F08KUF (CUNMBR/ZUNMBR)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08KUF (CUNMBR/ZUNMBR) multiplies an arbitrary complex matrix C by one of the complex unitary matrices Q or P which were determined by F08KSF (CGEBRD/ZGEBRD) when reducing a complex matrix to bidiagonal form.

2 Specification

```

SUBROUTINE F08KUF(VECT, SIDE, TRANS, M, N, K, A, LDA, TAU, C, LDC, WORK,
1                LWORK, INFO)
ENTRY          cunmbr(VECT, SIDE, TRANS, M, N, K, A, LDA, TAU, C, LDC, WORK,
1                LWORK, INFO)
INTEGER       M, N, K, LDA, LDC, LWORK, INFO
complex     A(LDA,*), TAU(*), C(LDC,*), WORK(*)
CHARACTER*1   VECT, SIDE, TRANS

```

The ENTRY statement enables the routine to be called by its LAPACK name.

3 Description

This routine is intended to be used after a call to F08KSF (CGEBRD/ZGEBRD), which reduces a complex rectangular matrix A to real bidiagonal form B by a unitary transformation: $A = QB P^H$. F08KSF (CGEBRD/ZGEBRD) represents the matrices Q and P^H as products of elementary reflectors.

This routine may be used to form one of the matrix products

$$QC, Q^H C, CQ, CQ^H, PC, P^H C, CP \text{ or } CP^H,$$

overwriting the result on C (which may be any complex rectangular matrix).

5 Parameters

Note: in the description below, r denotes the order of Q or P^H : $r = M$ if SIDE = 'L' and $r = N$ if SIDE = 'R'.

1: VECT – CHARACTER*1

Input

On entry: indicates whether Q or Q^H or P or P^H is to be applied to C as follows:

if VECT = 'Q', Q or Q^H is applied to C ;

if VECT = 'P', P or P^H is applied to C .

Constraint: VECT = 'Q' or 'P'.

- 2: SIDE – CHARACTER*1 *Input*
On entry: indicates how Q or Q^H or P or P^H is to be applied to C as follows:
 if SIDE = 'L', Q or Q^H or P or P^H is applied to C from the left;
 if SIDE = 'R', Q or Q^H or P or P^H is applied to C from the right.
Constraint: SIDE = 'L' or 'R'.
- 3: TRANS – CHARACTER*1 *Input*
On entry: indicates whether Q or P or Q^H or P^H is to be applied to C as follows:
 if TRANS = 'N', Q or P is applied to C ;
 if TRANS = 'C', Q^H or P^H is applied to C .
Constraint: TRANS = 'N' or 'C'.
- 4: M – INTEGER *Input*
On entry: m_C , the number of rows of the matrix C .
Constraint: $M \geq 0$.
- 5: N – INTEGER *Input*
On entry: n_C , the number of columns of the matrix C .
Constraint: $N \geq 0$.
- 6: K – INTEGER *Input*
On entry: if VECT = 'Q', the number of columns in the original matrix A ; if VECT = 'P', the number of rows in the original matrix A .
Constraint: $K \geq 0$.
- 7: A(LDA,*) – **complex** array *Input/Output*
Note: the second dimension of the array A must be at least $\max(1, \min(r, K))$ if VECT = 'Q' and at least $\max(1, r)$ if VECT = 'P'.
On entry: details of the vectors which define the elementary reflectors, as returned by F08KSF (CGEBRD/ZGEBRD).
On exit: used as internal workspace prior to being restored and hence is unchanged.
- 8: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F08KUF (CUNMBR/ZUNMBR) is called.
Constraints:
 $LDA \geq \max(1, r)$ if VECT = 'Q',
 $LDA \geq \max(1, \min(r, K))$ if VECT = 'P'.
- 9: TAU(*) – **complex** array *Input*
Note: the dimension of the array TAU must be at least $\max(1, \min(r, K))$.
On entry: further details of the elementary reflectors, as returned by F08KSF (CGEBRD/ZGEBRD) in its parameter $TAUQ$ if VECT = 'Q', or in its parameter $TAUP$ if VECT = 'P'.

