

## NAG C Library Function Document

### nag\_zhetri (f07mwc)

#### 1 Purpose

nag\_zhetri (f07mwc) computes the inverse of a complex Hermitian indefinite matrix  $A$ , where  $A$  has been factorized by nag\_zhetrf (f07mrc).

#### 2 Specification

```
void nag_zhetri (Nag_OrderType order, Nag_UploType uplo, Integer n, Complex a[],
                Integer pda, const Integer ipiv[], NagError *fail)
```

#### 3 Description

To compute the inverse of a complex Hermitian indefinite matrix  $A$ , this function must be preceded by a call to nag\_zhetrf (f07mrc), which computes the Bunch–Kaufman factorization of  $A$ .

If **uplo** = **Nag\_Upper**,  $A = PUDU^H P^T$  and  $A^{-1}$  is computed by solving  $U^H P^T X P U = D^{-1}$  for  $X$ .

If **uplo** = **Nag\_Lower**,  $A = PLDL^H P^T$  and  $A^{-1}$  is computed by solving  $L^H P^T X P L = D^{-1}$  for  $X$ .

#### 4 References

#### 5 Parameters

- 1: **order** – Nag\_OrderType *Input*  
*On entry:* the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag\_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.  
*Constraint:* **order** = **Nag\_RowMajor** or **Nag\_ColMajor**.
- 2: **uplo** – Nag\_UploType *Input*  
*On entry:* indicates how  $A$  has been factorized as follows:  
     if **uplo** = **Nag\_Upper**,  $A = PUDU^H P^T$ , where  $U$  is upper triangular;  
     if **uplo** = **Nag\_Lower**,  $A = PLDL^H P^T$ , where  $L$  is lower triangular.  
*Constraint:* **uplo** = **Nag\_Upper** or **Nag\_Lower**.
- 3: **n** – Integer *Input*  
*On entry:*  $n$ , the order of the matrix  $A$ .  
*Constraint:*  $n \geq 0$ .
- 4: **a**[*dim*] – Complex *Input/Output*  
**Note:** the dimension, *dim*, of the array **a** must be at least  $\max(1, \mathbf{pda} \times \mathbf{n})$ .  
*On entry:* details of the factorization of  $A$ , as returned by nag\_zhetrf (f07mrc).

*On exit:* the factorization is overwritten by the  $n$  by  $n$  Hermitian matrix  $A^{-1}$ . If **uplo** = **Nag\_Upper**, the upper triangle of  $A^{-1}$  is stored in the upper triangular part of the array; if **uplo** = **Nag\_Lower**, the lower triangle of  $A^{-1}$  is stored in the lower triangular part of the array.

5: **pda** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **a**.

*Constraint:* **pda**  $\geq \max(1, \mathbf{n})$ .

6: **ipiv**[*dim*] – const Integer *Input*

**Note:** the dimension, *dim*, of the array **ipiv** must be at least  $\max(1, \mathbf{n})$ .

*On entry:* details of the interchanges and the block structure of  $D$ , as returned by nag\_zhetrf (f07mrc).

7: **fail** – NagError \* *Output*

The NAG error parameter (see the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_INT

*On entry,* **n** =  $\langle value \rangle$ .

*Constraint:* **n**  $\geq 0$ .

*On entry,* **pda** =  $\langle value \rangle$ .

*Constraint:* **pda**  $> 0$ .

### NE\_INT\_2

*On entry,* **pda** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$ .

*Constraint:* **pda**  $\geq \max(1, \mathbf{n})$ .

### NE\_SINGULAR

The block diagonal matrix  $D$  is exactly singular.

### NE\_ALLOC\_FAIL

Memory allocation failed.

### NE\_BAD\_PARAM

*On entry,* parameter  $\langle value \rangle$  had an illegal value.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

The computed inverse  $X$  satisfies a bound of the form

if **uplo** = **Nag\_Upper**,  $|DU^H P^T X P U - I| \leq c(n)\epsilon(|D| |U^H| |P^T| |X| |P| |U| + |D| |D^{-1}|)$ ;

if **uplo** = **Nag\_Lower**,  $|DL^H P^T X P L - I| \leq c(n)\epsilon(|D| |L^H| |P^T| |X| |P| |L| + |D| |D^{-1}|)$ ,

$c(n)$  is a modest linear function of  $n$ , and  $\epsilon$  is the *machine precision*.

## 8 Further Comments

The total number of real floating-point operations is approximately  $\frac{8}{3}n^3$ .

The real analogue of this function is `nag_dsytri` (f07mjc).

## 9 Example

To compute the inverse of the matrix  $A$ , where

$$A = \begin{pmatrix} -1.36 + 0.00i & 1.58 + 0.90i & 2.21 - 0.21i & 3.91 + 1.50i \\ 1.58 - 0.90i & -8.87 + 0.00i & -1.84 - 0.03i & -1.78 + 1.18i \\ 2.21 + 0.21i & -1.84 + 0.03i & -4.63 + 0.00i & 0.11 + 0.11i \\ 3.91 - 1.50i & -1.78 - 1.18i & 0.11 - 0.11i & -1.84 + 0.00i \end{pmatrix}.$$

Here  $A$  is Hermitian indefinite and must first be factorized by `nag_zhetrf` (f07mrc).
