G05HDF – NAG Fortran Library Routine Document

Note. Before using this routine, please read the Users' Note for your implementation to check the interpretation of bold italicised terms and other implementation-dependent details.

1 Purpose

G05HDF generates a realisation of a multivariate time series from a vector autoregressive moving average (VARMA) model. The realisation may be continued or a new realisation generated at subsequent calls to G05HDF.

2 Specification

SUBROUTINE GO5HD	F(MODE, K, IP, IQ, MEAN, PAR, LPAR, QQ, IK, N, W,				
1 REF, LREF, IWORK, LIWORK, IFAIL)					
INTEGER	K, IP, IQ, LPAR, IK, N, LREF, IWORK(LIWORK),				
1	LIWORK, IFAIL				
real	PAR(LPAR), QQ(IK,K), W(IK,N), REF(LREF)				
CHARACTER*1	MODE, MEAN				

3 Description

Let the vector $W_t = (w_{1t}, w_{2t}, \dots, w_{kt})^T$, denote a k dimensional time series which is assumed to follow a vector autoregressive moving average (VARMA) model of the form:

$$W_t - \mu = \phi_1(W_{t-1} - \mu) + \phi_2(W_{t-2} - \mu) + \dots + \phi_p(W_{t-p} - \mu) + \epsilon_t - \theta_1 \epsilon_{t-1} - \theta_2 \epsilon_{t-2} - \dots - \theta_q \epsilon_{t-q}$$
(1)

where $\epsilon_t = (\epsilon_{1t}, \epsilon_{2t}, \dots, \epsilon_{kt})^T$, is a vector of k residual series assumed to be Normally distributed with zero mean and positive-definite covariance matrix Σ . The components of ϵ_t are assumed to be uncorrelated at non-simultaneous lags. The ϕ_i 's and θ_j 's are k by k matrices of parameters. $\{\phi_i\}$, for $i = 1, 2, \dots, p$, are called the autoregressive (AR) parameter matrices, and $\{\theta_j\}$, for $j = 1, 2, \dots, q$, the moving average (MA) parameter matrices. The parameters in the model are thus the p k by $k \phi$ -matrices, the q k by $k \theta$ -matrices, the mean vector μ and the residual error covariance matrix Σ . Let

$$A(\phi) = \begin{bmatrix} \phi_1 & I & 0 & . & . & . & 0\\ \phi_2 & 0 & I & 0 & . & . & 0\\ \cdot & & & \cdot & & & \\ \cdot & & & & \cdot & & \\ \phi_{p-1} & 0 & . & . & 0 & 0\\ \phi_p & 0 & . & . & 0 & 0 \end{bmatrix}_{pk \times pk}$$
$$B(\theta) = \begin{bmatrix} \theta_1 & I & 0 & . & . & 0\\ \theta_2 & 0 & I & 0 & . & . & 0\\ \theta_2 & 0 & I & 0 & . & . & 0\\ \cdot & & & \cdot & & \\ \theta_{q-1} & 0 & . & . & 0 & 0 \\ \theta_q & 0 & . & . & . & 0 & 0 \end{bmatrix}_{qk \times qk}$$

and

where I denotes the k by k identity matrix.

The model (1) must be both stationary and invertible. The model is said to be stationary if the eigenvalues of $A(\phi)$ lie inside the unit circle and invertible if the eigenvalues of $B(\theta)$ lie inside the unit circle.

For $k \ge 6$ the VARMA model (1) is recast into state space form and a realisation of the state vector at time zero computed. For all other cases the routine computes a realisation of the pre-observed vectors $W_0, W_{-1}, \ldots, W_{1-p}, \epsilon_0, \epsilon_{-1}, \ldots, \epsilon_{1-q}$, from equation (1), see Shea [2]. This realisation is then used to

generate a sequence of successive time series observations. Note that special action is taken for pure MA models, that is for p = 0.

At the user's request a new realisation of the time series may be generated with less computation using only the information saved in a reference vector from a previous call to G05HDF. See the description of the parameter MODE in Section 5 for details.

The routine returns a realisation of W_1, W_2, \ldots, W_n . On a successful exit, the recent history is updated and saved in the array REF so that G05HDF may be called again to generate a realisation of W_{n+1}, W_{n+2}, \ldots , etc. See the description of the parameter MODE in Section 5 for details.

Further computational details are given in [2]. Note however that this routine uses a spectral decomposition rather than a Cholesky factorisation to generate the multivariate Normals. Although this method involves more multiplications than the Cholesky factorisation method and is thus slightly slower it is more stable when faced with ill-conditioned covariance matrices. A method of assigning the AR and MA coefficient matrices so that the stationarity and invertibility conditions are satisfied is described in Barone [1].

