E01 – Interpolation

# NAG Fortran Library Routine Document

#### E01ABF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

#### 1 Purpose

E01ABF interpolates at a given point x from a table of function values evaluated at equidistant points, by Everett's formula.

# 2 Specification

SUBROUTINE E01ABF(N, P, A, G, N1, N2, IFAIL)
INTEGER

N, N1, N2, IFAIL

real

P, A(N1), G(N2)

#### 3 Description

This routine interpolates at a given point

$$x = x_0 + ph$$
, where  $-1$ 

from a table of values  $(x_0+mh)$  and  $y_m$  where  $m=-(n-1),-(n-2),\ldots,-1,0,1,\ldots,n$ . The formula used is that of Fröberg (1970), neglecting the remainder term:

$$y_p = \sum_{r=0}^{n-1} \left( \frac{1-p+r}{2r+1} \right) \delta^{2r} y_0 + \sum_{r=0}^{n-1} \left( \frac{p+r}{2r+1} \right) \delta^{2r} y_1.$$

The values of  $\delta^{2r}y_0$  and  $\delta^{2r}y_1$  are stored on exit from the routine in addition to the interpolated function value  $y_v$ .

#### 5 Parameters

1: N – INTEGER Input

On entry: n, half the number of points to be used in the interpolation.

2: P - real Input

On entry: the point p at which the interpolated function value is required i.e.,  $p = (x - x_0)/h$  with -1.0 .

*Constraint*: -1.0 < P < 1.0.

3: A(N1) - real array Input/Output

On entry: A(i) must be set to the function value  $y_{i-n}$  for i = 1, 2, ..., 2n.

On exit: the contents of A are unspecified.

[NP3546/20A] E01ABF.1

4: G(N2) - real array

Output

On exit: the array contains

$$y_0$$
 in G(1) 
$$y_1$$
 in G(2) 
$$\delta^{2r}y_0$$
 in G(2 $r+1$ ) 
$$\delta^{2r}y_1$$
 in G(2 $r+2$ ) for  $r=1,2,\ldots,n-1$ .

The interpolated function value  $y_p$  is stored in G(2n+1).

5: N1 – INTEGER Input

On entry: the value 2n, that is, N1 is equal to the number of data points.

6: N2 – INTEGER Input

On entry: the value 2n + 1, that is, N2 is one more than the number of data points.

7: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

# 6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

 $\begin{aligned} \text{IFAIL} &= 1 \\ &\quad \text{On entry, } P \leq -1.0, \\ &\quad \text{or} &\quad P \geq 1.0. \end{aligned}$ 

# 7 Accuracy

In general, increasing n improves the accuracy of the result until full attainable accuracy is reached, after which it might deteriorate. If x lies in the central interval of the data (i.e.,  $0.0 \le p \le 1.0$ ), as is desirable, an upper bound on the contribution of the highest order differences (which is usually an upper bound on the error of the result) is given approximately in terms of the elements of the array G by  $a \times (|G(2n-1)| + |G(2n)|)$ , where a = 0.1, 0.02, 0.005, 0.001, 0.0002 for n = 1, 2, 3, 4, 5 respectively, thereafter decreasing roughly by a factor of 4 each time.

#### **8** Further Comments

The computation time increases as the order of n increases.

E01 – Interpolation

# 9 Example

To interpolate at the point x = 0.28 from the function values

$$\begin{pmatrix} x_i & -1.00 & -0.50 & 0.00 & 0.50 & 1.00 & 1.50 \ y_i & 0.00 & -0.53 & -1.00 & -0.46 & 2.00 & 11.09 \end{pmatrix}$$

We take n = 3 and p = 0.56.

# 9.1 Program Text

**Note:** the listing of the example program presented below uses **bold italicised** terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
