

## NAG C Library Function Document

### nag\_rngs\_orthog\_matrix (g05qac)

#### 1 Purpose

nag\_rngs\_orthog\_matrix (g05qac) generates a random orthogonal matrix.

#### 2 Specification

```
void nag_rngs_orthog_matrix (Nag_OrderType order, Nag_SideType side,
    Nag_InitializeA init, Integer m, Integer n, double a[], Integer pda,
    Integer igen, Integer iseed[], NagError *fail)
```

#### 3 Description

nag\_rngs\_orthog\_matrix (g05qac) pre- or post-multiplies an  $m$  by  $n$  matrix  $A$  by a random orthogonal matrix  $U$ , overwriting  $A$ . The matrix  $A$  may optionally be initialised to the identity matrix before multiplying by  $U$ , hence  $U$  is returned.  $U$  is generated using the method of Stewart (1980). The algorithm can be summarized as follows.

Let  $x_1, x_2, \dots, x_{n-1}$  follow independent multinormal distributions with zero mean and variance  $I\sigma^2$  and dimensions  $n, n-1, \dots, 2$ ; let  $H_j = \text{diag}(I_{j-1}, H_j^*)$ , where  $I_{j-1}$  is the identity matrix and  $H_j^*$  is the Householder transformation that reduces  $x_j$  to  $r_{jj}e_1$ ,  $e_1$  being the vector with first element one and the remaining elements zero and  $r_{jj}$  being a scalar, and let  $D = \text{diag}(\text{sign}(r_{11}), \text{sign}(r_{22}), \dots, \text{sign}(r_{nn}))$ . Then the product  $U = DH_1H_2\dots H_{n-1}$  is a random orthogonal matrix distributed according to the Haar measure over the set of orthogonal matrices of  $n$ . See Stewart (1980), Theorem 3.3.

One of the initialisation functions nag\_rngs\_init\_repeatable (g05kbc) (for a repeatable sequence if computed sequentially) or nag\_rngs\_init\_nonrepeatable (g05kcc) (for a non-repeatable sequence) must be called prior to the first call to nag\_rngs\_orthog\_matrix (g05qac).

#### 5 Parameters

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **side** – Nag\_SideType *Input*

*On entry:* indicates whether the matrix  $A$  is multiplied on the left or right by the random orthogonal matrix  $U$ .

If **side** = Nag\_LeftSide, the matrix  $A$  is multiplied on the left, i.e., pre-multiplied.

If **side** = Nag\_RightSide, the matrix  $A$  is multiplied on the right, i.e., post-multiplied.

*Constraint:* **side** = Nag\_LeftSide or Nag\_RightSide.

3: **init** – Nag\_InitializeA *Input*

*On entry:* indicates whether or not **a** should be initialised to the identity matrix.

If **init** = Nag\_InitializeI, **a** is initialised to the identity matrix.

If **init** = Nag\_InputA, **a** is not initialised and the matrix *A* must be supplied in **a**.

*Constraint:* **init** = Nag\_InitializeI or Nag\_InputA.

4: **m** – Integer *Input*

*On entry:* the number of rows of the matrix *A*, *m*.

*Constraints:*

if **side** = Nag\_LeftSide, **m** > 1;  
otherwise **m**  $\geq$  1.

5: **n** – Integer *Input*

*On entry:* the number of columns of the matrix *A*, *n*.

*Constraints:*

if **side** = Nag\_RightSide, **n** > 1;  
otherwise **n**  $\geq$  1.

6: **a[dim]** – double *Input/Output*

**Note:** the dimension, *dim*, of the array **a** must be at least  $\max(1, \text{pda} \times \mathbf{n})$  when **order** = Nag\_ColMajor and at least  $\max(1, \text{pda} \times \mathbf{m})$  when **order** = Nag\_RowMajor.

If **order** = Nag\_ColMajor, the (*i*, *j*)th element of the matrix *A* is stored in **a**[ $(j - 1) \times \text{pda} + i - 1$ ] and if **order** = Nag\_RowMajor, the (*i*, *j*)th element of the matrix *A* is stored in **a**[ $(i - 1) \times \text{pda} + j - 1$ ].

*On entry:* if **init** = Nag\_InputA, **a** must contain the matrix *A*.

*On exit:* the matrix *UA* when **side** = Nag\_LeftSide or the matrix *AU* when **side** = Nag\_RightSide.

7: **pda** – Integer *Input*

*On entry:* the stride separating matrix row or column elements (depending on the value of **order**) in the array **a**.

*Constraints:*

if **order** = Nag\_ColMajor, **pda**  $\geq \mathbf{m}$ ;  
if **order** = Nag\_RowMajor, **pda**  $\geq \mathbf{n}$ .

8: **igen** – Integer *Input*

*On entry:* must contain the identification number for the generator to be used to return a pseudo-random number and should remain unchanged following initialisation by a prior call to one of the functions nag\_rngs\_init\_repeatable (g05kbc) or nag\_rngs\_init\_nonrepeatable (g05kcc).

9: **iseed[4]** – Integer *Input/Output*

*On entry:* contains values which define the current state of the selected generator.

*On exit:* contains updated values defining the new state of the selected generator.

10: **fail** – NagError \* *Input/Output*

The NAG error parameter (see the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_INT

On entry, **pda** =  $\langle \text{value} \rangle$ .

Constraint: **pda** > 0.

On entry, **n** =  $\langle \text{value} \rangle$ .

Constraint: **n**  $\geq$  1.

On entry, **m** =  $\langle \text{value} \rangle$ .

Constraint: **m**  $\geq$  1.

### NE\_INT\_2

On entry, **pda** =  $\langle \text{value} \rangle$ , **m** =  $\langle \text{value} \rangle$ .

Constraint: **pda**  $\geq$  **m**.

On entry, **pda** =  $\langle \text{value} \rangle$ , **n** =  $\langle \text{value} \rangle$ .

Constraint: **pda**  $\geq$  **n**.

### NE\_ENUM\_INT

On entry, **side** =  $\langle \text{value} \rangle$ , **m** =  $\langle \text{value} \rangle$ .

Constraint: if **side** = Nag\_LeftSide, **m** > 1;  
otherwise **m**  $\geq$  1.

On entry, **side** =  $\langle \text{value} \rangle$ , **n** =  $\langle \text{value} \rangle$ .

Constraint: if **side** = Nag\_RightSide, **n** > 1;  
otherwise **n**  $\geq$  1.

### NE\_ORTHOGONAL\_MATRIX

Orthogonal matrix of dimension 1 requested.

### NE\_ALLOC\_FAIL

Memory allocation failed.

### NE\_BAD\_PARAM

On entry, parameter  $\langle \text{value} \rangle$  had an illegal value.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

The maximum error in  $U^T U$  should be a modest multiple of **machine precision** (see Chapter x02).

## 8 Further Comments

`nag_rngs_corr_matrix` (g05qbc) computes a random correlation matrix from a random orthogonal matrix.

## 9 Example

Following initialisation of the pseudo-random number generator by a call to `nag_rngs_init_repeatable` (g05kbc), a 4 by 4 orthogonal matrix is generated using the **init** = Nag\_InitializeI option and the result printed.
