

NAG Fortran Library Routine Document

C06PCF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

C06PCF calculates the discrete Fourier transform of a sequence of n complex data values (using complex data type).

2 Specification

```
SUBROUTINE C06PCF (DIRECT, X, N, WORK, IFAIL)
  INTEGER          N, IFAIL
  complex*16     X(N), WORK(*)
  CHARACTER*1     DIRECT
```

3 Description

Given a sequence of n complex data values z_j , for $j = 0, 1, \dots, n - 1$, C06PCF calculates their (**forward** or **backward**) discrete Fourier transform defined by

$$\hat{z}_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j \times \exp\left(\pm i \frac{2\pi jk}{n}\right), \quad k = 0, 1, \dots, n - 1.$$

(Note the scale factor of $\frac{1}{\sqrt{n}}$ in this definition.) The minus sign is taken in the argument of the exponential within the summation when the forward transform is required, and the plus sign is taken when the backward transform is required. A call of the routine with `DIRECT = 'F'` followed by a call with `DIRECT = 'B'` will restore the original data.

The routine uses a variant of the fast Fourier transform (FFT) algorithm (see Brigham (1974)) known as the Stockham self-sorting algorithm, which is described in Temperton (1983b).

5 Parameters

- 1: `DIRECT` – CHARACTER*1 *Input*
On entry: if the **Forward** transform as defined in Section 3 is to be computed, then `DIRECT` must be set equal to 'F'.
 If the **Backward** transform is to be computed then `DIRECT` must be set equal to 'B'.
Constraint: `DIRECT = 'F'` or 'B'.
- 2: `X(N)` – **complex*16** array *Input/Output*
On entry: if `X` is declared with bounds $(0 : N - 1)$ in the (sub)program from which C06PCF is called, then `X(j)` must contain z_j , for $j = 0, 1, \dots, n - 1$.
On exit: the components of the discrete Fourier transform. If `X` is declared with bounds $(0 : N - 1)$ in the (sub)program from which C06PCF is called, then for $0 \leq k \leq n - 1$, \hat{z}_k is contained in `X(k)`.

- 3: N – INTEGER *Input*
On entry: n , the number of data values. The total number of prime factors of N , counting repetitions, must not exceed 30.
Constraint: $N \geq 1$.
- 4: WORK(*) – **complex*16** array *Workspace*
Note: the dimension of the array WORK must be at least $2 \times N + 15$.
 The workspace requirements as documented for C06PCF may be an overestimate in some implementations. For full details of the workspace required by this routine please refer to the Users' Note for your implementation.
On exit: the real part of WORK(1) contains the minimum workspace required for the current value of N with this implementation.
- 5: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Chapter P01 for details.
On exit: IFAIL = 0 unless the routine detects an error (see Section 6).
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $N < 1$.

IFAIL = 2

On entry, DIRECT is not equal to one of 'F' or 'B'.

IFAIL = 3

On entry, N has more than 30 prime factors.

IFAIL = 4

An unexpected error has occurred in an internal call. Check all (sub)program calls and array dimensions. Seek expert help.

7 Accuracy

Some indication of accuracy can be obtained by performing a subsequent inverse transform and comparing the results with the original sequence (in exact arithmetic they would be identical).

8 Further Comments

The time taken is approximately proportional to $n \times \log n$, but also depends on the factorization of n . C06PCF is somewhat faster than average if the only prime factors of n are 2, 3 or 5; and fastest of all if n is a power of 2.

9 Example

This example reads in a sequence of complex data values and prints their discrete Fourier transform (as computed by C06PCF with DIRECT = 'F').

It then performs an inverse transform, using C06PCF with DIRECT = 'B', and prints the sequence obtained alongside the original data values.
