## nag\_dpbrfs (f07hhc)

### 1 Purpose

nag\_dpbrfs (f07hhc) returns error bounds for the solution of a real symmetric positive-definite band system of linear equations with multiple right-hand sides,  $AX = B$ . It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

### 2 Specification

```
void nag_dpbrfs (Nag_OrderType order, Nag_UptoType uplo, Integer n, Integer kd,
                 Integer nrhs, const double ab[], Integer pdab, const double afb[],
                 Integer pdafb, const double b[], Integer pdb, double x[], Integer pdx,
                 double ferr[], double berr[], NagError *fail)
```

### 3 Description

nag\_dpbrfs (f07hhc) returns the backward errors and estimated bounds on the forward errors for the solution of a real symmetric positive-definite band system of linear equations with multiple right-hand sides  $AX = B$ . The function handles each right-hand side vector (stored as a column of the matrix  $B$ ) independently, so we describe the function of nag\_dpbrfs (f07hhc) in terms of a single right-hand side  $b$  and solution  $x$ .

Given a computed solution  $x$ , the function computes the *component-wise backward error*  $\beta$ . This is the size of the smallest relative perturbation in each element of  $A$  and  $b$  such that  $x$  is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$

$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where  $\hat{x}$  is the true solution.

For details of the method, the f07 Chapter Introduction.

### 5 Parameters

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **uplo** – Nag\_UptoType *Input*

*On entry:* indicates whether the upper or lower triangular part of  $A$  is stored and how  $A$  has been factorized, as follows:

if **uplo** = **Nag\_Upper**, the upper triangular part of  $A$  is stored and  $A$  is factorized as  $U^T U$ , where  $U$  is upper triangular;

if **uplo** = **Nag\_Lower**, the lower triangular part of  $A$  is stored and  $A$  is factorized as  $LL^T$ , where  $L$  is lower triangular.

*Constraint:* **uplo** = **Nag\_Upper** or **Nag\_Lower**.

3: **n** – Integer *Input*

*On entry:*  $n$ , the order of the matrix  $A$ .

*Constraint:* **n**  $\geq 0$ .

4: **kd** – Integer *Input*

*On entry:*  $k$ , the number of super-diagonals or sub-diagonals of the matrix  $A$ .

*Constraint:* **kd**  $\geq 0$ .

5: **nrhs** – Integer *Input*

*On entry:*  $r$ , the number of right-hand sides.

*Constraint:* **nrhs**  $\geq 0$ .

6: **ab**[*dim*] – const double *Input*

**Note:** the dimension, *dim*, of the array **ab** must be at least  $\max(1, \text{pdab} \times \mathbf{n})$ .

If **order** = **Nag\_ColMajor**, the  $(i, j)$ th element of the matrix is stored in **ab**[ $(j - 1) \times \text{pdab} + i - 1$ ] and if **order** = **Nag\_RowMajor**, the  $(i, j)$ th element of the matrix is stored in **ab**[ $(i - 1) \times \text{pdab} + j - 1$ ].

*On entry:* the  $n$  by  $n$  original symmetric band matrix  $A$  as supplied to nag\_dpbtrf (f07hdc).

7: **pdab** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix  $A$  in the array **ab**.

*Constraint:* **pdab**  $\geq \text{kd} + 1$ .

8: **afb**[*dim*] – const double *Input*

**Note:** the dimension, *dim*, of the array **afb** must be at least  $\max(1, \text{pdafb} \times \mathbf{n})$ .

*On entry:* the Cholesky factor of  $A$ , as returned by nag\_dpbtrf (f07hdc).

9: **pdafb** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **afb**.

*Constraint:* **pdafb**  $\geq \text{kd} + 1$ .

10: **b**[*dim*] – const double *Input*

**Note:** the dimension, *dim*, of the array **b** must be at least  $\max(1, \text{pdb} \times \text{nrhs})$  when **order** = **Nag\_ColMajor** and at least  $\max(1, \text{pdb} \times \mathbf{n})$  when **order** = **Nag\_RowMajor**.

If **order** = **Nag\_ColMajor**, the  $(i, j)$ th element of the matrix  $B$  is stored in **b**[ $(j - 1) \times \text{pdb} + i - 1$ ] and if **order** = **Nag\_RowMajor**, the  $(i, j)$ th element of the matrix  $B$  is stored in **b**[ $(i - 1) \times \text{pdb} + j - 1$ ].

*On entry:* the  $n$  by  $r$  right-hand side matrix  $B$ .

