## F04ABF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

F04ABF calculates the accurate solution of a set of real symmetric positive-definite linear equations with multiple right-hand sides, using a Cholesky factorization and iterative refinement.

### 2 Specification

```
SUBROUTINE F04ABF(A, IA, B, IB, N, M, C, IC, WKSPCE, BB, IBB, IFAIL)
INTEGER          IA, IB, N, M, IC, IBB, IFAIL
real          A(IA,*), B(IB,*), C(IC,*), WKSPCE(*), BB(IBB,*)
```

### 3 Description

Given a set of real linear equations  $AX = B$ , where  $A$  is symmetric positive-definite, this routine first computes a Cholesky factorization of  $A$  as  $A = LL^T$ , where  $L$  is lower triangular. An approximation to  $X$  is found by forward and backward substitution. The residual matrix  $R = B - AX$  is then calculated using *additional precision*, and a correction  $D$  to  $X$  is found by solving  $LL^T D = R$ .  $X$  is replaced by  $X + D$ , and this iterative refinement of the solution is repeated until full machine accuracy has been obtained.

### 4 References

### 5 Parameters

- 1:  $A(IA,*)$  – *real* array *Input/Output*  
**Note:** the second dimension of the array  $A$  must be at least  $\max(1, N)$ .  
*On entry:* the upper triangle of the  $n$  by  $n$  positive-definite symmetric matrix  $A$ . The elements of the array below the diagonal need not be set.  
*On exit:* the elements of the array below the diagonal are overwritten; the upper triangle of  $A$  is unchanged.
- 2:  $IA$  – INTEGER *Input*  
*On entry:* the first dimension of the array  $A$  as declared in the (sub)program from which F04ABF is called.  
*Constraint:*  $IA \geq \max(1, N)$ .
- 3:  $B(IB,*)$  – *real* array *Input*  
**Note:** the second dimension of the array  $B$  must be at least  $\max(1, M)$ .  
*On entry:* the  $n$  by  $m$  right-hand side matrix  $B$ .
- 4:  $IB$  – INTEGER *Input*  
*On entry:* the first dimension of the array  $B$  as declared in the (sub)program from which F04ABF is called.

- Constraint:*  $IB \geq \max(1, N)$ .
- 5: N – INTEGER *Input*  
*On entry:*  $n$ , the order of the matrix  $A$ .  
*Constraint:*  $N \geq 0$ .
- 6: M – INTEGER *Input*  
*On entry:*  $m$ , the number of right-hand sides.  
*Constraint:*  $M \geq 0$ .
- 7: C(IC,\*) – *real* array *Output*  
**Note:** the second dimension of the array  $C$  must be at least  $\max(1, M)$ .  
*On exit:* the  $n$  by  $m$  solution matrix  $X$ .
- 8: IC – INTEGER *Input*  
*On entry:* the first dimension of the array  $C$  as declared in the (sub)program from which F04ABF is called.  
*Constraint:*  $IC \geq \max(1, N)$ .
- 9: WKSPACE(\*) – *real* array *Workspace*  
**Note:** the dimension of the array WKSPACE must be at least  $\max(1, N)$ .
- 10: BB(IBM,\*) – *real* array *Output*  
**Note:** the second dimension of the array  $BB$  must be at least  $\max(1, M)$ .  
*On exit:* the final  $n$  by  $m$  residual matrix  $R = B - AX$ .
- 11: IBM – INTEGER *Input*  
*On entry:* the first dimension of the array  $BB$  as declared in the (sub)program from which F04ABF is called.  
*Constraint:*  $IBM \geq \max(1, N)$ .
- 12: IFAIL – INTEGER *Input/Output*  
*On entry:* IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.  
*On exit:*  $IFAIL = 0$  unless the routine detects an error (see Section 6).  
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

## 6 Error Indicators and Warnings

If on entry  $IFAIL = 0$  or  $-1$ , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

$IFAIL = 1$

The matrix  $A$  is not positive-definite possibly due to rounding errors.

IFAIL = 2

Iterative refinement fails to improve the solution, i.e., the matrix  $A$  is too ill-conditioned.

IFAIL = 3

On entry,  $N < 0$ ,  
 or  $M < 0$ ,  
 or  $IA < \max(1, N)$ ,  
 or  $IB < \max(1, N)$ ,  
 or  $IC < \max(1, N)$ ,  
 or  $IBB < \max(1, N)$ .

## 7 Accuracy

The computed solutions should be correct to full machine accuracy. For a detailed error analysis see page 39 of Wilkinson and Reinsch (1971).

## 8 Further Comments

The time taken by the routine is approximately proportional to  $n^3$ .

If there is only one right-hand side, it is simpler to use F04ASF.

## 9 Example

To solve the set of linear equations  $AX = B$  where

$$A = \begin{pmatrix} 5 & 7 & 6 & 5 \\ 7 & 10 & 8 & 7 \\ 6 & 8 & 10 & 9 \\ 5 & 7 & 9 & 10 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 23 \\ 32 \\ 33 \\ 31 \end{pmatrix}.$$

### 9.1 Program Text

**Note:** the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
