

## NAG C Library Function Document

### nag\_dgetrf (f07adc)

#### 1 Purpose

nag\_dgetrf (f07adc) computes the  $LU$  factorization of a real  $m$  by  $n$  matrix.

#### 2 Specification

```
void nag_dgetrf (Nag_OrderType order, Integer m, Integer n, double a[],
                Integer pda, Integer ipiv[], NagError *fail)
```

#### 3 Description

nag\_dgetrf (f07adc) forms the  $LU$  factorization of a real  $m$  by  $n$  matrix  $A$  as  $A = PLU$ , where  $P$  is a permutation matrix,  $L$  is lower triangular with unit diagonal elements (lower trapezoidal if  $m > n$ ) and  $U$  is upper triangular (upper trapezoidal if  $m < n$ ). Usually  $A$  is square ( $m = n$ ), and both  $L$  and  $U$  are triangular. The function uses partial pivoting, with row interchanges.

#### 4 References

#### 5 Parameters

- 1: **order** – Nag\_OrderType *Input*  
*On entry:* the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag\_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.  
*Constraint:* **order = Nag\_RowMajor** or **Nag\_ColMajor**.
- 2: **m** – Integer *Input*  
*On entry:*  $m$ , the number of rows of the matrix  $A$ .  
*Constraint:*  $m \geq 0$ .
- 3: **n** – Integer *Input*  
*On entry:*  $n$ , the number of columns of the matrix  $A$ .  
*Constraint:*  $n \geq 0$ .
- 4: **a**[*dim*] – double *Input/Output*  
**Note:** the dimension, *dim*, of the array **a** must be at least  $\max(1, \mathbf{pda} \times \mathbf{n})$  when **order = Nag\_ColMajor** and at least  $\max(1, \mathbf{pda} \times \mathbf{m})$  when **order = Nag\_RowMajor**.  
 If **order = Nag\_ColMajor**, the  $(i, j)$ th element of the matrix  $A$  is stored in **a**[( $j - 1$ )  $\times$  **pda** +  $i - 1$ ] and if **order = Nag\_RowMajor**, the  $(i, j)$ th element of the matrix  $A$  is stored in **a**[( $i - 1$ )  $\times$  **pda** +  $j - 1$ ].  
*On entry:* the  $m$  by  $n$  matrix  $A$ .  
*On exit:* **a** is overwritten by the factors  $L$  and  $U$ ; the unit diagonal elements of  $L$  are not stored.

- 5: **pda** – Integer *Input*  
*On entry:* the stride separating matrix row or column elements (depending on the value of **order**) in the array **a**.  
*Constraints:*  
 if **order** = **Nag\_ColMajor**, **pda**  $\geq$   $\max(1, \mathbf{m})$ ;  
 if **order** = **Nag\_RowMajor**, **pda**  $\geq$   $\max(1, \mathbf{n})$ .
- 6: **ipiv**[*dim*] – Integer *Output*  
**Note:** the dimension, *dim*, of the array **ipiv** must be at least  $\max(1, \min(\mathbf{m}, \mathbf{n}))$ .  
*On exit:* the pivot indices. Row *i* of the matrix *A* was interchanged with row **ipiv**[*i* – 1] for  $i = 1, 2, \dots, \min(m, n)$ .
- 7: **fail** – NagError \* *Output*  
 The NAG error parameter (see the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_INT

On entry, **m** =  $\langle value \rangle$ .  
 Constraint: **m**  $\geq$  0.

On entry, **n** =  $\langle value \rangle$ .  
 Constraint: **n**  $\geq$  0.

On entry, **pda** =  $\langle value \rangle$ .  
 Constraint: **pda**  $>$  0.

### NE\_INT\_2

On entry, **pda** =  $\langle value \rangle$ , **m** =  $\langle value \rangle$ .  
 Constraint: **pda**  $\geq$   $\max(1, \mathbf{m})$ .

On entry, **pda** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$ .  
 Constraint: **pda**  $\geq$   $\max(1, \mathbf{n})$ .

### NE\_SINGULAR

$u(\langle value \rangle, \langle value \rangle)$  is exactly zero. The factorization has been completed but the factor *U* is exactly singular, and division by zero will occur if it is subsequently used to solve a system of linear equations or to invert *A*.

### NE\_ALLOC\_FAIL

Memory allocation failed.

### NE\_BAD\_PARAM

On entry, parameter  $\langle value \rangle$  had an illegal value.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

The computed factors  $L$  and  $U$  are the exact factors of a perturbed matrix  $A + E$ , where

$$|E| \leq c(\min(m, n))\epsilon P|L||U|,$$

$c(n)$  is a modest linear function of  $n$ , and  $\epsilon$  is the *machine precision*.

## 8 Further Comments

The total number of floating-point operations is approximately  $\frac{2}{3}n^3$  if  $m = n$  (the usual case),  $\frac{1}{3}n^2(3m - n)$  if  $m > n$  and  $\frac{1}{3}m^2(3n - m)$  if  $m < n$ .

A call to this function with  $m = n$  may be followed by calls to the functions:

nag\_dgetrs (f07aec) to solve  $AX = B$  or  $A^T X = B$ ;

nag\_dgecon (f07agc) to estimate the condition number of  $A$ ;

nag\_dgetri (f07ajc) to compute the inverse of  $A$ .

The complex analogue of this function is nag\_zgetrf (f07arc).

## 9 Example

To compute the  $LU$  factorization of the matrix  $A$ , where

$$A = \begin{pmatrix} 1.80 & 2.88 & 2.05 & -0.89 \\ 5.25 & -2.95 & -0.95 & -3.80 \\ 1.58 & -2.69 & -2.90 & -1.04 \\ -1.11 & -0.66 & -0.59 & 0.80 \end{pmatrix}.$$
