## nag\_dpotrs (f07fec)

### 1 Purpose

nag\_dpotrs (f07fec) solves a real symmetric positive-definite system of linear equations with multiple right-hand sides,  $AX = B$ , where  $A$  has been factorized by nag\_dpotrf (f07fdc).

### 2 Specification

```
void nag_dpotrs (Nag_OrderType order, Nag_UptoType uplo, Integer n, Integer nrhs,
                 const double a[], Integer pda, double b[], Integer pdb, NagError *fail)
```

### 3 Description

To solve a real symmetric positive-definite system of linear equations  $AX = B$ , this function must be preceded by a call to nag\_dpotrf (f07fdc) which computes the Cholesky factorization of  $A$ . The solution  $X$  is computed by forward and backward substitution.

If **uplo** = **Nag\_Upper**,  $A = U^T U$ , where  $U$  is upper triangular; the solution  $X$  is computed by solving  $U^T Y = B$  and then  $UX = Y$ .

If **uplo** = **Nag\_Lower**,  $A = LL^T$ , where  $L$  is lower triangular; the solution  $X$  is computed by solving  $LY = B$  and then  $L^T X = Y$ .

### 4 References

### 5 Parameters

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag\_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

*Constraint:* **order** = **Nag\_RowMajor** or **Nag\_ColMajor**.

2: **uplo** – Nag\_UptoType *Input*

*On entry:* indicates whether  $A$  has been factorized as  $U^T U$  or  $LL^T$ , as follows:

if **uplo** = **Nag\_Upper**, then  $A = U^T U$ , where  $U$  is upper triangular;  
 if **uplo** = **Nag\_Lower**, then  $A = LL^T$ , where  $L$  is lower triangular.

*Constraint:* **uplo** = **Nag\_Upper** or **Nag\_Lower**.

3: **n** – Integer *Input*

*On entry:*  $n$ , the order of the matrix  $A$ .

*Constraint:* **n**  $\geq 0$ .

4: **nrhs** – Integer *Input*

*On entry:*  $r$ , the number of right-hand sides.

*Constraint:* **nrhs**  $\geq 0$ .

- 5:    **a**[*dim*] – const double *Input*  
**Note:** the dimension, *dim*, of the array **a** must be at least  $\max(1, \mathbf{pda} \times \mathbf{n})$ .  
*On entry:* the Cholesky factor of  $A$ , as returned by nag\_dpotrf (f07fdc).
- 6:    **pda** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **a**.  
*Constraint:* **pda**  $\geq \max(1, \mathbf{n})$ .
- 7:    **b**[*dim*] – double *Input/Output*  
**Note:** the dimension, *dim*, of the array **b** must be at least  $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$  when **order** = Nag\_ColMajor and at least  $\max(1, \mathbf{pdb} \times \mathbf{n})$  when **order** = Nag\_RowMajor.  
If **order** = Nag\_ColMajor, the  $(i, j)$ th element of the matrix  $B$  is stored in **b**[(*j* – 1)  $\times$  **pdb** + *i* – 1] and if **order** = Nag\_RowMajor, the  $(i, j)$ th element of the matrix  $B$  is stored in **b**[(*i* – 1)  $\times$  **pdb** + *j* – 1].  
*On entry:* the *n* by *r* right-hand side matrix  $B$ .  
*On exit:* the *n* by *r* solution matrix  $X$ .
- 8:    **pdb** – Integer *Input*  
*On entry:* the stride separating matrix row or column elements (depending on the value of **order**) in the array **b**.  
*Constraints:*  
if **order** = Nag\_ColMajor, **pdb**  $\geq \max(1, \mathbf{n})$ ;  
if **order** = Nag\_RowMajor, **pdb**  $\geq \max(1, \mathbf{nrhs})$ .
- 9:    **fail** – NagError \* *Output*  
The NAG error parameter (see the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_INT

On entry, **n** =  $\langle\text{value}\rangle$ .

Constraint: **n**  $\geq 0$ .

On entry, **nrhs** =  $\langle\text{value}\rangle$ .

Constraint: **nrhs**  $\geq 0$ .

On entry, **pda** =  $\langle\text{value}\rangle$ .

Constraint: **pda**  $> 0$ .

On entry, **pdb** =  $\langle\text{value}\rangle$ .

Constraint: **pdb**  $> 0$ .

### NE\_INT\_2

On entry, **pda** =  $\langle\text{value}\rangle$ , **n** =  $\langle\text{value}\rangle$ .

Constraint: **pda**  $\geq \max(1, \mathbf{n})$ .

On entry, **pdb** =  $\langle\text{value}\rangle$ , **n** =  $\langle\text{value}\rangle$ .

Constraint: **pdb**  $\geq \max(1, \mathbf{n})$ .

On entry, **pdb** =  $\langle\text{value}\rangle$ , **nrhs** =  $\langle\text{value}\rangle$ .

Constraint: **pdb**  $\geq \max(1, \mathbf{nrhs})$ .

**NE\_ALLOC\_FAIL**

Memory allocation failed.

**NE\_BAD\_PARAM**

On entry, parameter  $\langle value \rangle$  had an illegal value.

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

For each right-hand side vector  $b$ , the computed solution  $x$  is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

if **uplo** = Nag\_Upper,  $|E| \leq c(n)\epsilon|U^T| |U|$ ;

if **uplo** = Nag\_Lower,  $|E| \leq c(n)\epsilon|L| |L^T|$ ,

$c(n)$  is a modest linear function of  $n$ , and  $\epsilon$  is the **machine precision**.

If  $\hat{x}$  is the true solution, then the computed solution  $x$  satisfies a forward error bound of the form

$$\frac{\|x - \hat{x}\|_\infty}{\|x\|_\infty} \leq c(n) \operatorname{cond}(A, x)\epsilon$$

where  $\operatorname{cond}(A, x) = \|A^{-1}\| |A| \|x\|_\infty / \|x\|_\infty \leq \operatorname{cond}(A) = \|A^{-1}\| |A|\|_\infty \leq \kappa_\infty(A)$ . Note that  $\operatorname{cond}(A, x)$  can be much smaller than  $\operatorname{cond}(A)$ .

Forward and backward error bounds can be computed by calling nag\_dporfs (f07fhc), and an estimate for  $\kappa_\infty(A)$  ( $= \kappa_1(A)$ ) can be obtained by calling nag\_dpocon (f07fgc).

## 8 Further Comments

The total number of floating-point operations is approximately  $2n^2r$ .

This function may be followed by a call to nag\_dporfs (f07fhc) to refine the solution and return an error estimate.

The complex analogue of this function is nag\_zpotrs (f07fsc).

## 9 Example

To solve the system of equations  $AX = B$ , where

$$A = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.18 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.18 & 0.34 & 1.18 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 8.70 & 8.30 \\ -13.35 & 2.13 \\ 1.89 & 1.61 \\ -4.14 & 5.00 \end{pmatrix}.$$

Here  $A$  is symmetric positive-definite and must first be factorized by nag\_dpotrf (f07fdc).
