

NAG Fortran Library Routine Document

F08AGF (SORMQR/DORMQR)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08AGF (SORMQR/DORMQR) multiplies an arbitrary real matrix C by the real orthogonal matrix Q from a QR factorization computed by F08AEF (SGEQRF/DGEQRF) or F08BEF (SGEQPF/DGEQPF).

2 Specification

```

SUBROUTINE F08AGF(SIDE, TRANS, M, N, K, A, LDA, TAU, C, LDC, WORK,
1                LWORK, INFO)
ENTRY          sormqr(SIDE, TRANS, M, N, K, A, LDA, TAU, C, LDC, WORK,
1                LWORK, INFO)
INTEGER       M, N, K, LDA, LDC, LWORK, INFO
real        A(LDA,*), TAU(*), C(LDC,*), WORK(*)
CHARACTER*1   SIDE, TRANS

```

The ENTRY statement enables the routine to be called by its LAPACK name.

3 Description

This routine is intended to be used after a call to F08AEF (SGEQRF/DGEQRF) or F08BEF (SGEQPF/DGEQPF), which perform a QR factorization of a real matrix A . The orthogonal matrix Q is represented as a product of elementary reflectors.

This routine may be used to form one of the matrix products

$$QC, Q^T C, CQ \text{ or } CQ^T,$$

overwriting the result on C (which may be any real rectangular matrix).

A common application of this routine is in solving linear least-squares problems, as described in the F08 Chapter Introduction and illustrated in Section 9 of the document for F08AEF (SGEQRF/DGEQRF).

5 Parameters

1: SIDE – CHARACTER*1 *Input*

On entry: indicates how Q or Q^T is to be applied to C as follows:

if SIDE = 'L', Q or Q^T is applied to C from the left;

if SIDE = 'R', Q or Q^T is applied to C from the right.

Constraint: SIDE = 'L' or 'R'.

- 2: TRANS – CHARACTER*1 *Input*
On entry: indicates whether Q or Q^T is to be applied to C as follows:
 if TRANS = 'N', Q is applied to C ;
 if TRANS = 'T', Q^T is applied to C .
Constraint: TRANS = 'N' or 'T'.
- 3: M – INTEGER *Input*
On entry: m , the number of rows of the matrix C .
Constraint: $M \geq 0$.
- 4: N – INTEGER *Input*
On entry: n , the number of columns of the matrix C .
Constraint: $N \geq 0$.
- 5: K – INTEGER *Input*
On entry: k , the number of elementary reflectors whose product defines the matrix Q .
Constraints:
 $M \geq K \geq 0$ if SIDE = 'L',
 $N \geq K \geq 0$ if SIDE = 'R'.
- 6: A(LDA,*) – *real* array *Input/Output*
Note: the second dimension of the array A must be at least $\max(1, K)$.
On entry: details of the vectors which define the elementary reflectors, as returned by F08AEF (SGEQRF/DGEQRF) or F08BEF (SGEQPF/DGEQPF).
On exit: used as internal workspace prior to being restored and hence is unchanged.
- 7: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F08AGF (SORMQR/DORMQR) is called.
Constraints:
 $LDA \geq \max(1, M)$ if SIDE = 'L',
 $LDA \geq \max(1, N)$ if SIDE = 'R'.
- 8: TAU(*) – *real* array *Input*
Note: the dimension of the array TAU must be at least $\max(1, K)$.
On entry: further details of the elementary reflectors, as returned by F08AEF (SGEQRF/DGEQRF) or F08BEF (SGEQPF/DGEQPF).
- 9: C(LDC,*) – *real* array *Input/Output*
Note: the second dimension of the array C must be at least $\max(1, N)$.
On entry: the m by n matrix C .
On exit: C is overwritten by QC or $Q^T C$ or CQ or CQ^T as specified by SIDE and TRANS.
- 10: LDC – INTEGER *Input*
On entry: the first dimension of the array C as declared in the (sub)program from which F08AGF (SORMQR/DORMQR) is called.

Constraint: $LDC \geq \max(1, M)$.

11: WORK(*) – *real* array *Workspace*

Note: the dimension of the array WORK must be at least $\max(1, LWORK)$.

On exit: if INFO = 0, WORK(1) contains the minimum value of LWORK required for optimum performance.

12: LWORK – INTEGER *Input*

On entry: the dimension of the array WORK as declared in the (sub)program from which F08AGF (SORMQR/DORMQR) is called, unless LWORK = -1, in which case a workspace query is assumed and the routine only calculates the optimal dimension of WORK (using the formula given below).

Suggested value: for optimum performance LWORK should be at least $N \times nb$ if SIDE = 'L' and at least $M \times nb$ if SIDE = 'R', where *nb* is the **blocksize**.

Constraints:

$$\begin{aligned} LWORK &\geq \max(1, N) \text{ or } LWORK = -1 \text{ if SIDE = 'L',} \\ LWORK &\geq \max(1, M) \text{ or } LWORK = -1 \text{ if SIDE = 'R'.} \end{aligned}$$

13: INFO – INTEGER *Output*

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = -*i*, the *i*th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The computed result differs from the exact result by a matrix *E* such that

$$\|E\|_2 = O(\epsilon)\|C\|_2,$$

where ϵ is the *machine precision*.

8 Further Comments

The total number of floating-point operations is approximately $2nk(2m - k)$ if SIDE = 'L' and $2mk(2n - k)$ if SIDE = 'R'.

The complex analogue of this routine is F08AUF (CUNMQR/ZUNMQR).

9 Example

See Section 9 of the document for F08AEF (SGEQRF/DGEQRF).
