

NAG C Library Function Document

nag_dgbbnd (f08lec)

1 Purpose

nag_dgbbnd (f08lec) reduces a real m by n band matrix to upper bidiagonal form.

2 Specification

```
void nag_dgbbnd (Nag_OrderType order, Nag_VectType vect, Integer m, Integer n,
                 Integer ncc, Integer kl, Integer ku, double ab[], Integer pdab, double d[],
                 double e[], double q[], Integer pdq, double pt[], Integer pdpt, double c[],
                 Integer pdc, NagError *fail)
```

3 Description

nag_dgbbnd (f08lec) reduces a real m by n band matrix to upper bidiagonal form B by an orthogonal transformation: $A = QBP^T$. The orthogonal matrices Q and P^T , of order m and n respectively, are determined as a product of Givens rotation matrices, and may be formed explicitly by the function if required. A matrix C may also be updated to give $\bar{C} = Q^TC$.

The function uses a vectorisable form of the reduction.

4 References

None.

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **vect** – Nag_VectType *Input*

On entry: indicates whether the matrices Q and/or P^T are generated:

- if **vect** = Nag_DoNotForm, then neither Q nor P^T is generated;
- if **vect** = Nag_FormQ, then Q is generated;
- if **vect** = Nag_FormP, then P^T is generated;
- if **vect** = Nag_FormBoth, then both Q and P^T are generated.

Constraint: **vect** = Nag_DoNotForm, Nag_FormQ, Nag_FormP or Nag_FormBoth.

3: **m** – Integer *Input*

On entry: m , the number of rows of the matrix A .

Constraint: **m** ≥ 0 .

4: **n** – Integer *Input*

On entry: n , the number of columns of the matrix A .

Constraint: $\mathbf{n} \geq 0$.

5: **ncc** – Integer *Input*

On entry: n_C , the number of columns of the matrix C .

Constraint: $\mathbf{ncc} \geq 0$.

6: **kl** – Integer *Input*

On entry: k_l , the number of sub-diagonals within the band of A .

Constraint: $\mathbf{kl} \geq 0$.

7: **ku** – Integer *Input*

On entry: k_u , the number of super-diagonals within the band of A .

Constraint: $\mathbf{ku} \geq 0$.

8: **ab[dim]** – double *Input/Output*

Note: the dimension, dim , of the array **ab** must be at least $\max(1, \mathbf{pdab} \times \mathbf{n})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdab} \times \mathbf{m})$ when **order** = **Nag_RowMajor**.

On entry: the original m by n band matrix A . This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements a_{ij} , for $i = 1, \dots, m$ and $j = \max(1, i - k_l), \dots, \min(n, i + k_u)$, depends on the **order** parameter as follows:

if **order** = **Nag_ColMajor**, a_{ij} is stored as **ab**[($j - 1$) \times **pdab** + **ku** + $i - j$];

if **order** = **Nag_RowMajor**, a_{ij} is stored as **ab**[($i - 1$) \times **pdab** + **kl** + $j - i$].

On exit: A is overwritten by values generated during the reduction.

9: **pdab** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **ab**.

Constraint: $\mathbf{pdab} \geq \mathbf{kl} + \mathbf{ku} + 1$.

10: **d[dim]** – double *Output*

Note: the dimension, dim , of the array **d** must be at least $\max(1, \min(\mathbf{m}, \mathbf{n}))$.

On exit: the diagonal elements of the bidiagonal matrix B .

11: **e[dim]** – double *Output*

Note: the dimension, dim , of the array **e** must be at least $\max(1, \min(\mathbf{m}, \mathbf{n}) - 1)$.

On exit: the super-diagonal elements of the bidiagonal matrix B .

12: **q[dim]** – double *Output*

Note: the dimension, dim , of the array **q** must be at least $\max(1, \mathbf{pdq} \times \mathbf{m})$ when **vect** = **Nag_FormQ** or **Nag_FormBoth** and at least 1 otherwise.

If **order** = **Nag_ColMajor**, the (i, j) th element of the matrix Q is stored in **q**[($j - 1$) \times **pdq** + $i - 1$] and if **order** = **Nag_RowMajor**, the (i, j) th element of the matrix Q is stored in **q**[($i - 1$) \times **pdq** + $j - 1$].

On exit: the m by m orthogonal matrix Q , if **vect** = **Nag_FormQ** or **Nag_FormBoth**.

q is not referenced if **vect** = **Nag_DoNotForm** or **Nag_FormP**.

13: **pdq** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **q**.

Constraints:

if **vect** = **Nag_FormQ** or **Nag_FormBoth**, **pdq** $\geq \max(1, m)$;
otherwise **pdq** ≥ 1 .

14: **pt**[*dim*] – double *Output*

Note: the dimension, *dim*, of the array **pt** must be at least $\max(1, \text{pdpt} \times n)$ when **vect** = **Nag_FormP** or **Nag_FormBoth** and at least 1 otherwise.

If **order** = **Nag_ColMajor**, the (i, j) th element of the matrix is stored in **pt**[(*j* – 1) \times **pdpt** + *i* – 1] and if **order** = **Nag_RowMajor**, the (i, j) th element of the matrix is stored in **pt**[(*i* – 1) \times **pdpt** + *j* – 1].

On exit: the *n* by *n* orthogonal matrix P^T , if **vect** = **Nag_FormP** or **Nag_FormBoth**.

pt is not referenced if **vect** = **Nag_DoNotForm** or **Nag_FormQ**.

