnected. The monitored server then logged an error and incremented `Aborted_clients`. (Bug#35648)
- Alerts fired after a blackout period based on data collections that happened during the blackout. (Bug#35617)
- The translation of the ADD ROW button on the Rule Definition window was incorrect. (Bug#35495)
- An uninstallation message asked about removing Apache files, even though Apache is no longer used. (Bug#35154)
- After updating from a previous version to the latest 1.3 version, the **QUERY CACHE HAS SUB-OPTIMAL HIT RATE** was still displayed in English after setting the locale to Japanese. Note, the rule was translated correctly if the full installer was used. (Bug#35134)
- The MySQL Enterprise Monitor uninstall dialog box had missing text when using the Japanese locale. (Bug#34982)
- Running the installer with the `--help` option caused an incorrect message to be displayed. (Bug#34200)
- When using the unattended `unInstall` script on Linux together with the option `--env deleteUserData=yes` the correct warning text was displayed. However, this text should not be displayed in unattended mode. Further, the option `--env deleteUserData=yes` was not displayed by the `--help` output. (Bug#34071)
- Platinum Unlimited customers sometimes received a warning stating incorrectly that their subscription supported zero hosts. (Bug#34010)
- Clicking on the resolution notes link for a closed event on the events tab showed incorrect behaviour. The popup initially showed the resolution notes, but when the resolution tab was clicked the notes disappeared and were replaced by an edit box. (Bug#33935)
- The status on the product information page was not translated when the user locale was set to Japanese. (Bug#32785)
- When the locale was set to Japanese, the date picker still had English month titles. (Bug#32741)
- Flashing display of a pop-up used while saving outgoing email settings was caused by problematic initial placement calculations. (Bug#32579)
- AIX 5.2 Agent did not work on AIX 5.3. (Bug#32414)
- When the First Time Setup program was run it did not prompt the user to allow importing an Advisor bundle. (Bug#32199)
- Agent on MacOSX did not read IP addresses for network interfaces correctly, so the monitor displayed empty host IP addresses. (Bug#32188)
- HTML code in queries was not escaped when reporting replication errors, causing the code to be rendered into the page. (Bug#32186)
- The First Run pop-up defaulted to English rather than to the locale set in the browser. (Bug#32129)
- The error dialog box flashed in the upper left corner before being positioned in the center of the screen. This error dialog box now opens in the center of the screen. (Bug#32068)
- The Events list did not take into account Daylight Time and Standard Time when listing events that happened during 1:00am-1:59am. An event that occurred at 1:10am Standard Time was listed before an event that occurred 50 minutes before it at 1:20am Daylight Time. (Bug#32016)
- The pop-up for editing log levels failed to load due to bad instantiation data. (Bug#32013)
- During the repeated hour of Daylight Savings Time (when 2am turns back into 1am), the graphs were not drawing data. Instead, there was a straight line from the point at 1:00 to the second 1:00, which is what happens if there is no data. The repository did, however, have data for this hour. (Bug#31997)
- Only US English was supported for a locale setting. Other English variants are now available for the `locale` setting on the

`General Settings` or the `User Preferences` pages. (Bug#31801)

- If the user locale was changed the graph cache would continue to display the graph in the last locale until it timed out. (Bug#31680)
- No init script was installed for the MySQL Network Monitoring Service Manager, and so it did not restart automatically on reboot. (Bug#31676)
- The graph's displayed time was not the local time of the Dashboard corresponding to the requested time on the monitored server. (Bug#31656)
- Saving a rule with a name that already existed resulted in a stack trace in the window, instead of a more user-friendly error message. (Bug#30925)
- The `network.mysql.com` error messages were remapped thereby causing confusion. For example, the following error message:

  ```
  E9000: MySQL Enterprise Customer Center is having difficulties fetching your contract information.
  Please contact enterprise-feedback@mysql.com for assistance.
  ```

  Was remapped to:

  ```
  Unable to connect to verify credentials
  ```

  (Bug#30873)
- A newly added server showed as “down” in the user interface, and could potentially have sent a false alarm notification. (Bug#30735)
- The information on the Advisors, Check For Updates page did not accurately reflect how many rules and graphs were actually in the database and available to the user. (Bug#29623)
- The agent did not process `SIGHUP`. (Bug#29380)
- Monitor did not have a facility to stop or downgrade an agent collection frequency. (Bug#28589)
- After an agent installation was updated from 1.0.1.4391 to 1.1.0.4899, the version in the Add/Remove Programs menu was incorrectly displayed as 1.0.1.4391, even though the update was successful and the file version of `agent.exe` was correctly displayed as 1.1.0.4899. (Bug#27447)
- When viewing the **Results** of an **Event** in the **Events** tab of the **Dashboard**, the **Notifications** section did not reflect the **Notifications** settings at the time the **Event** was triggered, but rather the **Notifications** settings at the time the **Event Results** were viewed. (Bug#26349)
- When the Service Agent was remotely monitoring a MySQL server it incorrectly reported that it could collect operating system information. (Bug#22497)
- The Account Without Password advisor did not report all users who were without a password, it only reported one. (Bug#15165)

C.4. MySQL Connector/ODBC (MyODBC) Change History

C.4.1. Changes in MySQL Connector/ODBC 5.1.6 (Not yet released)

Bugs fixed:

- Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. (Bug#42120)
- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. (Bug#41942)
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. (Bug#41256)
- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

  ```
  SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
  ```

  (Bug#40316)
- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when

the record set was updated with the `Update` method. (Bug#39961)

- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. (Bug#39957)
- MyODBC would crash when a character set was being used on the server that was not supported in the client, for example cp1251:

```
[MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
```

  The fix causes MyODBC to return an error message instead of crashing. (Bug#39831)
- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. (Bug#39561)
- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. (Bug#39560)
- MyODBC Driver 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as “SERVER= localhost” instead of “SERVER=localhost” the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host ' localhost' (11001).
```

  (Bug#39085)
- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the NULL terminator. (Bug#38949)
- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid non-null string. (Bug#37649)
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. (Bug#37278)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. (Bug#36071)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug#30626)
- It was not possible to use Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':

[MySQL][ODBC 3.51 Driver]SSL connection error.
```

  (Bug#29955)
- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

  When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

  (Bug#26950)

C.4.2. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. (Bug#37342)

- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. (Bug#37254)
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. (Bug#36293)
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. (Bug#36275)
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. (Bug#36203)
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. (Bug#36069)

C.4.3. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. (Bug#35920)
- The driver installer could not create a new DSN if many other drivers were already installed. (Bug#35776)
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug#35581)
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. (Bug#33910)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug#32057)

C.4.4. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change**: You must uninstall previous 5.1.x editions of Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. (Bug#34672)
- Installation of Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. (Bug#34522)
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. (Bug#34429)
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. (Bug#34271)
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. (Bug#33918)

- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the Connector/ODBC driver. (Bug#33825)
- Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. (Bug#33808)
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. (Bug#24535)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)

C.4.5. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- Explicit descriptors are implemented. (Bug#32064)
- A full implementation of SQLForeignKeys based on the information available from INFORMATION_SCHEMA in 5.0 and later versions of the server has been implemented.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which allows more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. (Bug#33897)
- Within the GUI interface, when connecting to a MySQL server on a non-standard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. (Bug#33822)
- Specifying a non-existent database name within the GUI dialog would result in an empty list, not an error. (Bug#33615)
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. (Bug#33388)
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. (Bug#33130)
- Retrieving data from a `BLOB` column would fail within `SQLGetData`when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. (Bug#32684)

- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. (Bug#28617)
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. (Bug#19923)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug#12805, Bug#30890)
- Dynamic cursors on statements with parameters were not supported. (Bug#11846)
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. (Bug#10128)
- Adding or updating a row using `SQLSetPos()` on a result set with aliased columns would fail. (Bug#6157)

C.4.6. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from Connector/ODBC 3.51.21 and 3.51.22.

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- **Incompatible Change**: Replaced myodbc3i (now myodbc-installer) with Connector/ODBC 5.0 version.
- **Incompatible Change**: Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change**: Disallow `SET NAMES` in initial statement and in executed statements.

- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. (Bug#32685)
- Added MSI installer for Windows 64-bit. (Bug#31510)
- Implemented support for `SQLCancel()`. (Bug#15601)
- Added support for `SQL_NUMERIC_STRUCT`. (Bug#3028, Bug#24920)
- Removed non-threadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of Connector/ODBC 5.0, supports Unicode option values.
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. (Bug#32596)
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. (Bug#32161)
- ADO was unable to open record set using dynamic cursor. (Bug#32014)
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. (Bug#31720)
- Memory usage would increase considerably. (Bug#31115)
- SQL statements are limited to 64KB. (Bug#30983, Bug#30984)
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. (Bug#29765)
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. (Bug#29239)
- ADO Not possible to update a client side cursor. (Bug#27961)
- Recordset `Update()` fails when using `adUseClient` cursor. (Bug#26985)
- Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and other punctuation marks. (Bug#16178)
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

C.4.7. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of Connector/ODBC 5.1.x before upgrading.

  See also Bug#34571.

Functionality added or changed:

- Added support for Unicode functions (`SQLConnectW`, etc).
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for `SQL_C_WCHAR`.

C.4.8. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

> **Note**
>
> Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1. See Section 20.1.2.1, “Connector/ODBC Roadmap”.

Bugs fixed:

- Inserting `NULL` values into a `DATETIME` column from Access reports an error. (Bug#27896)
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. (Bug#20127)

C.4.9. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. (Bug#25316)
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. (Bug#25263)
- Transaction support has been added and tested. (Bug#25045)
- Internal function, `my_setpos_delete_ignore()` could cause a crash. (Bug#22796)
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.
- Fixed the binding of certain integer types.

C.4.10. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. (Bug#24876)
- Added initial unicode support in data and metadata. (Bug#24837)
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. (Bug#24485)
- Added loose handling of retrieving some diagnostic data. (Bug#15782)
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. (Bug#24675)
- String query parameters are new escaped correctly. (Bug#19078)

C.4.11. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as SQL_NUMBERIC_STRUCT.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Added limit of display size when requested via `SQLColAttribute`/`SQL_DESC_DISPLAY_SIZE`.
- Fixed buffer length return for SQLDriverConnect.
- ODBC v2 behaviour in driver now supports ODBC v3 date/time types (since DriverManager maps them).
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed SQLGetData to clear the NULL indicator correctly during multiple calls.

C.4.12. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.

- Fixed display size to be length if max length isn't available.
- Made distinction between `CHAR`/`BINARY` (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using `SQL_C_LONG`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Allow SQLDescribeCol to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed hanlding of numeric pointers in SQLColAttribute.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by SQLGetDiagRec.

C.4.13. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for `SQLStatistics` to `MYODBCShell`.
- Improved trace/log.

