

# NAG Toolbox for MATLAB

## f08np

### 1 Purpose

f08np computes the eigenvalues and, optionally, the left and/or right eigenvectors for an  $n$  by  $n$  complex nonsymmetric matrix  $A$ .

Optionally, it also computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors, reciprocal condition numbers for the eigenvalues, and reciprocal condition numbers for the right eigenvectors.

### 2 Syntax

```
[a, w, vl, vr, ilo, ihi, scale, abnrm, rconde, rcondv, info] =  
f08np(balanc, jobvl, jobvr, sense, a, 'n', n)
```

### 3 Description

The right eigenvector  $v_j$  of  $A$  satisfies

$$Av_j = \lambda_j v_j$$

where  $\lambda_j$  is the  $j$ th eigenvalue of  $A$ . The left eigenvector  $u_j$  of  $A$  satisfies

$$u_j^H A = \lambda_j u_j^H$$

where  $u_j^H$  denotes the conjugate transpose of  $u_j$ .

Balancing a matrix means permuting the rows and columns to make it more nearly upper triangular, and applying a diagonal similarity transformation  $DAD^{-1}$ , where  $D$  is a diagonal matrix, with the aim of making its rows and columns closer in norm and the condition numbers of its eigenvalues and eigenvectors smaller. The computed reciprocal condition numbers correspond to the balanced matrix. Permuting rows and columns will not change the condition numbers (in exact arithmetic) but diagonal scaling will. For further explanation of balancing, see Section 4.8.1.2 of Anderson *et al.* 1999.

Following the optional balancing, the matrix  $A$  is first reduced to upper Hessenberg form by means of unitary similarity transformations, and the  $QR$  algorithm is then used to further reduce the matrix to upper triangular Schur form,  $T$ , from which the eigenvalues are computed. Optionally, the eigenvectors of  $T$  are also computed and backtransformed to those of  $A$ .

### 5 Parameters

#### 5.1 Compulsory Input Parameters

##### 1: balanc – string

Indicates how the input matrix should be diagonally scaled and/or permuted to improve the conditioning of its eigenvalues.

**balanc** = 'N'

Do not diagonally scale or permute.

**balanc** = 'P'

Perform permutations to make the matrix more nearly upper triangular. Do not diagonally scale.

**balanc** = 'S'

Diagonally scale the matrix, i.e., replace  $A$  by  $DAD^{-1}$ , where  $D$  is a diagonal matrix chosen to make the rows and columns of  $A$  more equal in norm. Do not permute.

**balanc** = 'B'

Both diagonally scale and permute  $A$ .

Computed reciprocal condition numbers will be for the matrix after balancing and/or permuting. Permuting does not change condition numbers (in exact arithmetic), but balancing does.

*Constraint:* **balanc** = 'N', 'P', 'S' or 'B'.

2: **jobvl** – string

If **jobvl** = 'N', the left eigenvectors of  $A$  are not computed.

If **jobvl** = 'V', the left eigenvectors of  $A$  are computed.

If **sense** = 'E' or 'B', **jobvl** must be set to **jobvl** = 'V'.

*Constraint:* **jobvl** = 'N' or 'V'.

3: **jobvr** – string

If **jobvr** = 'N', the right eigenvectors of  $A$  are not computed.

If **jobvr** = 'V', the right eigenvectors of  $A$  are computed.

If **sense** = 'E' or 'B', **jobvr** must be set to **jobvr** = 'V'.

*Constraint:* **jobvr** = 'N' or 'V'.

4: **sense** – string

Determines which reciprocal condition numbers are computed.

**sense** = 'N'

None are computed.

**sense** = 'E'

Computed for eigenvalues only.

**sense** = 'V'

Computed for right eigenvectors only.

**sense** = 'B'

Computed for eigenvalues and right eigenvectors.

If **sense** = 'E' or 'B', both left and right eigenvectors must also be computed (**jobvl** = 'V' and **jobvr** = 'V').

*Constraint:* **sense** = 'N', 'E', 'V' or 'B'.

5: **a(lda,\*)** – complex array

The first dimension of the array **a** must be at least  $\max(1, \mathbf{n})$

The second dimension of the array must be at least  $\max(1, \mathbf{n})$

The  $n$  by  $n$  matrix  $A$ .

## 5.2 Optional Input Parameters

1: **n** – **int32 scalar**

*Default:* The first dimension of the array **a** and the second dimension of the array **a**. (An error is raised if these dimensions are not equal.)

$n$ , the order of the matrix  $A$ .

*Constraint:*  $n \geq 0$ .

## 5.3 Input Parameters Omitted from the MATLAB Interface

lda, ldvl, ldvr, work, lwork, rwork

## 5.4 Output Parameters

1: **a(lda,\*)** – **complex array**

The first dimension of the array **a** must be at least  $\max(1, n)$

The second dimension of the array must be at least  $\max(1, n)$

**a** has been overwritten. If **jobvl** = 'V' or **jobvr** = 'V',  $A$  contains the Schur form of the balanced version of the matrix  $A$ .

2: **w(\*)** – **complex array**

**Note:** the dimension of the array **w** must be at least  $\max(1, n)$ .

Contains the computed eigenvalues.

3: **vl(ldvl,\*)** – **complex array**

The first dimension, **ldvl**, of the array **vl** must satisfy

if **jobvl** = 'V',  $\text{ldvl} \geq \max(1, n)$ ;  
 $\text{ldvl} \geq 1$  otherwise.

