

NAG Fortran Library Routine Document

C06PUF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

C06PUF computes the two-dimensional discrete Fourier transform of a bivariate sequence of complex data values (using complex data type).

2 Specification

```
SUBROUTINE C06PUF (DIRECT, M, N, X, WORK, IFAIL)
  INTEGER          M, N, IFAIL
  complex*16     X(M*N), WORK(*)
  CHARACTER*1     DIRECT
```

3 Description

C06PUF computes the two-dimensional discrete Fourier transform of a bivariate sequence of complex data values $z_{j_1 j_2}$, where $j_1 = 0, 1, \dots, m-1$ and $j_2 = 0, 1, \dots, n-1$.

The discrete Fourier transform is here defined by

$$\hat{z}_{k_1 k_2} = \frac{1}{\sqrt{mn}} \sum_{j_1=0}^{m-1} \sum_{j_2=0}^{n-1} z_{j_1 j_2} \times \exp\left(\pm 2\pi i \left(\frac{j_1 k_1}{m} + \frac{j_2 k_2}{n}\right)\right),$$

where $k_1 = 0, 1, \dots, m-1$ and $k_2 = 0, 1, \dots, n-1$.

(Note the scale factor of $\frac{1}{\sqrt{mn}}$ in this definition.) The minus sign is taken in the argument of the exponential within the summation when the forward transform is required, and the plus sign is taken when the backward transform is required. A call of the routine with DIRECT = 'F' followed by a call with DIRECT = 'B' will restore the original data.

This routine calls C06PRF to perform multiple one-dimensional discrete Fourier transforms by the fast Fourier transform (FFT) algorithm in Brigham (1974).

5 Parameters

1: DIRECT – CHARACTER*1

Input

On entry: if the **Forward** transform as defined in Section 3 is to be computed, then DIRECT must be set equal to 'F'.

If the **Backward** transform is to be computed then DIRECT must be set equal to 'B'.

Constraint: DIRECT = 'F' or 'B'.

- 2: M – INTEGER *Input*
On entry: m , the first dimension of the transform.
Constraint: $M \geq 1$.
- 3: N – INTEGER *Input*
On entry: n , the second dimension of the transform.
Constraint: $N \geq 1$.
- 4: X(M × N) – **complex*16** array *Input/Output*
On entry: the complex data values. If X is regarded as a two-dimensional array of dimension (0 : M – 1, 0 : N – 1), then X(j_1, j_2) must contain $z_{j_1 j_2}$.
On exit: the corresponding elements of the computed transform.
- 5: WORK(*) – **complex*16** array *Workspace*
Note: the dimension of the array WORK must be at least $M \times N + N + M + 30$.
 The workspace requirements as documented for C06PUF may be an overestimate in some implementations. For full details of the workspace required by this routine please refer to the Users' Note for your implementation.
On exit: the real part of WORK(1) contains the minimum workspace required for the current values of M and N with this implementation.
- 6: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, –1 or 1. If you are unfamiliar with this parameter you should refer to Chapter P01 for details.
On exit: IFAIL = 0 unless the routine detects an error (see Section 6).
 For environments where it might be inappropriate to halt program execution when an error is detected, the value –1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter the recommended value is 0. **When the value –1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or –1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $M < 1$.

IFAIL = 2

On entry, $N < 1$.

IFAIL = 3

On entry, DIRECT not equal to one of 'F' or 'B'.

IFAIL = 4

On entry, N has more than 30 prime factors.

IFAIL = 5

On entry, M has more than 30 prime factors.

IFAIL = 6

An unexpected error has occurred in an internal call. Check all (sub)program calls and array dimensions. Seek expert help.

7 Accuracy

Some indication of accuracy can be obtained by performing a subsequent inverse transform and comparing the results with the original sequence (in exact arithmetic they would be identical).

8 Further Comments

The time taken is approximately proportional to $mn \times \log(mn)$, but also depends on the factorization of the individual dimensions m and n . C06PUF is somewhat faster than average if their only prime factors are 2, 3 or 5; and fastest of all if they are powers of 2.

9 Example

This example reads in a bivariate sequence of complex data values and prints the two-dimensional Fourier transform. It then performs an inverse transform and prints the sequence so obtained, which may be compared to the original data values.
