

# NAG Fortran Library Routine Document

## F04ATF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

F04ATF calculates the accurate solution of a set of real linear equations with a single right-hand side, using an *LU* factorization with partial pivoting, and iterative refinement.

### 2 Specification

```
SUBROUTINE F04ATF(A, IA, B, N, C, AA, IAA, WKS1, WKS2, IFAIL)
INTEGER          IA, N, IAA, IFAIL
real           A(IA,*), B(*), C(*), AA(IAA,*), WKS1(*), WKS2(*)
```

### 3 Description

Given a set of real linear equations,  $Ax = b$ , the routine first computes an *LU* factorization of  $A$  with partial pivoting,  $PA = LU$ , where  $P$  is a permutation matrix,  $L$  is lower triangular and  $U$  is unit upper triangular. An approximation to  $x$  is found by forward and backward substitution in  $Ly = Pb$  and  $Ux = y$ . The residual vector  $r = b - Ax$  is then calculated using *additional precision*, and a correction  $d$  to  $x$  is found by solving  $LUd = r$ .  $x$  is replaced by  $x + d$ , and this iterative refinement of the solution is repeated until full machine accuracy is obtained.

### 4 References

### 5 Parameters

- 1:  $A(IA,*)$  – **real** array *Input*  
**Note:** the second dimension of the array  $A$  must be at least  $\max(1, N)$ .  
*On entry:* the  $n$  by  $n$  matrix  $A$ .
- 2:  $IA$  – INTEGER *Input*  
*On entry:* the first dimension of the array  $A$  as declared in the (sub)program from which F04ATF is called.  
*Constraint:*  $IA \geq \max(1, N)$ .
- 3:  $B(*)$  – **real** array *Input*  
**Note:** the dimension of the array  $B$  must be at least  $\max(1, N)$ .  
*On entry:* the right-hand side vector  $b$ .
- 4:  $N$  – INTEGER *Input*  
*On entry:*  $n$ , the order of the matrix  $A$ .  
*Constraint:*  $N \geq 0$ .

- 5:  $C(*)$  – *real* array *Output*  
**Note:** the dimension of the array  $C$  must be at least  $\max(1, N)$ .  
*On exit:* the solution vector  $x$ .
- 6:  $AA(IAA,*)$  – *real* array *Output*  
**Note:** the second dimension of the array  $AA$  must be at least  $\max(1, N)$ .  
*On exit:* the triangular factors  $L$  and  $U$ , except that the unit diagonal elements of  $U$  are not stored.
- 7:  $IAA$  – INTEGER *Input*  
*On entry:* the first dimension of the array  $AA$  as declared in the (sub)program from which F04ATF is called.  
*Constraint:*  $IAA \geq \max(1, N)$ .
- 8:  $WKS1(*)$  – *real* array *Workspace*  
**Note:** the dimension of the array  $WKS1$  must be at least  $\max(1, N)$ .
- 9:  $WKS2(*)$  – *real* array *Workspace*  
**Note:** the dimension of the array  $WKS2$  must be at least  $\max(1, N)$ .
- 10:  $IFAIL$  – INTEGER *Input/Output*  
*On entry:*  $IFAIL$  must be set to 0,  $-1$  or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.  
*On exit:*  $IFAIL = 0$  unless the routine detects an error (see Section 6).  
 For environments where it might be inappropriate to halt program execution when an error is detected, the value  $-1$  or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. **When the value  $-1$  or 1 is used it is essential to test the value of  $IFAIL$  on exit.**

## 6 Error Indicators and Warnings

If on entry  $IFAIL = 0$  or  $-1$ , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

$IFAIL = 1$

The matrix  $A$  is singular, possibly due to rounding errors.

$IFAIL = 2$

Iterative refinement fails to improve the solution, i.e., the matrix  $A$  is too ill-conditioned.

$IFAIL = 3$

On entry,  $N < 0$ ,  
 or  $IA < \max(1, N)$ ,  
 or  $IAA < \max(1, N)$ .

## 7 Accuracy

The computed solutions should be correct to full machine accuracy. For a detailed error analysis see page 107 of Wilkinson and Reinsch (1971).

## 8 Further Comments

The time taken by the routine is approximately proportional to  $n^3$ .

The routine **must not** be called with the same name for parameters B and C.

## 9 Example

To solve the set of linear equations  $Ax = b$  where

$$A = \begin{pmatrix} 33 & 16 & 72 \\ -24 & -10 & -57 \\ -8 & -4 & -17 \end{pmatrix} \quad \text{and} \quad b = \begin{pmatrix} -359 \\ 281 \\ 85 \end{pmatrix}.$$

### 9.1 Program Text

**Note:** the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
