NAG Fortran Library Routine Document E04CCF/E04CCA

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

E04CCF/E04CCA minimizes a general function F(x) of n independent variables $x = (x_1, x_2, \dots, x_n)^T$ by the Simplex method. Derivatives of the function need not be supplied.

E04CCA is a version of E04CCF that has additional parameters in order to make it safe for use in multithreaded applications (see Section 5).

2 Specification

2.1 Specification for E04CCF

```
SUBROUTINE E04CCF (N, X, F, TOL, IW, W1, W2, W3, W4, W5, W6, FUNCT, MONIT, MAXCAL, IFAIL)

INTEGER

double precision

X(N), F, TOL, W1(N), W2(N), W3(N), W4(N), W5(IW), W6(IW,N)

EXTERNAL

FUNCT, MONIT
```

2.2 Specification for E04CCA

```
SUBROUTINE E04CCA (N, X, F, TOL, IW, W1, W2, W3, W4, W5, W6, FUNCT,

MONIT, MAXCAL, IUSER, RUSER, IFAIL)

INTEGER

N, IW, MAXCAL, IUSER(*), IFAIL

Adouble precision

X(N), F, TOL, W1(N), W2(N), W3(N), W4(N), W5(IW),

W6(IW,N), RUSER(*)

EXTERNAL

FUNCT, MONIT
```

3 Description

E04CCF/E04CCA finds an approximation to a minimum of a function of n variables. You must supply a (sub)program to calculate the value of the function for any set of values of the variables.

The method is iterative. A simplex of n+1 points is set up in the n-dimensional space of the variables (for example in 2 dimensions the simplex is a triangle) under the assumption that the problem has been scaled so that the values of the independent variables at the minimum are of order unity. The starting point you have provided is the first vertex of the simplex, the remaining n vertices are generated by the routine. The vertex of the simplex with the largest function value is reflected in the centre of gravity of the remaining vertices and the function value at this new point is compared with the remaining function values. Depending on the outcome of this test the new point is accepted or rejected, a further expansion move may be made, or a contraction may be carried out. See Nelder and Mead (1965) and Parkinson and Hutchinson (1972) for more details. When no further progress can be made the sides of the simplex are reduced in length and the method is repeated.

The method tends to be slow, but it is robust and therefore very useful for functions that are subject to inaccuracies.

5 Parameters

1: N – INTEGER Input

On entry: the number n of independent variables.

Constraint: N > 0.

2: X(N) - double precision array

Input/Output

On entry: a guess at the position of the minimum. Note that the problem should be scaled so that the values of the X(i) are of order unity.

On exit: the value of x corresponding to the function value in F.

3: F - double precision

Output

On exit: the lowest function value found.

4: TOL – *double precision*

Input

On entry: the error tolerable in the result. If f_i , for i = 1, 2, ..., n + 1, are the individual function values at the vertices of a simplex and f_m is the mean of these values, then the routine will terminate when

$$\sqrt{\frac{1}{n+1}\sum_{i=1}^{n+1}(f_i-f_m)^2}$$
 < TOL.

Constraint: TOL must be greater than or equal to the machine precision (see Chapter X02).

5: IW – INTEGER Input

On entry: the value N + 1.

Constraint: IW = N + 1.

W1(N) – double precision array Workspace 6: W2(N) – double precision array Workspace 7: 8: W3(N) – double precision array Workspace W4(N) – double precision array Workspace 9: W5(IW) – double precision array Workspace 10: W6(IW,N) – double precision array Workspace 11:

12: FUNCT – SUBROUTINE, supplied by the user.

External Procedure

FUNCT must calculate the value of the function at XC and assign this value to FC. It should be tested separately before being used in conjunction with E04CCF/E04CCA.

The specification of FUNCT for E04CCF is:

SUBROUTINE FUNCT (N, XC, FC)

INTEGER N

double precision XC(N), FC

The specification of FUNCT for E04CCA is:

SUBROUTINE FUNCT (N, XC, FC, IUSER, RUSER)

INTEGER N, IUSER(*)

double precision XC(N), FC, RUSER(*)

1: N – INTEGER Input

On entry: the number n of variables.

E04CCF/E04CCA.2 [NP3657/21]

2: XC(N) – *double precision* array

Input

On entry: the point x at which the function is required.

3: FC – double precision

Output

On exit: the value of the function F(x) at the current point x.

Note: the following are additional parameters for specific use with E04CCA. Users of E04CCF therefore need not read the remainder of this description.

