

NAG C Library Function Document

nag_dsygst (f08sec)

1 Purpose

nag_dsygst (f08sec) reduces a real symmetric-definite generalized eigenproblem $Az = \lambda Bz$, $ABz = \lambda z$ or $BAz = \lambda z$ to the standard form $Cy = \lambda y$, where A is a real symmetric matrix and B has been factorized by nag_dpotrf (f07fdc).

2 Specification

```
void nag_dsygst (Nag_OrderType order, Nag_ComputeType comp_type,
                 Nag_UptoType uplo, Integer n, double a[], Integer pda, const double b[],
                 Integer pdb, NagError *fail)
```

3 Description

To reduce the real symmetric-definite generalized eigenproblem $Az = \lambda Bz$, $ABz = \lambda z$ or $BAz = \lambda z$ to the standard form $Cy = \lambda y$, this function must be preceded by a call to nag_dpotrf (f07fdc) which computes the Cholesky factorization of B ; B must be positive-definite.

The different problem types are specified by the parameter **comp_type**, as indicated in the table below. The table shows how C is computed by the function, and also how the eigenvectors z of the original problem can be recovered from the eigenvectors of the standard form.

comp_type	Problem	uplo	B	C	z
1	$Az = \lambda Bz$	Nag_Upper Nag_Lower	$U^T U$ LL^T	$U^{-T} AU^{-1}$ $L^{-1} AL^{-T}$	$U^{-1} y$ $L^{-T} y$
2	$ABz = \lambda z$	Nag_Upper Nag_Lower	$U^T U$ LL^T	UAU^T $L^T AL$	$U^{-1} y$ $L^{-T} y$
3	$BAz = \lambda z$	Nag_Upper Nag_Lower	$U^T U$ LL^T	UAU^T $L^T AL$	$U^T y$ Ly

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.

2: **comp_type** – Nag_ComputeType *Input*

On entry: indicates how the standard form is computed as follows:

```

if comp_type = Nag_Compute_1,
    if uplo = Nag_Upper,  $C = U^{-T}AU^{-1}$ ;
    if uplo = Nag_Lower,  $C = L^{-1}AL^{-T}$ ;
if comp_type = Nag_Compute_2 or Nag_Compute_3,
    if uplo = Nag_Upper,  $C = UAU^T$ ;
    if uplo = Nag_Lower,  $C = L^TAL$ .

```

Constraint: **comp_type** = Nag_Compute_1, Nag_Compute_2 or Nag_Compute_3.

3: **uplo** – Nag_Uplotype *Input*

On entry: indicates whether the upper or lower triangular part of A is stored and how B has been factorized, as follows:

```

if uplo = Nag_Upper, the upper triangular part of  $A$  is stored and  $B = U^TU$ ;
if uplo = Nag_Lower, the lower triangular part of  $A$  is stored and  $B = LL^T$ .

```

Constraint: **uplo** = Nag_Upper or Nag_Lower.

4: **n** – Integer *Input*

On entry: n , the order of the matrices A and B .

Constraint: **n** ≥ 0 .

5: **a[dim]** – double *Input/Output*

Note: the dimension, dim , of the array **a** must be at least $\max(1, \text{pda} \times n)$.

If **order** = Nag_ColMajor, the (i, j) th element of the matrix A is stored in **a**[($j - 1$) \times **pda** + $i - 1$] and if **order** = Nag_RowMajor, the (i, j) th element of the matrix A is stored in **a**[($i - 1$) \times **pda** + $j - 1$].

On entry: the n by n symmetric matrix A . If **uplo** = Nag_Upper, the upper triangle of A must be stored and the elements of the array below the diagonal are not referenced; if **uplo** = Nag_Lower, the lower triangle of A must be stored and the elements of the array above the diagonal are not referenced.

On exit: the upper or lower triangle of A is overwritten by the corresponding upper or lower triangle of C as specified by **comp_type** and **uplo**.

6: **pda** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **a**.

Constraint: **pda** $\geq \max(1, n)$.

7: **b[dim]** – const double *Input*

Note: the dimension, dim , of the array **b** must be at least $\max(1, \text{pdb} \times n)$.

If **order** = Nag_ColMajor, the (i, j) th element of the matrix B is stored in **b**[($j - 1$) \times **pdb** + $i - 1$] and if **order** = Nag_RowMajor, the (i, j) th element of the matrix B is stored in **b**[($i - 1$) \times **pdb** + $j - 1$].

On entry: the Cholesky factor of B as specified by **uplo** and returned by nag_dpotrf (f07fdc).

8: **pdb** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **b**.

Constraint: **pdb** $\geq \max(1, n)$.

9: **fail** – NagError **Output*

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **pda** = $\langle value \rangle$.

Constraint: **pda** > 0 .

On entry, **pdb** = $\langle value \rangle$.

Constraint: **pdb** > 0 .

NE_INT_2

On entry, **pda** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pda** $\geq \max(1, n)$.

On entry, **pdb** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pdb** $\geq \max(1, n)$.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

Forming the reduced matrix C is a stable procedure. However it involves implicit multiplication by B^{-1} (if **comp_type** = Nag_Compute_1) or B (if **comp_type** = Nag_Compute_2 or Nag_Compute_3). When the function is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion.

8 Further Comments

The total number of floating-point operations is approximately n^3 .

The complex analogue of this function is nag_zhegst (f08ssc).

9 Example

To compute all the eigenvalues of $Az = \lambda Bz$, where

$$A = \begin{pmatrix} 0.24 & 0.39 & 0.42 & -0.16 \\ 0.39 & -0.11 & 0.79 & 0.63 \\ 0.42 & 0.79 & -0.25 & 0.48 \\ -0.16 & 0.63 & 0.48 & -0.03 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.18 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.18 & 0.34 & 1.18 \end{pmatrix}.$$

Here B is symmetric positive-definite and must first be factorized by nag_dpotrf (f07fdc). The program calls nag_dsygst (f08sec) to reduce the problem to the standard form $Cy = \lambda y$; then nag_dsytrd (f08fec) to reduce C to tridiagonal form, and nag_dsterf (f08jfc) to compute the eigenvalues.
