## nag\_dpptrf (f07gdc)

### 1 Purpose

nag\_dpptrf (f07gdc) computes the Cholesky factorization of a real symmetric positive-definite matrix, using packed storage.

### 2 Specification

```
void nag_dpptrf (Nag_OrderType order, Nag_UptoType uplo, Integer n, double ap[],  
NagError *fail)
```

### 3 Description

nag\_dpptrf (f07gdc) forms the Cholesky factorization of a real symmetric positive-definite matrix  $A$  either as  $A = U^T U$  if **uplo** = Nag\_Upper, or  $A = LL^T$  if **uplo** = Nag\_Lower, where  $U$  is an upper triangular matrix and  $L$  is lower triangular, using packed storage.

### 4 References

Demmel J W (1989) On floating-point errors in Cholesky *LAPACK Working Note No. 14* University of Tennessee, Knoxville

Golub G H and Van Loan C F (1996) *Matrix Computations* (3rd Edition) Johns Hopkins University Press, Baltimore

### 5 Parameters

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **uplo** – Nag\_UptoType *Input*

*On entry:* indicates whether the upper or lower triangular part of  $A$  is stored and how  $A$  is factorized, as follows:

if **uplo** = Nag\_Upper, the upper triangular part of  $A$  is stored and  $A$  is factorized as  $U^T U$ , where  $U$  is upper triangular;

if **uplo** = Nag\_Lower, the lower triangular part of  $A$  is stored and  $A$  is factorized as  $LL^T$ , where  $L$  is lower triangular.

*Constraint:* **uplo** = Nag\_Upper or Nag\_Lower.

3: **n** – Integer *Input*

*On entry:*  $n$ , the order of the matrix  $A$ .

*Constraint:* **n**  $\geq 0$ .

4: **ap[dim]** – double *Input/Output*

**Note:** the dimension,  $dim$ , of the array **ap** must be at least  $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$ .

*On entry:* the symmetric positive-definite matrix  $A$ , packed by rows or columns. The storage of elements  $a_{ij}$  depends on the **order** and **uplo** parameters as follows:

```

if order = Nag_ColMajor and uplo = Nag_Upper,
     $a_{ij}$  is stored in  $\mathbf{ap}[(j-1) \times j/2 + i - 1]$ , for  $i \leq j$ ;
if order = Nag_ColMajor and uplo = Nag_Lower,
     $a_{ij}$  is stored in  $\mathbf{ap}[(2n-j) \times (j-1)/2 + i - 1]$ , for  $i \geq j$ ;
if order = Nag_RowMajor and uplo = Nag_Upper,
     $a_{ij}$  is stored in  $\mathbf{ap}[(2n-i) \times (i-1)/2 + j - 1]$ , for  $i \leq j$ ;
if order = Nag_RowMajor and uplo = Nag_Lower,
     $a_{ij}$  is stored in  $\mathbf{ap}[(i-1) \times i/2 + j - 1]$ , for  $i \geq j$ .

```

*On exit:* the upper or lower triangle of  $A$  is overwritten by the Cholesky factor  $U$  or  $L$  as specified by **uplo**, using the same packed storage format as described above.

5: <b>fail</b> – NagError *	<i>Output</i>
The NAG error parameter (see the Essential Introduction).	

## 6 Error Indicators and Warnings

### NE\_INT

On entry, **n** =  $\langle value \rangle$ .  
 Constraint: **n**  $\geq 0$ .

### NE\_POS\_DEF

The leading minor of order  $\langle value \rangle$  is not positive-definite and the factorization could not be completed. Hence  $A$  itself is not positive-definite. This may indicate an error in forming the matrix  $A$ . To factorize a symmetric matrix which is not positive-definite, call nag\_dsptrf (f07pdc) instead.

### NE\_ALLOC\_FAIL

Memory allocation failed.

### NE\_BAD\_PARAM

On entry, parameter  $\langle value \rangle$  had an illegal value.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

If **uplo** = **Nag\_Upper**, the computed factor  $U$  is the exact factor of a perturbed matrix  $A + E$ , where

$$|E| \leq c(n)\epsilon|U^T||U|,$$

$c(n)$  is a modest linear function of  $n$ , and  $\epsilon$  is the **machine precision**.

If **uplo** = **Nag\_Lower**, a similar statement holds for the computed factor  $L$ . It follows that  $|e_{ij}| \leq c(n)\epsilon\sqrt{a_{ii}a_{jj}}$ .

## 8 Further Comments

The total number of floating-point operations is approximately  $\frac{1}{3}n^3$ .

A call to this function may be followed by calls to the functions:

nag\_dptrf (f07gdc) to solve  $AX = B$ ;  
nag\_dppcon (f07ggc) to estimate the condition number of  $A$ ;  
nag\_dpptri (f07gjc) to compute the inverse of  $A$ .

The complex analogue of this function is nag\_zptrf (f07grc).

## 9 Example

To compute the Cholesky factorization of the matrix  $A$ , where

$$A = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.18 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.18 & 0.34 & 1.18 \end{pmatrix},$$

using packed storage.
