nag_rngs_von_mises (g05lpc)

1 Purpose

nag_rngs_von_mises (g05lpc) generates a vector of pseudo-random numbers from a von Mises distribution with concentration parameter κ .

2 Specification

```
void nag_rngs_von_mises (double vk, Integer n, double x[], Integer igen,
    Integer iseed[], NagError *fail)
```

3 Description

The von Mises distribution is a symmetric distribution used in the analysis of circular data. The probability density function of this distribution on the circle with mean direction $\mu_0 = 0$ and concentration parameter kappa, κ , can be written as:

$$f(\theta) = \frac{e^{\kappa \cos \theta}}{2\pi I_0(\kappa)},$$

where θ is reduced modulo 2π so that $-\pi \leq \theta < \pi$ and $\kappa \geq 0$. For very small κ the distribution is almost the uniform distribution, whereas for $\kappa \rightarrow \infty$ all the probability is concentrated at one point.

The n variates, $\theta_1, \theta_2, \dots, \theta_n$, are generated using an envelope rejection method with a wrapped Cauchy target distribution as proposed by Best and Fisher (1979) and described by Dagpunar (1988).

One of the initialisation functions nag_rngs_init_repeatable (g05kbc) (for a repeatable sequence if computed sequentially) or nag_rngs_init_nonrepeatable (g05kcc) (for a non-repeatable sequence) must be called prior to the first call to nag_rngs_von_mises (g05lpc).

5 Parameters

- | | | |
|----|--|---------------|
| 1: | vk – double | <i>Input</i> |
| | <i>On entry:</i> the concentration parameter, κ , of the required von Mises distribution.
<i>Constraint:</i> vk > 0.0. | |
| 2: | n – Integer | <i>Input</i> |
| | <i>On entry:</i> the number, n , of pseudo-random numbers to be generated.
<i>Constraint:</i> n ≥ 0. | |
| 3: | x[dim] – double | <i>Output</i> |
| | Note: the dimension, dim , of the array x must be at least $\max(1, \mathbf{n})$.
<i>On exit:</i> the n pseudo-random numbers from the specified von Mises distribution. | |

- 4: **igen** – Integer *Input*
On entry: must contain the identification number for the generator to be used to return a pseudo-random number and should remain unchanged following initialisation by a prior call to one of the functions `nag_rngs_init_repeatable` (g05kbc) or `nag_rngs_init_nonrepeatable` (g05kcc).
- 5: **iseed**[4] – Integer *Input/Output*
On entry: contains values which define the current state of the selected generator.
On exit: contains updated values defining the new state of the selected generator.
- 6: **fail** – NagError * *Input/Output*
The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.
Constraint: **n** ≥ 0 .

NE_REAL

On entry, **vk** = $\langle value \rangle$.
Constraint: **vk** > 0.0 .

NE_BAD_PARAM

On entry, parameter $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

Not applicable.

8 Further Comments

For a given number of random variates the generation time increases slightly with increasing κ .

If **vk** is supplied too large (i.e., **vk** $> \sqrt{\text{nag_real_largest_number}(X02ALC())}$) then floating point overflow will occur in internal calculation.

9 Example

The example program prints the first five pseudo-random real numbers from a von Mises distribution with $\kappa = 1.0$, generated by a single call to `nag_rngs_von_mises` (g05lpc), after initialisation by `nag_rngs_init_repeatable` (g05kbc).