Bugs fixed:

- SQLBindParameter now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

C.4.14. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release

- Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.
- Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

C.4.15. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

C.4.16. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
  - `SQLBindParameter`
  - `SQLBindCol`

C.4.17. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

C.4.18. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
  - `SQLAllocHandle`
  - `SQLCloseCursor`
  - `SQLColAttribute`
  - `SQLColumns`
  - `SQLConnect`

- SQLCopyDesc
- SQLDisconnect
- SQLExecDirect
- SQLExecute
- SQLFetch
- SQLFreeHandle
- SQLFreeStmt
- SQLGetConnectAttr
- SQLGetData
- SQLGetDescField
- SQLGetDescRec
- SQLGetDiagField
- SQLGetDiagRec
- SQLGetEnvAttr
- SQLGetFunctions
- SQLGetStmtAttr
- SQLGetTypeInfo
- SQLNumResultCols
- SQLPrepare
- SQLRowcount
- SQLTables

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- SQLSetConnectAttr
- SQLSetDescField
- SQLSetDescRec
- SQLSetEnvAttr
- SQLSetStmtAttr

C.4.19. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs fixed:

- The client program hung when the network connection to the server was interrupted. (Bug#40407)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- It was not possible to use Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

(Bug#29955)

C.4.20. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. (Bug#29402)

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. (Bug#30770)
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. (Bug#24131)

C.4.21. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug#35581)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug#32057)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug#12805, Bug#30890)

C.4.22. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement**: Accessing a parameer with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stropped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. (Bug#34575)
- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- When using ADO, the count of parameters in a query would always return zero. (Bug#33298)
- Using tables with a single quote or other non-standard characters in the table or column names through ODBC would fail. (Bug#32989)

- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug#32864)
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug#32420)
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug#31959)
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

  > **Note**
  >
  > ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

  (Bug#31495)
- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. (Bug#31220)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug#29871)
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. (Bug#27351)
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. (Bug#27158)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)
- With some connections to MySQL databases using Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. (Bug#16653)

C.4.23. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. (Bug#32727)
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. (Bug#32587)
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. (Bug#32366)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. (Bug#3780)

C.4.24. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

  This regression was introduced by Bug#10491.

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. (Bug#32294)
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. (Bug#32253)
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. (Bug#32171)
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. (Bug#30958)
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. (Bug#13776)

C.4.25. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. (Bug#31246)
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. (Bug#31055)
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. (Bug#31009)
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). (Bug#30939)
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. (Bug#30568)
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. (Bug#30499)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug#29871)
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column allowed `NULL` values. This was dur to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. (Bug#26108)
- Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. (Bug#3456)

C.4.26. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. (Bug#30840)
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. (Bug#30774)
- The wrong column size was returned for binary data. (Bug#30547)
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. (Bug#30520)
- `SQLGetConnectAttr()` did not reflect the connection state correctly. (Bug#14639)

- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

C.4.27. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see Section C.4.28, “Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)”.

Functionality added or changed:

- Because of Bug#10491 in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

C.4.28. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change**: The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the mysql database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. (Bug#28662)
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would bge installed local to the user, not globally. (Bug#15326, Bug#10444)
- Connector/ODBC now supports batched statements. In order to enable cached statement support you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or **Allow multiple statements** within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. (Bug#7445)
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. (Bug#6741)
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns . (Bug#9927) (Bug#30081)
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. (Bug#29964)
- Getting table metadata (through the `SQLColumns()` would fail, returning a bad table definition to calling applications. (Bug#29888)

- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug#28657)
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. (Bug#27862)
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. (Bug#19345)
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. (Bug#14414)
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. (Bug#14407)
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in SQLColumns() was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

C.4.29. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. (Bug#9498, Bug#6667)
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling SQLGetData() if value is null. Now returns SQL_ERROR w/state 22002.
- The setup library has been split into its own RPM package, to allow installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. (Bug#29709)
- Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. (Bug#28316)
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. (Bug#27315)
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. (Bug#26934)
- For a stored procedure that returns multiple result sets, Connector/ODBC returned only the first result set. (Bug#16817)
- Calling `SQLGetDiagField` with `RecNumber 0, DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. (Bug#16224)
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum allowed ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. (Bug#13766)
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. (Bug#10563)
- When inserting a large `BLOB` field, Connector/ODBC would crash due to a memory allocation error. (Bug#10562)
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. (Bug#9498)
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained non-alphanumeric characters. (Bug#8860)
- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

C.4.30. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. (Bug#12918)

Bugs fixed:

- Calls to SQLNativeSql() could cause stack corruption due to an incorrect pointer cast. (Bug#28758)
- Using curors on results sets with multi-column keys could select the wrong value. (Bug#28255)
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. (Bug#27723)
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. (Bug#27544)
- SQLTables() did not distinguish tables from views. (Bug#23031)
- Data in `TEXT` columns would fail to be read correctly. (Bug#16917)
- Specifying strings as parameters using the `adBSTR` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. (Bug#16235)
- SQL_WVARCHAR and SQL_WLONGVARCHAR parameters were not properly quoted and escaped. (Bug#16235)
- Using `BETWEEN` with date values, the wrong results could be returned. (Bug#15773)
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. (Bug#4657)
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

C.4.31. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. (Bug#27591)
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. (Bug#27589)
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. (Bug#27220)
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. (Bug#24306)
- Using `SQLProcedures` does not return the database name within the returned resultset. (Bug#23033)
- The `SQLTransact()` function did not support an empty connection handle. (Bug#21588)
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. (Bug#7912)
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. (Bug#5853)
- Connector/ODBC would return too many foreign key results when accessing tables with similar names. (Bug#4518)

C.4.32. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. (Bug#19823)
- Added auto is null option to Connector/ODBC option parameters. (Bug#10910)
- Added auto-reconnect option to Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. (Bug#26024)
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. (Bug#25846)
- Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. (Bug#22446)
- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. (Bug#20547)
- Using `DataAdapter`, Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). (Bug#20459)
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. (Bug#20208)
- The ODBC driver name and version number were incorrectly reported by the driver. (Bug#19740)
- A string format exception would be raised when using iODBC, Connector/ODBC and the embedded MySQL server. (Bug#16535)
- The `SQLDriverConnect()` ODBC method did not work with recent Connector/ODBC releases. (Bug#12393)

C.4.33. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

C.4.34. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. (Bug#15635)
- File DSNs could not be saved. (Bug#12019)
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. (Bug#9539)

C.4.35. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. (Bug#8198)
- `SQLGetTypoInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. (Bug#8138)

C.5. MySQL Connector/NET Change History

C.5.1. Changes in MySQL Connector/NET 6.0.4 (Not yet released beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- A SQL query string containing an escaped backslash caused an exception to be generated:

```
Index and length must refer to a location within the string.
Parameter name: length
at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
fAlwaysCopy)
at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
MySqlParameterCollection parameters, MySqlPacket packet)
at MySql.Data.MySqlClient.Statement.BindParameters()
at MySql.Data.MySqlClient.PreparableStatement.Execute()
at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior be□havior)
at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

(Bug#44960)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build Connector/NET from source. (Bug#44822)
- The DataReader in Connector/NET 6.0.3 considered a BINARY(16) field as a GUID with a length of 16. (Bug#44507)
- When creating a new DataSet the following error was generated:

```
Failed to open a connection to database.
Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
```

(Bug#44460)

- The Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)

C.5.2. Changes in MySQL Connector/NET 6.0.3 (28 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

  The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

```
INSERT INTO anytable SET Text='test--test';
```

  The tokenizer incorrectly interpreted the value as containing a comment.

```
UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
ID=4711;'
```

  A `MySqlException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```
Fatal error encountered during command execution.
EXCEPTION: MySqlException - Parameter '?'' must be defined.
```

  (Bug#44318)

Bugs fixed:

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

  When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when REFERENCES, ADD REFERENCE was selected. (Bug#44141)

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

  When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by

`ISSchemaProvider` were `UNSIGNED`. (Bug#44123)

C.5.3. Changes in MySQL Connector/NET 6.0.2 (07 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Connector/Net 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

  The following error message was generated:

  ```
  .NET Framework Data Provider for MySQL: The data provider object factory service was not
  found.
  ```

  (Bug#44064)

C.5.4. Changes in MySQL Connector/NET 6.0.1 (02 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. (Bug#43574)
- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message “Max value too long or too short for Int32”. (Bug#43480)

C.5.5. Changes in MySQL Connector/NET 6.0.0 (02 March 2009 alpha)

This is a new Alpha development release.

Bugs fixed:

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug#42801)

C.5.6. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. (Bug#39072)
- The Connector/NET installer program ended prematurely without reporting the specific error. (Bug#39019)
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException` . (Bug#38939)
- Possible overflow in `MySqlPacket.ReadLong()`. (Bug#36997)
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. (Bug#36836)

C.5.7. Changes in MySQL Connector/NET 5.2.7 (Not yet released)

Bugs fixed:

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it

was not possible to build Connector/NET from source. (Bug#44822)

- The Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)
- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

```
The method or operation is not implemented
```

(Bug#39409)

C.5.8. Changes in MySQL Connector/NET 5.2.6 (28 April 2009)

Functionality added or changed:

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. (Bug#44194)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)

- `GetSchema("MetaDataCollections")` should have returned a table with a column named “NumberOfRestrictions” not “NumberOfRestriction”.

  This can be confirmed by referencing the Microsoft Documentation. (Bug#43990)

- Requests sent to the Connector/NET role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. (Bug#43553)

- When using `MySqlBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. (Bug#43332)

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug#42801)

- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

  The generated query was, for example:

```
SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
FROM my_aspnet_Membership WHERE userId=13
```

  Note that `applicationId` is not used. (Bug#42574)

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named “lastUpdatdDate” ('e' is missing) instead of the correct “lastUpdatedDate”. (Bug#41654)

- The `GetGuid()` method of `MySqlDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. (Bug#41452)

- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. (Bug#41408)

- If a `Stored Procedure` contained spaces in its parameter list, and was then called from Connector/NET, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

  The exception generated was:

  ```
  Parameter '0' not found in the collection.
  ```

  (Bug#41034)

- The `DATETIME` format contained an erroneous space. (Bug#41021)

- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

  If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

  The exception generated was:

  ```
  The profile default provider was not found.
  ```

  Note that the exception stated: 'the profile **default provider**...', even though a different name was explicitly requested. (Bug#40871)

- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

  However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. (Bug#40139)

C.5.9. Changes in MySQL Connector/NET 5.2.5 (19 November 2008)

Bugs fixed:

- Visual Studio 2008 displayed the following error three times on start-up:

  ```
  "Package Load Failure

  Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
  Version=5.2.4, Culture=neutral, PublicKeyTopen=null' has failed to load properly (GUID =
  {79A115C9-B133-4891-9E7B-242509DAD272}).  Please contact the package vendor for
  assistance.  Application restart is recommended, due to possible environment corruption.
  Would you like to disable loading the package in the future?  You may use
  'devenve/resetskippkgs' to re-enable package loading."
  ```

  (Bug#40726)

C.5.10. Changes in MySQL Connector/NET 5.2.4 (13 November 2008)

Bugs fixed:

- `MySqlDataReader` did not feature a `GetSByte` method. (Bug#40571)

- When working with stored procedures Connector/NET generated an exception `Unknown "table parameters" in information_schema`. (Bug#40382)

- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. (Bug#40231)

- If connection pooling was not set explicitly in the connection string, Connector/NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug#40091)

- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained "??" instead of the correct national character symbols. (Bug#40076)
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- After the `ConnectionString` property was initialized via the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. (Bug#39728)
- When using `ProfileProvider`, attempting to update a previously saved property failed. (Bug#39330)
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. (Bug#39294)
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. (Bug#39275)
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

  Also, if **TableAdapter** was right-clicked and then Add, Query, Use Existing Stored Procedures selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. (Bug#39252)
- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-chema="true"`. (Bug#39072)
- Connector/NET called hashed password methods not supported in Mono 2.0 Preview 2. (Bug#38895)

C.5.11. Changes in MySQL Connector/NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `Connection-State.Closed` event. (Bug#38119)
- Changed how the procedure schema collection is retrieved. If the connection string contains "`use procedure bod-ies=true`" then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains "`use procedure bodies=false`", then the Information Schema collection is queried. (Bug#36694)
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug#36694)
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. (Bug#36205)

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug#38721)
- Connector/Net uninstaller did not clean up all installed files. (Bug#38534)
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connec-tion == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationEx-ception`. (Bug#38276)
- The provider did not silently create the user if the user did not exist. (Bug#38243)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)

- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after after closing `MySqlDataReader`:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25;auto enlist=false;pooling=false;
  Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug#37955)
- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. (Bug#37469)
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. (Bug#37239)
- The `autogenerateschema` option produced tables with incorrect collations. (Bug#36444)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug#30603)

C.5.12. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated '?' is the preferred parameter marker. (Bug#37349)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug#36313)
- Tables with `GEOMETRY` field types would return an unknown datatype exception. (Bug#36081)
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. (Bug#36000)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug#35619)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. (Bug#35336)
- An error would be raised when calling `GetPassword()` with a `NULL` value. (Bug#35332)
- When retreiving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. (Bug#35041)
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. (Bug#34941)
- When creating a new stored procedured, the new parameter code which allows the use of the `@` symbol would interfere with the specification of a `DEFINER`. (Bug#34940)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug#34460)

- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. (Bug#34001)
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug#31338)
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

C.5.13. Changes in MySQL Connector/NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. (Bug#34792)
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. (Bug#34699)
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to Connector/NET not loading properly when using the interface to a MySQL server within Visual Studio. (Bug#34674)
- A number issues were identified in the case, connection and scema areas of the code for `MembershipProvider`, `RoleProvider`, `ProfileProvider`. (Bug#34495)
- When using web providers, the Connector/NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the memvership provider list. (Bug#34451)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug#34448)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug#34359)
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug#34338)
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

C.5.14. Changes in MySQL Connector/NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug#34052)
- Added support for `DbDataAdapter` `UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the multi-value form if possible.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added ClearPool and ClearAllPools features.

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug#34220)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information.

Bug#34204)

- The status of connections reported through the state change handler was not being updated correctly. (Bug#34082)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug#34000)
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug#33909)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug#26344)

C.5.15. Changes in MySQL Connector/NET 5.1.8 (Not yet released)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

  In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)

- The `DATETIME` format contained an erroneous space. (Bug#41021)
- If connection pooling was not set explicitly in the connection string, Connector/NET added ";Pooling=False" to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted "Pooling=True" to "pooling=True".

  If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated ";Pooling=False" to the end of the connection string. The resulting connection string was thus terminated with "pooling=True;Pooling=False". This disabled connection pooling completely. (Bug#40091)

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)

C.5.16. Changes in MySQL Connector/NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)

- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after after closing `MySqlDataReader`:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25;auto enlist=false;pooling=false;
  Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug#37955)
- As `MySqlDbType.DateTime` is not available in `VB.Net` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. (Bug#37406)
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. (Bug#37398)
- Documentation incorrectly stated that “the DataColumn class in .NET 1.0 and 1.1 does not allow columns with type of UInt16, UInt32, or UInt64 to be autoincrement columns”. (Bug#37350)
- `SemaphoreFullException` is generated when application is closed. (Bug#36688)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug#30603)

C.5.17. Changes in MySQL Connector/NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug#36313)
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrival = true` and `RequireQuestionAndAnswer = false`. (Bug#36159)
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. (Bug#36157)
- Tables with `GEOMETRY` field types would return an unknown datatype exception. (Bug#36081)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug#35619)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug#34460)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug#34448)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug#34359)

- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug#34338)
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug#31338)

C.5.18. Changes in MySQL Connector/NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug#34052)

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug#34220)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug#34204)
- The status of connections reported through the state change handler was not being updated correctly. (Bug#34082)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug#34000)
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug#33909)
- Connector/NET would fail to compile properly with `nant`. (Bug#33508)
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. (Bug#33347)
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)

C.5.19. Changes in MySQL Connector/NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with non-input direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDataTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- Connector/NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. (Bug#31703)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)

- Trying to use a connection that was not open could return an ambiguous and misleading error message. (Bug#31262)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)` were not returned as boolean fields. (Bug#27959)
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. (Bug#27958)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug#26344)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

C.5.20. Changes in MySQL Connector/NET 5.1.3 (21 September 2007 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- The Saudi Hijri calendar was not supported. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. (Bug#29476)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. (Bug#29236)
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. (Bug#29235)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug#29123)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. (Bug#29098)

- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug#28709)

C.5.21. Changes in MySQL Connector/NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. (Bug#28706)
- Creating a user would fail due to the application name being set incorrectly. (Bug#28648)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. (Bug#28536)
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. (Bug#28437)
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. (Bug#28204)
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. (Bug#26347)

C.5.22. Changes in MySQL Connector/NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Installation of the Connector/NET on Windows would fail if VisualStudio had not already been installed. (Bug#28260)
- Connector/NET would look for the wrong table when executing `User.IsRole()`. (Bug#28251)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- `DATETIME` fields from versions of MySQL bgefore 4.1 would be incorrectly parsed, resulting in a exception. (Bug#23342)
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

C.5.23. Changes in MySQL Connector/NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

C.5.24. Changes in MySQL Connector/NET 5.0.10 (Not yet released)

Bugs fixed:

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after after closing `MySqlDataReader`:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25;auto enlist=false;pooling=false;
  Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug#37955)
- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)

C.5.25. Changes in MySQL Connector/NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug#35492)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with non-input direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDataTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as deifned within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)

- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

C.5.26. Changes in MySQL Connector/NET 5.0.8 (21 August 2007)

> **Note**
>
> This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- Fixed bug where Connector/Net was hand building some date time patterns rather than using the patterns provided under CultureInfo. This caused problems with some calendars that do not support the same ranges as Gregorian.. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug#29123)
- Log messages would be truncated to 300 bytes. (Bug#28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug#28204)
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. ExecuteReader had to be changed to check for this.

C.5.27. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug#27765)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug#27289)
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug#27269)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug#26754)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug#26472)
- The `characterset` property would not be identified during a connection (also affected Visual Studion Plugin). (Bug#26147, Bug#27240)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug#25947)
- `DATETIME` fields from versions of MySQL bgefore 4.1 would be incorrectly parsed, resulting in a exception. (Bug#23342)

C.5.28. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)
- `DESCRIBE ....` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. (Bug#27221)
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. (Bug#27187)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- Exception thrown when using large values in `UInt64` parameters. (Bug#27093)
- MySQL Visual Studio Plugin 1.1.2 does not work with Connector/Net 5.0.5. (Bug#26960)

C.5.29. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with DeriveParameters now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from

the collection.

- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to allow calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug#26660)
- Connector/NET would fail to install under Windows Vista. (Bug#26430)
- Opening a connection would be slow due to host name lookup. (Bug#26152)
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug#25950)
- Registry would be incorrectly populated with installation locations. (Bug#25928)
- Times with negative values would be returned incorrectly. (Bug#25912)
- Returned data types of a `DataTypes` collection do not contain the right correctl CLR Datatype. (Bug#25907)
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. (Bug#25906)
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug#25569)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug#25458)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)
- Connector/NET would not compile properly when used with Mono 1.2. (Bug#24263)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

C.5.30. Changes in MySQL Connector/NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

C.5.31. Changes in MySQL Connector/NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.

- The `MySqlCommand` object now supports asynchronous query methods. This is implemented useg the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from storaed procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The ShapZipLib library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

Bugs fixed:

- Additional text added to error message (Bug#25178)
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. (Bug#25033)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug#24565)
- Stored procedure executions are not thread safe. (Bug#23905)
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. (Bug#23687)
- Nested transactions (which are unsupported)do not raise an error or warning. (Bug#22400)

C.5.32. Changes in MySQL Connector/NET 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the numbver of procedures that are cacheds by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, Connector/NET would incorrectly resolve host names. (Bug#23758)

- Column names with accented characters were not parsed properly causing malformed column names in result sets. (Bug#23657)
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. (Bug#23538)
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. (Bug#23268)
- During installation, an antivirus error message would be raised (indicating a malicious script problem). (Bug#23245)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)
- Using Windows Vista (RC2) as a non-privileged user would raise a `Registry key 'Global' access denied`. (Bug#22882)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug#18186)
- Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. (Bug#16126)

C.5.33. Changes in MySQL Connector/NET 5.0.1 (01 October 2006)

Bugs fixed:

- Connector/NET on a Tukish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. (Bug#22042)
- The `MySqlexception` class is now derived from the `DbException` class. (Bug#21874)
- The # would not be accepted within column/table names, even though it was valid. (Bug#21521)
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug#11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

C.5.34. Changes in MySQL Connector/NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented PacketReader/PacketWriter support into `MySqlStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.

