# NAG Fortran Library Routine Document

# F03ACF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

# 1 Purpose

F03ACF calculates the determinant of a real symmetric positive-definite band matrix using a Cholesky factorization.

# 2 Specification

SUBROUTINE F03ACF(A, IA, N, M, DET, RL, IL, M1, IFAIL)INTEGERIA, N, M, IL, M1, IFAILrealA(IA,M1), DET, RL(IL,M1)

# **3** Description

The determinant of A is calculated using the Cholesky factorization  $A = LL^T$ , where L is a lower triangular band matrix. The determinant of A is the product of the squares of the diagonal elements of L.

# 4 References

Wilkinson J H and Reinsch C (1971) Handbook for Automatic Computation II, Linear Algebra Springer-Verlag

### **5** Parameters

1: A(IA,M1) – *real* array

On entry: the lower triangle of the n by n positive-definite symmetric band matrix A, with the diagonal of the matrix stored in the (m + 1)th column of the array, and the m sub-diagonals within the band stored in the first m columns of the array. Each row of the matrix is stored in the corresponding row of the array. For example, if n = 5 and m = 2, the storage scheme is

(*	*	$a_{11}$
*	$a_{21}$	a <sub>22</sub>
<i>a</i> <sub>31</sub>	$a_{32}$	a <sub>33</sub>
$a_{42}$	$a_{43}$	$a_{44}$
$a_{53}$	$a_{54}$	$a_{55}$ /

The elements in the top left corner of the array are not used. The following code may be used to assign elements within the band of the lower triangle of the matrix to the correct elements of the array:

```
DO 20 I = 1, N
DO 10 J = MAX(1,I-M), I
A(I,J-I+M+1) = matrix(I,J)
10 CONTINUE
20 CONTINUE
```

#### 2: IA – INTEGER

On entry: the first dimension of the array A as declared in the (sub)program from which F03ACF is called.

*Constraint*:  $IA \ge N$ .

Input

Input

- 3: N INTEGER Input On entry: n, the order of the matrix A.
- 4: M INTEGER Input
  - On entry: m, the number of sub-diagonals within the band of A.
- 5: DET *real*

On exit: the determinant of A.

6: RL(IL,M1) – *real* array

On exit: the lower triangular matrix L, stored in the same way as A, except that in place of the diagonal elements, their reciprocals are stored.

7: IL – INTEGER

On entry: the first dimension of the array RL as declared in the (sub)program from which F03ACF is called.

*Constraint*:  $IL \ge N$ .

8: M1 – INTEGER

On entry: the value m + 1.

9: IFAIL – INTEGER

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

# 6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

The matrix A is not positive-definite, possibly due to rounding errors.

IFAIL = 2

Overflow. The value of the determinant is too large to be held in the computer.

IFAIL = 3

Underflow. The value of the determinant is too small to be held in the computer.

# 7 Accuracy

The accuracy of the determinant depends on the conditioning of the original matrix. For a detailed error analysis see page 54 of Wilkinson and Reinsch (1971).

### 8 **Further Comments**

The time taken by the routine is approximately proportional to  $n(m+1)^2$ .

This routine should only be used when  $m \ll n$  since as m approaches n, it becomes less efficient to take advantage of the band form.

### 9 Example

To calculate the determinant of the real symmetric positive-definite band matrix

$$\begin{pmatrix} 5 & -4 & 1 & & & \\ -4 & 6 & -4 & 1 & & & \\ 1 & -4 & 6 & -4 & 1 & & \\ & 1 & -4 & 6 & -4 & 1 & \\ & & 1 & -4 & 6 & -4 & 1 \\ & & 1 & -4 & 6 & -4 \\ & & & 1 & -4 & 5 \end{pmatrix}.$$

#### 9.1 Program Text

**Note:** the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
