NAG C Library Function Document

nag_dgbrfs (f07bhc)

1 Purpose

nag_dgbrfs (f07bhc) returns error bounds for the solution of a real band system of linear equations with multiple right-hand sides, $AX = B$ or $A^T X = B$. It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

2 Specification

```
void nag_dgbrfs (Nag_OrderType order, Nag_TransType trans, Integer n, Integer kl,
        Integer ku, Integer nrhs, const double ab[], Integer pdab, const double afb[],
        Integer pdafb, const Integer ipiv[], const double b[], Integer pdb, double x[],
        Integer pdx, double ferr[], double berr[], NagError *fail)
```

3 Description

nag_dgbrfs (f07bhc) returns the backward errors and estimated bounds on the forward errors for the solution of a real band system of linear equations with multiple right-hand sides $AX = B$ or $A^T X = B$. The function handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of nag_dgbrfs (f07bhc) in terms of a single right-hand side b and solution x.

Given a computed solution x, the function computes the *component-wise backward error* β. This is the size of the smallest relative perturbation in each element of A and b such that x is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$
$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where $\hat{x}$ is the true solution.

For details of the method, see the f07 Chapter Introduction.

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order** = **Nag_RowMajor** or **Nag_ColMajor**.

2: **trans** – Nag_TransType *Input*

On entry: indicates the form of the linear equations for which X is the computed solution as follows:

if **trans** = **Nag_NoTrans**, then the linear equations are of the form $AX = B$.

if **trans** = **Nag_Trans** or **Nag_ConjTrans**, then the linear equations are of the form $A^T X = B$.

Constraint: **trans** = **Nag_NoTrans**, **Nag_Trans** or **Nag_ConjTrans**.

3: **n** – Integer *Input*

On entry: n, the order of the matrix A.

Constraint: **n** ≥ 0.

4: **kl** – Integer *Input*

On entry: k_l, the number of sub-diagonals within the band of A.

Constraint: **kl** ≥ 0.

5: **ku** – Integer *Input*

On entry: k_u, the number of super-diagonals within the band of A.

Constraint: **ku** ≥ 0.

6: **nrhs** – Integer *Input*

On entry: r, the number of right-hand sides.

Constraint: **nrhs** ≥ 0.

7: **ab**$[dim]$ – const double *Input*

Note: the dimension, dim, of the array **ab** must be at least $\max(1, \textbf{pdab} \times \textbf{n})$.

On entry: the original n by n band matrix A as supplied to nag_dgbtrf (f07bdc) but with reduced requirements since the matrix is not factorized. This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements a_{ij}, for $i = 1, \ldots, n$ and $j = \max(1, i - k_l), \ldots, \min(n, i + k_u)$, depends on the **order** parameter as follows:

if **order** = **Nag_ColMajor**, a_{ij} is stored as **ab**$[(j-1) \times \textbf{pdab} + \textbf{ku} + i - j]$;

if **order** = **Nag_RowMajor**, a_{ij} is stored as **ab**$[(i-1) \times \textbf{pdab} + \textbf{kl} + j - i]$.

8: **pdab** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **ab**.

Constraint: **pdab** $\geq$ **kl** + **ku** + 1.

9: **afb**$[dim]$ – const double *Input*

Note: the dimension, dim, of the array **afb** must be at least $\max(1, \textbf{pdafb} \times \textbf{n})$.

On entry: the LU factorization of A, as returned by nag_dgbtrf (f07bdc).

10: **pdafb** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **afb**.

Constraint: **pdafb** $\geq 2 \times$ **kl** + **ku** + 1.

11: **ipiv**$[dim]$ – const Integer *Input*

Note: the dimension, dim, of the array **ipiv** must be at least $\max(1, \textbf{n})$.

On entry: the pivot indices, as returned by nag_dgbtrf (f07bdc).

12: **b**[dim] – const double *Input*

Note: the dimension, dim, of the array **b** must be at least $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdb} \times \mathbf{n})$ when **order** = **Nag_RowMajor**.

If **order** = **Nag_ColMajor**, the (i, j)th element of the matrix B is stored in **b**$[(j-1) \times \mathbf{pdb} + i - 1]$ and if **order** = **Nag_RowMajor**, the (i, j)th element of the matrix B is stored in **b**$[(i-1) \times \mathbf{pdb} + j - 1]$.

On entry: the n by r right-hand side matrix B.

13: **pdb** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **b**.

Constraints:

if **order** = **Nag_ColMajor**, **pdb** $\geq \max(1, \mathbf{n})$;
if **order** = **Nag_RowMajor**, **pdb** $\geq \max(1, \mathbf{nrhs})$.

