## dtrsm (f06yjc)

### 1 Purpose

dtrsm (f06yjc) performs one of the matrix-matrix operations

$$\begin{aligned} B &\leftarrow \alpha A^{-1}B, & B &\leftarrow \alpha A^{-T}B, \\ B &\leftarrow \alpha BA^{-1}, \quad \text{or} \quad B \leftarrow \alpha BA^{-T} \end{aligned}$$

where  $B$  is an  $m$  by  $n$  complex matrix,  $A$  is a complex triangular matrix, and  $\alpha$  is a complex scalar.

### 2 Specification

```
#include <nag.h>
#include <nagf06.h>

void dtrsm (OperationSide side, MatrixTriangle uplo, MatrixTranspose transa,
            MatrixUnitTriangular diag, Integer m, Integer n, double alpha,
            const double a[], Integer tda, double b[], Integer tdb)
```

### 3 Arguments

- 1: **side** – OperationSide *Input*  
*On entry:* specifies whether  $B$  is operated on from the left or the right, as follows:  
 if **side** = **LeftSide**,  $B$  is pre-multiplied from the left;  
 if **side** = **RightSide**,  $B$  is post-multiplied from the right.  
*Constraint:* **side** = **LeftSide** or **RightSide**.
- 2: **uplo** – MatrixTriangle *Input*  
*On entry:* specifies whether  $A$  upper or lower triangular as follows:  
 if **uplo** = **UpperTriangle**,  $A$  is upper triangular;  
 if **uplo** = **LowerTriangle**,  $A$  is lower triangular.  
*Constraint:* **uplo** = **UpperTriangle** or **LowerTriangle**.
- 3: **transa** – MatrixTranspose *Input*  
*On entry:* specifies whether the operation involves  $A$ ,  $A^T$  or  $A^H$ , as follows:  
 if **transa** = **NoTranspose**, it involves  $A$ ;  
 if **transa** = **Transpose**, it involves  $A^T$ ;  
 if **transa** = **ConjugateTranspose**, it involves  $A^H$ .  
*Constraint:* **transa** = **NoTranspose**, **Transpose** or **ConjugateTranspose**.
- 4: **diag** – MatrixUnitTriangular *Input*  
*On entry:* specifies whether  $A$  has non-unit or unit diagonal elements, as follows:  
 if **diag** = **NotUnitTriangular**, the diagonal elements are stored explicitly;  
 if **diag** = **UnitTriangular**, the diagonal elements are assumed to be 1, and are not referenced.  
*Constraint:* **diag** = **NotUnitTriangular** or **UnitTriangular**.

5:	<b>m</b> – Integer	<i>Input</i>
<i>On entry:</i> $m$ , the number of rows of the matrix $B$ ; the order of $A$ if <b>side</b> = <b>LeftSide</b> .		
<i>Constraint:</i> $\mathbf{m} \geq 0$ .		
6:	<b>n</b> – Integer	<i>Input</i>
<i>On entry:</i> $n$ , the number of columns of the matrix $B$ ; the order of $A$ if <b>side</b> = <b>RightSide</b> .		
<i>Constraint:</i> $\mathbf{n} \geq 0$ .		
7:	<b>alpha</b> – double	<i>Input</i>
<i>On entry:</i> the scalar $\alpha$ .		
8:	<b>a</b> [ $\times$ <b>tda</b> ] – const double	<i>Input</i>
<i>On entry:</i> the triangular matrix $A$ .		
<b>side</b> = <b>LeftSide</b>		
$A$ is $m$ by $m$ .		
<b>side</b> = <b>RightSide</b>		
$n$ by $n$ .		
<b>uplo</b> = <b>UpperTriangle</b>		
$A$ is upper triangular and the elements of the array below the diagonal are not referenced.		
<b>uplo</b> = <b>LowerTriangle</b>		
$A$ is lower triangular and the elements of the array above the diagonal are not referenced.		
<b>diag</b> = <b>UnitTriangular</b>		
The diagonal elements of $A$ are not referenced, but are assumed to be 1.		
9:	<b>tda</b> – Integer	<i>Input</i>
<i>On entry:</i> the second dimension of the array <b>a</b> as declared in the function from which dtrsm (f06yjc) is called.		
<i>Constraint:</i> $\mathbf{tda} \geq \max(1, \mathbf{m})$ if <b>side</b> = <b>LeftSide</b> ; $\mathbf{tda} \geq \max(1, \mathbf{n})$ if <b>side</b> = <b>RightSide</b> .		
10:	<b>b</b> [ $\mathbf{m} \times$ <b>tdb</b> ] – double	<i>Input/Output</i>
<i>On entry:</i> the $m$ by $n$ matrix $B$ . If <b>alpha</b> = 0, <b>b</b> need not be set.		
<i>On exit:</i> the updated matrix $B$ .		
11:	<b>tdb</b> – Integer	<i>Input</i>
<i>On entry:</i> the second dimension of the array <b>b</b> as declared in the function from which dtrsm (f06yjc) is called.		
<i>Constraint:</i> $\mathbf{tdb} \geq \max(1, \mathbf{n})$ .		

## 4 Error Indicators and Warnings

If a function is called with an invalid argument then an error message is output on stderr, giving the name of the function and the number of the first invalid argument, and execution is terminated.
