

NAG Fortran Library Routine Document

D02PWF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

D02PWF resets the end point in an integration performed by D02PDF.

2 Specification

```
SUBROUTINE D02PWF (TENDNU, IFAIL)
  INTEGER          IFAIL
  double precision TENDNU
```

3 Description

D02PWF and its associated routines (D02PVF, D02PDF, D02PXF, D02PYF, D02PZF) solve the initial value problem for a first-order system of ordinary differential equations. The routines, based on Runge–Kutta methods and derived from RKSUITE (see Brankin *et al.* (1991)), integrate

$$y' = f(t, y) \quad \text{given} \quad y(t_0) = y_0$$

where y is the vector of n solution components and t is the independent variable.

D02PWF is used to reset the final value of the independent variable, t_f , when the integration is already underway. It can be used to extend or reduce the range of integration. The new value must be beyond the current value of the independent variable (as returned in TNOW by D02PDF) in the current direction of integration. It is much more efficient to use D02PWF for this purpose than to use D02PVF which involves the overhead of a complete restart of the integration.

If you want to change the direction of integration then you must restart by a call to D02PVF.

4 References

5 Parameters

1: TENDNU – *double precision* *Input*
On entry: the new value for t_f .

Constraint: $\text{sign}(\text{TENDNU} - \text{TNOW}) = \text{sign}(\text{TEND} - \text{TSTART})$, where TSTART and TEND are as supplied in the previous call to D02PVF and TNOW is returned by the preceding call to D02PDF. TENDNU must be distinguishable from TNOW for the method and the *machine precision* being used..

2: IFAIL – INTEGER *Input/Output*

On entry: IFAIL must be set to 0, –1 or 1. If you are unfamiliar with this parameter you should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value –1 or 1 is recommended. If the output of error messages is undesirable, then

the value 1 is recommended. Otherwise, if you are not familiar with this parameter the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, an invalid input value for TENDNU was detected or an invalid call to D02PWF was made, for example without a previous call to the integration routine D02PDF. You cannot continue integrating the problem.

7 Accuracy

Not applicable.

8 Further Comments

None.

9 Example

We integrate a two body problem. The equations for the co-ordinates $(x(t), y(t))$ of one body as functions of time t in a suitable frame of reference are

$$x'' = -\frac{x}{r^3}$$

$$y'' = -\frac{y}{r^3}, \quad r = \sqrt{x^2 + y^2}.$$

The initial conditions

$$\begin{aligned} x(0) &= 1 - \epsilon, & x'(0) &= 0 \\ y(0) &= 0, & y'(0) &= \sqrt{\frac{1 + \epsilon}{1 - \epsilon}} \end{aligned}$$

lead to elliptic motion with $0 < \epsilon < 1$. We select $\epsilon = 0.7$ and repose as

$$y'_1 = y_3$$

$$y'_2 = y_4$$

$$y'_3 = -\frac{y_1}{r^3}$$

$$y'_4 = -\frac{y_2}{r^3}$$

over the range $[0, 6\pi]$. We use relative error control with threshold values of $1.0\text{D} - 10$ for each solution component and compute the solution at intervals of length π across the range using D02PWF to reset the end of the integration range. We use a high-order Runge-Kutta method (METHOD = 3) with tolerances TOL = $1.0\text{D} - 4$ and TOL = $1.0\text{D} - 5$ in turn so that we may compare the solutions. The value of π is obtained by using X01AAF.

Note that the length of TOL = $1.0\text{D} - 4$ and WORK is large enough for any valid combination of input arguments to D02PVF.
