WARNING REGARDING MEDICAL AND CLINICAL USE OF NATIONAL INSTRUMENTS PRODUCTS

FCC/DOC Radio Frequency Interference Class B Compliance

This equipment generates and uses radio frequency energy and, if not installed and used in strict accordance with the instructions in this manual, may cause interference to radio and television reception. Classification requirements are the same for the Federal Communications Commission (FCC) and the Canadian Department of Communications (DOC). This equipment has been tested and found to comply with the following two regulatory agencies:

Federal Communications Commission

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Notices to User*:* ***Changes or modifications not expressly approved by National Instruments could void the user's authority to operate the equipment under the FCC Rules.***

*****This device complies with the FCC rules only if used with shielded interface cables of suitable quality and construction. National Instruments used such cables to test this device and provides them for sale to the user. The use of inferior or nonshielded interface cables could void the user's authority to operate the equipment under the FCC rules.***

If necessary, consult National Instruments or an experienced radio/television technician for additional suggestions. The following booklet prepared by the FCC may also be helpful: *Interference to Home Electronic Entertainment Equipment Handbook.* This booklet is available from the U.S. Government Printing Office, Washington, DC 20402.

Canadian Department of Communications

This Class B digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de la classe B respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.

Glossary

Figures

Tables

This manual contains instructions for installing and configuring the National Instruments AT-GPIB/TNT or AT-GPIB interface board and the NI-488.2M software for Windows NT. The NI-488.2M software is intended for use with Microsoft Windows NT version 3.51 or higher.

This manual assumes that you are already familiar with the Windows NT operating system.

How to Use the Manual Set
Use this getting started manual to install and configure your GPIB board and the NI-488.2M software for Windows NT.

Use the *NI-488.2M User Manual for Windows 95 and Windows NT* to learn the basics of GPIB and how to develop an application program. You can also use the User Manual as a reference for debugging information and detailed examples.

Use the *NI-488.2M Function Reference Manual for Win32* for specific NI-488 function and NI-488.2 routine information, such as format, parameters, and possible errors.

Organization of This Manual

This manual is organized as follows:

- Chapter 1, *Introduction*, explains how to use this manual, lists what you need to get started, and briefly describes the GPIB board and the NI-488.2M software.

- Chapter 2, *Hardware Configuration and Installation,* contains instructions to help you configure and install your GPIB board.

- Chapter 3, *Software Installation and Configuration*, contains instructions to help you install and configure your NI-488.2M software for Windows NT.

- Chapter 4, *Installation Verification*, describes how to verify the hardware and software installation.

- Chapter 5, *Begin to Use the GPIB Software,* helps you get started with the NI-488.2M software for Windows NT.

- Appendix A, *Hardware Specifications*, describes the electrical, physical, and environmental characteristics of the GPIB boards and the recommended operating conditions.

- Appendix B, *Troubleshooting and Common Questions*, contains troubleshooting information and the answers to common questions.

- Appendix C, *Customer Communication*, contains forms you can use to request help from National Instruments or to comment on our products and manuals.

- The *Glossary* contains an alphabetical list and description of terms that appear in this manual, including abbreviations, acronyms, metric prefixes, mnemonics, and symbols.

Conventions Used in This Manual

The following conventions appear in this manual.

»	The **»** symbol leads you through nested menu items and dialog box options to a final action. The sequence **File»Page Setup»Options»Substitute Fonts** directs you to pull down the **File** menu, select the **Page Setup** item, select **Options**, and finally select the **Substitute Fonts** options from the last dialog box.
AT-GPIB/TNT	AT-GPIB/TNT refers to a National Instruments GPIB board for the ISA bus equipped with the TNT4882C ASIC.
AT-GPIB	AT-GPIB refers to a National Instruments GPIB board for the ISA bus equipped with the NAT4882 and Turbo488 ASICs.
bold	Bold text denotes the names of menus, menu items, parameters, dialog boxes, dialog box buttons or options, icons, windows, or LEDs.
bold italic	Bold italic text denotes a note, caution, or warning.
`bold monospace`	Bold text in this font denotes the messages and responses that the computer automatically prints to the screen. This font also emphasizes lines of code that are unique from the other examples.
GPIB board	GPIB board refers generically to either the AT-GPIB/TNT or AT-GPIB board when information can apply to either board.
IEEE 488 and IEEE 488.2	IEEE 488 and IEEE 488.2 refer to the ANSI/IEEE Standard 488.1-1987 and the ANSI/IEEE Standard 488.2-1992, respectively, which define the GPIB.
italic	Italic text denotes emphasis, a cross reference, or an introduction to a key concept. This font also denotes text for which you supply the appropriate word or value, as in Windows 3.*x*.
`italic monospace`	Italic text in this font denotes that you must supply the appropriate words or values in the place of these items.

monospace   Text in this font denotes text or characters that you should literally enter from the keyboard, sections of code, programming examples, and syntax examples. This font can also denote the proper names of disk drives, paths, directories, programs, subprograms, subroutines, device names, functions, operations, variables, filenames and extensions, and for statements and comments taken from programs.

The *Glossary* lists abbreviations, acronyms, metric prefixes, mnemonics, symbols, and terms.

Related Documentation

The following documents contain information that you may find helpful as you read this manual.

- ANSI/IEEE Standard 488.1-1987, *IEEE Standard Digital Interface for Programmable Instrumentation*

- ANSI/IEEE Standard 488.2-1992, *IEEE Standard Codes, Formats, Protocols, and Common Commands*

- *Microsoft Windows NT System Guide*, Microsoft Corporation

Customer Communication

National Instruments wants to receive your comments on our products and manuals. We are interested in the applications you develop with our products, and we want to help if you have problems with them. To make it easy for you to contact us, this manual contains comment and configuration forms for you to complete. These forms are in Appendix C, *Customer Communication*, at the end of this manual.