4: IUSER(*) – INTEGER array

User Workspace

5: RUSER(*) – *double precision* array

User Workspace

FUNCT is called from E04CCA with the parameters IUSER and RUSER as supplied to E04CCA. You are free to use the arrays IUSER and RUSER to supply information to FUNCT.

FUNCT must be declared as EXTERNAL in the (sub)program from which E04CCF/E04CCA is called. Parameters denoted as *Input* must **not** be changed by this procedure.

13: MONIT – SUBROUTINE, supplied by the user.

External Procedure

MONIT is called once every iteration in E04CCF/E04CCA. It can be used to print out the current values of any selection of its parameters but must not be used to change the values of the parameters.

The specification of MONIT for E04CCF is:

SUBROUTINE MONIT (FMIN, FMAX, SIM, N, IS, NCALL)

INTEGER N, IS, NCALL

double precision FMIN, FMAX, SIM(IS,N)

The specification of MONIT for E04CCA is:

SUBROUTINE MONIT (FMIN, FMAX, SIM, N, IS, NCALL, IUSER, RUSER)

INTEGER
N, IS, NCALL, IUSER(*)

1: FMIN – double precision

Input

On entry: the smallest function value in the current simplex.

2: FMAX – double precision

Input

On entry: the largest function value in the current simplex.

3: SIM(IS,N) – *double precision* array

Input

On entry: the rows of SIM contain the position vectors of the vertices of the current simplex.

4: N – INTEGER

Input

On entry: the number of variables.

5: IS – INTEGER

Input

On entry: the first dimension of the array SIM.

6: NCALL – INTEGER

Input

On entry: the number of times that FUNCT has been called so far.

[NP3657/21] E04CCF/E04CCA.3

Note: the following are additional parameters for specific use with E04CCA. Users of E04CCF therefore need not read the remainder of this description.

7: IUSER(*) - INTEGER array

User Workspace

8: RUSER(*) – *double precision* array

User Workspace

MONIT is called from E04CCA with the parameters IUSER and RUSER as supplied to E04CCA. You are free to use the arrays IUSER and RUSER to supply information to MONIT.

MONIT must be declared as EXTERNAL in the (sub)program from which E04CCF/E04CCA is called. Parameters denoted as *Input* must **not** be changed by this procedure.

14: MAXCAL – INTEGER

Input

On entry: the maximum number of function evaluations to be allowed.

Constraint: $MAXCAL \ge 1$.

15: IFAIL – INTEGER

Input/Output

Note: for E04CCA, IFAIL does not occur in this position in the parameter list. See the additional parameters described below.

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

Note: the following are additional parameters for specific use with E04CCA. Users of E04CCF therefore need not read the remainder of this description.

15: IUSER(*) – INTEGER array

User Workspace

Note: the dimension of the array IUSER must be at least 1.

IUSER is not used by E04CCA, but is passed directly to the user-supplied (sub)programs FUNCT and MONIT and may be used to pass information to those routines.

16: RUSER(*) - double precision array

User Workspace

Note: the dimension of the array RUSER must be at least 1.

RUSER is not used by E04CCA, but is passed directly to the user-supplied (sub)programs FUNCT and MONIT and may be used to pass information to those routines.

17: IFAIL – INTEGER

Input/Output

Note: see the parameter description for IFAIL above.

E04CCF/E04CCA.4 [NP3657/21]

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

```
\begin{split} \text{IFAIL} &= 1 \\ &\quad \text{On entry, } N < 1, \\ &\quad \text{or} &\quad \text{TOL} < \textit{machine precision} \text{ (see Chapter X02),} \\ &\quad \text{or} &\quad \text{IW} \neq N+1, \\ &\quad \text{or} &\quad \text{MAXCAL} < 1. \end{split} \text{IFAIL} = 2
```

MAXCAL function evaluations have been completed, E04CCF/E04CCA has been terminated prematurely. Check the coding of the user-supplied (sub)program FUNCT before increasing the value of MAXCAL.

7 Accuracy

On a successful exit the accuracy will be as defined by TOL.

8 Further Comments

The time taken by E04CCF/E04CCA depends on the number of variables, the behaviour of the function and the distance of the starting point from the minimum. Each iteration consists of 1 or 2 function evaluations unless the size of the simplex is reduced, in which case n+1 function evaluations are required.

9 Example

To find a minimum of the function

$$F = e^{x_1} (4x_1^2 + 2x_2^2 + 4x_1x_2 + 2x_2 + 1).$$

9.1 Program Text

Note: the following program illustrates the use of E04CCF. An equivalent program illustrating the use of E04CCA is available with the supplied Library and is also available from the NAG web site.
