

## nag\_ode\_ivp\_rk\_range (d02pcc)

### 1. Purpose

**nag\_ode\_ivp\_rk\_range (d02pcc)** is a function for solving the initial value problem for a first order system of ordinary differential equations using Runge-Kutta methods.

### 2. Specification

```
#include <nag.h>
#include <nagd02.h>

void nag_ode_ivp_rk_range(Integer neq,
    void (*f) (Integer neq, double t, double y[],
        double yp[], Nag_User *comm),
    double twant, double *tgot,
    double ygot[], double ypgot[], double ymax[],
    Nag_ODE_RK *opt, Nag_User *comm, NagError *fail)
```

### 3. Description

This function and its associated functions (**nag\_ode\_ivp\_rk\_setup (d02pvc)**, **nag\_ode\_ivp\_rk\_errass (d02pzc)**) solve the initial value problem for a first order system of ordinary differential equations. The functions, based on Runge-Kutta methods and derived from RKSUITE (Brankin *et al*, 1991) integrate

$$y' = f(t, y) \quad \text{given} \quad y(t_0) = y_0$$

where  $y$  is the vector of **neq** solution components and  $t$  is the independent variable.

This function is designed for the usual task, namely to compute an approximate solution at a sequence of points. You must first call **nag\_ode\_ivp\_rk\_setup (d02pvc)** to specify the problem and how it is to be solved. Thereafter you call **nag\_ode\_ivp\_rk\_range** repeatedly with successive values of **twant**, the points at which you require the solution, in the range from **tstart** to **tend** (as specified in **nag\_ode\_ivp\_rk\_setup (d02pvc)**). In this manner **nag\_ode\_ivp\_rk\_range** returns the point at which it has computed a solution **tgot** (usually **twant**), the solution there **ygot** and its derivative **ypgot**. If **nag\_ode\_ivp\_rk\_range** encounters some difficulty in taking a step toward **twant**, then it returns the point of difficulty **tgot** and the solution and derivative computed there **ygot** and **ypgot**.

In the call to **nag\_ode\_ivp\_rk\_setup (d02pvc)** you can specify the first step size for **nag\_ode\_ivp\_rk\_range** to attempt or that it compute automatically an appropriate value. Thereafter **nag\_ode\_ivp\_rk\_range** estimates an appropriate step size for its next step. This value and other details of the integration can be obtained after any call to **nag\_ode\_ivp\_rk\_range** by examining the contents of the structure **opt**, see Section 4. The local error is controlled at every step as specified in **nag\_ode\_ivp\_rk\_setup (d02pvc)**. If you wish to assess the true error, you must set **errass = Nag\_ErrorAssess\_on** in the call to **nag\_ode\_ivp\_rk\_setup (d02pvc)**. This assessment can be obtained after any call to **nag\_ode\_ivp\_rk\_range** by a call to the function **nag\_ode\_ivp\_rk\_errass (d02pzc)**.

For more complicated tasks, you are referred to functions **nag\_ode\_ivp\_rk\_onestep (d02pdc)**, **nag\_ode\_ivp\_rk\_interp (d02pxc)** and **nag\_ode\_ivp\_rk\_reset\_tend (d02pwc)**.

### 4. Parameters

#### neq

Input: the number of ordinary differential equations in the system to be solved.

Constraint: **neq**  $\geq 1$ .

#### f

This function must evaluate the first derivatives  $y'_i$  (that is the functions  $f_i$ ) for given values of the arguments  $t, y_i$ .

```
void f (Integer neq, double t, double y[], double yp[], Nag_User *comm)
```

**neq**  
Input: the number of differential equations.

**t**  
Input: the current value of the independent variable,  $t$ .

**y[neq]**  
Input: the current values of the dependent variables,  $y_i$  for  $i = 1, 2, \dots, \mathbf{neq}$ .

**yp[neq]**  
Output: the values of  $f_i$  for  $i = 1, 2, \dots, \mathbf{neq}$ .

**comm**  
Input/Output: pointer to a structure of type Nag\_User with the following member:

**p** - Pointer  
Input/Output: The pointer **comm**->**p** should be cast to the required type, e.g. `struct user *s = (struct user *)comm->p`, to obtain the original object's address with appropriate type. (See the argument **comm** below.)

**twant**

Input: the next value of the independent variable,  $t$ , where a solution is desired.

Constraints: **twant** must be closer to **tend** than the previous of **tgot** (or **tstart** on the first call to nag\_ode\_ivp\_rk\_range); see nag\_ode\_ivp\_rk\_setup (d02pvc) for a description of **tstart** and **tend**. **twant** must not lie beyond **tend** in the direction of integration.

**tgot**

Output: the value of the independent variable  $t$  at which a solution has been computed. On successful exit with fail.code = **NE\_NOERROR**, **tgot** will equal **twant**. For non-trivial values of fail.code (i.e., those not related to an invalid call of nag\_ode\_ivp\_rk\_range) a solution has still been computed at the value of **tgot** but in general **tgot** will not equal **twant**.

