# NAG C Library Function Document

# nag estimate garchGJR (g13fec)

## 1 Purpose

nag\_estimate\_garchGJR (g13fec) estimates the parameters of a univariate regression-GJR GARCH(p, q) process (see Glosten, et al. (1993)).

# 2 Specification

# 3 Description

A univariate regression-GJR GARCH(p, q) process, with p coefficients  $\alpha_i$ , i = 1, ..., p, q coefficients,  $\beta_i$ , i = 1, ..., q, mean  $b_o$ , and k linear regression coefficients  $b_i$ , i = 1, ..., k, can be represented by:

$$y_t = b_o + x_t^T b + \epsilon_t$$

$$\epsilon_t | \psi_{t-1} \sim N(0, h_t)$$
(1)

$$h_t = \alpha_0 + \sum_{i=1}^q (\alpha_i + \gamma S_{t-i}) \epsilon_{t-i}^2 + \sum_{i=1}^p \beta_i h_{t-i}, \quad t = 1, \dots, T.$$

where  $S_t=1$ , if  $\epsilon_t<0$ , and  $S_t=0$ , if  $\epsilon_t\geq 0$ . Here T is the number of terms in the sequence,  $y_t$  denotes the endogenous variables,  $x_t$  the exogenous variables,  $b_o$  the mean, b the regression coefficients,  $\epsilon_t$  the residuals,  $\gamma$  is the asymmetry parameter,  $h_t$  is the conditional variance, and  $\psi_t$  the information set of all information up to time t.

The routine nag\_estimate\_garchGJR provides an estimate for  $\hat{\theta}$ , the  $(p+q+k+3) \times 1$  parameter vector  $\theta = (b_o, b^T, \omega^T)$  where  $\omega^T = (\alpha_0, \alpha_1, \dots, \alpha_q, \beta_1, \dots, \beta_p, \gamma)$  and  $b^T = (b_1, \dots, b_k)$ .

mn, nreg (see Section 4) can be used to simplify the GARCH(p,q) expression in equation (1) as follows:

## No Regression or Mean

$$y_t = \epsilon_t,$$
  
 $\mathbf{mn} = 0,$   
 $\mathbf{nreg} = 0,$  and  
 $\theta$  is a  $(p+q+2) \times 1$  vector.

### No Regression

$$y_t = b_o + \epsilon_t,$$
  
 $\mathbf{mn} = 1,$   
 $\mathbf{nreg} = 0,$  and  
 $\theta$  is a  $(p+q+3) \times 1$  vector.

**Note:** if the  $y_t = \mu + \epsilon_t$ , where  $\mu$  is known (not to be estimated by nag\_estimate\_garchGJR) then equation (1) can be written as  $y_t^{\mu} = \epsilon_t$ , where  $y_t^{\mu} = y_t - \mu$ . This corresponds to the case **No Regression or Mean**, with  $y_t$  replaced by  $y_t - \mu$ .

#### No Mean

$$y_t = x_t^T b + \epsilon_t,$$

$$mn = 0$$
,

$$nreg = k$$
 and

$$\theta$$
 is a  $(p+q+k+2) \times 1$  vector.

# 4 Parameters

**Note:** for convenience **npar** will be used here to denote the expression  $2+\mathbf{q}+\mathbf{p}+\mathbf{mn}+\mathbf{nreg}$  representing the number of model parameters.

1: **yt[num]** – const double

Input

On entry: the sequence of observations,  $y_t$ , t = 1, ..., T.

2: x[num][tdx] - const double

Input

On entry: row t of **x** contains the time dependent exogenous vector  $x_t$ , where  $x_t^T = (x_t^1, \dots, x_t^k)$ , for  $t = 1, \dots, T$ .

3: **tdx** – Integer

Input

On entry: the second dimension of the array x as declared in the function from which nag estimate garchGJR is called.

Constraint:  $tdx \ge nreg$ .

4: **num** – Integer

Input

On entry: the number of terms in the sequence, T.

Constraint:  $num \ge npar$ .