- 10: C(LDC,*) – **complex** array Input/Output
Note: the second dimension of the array C must be at least $\max(1, N)$.
On entry: the matrix C.
On exit: C is overwritten by QC or $Q^H C$ or CQ or CQ^H or PC or $P^H C$ or CP or CP^H as specified by VECT, SIDE and TRANS.
- 11: LDC – INTEGER Input
On entry: the first dimension of the array C as declared in the (sub)program from which F08KUF (CUNMBR/ZUNMBR) is called.
Constraint: $LDC \geq \max(1, M)$.
- 12: WORK(*) – **complex** array Workspace
Note: the dimension of the array WORK must be at least $\max(1, LWORK)$.
On exit: if INFO = 0, the real part of WORK(1) contains the minimum value of LWORK required for optimum performance.
- 13: LWORK – INTEGER Input
On entry: the dimension of the array WORK as declared in the (sub)program from which F08KUF (CUNMBR/ZUNMBR) is called, unless LWORK = -1, in which case a workspace query is assumed and the routine only calculates the optimal dimension of WORK (using the formula given below).
Suggested value: for optimum performance LWORK should be at least $N \times nb$ if SIDE = 'L' and at least $M \times nb$ if SIDE = 'R', where *nb* is the **blocksize**.
Constraints:
 $LWORK \geq \max(1, N)$ or LWORK = -1 if SIDE = 'L',
 $LWORK \geq \max(1, M)$ or LWORK = -1 if SIDE = 'R'.
- 14: INFO – INTEGER Output
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = -*i*, the *i*th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The computed result differs from the exact result by a matrix *E* such that

$$\|E\|_2 = O(\epsilon)\|C\|_2,$$

where ϵ is the **machine precision**.

8 Further Comments

The total number of real floating-point operations is approximately

$$8n_C k(2m_C - k) \text{ if SIDE = 'L' and } m_C \geq k;$$

$$8m_C k(2n_C - k) \text{ if SIDE = 'R' and } n_C \geq k;$$

$$8m_C^2 n_C \quad \text{if SIDE = 'L' and } m_C < k;$$

$$8m_C n_C^2 \quad \text{if SIDE = 'R' and } n_C < k;$$

where k is the value of the parameter K .

The real analogue of this routine is F08KGF (SORMBR/DORMBR).

9 Example

For this routine two examples are presented. Both illustrate how the reduction to bidiagonal form of a matrix A may be preceded by a QR or LQ factorization of A .

In the first example, $m > n$, and

$$A = \begin{pmatrix} 0.96 - 0.81i & -0.03 + 0.96i & -0.91 + 2.06i & -0.05 + 0.41i \\ -0.98 + 1.98i & -1.20 + 0.19i & -0.66 + 0.42i & -0.81 + 0.56i \\ 0.62 - 0.46i & 1.01 + 0.02i & 0.63 - 0.17i & -1.11 + 0.60i \\ -0.37 + 0.38i & 0.19 - 0.54i & -0.98 - 0.36i & 0.22 - 0.20i \\ 0.83 + 0.51i & 0.20 + 0.01i & -0.17 - 0.46i & 1.47 + 1.59i \\ 1.08 - 0.28i & 0.20 - 0.12i & -0.07 + 1.23i & 0.26 + 0.26i \end{pmatrix}.$$

The routine first performs a QR factorization of A as $A = Q_a R$ and then reduces the factor R to bidiagonal form B : $R = Q_b B P^H$. Finally it forms Q_a and calls F08KUF (CUNMBR/ZUNMBR) to form $Q = Q_a Q_b$.

In the second example, $m < n$, and

$$A = \begin{pmatrix} 0.28 - 0.36i & 0.50 - 0.86i & -0.77 - 0.48i & 1.58 + 0.66i \\ -0.50 - 1.10i & -1.21 + 0.76i & -0.32 - 0.24i & -0.27 - 1.15i \\ 0.36 - 0.51i & -0.07 + 1.33i & -0.75 + 0.47i & -0.08 + 1.01i \end{pmatrix}.$$

The routine first performs an LQ factorization of A as $A = L P_a^H$ and then reduces the factor L to bidiagonal form B : $L = Q B P_b^H$. Finally it forms P_b^H and calls F08KUF (CUNMBR/ZUNMBR) to form $P^H = P_b^H P_a^H$.

9.1 Program Text

Note: the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