15: **pdpt** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **pt**.

Constraints:

if **vect** = **Nag_FormP** or **Nag_FormBoth**, **pdpt** $\geq \max(1, n)$;
otherwise **pdpt** ≥ 1 .

16: **c**[*dim*] – double *Input/Output*

Note: the dimension, *dim*, of the array **c** must be at least $\max(1, \text{pdc} \times \text{ncc})$ when **order** = **Nag_ColMajor** and at least $\max(1, \text{pdc} \times m)$ when **order** = **Nag_RowMajor**.

If **order** = **Nag_ColMajor**, the (i, j) th element of the matrix *C* is stored in **c**[(*j* – 1) \times **pdc** + *i* – 1] and if **order** = **Nag_RowMajor**, the (i, j) th element of the matrix *C* is stored in **c**[(*i* – 1) \times **pdc** + *j* – 1].

On entry: an *m* by *n_C* matrix *C*.

On exit: *C* is overwritten by $Q^T C$.

c is not referenced if **ncc** = 0.

17: **pdc** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **c**.

Constraints:

if **order** = **Nag_ColMajor**,
 if **ncc** > 0, **pdc** $\geq \max(1, m)$;
 if **ncc** = 0, **pdc** ≥ 1 ;

if **order** = **Nag_RowMajor**, **pdc** $\geq \max(1, \text{ncc})$.

18: **fail** – NagError * *Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **m** = $\langle value \rangle$.

Constraint: **m** ≥ 0 .

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **ncc** = $\langle value \rangle$.

Constraint: **ncc** ≥ 0 .

On entry, **kl** = $\langle value \rangle$.

Constraint: **kl** ≥ 0 .

On entry, **ku** = $\langle value \rangle$.

Constraint: **ku** ≥ 0 .

On entry, **pdab** = $\langle value \rangle$.

Constraint: **pdab** > 0 .

On entry, **pdq** = $\langle value \rangle$.

Constraint: **pdq** > 0 .

On entry, **pdpt** = $\langle value \rangle$.

Constraint: **pdpt** > 0 .

On entry, **pdc** = $\langle value \rangle$.

Constraint: **pdc** > 0 .

NE_INT_2

On entry, **pdq** = $\langle value \rangle$, **m** = $\langle value \rangle$.

Constraint: if **vect** = **Nag_FormQ** or **Nag_FormBoth**, **pdq** $\geq \max(1, m)$;
otherwise **pdq** ≥ 1 .

On entry, **pdc** = $\langle value \rangle$, **ncc** = $\langle value \rangle$.

Constraint: **pdc** $\geq \max(1, ncc)$.

NE_INT_3

On entry, **kl** = $\langle value \rangle$, **ku** = $\langle value \rangle$, **pdab** = $\langle value \rangle$.

Constraint: **pdab** $\geq kl + ku + 1$.

On entry, **m** = $\langle value \rangle$, **ncc** = $\langle value \rangle$, **pdc** = $\langle value \rangle$.

Constraint: if **ncc** > 0 , **pdc** $\geq \max(1, m)$;
if **ncc** = 0, **pdc** ≥ 1 .

NE_ENUM_INT_2

On entry, **vect** = $\langle value \rangle$, **m** = $\langle value \rangle$, **pdq** = $\langle value \rangle$.

Constraint: if **vect** = **Nag_FormQ** or **Nag_FormBoth**, **pdq** $\geq \max(1, m)$;
otherwise **pdq** ≥ 1 .

On entry, **vect** = $\langle value \rangle$, **n** = $\langle value \rangle$, **pdpt** = $\langle value \rangle$.

Constraint: if **vect** = **Nag_FormP** or **Nag_FormBoth**, **pdpt** $\geq \max(1, n)$;
otherwise **pdpt** ≥ 1 .

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The computed bidiagonal form B satisfies $QBP^T = A + E$, where

$$\|E\|_2 \leq c(n)\epsilon\|A\|_2,$$

$c(n)$ is a modestly increasing function of n , and ϵ is the **machine precision**.

The elements of B themselves may be sensitive to small perturbations in A or to rounding errors in the computation, but this does not affect the stability of the singular values and vectors.

The computed matrix Q differs from an exactly orthogonal matrix by a matrix F such that

$$\|F\|_2 = O(\epsilon).$$

A similar statement holds for the computed matrix P^T .

8 Further Comments

The total number of real floating-point operations is approximately the sum of:

$6n^2k$, if **vect** = **Nag_DoNotForm** and **ncc** = 0, and

$3n^2n_C(k - 1)/k$, if C is updated, and

$3n^3(k - 1)/k$, if either Q or P^T is generated (double this if both),

where $k = k_l + k_u$, assuming $n \gg k$. For this section we assumed that $m = n$.

The complex analogue of this function is **nag_zgbbnd** (f08lsc).

9 Example

To reduce the matrix A to upper bidiagonal form, where

$$A = \begin{pmatrix} -0.57 & -1.28 & 0.00 & 0.00 \\ -1.93 & 1.08 & -0.31 & 0.00 \\ 2.30 & 0.24 & 0.40 & -0.35 \\ 0.00 & 0.64 & -0.66 & 0.08 \\ 0.00 & 0.00 & 0.15 & -2.13 \\ -0.00 & 0.00 & 0.00 & 0.50 \end{pmatrix}.$$