5: **p** – Integer

Input

On entry: the GARCH(p, q) parameter p.

Constraint:  $\mathbf{p} \geq 0$ .

6: **q** – Integer

Input

On entry: the GARCH(p, q) parameter q.

Constraint:  $\mathbf{q} \geq 1$ .

7: **nreg** – Integer

Input

On entry: the number of regression coefficients, k.

Constraint:  $nreg \ge 0$ .

8: **mn** – Integer

Input

On entry: if mn = 1 then the mean term  $b_0$  will be included in the model.

Constraint:  $\mathbf{mn} = 0$  or  $\mathbf{mn} = 1$ .

g13fec.2

[NP3491/6]

#### 9: **theta[npar]** – double

Input/Output

On entry: the initial parameter estimates for the vector  $\theta$ . The first element contains the coefficient  $\alpha_o$ , the next  $\mathbf{q}$  elements contain the coefficients  $\alpha_i$ ,  $i=1,\ldots,q$ . The next  $\mathbf{p}$  elements are the coefficients  $\beta_j$ ,  $j=1,\ldots,p$ . The next element contains the asymmetry parameter  $\gamma$ . If  $\mathbf{est\_opt} = \mathbf{Nag\_Garch\_Est\_Initial\_False}$  then (when  $\mathbf{mn}=1$ ) the next term contains an initial estimate of the mean term  $b_o$  and the remaining  $\mathbf{nreg}$  elements are taken as initial estimates of the linear regression coefficients  $b_i$ ,  $i=1,\ldots,k$ .

On exit: the estimated values  $\hat{\theta}$  for the vector  $\theta$ . The first element contains the coefficient  $\alpha_o$ , the next  $\mathbf{q}$  elements contain the coefficients  $\alpha_i$ ,  $i=1,\ldots,q$ . The next  $\mathbf{p}$  elements are the coefficients  $\beta_j$ ,  $j=1,\ldots,p$ . The next element contains the estimate for the asymmetry parameter  $\gamma$ . If  $\mathbf{mn}=1$  then the next element contains an estimate for the mean term  $b_o$ . The final  $\mathbf{nreg}$  elements are the estimated linear regression coefficients  $b_i$ ,  $i=1,\ldots,k$ .

10: **se[npar]** – double

Output

On exit: the standard errors for  $\hat{\theta}$ . The first element contains the standard error for  $\alpha_o$ , the next  $\mathbf{q}$  elements contain the standard errors for  $\alpha_i$ ,  $i=1,\ldots,q$ , the next  $\mathbf{p}$  elements are the standard errors for  $\beta_j$ ,  $j=1,\ldots,p$ . The next element contains the standard error for  $\gamma$ . If  $\mathbf{mn}=1$  then the next element contains the standard error for  $b_o$ . The final  $\mathbf{nreg}$  elements are the standard errors for  $b_j$ ,  $j=1,\ldots,k$ .

11: sc[npar] - double

Output

On exit: the scores for  $\hat{\theta}$ . The first element contains the score for  $\alpha_o$ , the next  $\mathbf{q}$  elements contain the score for  $\alpha_i$ ,  $i=1,\ldots,q$ , the next  $\mathbf{p}$  elements are the scores for  $\beta_j$ ,  $j=1,\ldots,p$ . The next element contains the score for  $\gamma$ . If  $\mathbf{mn}=1$  then the next element contains the score for  $b_o$ . The final  $\mathbf{nreg}$  elements are the scores for  $b_j$ ,  $j=1,\ldots,k$ .

#### 12: **covar[npar][tdc]** – double

Output

On exit: the covariance matrix of the parameter estimates  $\hat{\theta}$ , that is the inverse of the Fisher Information Matrix.

13: **tdc** – Integer

Input

On entry: the second dimension of the array **covar** as declared in the function from which nag\_estimate\_garchGJR is called.

Constraint:  $tdc \ge npar$ .

14: **hp** – double \*

Input/Output

On entry: If est\_opt = Nag\_Garch\_Est\_Initial\_False then hp is the value to be used for the pre-observed conditional variance. If est\_opt = Nag\_Garch\_Est\_Initial\_True then hp is not referenced.