- Added internal implemention of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- CommandText: Question mark in comment line is being parsed as a parameter. (Bug#6214)

C.5.35. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. (Bug#33682)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with non-input direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug#32093)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handeler would fail with a `NULL` exception. (Bug#30964)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

C.5.36. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)

- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)

C.5.37. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the numbver of procedures that are cacheds by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. (Bug#25912)
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- Additional text added to error message. (Bug#25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug#24565)
- Stored procedure executions are not thread safe. (Bug#23905)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug#23862)

- One system where IPv6 was enabled, Connector/NET would incorrectly resolve host names. (Bug#23758)
- Nested transactions do not raise an error or warning. (Bug#22400)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

C.5.38. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- Connector/NET on a Tukish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- The # would not be accepted within column/table names, even though it was valid. (Bug#21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581)
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- The DiscoverParameters function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515)
- When running a query that included a date comparison, a DateReader error would be raised. (Bug#19481)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814)
- CHAR type added to MySqlDbType. (Bug#17749)
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug#17736)
- The CommandBuilder ignored Unsigned flag at Parameter creation. (Bug#17375)
- When working with multiple threads, character set initialization would generate errors. (Bug#17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug#16934)
- `DataReader` would show the value of the previous row (or last row with non-null data) if the current row contained a `date-time` field with a null value. (Bug#16884)
- Unsigned data types were not properly supported. (Bug#16788)
- The connection string parser did not allow single or double quotes in the password. (Bug#16659)
- The `MySqlDateTime` class did not contain constructors. (Bug#15112)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug#15077)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConver-`

sionException exception would be raised. (Bug#11991)

- An MySql.Data.Types.MySqlConversionException would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- When using MySqlDataAdapter, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131)
- Executing multiple queries as part of a transaction returns There is already an openDataReader associated with this Connection which must be closed first. (Bug#7248)
- Incorrect field/data lengths could be returned for VARCHAR UTF8 columns. Bug (#14592)

C.5.39. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned tinyint (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- A #42000Query was empty exception occurred when executing a query built with MySqlCommandBuilder, if the query string ended with a semicolon. (Bug#14631)
- The parameter collection object's Add() method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927)
- Added support for the cp932 character set. (Bug#13806)
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that ANSI_QUOTES had to be enabled to make this possible. (Bug#13753)
- The Ping() method did not update the State property of the Connection object. (Bug#13658)
- Implemented the MySqlCommandBuilder.DeriveParameters method that is used to discover the parameters for a stored procedure. (Bug#13632)
- A statement that contained multiple references to the same parameter could not be prepared. (Bug#13541)

C.5.40. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- Connector/NET 1.0.5 could not connect on Mono. (Bug#13345)
- Serializing a parameter failed if the first value passed in was NULL. (Bug#13276)
- Field names that contained the following characters caused errors: ()%<>/ (Bug#13036)
- The nant build sequence had problems. (Bug#12978)
- The Connector/NET 1.0.5 installer would not install alongside Connector/NET 1.0.4. (Bug#12835)

C.5.41. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- Connector/NET could not connect to MySQL 4.1.14. (Bug#12771)
- With multiple hosts in the connection string, Connector/NET would not connect to the last host in the list. (Bug#12628)
- The ConnectionString property could not be set when a MySqlConnection object was added with the designer. (Bug#12551, Bug#8724)
- The cp1250 character set was not supported. (Bug#11621)

- A call to a stored procedure caused an exception if the stored procedure had no parameters. (Bug#11542)
- Certain malformed queries would trigger a `Connection must be valid and open` error message. (Bug#11490)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. (Bug#11450)
- Connector/NET interpreted the new decimal data type as a byte array. (Bug#11294)
- Added support to call a stored function from Connector/NET. (Bug#10644)
- Connection could fail when .NET thread pool had no available worker threads. (Bug#10637)
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. (Bug#10281)
- Decimal parameters caused syntax errors. (Bug#10152, Bug#11550, Bug#10486)
- Parameters were not recognized when they were separated by linefeeds. (Bug#9722)
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. (Bug#8382)
- Trying to read a `TIMESTAMP` column generated an exception. (Bug#7951)
- Connector/NET could not work properly with certain regional settings. (WL#8228)

C.5.42. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. (Bug#7755)
- Quote character \222 not quoted in `EscapeString`. (Bug#7724)
- GetBytes is working no more. (Bug#7704)
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug#7612)
- Clone method bug in `MySqlCommand`. (Bug#7478)
- Problem with Multiple resultsets. (Bug#7436)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug#7345)
- `MySqlCommand.Connection` returns an IDbConnection. (Bug#7258)
- Calling prepare causing exception. (Bug#7243)
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

C.5.43. Changes in MySQL Connector/NET 1.0.3 (12 October 2004 gamma)

Bugs fixed:

- Invalid query string when using inout parameters (Bug#7133)
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug#7132)
- `MySqlDateTime` in Datatables sorting by Text, not Date. (Bug#7032)
- Exception stack trace lost when re-throwing exceptions. (Bug#6983)

- Errors in parsing stored procedure parameters. (Bug#6902)
- InvalidCast when using `DATE_ADD`-function. (Bug#6879)
- Int64 Support in `MySqlCommand` Parameters. (Bug#6863)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug#6831)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRange` exception. (Bug#6770)
- Integer "out" parameter from stored procedure returned as string. (Bug#6668)
- An Open Connection has been Closed by the Host System. (Bug#6634)
- Fixed Invalid character set index: 200. (Bug#6547)
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create START MENU items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

C.5.44. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

Bugs fixed:

- Fixed Objects not being disposed (Bug#6649)
- Fixed Charset-map for UCS-2 (Bug#6541)
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset (Bug#6429)
- Fixed double type handling in MySqlParameter(string parameterName, object value) (Bug#6428)
- Fixed Installation directory ignored using custom installation (Bug#6329)
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ (Bug#6322)
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

C.5.45. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

Bugs fixed:

- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) (Bug#6230)
- Fixed GetBoolean returns wrong values (Bug#6227)
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters (Bug#6217)
- Fixed NET Connector source missing resx files (Bug#6216)
- Fixed System.OverflowException when using YEAR datatype (Bug#6036)
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found (Bug#6006)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) (Bug#5900)
- Fixed missing Reference in DbType setter (Bug#5897)
- Fixed Parsing the ';' char (Bug#5876)
- Fixed DBNull Values causing problems with retrieving/updating queries. (Bug#5798)
- IsNullable error (Bug#5796)
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value (Bug#5621)
- Fixed construtor initialize problems in MySqlCommand() (Bug#5613)
- Fixed Yet Another "object reference not set to an instance of an object" (Bug#5496)
- Fixed Can't display Chinese correctly (Bug#5288)
- Fixed MySqlDataReader and 'show tables from ...' behavior (Bug#5256)
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed Bug#5458 Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed Bug#5388 DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed Bug#5602 Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed Bug#5392 MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed Bug#5474 cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later

- Fixed Bug#5469 Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

C.5.46. Changes in MySQL Connector/NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. (Bug#3889)
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added `COPYING.rtf` file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

C.5.47. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long sql commands so blob columns do not blow out our log.
- host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug#5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. (Bug#5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to allow use of @ parameter marker.

- `MySqlCommandBuilder`. (Bug#4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug#4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new .Types types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver (Bug#4520)
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. (Bug#4505)
- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. (Bug#4486)
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. (Bug#4324)
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting maxPacketSize to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. (Bug#4442)
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. (Bug#4071)
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Allow reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.

- Error processing show create table. (Bug#4074)
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug#4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug#3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug#3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug#3888)
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.

- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdatper` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

C.5.48. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to allow it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is alive.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to allow values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitly (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

C.5.49. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year datatype now supported.

- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

C.5.50. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to Thread.Sleep(0) in MySqlDataStream to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.

- Fixed `MySqlPool` deadlock condition as well as stupid bug where CreateNewPooledConnection was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed sql parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to allow for `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match SqlClient (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).

- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split sql code (thanks everyone!).

C.5.51. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

C.5.52. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` datatype handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command sql processing so quotes are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlClient compliant so that DataReaders have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset.

- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of Command worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now PgSql.
- Added attribute to PgSql code to prevent designer from trying to show.
- Added `MySQLDbType` property to Parameter object and added proper conversion code to convert from `DbType` to `MySQLDbType`).
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only allows characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from Field.cs. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

C.5.53. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.

- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using DBNull.Value instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an auto_insert field is not present.
- Field now uses typeof keyword to return `System.Types` (performance).

C.5.54. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use xsd (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

C.5.55. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work.

C.5.56. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

C.6. MySQL Visual Studio Plugin Change History

> **Note**
>
> As of Connector/NET 5.1.2 (14 June 2007), the Visual Studion Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see Section C.5, “MySQL Connector/NET Change History”.

C.6.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

C.6.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug#24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)

C.6.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

C.6.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

C.7. MySQL Connector/J Change History

C.7.1. Changes in MySQL Connector/J 5.1.x

C.7.1.1. Changes in MySQL Connector/J 5.1.8 (Not yet released)

Bugs fixed:

- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. (Bug#44869)
- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44868)
- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

  This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. (Bug#44867)

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44865)

- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44863)

- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44862)

- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationsException` exceptions generated. However, this code was never reached.

  In the `CommunicationsException` code:

  ```
  private boolean streamingResultSetInPlay = false;

  public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
  long lastPacketReceivedTimeMs, Exception underlyingException) {

  this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
        lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
        this.streamingResultSetInPlay);
  ```

  `streamingResultSetInPlay` was always false, which in the following code in `SQLError.createLinkFailureMessageBasedOnHeuristics()` never being executed:

  ```
  if (streamingResultSetInPlay) {
      exceptionMessageBuf.append(
      Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
  } else {
  ...
  ```

  (Bug#44588)

- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug#44056)

- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

  `LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

  With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug#43421)

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug#43071)

- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug#43070)

- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

  ```
  java.util.ConcurrentModificationException
   at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
   at java.util.HashMap$KeyIterator.next(Unknown Source)
   at
  com.mysql.jdbc.LoadBalancingConnectionProxy.getGlobalBlacklist(LoadBalancingConnectionProxy.java:520)
   at com.mysql.jdbc.RandomBalanceStrategy.pickConnection(RandomBalanceStrategy.java:55)
   at
  com.mysql.jdbc.LoadBalancingConnectionProxy.pickNewConnection(LoadBalancingConnectionProxy.java:414)
   at
  com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)
  ```

  (Bug#42055)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug#41730)

- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

  Note

The performance regression in `indexOfIgnoreCaseRespectMarker()` has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

(Bug#41532)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug#41161)

C.7.1.2. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug#42309)
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an "S", in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug#40031)
- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug#39962)
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. (Bug#39956)
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug#39911)
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with "08", it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

  There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

  ```
  int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue
  ```

  This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. (Bug#39784)
- When configuring the Java Replication Driver the last slave specified was never used. (Bug#39611)
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. (Bug#39352)
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. (Bug#38782)
- Connector/J threw the following exception when using a read-only connection:

  ```
  java.sql.SQLException: Connection is read-only. Queries leading to data
  modification are not allowed.
  ```

  (Bug#38747)
- Connector/J was unable to connect when using a non-latin1 password. (Bug#37570)
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug#35170)

- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. (Bug#34185)
- The `loadBalance` `bestResponseTime` blacklists did not have a global state. (Bug#33861)

C.7.1.3. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the resul sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` paramaters. (Bug#33678)
- XAConnections and datasources have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible via the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` propery. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

  When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a non-verifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug#36830)
- When trying to read `Time` values like “00:00:00” with `ResultSet.getTime(int)` an exception is thrown. (Bug#36051)
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug#35810)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug#35666)
- When using the keyword “loadbalance” in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug#35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug#35610)
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug#35489)
- In calling a stored function returning a `bigint`, an exception is encountered beginning:

  ```
  java.sql.SQLException: java.lang.NumberFormatException: For input string:
  ```

  followed by the text of the stored function starting after the argument list. (Bug#35199)
- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnName()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

  ```
  SELECT column AS aliasName from table
  ```

  (Bug#35150)
- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from ConnectionProperties are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug#34937)
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMP`s when using server-side prepared statements (not enabled by default). (Bug#34913)

- `RowDataStatic` does't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug#34762)
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug#34703)
- It was not possible to truncate a `BLOB` using `Blog.truncate()` when using 0 as an argument. (Bug#34677)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug#34518)
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug#34194)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug#34093)
- The internal class `ResultSetInternalMethods` referenced the non-public class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug#33823)
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug#33734)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug#33594)
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug#33162)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

  We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

  We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name via the `loadBalanceStrategy` configuration property. (Bug#32877)
- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values , as the hours end up being the same when sent as the literal that MySQL requires.

  Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

  This bug fix also fixes Bug#15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (i.e. the old date/time handling code will be deprecated) (Bug#32577, Bug#15604)
- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver than hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug#32246)
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug#32101)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBounds` exception when setting the last parameter to null. (Bug#31823)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug#31790)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug#31192)
- Further fixes have been made to this bug in the event that a node is non-responsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug#31053)

- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug#30508)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug#20491)
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

C.7.1.4. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than 5 * stddev of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)

C.7.1.5. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

C.7.1.6. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to allow user names or database names in any character set to be used in the JDBC connection URL. (Bug#29853)
- Added two configuration parameters:
  - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

  - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.

- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.

- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.

- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).

- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).

- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` via the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.

- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.

- Errors encountered during `Statement`/`PreparedStatement`/`CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

  If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

  If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

  Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT`/`REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on com.mysql.jdbc.Statement: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:

  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

    This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

    If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

  - `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

    This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

  Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs` The regex must follow the patterns used for the `java.util.regex`package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in PreparedStatmentWrapper delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all paramters as "IN" paramters but allow callers to call registerOutParameter() on them without throwing an exception. (Bug#28689)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

C.7.1.7. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

C.7.1.8. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change**: Pulled vendor-extension methods of `Connection` implementation out into an interface to support

`java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

  Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

  `StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.
- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be re-written in the form `CALL (...); CALL (...); ...` to send the batch in as few client-server round trips as possible.

C.7.1.9. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

> **Note**
>
> The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

  > **Note**
  >
  > This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the SQLState class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR`/`NVARCHAR` types.
- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's SQLXML interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

  To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

  - `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
  - `com.mysql.jdbc.java6.rtjar` — full path to your Java-6 `rt.jar` file
- New feature — driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided via `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

  The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

  This functionality is only available when using Java-6 or newer.
- `com.mysql.jdbc.java6.rtjar` — full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

C.7.2. Changes in MySQL Connector/J 5.0.x

C.7.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
  - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

  If the driver gives up, it will throw the last-received `SQLException`. (Bug#31053)
- `setObject(int, Object, int, int)` delegate in PreparedStatmentWrapper delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all paramters as "IN" paramters but allow callers to call registerOutParameter() on them without throwing an exception. (Bug#28689)
- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)
- `UNSIGNED` types not reported via `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

  This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly via `DBMD.getColumns()`. (Bug#27916)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug#27412)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

C.7.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements in order to function.
- `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
- Give more information in EOFExceptions thrown out of MysqlIO (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and autoReconnect to `true`.
- `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes ResultSetMetadata.isCaseSensitive() much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to allow tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
  - `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that allow Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling setFetchSize() on a Statement or ResultSet) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

  > **Note**
  >
  > If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. (Bug#29605)

- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. (Bug#28956)

- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. (Bug#28851)

- PreparedStatement.getMetaData() for statements containing leading one-line comments is not returned correctly.

  As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. (Bug#28469)

C.7.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at `ReplicationConnection` or `lbpool`).

  If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

  Therefore, for this to work (at all), you must use transactions, even if only reading data.

  Physical connections to the given hosts will not be created until needed.

  The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

  There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

  - `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.

  - `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.

- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.

- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).

- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

  This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

  > **Note**
  >
  > This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set via `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a ReplicationConnection (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

  In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.
- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

  This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.
- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). (Bug#28085)
- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. (Bug#27655)
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). (Bug#27655)
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

  If the comments happen to contain parameter markers (`?`), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

  > **Note**
  >
  > The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

  (Bug#27400)
- `ResultSet.get*()` with a column index < 1 returns misleading error message. (Bug#27317)
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. (Bug#27317)
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. (Bug#26959)

- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug#26789)
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug#26592)
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug#26173)
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug#25715)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug#25624)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug#25545)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug#25517)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug#25328)

C.7.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string:

  ```
  useServerPrepStmts=true
  ```

  The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).
- Improved speed of `datetime` parsing for ResultSets that come from plain or non-server-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable via `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat java.util.Date as a java.sql.Timestamp because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed via correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug#26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug#25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug#25514)

- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug#25399)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug#25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedState.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them via `ResultSetMetaData`. (Bug#25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug#25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug#25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug#24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug#23303)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug#21480)
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug#21438)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug#21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug#21267)
- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to cre-

ate instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underyling exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a HashMap. This allows us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, TreeMaps are about half as fast wall-clock time as a HashMap, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

C.7.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- DBMD.getColumns() does not return expected COLUMN_SIZE for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimitters to be consistent with the ODBC driver. (Bug#22613)
- Added new _ci collations to CharsetMapping - utf8_unicode_ci not working. (Bug#22456)
- Driver was using milliseconds for Statement.setQueryTimeout() when specification says argument is to be in seconds. (Bug#22359)
- Workaround for server crash when calling stored procedures via a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). (Bug#22297)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. (Bug#22024)
- When using information_schema for metadata, COLUMN_SIZE for getColumns() is not clamped to range of java.lang.Integer

as is the case when not using information_schema, thus leading to a truncation exception that isn't present when not using information_schema. (Bug#21544)

- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-1 mappings between findColumn() and rsmd.getColumnName(), usually manifests itself as "Can't find column (")" exceptions. (Bug#21379)
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- DatabaseMetaData correctly reports `true` for `supportsCatalog*()` methods.
- Driver now supports `{call sp}` (without "()" if procedure has no arguments).

C.7.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. (Bug#20650)
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug#20650)

C.7.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. (Bug#20242)
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug#20242)
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). (Bug#20242)
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. (Bug#20242)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug#19169)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` systtem variable to the character set that is used for error messages. (Bug#18086)
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug#17401)

C.7.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

C.7.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://...`. (Bug#14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug#14729)
- When fix for Bug#14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug#14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug#14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to Bug#14972). (Bug#14729)
- Moved all `SQLException` constructor usage to a factory in `SQLError` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug#14729)
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `''`, `(int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.) (Bug#14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

  Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug#14729)
- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug#14729)
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnName()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

C.7.3. Changes in MySQL Connector/J 3.1.x

C.7.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)

C.7.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

Bugs fixed:

- Check and store value for continueBatchOnError property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause NullPointerExceptions when it is required to check this property. (Bug#22290)
- Fixed Bug#18258 - DatabaseMetaData.getTables(), columns() with bad catalog parameter threw exception rather than return empty result set (as required by spec). (Bug#22290)
- Driver now sends numeric 1 or 0 for client-prepared statement setBoolean() calls instead of '1' or '0'. (Bug#22290)
- Fixed bug where driver would not advance to next host if roundRobinLoadBalance=true and the last host in the list is down. (Bug#22290)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). (Bug#22290)
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to STDERR. (Bug#21207)
- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). (Bug#21207)
- ResultSet.getSomeInteger() doesn't work for BIT(>1). (Bug#21062)
- Escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO_BACKSLASH_ESCAPES being set, and stacked quote characters forms of escaping (that is, '' or ""). (Bug#20888)
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Bug#20687)
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. (Bug#20485)
- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. (Bug#20479)
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. (Bug#20306)
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. (Bug#19993)
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. (Bug#19993)
- Connection fails to localhost when using timeout and IPv6 is configured. (Bug#19726)
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX_VALUE. (Bug#18880)
- Fixed memory leak with profileSQL=true. (Bug#16987)
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddrs with null content. (Bug#16791)

C.7.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- `Fixed PreparedStatement.setObject(int, Object, int)` doesn't respect scale of BigDecimals. (Bug#19615)
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug#19282)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT type`. (Bug#19282)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug#19282)
- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug#18740)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug#18554)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug#18496)
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. (Bug#18041)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug#18041)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug#17898)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug#17587)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug#17587)
- Added additional accessor and mutator methods on ConnectionProperties so that DataSource users can use same naming as regular URL properties. (Bug#17587)
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. (Bug#17450)
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug#17099)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug#16841)
- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug#15854)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug#15676)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug#15570)
- No "dos" character set in MySQL > 4.1.0. (Bug#15544)
- `INOUT` parameter does not store `IN` value. (Bug#15464)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). (Bug#15383)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug#14938)

- Exception thrown for new decimal type when using updatable result sets. (Bug#14609)
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently . (Bug#13601)
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. (Bug#13469)
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

  If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. (Bug#13469)
- LogFactory now prepends "com.mysql.jdbc.log" to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example "logger=CommonsLogger" instead of "logger=com.mysql.jdbc.log.CommonsLogger". (Bug#13469)
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. (Bug#11874)

C.7.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug#15141)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065)
- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePStmtStreams` to `true` (also included in the 3-0-Compat configuration “bundle”). (Bug#15024)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug#14972)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug#14938)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug#14909)
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug#14815)
- `storesMixedCaseIdentifiers()` returns `false` (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `true` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug#14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug#14562)
- `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=1` (on server):

    - `storesLowerCaseIdentifiers()` returns `true`
    - `storesLowerCaseQuotedIdentifiers()` returns `true`
    - `storesMixedCaseIdentifiers()` returns `false`
    - `storesMixedCaseQuotedIdentifiers()` returns `false`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`

    (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- Fixed `DatabaseMetaData.stores*Identifiers()`:
    - If `lower_case_table_names=0` (on server):
        - `storesLowerCaseIdentifiers()` returns `false`
        - `storesLowerCaseQuotedIdentifiers()` returns `false`
        - `storesMixedCaseIdentifiers()` returns `true`
        - `storesMixedCaseQuotedIdentifiers()` returns `true`
        - `storesUpperCaseIdentifiers()` returns `false`
        - `storesUpperCaseQuotedIdentifiers()` returns `true`
    - If `lower_case_table_names=1` (on server):
        - `storesLowerCaseIdentifiers()` returns `true`
        - `storesLowerCaseQuotedIdentifiers()` returns `true`
        - `storesMixedCaseIdentifiers()` returns `false`
        - `storesMixedCaseQuotedIdentifiers()` returns `false`
        - `storesUpperCaseIdentifiers()` returns `false`
        - `storesUpperCaseQuotedIdentifiers()` returns `true`

    (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
- Extraneous sleep on `autoReconnect`. (Bug#13775)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)

- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
- `logSlowQueries` should give better info. (Bug#12230)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a place-holder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT`/`INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

C.7.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now allows you to specify variables that start with the "`@`" sign. (Bug#13453)
- URL configuration parameters don't allow "`&`" or "`=`" in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html).