Introduction
This chapter explains how to use this manual, lists what you need to get started, and briefly describes the GPIB board and the NI-488.2M software.

How to Use This Manual
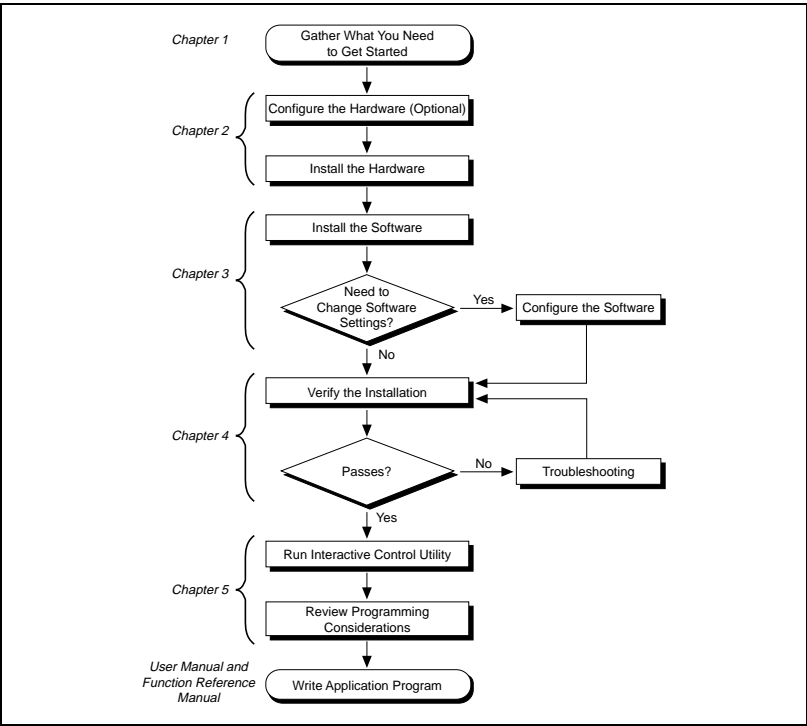

What You Need to Get Started

❑ One of the following boards:
      AT-GPIB/TNT
      AT-GPIB

❑ The following 3.5 in., high density (1.44 MB) disks, which your kit contains:
      GPIB Software for Windows NT (Setup Disk)
      GPIB Software for Windows NT (NI-488.2M Software)

❑ Windows NT Version 3.51 or higher installed on your computer

Hardware Description

The AT-GPIB/TNT board, equipped with the TNT4882C ASIC, uses the NI-488.2M software to transform any ISA or EISA bus computer into a fully functional GPIB Talker/Listener/Controller that has complete communications and bus management capability. The TNT4882C chip combines the circuitry of the NAT4882 ASIC, the Turbo488 performance-enhancing ASIC, and GPIB transceivers to create a single-chip IEEE 488.2 Talker/Listener/Controller interface. The TNT4882C also implements the HS488 high-speed protocol, which increases the maximum data transfer rate of the AT-GPIB/TNT to 3.4 Mbytes/s, when used in an EISA computer. For more information about HS488, refer to Chapter 7, *GPIB Programming Techniques,* in the *NI-488.2M User Manual for Windows 95 and Windows NT.*

The AT-GPIB board, equipped with NAT4882 and Turbo488 ASICs, also uses the NI-488.2M software to transform any ISA or EISA bus computer into a fully functional IEEE 488.2 Talker/Listener/Controller that has complete communications and bus management capability. The NAT4882 controller chip is fully compatible with the IEEE 488.2 standard. The Turbo488 performance-enhancing ASIC boosts GPIB read and write transfers to rates exceeding 1 Mbytes/s.

The AT-GPIB/TNT board is fully compatible with all versions of AT-GPIB hardware. You can use standard GPIB cables to connect the AT-GPIB/TNT with up to 14 instruments. You can connect the AT-GPIB

board with up to 13 instruments. If you want to use more than the maximum number of instruments, you can order a bus extender or expander from National Instruments. Refer to Appendix A, *Hardware Specifications,* for more information about the GPIB hardware specifications and operating conditions.

Software Description

The NI-488.2M software for Windows NT includes a loadable Windows NT kernel device driver and supporting utilities.

NI-488.2M Software Components

The NI-488.2M software package includes the following components:

- Device driver

- Diagnostic test

- Configuration utility

- Interactive control program

- Utilities for software development and debugging

- Language interface library for Microsoft Visual C/C++, Borland C/C++, and Visual Basic

- Virtual device driver and special DOS and Windows 3 drivers for running existing NI-488.2 for DOS and Windows 3 applications under Windows NT

- Example programs that use NI-488 functions and NI-488.2 routines

For a detailed list of files, refer to the *NI-488.2M User Manual for Windows 95 and Windows NT*.

Hardware Configuration and Installation
This chapter contains instructions to help you configure and install your GPIB board.

Warning: *Electrostatic discharge can damage several components on your GPIB board. To avoid electrostatic damage when you handle the board, touch the antistatic plastic package to a metal part of your computer chassis before you remove the board from the package.*

Using the Hardware Default Settings

The GPIB board default settings are suitable for most computer systems. However, if the default settings conflict with another device in your system, or if you need to install more than one GPIB board, you must reconfigure the hardware.

