NAG Fortran Library Routine Document

G13CAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

G13CAF calculates the smoothed sample spectrum of a univariate time series using one of four lag windows – rectangular, Bartlett, Tukey or Parzen window.

2 Specification

```
SUBROUTINE G13CAF(NX, MTX, PX, IW, MW, IC, NC, C, KC, L, LG, NXG, XG,
1                 NG, STATS, IFAIL)
INTEGER           NX, MTX, IW, MW, IC, NC, KC, L, LG, NXG, NG, IFAIL
real              PX, C(NC), XG(NXG), STATS(4)
```

3 Description

The smoothed sample spectrum is defined as

$$\hat{f}(\omega) = \frac{1}{2\pi}\left(C_0 + 2\sum_{k=1}^{M-1} w_k C_k \cos(\omega k)\right),$$

where M is the window width, and is calculated for frequency values

$$\omega_i = \frac{2\pi i}{L}, \quad i = 0, 1, \ldots, [L/2],$$

where [ ] denotes the integer part.

The autocovariances C_k may be supplied by the user, or constructed from a time series $x_1, x_2, \ldots, x_n$, as

$$C_k = \tfrac{1}{n}\sum_{t=1}^{n-k} x_t x_{t+k},$$

the fast Fourier transform (FFT) being used to carry out the convolution in this formula.

The time series may be mean or trend corrected (by classical least squares), and tapered before calculation of the covariances, the tapering factors being those of the split cosine bell:

$$\begin{aligned}
&\tfrac{1}{2}(1 - \cos(\pi(t - \tfrac{1}{2})/T)), && 1 \le t \le T\\
&\tfrac{1}{2}(1 - \cos(\pi(n - t + \tfrac{1}{2})/T)), && n + 1 - T \le t \le n\\
&1, && \text{otherwise,}
\end{aligned}$$

where $T = \left[\dfrac{np}{2}\right]$ and p is the tapering proportion.

The smoothing window is defined by

$$w_k = W\left(\frac{k}{M}\right), \quad k \le M - 1,$$

which for the various windows is defined over $0 \le \alpha < 1$ by

rectangular:

$$W(\alpha) = 1$$

Bartlett:

$$W(\alpha) = 1 - \alpha$$

Tukey:

$$W(\alpha) = \tfrac{1}{2}(1 + \cos(\pi\alpha))$$

Parzen:

$$W(\alpha) = 1 - 6\alpha^2 + 6\alpha^3, \quad 0 \leq \alpha \leq \tfrac{1}{2}$$

$$W(\alpha) = 2(1 - \alpha)^3, \qquad \tfrac{1}{2} < \alpha < 1.$$

The sampling distribution of $\hat{f}(\omega)$ is approximately that of a scaled χ^2_d variate, whose degrees of freedom d is provided by the routine, together with multiplying limits mu, ml from which approximate 95% confidence intervals for the true spectrum $f(\omega)$ may be constructed as $[ml \times \hat{f}(\omega),\ mu \times \hat{f}(\omega)]$. Alternatively, $\log \hat{f}(\omega)$ may be returned, with additive limits.

The bandwidth b of the corresponding smoothing window in the frequency domain is also provided. Spectrum estimates separated by (angular) frequencies much greater than b may be assumed to be independent.

5 Parameters

1: NX – INTEGER *Input*

On entry: the length of the time series, n.

Constraint: NX ≥ 1.

2: MTX – INTEGER *Input*

On entry: if covariances are to be calculated by the routine (IC $= 0$), MTX must specify whether the data are to be initially mean or trend corrected.

MTX $= 0$

For no correction.

MTX $= 1$

For mean correction.

MTX $= 2$

For trend correction.

Constraint: $0 \leq$ MTX ≤ 2, if IC $= 0$.

If covariances are supplied (IC $\neq 0$), MTX is not used.

3: PX – ***real*** *Input*

On entry: if covariances are to be calculated by the routine (IC $= 0$), PX must specify the proportion of the data (totalled over both ends) to be initially tapered by the split cosine bell taper. If covariances are supplied (IC $\neq 0$), then PX must specify the proportion of data tapered before the supplied covariances were calculated and after any mean or trend correction. PX is required for the calculation of output statistics. A value of 0.0 implies no tapering.

Constraint: $0.0 \leq$ PX ≤ 1.0.

4: IW – INTEGER *Input*

On entry: the choice of lag window. IW = 1 for rectangular, 2 for Bartlett, 3 for Tukey or 4 for Parzen.

Constraint: $1 \leq \text{IW} \leq 4$.

5: MW – INTEGER *Input*

On entry: the 'cut-off' point, M, of the lag window. Windowed covariances at lag M or greater are zero.

Constraint: $1 \leq \text{MW} \leq \text{NX}$.

6: IC – INTEGER *Input*

On entry: indicates whether covariances are to be calculated in the routine or supplied in the call to the routine.

IC = 0 if covariances are to be calculated,

IC $\neq$ 0 if covariances are to be supplied.

7: NC – INTEGER *Input*

On entry: the number of covariances to be calculated in the routine or supplied in the call to the routine.

Constraint: $\text{MW} \leq \text{NC} \leq \text{NX}$.

