

NAG Fortran Library Routine Document

G02BDF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

G02BDF computes means and standard deviations of variables, sums of squares and cross-products about zero, and correlation-like coefficients for a set of data.

2 Specification

```
SUBROUTINE G02BDF(N, M, X, IX, XBAR, STD, SSPZ, ISSPZ, RZ, IRZ, IFAIL)
INTEGER          N, M, IX, ISSPZ, IRZ, IFAIL
real           X(IX,M), XBAR(M), STD(M), SSPZ(ISSPZ,M), RZ(IRZ,M)
```

3 Description

The input data consists of n observations for each of m variables, given as an array

$$[x_{ij}], \quad i = 1, 2, \dots, n \quad (n \geq 2), \quad j = 1, 2, \dots, m \quad (m \geq 2),$$

where x_{ij} is the i th observation on the j th variable.

The quantities calculated are:

(a) Means:

$$\bar{x}_j = \frac{1}{n} \sum_{i=1}^n x_{ij}, \quad j = 1, 2, \dots, m.$$

(b) Standard deviations:

$$s_j = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_{ij} - \bar{x}_j)^2}, \quad j = 1, 2, \dots, m.$$

(c) Sums of squares and cross-products about zero:

$$\tilde{S}_{jk} = \sum_{i=1}^n x_{ij}x_{ik}, \quad j, k = 1, 2, \dots, m.$$

(d) Correlation-like coefficients:

$$\tilde{R}_{jk} = \frac{\tilde{S}_{jk}}{\sqrt{\tilde{S}_{jj}\tilde{S}_{kk}}}, \quad j, k = 1, 2, \dots, m.$$

If \tilde{S}_{jj} or \tilde{S}_{kk} is zero, \tilde{R}_{jk} is set to zero.

4 References

None.

5 Parameters

- 1: N – INTEGER *Input*
On entry: the number, n , of observations or cases.
Constraint: $N \geq 2$.
- 2: M – INTEGER *Input*
On entry: the number, m , of variables.
Constraint: $M \geq 2$.
- 3: X(IX,M) – *real* array *Input*
On entry: X(i, j) must be set to the value of x_{ij} , the i th observation on the j th variable, for $i = 1, 2, \dots, n$; $j = 1, 2, \dots, m$.
- 4: IX – INTEGER *Input*
On entry: the first dimension of the array X as declared in the (sub)program from which G02BDF is called.
Constraint: $IX \geq N$.
- 5: XBAR(M) – *real* array *Output*
On exit: XBAR(j) contains the mean value, \bar{x}_j , of the j th variable, for $j = 1, 2, \dots, m$.
- 6: STD(M) – *real* array *Output*
On exit: the standard deviation, s_j , of the j th variable, for $j = 1, 2, \dots, m$.
- 7: SSPZ(ISSPZ,M) – *real* array *Output*
On exit: SSPZ(j, k) is the cross-product about zero, \tilde{S}_{jk} , for $j, k = 1, 2, \dots, m$.
- 8: ISSPZ – INTEGER *Input*
On entry: the first dimension of the array SSPZ as declared in the (sub)program from which G02BDF is called.
Constraint: $ISSPZ \geq M$.
- 9: RZ(IRZ,M) – *real* array *Output*
On exit: RZ(j, k) is the correlation-like coefficient, \tilde{R}_{jk} , between the j th and k th variables, for $j, k = 1, 2, \dots, m$.
- 10: IRZ – INTEGER *Input*
On entry: the first dimension of the array RZ as declared in the (sub)program from which G02BDF is called.
Constraint: $IRZ \geq M$.
- 11: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.
On exit: IFAIL = 0 unless the routine detects an error (see Section 6).
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the

value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $N < 2$.

IFAIL = 2

On entry, $M < 2$.

IFAIL = 3

On entry, $IX < N$,
or ISSPZ < M,
or IRZ < M.

7 Accuracy

The routine does not use *additional precision* arithmetic for the accumulation of scalar products, so there may be a loss of significant figures for large n .

8 Further Comments

The time taken by the routine depends on n and m .

The routine uses a two-pass algorithm.

9 Example

The following program reads in a set of data consisting of five observations on each of three variables. The means, standard deviations, sums of squares and cross-products about zero, and correlation-like coefficients for all three variables are then calculated and printed.

9.1 Program Text

Note: the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