Table 2-1 shows the default settings for the switches and jumpers on the GPIB board.

Table 2-1. Hardware Default Settings

GPIB Board Setting	Default
Base I/O Address (hex)	2C0
DMA Channel	5
Interrupt Line (IRQ)	11

To modify the default settings of the GPIB board, proceed to the
Configure the Hardware (Optional) section of this chapter. If you do not
need to reconfigure the board, proceed to the *Install the Hardware*
section.

Note to EISA Users

If you have an EISA bus-based computer, you should use the EISA
configuration files included on your NI-488.2M distribution disk(s) to
configure your GPIB board. The `!NICC304.CFG` file is the configuration
file for the AT-GPIB/TNT and the `!NICC005.CFG` file is the
configuration file for the AT-GPIB. Both files are located on the first
distribution disk. Follow the instructions that came with your computer to
copy the appropriate EISA configuration file to your EISA configuration
disk. Then, run your EISA configuration program, which uses the
information in the configuration file, to help you select appropriate
settings for the GPIB hardware. After the program determines the
settings, you must manually set the DIP switches and jumpers on the
GPIB hardware to match the selections.

The DIP switches on the GPIB board use negative logic; the OFF position
of a switch represents a logic one and the ON position represents a logic
zero. As a result, some of the screens in your EISA configuration
program might show a pattern of ones and zeros which is exactly
opposite of the correct way to set your switch. To be sure you are setting
the switch correctly, set it according to the ON and OFF pattern instead
of the graphic representation of ones and zeros.

To modify the default settings of the GPIB board, proceed to the
Configure the Hardware (Optional) section of this chapter. If you do not
need to reconfigure the board, proceed to the *Install the Hardware*
section.

Install the Hardware

Perform the following steps to install your GPIB board.

1. Turn off your computer. Keep the computer plugged in so that it
    remains grounded while you install the GPIB hardware.

2. Remove the top cover (or other access panels) to give yourself access to the computer expansion slots.

3. Find an unused expansion slot in your computer. The GPIB board requires a 16-bit ISA expansion slot.

4. Remove the corresponding slot cover on the back panel of the computer.

5. Insert the GPIB board into the slot with the GPIB connector sticking out of the opening on the back panel, as shown in Figure 2-1. It might be a tight fit, but do not force the board into place.
Figure 2-1. Installing the GPIB Board

6. Screw the mounting bracket of the GPIB board to the back panel rail of the computer.

7. Replace the top cover (or the access port to the expansion slot).

8.   Turn on your computer and start Windows NT.

The GPIB board hardware installation is now complete. Proceed to the *Install the Software* section in Chapter 3, *Software Installation and Configuration*.

Configure the Hardware (Optional)

Follow the instructions in this section to change the hardware default settings of the GPIB board. The GPIB board default settings are suitable for most computer systems. However, if the default settings conflict with another device in your system, or if you need to install more than one GPIB board, you must reconfigure the hardware.

The default settings for the switches and jumpers on the GPIB board are as follows:

- Base I/O Address (hex): 2C0
- DMA Channel: 5
- Interrupt Line (IRQ): 11

Refer to Figure 2-2 or Figure 2-3 to locate the switches and jumpers on your GPIB board.

Figure 2-2 shows the location of the configuration jumpers and switches on the AT-GPIB/TNT board.
Figure 2-2. AT-GPIB/TNT Parts Locator Diagram

1	Product Name, Revision Letter, and Assembly Number	4	DMA Channel
2	Base I/O Address (SW1)	5	Interrupt Level
3	Serial Number	6	Shield Ground (W3)

Figure 2-3 shows the location of the configuration jumpers and switches on the AT-GPIB board.

1	Product Name and Revision Letter	5	Interrupt Level
2	Assembly Number	6	Base I/O Address (U25)
3	Serial Number	7	Shield Ground (W1)
4	DMA Channel		
Figure 2-3. AT-GPIB Parts Locator Diagram

Selecting the Base I/O Address

Computers with an ISA or EISA bus have a segment of memory reserved for input and output. This segment is referred to as the I/O address space. The base I/O address of a plug-in board such as the GPIB board is the first position in the I/O address space the plug-in interface board occupies.

By default, the GPIB board is configured to use base I/O address 2C0 hex. With this setting, the board uses the I/O address space 2C0 hex through 2DF hex. If another device is already using this address range, or if you are installing more than one board, follow these steps to reconfigure the base I/O address setting.

1. Choose a new base I/O address setting. If you are installing more than one GPIB board, each board must use a unique base I/O address.

   Table 2-2 lists the possible switch settings, the corresponding base I/O addresses, and the I/O address space used for each setting. The default settings are in bold italic text.

Table 2-2. Possible Base I/O Address Switch Settings

Switch Setting					Base I/O Address (hex)	I/O Address Space Used (hex)
A9	**A8**	**A7**	**A6**	**A5**		
0	1	0	0	0	100	100 to 11F
0	1	0	0	1	120	120 to 13F
0	1	0	1	0	140	140 to 15F
0	1	0	1	1	160	160 to 17F
0	1	1	0	0	180	180 to 19F
0	1	1	0	1	1A0	1A0 to 1BF
0	1	1	1	0	1C0	1C0 to 1DF
0	1	1	1	1	1E0	1E0 to 1FF
1	0	0	0	0	200	200 to 21F
1	0	0	0	1	220	220 to 23F
1	0	0	1	0	240	240 to 25F
1	0	0	1	1	260	260 to 27F
1	0	1	0	0	280	280 to 29F
1	0	1	0	1	2A0	2A0 to 2BF
1	*0*	*1*	*1*	*0*	*2C0*	*2C0 to 2DF*
1	0	1	1	1	2E0	2E0 to 2FF
1	1	0	0	0	300	300 to 31F
1	1	0	0	1	320	320 to 33F
1	1	0	1	0	340	340 to 35F
1	1	0	1	1	360	360 to 37F
1	1	1	0	0	380	380 to 39F
1	1	1	0	1	3A0	3A0 to 3BF
1	1	1	1	0	3C0	3C0 to 3DF
1	1	1	1	1	3E0	3E0 to 3FF

2. Locate the base I/O address switch at SW1 on your AT-GPIB/TNT board or at U25 on your AT-GPIB board. Refer to the appropriate parts locator diagram, Figure 2-2 or 2-3.

