

NAG Fortran Library Routine Document

D01BDF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

D01BDF calculates an approximation to the integral of a function over a finite interval $[a, b]$:

$$I = \int_a^b f(x) dx.$$

It is non-adaptive and as such is recommended for the integration of 'smooth' functions. These **exclude** integrands with singularities, derivative singularities or high peaks on $[a, b]$, or which oscillate too strongly on $[a, b]$.

2 Specification

```
SUBROUTINE D01BDF(F, A, B, EPSABS, EPSREL, RESULT, ABSERR)
  real F, A, B, EPSABS, EPSREL, RESULT, ABSERR
EXTERNAL F
```

3 Description

D01BDF is based on the QUADPACK routine QNG (Piessens *et al.* (1983)). It is a non-adaptive routine which uses as its basic rules, the Gauss 10-point and 21-point formulae. If the accuracy criterion is not met, formulae using 43 and 87 points are used successively, stopping whenever the accuracy criterion is satisfied.

This routine is designed for smooth integrands only.

5 Parameters

1: F – *real* FUNCTION, supplied by the user. *External Procedure*

F must return the value of the integrand f at a given point.

Its specification is:

<pre> <i>real</i> FUNCTION F(X) <i>real</i> X 1: X – <i>real</i> <i>Input</i> On entry: the point at which the integrand f must be evaluated.</pre>

F must be declared as EXTERNAL in the (sub)program from which D01BDF is called. Parameters denoted as *Input* must **not** be changed by this procedure.

- 2: *A* – *real* *Input*
On entry: the lower limit of integration, *a*.
- 3: *B* – *real* *Input*
On entry: the upper limit of integration, *b*. It is not necessary that $a < b$.
- 4: *EPSABS* – *real* *Input*
On entry: the absolute accuracy required. If *EPSABS* is negative, the absolute value is used. See Section 7.
- 5: *EPSREL* – *real* *Input*
On entry: the relative accuracy required. If *EPSREL* is negative, the absolute value is used. See Section 7.
- 6: *RESULT* – *real* *Output*
On exit: the approximation to the integral *I*.
- 7: *ABSERR* – *real* *Output*
On exit: an estimate of the modulus of the absolute error, which should be an upper bound for $|I - \text{RESULT}|$.

6 Error Indicators and Warnings

There are no specific errors detected by the routine. However, if *ABSERR* is greater than

$$\max\{\text{EPSABS}, \text{EPSREL} \times |\text{RESULT}|\}$$

this indicates that the routine has probably failed to achieve the requested accuracy within 87 function evaluations.

7 Accuracy

The routine attempts to compute an approximation, *RESULT*, such that:

$$|I - \text{RESULT}| \leq \text{tol}$$

where

$$\text{tol} = \max\{|\text{EPSABS}|, |\text{EPSREL}| \times |I|\}$$

and *EPSABS* and *EPSREL* are user-specified absolute and relative error tolerances. There can be no guarantee that this is achieved, and users are advised to subdivide the interval if they have any doubts about the accuracy obtained. Note that *ABSERR* contains an estimated bound on $|I - \text{RESULT}|$.

8 Further Comments

The time taken by the routine depends on the integrand and on the accuracy required.

9 Example

To compute

$$\int_0^1 x^2 \sin(10\pi x) dx.$$

9.1 Program Text

Note: the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