5 Parameters

1: MODE — CHARACTER*1

 $On\ entry:$ must be set as follows:

MODE = S' (Start), the routine is being called for the first time; a realisation of the recent history is computed, and the sequence of time series values from the VARMA model is then generated.

MODE = R' (Restart), the routine must have been called before with the same VARMA model; a new realisation of the recent history is computed using information stored in the reference vector, followed by the sequence of time series values.

MODE = C' (Continue), the routine must have been called before with the same VARMA model; a new sequence is generated, from the point at which the last sequence ended, using a realisation of the recent history which was updated and stored by the previous call to the routine.

If MODE = 'R' or 'C', then the user must ensure that the reference vector REF and the values of K, IP, IQ, MEAN, PAR, QQ and IK have not been changed between calls to G05HDF.

Constraint: MODE = 'S', 'R' or 'C'.

2:	К —	INTEGER

On entry: the dimension k, of the multivariate time series.

Constraint: $K \ge 1$.

3: IP — INTEGER

On entry: the number of AR parameter matrices, p. Constraint: IP ≥ 0 .

4: IQ — INTEGER

On entry: the number of MA parameter matrices, q. Constraint: IQ ≥ 0 . Input

Input

Input

Input

[NP3445/2/pdf]

5: MEAN — CHARACTER*1

On entry: indicates whether or not all elements of μ are to be supplied by the user or to be taken as zero.

If MEAN = 'M' the values of μ , are supplied in the array PAR.

If MEAN = 'Z', all elements of μ are to be taken as zero.

Constraint: MEAN = 'M' or 'Z'.

6: PAR(LPAR) - real array

On entry: the parameter values read in row by row in the order $\phi_1, \phi_2, \ldots, \phi_n, \theta_1, \theta_2, \ldots, \theta_n, \mu$.

Thus, if IP > 0, then PAR($(l-1) \times k \times k + (i-1) \times k + j$) must be set equal to the (i, j)th element of ϕ_l , for $l = 1, 2, \ldots, p$; $i, j = 1, 2, \ldots, k$.

If IQ > 0, then PAR $(p \times k \times k + (l-1) \times k \times k + (i-1) \times k + j)$ must be set equal to the (i, j)th element of θ_l , for l = 1, 2, ..., q; i, j = 1, 2, ..., k.

If MEAN = 'M', then PAR($(p+q) \times k \times k + i$) must be set equal to the *i*th component of the mean vector μ , for i = 1, 2, ..., k.

Constraint: the first IP \times K \times K elements of PAR must satisfy the stationarity condition and the next IQ \times K \times K elements of PAR must satisfy the invertibility condition.

7: LPAR — INTEGER

 $On\ entry:$ the dimension of the array PAR as declared in the (sub)program from which G05HDF is called.

Constraints: LPAR $\geq \max(1, \operatorname{npar})$ where

npar = $(IP + IQ) \times K \times K$ if MEAN = 'Z' and npar = $(IP + IQ) \times K \times K + K$ if MEAN = 'M'.

8: QQ(IK,K) - real array

On entry: QQ(i, j) must contain the (i, j)th element of Σ . Only the lower triangle is required.

Constraint: the elements of QQ must be such that Σ is positive-definite.

9: IK — INTEGER

On entry: the first dimension of the arrays QQ and W as declared in the (sub)program from which G05HDF is called.

Constraint: $IK \ge K$.

10: N - INTEGER

On entry: the number of observations to be generated, n.

Constraint: $N \ge 1$.

11: W(IK,N) - real array

On exit: W(i,t) will contain a realisation of the *i*th component of W_t , for i = 1, 2, ..., k; t = 1, 2, ..., n.

12: $\operatorname{REF}(\operatorname{LREF}) - real$ array

On entry: if MODE = 'R' or 'C', then the array REF as output from the previous call to G05HDF must be input without any change to the first m + (k+1)(k+2) + (m+1)(m+2) elements where $m = k \times \max(p,q)$ if $k \ge 6$ and k(p+q) if k < 6.

If MODE = 'S', then the contents of REF need not be set.

On exit: the first m + (k+1)(k+2) + (m+1)(m+2) elements of the array REF contain information required for any subsequent calls to the routine with MODE = 'R' or 'C'; the rest of the array is used as workspace. See Section 8.

Input

Input

Input

Input

Output

Input/Output

Input

Input

13: LREF — INTEGER

 $On\ entry:$ the dimension of the array REF as declared in the (sub)program from which G05HDF is called.

