NAG C Library Function Document

nag_dspcon (f07pgc)

1 Purpose

nag_dspcon (f07pgc) estimates the condition number of a real symmetric indefinite matrix A, where A has been factorized by nag_dsptrf (f07pdc), using packed storage.

2 Specification

```
void nag_dspcon (Nag_OrderType order, Nag_UploType uplo, Integer n,
     const double ap[], const Integer ipiv[], double anorm, double *rcond,
     NagError *fail)
```

3 Description

nag_dspcon (f07pgc) estimates the condition number (in the 1-norm) of a real symmetric indefinite matrix A:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1.$$

Since A is symmetric, $\kappa_1(A) = \kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty$.

Because $\kappa_1(A)$ is infinite if A is singular, the function actually returns an estimate of the **reciprocal** of $\kappa_1(A)$.

The function should be preceded by a call to nag_dsp_norm (f16rdc) to compute $\|A\|_1$ and a call to nag_dsptrf (f07pdc) to compute the Bunch–Kaufman factorization of A. The function then uses Higham's implementation of Hager's method (see Higham (1988)) to estimate $\|A^{-1}\|_1$.

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = **Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order** = **Nag_RowMajor** or **Nag_ColMajor**.

2: **uplo** – Nag_UploType *Input*

On entry: indicates how A has been factorized as follows:

if **uplo** = **Nag_Upper**, $A = PUDU^TP^T$, where U is upper triangular;

if **uplo** = **Nag_Lower**, $A = PLDL^TP^T$, where L is lower triangular.

Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.

3: **n** – Integer *Input*

On entry: n, the order of the matrix A.

Constraint: **n** ≥ 0.

4: **ap**[dim] – const double *Input*

Note: the dimension, dim, of the array **ap** must be at least $\max(1, \mathbf{n} \times (\mathbf{n}+1)/2)$.

On entry: details of the factorization of A stored in packed form, as returned by nag_dsptrf (f07pdc).

5: **ipiv**[dim] – const Integer *Input*

Note: the dimension, dim, of the array **ipiv** must be at least $\max(1, \mathbf{n})$.

On entry: details of the interchanges and the block structure of D, as returned by nag_dsptrf (f07pdc).

6: **anorm** – double *Input*

On entry: the 1-norm of the **original** matrix A, which may be computed by calling nag_dsp_norm (f16rdc). **anorm** must be computed either **before** calling nag_dsptrf (f07pdc) or else from a copy of the original matrix A.

Constraint: **anorm** ≥ 0.0.

7: **rcond** – double * *Output*

On exit: an estimate of the reciprocal of the condition number of A. **rcond** is set to zero if exact singularity is detected or the estimate underflows. If **rcond** is less than ***machine precision***, A is singular to working precision.

8: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

NE_REAL

On entry, **anorm** = ⟨*value*⟩.
Constraint: **anorm** ≥ 0.0.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter ⟨*value*⟩ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed estimate **rcond** is never less than the true value ρ, and in practice is nearly always less than 10ρ, although examples can be constructed where **rcond** is much larger.

8 Further Comments

A call to nag_dspcon (f07pgc) involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 4 or 5 and never more than 11. Each solution involves approximately $2n^2$ floating-point operations but takes considerably longer than a call to nag_dsptrs (f07pec) with 1 right-hand side, because extra care is taken to avoid overflow when A is approximately singular.

The complex analogues of this function are nag_zhpcon (f07puc) for Hermitian matrices and nag_zspcon (f07quc) for symmetric matrices.

9 Example

To estimate the condition number in the 1-norm (or infinity-norm) of the matrix A, where

$$A = \begin{pmatrix} 2.07 & 3.87 & 4.20 & -1.15 \\ 3.87 & -0.21 & 1.87 & 0.63 \\ 4.20 & 1.87 & 1.15 & 2.06 \\ -1.15 & 0.63 & 2.06 & -1.81 \end{pmatrix}.$$

Here A is symmetric indefinite, stored in packed form, and must first be factorized by nag_dsptrf (f07pdc). The true condition number in the 1-norm is 75.68.
