## nag\_zgbrfs (f07bvc)

### 1 Purpose

nag\_zgbrfs (f07bvc) returns error bounds for the solution of a complex band system of linear equations with multiple right-hand sides,  $AX = B$ ,  $A^T X = B$  or  $A^H X = B$ . It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

### 2 Specification

```
void nag_zgbrfs (Nag_OrderType order, Nag_TransType trans, Integer n, Integer kl,
                 Integer ku, Integer nrhs, const Complex ab[], Integer pdab,
                 const Complex afb[], Integer pdafb, const Integer ipiv[], const Complex b[],
                 Integer pdb, Complex x[], Integer pdx, double ferr[], double berr[],

```

### 3 Description

nag\_zgbrfs (f07bvc) returns the backward errors and estimated bounds on the forward errors for the solution of a complex band system of linear equations with multiple right-hand sides  $AX = B$ ,  $A^T X = B$  or  $A^H X = B$ . The function handles each right-hand side vector (stored as a column of the matrix  $B$ ) independently, so we describe the function of nag\_zgbrfs (f07bvc) in terms of a single right-hand side  $b$  and solution  $x$ .

Given a computed solution  $x$ , the function computes the *component-wise backward error*  $\beta$ . This is the size of the smallest relative perturbation in each element of  $A$  and  $b$  such that  $x$  is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$

$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where  $\hat{x}$  is the true solution.

For details of the method, see the f07 Chapter Introduction.

if **trans** = Nag\_Trans, the linear equations are of the form  $A^T X = B$ ;

if **trans** = Nag\_ConjTrans, the linear equations are of the form  $A^H X = B$ .

The storage of elements  $a_{ij}$ , for  $i = 1, \dots, n$  and  $j = \max(1, i - k_l), \dots, \min(n, i + k_u)$ , depends on the **order** parameter as follows:

if **order** = Nag\_ColMajor,  $a_{ij}$  is stored as **ab**[( $j - 1$ )  $\times$  **pdab** + **ku** +  $i - j$ ];

if **order** = Nag\_RowMajor,  $a_{ij}$  is stored as **ab**[( $i - 1$ )  $\times$  **pdab** + **kl** +  $j - i$ ].

### NE\_ALLOC\_FAIL

Memory allocation failed.

### NE\_BAD\_PARAM

On entry, parameter  $\langle value \rangle$  had an illegal value.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

The bounds returned in **ferr** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

## 8 Further Comments

For each right-hand side, computation of the backward error involves a minimum of  $16n(k_l + k_u)$  real floating-point operations. Each step of iterative refinement involves an additional  $8n(4k_l + 3k_u)$  real operations. This assumes  $n \gg k_l$  and  $n \gg k_u$ . At most 5 steps of iterative refinement are performed, but usually only 1 or 2 steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form  $Ax = b$  or  $A^H x = b$ ; the number is usually 5 and never more than 11. Each solution involves approximately  $8n(2k_l + k_u)$  real operations.

The real analogue of this function is nag\_dgbrfs (f07bhc).

## 9 Example

To solve the system of equations  $AX = B$  using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} -1.65 + 2.26i & -2.05 - 0.85i & 0.97 - 2.84i & 0.00 + 0.00i \\ 0.00 + 6.30i & -1.48 - 1.75i & -3.99 + 4.01i & 0.59 - 0.48i \\ 0.00 + 0.00i & -0.77 + 2.83i & -1.06 + 1.94i & 3.33 - 1.04i \\ 0.00 + 0.00i & 0.00 + 0.00i & 4.48 - 1.09i & -0.46 - 1.72i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -1.06 + 21.50i & 12.85 + 2.84i \\ -22.72 - 53.90i & -70.22 + 21.57i \\ 28.24 - 38.60i & -20.73 - 1.23i \\ -34.56 + 16.73i & 26.01 + 31.97i \end{pmatrix}.$$

Here  $A$  is nonsymmetric and is treated as a band matrix, which must first be factorized by nag\_zgbtrf (f07brc).