11:	<b>pdb</b> – Integer	<i>Input</i>
<i>On entry:</i> the stride separating matrix row or column elements (depending on the value of <b>order</b> ) in the array <b>b</b> .		
<i>Constraints:</i>		
	if <b>order</b> = Nag_ColMajor, <b>pdb</b> $\geq \max(1, \mathbf{n})$ ; if <b>order</b> = Nag_RowMajor, <b>pdb</b> $\geq \max(1, \mathbf{nrhs})$ .	
12:	<b>x</b> [ <i>dim</i> ] – double	<i>Input/Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>x</b> must be at least $\max(1, \mathbf{pdx} \times \mathbf{nrhs})$ when <b>order</b> = Nag_ColMajor and at least $\max(1, \mathbf{pdx} \times \mathbf{n})$ when <b>order</b> = Nag_RowMajor.		
If <b>order</b> = Nag_ColMajor, the $(i, j)$ th element of the matrix $X$ is stored in <b>x</b> [( <i>j</i> – 1) $\times$ <b>pdx</b> + <i>i</i> – 1] and if <b>order</b> = Nag_RowMajor, the $(i, j)$ th element of the matrix $X$ is stored in <b>x</b> [( <i>i</i> – 1) $\times$ <b>pdx</b> + <i>j</i> – 1].		
<i>On entry:</i> the <i>n</i> by <i>r</i> solution matrix $X$ , as returned by nag_dpbtrs (f07hec).		
<i>On exit:</i> the improved solution matrix $X$ .		
13:	<b>pdx</b> – Integer	<i>Input</i>
<i>On entry:</i> the stride separating matrix row or column elements (depending on the value of <b>order</b> ) in the array <b>x</b> .		
<i>Constraints:</i>		
	if <b>order</b> = Nag_ColMajor, <b>pdx</b> $\geq \max(1, \mathbf{n})$ ; if <b>order</b> = Nag_RowMajor, <b>pdx</b> $\geq \max(1, \mathbf{nrhs})$ .	
14:	<b>ferr</b> [ <i>dim</i> ] – double	<i>Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>ferr</b> must be at least $\max(1, \mathbf{nrhs})$ .		
<i>On exit:</i> <b>ferr</b> [ <i>j</i> – 1] contains an estimated error bound for the <i>j</i> th solution vector, that is, the <i>j</i> th column of $X$ , for $j = 1, 2, \dots, r$ .		
15:	<b>berr</b> [ <i>dim</i> ] – double	<i>Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>berr</b> must be at least $\max(1, \mathbf{nrhs})$ .		
<i>On exit:</i> <b>berr</b> [ <i>j</i> – 1] contains the component-wise backward error bound $\beta$ for the <i>j</i> th solution vector, that is, the <i>j</i> th column of $X$ , for $j = 1, 2, \dots, r$ .		
16:	<b>fail</b> – NagError *	<i>Output</i>
The NAG error parameter (see the Essential Introduction).		

## 6 Error Indicators and Warnings

### NE\_INT

On entry, **n** =  $\langle \text{value} \rangle$ .

Constraint: **n**  $\geq 0$ .

On entry, **kd** =  $\langle \text{value} \rangle$ .

Constraint: **kd**  $\geq 0$ .

On entry, **nrhs** =  $\langle \text{value} \rangle$ .

Constraint: **nrhs**  $\geq 0$ .

On entry, **pdab** =  $\langle \text{value} \rangle$ .

Constraint: **pdab**  $> 0$ .

On entry, **pdafb** =  $\langle \text{value} \rangle$ .

Constraint: **pdafb**  $> 0$ .

On entry, **pdb** =  $\langle value \rangle$ .  
 Constraint: **pdb** > 0.

On entry, **pdx** =  $\langle value \rangle$ .  
 Constraint: **pdx** > 0.

## NE\_INT\_2

On entry, **pdab** =  $\langle value \rangle$ , **kd** =  $\langle value \rangle$ .  
 Constraint: **pdab**  $\geq$  **kd** + 1.

On entry, **pdafb** =  $\langle value \rangle$ , **kd** =  $\langle value \rangle$ .  
 Constraint: **pdafb**  $\geq$  **kd** + 1.

On entry, **pdb** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$ .  
 Constraint: **pdb**  $\geq$  max(1, **n**).

On entry, **pdb** =  $\langle value \rangle$ , **nrhs** =  $\langle value \rangle$ .  
 Constraint: **pdb**  $\geq$  max(1, **nrhs**).

On entry, **pdx** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$ .  
 Constraint: **pdx**  $\geq$  max(1, **n**).

On entry, **pdx** =  $\langle value \rangle$ , **nrhs** =  $\langle value \rangle$ .  
 Constraint: **pdx**  $\geq$  max(1, **nrhs**).

## NE\_ALLOC\_FAIL

Memory allocation failed.

## NE\_BAD\_PARAM

On entry, parameter  $\langle value \rangle$  had an illegal value.

## NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

The bounds returned in **ferr** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

## 8 Further Comments

For each right-hand side, computation of the backward error involves a minimum of  $8nk$  floating-point operations. Each step of iterative refinement involves an additional  $12nk$  operations. This assumes  $n \gg k$ . At most 5 steps of iterative refinement are performed, but usually only 1 or 2 steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form  $Ax = b$ ; the number is usually 4 or 5 and never more than 11. Each solution involves approximately  $4nk$  operations.

The complex analogue of this function is nag\_zpbrfs (f07hvc).

## 9 Example

To solve the system of equations  $AX = B$  using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} 5.49 & 2.68 & 0.00 & 0.00 \\ 2.68 & 5.63 & -2.39 & 0.00 \\ 0.00 & -2.39 & 2.60 & -2.22 \\ 0.00 & 0.00 & -2.22 & 5.17 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 22.09 & 5.10 \\ 9.31 & 30.81 \\ -5.24 & -25.82 \\ 11.83 & 22.90 \end{pmatrix}.$$

Here  $A$  is symmetric and positive-definite, and is treated as a band matrix, which must first be factorized by nag\_dpbtfr (f07hdc).
