nag_dsytri (f07mjc)

1 Purpose

nag_dsytri (f07mjc) computes the inverse of a real symmetric indefinite matrix A , where A has been factorized by nag_dsytrf (f07mdc).

2 Specification

```
void nag_dsytri (Nag_OrderType order, Nag_UploType uplo, Integer n, double a[],
                Integer pda, const Integer ipiv[], NagError *fail)
```

3 Description

To compute the inverse of a real symmetric indefinite matrix A , this function must be preceded by a call to nag_dsytrf (f07mdc), which computes the Bunch–Kaufman factorization of A .

If **uplo** = **Nag_Upper**, $A = PUDU^T P^T$ and A^{-1} is computed by solving $U^T P^T XPU = D^{-1}$ for X .

If **uplo** = **Nag_Lower**, $A = PLDL^T P^T$ and A^{-1} is computed by solving $L^T P^T XPL = D^{-1}$ for X .

5 Parameters

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.
Constraint: **order** = **Nag_RowMajor** or **Nag_ColMajor**.
- 2: **uplo** – Nag_UploType *Input*
On entry: indicates how A has been factorized as follows:
 if **uplo** = **Nag_Upper**, $A = PUDU^T P^T$, where U is upper triangular;
 if **uplo** = **Nag_Lower**, $A = PLDL^T P^T$, where L is lower triangular.
Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.
- 3: **n** – Integer *Input*
On entry: n , the order of the matrix A .
Constraint: $n \geq 0$.
- 4: **a**[*dim*] – double *Input/Output*
Note: the dimension, *dim*, of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.
On entry: details of the factorization of A , as returned by nag_dsytrf (f07mdc).

On exit: the factorization is overwritten by the n by n symmetric matrix A^{-1} . If **uplo** = **Nag_Upper**, the upper triangle of A^{-1} is stored in the upper triangular part of the array; if **uplo** = **Nag_Lower**, the lower triangle of A^{-1} is stored in the lower triangular part of the array.

5: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **a**.

Constraint: **pda** $\geq \max(1, \mathbf{n})$.

6: **ipiv**[*dim*] – const Integer *Input*

Note: the dimension, *dim*, of the array **ipiv** must be at least $\max(1, \mathbf{n})$.

On entry: details of the interchanges and the block structure of D , as returned by nag_dsyrtrf (f07mdc).

7: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **pda** = $\langle value \rangle$.

Constraint: **pda** > 0 .

NE_INT_2

On entry, **pda** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pda** $\geq \max(1, \mathbf{n})$.

NE_SINGULAR

The block diagonal matrix D is exactly singular.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed inverse X satisfies a bound of the form

if **uplo** = **Nag_Upper**, $|DU^T P^T X P U - I| \leq c(n)\epsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$;

if **uplo** = **Nag_Lower**, $|DL^T P^T X P L - I| \leq c(n)\epsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$,

$c(n)$ is a modest linear function of n , and ϵ is the *machine precision*.

8 Further Comments

The total number of floating-point operations is approximately $\frac{2}{3}n^3$.

The complex analogues of this function are `nag_zhetri` (f07mwc) for Hermitian matrices and `nag_zsytri` (f07nwc) for symmetric matrices.

9 Example

To compute the inverse of the matrix A , where

$$A = \begin{pmatrix} 2.07 & 3.87 & 4.20 & -1.15 \\ 3.87 & -0.21 & 1.87 & 0.63 \\ 4.20 & 1.87 & 1.15 & 2.06 \\ -1.15 & 0.63 & 2.06 & -1.81 \end{pmatrix}.$$

Here A is symmetric indefinite and must first be factorized by `nag_dsytrf` (f07mdc).