The second dimension of the array must be at least  $\max(1, n)$

If **jobvl** = 'V', the left eigenvectors  $u_j$  are stored one after another in the columns of **vl**, in the same order as their corresponding eigenvalues.

If **jobvl** = 'N', **vl** is not referenced.

$u_j = \text{vl}(:, j)$ , the  $j$ th column of **vl**.

4: **vr(ldvr,\*)** – **complex array**

The first dimension, **ldvr**, of the array **vr** must satisfy

if **jobvr** = 'V',  $\text{ldvr} \geq \max(1, n)$ ;  
 $\text{ldvr} \geq 1$  otherwise.

The second dimension of the array must be at least  $\max(1, n)$

If **jobvr** = 'V', the right eigenvectors  $v_j$  are stored one after another in the columns of **vr**, in the same order as their corresponding eigenvalues.

If **jobvr** = 'N', **vr** is not referenced.

$v_j = \text{vr}(:, j)$ , the  $j$ th column of **vr**.

5: **ilo** – int32 scalar

6: **ihi** – int32 scalar

**ilo** and **ihi** are integer values determined when  $A$  was balanced. The balanced  $A$  has  $a_{ij} = 0$  if  $i > j$  and  $j = 1, \dots, \mathbf{ilo} - 1$  or  $i = \mathbf{ihi} + 1, \dots, \mathbf{n}$ .

7: **scale**(\*) – double array

**Note:** the dimension of the array **scale** must be at least  $\max(1, \mathbf{n})$ .

Details of the permutations and scaling factors applied when balancing  $A$ .

If  $p_j$  is the index of the row and column interchanged with row and column  $j$ , and  $d_j$  is the scaling factor applied to row and column  $j$ , then

$$\mathbf{scale}(j) = p_j, \text{ for } j = 1, \dots, \mathbf{ilo} - 1;$$

$$\mathbf{scale}(j) = d_j, \text{ for } j = \mathbf{ilo}, \dots, \mathbf{ihi};$$

$$\mathbf{scale}(j) = p_j, \text{ for } j = \mathbf{ihi} + 1, \dots, \mathbf{n}.$$

The order in which the interchanges are made is  $\mathbf{n}$  to  $\mathbf{ihi} + 1$ , then 1 to  $\mathbf{ilo} - 1$ .

8: **abnrm** – double scalar

The 1-norm of the balanced matrix (the maximum of the sum of absolute values of elements of any column).

9: **rconde**(\*) – double array

**Note:** the dimension of the array **rconde** must be at least  $\max(1, \mathbf{n})$ .

**rconde**( $j$ ) is the reciprocal condition number of the  $j$ th eigenvalue.

10: **rcondv**(\*) – double array

**Note:** the dimension of the array **rcondv** must be at least  $\max(1, \mathbf{n})$ .

**rcondv**( $j$ ) is the reciprocal condition number of the  $j$ th right eigenvector.

11: **info** – int32 scalar

**info** = 0 unless the function detects an error (see Section 6).

## 6 Error Indicators and Warnings

Errors or warnings detected by the function:

**info** =  $-i$

If **info** =  $-i$ , parameter  $i$  had an illegal value on entry. The parameters are numbered as follows:

1: **balanc**, 2: **jobvl**, 3: **jobvr**, 4: **sense**, 5: **n**, 6: **a**, 7: **lda**, 8: **w**, 9: **vl**, 10: **ldvl**, 11: **vr**, 12: **ldvr**, 13: **ilo**, 14: **ihi**, 15: **scale**, 16: **abnrm**, 17: **rconde**, 18: **rcondv**, 19: **work**, 20: **lwork**, 21: **rwork**, 22: **info**.

It is possible that **info** refers to a parameter that is omitted from the MATLAB interface. This usually indicates that an error in one of the other input parameters has caused an incorrect value to be inferred.

**info** > 0

If **info** =  $i$ , the  $QR$  algorithm failed to compute all the eigenvalues, and no eigenvectors or condition numbers have been computed; elements 1 :  $\mathbf{ilo} - 1$  and  $i + 1$  :  $\mathbf{n}$  of **w** contain eigenvalues which have converged.

## 7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix  $(A + E)$ , where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and  $\epsilon$  is the *machine precision*. See Section 4.8 of Anderson *et al.* 1999 for further details.

## 8 Further Comments

Each eigenvector is normalized to have Euclidean norm equal to unity and the element of largest absolute value real and positive.

The total number of floating-point operations is proportional to  $n^3$ .

The real analogue of this function is f08nb.

## 9 Example

```

balanc = 'Balance';
jobvl = 'Vectors (left)';
jobvr = 'Vectors (right)';
sense = 'Both reciprocal condition numbers';
a = [complex(-3.97, -5.04), complex(-4.11, +3.7), complex(-0.34, +1.01),
      complex(1.29, -0.86);
      complex(0.34, -1.5), complex(1.52, -0.43), complex(1.88, -5.38),
      complex(3.36, +0.65);
      complex(3.31, -3.85), complex(2.5, +3.45), complex(0.88, -1.08),
      complex(0.64, -1.48);
      complex(-1.1, +0.82), complex(1.81, -1.59), complex(3.25, +1.33),
      complex(1.57, -3.44)];
[aOut, w, vl, vr, ilo, ihi, scale, abnrm, rconde, rcondv, info] =
f08np(balanc, jobvl, jobvr, sense, a)
