

NAG C Library Function Document

nag_zsprfs (f07qvc)

1 Purpose

nag_zsprfs (f07qvc) returns error bounds for the solution of a complex symmetric system of linear equations with multiple right-hand sides, $AX = B$ using packed storage. It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

2 Specification

```
void nag_zsprfs (Nag_OrderType order, Nag_UptoType uplo, Integer n, Integer nrhs,
                 const Complex ap[], const Complex afp[], const Integer ipiv[],
                 const Complex b[], Integer pdb, Complex x[], Integer pdx, double ferr[],
                 double berr[], NagError *fail)
```

3 Description

nag_zsprfs (f07qvc) returns the backward errors and estimated bounds on the forward errors for the solution of a complex symmetric system of linear equations with multiple right-hand sides $AX = B$, using packed storage. The function handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of nag_zsprfs (f07qvc) in terms of a single right-hand side b and solution x .

Given a computed solution x , the function computes the *component-wise backward error* β . This is the size of the smallest relative perturbation in each element of A and b such that x is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$

$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where \hat{x} is the true solution.

For details of the method the f07 Chapter Introduction.

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UptoType *Input*

On entry: indicates whether the upper or lower triangular part of A is stored and how A is to be factorized, as follows:

if **uplo** = **Nag_Upper**, the upper triangular part of A is stored and A is factorized as $PUDU^TP^T$, where U is upper triangular;

if **uplo** = **Nag_Lower**, the lower triangular part of A is stored and A is factorized as $PLDL^TP^T$, where L is lower triangular.

Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.

3: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: **n** ≥ 0 .

4: **nrhs** – Integer *Input*

On entry: r , the number of right-hand sides.

Constraint: **nrhs** ≥ 0 .

5: **ap**[*dim*] – const Complex *Input*

Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$.

On entry: the n by n original symmetric matrix A as supplied to nag_zsprf (f07qrc).

6: **afp**[*dim*] – const Complex *Input*

Note: the dimension, *dim*, of the array **afp** must be at least $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$.

On entry: details of the factorization of A stored in packed form, as returned by nag_zsprf (f07qrc).

7: **ipiv**[*dim*] – const Integer *Input*

Note: the dimension, *dim*, of the array **ipiv** must be at least $\max(1, \mathbf{n})$.

On entry: details of the interchanges and the block structure of D , as returned by nag_zsprf (f07qrc).

8: **b**[*dim*] – const Complex *Input*

Note: the dimension, *dim*, of the array **b** must be at least $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdb} \times \mathbf{n})$ when **order** = **Nag_RowMajor**.

If **order** = **Nag_ColMajor**, the (i, j) th element of the matrix B is stored in **b**[(*j* – 1) \times **pdb** + *i* – 1] and if **order** = **Nag_RowMajor**, the (i, j) th element of the matrix B is stored in **b**[(*i* – 1) \times **pdb** + *j* – 1].

On entry: the n by r right-hand side matrix B .

9: **pdb** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **b**.

Constraints:

if **order** = **Nag_ColMajor**, **pdb** $\geq \max(1, \mathbf{n})$;
 if **order** = **Nag_RowMajor**, **pdb** $\geq \max(1, \mathbf{nrhs})$.

10: **x**[*dim*] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **x** must be at least $\max(1, \mathbf{pdx} \times \mathbf{nrhs})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdx} \times \mathbf{n})$ when **order** = **Nag_RowMajor**.

If **order** = Nag_ColMajor, the (i, j) th element of the matrix X is stored in $\mathbf{x}[(j - 1) \times \mathbf{pdx} + i - 1]$ and if **order** = Nag_RowMajor, the (i, j) th element of the matrix X is stored in $\mathbf{x}[(i - 1) \times \mathbf{pdx} + j - 1]$.

On entry: the n by r solution matrix X , as returned by nag_zsptrs (f07qsc).

On exit: the improved solution matrix X .

11: **pdx** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **x**.

Constraints:

if **order** = Nag_ColMajor, **pdx** $\geq \max(1, \mathbf{n})$;
 if **order** = Nag_RowMajor, **pdx** $\geq \max(1, \mathbf{nrhs})$.

12: **ferr**[*dim*] – double *Output*

Note: the dimension, *dim*, of the array **ferr** must be at least $\max(1, \mathbf{nrhs})$.

On exit: **ferr**[*j* – 1] contains an estimated error bound for the *j*th solution vector, that is, the *j*th column of X , for $j = 1, 2, \dots, r$.

13: **berr**[*dim*] – double *Output*

Note: the dimension, *dim*, of the array **berr** must be at least $\max(1, \mathbf{nrhs})$.

On exit: **berr**[*j* – 1] contains the component-wise backward error bound β for the *j*th solution vector, that is, the *j*th column of X , for $j = 1, 2, \dots, r$.

14: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle \text{value} \rangle$.

Constraint: **n** ≥ 0 .

On entry, **nrhs** = $\langle \text{value} \rangle$.

Constraint: **nrhs** ≥ 0 .

On entry, **pdb** = $\langle \text{value} \rangle$.

Constraint: **pdb** > 0 .

On entry, **pdx** = $\langle \text{value} \rangle$.

Constraint: **pdx** > 0 .

NE_INT_2

On entry, **pdb** = $\langle \text{value} \rangle$, **n** = $\langle \text{value} \rangle$.

Constraint: **pdb** $\geq \max(1, \mathbf{n})$.

On entry, **pdb** = $\langle \text{value} \rangle$, **nrhs** = $\langle \text{value} \rangle$.

Constraint: **pdb** $\geq \max(1, \mathbf{nrhs})$.

On entry, **pdx** = $\langle \text{value} \rangle$, **n** = $\langle \text{value} \rangle$.

Constraint: **pdx** $\geq \max(1, \mathbf{n})$.

On entry, **pdx** = $\langle \text{value} \rangle$, **nrhs** = $\langle \text{value} \rangle$.

Constraint: **pdx** $\geq \max(1, \mathbf{nrhs})$.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The bounds returned in **ferr** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Further Comments

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ real floating-point operations. Each step of iterative refinement involves an additional $24n^2$ real operations. At most 5 steps of iterative refinement are performed, but usually only 1 or 2 steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 5 and never more than 11. Each solution involves approximately $8n^2$ real operations.

The real analogue of this function is **nag_dsprfs** (f07phc).

9 Example

To solve the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} -0.39 - 0.71i & 5.14 - 0.64i & -7.86 - 2.96i & 3.80 + 0.92i \\ 5.14 - 0.64i & 8.86 + 1.81i & -3.52 + 0.58i & 5.32 - 1.59i \\ -7.86 - 2.96i & -3.52 + 0.58i & -2.83 - 0.03i & -1.54 - 2.86i \\ 3.80 + 0.92i & 5.32 - 1.59i & -1.54 - 2.86i & -0.56 + 0.12i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -55.64 + 41.22i & -19.09 - 35.97i \\ -48.18 + 66.00i & -12.08 - 27.02i \\ -0.49 - 1.47i & 6.95 + 20.49i \\ -6.43 + 19.24i & -4.59 - 35.53i \end{pmatrix}.$$

Here A is symmetric, stored in packed form, and must first be factorized by **nag_zsptrf** (f07qrc).
