

NAG C Library Function Document

nag_dsytrd (f08fec)

1 Purpose

nag_dsytrd (f08fec) reduces a real symmetric matrix to tridiagonal form.

2 Specification

```
void nag_dsytrd (Nag_OrderType order, Nag_UptoType uplo, Integer n, double a[],  
     Integer pda, double d[], double e[], double tau[], NagError *fail)
```

3 Description

nag_dsytrd (f08fec) reduces a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = QTQ^T$.

The matrix Q is not formed explicitly but is represented as a product of $n - 1$ elementary reflectors (see the f08 Chapter Introduction for details). Functions are provided to work with Q in this representation (see Section 8).

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UptoType *Input*

On entry: indicates whether the upper or lower triangular part of A is stored as follows:

if **uplo** = Nag_Upper, the upper triangular part of A is stored;

if **uplo** = Nag_Lower, the lower triangular part of A is stored.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

3: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: **n** ≥ 0 .

4: **a[dim]** – double *Input/Output*

Note: the dimension, dim , of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.

If **order** = Nag_ColMajor, the (i, j) th element of the matrix A is stored in **a** $[(j - 1) \times \mathbf{pda} + i - 1]$ and if **order** = Nag_RowMajor, the (i, j) th element of the matrix A is stored in **a** $[(i - 1) \times \mathbf{pda} + j - 1]$.

On entry: the n by n symmetric matrix A . If **uplo** = Nag_Upper, the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced; if **uplo** = Nag_Lower, the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.

On exit: **a** is overwritten by the tridiagonal matrix T and details of the orthogonal matrix Q as specified by **uplo**.

5: **pda** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **a**.

Constraint: **pda** $\geq \max(1, n)$.

6: **d[dim]** – double *Output*

Note: the dimension, dim , of the array **d** must be at least $\max(1, n)$.

On exit: the diagonal elements of the tridiagonal matrix T .

7: **e[dim]** – double *Output*

Note: the dimension, dim , of the array **e** must be at least $\max(1, n - 1)$.

On exit: the off-diagonal elements of the tridiagonal matrix T .

8: **tau[dim]** – double *Output*

Note: the dimension, dim , of the array **tau** must be at least $\max(1, n - 1)$.

On exit: further details of the orthogonal matrix Q .

9: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **pda** = $\langle value \rangle$.

Constraint: **pda** > 0 .

NE_INT_2

On entry, **pda** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pda** $\geq \max(1, n)$.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed tridiagonal matrix T is exactly similar to a nearby matrix $A + E$, where

$$\|E\|_2 \leq c(n)\epsilon\|A\|_2,$$

$c(n)$ is a modestly increasing function of n , and ϵ is the **machine precision**.

The elements of T themselves may be sensitive to small perturbations in A or to rounding errors in the computation, but this does not affect the stability of the eigenvalues and eigenvectors.

8 Further Comments

The total number of floating-point operations is approximately $\frac{4}{3}n^3$.

To form the orthogonal matrix Q this function may be followed by a call to nag_dorgtr (f08ffc):

```
nag_dorgtr (order, uplo, n, &a, pda, tau, &fail)
```

To apply Q to an n by p real matrix C this function may be followed by a call to nag_dormtr (f08fgc). For example,

```
nag_dormtr (order, Nag_LeftSide, uplo, Nag_NoTrans, n, p, &a, pda,
tau, &c, pdc, &fail)
```

forms the matrix product QC .

The complex analogue of this function is nag_zhetrd (f08fsc).

9 Example

To reduce the matrix A to tridiagonal form, where

$$A = \begin{pmatrix} 2.07 & 3.87 & 4.20 & -1.15 \\ 3.87 & -0.21 & 1.87 & 0.63 \\ 4.20 & 1.87 & 1.15 & 2.06 \\ -1.15 & 0.63 & 2.06 & -1.81 \end{pmatrix}.$$