3. Change the switch settings to configure the GPIB board to the new base I/O address.

    Press down on the side marked OFF to select a binary value of 1 for the corresponding address bit. Press down on the ON side of the switch to select a binary value of 0. Refer to Figure 2-4 for an example of the switch settings and corresponding base I/O addresses.
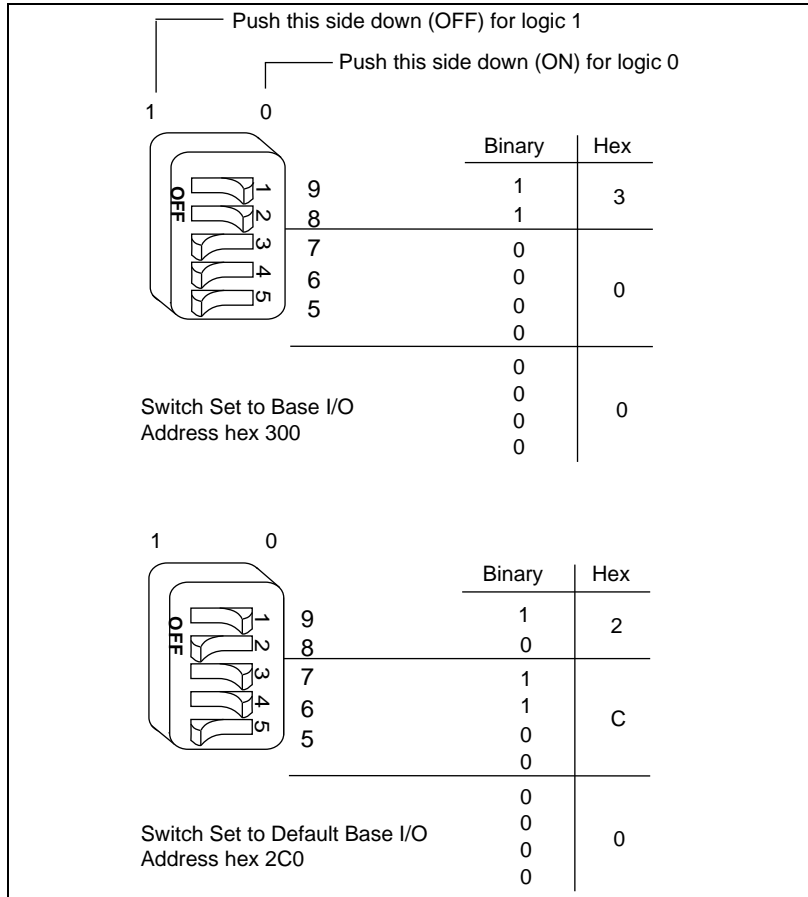

Figure 2-4. Base I/O Address Switch Settings

4. Record your new settings on the *Hardware and Software Configuration Form* in Appendix C, *Customer Communication*.

5. Remember that after you install the NI-488.2M software, you must use the GPIB Configuration utility to configure your software settings to match your new hardware settings. Refer to the *Configure the Software (Optional)* section in Chapter 3, *Software Installation and Configuration*, for information on the GPIB Configuration utility.

Selecting the Interrupt Request Line

Computers with an ISA or EISA bus have a series of interrupt lines available to devices. Devices use interrupts to get immediate service from the CPU for asynchronous events. Your GPIB hardware and the NI-488.2M software use interrupts to get service from the CPU when necessary.

☞   **Note:**   *Do not disable interrupts. The NI-488.2M software for Windows NT requires interrupts to be enabled. It does not work properly with interrupts disabled.*

By default, the GPIB board is configured to use interrupt request line 11. If this is not an acceptable setting or if you are installing more than one board, follow these steps to reconfigure the interrupt request line:

1. Choose a new interrupt request line (IRQ) setting.

    You can configure the GPIB board to use any of the following interrupt lines: IRQ3, 4, 5, 7, 9, 10, 11, 12, or 15. Do not use interrupt line 6 or interrupt line 14. On most systems, the diskette drive controller uses interrupt line 6 and the hard disk drive controller uses interrupt line 14.

    If you are installing more than one GPIB board, each board must use a unique IRQ setting.

2. Find the jumpers that set the interrupt request line. The jumpers are located on the lower edge of your GPIB board. Refer to the appropriate parts locator diagram, Figure 2-2 or 2-3.

3. Change the jumper settings to configure the GPIB board to the new interrupt request line.

To use lines 10, 11, 12, or 15, use the jumper block shown in Figure 2-5. To use interrupt lines 3, 4, 5, 7, or 9, use the jumper block shown in Figure 2-6.