14: **x**[dim] – double *Input/Output*

Note: the dimension, dim, of the array **x** must be at least $\max(1, \mathbf{pdx} \times \mathbf{nrhs})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdx} \times \mathbf{n})$ when **order** = **Nag_RowMajor**.

If **order** = **Nag_ColMajor**, the (i, j)th element of the matrix X is stored in **x**$[(j-1) \times \mathbf{pdx} + i - 1]$ and if **order** = **Nag_RowMajor**, the (i, j)th element of the matrix X is stored in **x**$[(i-1) \times \mathbf{pdx} + j - 1]$.

On entry: the n by r solution matrix X, as returned by nag_dgbtrs (f07bec).

On exit: the improved solution matrix X.

15: **pdx** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **x**.

Constraints:

if **order** = **Nag_ColMajor**, **pdx** $\geq \max(1, \mathbf{n})$;
if **order** = **Nag_RowMajor**, **pdx** $\geq \max(1, \mathbf{nrhs})$.

16: **ferr**[dim] – double *Output*

Note: the dimension, dim, of the array **ferr** must be at least $\max(1, \mathbf{nrhs})$.

On exit: **ferr**$[j-1]$ contains an estimated error bound for the jth solution vector, that is, the jth column of X, for $j = 1, 2, \ldots, r$.

17: **berr**[dim] – double *Output*

Note: the dimension, dim, of the array **berr** must be at least $\max(1, \mathbf{nrhs})$.

On exit: **berr**$[j-1]$ contains the component-wise backward error bound β for the jth solution vector, that is, the jth column of X, for $j = 1, 2, \ldots, r$.

18: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

On entry, **kl** = ⟨*value*⟩.
Constraint: **kl** ≥ 0.

On entry, **ku** = ⟨*value*⟩.
Constraint: **ku** ≥ 0.

On entry, **nrhs** = ⟨*value*⟩.
Constraint: **nrhs** ≥ 0.

On entry, **pdab** = ⟨*value*⟩.
Constraint: **pdab** > 0.

On entry, **pdafb** = ⟨*value*⟩.
Constraint: **pdafb** > 0.

On entry, **pdb** = ⟨*value*⟩.
Constraint: **pdb** > 0.

On entry, **pdx** = ⟨*value*⟩.
Constraint: **pdx** > 0.

NE_INT_2

On entry, **pdb** = ⟨*value*⟩, **n** = ⟨*value*⟩.
Constraint: **pdb** $\geq \max(1, \mathbf{n})$.

On entry, **pdb** = ⟨*value*⟩, **nrhs** = ⟨*value*⟩.
Constraint: **pdb** $\geq \max(1, \mathbf{nrhs})$.

On entry, **pdx** = ⟨*value*⟩, **n** = ⟨*value*⟩.
Constraint: **pdx** $\geq \max(1, \mathbf{n})$.

On entry, **pdx** = ⟨*value*⟩, **nrhs** = ⟨*value*⟩.
Constraint: **pdx** $\geq \max(1, \mathbf{nrhs})$.

NE_INT_3

On entry, **pdab** = ⟨*value*⟩, **kl** = ⟨*value*⟩, **ku** = ⟨*value*⟩.
Constraint: **pdab** $\geq \mathbf{kl} + \mathbf{ku} + 1$.

On entry, **pdafb** = ⟨*value*⟩, **kl** = ⟨*value*⟩, **ku** = ⟨*value*⟩.
Constraint: **pdafb** $\geq 2 \times \mathbf{kl} + \mathbf{ku} + 1$.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter ⟨*value*⟩ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The bounds returned in **ferr** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Further Comments

For each right-hand side, computation of the backward error involves a minimum of $4n(k_l + k_u)$ floating-point operations. Each step of iterative refinement involves an additional $2n(4k_l + 3k_u)$ operations. This

assumes $n \gg k_l$ and $n \gg k_u$. At most 5 steps of iterative refinement are performed, but usually only 1 or 2 steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$ or $A^T x = b$; the number is usually 4 or 5 and never more than 11. Each solution involves approximately $2n(2k_l + k_u)$ operations.

The complex analogue of this function is nag_zgbrfs (f07bvc).

9 Example

To solve the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} -0.23 & 2.54 & -3.66 & 0.00 \\ -6.98 & 2.46 & -2.73 & -2.13 \\ 0.00 & 2.56 & 2.46 & 4.07 \\ 0.00 & 0.00 & -4.78 & -3.82 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 4.42 & -36.01 \\ 27.13 & -31.67 \\ -6.14 & -1.16 \\ 10.50 & -25.82 \end{pmatrix}.$$

Here A is nonsymmetric and is treated as a band matrix, which must first be factorized by nag_dgbtrf (f07bdc).