  If the "`%`" character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of "`%`" when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug#13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug#13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it). (Bug#13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY`/`VARBINARY` and related types. (Bug#13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug#13277)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug#12970)
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug#12753)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug#12752)
- `getExportedKeys()` (Bug#12541)
- Specifying a catalog works as stated in the API docs. (Bug#12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug#12541)

- `getIndexInfo()` (Bug#12541)
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug#12541)
- `getImportedKeys()` (Bug#12541)
- Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. (Bug#12541)
- `getCrossReference()` (Bug#12541)
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug#12541)
- `getColumns()` (Bug#12541)
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`
  - `getIndexInfo()`
  - `getPrimaryKeys()`
  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

  The `catalog` argument in all of these methods now behaves in the following way:
  - Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
  - Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
  - Specifying a catalog works as stated in the API docs.
  - Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

  (Bug#12541)
- `getBestRowIdentifier()` (Bug#12541)
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug#12541)
- `getTables()` (Bug#12541)
- `getPrimaryKeys()` (Bug#12541)
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). (Bug#12417)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug#12229)
- Properties shared between master and slave with replication connection. (Bug#12218)
- Geometry types not handled with server-side prepared statements. (Bug#12104)
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. (Bug#11976)
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug#11879)

- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug#11798)
- Escape tokenizer doesn't respect stacked single quotes for escapes. (Bug#11797)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug#11797)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug#11781)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug#11781)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT`/`OUTPUT` parameters as well as `INPUT` parameters. (Bug#11781)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers where within the range of the positive signed type. (Bug#11663)
- Moved source code to Subversion repository. (Bug#11663)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663)
- Fixed statements generated for testcases missing `;` for “plain” statements. (Bug#11629)
- Spurious `!` on console when character encoding is `utf8`. (Bug#11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug#11614)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. (Bug#11498)
- Escape processor didn't honor strings demarcated with double quotes. (Bug#11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug#11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug#10630)

C.7.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implemention of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

C.7.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. (Bug#11411)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug#11411)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug#11360)
- Connector/J dumping query into `SQLException` twice. (Bug#11360)
- `autoReconnect` ping causes exception on connection startup. (Bug#11259)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug#11115)
- `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality (Bug#11115)
- `maxPerformance` — maximum performance without being reckless (Bug#11115)
- `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can (Bug#11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug#11115)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug#11115)
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
  - `maxPerformance` — maximum performance without being reckless
  - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality

  (Bug#11115)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug#10850)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug#10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug#10850)
- 0-length streams not sent to server when using server-side prepared statements. (Bug#10850)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. (Bug#10850)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug#10496)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug#10496)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. (Bug#10496)
- The datatype returned for `TINYINT(1)` columns when `tinyInt1isBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyInt1isBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug#10485)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORT`s. (Bug#10485)

- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug#10156)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug#10155)
- Double quotes not recognized when parsing client-side prepared statements. (Bug#10155)
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions. (Bug#10155)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug#10155)
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug#10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug#10155)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug#10144)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug#10144)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

C.7.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug#9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug#9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug#9778)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug#9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778)
- Should accept `null` for name patterns in DBMD (meaning "`%`"), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug#9769)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug#9704)
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:

  1. Log4j, if it is available,
  2. Then JDK1.4 logging,

3. Then fallback to our `STDERR` logging.

(Bug#9704)

- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug#9704)
- Stored procedures with `DECIMAL` parameters with storage specifications that contained "`,`" in them would fail. (Bug#9682)
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug#9682)
- Added support for the c3p0 connection pool's (http://c3p0.sf.net/) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. (Bug#9320)
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug#9320)
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug#9320)
- `Connection.canHandleAsPreparedStatement()` now makes "best effort" to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug#9320)
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug#9320)
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug#9319)
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug#9319)
- A continuation of Bug#8868, where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug#9236)
- Cannot use `UTF-8` for characterSetResults configuration property. (Bug#9206)
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug#9040)
- `ServerPreparedStatements` now correctly "stream" `BLOB`/`CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug#8868)
- `DATE_FORMAT()` queries returned as `BLOB`s from `getObject()`. (Bug#8868)
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug#8868)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug#8868)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug#8868)
- Check for empty strings (`''`) when converting `CHAR`/`VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug#8803)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug#8803)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. (Bug#8800)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug#8792)
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.

- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

C.7.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatements` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug#8487)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug#8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug#8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug#8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug#8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if non-rounding `BigDecimal.setScale()` fails. (Bug#8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug#8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Infinite recursion when “falling back” to master in failover configuration. (Bug#7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug#7952)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug#7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over statement.close() or new execution on same statement (suggested by Kevin Burton). (Bug#7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug#7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug#7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(...., cal)`. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug#4718)

- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug#4718)
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug#4718)
- Send correct value for "boolean" `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug#4718)
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug#4718)

C.7.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

C.7.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is < `max_allowed_packet` on server. (Bug#6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all "padding" zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug#6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug#6399)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`). (Bug#6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug#6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359. (Bug#6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug#6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359. (Bug#6225)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some

usecase/jvm combinations, this is friendlier on the garbage collector. (Bug#5706)

- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug#5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug#5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error "Wrong arguments to mysql_stmt_execute()". (Bug#5235)
- Handle case when string representation of timestamp contains trailing "`.`" with no numbers following it. (Bug#5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales "override" case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

C.7.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundExceptions`. (Bug#5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an SQLState of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug#5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug#5032)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retreiving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug#5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug#5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug#5032)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug#5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug#4689)
- `ResultSet.wasNull()` does not work for primatives if a previous `null` was returned. (Bug#4689)
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes via `useFastIntParsing=false` property. (Bug#4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's "standard" description, followed by the server's error message). This property is set to `true` by default. (Bug#4642)
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buf-`

fer.readInt() -> Buffer.readShort()). (Bug#4510)

- Added support in DatabaseMetaData.getTables() and getTableTypes() for views, which are now available in MySQL server 5.0.x. (Bug#4510)
- ResultSet.getObject() returns wrong type for strings when using prepared statements. (Bug#4482)
- Calling MysqlPooledConnection.close() twice (even though an application error), caused NPE. Fixed. (Bug#4482)

C.7.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when useTimezone=true. (Bug#4311)
- Error in retrieval of mediumint column with prepared statements and binary protocol. (Bug#4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in ResultSet.getObject() for the bigint unsigned type, which used to return BigDecimal instances, it now returns instances of java.lang.BigInteger. (Bug#4311)
- Externalized more messages (on-going effort). (Bug#4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119)
- Added constants for MySQL error numbers (publicly accessible, see com.mysql.jdbc.MysqlErrorNumbers), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). (Bug#4119)
- Added packet debuging code (see the enablePacketDebug property documentation). (Bug#4119)
- Use SQL Standard SQL states by default, unless useSqlStateCodes property is set to false. (Bug#4119)
- Mangle output parameter names for CallableStatements so they will not clash with user variable names.
- Added support for INOUT parameters in CallableStatements.

C.7.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug#3804)
- getWarnings() returns SQLWarning instead of DataTruncation. (Bug#3804)
- getProcedureColumns() doesn't work with wildcards for procedure name. (Bug#3540)
- getProcedures() does not return any procedures in result set. (Bug#3539)
- Fixed DatabaseMetaData.getProcedures() when run on MySQL-5.0.0 (output of SHOW PROCEDURE STATUS changed between 5.0.0 and 5.0.1. (Bug#3520)
- Added connectionCollation property to cause driver to issue set collation_connection=... query on connection init if default collation for given charset is not appropriate. (Bug#3520)
- DBMD.getSQLStateType() returns incorrect value. (Bug#3520)
- Correctly map output parameters to position given in prepareCall() versus. order implied during registerOutParameter(). (Bug#3146)
- Cleaned up detection of server properties. (Bug#3146)
- Correctly detect initial character set for servers >= 4.1.0. (Bug#3146)
- Support placeholder for parameter metadata for server >= 4.1.2. (Bug#3146)

- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

C.7.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug#2671)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug#2671)
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code. (Bug#2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623)
- Merged unbuffered input code from 3.0. (Bug#2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug#2606)
- Server-side prepared statements were not returning datatype `YEAR` correctly. (Bug#2606)
- Fixed charset conversion issue in `getTables()`. (Bug#2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug#2502)
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. (Bug#2359)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug#2359)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. (Bug#2359)
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug#2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug#1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-`'%'` column name patterns. (Bug#1673)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month

descrepencies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug#1673)

- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug#1673)
- Fixed sending of queries larger than 16M. (Bug#1673)
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug#1673)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug#1673)
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug#1673)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug#1673)
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug#1673)
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions >= 5.0.0
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL >= 4.0.14 or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

C.7.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

C.7.4. Changes in MySQL Connector/J 3.0.x

C.7.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server Bug#9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. (Bug#8812)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug#8812)
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug#8629)
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later. (Bug#8629)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. (Bug#8629)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug#8629)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug#8064)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). (Bug#7686)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug#7601)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7601)
- Escape sequence {fn convert(..., type)} now supports ODBC-style types that are prepended by `SQL_`. (Bug#7601)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug#7316)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug#7081)
- Added `useOldUTF8Behavior`' configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug#7081)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug#7081)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7061)

- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966)
- Adding `CP943` to aliases for `sjis`. (Bug#6549, Bug#7607)
- `Timestamp`/`Time` conversion goes in the wrong "direction" when `useTimeZone=true` and server time zone differs from client time zone. (Bug#5874)

C.7.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1)` -> `BIT`/`Boolean` conversion configurable via `tinyInt1isBit` property (default `true` to be JDBC compliant out of the box). (Bug#5664)
- Off-by-one bug in `Buffer.readString(`*`string`*`)`. (Bug#5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug#5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type. (Bug#5664)
- Only set `character_set_results` during connection establishment if server version >= 4.1.1. (Bug#5664)
- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of "original" table and column names.
- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

C.7.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug#5069)
- Parse new time zone variables from 4.1.x servers. (Bug#5069)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022)
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug#4880)
- "Production" is now "GA" (General Availability) in naming scheme of distributions. (Bug#4860, Bug#4138)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that "like" types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4860, Bug#4138)
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742)
- Added FLOSS license exemption. (Bug#4742)

- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug#4334)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

  > **Warning**
  >
  > This required a change to the `SocketFactory` `connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

  (Bug#4334)
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug#4334)
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010)

C.7.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

C.7.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug#3920)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug#3873)
- Using a `MySQLDatasource` without server name fails. (Bug#3848)

C.7.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. (Bug#3570)
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug#3557)
- Not specifying database in URL caused `MalformedURL` exception. (Bug#3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug#3554)
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse). (Bug#3554)
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug#3554)
- Made `StringRegressionTest` 4.1-unicode aware. (Bug#3520)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug#3511)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957)

- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets. (Bug#2670)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and/or `setBinary/CharacterStream()`. . (Bug#2670)
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug#2670)
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers >= 4.1.2. (Bug#2670)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL >= 4.1.0. (Bug#2670)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column. (Bug#2670)
- Only set `character_set_results` for MySQL >= 4.1.0. (Bug#2670)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. . (Bug#103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to SQLState of `23000`.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

C.7.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug#2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug#2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue http://developer.java.sun.com/developer/bugParade/bugs/4401235.html) (Bug#2578)
- Fixed failover always going to last host in list. (Bug#2578)
- Detect `on`/`off` or `1`, `2`, `3` form of `lower_case_table_names` value on server. (Bug#2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` *or* `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