Figure 2-5 shows the setting for IRQ11.
Figure 2-5. Interrupt Jumper Setting for IRQ11 (Default Setting)

Figure 2-6 shows the setting for IRQ5.
Figure 2-6. Interrupt Jumper Setting for IRQ5

4. Record your new settings on the *Hardware and Software Configuration Form* in Appendix C, *Customer Communication*.

5. Remember that after you install the NI-488.2M software, you must use the GPIB Configuration utility to configure your software settings to match your new hardware settings. Refer to the *Configure the Software (Optional)* section in Chapter 3, *Software Installation and Configuration*, for information on the GPIB Configuration utility.

Selecting the DMA Channel

Direct memory access (DMA) refers to data transfers directly to or directly from devices such as the GPIB board and computer memory. Your GPIB hardware and the NI-488.2M software are designed to perform DMA. In most cases, data transfers using DMA are significantly faster than programmed I/O transfers, which use more CPU time.

By default, the GPIB board is configured to use DMA channel 5. If this is not an acceptable setting or if you are installing more than one board, complete the following steps to reconfigure the DMA channel.

1. Choose a new DMA channel setting.

    You can use channel 5, 6, or 7. If you are installing more than one GPIB board, each board must either use a unique DMA channel or must not use DMA at all.

2. Locate the jumpers that select the DMA channel. Refer to the appropriate parts locator diagram, Figure 2-2 or 2-3.

3. Change the jumper settings to configure the GPIB board to the new DMA channel. To select a new DMA channel, you must set both the DMA Acknowledge and DMA Request lines, as shown in Table 2-3.

Table 2-3. DMA Channels

DMA Channel	Signal Lines	
	DMA Acknowledge	DMA Request
5	DACK5	DRQ5
6	DACK6	DRQ6
7	DACK7	DRQ7

Figure 2-7 shows the jumper position for selecting DMA channel 7.
Figure 2-7. DMA Channel Jumper Setting for DMA Channel 7

4. Record your new settings on the *Hardware and Software Configuration Form* in Appendix C, *Customer Communication*.

5. Remember that after you install the NI-488.2M software, you must use the GPIB Configuration utility to configure your software setting to match your new hardware settings. Refer to the *Configure the Software (Optional)* section in Chapter 3*, Software Installation and Configuration*, for information on the GPIB Configuration utility.

Using Programmed I/O for GPIB Transfers

As an alternative to DMA transfers, you can use programmed I/O. To use programmed I/O, disable DMA for the GPIB board by moving the jumpers as shown in Figure 2-8.
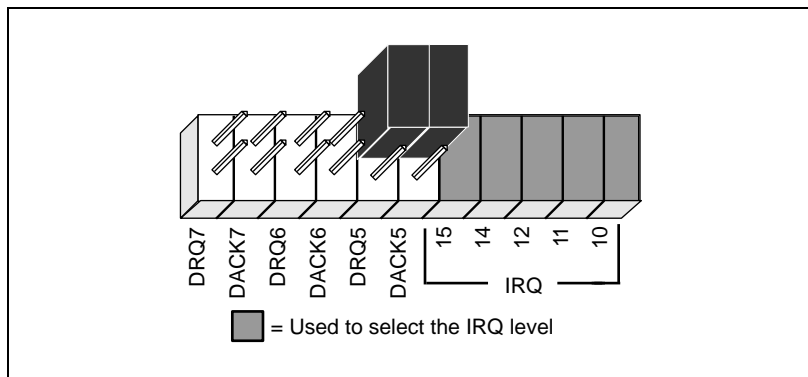

Figure 2-8. DMA Jumper Setting for No DMA Channel

Setting the Shield Ground Configuration

The GPIB board is set at the factory with the jumper in place to connect the logic ground of the GPIB board to its shield ground. This configuration minimizes EMI emissions.

Caution: *The GPIB board was tested for compliance with FCC standards with the shield ground connected to logic ground. Removing the jumper might cause EMI emissions to exceed any or all of the applicable standards*

If your application requires that logic ground be disconnected from shield ground, follow these steps:

1. Refer to Figure 2-2 to locate the shield ground jumper W3 on the AT-GPIB/TNT board. If you are using the AT-GPIB board, refer to Figure 2-3 to locate the shield ground jumper W1.

2. Remove the jumper and place it across only one of the jumper pins, as shown in Figure 2-9.

a. Logic Ground Connected to Shield Ground (Default)

b. Logic Ground Disconnected from Shield Ground
Figure 2-9. Ground Configuration Jumper Settings

3. Record the jumper setting on the *Hardware and Software Configuration Form* in Appendix C, *Customer Communication*.

Now that you have properly configured the hardware, return to the *Install the Hardware* section at the beginning of this chapter for the installation instructions.

Software Installation and Configuration
This chapter contains instructions to help you install and configure your NI-488.2M software for Windows NT.

Install the Software

After you have installed and configured the hardware, you are ready to install the NI-488.2M software. Complete the following steps to run the software installation program.

1. Log onto your Windows NT system using the `Administrator` account. The NI-488.2M installation program must have `Administrator` privileges because the program modifies the configuration registry of your computer.

2. Insert the NI-488.2M software for Windows NT distribution disk into an unused drive.

3. Windows NT 3.51: Select **Run...** from the **File** menu in the **Program Manager**.

   Windows NT 4.0 or higher: Select **Run...** from the **Start** menu.

   Type the following command into the dialog box:

   `x:\setup`

   where `x` is the letter of the drive containing the distribution disk (usually `a` or `b`).

   The software installation begins with the following screen.

Figure 3-1. NI-488.2M Software for Windows NT Installation Screen

The setup program takes you through the necessary steps to install the NI-488.2M software. For help during the installation, click on the **Help** button. You can exit the setup program at any time by clicking on the **Exit** button.

