

NAG Fortran Library Routine Document

G02CBF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

G02CBF performs a simple linear regression with no constant, with dependent variable y and independent variable x .

2 Specification

```
SUBROUTINE G02CBF(N, X, Y, RESULT, IFAIL)
  INTEGER          N, IFAIL
  real            X(N), Y(N), RESULT(20)
```

3 Description

The routine fits a straight line of the form

$$y = bx$$

to the data points

$$(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n),$$

such that

$$y_i = bx_i + e_i, \quad i = 1, 2, \dots, n \quad (n \geq 2).$$

The routine calculates the regression coefficient, b , and the various other statistical quantities by minimizing

$$\sum_{i=1}^n e_i^2.$$

The input data consists of the n pairs of observations $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ on the independent variable x and the dependent variable y .

The quantities calculated are:

(a) Means:

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i; \quad \bar{y} = \frac{1}{n} \sum_{i=1}^n y_i.$$

(b) Standard deviations:

$$s_x = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}; \quad s_y = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (y_i - \bar{y})^2}.$$

(c) Pearson product-moment correlation coefficient:

$$r = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2 \sum_{i=1}^n (y_i - \bar{y})^2}}.$$

(d) The regression coefficient, b :

$$b = \frac{\sum_{i=1}^n x_i y_i}{\sum_{i=1}^n x_i^2}.$$

- (e) The sum of squares attributable to the regression, SSR , the sum of squares of deviations about the regression, SSD , and the total sum of squares, SST :

$$SST = \sum_{i=1}^n y_i^2; \quad SSD = \sum_{i=1}^n (y_i - bx_i)^2, \quad SSR = SST - SSD.$$

- (f) The degrees of freedom attributable to the regression, DFR , the degrees of freedom of deviations about the regression, DFD , and the total degrees of freedom, DFT :

$$DFT = n; \quad DFD = n - 1, \quad DFR = 1.$$

- (g) The mean square attributable to the regression, MSR , and the mean square of deviations about the regression, MSD .

$$MSR = SSR/DFR; \quad MSD = SSD/DFD.$$

- (h) The F -value for the analysis of variance:

$$F = MSR/MSD.$$

- (i) The standard error of the regression coefficient:

$$se(b) = \sqrt{\frac{MSD}{\sum_{i=1}^n x_i^2}}.$$

- (j) The t -value for the regression coefficient:

$$t(b) = \frac{b}{se(b)}.$$

5 Parameters

- | | | |
|----|---|--|
| 1: | N – INTEGER | <i>Input</i> |
| | <i>On entry:</i> the number, n , of pairs of observations. | |
| | <i>Constraint:</i> $N \geq 2$. | |
| 2: | X(N) – <i>real</i> array | <i>Input</i> |
| | <i>On entry:</i> X(i) must contain x_i , for $i = 1, 2, \dots, n$. | |
| 3: | Y(N) – <i>real</i> array | <i>Input</i> |
| | <i>On entry:</i> Y(i) must contain y_i , for $i = 1, 2, \dots, n$. | |
| 4: | RESULT(20) – <i>real</i> array | <i>Output</i> |
| | <i>On exit:</i> the following information: | |
| | RESULT(1) | \bar{x} , the mean value of the independent variable, x ; |
| | RESULT(2) | \bar{y} , the mean value of the dependent variable, y ; |
| | RESULT(3) | s_x , the standard deviation of the independent variable, x ; |
| | RESULT(4) | s_y , the standard deviation of the dependent variable, y ; |
| | RESULT(5) | r , the Pearson product-moment correlation between the independent variable x and the dependent variable y ; |
| | RESULT(6) | b , the regression coefficient; |
| | RESULT(7) | the value 0.0; |
| | RESULT(8) | $se(b)$, the standard error of the regression coefficient; |
| | RESULT(9) | the value 0.0; |
| | RESULT(10) | $t(b)$, the t -value for the regression coefficient; |

RESULT(11) the value 0.0;
 RESULT(12) SSR , the sum of squares attributable to the regression;
 RESULT(13) DFR , the degrees of freedom attributable to the regression;
 RESULT(14) MSR , the mean square attributable to the regression;
 RESULT(15) F , the F -value for the analysis of variance;
 RESULT(16) SSD , the sum of squares of deviations about the regression;
 RESULT(17) DFD , the degrees of freedom of deviations about the regression;
 RESULT(18) MSD , the mean square of deviations about the regression;
 RESULT(19) SST , the total sum of squares;
 RESULT(20) DFT , the total degrees of freedom.

5: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $N < 2$.

IFAIL = 2

On entry, all N values of at least one of the variables x and y are identical.

7 Accuracy

The routine does not use *additional precision* arithmetic for the accumulation of scalar products, so there may be a loss of significant figures for large n .

If, in calculating F or $t(b)$ (see Section 3), the numbers involved are such that the result would be outside the range of numbers which can be stored by the machine, then the answer is set to the largest quantity which can be stored as a *real* variable, by means of a call to X02ALF.

8 Further Comments

Computation time depends on n .

The routine uses a two-pass algorithm.

9 Example

The following program reads in eight observations on each of two variables, and then performs a simple linear regression with no constant with the first variable as the independent variable, and the second variable as the dependent variable. Finally the results are printed.

9.1 Program Text

Note: the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
