# nag\_opt\_lsq\_check\_deriv (e04yac)

#### 1. Purpose

nag\_opt\_lsq\_check\_deriv checks that a user-supplied C function for evaluating a vector of functions and the matrix of their first derivatives produces derivative values which are consistent with the function values calculated.

## 2. Specification

### 3. Description

The function nag\_opt\_lsq\_deriv (e04gbc) for minimizing a sum of squares of m nonlinear functions (or 'residuals'),  $f_i(x_1, x_2, \ldots, x_n)$ , for  $i = 1, 2, \ldots, m$ ;  $m \ge n$ , requires the user to supply a C function to evaluate the  $f_i$  and their first derivatives. nag\_opt\_lsq\_check\_deriv checks the derivatives calculated by such a user-supplied function. As well as the C function to be checked (lsqfun), the user must supply a point  $x = (x_1, x_2, \ldots, x_n)^T$  at which the check is to be made.

nag\_opt\_lsq\_check\_deriv first calls lsqfun to evaluate the  $f_i(x)$  and their first derivatives, and uses these to calculate the sum of squares  $F(x) = \sum_{i=1}^m [f_i(x)]^2$ , and its first derivatives  $g_j = \frac{\partial f}{\partial x_j}\Big|_x$ , for  $j=1,2,\ldots,n$ . The components of g along two orthogonal directions (defined by unit vectors  $p_1$  and  $p_2$ , say) are then calculated; these will be  $g^Tp_1$  and  $g^Tp_2$  respectively. The same components are also estimated by finite differences, giving quantities

$$v_k = \frac{F(x + hp_k) - F(x)}{h}, \quad k = 1, 2$$

where h is a small positive scalar. If the relative difference between  $v_1$  and  $g^T p_1$  or between  $v_2$  and  $g^T p_2$  is judged too large, an error indicator is set.

#### 4. Parameters

m

 $\mathbf{n}$ 

Input: the number m of residuals,  $f_i(x)$ , and the number n of variables,  $x_j$ . Constraint:  $1 \le \mathbf{n} \le \mathbf{m}$ .

### lsqfun

**Isqfun** must calculate the vector of values  $f_i(x)$  and their first derivatives  $\frac{\partial f_i}{\partial x_j}$  at any point x. (The minimization routine nag\_opt\_lsq\_deriv (e04gbc) gives the user the option of resetting a parameter, **comm->flag**, to terminate the minimization process immediately. nag\_opt\_lsq\_check\_deriv will also terminate immediately, without finishing the checking process, if the parameter in question is reset to a negative value.) The specification of **lsqfun** is:

[NP3275/5/pdf] 3.e04yac.1

void lsqfun(Integer m, Integer n, double x[], double fvec[], double fjac[], Integer tdj, Nag\_Comm \*comm), m n Input: the numbers m and n of residuals and variables, respectively. x[n]Input: the point x at which the values of the  $f_i$  and the  $\frac{\partial f_i}{\partial x}$  are required. fvec[m]Output: unless **comm->flag** is reset to a negative number, then **fvec**[i-1] must contain the value of  $f_i$  at the point x, for  $i = 1, 2, \ldots, m$ . fjac[m\*tdj] Output: unless comm->flag is reset to a negative number, then the value in  $\mathbf{fjac}[(i-1)^*\mathbf{tdj}+j-1]$  must be the first derivative  $\frac{\partial f_i}{\partial x_i}$  at the point  $\mathbf{x}$ , for  $i = 1, 2, \dots, m; j = 1, 2, \dots, n.$ tdj Input: the last dimension of the array fjac as declared in the function from which nag\_opt\_lsq\_check\_deriv is called. comm Pointer to structure of type Nag\_Comm; the following members are relevant to lsqfun. flag – Integer Input: **comm->flag** will be set to 2. Output: if lsqfun resets comm->flag to some negative number then nag\_opt\_lsq\_check\_deriv will terminate immediately with the error indicator NE\_USER\_STOP. If fail is supplied to nag\_opt\_lsq\_check\_deriv, fail.errnum will be set to the user's setting of **comm->flag**. first – Boolean Input: will be set to TRUE on the first call to lsqfun and FALSE for all subsequent calls. **nf** – Integer Input: the number of calls made to **lsqfun** including the current one. user – double \* iuser - Integer \* **p** – Pointer The type Pointer will be void \* with a C compiler that defines void \*

and char \* otherwise.

