

# NAG Fortran Library Routine Document

## G02BNF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

### 1 Purpose

G02BNF computes Kendall and/or Spearman non-parametric rank correlation coefficients for a set of data; the data array is overwritten with the ranks of the observations.

### 2 Specification

```

SUBROUTINE G02BNF(N, M, X, IX, ITYPE, RR, IRR, KWORKA, KWORKB, WORK1,
1                WORK2, IFAIL)
INTEGER          N, M, IX, ITYPE, IRR, KWORKA(N), KWORKB(N), IFAIL
real          X(IX,M), RR(IRR,M), WORK1(M), WORK2(M)

```

### 3 Description

The input data consists of  $n$  observations for each of  $m$  variables, given as an array

$$[x_{ij}], \quad i = 1, 2, \dots, n \ (n \geq 2), j = 1, 2, \dots, m \ (m \geq 2),$$

where  $x_{ij}$  is the  $i$ th observation of the  $j$ th variable.

The quantities calculated are:

(a) Ranks:

For a given variable,  $j$  say, each of the  $n$  observations,  $x_{1j}, x_{2j}, \dots, x_{nj}$ , has associated with it an additional number, the 'rank' of the observation, which indicates the magnitude of that observation relative to the magnitudes of the other  $n - 1$  observations on that same variable.

The smallest observation for variable  $j$  is assigned the rank 1, the second smallest observation for variable  $j$  the rank 2, the third smallest the rank 3, and so on until the largest observation for variable  $j$  is given the rank  $n$ .

If a number of cases all have the same value for the given variable,  $j$ , then they are each given an 'average' rank, e.g., if in attempting to assign the rank  $h + 1$ ,  $k$  observations were found to have the same value, then instead of giving them the ranks

$$h + 1, h + 2, \dots, h + k,$$

all  $k$  observations would be assigned the rank

$$\frac{2h + k + 1}{2}$$

and the next value in ascending order would be assigned the rank

$$h + k + 1.$$

The process is repeated for each of the  $m$  variables.

Let  $y_{ij}$  be the rank assigned to the observation  $x_{ij}$  when the  $j$ th variable is being ranked. The actual observations  $x_{ij}$  are replaced by the ranks  $y_{ij}$ .

## (b) Non parametric rank correlation coefficients

## (i) Kendall's tau:

$$R_{jk} = \frac{\sum_{h=1}^n \sum_{i=1}^n \text{sign}(y_{hj} - y_{ij}) \text{sign}(y_{hk} - y_{ik})}{\sqrt{[n(n-1) - T_j][n(n-1) - T_k]}}, \quad j, k = 1, 2, \dots, m,$$

where  $\text{sign } u = 1$  if  $u > 0$ ,

$\text{sign } u = 0$  if  $u = 0$ ,

$\text{sign } u = -1$  if  $u < 0$ ,

and  $T_j = \sum t_j(t_j - 1)$ , where  $t_j$  is the number of ties of a particular value of variable  $j$ , and the summation is over all tied values of variable  $j$ .

## (ii) Spearman's:

$$R_{jk}^* = \frac{n(n^2 - 1) - 6 \sum_{i=1}^n (y_{ij} - y_{ik})^2 - \frac{1}{2}(T_j^* + T_k^*)}{\sqrt{[n(n^2 - 1) - T_j^*][n(n^2 - 1) - T_k^*]}}, \quad j, k = 1, 2, \dots, m,$$

where  $T_j^* = \sum t_j(t_j^2 - 1)$ ,  $t_j$  being the number of ties of a particular value of variable  $j$ , and the summation being over all tied values of variable  $j$ .