**ygot[neq]**

Input: on the first call to nag\_ode\_ivp\_rk\_range, **ygot** need not be set. On all subsequent calls **ygot** must remain unchanged.

Output: an approximation to the true solution at the value of **tgot**. At each step of the integration to **tgot**, the local error has been controlled as specified in nag\_ode\_ivp\_rk\_setup (d02pvc). The local error has still been controlled even when **tgot**  $\neq$  **twant**, that is after a return with a non-trivial error.

**ypgot[neq]**

Output: an approximation to the first derivative of the true solution at **tgot**.

**ymax[neq]**

Input: on the first call to nag\_ode\_ivp\_rk\_range, **ymax** need not be set. On all subsequent calls **ymax** must remain unchanged.

Output: **ymax**[ $i-1$ ] contains the largest value of  $|y_i|$  computed at any step in the integration so far.

**opt**

Input: pointer to a structure of type Nag\_ODE\_RK as initialised by the setup function nag\_ode\_ivp\_rk\_setup (d02pvc).

Output: the following structure members hold information as follows:

**totfcn** - Integer

The total number of evaluations of  $f$  used in the primary integration so far; this does not include evaluations of  $f$  for the secondary integration specified by a prior call to nag\_ode\_ivp\_rk\_setup (d02pvc) with errass = **Nag\_ErrorAssess\_on**.

**stpcst** - Integer

The cost in terms of number of evaluations of  $f$  of a typical step with the method being

used for the integration. The method is specified by the parameter **method** in a prior call to `nag_ode_ivp_rk_setup` (d02pvc).

**waste** - double

The number of attempted steps that failed to meet the local error requirement divided by the total number of steps attempted so far in the integration. A “large” fraction indicates that the integrator is having trouble with the problem being solved. This can happen when the problem is “stiff” and also when the solution has discontinuities in a low order derivative.

**stpsok** - Integer

The number of accepted steps.

**hnext** - double

The step size the integrator plans to use for the next step.

#### **comm**

Input/Output: pointer to a structure of type `Nag_User` with the following member:

**p** - Pointer

Input/Output: The pointer **p**, of type `Pointer`, allows the user to communicate information to and from the user-defined function **f()**. An object of the required type should be declared by the user, e.g. a structure, and its address assigned to the pointer **p** by means of a cast to `Pointer` in the calling program, e.g. `comm.p = (Pointer)&s`. The type pointer will be `void *` with a C compiler that defines `void *` and `char *` otherwise.

#### **fail**

The NAG error parameter, see the Essential Introduction to the NAG C Library.

## 5. Error Indications and Warnings

### **NE\_PREV\_CALL**

The previous call to a function had resulted in a severe error. You must call `nag_ode_ivp_rk_setup` (d02pvc) to start another problem.

### **NE\_NO\_SETUP**

The setup function `nag_ode_ivp_rk_setup` (d02pvc) has not been called.

### **NE\_RK\_INVALID\_CALL**

The function to be called as specified in the setup routine `nag_ode_ivp_rk_setup` (d02pvc) was `nag_ode_ivp_rk_onestep` (d02pdc). However the actual call was made to `nag_ode_ivp_rk_range`. This is not permitted.

### **NE\_PREV\_CALL\_INI**

The previous call to the function `nag_ode_ivp_rk_range` had resulted in a severe error. You must call `nag_ode_ivp_rk_setup` (d02pvc) to start another problem.

### **NE\_NEQ**

The value of **neq** supplied is not the same as that given to the setup function `nag_ode_ivp_rk_setup` (d02pvc).

**neq** = *<value>* but the value given to `nag_ode_ivp_rk_setup` (d02pvc) was *<value>*.

### **NE\_RK\_TGOT\_EQ\_TEND**

The call to `nag_ode_ivp_rk_range` has been made after reaching **tend**. The previous call to `nag_ode_ivp_rk_range` resulted in **tgot** (**tstart** on the first call) = **tend**. You must call `nag_ode_ivp_rk_setup` (d02pvc) to start another problem.

### **NE\_RK\_TGOT\_RANGE\_TEND**

The call to `nag_ode_ivp_rk_range` has been made with a **twant** that does not lie between the previous value of **tgot** (**tstart** on the first call) and **tend**. This is not permitted.

### **NE\_RK\_TGOT\_RANGE\_TEND\_CLOSE**

The call to `nag_ode_ivp_rk_range` has been made with a **twant** that does not lie between the previous value of **tgot** (**tstart** on the first call) and **tend**. This is not permitted. However **twant** is very close to **tend**, so you may have meant it to be **tend** exactly. Check your program.

**NE\_RK\_TWANT\_CLOSE\_TGOT**

The call to nag\_ode\_ivp\_rk\_range has been made with a **twant** that is not sufficiently different from the last value of **tgot** (**tstart** on the first call). When using **method = Nag\_RK\_7\_8**, it must differ by at least  $\langle value \rangle$ .