Before calling nag\_opt\_lsq\_check\_deriv these pointers may be allocated memory by the user and initialised with various quantities for use by lsqfun when called from nag\_opt\_lsq\_check\_deriv.

The array  $\mathbf{x}$  must **not** be changed within **lsqfun**.

x[n]

Input:  $\mathbf{x}[j-1]$   $(j=1,2,\ldots,n)$  must be set to the co-ordinates of a suitable point at which to check the derivatives calculated by lsqfun. 'Obvious' settings, such as 0.0 or 1.0, should not be used since, at such particular points, incorrect terms may take correct values (particularly zero), so that errors can go undetected. For a similar reason, it is preferable that no two elements of  $\mathbf{x}$  should have the same value.

# fvec[m]

Output: unless comm->flag is set negative in the first call of lsqfun, fvec[i-1] contains the value of  $f_i$  at the point given in  $\mathbf{x}$ , for  $i = 1, 2, \dots, m$ .

3.e04yac.2[NP3275/5/pdf]

## fjac[m][tdj]

Output: unless **comm->flag** is set negative in the first call of **lsqfun**, **fjac**[i-1][j-1] contains the value of the first derivative  $\frac{\partial f_i}{\partial x_j}$  at the point given in  $\mathbf{x}$ , as calculated by **lsqfun**, for  $i=1,2,\ldots,m;\ j=1,2,\ldots,n$ .

tdj

Input: the second dimension of the array **fjac** as declared in the function from which nag\_opt\_lsq\_check\_deriv is called.

Constraint:  $tdj \ge n$ .

#### comm

Input/Output: structure containing pointers for communication to the user defined function; see the above description of **lsqfun** for details. If the user does not need to make use of this communication feature the null pointer NAGCOMM\_NULL may be used in the call to nag\_opt\_lsq\_check\_deriv; **comm** will then be declared internally for use in calls to **lsqfun**.

fail

The NAG error parameter, see the Essential Introduction to the NAG C Library.

#### 5. Error Indications and Warnings

#### NE\_USER\_STOP

User requested termination, user flag value =  $\langle value \rangle$ .

This exit occurs if the user sets **comm->flag** to a negative value in **lsqfun**. If **fail** is supplied the value of **fail.errnum** will be the same as the user's setting of **comm->flag**. The check on **lsqfun** will not have been completed.

#### NE\_INT\_ARG\_LT

On entry, **n** must not be less than 1:  $\mathbf{n} = \langle value \rangle$ .

#### NE\_2\_INT\_ARG\_LT

On entry,  $\mathbf{m} = \langle value \rangle$  while  $\mathbf{n} = \langle value \rangle$ . These parameters must satisfy  $\mathbf{m} \geq \mathbf{n}$ . On entry,  $\mathbf{tdj} = \langle value \rangle$  while  $\mathbf{n} = \langle value \rangle$ . These parameters must satisfy  $\mathbf{tdj} \geq \mathbf{n}$ .

#### NE\_ALLOC\_FAIL

Memory allocation failed.

### NE\_DERIV\_ERRORS

Large errors were found in the derivatives of the objective function.

The user should check carefully the derivation and programming of expressions for the  $\frac{\partial f_i}{\partial x_j}$ , because it is very unlikely that **lsqfun** is calculating them correctly.

### 6. Further Comments

nag\_opt\_lsq\_check\_deriv calls lsqfun three times.

Before using nag\_opt\_lsq\_check\_deriv to check the calculation of the first derivatives, the user should be confident that **lsqfun** is calculating the residuals correctly.

#### 6.1. Accuracy

fail.code is set to NE\_DERIV\_ERRORS if

$$(v_k - g^T p_k)^2 \geq h \times ((g^T p_k)^2 + 1)$$

for k=1 or 2. (See Section 3 for definitions of the quantities involved.) The scalar h is set equal to  $\sqrt{\epsilon}$ , where  $\epsilon$  is the **machine precision** as given by nag\_machine\_precision (X02AJC).

                   1.0
```

The following program could be used to check the first derivatives calculated by the required function lsqfun. (The tests of whether  $comm->flag \neq 0$  or 1 in lsqfun are present for when lsqfun is called by nag\_opt\_lsq\_deriv (e04gbc). nag\_opt\_lsq\_check\_deriv will always call lsqfun with comm->flag set to 2.)