When the setup program has finished copying the software onto your computer, it attempts to start the NI-488.2M driver. If the setup program cannot start the driver, it instructs you to restart Windows NT, which forces the driver to load.

If you modified the hardware configuration or installed more than one GPIB board, you must reconfigure the software. Refer to the next section, *Configure the Software (Optional)*, for instructions on running the GPIB Configuration utility. If you do not need to run the GPIB Configuration utility, refer to Chapter 4, *Installation Verification*, for instructions on verifying the hardware and software installation.

Configure the Software (Optional)

The GPIB Configuration utility is an interactive utility you can use to examine or modify the configuration of the driver. You must run the GPIB Configuration utility if you changed any of the hardware default settings or if you installed more than one GPIB board. Follow these steps to run the utility:

1. Double-click on the **GPIB** icon in the **Control Panel**.

    Windows NT 3.51: Open the **Control Panel** in the **Main** group of the **Program Manager**.

    Windows NT 4.0 or higher: Select **Start»Settings»Control Panel**.

    The GPIB Configuration utility displays a list of all the GPIB boards and device names.

2. Double-click on any name to examine or edit it. You can use the online help if you have any questions. For more information about GPIB Configuration utility options, refer to the *NI-488.2M User Manual for Windows 95 and Windows NT* or use the online help.

3. Click on the **OK** button to save your changes.

After you have installed and configured the software, you should verify the installation. Continue to the next chapter, Chapter 4, *Installation Verification*.

Chapter

4

Installation Verification
This chapter describes how to verify the hardware and software installation.

You can use the Diagnostic utility, installed with your GPIB software, to test the hardware and software installation. The Diagnostic utility verifies that your hardware and software are functioning properly and that the configuration of your GPIB interfaces does not conflict with anything else in your system.

Follow these instructions to run the Diagnostic utility:

Windows NT 3.51: Double-click on the **Diagnostic** icon in the **NI-488.2M Software for Windows NT** group of the **Program Manager**.

Windows NT 4.0 or higher: Select the **Diagnostic** item under **Start»Programs»NI-488.2M Software for Windows NT**.

When you have started the Diagnostic utility, test your GPIB interfaces by clicking on the **Test All** button. If the Diagnostic utility test is successful, it puts a check mark next to the interface and changes its status from "untested" to "passed." If the Diagnostic utility test fails, it puts an X next to the interface, and changes its status from "untested" to "failed." Figure 4-1 shows the Diagnostic utility dialog box after it has tested some GPIB interfaces.
Figure 4-1. Diagnostic Utility after Testing

You can get details on any of the tested GPIB interfaces by selecting the interface and clicking on the **Details** button. For each failed GPIB interface, select it and click on the **Details** button to get a description of the failure encountered. Use that information and the information in Appendix B, *Troubleshooting and Common Questions*, to troubleshoot the problem. There is also extensive troubleshooting information in the Diagnostic online help.

Begin to Use the GPIB Software
This chapter helps you get started with the NI-488.2M software for Windows NT.

Introduction to the Win32 Interactive Control Utility

You can use the interactive control utility to enter NI-488 functions and NI-488.2 routines interactively and see the values the function calls return. You can use this utility to do the following:

- Verify GPIB communication with your device quickly and easily.

- Learn the NI-488 functions and NI-488.2 routines before you write your application.

- Become familiar with the commands of your device.

- Receive data from your GPIB device.

- Troubleshoot problems with your application.

Follow these instructions to run the Win32 Interactive Control Utility:

Windows NT 3.51: Double-click on the **Win32 Interactive Control** icon in the **NI-488.2M Software for Windows NT** group of the **Program Manager**.

Windows NT 4.0 or higher: Select the **Win32 Interactive Control** item under **Start»Programs»NI-488.2M Software for Windows NT**.

This utility includes extensive online help. For more information about the Win32 Interactive Control utility, refer to the *NI-488.2M User Manual for Windows 95 and Windows NT*.

Introduction to the GPIB Spy Utility

Included with the NI-488.2M software is GPIB Spy, a Win32 utility that you can use to monitor NI-488.2M calls made by Win32, Win16, and DOS GPIB applications. You can use GPIB Spy to do the following:

- Capture information about NI-488 functions and NI-488.2M routines as your GPIB applications invoke them.

- Display captured information, including, but not limited to, input and output parameter values, I/O buffer contents, and return values.

- Save, restore, and print captured information.

Follow these instructions to run GPIB Spy:

Windows NT 3.51: Double-click on the **GPIB Spy** icon in the **NI-488.2M Software for Windows NT** group of the **Program Manager**.

Windows NT 4.0 or higher: Select the **GPIB Spy** item under **Start»Programs»NI-488.2M Software for Windows NT**.

For more information about the GPIB Spy utility, refer to Chapter 5, *GPIB Spy Utility*, in the *NI-488.2M User Manual for Windows 95 and Windows NT*, or use the GPIB Spy context-sensitive online help.

General Programming Considerations

As you begin developing your Win32 NI-488.2M application, remember the following points:

- For your C/C++ application, you must include the NI-488.2M header file in your source code.

- You can access the NI-488.2M software through the 32-bit DLL, `gpib-32.dll`, either by linking with one of the language interfaces provided with the NI-488.2M software, or by using direct DLL entry from any programming environment.

- Several sample GPIB applications are included with the NI-488.2M software. Use these as a guide for your own application development.

For information about choosing a programming method, developing your application, or compiling and linking, refer to the *NI-488.2M User Manual for Windows 95 and Windows NT*. For detailed information about each NI-488 function and NI-488.2 routine, refer to the *NI-488.2M Function Reference Manual for Win32*.