**NE\_RK\_PDC\_STEP**

In order to satisfy the error requirements nag\_ode\_ivp\_rk\_range would have to use a step size of  $\langle value \rangle$  at current **t** =  $\langle value \rangle$ . This is too small for the machine precision.

**NE\_RK\_PDC\_GLOBAL\_ERROR\_T**

The global error assessment may not be reliable for t past **tgot**. **tgot** =  $\langle value \rangle$ .

**NE\_RK\_PDC\_GLOBAL\_ERROR\_S**

The global error assessment algorithm failed at the start of the integration.

**NE\_STIFF\_PROBLEM**

The problem appears to be stiff.

**NW\_RK\_TOO\_MANY**

Approximately  $\langle value \rangle$  function evaluations have been used to compute the solution since the integration started or since this message was last printed.

**NE\_RK\_PCC\_METHOD**

The efficiency of the integration has been degraded. Consider calling the set up function nag\_ode\_ivp\_rk\_setup (d02pvc) to re-initialize the integration at the current point with the method changed to **NE\_RK\_4\_5**. Alternatively nag\_ode\_ivp\_rk\_range (d02pcc) can be called again to resume at the current point.

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

**NE\_MEMORY\_FREED**

Internally allocated memory has been freed by a call to nag\_ode\_ivp\_rk\_free (d02ppc) without a subsequent call to the set up function nag\_ode\_ivp\_rk\_setup (d02pvc).

**6. Further Comments**

If nag\_ode\_ivp\_rk\_range returns with fail.code = **NE\_RK\_PDC\_STEP** and the accuracy specified by **tol** and **thres** is really required then you should consider whether there is a more fundamental difficulty. For example, the solution may contain a singularity. In such a region the solution components will usually be of a large magnitude. Successive output values of **ygot** and **ymin** should be monitored (or the routine nag\_ode\_ivp\_rk\_onestep (d02pdc) should be used since this takes one integration step at a time) with the aim of trapping the solution before the singularity. In any case numerical solution cannot be continued through a singularity, and analytical treatment may be necessary.

Performance statistics are available after any return from nag\_ode\_ivp\_rk\_range by examining the structure **opt** see Section 4. If **errass** was set to **Nag\_ErrorAssess\_on** in the call to nag\_ode\_ivp\_rk\_setup (d02pvc), global error assessment is available after any return from nag\_ode\_ivp\_rk\_range (except when the error is due to incorrect input arguments or incorrect setup) by a call to the routine nag\_ode\_ivp\_rk\_errass (d02pzc). The approximate extra number of evaluations of  $f$  used is given by  $2 \times \mathbf{stpsok} \times \mathbf{stpcst}$  for method **NAG\_RK\_4\_5** or **NAG\_RK\_7\_8** and  $3 \times \mathbf{stpsok} \times \mathbf{stpcst}$  for method = **NAG\_RK\_2\_3**.

After a failure with fail.code = **NE\_RK\_PDC\_STEP**, **NE\_RK\_PDC\_GLOBAL\_ERROR\_T** or **NE\_RK\_PDC\_GLOBAL\_ERROR\_S** the diagnostic routine nag\_ode\_ivp\_rk\_errass (d02pzc) may be called only once.

If nag\_ode\_ivp\_rk\_range returns with fail.code = **NE\_STIFF\_PROBLEM** then it is advisable to change to another code more suited to the solution of stiff problems. nag\_ode\_ivp\_rk\_range will not return with fail.code = **NE\_STIFF\_PROBLEM** if the problem is actually stiff but it is estimated that integration can be completed using less function evaluations than already computed.

### 6.1. Accuracy

The accuracy of integration is determined by the parameters **tol** and **thres** in a prior call to `nag_ode_ivp_rk_setup` (d02pvc). Note that only the local error at each step is controlled by these parameters. The error estimates obtained are not strict bounds but are usually reliable over one step. Over a number of steps the overall error may accumulate in various ways, depending on the properties of the differential system.

### 8. Example

We solve the equation

$$y'' = -y, \quad y(0) = 0, y'(0) = 1$$

reposed as

$$y'_1 = y_2 \quad y'_2 = -y_1$$

over the range  $[0, 2\pi]$  with initial conditions  $y_1 = 0.0$  and  $y_2 = 1.0$ . We use relative error control with threshold values of  $1.0e-8$  for each solution component and compute the solution at intervals of length  $\pi/4$  across the range. We use a low order Runge-Kutta method (**method** = **Nag\_RK\_2.3**) with tolerances **tol** =  $1.0e-3$  and **tol** =  $1.0e-4$  in turn so that we may compare the solutions. The value of  $\pi$  is obtained by using X01AAC.

See also the example program for `nag_ode_ivp_rk_errass` (d02pzc).