## 5 Parameters

- 1: N – INTEGER *Input*  
*On entry:* the number,  $n$ , of observations or cases.  
*Constraint:*  $N \geq 2$ .
- 2: M – INTEGER *Input*  
*On entry:* the number,  $m$ , of variables.  
*Constraint:*  $M \geq 2$ .
- 3: X(IX,M) – *real* array *Input/Output*  
*On entry:* X( $i, j$ ) must be set to  $x_{ij}$ , the value of the  $i$ th observation on the  $j$ th variable, for  $i = 1, 2, \dots, n$ ;  $j = 1, 2, \dots, m$ .  
*On exit:* X( $i, j$ ) contains the rank  $y_{ij}$  of the observation  $x_{ij}$ , for  $i = 1, 2, \dots, n$ ;  $j = 1, 2, \dots, m$ .
- 4: IX – INTEGER *Input*  
*On entry:* the first dimension of the array X as declared in the (sub)program from which G02BNF is called.  
*Constraint:*  $IX \geq N$ .
- 5: ITYPE – INTEGER *Input*  
*On entry:* the type of correlation coefficients which are to be calculated. If ITYPE = -1, only Kendall's tau coefficients are calculated; if ITYPE = 0, both Kendall's tau and Spearman's coefficients are calculated; if ITYPE = 1, only Spearman's coefficients are calculated.
- 6: RR(IRR,M) – *real* array *Output*  
*On exit:* the requested correlation coefficients. If only Kendall's tau coefficients are requested (ITYPE = -1), then RR( $j, k$ ) contains Kendall's tau for the  $j$ th and  $k$ th variables; if only

Spearman's coefficients are requested ( $ITYPE = 1$ ), then  $RR(j, k)$  contains Spearman's rank correlation coefficient for the  $j$ th and  $k$ th variables. If both Kendall's tau and Spearman's coefficients are requested ( $ITYPE = 0$ ), then the upper triangle of  $RR$  contains the Spearman coefficients and the lower triangle the Kendall coefficients. That is, for the  $j$ th and  $k$ th variables, where  $j$  is less than  $k$ ,  $RR(j, k)$  contains the Spearman rank correlation coefficient, and  $RR(k, j)$  contains Kendall's tau, for  $j, k = 1, 2, \dots, m$ .

(Diagonal terms,  $RR(j, j)$ , are unity for all three values of  $ITYPE$ .)

7: IRR – INTEGER *Input*

*On entry:* the first dimension of the array  $RR$  as declared in the (sub)program from which G02BNF is called.

*Constraint:*  $IRR \geq M$ .

8: KWORKA(N) – INTEGER array *Workspace*

9: KWORKB(N) – INTEGER array *Workspace*

10: WORK1(M) – *real* array *Workspace*

11: WORK2(M) – *real* array *Workspace*

12: IFAIL – INTEGER *Input/Output*

*On entry:* IFAIL must be set to 0,  $-1$  or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

*On exit:* IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value  $-1$  or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. **When the value  $-1$  or 1 is used it is essential to test the value of IFAIL on exit.**

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or  $-1$ , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry,  $N < 2$ .

IFAIL = 2

On entry,  $M < 2$ .

IFAIL = 3

On entry,  $IX < N$ ,  
or  $IRR < M$ .

IFAIL = 4

On entry,  $ITYPE < -1$ ,  
or  $ITYPE > 1$ .

## 7 Accuracy

The method used is believed to be stable.

## 8 Further Comments

The time taken by the routine depends on  $n$  and  $m$ .

## 9 Example

The example program reads in a set of data consisting of nine observations on each of three variables. The program then calculates and prints the rank of each observation, and both Kendall's tau and Spearman's rank correlation coefficients for all three variables.

### 9.1 Program Text

**Note:** the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.

## 9.3 Program Results

G02BNF Example Program Results

Number of variables (columns) = 3  
 Number of cases (rows) = 9

Data matrix is:-

	1	2	3
1	1.7000	1.0000	0.5000
2	2.8000	4.0000	3.0000
3	0.6000	6.0000	2.5000
4	1.8000	9.0000	6.0000
5	0.9900	4.0000	2.5000
6	1.4000	2.0000	5.5000
7	1.8000	9.0000	7.5000
8	2.5000	7.0000	0.0000
9	0.9900	5.0000	3.0000

Matrix of ranks:-

	1	2	3
1	5.0000	1.0000	2.0000
2	9.0000	3.5000	5.5000
3	1.0000	6.0000	3.5000
4	6.5000	8.5000	8.0000
5	2.5000	3.5000	3.5000
6	4.0000	2.0000	7.0000
7	6.5000	8.5000	9.0000
8	8.0000	7.0000	1.0000
9	2.5000	5.0000	5.5000

Matrix of rank correlation coefficients:

Upper triangle -- Spearman's  
 Lower triangle -- Kendall's tau

	1	2	3
1	1.0000	0.2246	0.1186
2	0.0294	1.0000	0.3814
3	0.1176	0.2353	1.0000