8: C(NC) – ***real*** array *Input/Output*

On entry: if IC $\neq$ 0, then C must contain the NC covariances for lags from 0 to $(\text{NC} - 1)$, otherwise C need not be set.

On exit: if IC = 0, C will contain the NC calculated covariances.

If IC $\neq$ 0, the contents of C will be unchanged.

9: KC – INTEGER *Input*

On entry: if IC = 0, KC must specify the order of the fast Fourier transform (FFT) used to calculate the covariances. KC should be a product of small primes such as 2^m where m is the smallest integer such that $2^m \geq \text{NX} + \text{NC}$, provided $m \leq 20$.

If IC $\neq$ 0, that is covariances are supplied, then KC is not used.

Constraints:

$\text{KC} \geq \text{NX} + \text{NC}$.
The largest prime factor of KC must not exceed 19, and the total number of prime factors of KC, counting repetitions, must not exceed 20. These two restrictions are imposed by C06EAF which performs the FFT.

10: L – INTEGER *Input*

On entry: the frequency division, L, of the spectral estimates as $\frac{2\pi}{L}$. Therefore it is also the order of the FFT used to construct the sample spectrum from the covariances. L should be a product of small primes such as 2^m where m is the smallest integer such that $2^m \geq 2M - 1$, provided $m \leq 20$.

Constraints:

$\text{L} \geq 2 \times \text{MW} - 1$.
The largest prime factor of L must not exceed 19, and the total number of prime factors of L, counting repetitions, must not exceed 20. These two restrictions are imposed by C06EAF which performs the FFT.

11: LG – INTEGER *Input*

On entry: indicates whether unlogged or logged spectral estimates and confidence limits are required.

LG $= 0$ for unlogged, LG $\neq 0$ for logged.

12: NXG – INTEGER *Input*

On entry: the dimension of the array XG as declared in the (sub)program from which G13CAF is called.

Constraints:

if covariances are to be calculated, i.e., IC $= 0$, NXG $\geq \max(\mathrm{KC}, \mathrm{L})$,
if covariances are supplied, i.e., if IC $\neq 0$, NXG $\geq$ L.

13: XG(NXG) – ***real*** array *Input/Output*

On entry: if the covariances are to be calculated, then XG must contain the NX data points. If covariances are supplied, XG may contain any values.

On exit: contains the NG spectral estimates, $\hat{f}(\omega_i)$, for $i = 0, 1, \ldots, [L/2]$ in XG(1) to XG(NG) respectively (logged if LG $\neq 0$). The elements XG(i), for $i = \mathrm{NG}+1, \ldots, \mathrm{NXG}$ contain 0.0.

14: NG – INTEGER *Output*

On exit: the number of spectral estimates, $[L/2]+1$, in XG.

15: STATS(4) – ***real*** array *Output*

On exit: four associated statistics. These are the degrees of freedom in STATS(1), the lower and upper 95% confidence limit factors in STATS(2) and STATS(3) respectively (logged if LG $\neq 0$), and the bandwidth in STATS(4).

16: IFAIL – INTEGER *Input/Output*

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL $= 0$ unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL $= 0$ or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL $= 1$

On entry, NX < 1,
or MTX < 0 and IC $= 0$,
or MTX > 2 and IC $= 0$,
or PX < 0.0,
or PX > 1.0,
or IW < 1,
or IW > 4,
or MW < 1,
or MW $>$ NX,

or NC $<$ MW,
or NC $>$ NX,
or NXG $<$ max(KC, L) and IC $= 0$,
or NXG $<$ L and IC $\neq 0$.

IFAIL $= 2$

On entry, KC $<$ NX + NC,
or KC has a prime factor exceeding 19,
or KC has more than 20 prime factors, counting repetitions.

This error only occurs when IC $= 0$.

IFAIL $= 3$

On entry, L $< 2 \times$ MW $- 1$,
or L has a prime factor exceeding 19,
or L has more than 20 prime factors, counting repetitions.

IFAIL $= 4$

One or more spectral estimates are negative. Unlogged spectral estimates are returned in XG, and the degrees of freedom, unlogged confidence limit factors and bandwidth in STATS.

IFAIL $= 5$

The calculation of confidence limit factors has failed. This error will not normally occur. Spectral estimates (logged if requested) are returned in XG, and degrees of freedom and bandwidth in STATS.

7 Accuracy

The FFT is a numerically stable process, and any errors introduced during the computation will normally be insignificant compared with uncertainty in the data.

8 Further Comments

G13CAF carries out two FFTs of length KC to calculate the covariances and one FFT of length L to calculate the sample spectrum. The time taken by the routine for an FFT of length n is approximately proportional to $n \log(n)$ (see Section 8 of the document for C06EAF for further details).

9 Example

The example program reads a time series of length 256. It selects the mean correction option, a tapering proportion of 0.1, the Parzen smoothing window and a cut-off point for the window at lag 100. It chooses to have 100 auto-covariances calculated and unlogged spectral estimates at a frequency division of $2\pi/200$. It then calls G13CAF to calculate the univariate spectrum and statistics and prints the autocovariances and the spectrum together with its 95% confidence multiplying limits.

9.1 Program Text

Note: the listing of the example program presented below uses ***bold italicised*** terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
