nag_dsycon (f07mgc)

1 Purpose

nag_dsycon (f07mgc) estimates the condition number of a real symmetric indefinite matrix A , where A has been factorized by nag_dsytrf (f07mdc).

2 Specification

```
void nag_dsycon (Nag_OrderType order, Nag_UploType uplo, Integer n,
  const double a[], Integer pda, const Integer ipiv[], double anorm,
  double *rcond, NagError *fail)
```

3 Description

nag_dsycon (f07mgc) estimates the condition number (in the 1-norm) of a real symmetric indefinite matrix A :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1.$$

Since A is symmetric, $\kappa_1(A) = \kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty$.

Because $\kappa_1(A)$ is infinite if A is singular, the function actually returns an estimate of the **reciprocal** of $\kappa_1(A)$.

The function should be preceded by a call to nag_dsy_norm (f16rcc) to compute $\|A\|_1$ and a call to nag_dsytrf (f07mdc) to compute the Bunch–Kaufman factorization of A . The function then uses Higham's implementation of Hager's method (see Higham (1988)) to estimate $\|A^{-1}\|_1$.

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.

2: **uplo** – Nag_UploType *Input*

On entry: indicates how A has been factorized as follows:

if **uplo = Nag_Upper**, $A = PUDU^T P^T$, where U is upper triangular;

if **uplo = Nag_Lower**, $A = PLDL^T P^T$, where L is lower triangular.

Constraint: **uplo = Nag_Upper** or **Nag_Lower**.

- 3: **n** – Integer *Input*
On entry: n , the order of the matrix A .
Constraint: $n \geq 0$.
- 4: **a**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.
On entry: details of the factorization of A , as returned by nag_dsytrf (f07mdc).
- 5: **pda** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **a**.
Constraint: $\mathbf{pda} \geq \max(1, \mathbf{n})$.
- 6: **ipiv**[*dim*] – const Integer *Input*
Note: the dimension, *dim*, of the array **ipiv** must be at least $\max(1, \mathbf{n})$.
On entry: details of the interchanges and the block structure of D , as returned by nag_dsytrf (f07mdc).
- 7: **anorm** – double *Input*
On entry: the 1-norm of the **original** matrix A , which may be computed by calling nag_dsy_norm (f16rcc). **anorm** must be computed either **before** calling nag_dsytrf (f07mdc) or else from a copy of the original matrix A .
Constraint: $\mathbf{anorm} \geq 0.0$.
- 8: **rcond** – double * *Output*
On exit: an estimate of the reciprocal of the condition number of A . **rcond** is set to zero if exact singularity is detected or the estimate underflows. If **rcond** is less than *machine precision*, A is singular to working precision.
- 9: **fail** – NagError * *Output*
The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = *<value>*.

Constraint: $\mathbf{n} \geq 0$.

On entry, **pda** = *<value>*.

Constraint: $\mathbf{pda} > 0$.

NE_INT_2

On entry, **pda** = *<value>*, **n** = *<value>*.

Constraint: $\mathbf{pda} \geq \max(1, \mathbf{n})$.

NE_REAL

On entry, **anorm** = *<value>*.

Constraint: $\mathbf{anorm} \geq 0.0$.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed estimate **rcond** is never less than the true value ρ , and in practice is nearly always less than 10ρ , although examples can be constructed where **rcond** is much larger.

8 Further Comments

A call to nag_dsycon (f07mgc) involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 4 or 5 and never more than 11. Each solution involves approximately $2n^2$ floating-point operations but takes considerably longer than a call to nag_dsytrs (f07mec) with 1 right-hand side, because extra care is taken to avoid overflow when A is approximately singular.

The complex analogues of this function are nag_zhecon (f07muc) for Hermitian matrices and nag_zsycon (f07nuc) for symmetric matrices.

9 Example

To estimate the condition number in the 1-norm (or infinity-norm) of the matrix A , where

$$A = \begin{pmatrix} 2.07 & 3.87 & 4.20 & -1.15 \\ 3.87 & -0.21 & 1.87 & 0.63 \\ 4.20 & 1.87 & 1.15 & 2.06 \\ -1.15 & 0.63 & 2.06 & -1.81 \end{pmatrix}.$$

Here A is symmetric indefinite and must first be factorized by nag_dsytrf (f07mdc). The true condition number in the 1-norm is 75.68.