C.7.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug#2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug#2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug#2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug#2006)
- Fixed mappings in SQLError to report deadlocks with SQLStates of `41000`. (Bug#2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug#2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug#2006)
- Use constants for SQLStates. (Bug#2006)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug#2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug#2006)
- `ArrayIndexOutOfBounds` when parameter number == number of parameters + 1. (Bug#1958)
- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence {fn convert ... }. (Bug#1914)
- Implement `ResultSet.updateClob()`. (Bug#1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug#1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug#1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR`/`VARCHAR` columns. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug#1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- Fix for `ArrayIndexOutOfBounds` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password. (Bug#1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug#1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug#1576)
- Barge blobs and split packets not being read correctly. (Bug#1576)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug#1534)

- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511)

C.7.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.get/setString` mashing char 127. (Bug#1247)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any oustanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug#1247)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug#1247)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug#1247)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug#1246)
- Optimized `CLOB.setChracterStream()`. (Bug#1131)
- Fixed `CLOB.truncate()`. (Bug#1130)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug#1099)
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug#1099)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble`/`setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug#884)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. (Bug#879)
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time. (Bug#879)
- Issue exception on `ResultSet.get`*`XXX`*`()` on empty result set (wasn't caught in some cases). (Bug#848)
- Don't hide messages from exceptions thrown in I/O layers. (Bug#848)
- Fixed regression in large split-packet handling. (Bug#848)
- Better diagnostic error messages in exceptions for “streaming” result sets. (Bug#848)
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug#774)
- Don't wrap `SQLExceptions` in `RowDataDynamic`. (Bug#688)
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. (Bug#688)
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug#688)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. (Bug#688)
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). (Bug#688)
- Fix `UpdatableResultSet` to return values for `get`*`XXX`*`()` when on insert row. (Bug#675)
- Support `InnoDB` contraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug#664, Bug#517)
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). (Bug#664, Bug#517)

- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug#661)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug#496)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug#496)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

C.7.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug#378)
- Fix problem detecting server character set in some cases. (Bug#378)
- Allow multiple calls to `Statement.close()`. (Bug#378)
- Return correct number of generated keys when using `REPLACE` statements. (Bug#378)
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. . (Bug#378)
- Fix row data decoding error when using *very* large packets. (Bug#378)
- Optimized row data decoding. (Bug#378)
- Issue exception when operating on an already closed prepared statement. (Bug#378)
- Optimized usage of `EscapeProcessor`. (Bug#378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

C.7.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.

- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of 0x5c (`'\'`) character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

C.7.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return `""` when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

C.7.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBounds` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBe-`

`stRowIdentifier()`.

- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.

C.7.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatements` by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to allow control of amount of checking for "correctness" of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

C.7.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement`/`PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `testsuite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.

- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

C.7.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when "embedding" Java and MySQL server together in an end-user application.
- Added SSL support. See `README` for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when "forcing" a character encoding via properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in setBinary/Ascii/Character Stream() unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.

- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

C.7.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatemtent.setClob()`, `PreparedStatement.setObject(Clob)`.
- `Connection.isClosed()` no longer "pings" the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing "sensitive" information from them (such as host names, ports, or user names), as well as clearing "sensitive" data structures when possible.

C.7.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see `README`) Thanks to Doron.
- Testsuite now uses Junit (which you can get from http://www.junit.org.
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see `README`).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).

- Support for large packets (new addition to MySQL-4.0 protocol), see `README` for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements via controlling transient object creation in `MysqlIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me `<mark@mysql.com>`.
- Performance enchancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

C.7.5. Changes in MySQL Connector/J 2.0.x

C.7.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See `README` for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, "`"`" will be used as an identifier quote character, otherwise "`'`" will be used.

C.7.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PrepStmt`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

C.7.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.

- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect auto_increment fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

C.7.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

C.7.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

C.7.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).

- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

C.7.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADataSource`/`ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

C.7.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Captialize type names when `captializeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- PreparedStatement.setDouble() now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- PreparedStatement.setBoolean() will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

C.7.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

C.7.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has +/-Inf/inf support.
- `getObject()` on `ResultSet` correctly does `TINYINT`->`Byte` and `SMALLINT`->`Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT`/`BLOB`.
- Fixed `ArrayIndexOutOfBounds` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

C.7.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of -/+INF for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

C.7.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.

- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

C.7.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

C.7.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to ResultSet for insertRow() - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed ResultSet to return correct row numbers
- Statement.getUpdateCount() now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- Statement/PreparedStatement.getMoreResults() bug fixed. Thanks to Noel J. Bergman.
- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

C.7.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to specified to connect. (Thanks to Christian Motschke)

C.7.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'.
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)

- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to {} inside quotes.

C.7.7. Changes in MySQL Connector/J 1.2.x and lower

C.7.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

C.7.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

C.7.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)

- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

C.7.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidriectonally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

C.7.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

C.7.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

C.7.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an ex-

ponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

C.7.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

C.7.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

C.7.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that allows executeUpdate() to store values for IDs that are automatically generated for AUTO_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO_INCREMENT fields in your tables and are executing a lot of executeUpdate()s on one Statement, be sure to clearWarnings() every so often to save memory.

C.7.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccess error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

C.7.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

C.7.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`
  - `getTableTypes()`
  - `getColumns()`
  - `getCatalogs()`

C.8. MySQL Connector/MXJ Change History

C.8.1. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be writen to datadir.
- Added os.name-os.arch to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preperation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connetor/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

C.8.2. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in mysql_kill; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, in order to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: MySQL Forums (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml`: `usage` now slightly more verbose; some reformatting.
- Now incoporates Reggie Bernett's `SafeTerminateProcess` and only calls the unsafe TerminateProcess as a final last resort.
- New windows `kill.exe` fixes bug where mysqld was being force terminated. Issue reported by bruno haleblian and others, see: MySQL Forums.
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- In testing so far mysqld reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrats that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand in order to allow setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.

- SIGHUP is replaced with MySQLShutdown<PID> event.
- Clarified the immutability of baseDir, dataDir, pidFile, portFile.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added getDataDir() to interface MysqldResourceI.
- Added 5.1.14 binaries to repository.
- Replaced windows kill.exe resource with re-written version specific to mysqld.
- Added Patched StandardSocketFactory from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out gpl binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

C.8.3. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. (Bug#24004)
- Updated build.xml to build to handle with different gpl and commercial mysld version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved mysqld binary resourced into separate jar file NOTICE: CLASSPATH will now need to connector-mxj-db-files.jar.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (connector-mxj.properties) in the resources directory.
- Fixed test to be tollerant of /tmp being a symlink to /foo/tmp.

C.8.4. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

C.8.5. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" CLASSPATH will now need to include Connector/J jar.

- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust be deleting the /tmp/test-c.mxj directory before running tests.
- ServerLauncherSocketFactory.shutdown API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- MysqldResource now tied to dataDir as well as basedir (API CHANGE)
- moved PID file into datadir
- ServerLauncherSocketFactory.shutdown now works across JVMs.
- extracted splitLines(String) to Str utility class
- ServerLauncherSocketFactory.shutdown(port) no longer throws, only reports to System.err
- ServerLauncherSocketFactory now treats URL parameters in the form of `&server.foo=null` as `serverOptionMap.put("foo", null)`
- ServerLauncherSocketFactory.shutdown API change: now takes 2 File parameters (basedir, datadir)

C.8.6. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

C.8.7. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed HelpOptionsParser's need to reference a MysqldResource.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with Str).
- Minor refactorings for type casting and exception handling.

C.9. MySQL Connector/C++ Change History

C.9.1. Changes in MySQL Connector/C++ 1.0.x

C.9.1.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

Functionality added or changed:

- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

  ```
  connection->getMetaData->getSchema();
  ```

  This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.
- Improved memory management. Potential memory leak situations are handled more robustly.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Added `Result::getType()`. Implemented for the three result set classes.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.

Bugs fixed:

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

C.9.1.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009 beta)

Functionality added or changed:

- An installer was added for the Windows operating system.
- Minimum CMake version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- `metadataUseInfoSchema` was added to the connection property map, which allows control of the `INFORMATION_SCHEMA` for meta data.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- Added support for MySQL Connector/C.

Bugs fixed:

- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.

C.9.1.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009 alpha)

Functionality added or changed:

- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGED`, `DECIMAL UNSIGNED`, `DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- `MySQL_Driver::getPatchVersion` introduced.
- Major performance improvements due to new buffered `ResultSet` implementation.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- New BLOB implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `IOStream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istringstream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- `make package_source` now packs with bzip2.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the meta data functions will be faster.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typdefs for Windows to be able to use `int64_t`.
- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read-only.

These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.

- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.

Bugs fixed:

- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.
- Corrected handling of unsigned server types. Now returning correct values.
- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.

C.9.1.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008 alpha)

Functionality added or changed:

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added new unit test framework for JDBC compliance and regression testing.
- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

Bugs fixed:

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXXX` returns `true`.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed a bug in `getString()`. `getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

C.9.1.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008 alpha)

Functionality added or changed:

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked in order to evaluate the error type.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.
  - Two MySQL specific headers:

    `mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

    `mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

    However, you can make your application fully abstract by using the generic interface rather than these two headers.
- Driver Manager was removed.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- All examples can be given optional connection parameters on the command line, for example:

  ```
  examples/connect tcp://host:port user pass database
  ```

  or

  ```
  examples/connect unix:///path/to/mysql.sock user pass database
  ```

- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Introduced experimental CPack support, see make help.
- All tests changed to create TAP compliant output.

- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests added.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- New directory layout.

C.10. MySQL Proxy Change History

C.10.1. Changes in MySQL Proxy 0.7.0 (Not yet released)

Bugs fixed:

- **Security Enhancement**: Accessing `mysql-proxy` using a client or backend with a MySQL protocol less than MySQL 5.0 would result in `mysql-proxy` aborting with an assertion. This is because `mysql-proxy` only supports MySQL Protocol 5.0 or higher. The proxy will now report a fault. (Bug#31419)
- Using `mysql-proxy` with very large return datasets from queries, with or without manipulate of the dataset within the Lua engine could cause a crash. (Bug#39332)
- If a submitted packet was smaller than expected by the protocol, MySQL Proxy would terminate. (Bug#36743)
- When using `mysql-proxy` in a master-master replication scenario, a failure in one of the replication masters would fail to be identified by the proxy and connections would not be redirected to the other master. (Bug#35295)

C.10.2. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality added or changed:

- Fixed assertions on write-errors
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed error handling for socket functions on Windows.
- Added new features to `run-tests.lua`.

C.10.3. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. (Bug#30867)
- Added support in `read_query_result()` to overwrite the result-set.
- Added `--no-daemon` and `--pid-file`.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added testcases.

- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed assertion on `COM_BINLOG_DUMP`. (Bug#29764)
- Fixed assertion on result-packets like `[ field-len | fields | EOF | ERR ]`. (Bug#29732)
- Fixed assertion at login with empty password + empty default db. (Bug#29719)
- Fixed assertion at `COM_SHUTDOWN`. (Bug#29719)
- Fixed crash if `proxy.connection` is used in `connect_server()`.
- Fixed check for `glib2` to require at least 2.6.0.
- Fixed assertion when all backends are down and we try to connect.
- Fixed connection-stalling if `read_query_result()` throws an `assert()`ion.
- Fixed len-encoding on `proxy.resulsets`.
- Fixed compilation on win32.
- Fixed assertion when connecting to the MySQL 6.0.1.
- Fixed decoding of len-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result-sets.
- Fixed mem-leak with `proxy.response.*` is used.

C.10.4. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the INSTALL file.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.

Bugs fixed:

- Fixed mysql check in configure to die when mysql.h isn't detected.

- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing COM_STMT_*.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed warning if `connect_server()` is not provided.
- Fixed assertion when a error occurs at initial script exec time.
- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

C.10.5. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added `automake`/`autoconf` support.
- Added `cmake` support.

Appendix D. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

D.1. Restrictions on Stored Routines, Triggers, and Events

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of these restrictions apply to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- `BACKUP DATABASE` and `RESTORE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Implication: You cannot use dynamic SQL within stored functions or triggers (where you construct dynamically statements as strings and then execute them).

  In addition, SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See Section 12.7, “SQL Syntax for Prepared Statements”, for a list of statements supported as prepared statements. Statements not listed there are not supported for SQL prepared statements and thus are also not supported for stored routines unless noted otherwise in Section 18.2, “Using Stored Routines (Procedures and Functions)”.
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. Begin a transaction in this context with `START TRANSACTION` instead.

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to allow them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See Section 12.8.3.3, “`SELECT ... INTO` Statement”.
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log even for statement-based binary logging. See Section 18.6, “Binary Logging of Stored Programs”.

Although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored proced-

ure, that stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that variables take precedence over table columns is non-standard.

Use of stored routines can cause replication problems. This issue is discussed further in Section 18.6, “Binary Logging of Stored Programs”.

There are no stored routine debugging facilities.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

For triggers, the following additional statements or operations are disallowed:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. This does not apply when using statement-based replication. For more information, see Section 16.3.1.26, “Replication and Triggers”.
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, this means that you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug#16409, Bug#18896)
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition — due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution — events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug#16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug#16422)

- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically disallowed by the Event Scheduler. (Bug#16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are disallowed. (See Bug#22830 for more information.)
- Generally speaking, statements which are not permitted in stored routines or in SQL prepared statements are also not allowed in the body of an event. For more information, see Section 12.7, "SQL Syntax for Prepared Statements".

D.2. Restrictions on Signals

`SIGNAL` and `RESIGNAL` are not allowable as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

`SQLSTATE` values in class `'04'` are not treated specially. They are handled the same as other exceptions.

D.3. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API via the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are non-holdable (not held open after a commit).

Cursors are asensitive.

Cursors are non-scrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

D.4. Restrictions on Subqueries

- In MySQL 6.0 before 6.0.10, if you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE` for subqueries inside `IS NULL`, such as this:

  ```
  SELECT ... WHERE NULL IN (SELECT ...) IS NULL
  ```

  As of 6.0.10, the `IS NULL` limitation is removed and the comparison evaluates to `TRUE` or `FALSE`.
- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

  A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

  The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

  ```
  SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
  ```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return *M* and *N* rows, respectively, the execution time becomes on the order of O(*M*×*N*), rather than O(*M*+*N*) as it would be for an uncorrelated subquery.

An implication is that an IN subquery can be much slower than a query written using an IN(*value_list*) operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the FROM clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because the result from a subquery in the FROM clause is stored as a temporary table, so the relevant rows in t have already been selected by the time the update to t takes place.

- Row comparison operations are only partially supported:
  - For *expr* IN (*subquery*), *expr* can be an *n*-tuple (specified via row constructor syntax) and the subquery can return rows of *n*-tuples.
  - For *expr op* {ALL|ANY|SOME} (*subquery*), *expr* must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of *n*-tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for IN but not for the others is that IN is implemented by rewriting it as a sequence of = comparisons and AND operations. This approach cannot be used for ALL, ANY, or SOME.

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the FROM clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an IN subquery can be rewritten as a SELECT DISTINCT join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra DISTINCT operation and is not more efficient than the subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could

be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a,ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

  ```
  SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
           AS _t1, t2 WHERE t2.t2_col;
  ```

  The statement can be rewritten as a join like this:

  ```
  SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
  ```

  This type of rewriting would provide two benefits:

  - It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
  - It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

  ```
  SELECT a FROM big_table AS bt
  WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
  ```

  In this case, we could create a temporary table:

  ```
  CREATE TABLE t (key (non_key_field))
  (SELECT non_key_field FROM table WHERE condition)
  ```

  Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

D.5. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the FROM clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See Section D.4, “Restrictions on Subqueries”.

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying ALGORITHM = TEMPTABLE in the view definition.)

You can use DROP TABLE or ALTER TABLE to drop or alter a table that is used in a view definition. No warning results from the DROP or ALTER operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. CHECK TABLE can be used to check for views that have been invalidated by DROP or ALTER operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by PREPARE refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

  ```
  CREATE VIEW v AS SELECT RAND();
  PREPARE s FROM 'SELECT * FROM v';
  ALTER VIEW v AS SELECT NOW();
  EXECUTE s;
  ```

  The result returned by the EXECUTE statement is a random number, not the current date and time.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have UNION in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the WHERE clause. Some views that have subqueries in the SELECT list may be updatable.
- You cannot use UPDATE to update more than one underlying table of a view that is defined as a join.
- You cannot use DELETE to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the CREATE VIEW and SELECT privileges), that user will be unable to call SHOW CREATE VIEW on that object unless the user is also granted the SHOW VIEW privilege.

That shortcoming can lead to problems backing up a database with mysqldump, which may fail due to insufficient privileges. This problem is described in Bug#22062.

The workaround to the problem is for the administrator to manually grant the SHOW VIEW privilege to users who are granted CREATE VIEW, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is disallowed.

SHOW CREATE VIEW displays view definitions using an AS *alias_name* clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. As of MySQL 6.0.4, aliases for column names in CREATE VIEW statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of SHOW CREATE VIEW fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.

- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is the modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

D.6. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For "external XA," a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For "Internal XA", storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the *`bqual`* part of the *`xid`* value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

D.7. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not allowed in identifiers.
- The `ucs2`, `utf16`, and `utf32` character sets have the following restrictions:
  - They cannot be used as a client character set, which means that they do not work for `SET NAMES` or `SET CHARACTER SET`. (See Section 9.1.4, "Connection Character Sets and Collations".)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
  - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

D.8. Restrictions on `BACKUP DATABASE` and `RESTORE`

Currently, the `BACKUP DATABASE` and `RESTORE` statements have these limitations:

- `BACKUP DATABASE` backs up database and table definitions, table data, stored routines, triggers, events, and views. `TEMPORARY` tables are not included. Tablespace backup support is limited to the `Falcon` storage engine. Privileges are not saved before MySQL 6.0.7. As of 6.0.7, privileges for backed-up databases are saved. This includes privileges at the database level and below (table, column, routine). Global privileges are not saved.

For anything else not explicitly listed, assume that it is not backed up. This includes but is not limited to items such as UDF definitions and files, logs, and option files.

- The `BACKUP DATABASE` statement does not back up the `mysql` or `INFORMATION_SCHEMA` databases.
- There is no way to determine the contents of a backup image produced with `BACKUP DATABASE`. That is, you cannot determine which databases are in a given backup image and will be restored by using it with `RESTORE`.
- Before MySQL 6.0.9, `RESTORE` is a destructive operation. Each restored database is first dropped and then created and populated with the tables contained in the backup image. There is no warning about existing data being overwritten. As of MySQL 6.0.9, `RESTORE` aborts with an error if the backup image contains any databases that currently exist on the server, unless the optional keyword `OVERWRITE` is given following the image file name.
- `BACKUP DATABASE` and `RESTORE` cannot be used in stored routines, triggers, or events.
- `BACKUP DATABASE` and `RESTORE` cannot be used as prepared statements.
- `Falcon` tablespaces must not change characteristics between `BACKUP DATABASE` and `RESTORE`. A restore of databases containing tables in a modified tablespace will fail. Suppose that you back up a database containing a `Falcon` table. If you modify the tablespace characteristics, or drop or lose and then re-create it with characteristics not the same as originally, restoration of the database will fail.
- The backup image is consistent and has a well-defined validity point regardless of the storage engines used. However, non-transactional tables are locked for the duration of the `BACKUP DATABASE` operation if they use a storage engine other than `MyISAM` (such as `ARCHIVE` or `MEMORY`).

D.9. Limits in MySQL

This section lists current limits in MySQL 6.0.

D.9.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

D.9.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

  The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to four bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate 255 × 4 = 1020 bytes per value. Consequently, a table cannot contain more than 65,535 / 1020 = 64 such columns.

  Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 1022 bytes.

  `BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

  Declaring columns `NULL` can reduce the maximum number of columns allowed. `NULL` columns require additional space in the row to record whether or not their values are `NULL`.

  For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

  `delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether

the row has been deleted. *`delete_flag`* is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for `InnoDB` tables, for which storage size is no different for `NULL` columns than for `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
    -> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
    -> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

- Each table has an `.frm` file that contains the table definition. The `.frm` file size limit is fixed at 64KB. If a table definition reaches this size, no more columns can be added. The expression that checks information to be stored in the `.frm` file against the limit looks like this:

  ```
  if (info_length+(ulong) create_fields.elements*FCOMP+288+
      n_length+int_length+com_length > 65535L || int_count > 255)
  ```

  The relevant factors in this expression are:

  - `info_length` is space needed for “screens.” This is related to MySQL's Unireg heritage.
  - `create_fields.elements` is the number of columns.
  - `FCOMP` is 17.
  - `n_length` is the total length of all column names, including one byte per name as a separator.
  - `int_length` is related to the list of values for SET and ENUM columns.
  - `com_length` is the total length of column and table comments.

  Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:

  - `InnoDB` allows no more than 1000 columns.
  - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
  - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

D.9.3. Windows Platform Limitations

The following limitations apply only to the Windows platform:

- The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due to the compatibility functions used to open files on Windows that use the POSIX compatibility layer.

  This limitation will also cause problems if you try to set `open_files_limit` to a value greater than the 2048 file limit.

- On Windows 32-bit platforms it is not possible to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

To use more memory than this you will need to use a 64-bit version of Windows.

- When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

  This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.FRM` files in the default data directory configured with the `datadir` option.

- The timers within MySQL used on Windows are of a lower precision than the timers used on Linux. For most situations you may not notice a difference, but the delay implied by a call to `SLEEP()` on Windows and Linux may differ slightly due to the differences in precision.

- There is no 64-bit OLEDB Provider for ODBC (MSDASQL) in any 64-bit Windows operating system up to and including Windows Vista. In practical terms this means that you can't use the MySQL ODBC driver from ADO and other users of OLEDB.
