

NAG C Library Function Document

nag_dtpfrs (f07uhc)

1 Purpose

nag_dtpfrs (f07uhc) returns error bounds for the solution of a real triangular system of linear equations with multiple right-hand sides, $AX = B$ or $A^T X = B$, using packed storage.

2 Specification

```
void nag_dtpfrs (Nag_OrderType order, Nag_UploType uplo, Nag_TransType trans,
                Nag_DiagType diag, Integer n, Integer nrhs, const double ap[],
                const double b[], Integer pdb, const double x[], Integer pdx, double ferr[],
                double berr[], NagError *fail)
```

3 Description

nag_dtpfrs (f07uhc) returns the backward errors and estimated bounds on the forward errors for the solution of a real triangular system of linear equations with multiple right-hand sides $AX = B$ or $A^T X = B$, using packed storage. The function handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of nag_dtpfrs (f07uhc) in terms of a single right-hand side b and solution x .

Given a computed solution x , the function computes the *component-wise backward error* β . This is the size of the smallest relative perturbation in each element of A and b such that x is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b \\ |\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where \hat{x} is the true solution.

For details of the method, see the f07 Chapter Introduction.

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.

2: **uplo** – Nag_UploType *Input*

On entry: indicates whether A is upper or lower triangular as follows:

if **uplo** = **Nag_Upper**, A is upper triangular;

if **uplo** = **Nag_Lower**, A is lower triangular.

Constraint: **uplo** = **Nag_Upper** or **Nag_Lower**.

3: **trans** – Nag_TransType *Input*

On entry: indicates the form of the equations as follows:

if **trans** = **Nag_NoTrans**, the equations are of the form $AX = B$;

if **trans** = **Nag_Trans** or **Nag_ConjTrans**, the equations are of the form $A^T X = B$.

Constraint: **trans** = **Nag_NoTrans**, **Nag_Trans** or **Nag_ConjTrans**.

4: **diag** – Nag_DiagType *Input*

On entry: indicates whether A is a non-unit or unit triangular matrix as follows:

if **diag** = **Nag_NonUnitDiag**, A is a non-unit triangular matrix;

if **diag** = **Nag_UnitDiag**, A is a unit triangular matrix; the diagonal elements are not referenced and are assumed to be 1.

Constraint: **diag** = **Nag_NonUnitDiag** or **Nag_UnitDiag**.

5: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: $n \geq 0$.

6: **nrhs** – Integer *Input*

On entry: r , the number of right-hand sides.

Constraint: **nrhs** ≥ 0 .

7: **ap**[*dim*] – const double *Input*

Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, n \times (n + 1)/2)$.

On entry: the n by n triangular matrix A , packed by rows or columns. The storage of elements a_{ij} depends on the **order** and **uplo** parameters as follows:

if **order** = **Nag_ColMajor** and **uplo** = **Nag_Upper**,
 a_{ij} is stored in **ap**[($j - 1$) \times $j/2 + i - 1$], for $i \leq j$;

if **order** = **Nag_ColMajor** and **uplo** = **Nag_Lower**,
 a_{ij} is stored in **ap**[($2n - j$) \times ($j - 1$)/2 + $i - 1$], for $i \geq j$;

if **order** = **Nag_RowMajor** and **uplo** = **Nag_Upper**,
 a_{ij} is stored in **ap**[($2n - i$) \times ($i - 1$)/2 + $j - 1$], for $i \leq j$;

if **order** = **Nag_RowMajor** and **uplo** = **Nag_Lower**,
 a_{ij} is stored in **ap**[($i - 1$) \times $i/2 + j - 1$], for $i \geq j$.

8: **b**[*dim*] – const double *Input*

Note: the dimension, *dim*, of the array **b** must be at least $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdb} \times n)$ when **order** = **Nag_RowMajor**.

If **order** = **Nag_ColMajor**, the (i, j)th element of the matrix B is stored in **b**[($j - 1$) \times **pdb** + $i - 1$] and if **order** = **Nag_RowMajor**, the (i, j)th element of the matrix B is stored in **b**[($i - 1$) \times **pdb** + $j - 1$].

