F08KEF (SGEBRD/DGEBRD) – NAG Fortran Library Routine Document

Note. Before using this routine, please read the Users' Note for your implementation to check the interpretation of bold italicised terms and other implementation-dependent details.

1 Purpose

F08KEF (SGEBRD/DGEBRD) reduces a real m by n matrix to bidiagonal form.

2 Specification

```
SUBROUTINE FO8KEF(M, N, A, LDA, D, E, TAUQ, TAUP, WORK, LWORK, INFO) ENTRY sgebrd(M, N, A, LDA, D, E, TAUQ, TAUP, WORK, LWORK, INFO) INTEGER M, N, LDA, LWORK, INFO real A(LDA,*), D(*), E(*), TAUQ(*), TAUP(*), WORK(LWORK)
```

The ENTRY statement enables the routine to be called by its LAPACK name.

3 Description

This routine reduces a real m by n matrix A to bidiagonal form B by an orthogonal transformation: $A = QBP^T$, where Q and P^T are orthogonal matrices of order m and n respectively.

If $m \geq n$, the reduction is given by:

$$A = Q \begin{pmatrix} B_1 \\ 0 \end{pmatrix} P^T = Q_1 B_1 P^T,$$

where B_1 is an n by n upper bidiagonal matrix and Q_1 consists of the first n columns of Q.

If m < n, the reduction is given by

$$A = Q(B_1 \ 0)P^T = QB_1P_1^T,$$

where B_1 is an m by m lower bidiagonal matrix and P_1^T consists of the first m rows of P^T .

The orthogonal matrices Q and P are not formed explicitly but are represented as products of elementary reflectors (see the Chapter Introduction for details). Routines are provided to work with Q and P in this representation. (see Section 8).

5 Parameters

1: M — INTEGER Input

On entry: m, the number of rows of the matrix A.

Constraint: $M \ge 0$.

2: N — INTEGER

On entry: n, the number of columns of the matrix A.

Constraint: $N \geq 0$.

3: A(LDA,*) - real array

Input/Output

Note: the second dimension of the array A must be at least max(1,N).

On entry: the m by n matrix A.

On exit: if $m \ge n$, the diagonal and first super-diagonal are overwritten by the upper bidiagonal matrix B, elements below the diagonal are overwritten by details of the orthogonal matrix Q and elements above the first super-diagonal are overwritten by details of the orthogonal matrix P.

If m < n, the diagonal and first sub-diagonal are overwritten by the lower bidiagonal matrix B, elements below the first sub-diagonal are overwritten by details of the orthogonal matrix Q and elements above the diagonal are overwritten by details of the orthogonal matrix P.

4: LDA — INTEGER

Input

On entry: the first dimension of the array A as declared in the (sub)program from which F08KEF (SGEBRD/DGEBRD) is called.

Constraint: LDA $\geq \max(1,M)$.

5: D(*) — real array

Output

Note: the dimension of the array D must be at least max(1,min(M,N)).

On exit: the diagonal elements of the bidiagonal matrix B.

6: E(*) - real array

Output

Note: the dimension of the array E must be at least max(1, min(M,N)-1).

On exit: the off-diagonal elements of the bidiagonal matrix B.

7: TAUQ(*) - real array

Output

Note: the dimension of the array TAUQ must be at least max(1,min(M,N)).

On exit: further details of the orthogonal matrix Q.

8: TAUP(*) - real array

Output

Note: the dimension of the array TAUP must be at least max(1,min(M,N)).

On exit: further details of the orthogonal matrix P.

9: WORK(LWORK) — *real* array

Workspace

On exit: if INFO = 0, WORK(1) contains the minimum value of LWORK required for optimum performance.

10: LWORK — INTEGER

Input

On entry: the dimension of the array WORK as declared in the (sub)program from which F08KEF (SGEBRD/DGEBRD) is called.

Suggested value: for optimum performance LWORK should be at least (M+N) \times nb, where nb is the **blocksize**.

Constraint: LWORK $\geq \max(1,M,N)$.

11: INFO — INTEGER

Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = -i, the *i*th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The computed bidiagonal form B satisfies $QBP^T = A + E$, where

$$\parallel E \parallel_2 \le c(n)\epsilon \parallel A \parallel_2,$$

c(n) is a modestly increasing function of n, and ϵ is the **machine precision**.

The elements of B themselves may be sensitive to small perturbations in A or to rounding errors in the computation, but this does not affect the stability of the singular values and vectors.

8 Further Comments

The total number of floating-point operations is approximately $\frac{4}{3}n^2(3m-n)$ if $m \ge n$ or $\frac{4}{3}m^2(3n-m)$ if m < n.

If $m \gg n$, it can be more efficient to first call F08AEF (SGEQRF/DGEQRF) to perform a QR factorization of A, and then to call this routine to reduce the factor R to bidiagonal form. This requires approximately $2n^2(m+n)$ floating-point operations.

If $m \ll n$, it can be more efficient to first call F08AHF (SGELQF/DGELQF) to perform an LQ factorization of A, and then to call this routine to reduce the factor L to bidiagonal form. This requires approximately $2m^2(m+n)$ operations.

To form the orthogonal matrices P^T and/or Q, this routine may be followed by calls to F08KFF (SORGBR/DORGBR):

to form the m by m orthogonal matrix Q

```
CALL SORGBR ('Q',M,M,N,A,LDA,TAUQ,WORK,LWORK,INFO)
```

but note that the second dimension of the array A must be at least M, which may be larger than was required by F08KEF;

to form the n by n orthogonal matrix P^T

```
CALL SORGBR ('P', N, N, M, A, LDA, TAUP, WORK, LWORK, INFO)
```

but note that the first dimension of the array A, specified by the parameter LDA, must be at least N, which may be larger than was required by F08KEF.

To apply Q or P to a real rectangular matrix C, this routine may be followed by a call to F08KGF (SORMBR/DORMBR).

The complex analogue of this routine is F08KSF (CGEBRD/ZGEBRD).

9 Example

To reduce the matrix A to bidiagonal form, where

$$A = \begin{pmatrix} -0.57 & -1.28 & -0.39 & 0.25 \\ -1.93 & 1.08 & -0.31 & -2.14 \\ 2.30 & 0.24 & 0.40 & -0.35 \\ -1.93 & 0.64 & -0.66 & 0.08 \\ 0.15 & 0.30 & 0.15 & -2.13 \\ -0.02 & 1.03 & -1.43 & 0.50 \end{pmatrix}.$$

9.1 Program Text

Note. The listing of the example program presented below uses bold italicised terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