Running Existing DOS and Windows GPIB Applications

You can run existing DOS and Windows GPIB applications under Windows NT by using the GPIB Virtual Device Driver, gpib-vdd.dll, which is included with your NI-488.2M software.

To run DOS GPIB applications, load the special GPIB device driver gpib-nt.com instead of gpib.com, which you normally use with DOS. When you install the NI-488.2M software, the installation program copies gpib-nt.com into a new subdirectory called doswin16. To use gpib-nt.com, you must modify your config.nt file to load gpib-nt.com whenever a DOS application runs. The config.nt file is located in your *winnt*\system32 directory, where *winnt* is your Windows NT directory, for example, c:\windows. To load gpib-nt.com, add the following line to your config.nt file:

device=*path*\doswin16\gpib-nt.com

where *path* is the directory where you installed the GPIB software (the default installation directory is c:\gpib-nt).

To run 16-bit Windows GPIB applications, the system uses the special GPIB dynamic link library, gpib.dll. When you install the NI-488.2M software, the installation program copies gpib.dll into the *winnt*\system32 directory, where *winnt* is your Windows NT directory, for example c:\windows. As long as gpib.dll is in your Windows NT directory, your system automatically accesses gpib.dll whenever you launch a 16-bit Windows GPIB application.

Hardware Specifications
This appendix describes the electrical, physical, and environmental characteristics of the GPIB boards and the recommended operating conditions.

Table A-1. Electrical Characteristics for the AT-GPIB/TNT

Characteristic	Specification
Maximum GPIB Transfer Rates:	
3-Wire (IEEE 488)	1.4 Mbytes/s*
High Speed (HS488):	
In ISA Computer	1.6 Mbytes/s*
In EISA Computer	3.4 Mbytes/s*
Power Requirement (from PC AT I/O channel)	+5 VDC 50 mA Typical 120 mA Maximum
* Actual speed may vary considerably from speed shown due to system and instrumentation capabilities.	

Table A-2. Electrical Characteristics for the AT-GPIB

Characteristic	Specification

Maximum GPIB Transfer Rates:
 	
  Reads
  Writes
	
	1.3 Mbytes/s*
	1.3 Mbytes/s*

Power Requirement (from PC AT I/O channel)	+5 VDC 0.66 A Typical 1.5 A Maximum
* Actual speed may vary considerably from speed shown due to system and instrumentation capabilities.	

Table A-3. Physical Characteristics for the AT-GPIB/TNT and the AT-GPIB

Characteristic	Specification
Dimensions	4.2 in. by 6.5 in. (10.67 cm by 16.51 cm)
I/O Connector	IEEE 488 Standard 24-Pin

Table A-4. Environmental Characteristics for the AT-GPIB/TNT and the AT-GPIB

Characteristic	Specification

Operating Environment:
 	
  Component Temperature
  Relative Humidity
	
	0° to 55° C
	10% to 90%, Noncondensing

Storage Environment:
 	
  Temperature
  Relative Humidity
	
	-20° to 70° C
	5% to 90%, Noncondensing

EMI	FCC Class B Certified

Troubleshooting and Common Questions
This appendix contains troubleshooting information and the answers to common questions.

Troubleshooting Diagnostic Utility Failures

The following sections explain common error messages the Diagnostic utility generates.

Missing Software Components

This error occurs if the software components that are necessary for the GPIB software for Windows NT to function correctly are not present in the system. If you encounter this problem, reinstall the GPIB software for Windows NT and run the Diagnostic utility again.

No GPIB Interfaces Present

This error occurs if there are no GPIB interfaces physically present in the system or there is a resource conflict with the interfaces that are installed. If you encounter this problem, use the GPIB Configuration utility to examine the installed GPIB interfaces and the resources assigned to each. Then, run the Diagnostic utility again.

To access this information in the GPIB Configuration utility, complete the following steps:

1. Double-click on the **GPIB** icon in the **Control Panel**.

   Windows NT 3.51: Open the **Control Panel** in the **Main** group of the **Program Manager**.

   Windows NT 4.0 or higher: Select **Start»Settings»Control Panel**.

2. Click on the **Board Type** button and verify that the type of
    GPIB interface listed for each logical board name is correct. Click on
    the **OK** button to return to the main dialog box.

3. Double-click on each board name and verify that the hardware
    settings displayed in the dialog box match your actual hardware
    settings.

GPIB Cables Need To Be Disconnected

This error occurs if you have any GPIB cables connected to the
GPIB interface. Disconnect all GPIB cables and run the Diagnostic utility
again.

Address Resource Conflict

This error occurs if the address resources assigned to a GPIB interface
conflict with the address resources that other devices in the system are
using. To resolve an address resource conflict, refer to the *Resolving
Resource Conflicts* section, later in this appendix. After you have
resolved the conflict, run the Diagnostic utility again.

Interrupt Resource Conflict

This error occurs if the interrupt resources assigned to a GPIB interface
conflict with the interrupt resources that other devices in the system are
using. To resolve an interrupt resource conflict, refer to the *Resolving
Resource Conflicts* section, later in this appendix. After you have
resolved the conflict, run the Diagnostic utility again.

DMA Resource Conflict

This error occurs if the DMA resources assigned to a GPIB interface
conflict with the DMA resources that other devices in the system are
using. To resolve a DMA resource conflict, refer to the *Resolving
Resource Conflicts* section, later in this appendix. After you have
resolved the conflict, run the Diagnostic utility again.