Constraint:

Let $r = \max(IP, IQ)$ and l = K(K + 1)/2 if IP = 0, $l = K(K + 1)/2 + (IP - 1)K^2$ if $IP \ge 1$, If $K \ge 6$, then $LREF \ge (5r^2 + 1)K^2 + (4r + 3)K + 4$ If K < 6, then $LREF \ge ((IP + IQ)^2 + 1)K^2 + (4(IP + IQ) + 3)K + \max\{Kr(Kr + 2), K^2(IP + IQ)^2 + l(l + 3) + K^2(IQ + 1)\} + 4$. See Section 8 for some examples of the required size of the array REF.

14: IWORK(LIWORK) — INTEGER array

15: LIWORK — INTEGER Input On entry: the dimension of the array IWORK as declared in the (sub)program from which G05HDF is called.

Constraint: LIWORK $\geq K \times max(IP,IQ)$.

16: IFAIL — INTEGER

On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in Chapter P01) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors detected by the routine:

IFAIL = 1

On entry, $MODE \neq S'$, 'R' or 'C',

or K < 1,

or IP < 0,

- or IQ < 0,
- or MEAN \neq 'M' or 'Z',
- or LPAR $< \max((IP + IQ) \times K \times K + K, 1)$ and MEAN = 'M',
- or LPAR $< \max((IP + IQ)) \times K \times K, 1)$ and MEAN = 'Z',
- or IK < K,
- or N < 1,
- or LREF is too small,
- or LIWORK is too small.

$$IFAIL = 2$$

On entry, either the value of Σ is not positive-definite, or the AR parameters are such that the model is non-stationary, or the MA parameters are such that the model is non-invertible. To proceed, the user must try different parameter values.

IFAIL = 3

This is an unlikely exit brought about by an excessive number of iterations being needed by the NAG Fortran Library routine used to evaluate the eigenvalues of $A(\phi)$ or $B(\theta)$. If this error occurs please contact NAG.

Input/Output

Workspace

IFAIL = 4

G05HDF has not been able to calculate all the required elements of the array REF. This is an unlikely exit brought about by an excessive number of iterations being needed by F02FAF to evaluate eigenvalues to be stored in the array REF. If this error occurs please contact NAG.

 $\mathrm{IFAIL}=5$

G05HDF has not been able to calculate all the required elements of the array REF. This is likely to be because the AR parameters are very close to the boundary of the stationarity region.

IFAIL = 6

The reference vector REF has been corrupted, when MODE is set to 'R' or 'C'. To proceed, the user should set MODE to 'S'.

7 Accuracy

The accuracy is limited by the matrix computations performed, and this is dependent on the condition of the parameter and covariance matrices.

8 Further Comments

Note that, in reference to IFAIL = 2, G05HDF will permit MA parameters on the boundary of the invertibility region.

The elements of REF contain amongst other information details of the spectral decompositions which are used to generate future multivariate Normals. Note that these eigenvectors may not be unique on different machines. For example the eigenvectors corresponding to multiple eigenvalues may be permuted. Although an effort is made to ensure that the eigenvectors have the same sign on all machines, differences in the signs may theoretically still occur.

The following table gives some examples of the required size of the array REF, specified by the parameter LREF, for k = 1, 2, 3, and for various values of p and q.

		q							
		0	1	2	3				
		13	20	31	46				
	0	36	56	92	144				
		85	124	199	310				
		19	30	45	64				
	1	52	88	140	208				
		115	190	301	448				
p									
		35	50	69	92				
	2	136	188	256	340				
		397	508	655	838				
		57	76	99	126				
	3	268	336	420	520				
		877	1024	1207	1426				

Note that the routine G13DXF may be used to check whether a VARMA model is stationary and invertible.

The time taken depends on the values of p, q and especially n and k.

9 Example

This program generates two realisations, each of length 48, from the bivariate AR(1) model

$$W_t - \mu = \phi_1(W_{t-1} - \mu) + \epsilon_t$$

with

$$\phi_1 = \begin{bmatrix} 0.80 & 0.07\\ 0.00 & 0.58 \end{bmatrix},$$
$$\mu = \begin{bmatrix} 5.00\\ 9.00 \end{bmatrix},$$

and

$$\Sigma = \begin{bmatrix} 2.97 & 0\\ 0.64 & 5.38 \end{bmatrix}.$$

In the first call MODE is set to 'S' in order to set up the reference vector before generating the first realisation. In the subsequent call MODE is set to 'R' and a new recent history is generated and used to generate the second realisation.

The generator mechanism used is selected by an initial call to G05ZAF.

9.1 Program Text

Note. The listing of the example program presented below uses bold italicised terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
