nag_zpotri (f07fwc)

1 Purpose

nag_zpotri (f07fwc) computes the inverse of a complex Hermitian positive-definite matrix A , where A has been factorized by nag_zpotrf (f07frc).

2 Specification

```
void nag_zpotri (Nag_OrderType order, Nag_UptoType uplo, Integer n, Complex a[],  
    Integer pda, NagError *fail)
```

3 Description

To compute the inverse of a complex Hermitian positive-definite matrix A , the function must be preceded by a call to nag_zpotrf (f07frc), which computes the Cholesky factorization of A .

If **uplo** = **Nag_Upper**, $A = U^H U$ and A^{-1} is computed by first inverting U and then forming $(U^{-1})(U^{-1})^H$.

If **uplo** = **Nag_Lower**, $A = LL^H$ and A^{-1} is computed by first inverting L and then forming $(L^{-1})^H(L^{-1})$.

4 References

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order** = **Nag_RowMajor** or **Nag_ColMajor**.

2: **uplo** – Nag_UptoType *Input*

On entry: indicates whether A has been factorized as $U^H U$ or LL^H as follows:

if **uplo** = **Nag_Upper**, $A = U^H U$, where U is upper triangular;

if **uplo** = **Nag_Lower**, $A = LL^H$, where L is lower triangular.

Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.

3: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: **n** ≥ 0 .

4: **a[dim]** – Complex *Input/Output*

Note: the dimension, dim , of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.

On entry: the upper triangular matrix U if **uplo** = **Nag_Upper** or the lower triangular matrix L if **uplo** = **Nag_Lower**, as returned by nag_zpotrf (f07frc).

On exit: U is overwritten by the upper triangle of A^{-1} if **uplo** = **Nag_Upper**; L is overwritten by the lower triangle of A^{-1} if **uplo** = **Nag_Lower**.

5: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **a**.

Constraint: **pda** $\geq \max(1, n)$.

6: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle\text{value}\rangle$.

Constraint: **n** ≥ 0 .

On entry, **pda** = $\langle\text{value}\rangle$.

Constraint: **pda** > 0 .

NE_INT_2

On entry, **pda** = $\langle\text{value}\rangle$, **n** = $\langle\text{value}\rangle$.

Constraint: **pda** $\geq \max(1, n)$.

NE_SINGULAR

Element $\langle\text{value}\rangle$ of the diagonal of the Cholesky factor is zero. The Cholesky factor is singular, and the inverse of A cannot be computed.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle\text{value}\rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed inverse X satisfies

$$\|XA - I\|_2 \leq c(n)\epsilon\kappa_2(A) \quad \text{and} \quad \|AX - I\|_2 \leq c(n)\epsilon\kappa_2(A),$$

where $c(n)$ is a modest function of n , ϵ is the **machine precision** and $\kappa_2(A)$ is the condition number of A defined by

$$\kappa_2(A) = \|A\|_2\|A^{-1}\|_2.$$

8 Further Comments

The total number of real floating-point operations is approximately $\frac{8}{3}n^3$.

The real analogue of this function is nag_dpotri (f07fjc).

9 Example

To compute the inverse of the matrix A , where

$$A = \begin{pmatrix} 3.23 + 0.00i & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\ 1.51 + 1.92i & 3.58 + 0.00i & -0.23 + 1.11i & -1.18 + 1.37i \\ 1.90 - 0.84i & -0.23 - 1.11i & 4.09 + 0.00i & 2.33 - 0.14i \\ 0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29 + 0.00i \end{pmatrix}.$$

Here A is Hermitian positive-definite and must first be factorized by nag_zpotrf (f07frc).