On exit: If  $est_opt = Nag_Garch_Est_Initial_True$  then hp is the estimated value of the pre-observed conditional variance.

15: **et[num]** – double

Output

On exit: the estimated residuals,  $\epsilon_t$ , t = 1, ..., T.

16: **ht[num]** – double

Output

On exit: the estimated conditional variances,  $h_t$ , t = 1, ..., T.

17: **lgf** – double \*

Output

On exit: the value of the log likelihood function at  $\hat{\theta}$ .

## 18: **stat\_opt** – Nag\_Garch\_Stationary\_Type

Input

On entry: If stat\_opt = Nag\_Garch\_Stationary\_True then Stationary conditions are enforced. If stat opt = Nag Garch Stationary False then Stationary conditions are not enforced.

19: **est\_opt** – Nag Garch Est Initial Type

Input

On entry: If est\_opt = Nag\_Garch\_Est\_Initial\_True then the routine provides initial parameter estimates of the regression terms  $(b_o, b^T)$ . If est\_opt = Nag\_Garch\_Est\_Initial\_False then the initial estimates of the regression parameters  $(b_o, b^T)$  must be supplied by the user.

20: max iter – Integer

Input

On entry: the maximum number of iterations to be used by the optimisation routine when estimating the GARCH(p,q) parameters. If **max\_iter** is set to 0 then the standard errors, score vector and variance-covariance are calculated for the input value of  $\theta$  in **theta**; however the value of  $\theta$  is not updated.

Constraint:  $\max iter \ge 0$ .

21: **tol** – double

Input

On entry: the tolerance to be used by the optimisation routine when estimating the GARCH(p,q) parameters.

22: **fail** – NagError \*

Input/Output

The NAG error parameter (see the Essential Introduction).

## 5 Error Indicators and Warnings

#### **NE BAD PARAM**

On entry, parameter stat\_opt had an illegal value.

On entry, parameter est opt had an illegal value.

#### NE INT ARG LT

On entry, **nreg** must not be less than 0:  $nreg = \langle value \rangle$ .

On entry,  $\mathbf{q}$  must not be less than 1:  $\mathbf{q} = \langle value \rangle$ .

On entry, **p** must not be less than 0:  $\mathbf{p} = \langle value \rangle$ .

On entry, max\_iter must not be less than 0: max\_iter = <value>.

#### NE 2 INT ARG LT

On entry,  $tdx = \langle value \rangle$  while  $nreg = \langle value \rangle$ .

These parameters must satisfy  $tdx \ge nreg$ .

On entry,  $\mathbf{tdc} = \langle value \rangle$  while  $2+\mathbf{q}+\mathbf{p}+\mathbf{mn}+\mathbf{nreg} = \langle value \rangle$ .

These parameters must satisfy  $tdc \ge 2+q+p+mn+nreg$ .

On entry,  $\mathbf{num} = \langle value \rangle$  while  $2+\mathbf{q}+\mathbf{p}+\mathbf{mn}+\mathbf{nreg} = \langle value \rangle$ .

These parameters must satisfy num  $\geq 2+q+p+mn+nreg$ .

#### NE\_INVALID\_INT\_RANGE\_2

Value <value> given to mn is not valid. Correct range is 0 to 1.

#### NE MAT NOT FULL RANK

Matrix X does not give a model of full rank.

g13fec.4 [NP3491/6]

#### NE MAT NOT POS DEF

Attempt to invert the second derivative matrix needed in the calculation of the covariance matrix of the parameter estimates has failed. The matrix is not positive-definite, possibly due to rounding errors.

#### NE ALLOC FAIL

Memory allocation failed.

## NE INTERNAL ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

#### 8 Example

This example program illustrates the use of nag\_estimate\_garchGJR to model a GARCH(1,1) sequence generated by nag\_generate\_garchGJR (g05hmc), a six step forecast is then calculated using nag forecast garchGJR (g13ffc).