On entry: the n by r right-hand side matrix B .

- 9: **pdb** – Integer *Input*
On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **b**.
Constraints:
 if **order** = **Nag_ColMajor**, **pdb** \geq $\max(1, \mathbf{n})$;
 if **order** = **Nag_RowMajor**, **pdb** \geq $\max(1, \mathbf{nrhs})$.
- 10: **x**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **x** must be at least $\max(1, \mathbf{pdx} \times \mathbf{nrhs})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdx} \times \mathbf{n})$ when **order** = **Nag_RowMajor**.
 If **order** = **Nag_ColMajor**, the (*i*, *j*)th element of the matrix *X* is stored in **x**[(*j* – 1) \times **pdx** + *i* – 1] and if **order** = **Nag_RowMajor**, the (*i*, *j*)th element of the matrix *X* is stored in **x**[(*i* – 1) \times **pdx** + *j* – 1].
On entry: the *n* by *r* solution matrix *X*, as returned by nag_dtptrs (f07uec).
- 11: **pdx** – Integer *Input*
On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **x**.
Constraints:
 if **order** = **Nag_ColMajor**, **pdx** \geq $\max(1, \mathbf{n})$;
 if **order** = **Nag_RowMajor**, **pdx** \geq $\max(1, \mathbf{nrhs})$.
- 12: **ferr**[*dim*] – double *Output*
Note: the dimension, *dim*, of the array **ferr** must be at least $\max(1, \mathbf{nrhs})$.
On exit: **ferr**[*j* – 1] contains an estimated error bound for the *j*th solution vector, that is, the *j*th column of *X*, for *j* = 1, 2, ..., *r*.
- 13: **berr**[*dim*] – double *Output*
Note: the dimension, *dim*, of the array **berr** must be at least $\max(1, \mathbf{nrhs})$.
On exit: **berr**[*j* – 1] contains the component-wise backward error bound β for the *j*th solution vector, that is, the *j*th column of *X*, for *j* = 1, 2, ..., *r*.
- 14: **fail** – NagError * *Output*
 The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = *<value>*.

Constraint: **n** \geq 0.

On entry, **nrhs** = *<value>*.

Constraint: **nrhs** \geq 0.

On entry, **pdb** = *<value>*.

Constraint: **pdb** $>$ 0.

On entry, **pdx** = *<value>*.

Constraint: **pdx** $>$ 0.

NE_INT_2

On entry, **pdb** = *<value>*, **n** = *<value>*.

Constraint: **pdb** \geq $\max(1, \mathbf{n})$.

On entry, **pdb** = $\langle value \rangle$, **nrhs** = $\langle value \rangle$.

Constraint: **pdb** \geq max(1, **nrhs**).

On entry, **pdx** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pdx** \geq max(1, **n**).

On entry, **pdx** = $\langle value \rangle$, **nrhs** = $\langle value \rangle$.

Constraint: **pdx** \geq max(1, **nrhs**).

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The bounds returned in **fer** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Further Comments

A call to nag_dtpfrs (f07uhc) involves, for each right-hand side, solving a number of systems of linear equations of the form $Ax = b$ or $A^T x = b$; the number is usually 4 or 5 and never more than 11. Each solution involves approximately n^2 floating-point operations.

The complex analogue of this function is nag_ztpfrs (f07uvc).

9 Example

To solve the system of equations $AX = B$ and to compute forward and backward error bounds, where

$$A = \begin{pmatrix} 4.30 & 0.00 & 0.00 & 0.00 \\ -3.96 & -4.87 & 0.00 & 0.00 \\ 0.40 & 0.31 & -8.02 & 0.00 \\ -0.27 & 0.07 & -5.95 & 0.12 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} -12.90 & -21.50 \\ 16.75 & 14.93 \\ -17.55 & 6.33 \\ -11.04 & 8.09 \end{pmatrix},$$

using packed storage for A .
