

# NAG Fortran Library Routine Document

## G05MDF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

G05MDF generates a vector of pseudo-random integers from the discrete logarithmic distribution with parameter  $a$ .

### 2 Specification

```
SUBROUTINE G05MDF(MODE, A, N, X, IGEN, ISEED, R, NR, IFAIL)
INTEGER          MODE, N, X(N), IGEN, ISEED(4), NR, IFAIL
real           A, R(NR)
```

### 3 Description

G05MDF generates  $n$  integers  $x_i$  from a discrete logarithmic distribution, where the probability of  $x_i = I$  is

$$P(x_i = I) = -\frac{(a^I)}{(I \times \log(1 - a))} \quad I = 1, 2, \dots,$$

where  $0 < a < 1$ .

The variates can be generated with or without using a search table and index. If a search table is used then it is stored with the index in a reference vector and subsequent calls to G05MDF with the same parameter value can then use this reference vector to generate further variates.

One of the initialisation routines G05KBF (for a repeatable sequence if computed sequentially) or G05KCF (for a non-repeatable sequence) must be called prior to the first call to G05MDF.

### 4 References

### 5 Parameters

1: MODE – INTEGER *Input*

*On entry:* a code for selecting the operation to be performed by the routine:

MODE = 0

Set up reference vector only.

MODE = 1

Generate variates using reference vector set up in a prior call to G05MDF.

MODE = 2

Set up reference vector and generate variates.

MODE = 3

Generate variates without using the reference vector.

*Constraint:*  $0 \leq \text{MODE} \leq 3$ .

- 2: *A* – *real* *Input*  
*On entry:* the parameter *a* of the logarithmic distribution.  
*Constraint:*  $0.0 < A < 1.0$ .
- 3: *N* – INTEGER *Input*  
*On entry:* the number, *n*, of pseudo-random numbers to be generated.  
*Constraint:*  $N \geq 1$ .
- 4: *X(N)* – INTEGER array *Output*  
*On exit:* the *n* pseudo-random numbers from the specified logarithmic distribution.
- 5: *IGEN* – INTEGER *Input*  
*On entry:* must contain the identification number for the generator to be used to return a pseudo-random number and should remain unchanged following initialisation by a prior call to one of the routines G05KBF or G05KCF.
- 6: *ISEED(4)* – INTEGER array *Input/Output*  
*On entry:* contains values which define the current state of the selected generator.  
*On exit:* contains updated values defining the new state of the selected generator.
- 7: *R(NR)* – *real* array *Input/Output*  
*On exit:* the reference vector.
- 8: *NR* – INTEGER *Input*  
*On entry:* the dimension of the array *R* as declared in the (sub)program from which G05MDF is called.  
*Suggested value:*  $NR = 10 + \frac{40}{1-A}$ .  
*Constraints:*  
     if *MODE* = 0 or 2, then *NR* must not be too small, but the lower limit is too complicated to specify;  
     if *MODE* = 1, then *NR* should remain unchanged from the previous call to G05MDF;  
     if *MODE* = 3, then *R* is not referenced.
- 9: *IFAIL* – INTEGER *Input/Output*  
*On entry:* *IFAIL* must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.  
*On exit:* *IFAIL* = 0 unless the routine detects an error (see Section 6).  
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

## 6 Error Indicators and Warnings

If on entry *IFAIL* = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry,  $N < 1$ .

IFAIL = 2

On entry, NR is too small when  $\text{MODE} = 0$  or  $2$  (see Section 5).

IFAIL = 3

On entry,  $A \leq 0.0$   
or  $A \geq 1.0$ .

IFAIL = 4

On entry,  $\text{MODE} < 0$   
or  $\text{MODE} > 3$ .

IFAIL = 5

$\text{MODE} = 0$  or  $2$  and  $A$  is so close to  $1$  that NR would have to be larger than the largest representable integer. Use  $\text{MODE} = 3$  in this case.

IFAIL = 6

$A$  is not the same as when R was set up in a previous call with  $\text{MODE} = 0$  or  $2$ .

## 7 Accuracy

Not applicable.

## 8 Further Comments

None.

## 9 Example

The example program prints five pseudo-random integers from a logarithmic distribution with parameter  $a = 0.999$ , generated by a single call to G05MDF, after initialisation by G05KBF.

### 9.1 Program Text

**Note:** the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