Single-Cycle DMA Required

This error occurs if the Diagnostic utility detects that it is unable to
perform demand-mode DMA for the GPIB interface and that you have
not configured the GPIB software to use single-cycle DMA. GPIB

interfaces that use the system DMA controller (such as the
AT-GPIB/TNT) normally use demand-mode DMA. If you encounter this
error, you should use the GPIB Configuration utility to configure the
NI-488.2M software to use single-cycle DMA for all DMA transfers, and
then run the Diagnostic utility again.

To configure the NI-488.2M software to use single-cycle DMA for a
particular GPIB interface, complete the following steps.

1. Double-click on the **GPIB** icon in the **Control Panel**.

    Windows NT 3.51: Open the **Control Panel** in the **Main** group of
    the **Program Manager**.

    Windows NT 4.0 or higher: Select **Start»Settings»Control Panel**.

2. Double-click on the GPIB interface you want to configure.

3. Make sure that the **Use Demand Mode DMA** item is unchecked.

GPIB Software Problem Encountered

This error occurs if the Diagnostic utility detects that it is unable to
communicate correctly with the GPIB hardware using the installed GPIB
software. If you encounter this error, shut down your computer, restart it,
and run the Diagnostic utility again. If the problem persists, try
reinstalling the GPIB software for Windows NT.

Unknown Problem Encountered

This error occurs if an unknown problem is encountered when you try to
execute the Diagnostic utility. If this error occurs, shut down your
computer, restart it, and run the Diagnostic utility again. If the problem
persists, try reinstalling the GPIB software for Windows NT.

Resolving Resource Conflicts

Resource conflicts occur when your system contains hardware that is
configured to use the same resources as your GPIB interface. The
NI-488.2M driver detects some resource conflicts when it loads. When
the driver detects conflicts as it loads, it records an error message
describing the conflict. You can use the **Event Viewer**, as described in
the following section, *Using Windows NT Diagnostic Tools*, to see which
resource is in conflict.

Once you have identified the resource that caused the conflict, use the GPIB Configuration utility to reconfigure your GPIB interface so that it uses conflict-free resources. To help in the selection of conflict-free resources, Microsoft has provided a utility called **Windows NT Diagnostics**. This utility displays a list of the I/O port addresses, interrupt levels, and DMA channels that are currently being used in your system. Assign resources this utility does not list to your GPIB interface.

Follow these instructions to run the **Windows NT Diagnostics** utility:

Windows NT 3.51: Double-click on the **Windows NT Diagnostics** icon in the **Administrative Tools** group of the **Program Manager**.

Windows NT 4.0 or higher: Select **Start»Programs»Administrative Tools»Windows NT Diagnostics**.

Using Windows NT Diagnostic Tools

There are many reasons why the NI-488.2M driver might not load. If the software is not properly installed or if there is a conflict between the GPIB hardware and the other hardware in the system, the NI-488.2M driver fails to start. Two Windows NT utilities are useful in determining the source of the problem: the **Devices** applet in the **Control Panel**, and the **Event Viewer**. The following sections describe the information available through each utility.

Examining NT Devices to Verify the NI-488.2M Installation

To verify whether the NI-488.2M devices are installed correctly (that is, that the devices are started), run the **Devices** applet in the **Control Panel**, as shown in the following paragraphs.

Windows NT 3.51: Open the **Control Panel** in the **Main** group of the **Program Manager**.

Windows NT 4.0 or later: Select **Start»Settings»Control Panel**.

This utility lists all of the devices Windows NT detects. Each device has a status associated with it. If the NI-488.2M driver is installed correctly, the following lines appear in the list of NT devices:

```
Device                          Status      Started
GPIB Board Class Driver         Started     Automatic
GPIB Device Class Driver        Started     Automatic
```

You should also see one or more lines similar to the following:

```
Device                          Status      Started
GPIB Port Driver (AT-GPIB)      ****        System
GPIB Port Driver (PCI-GPIB)     ****        System
```

The **GPIB Board Class Driver**, the **GPIB Device Class Driver**, and at least one of the **GPIB Port Drivers** listed by the **Devices** applet should have a status of **Started**. If not, refer to the next section, *Examining the NT System Log Using the Event Viewer.*

If the GPIB Class Driver lines are not present or at least one GPIB Port Driver line is not present, the NI-488.2M software is not installed properly. You must reinstall the NI-488.2M software.

Examining the NT System Log Using the Event Viewer

Windows NT maintains a system log. If the NI-488.2M driver is unable to start, it records entries in the system log explaining why it failed to start. You can examine the system log by running the **Event Viewer** utility, as shown in the following paragraphs.

Windows NT 3.51: Double-click on the **Event Viewer** icon in the **Administrative Tools** group of the **Program Manager**.

Windows NT 4.0 or higher: Select **Start»Programs»Administrative Tools»Event Viewer**. Events that might appear in the system log include the following:

- The system cannot locate the device file for one or more of the devices that make up the NI-488.2M driver and an event is logged that **The system cannot find the file specified**. In this case, the NI-488.2M software is incorrectly installed. You should reinstall the software.

- A conflict exists between the GPIB hardware and the other hardware in the system. If this is the case, an event is logged that indicates the nature of the resource conflict. To correct this conflict, reconfigure the GPIB hardware and the NI-488.2M software. Refer to Chapter 2, *Hardware Configuration and Installation* and Chapter 3, *Software Installation and Configuration*, for configuration information.

Common Questions

How can I determine which type of GPIB hardware I have installed?

Run the GPIB Configuration utility. To run the utility, open your Windows NT Control Panel and select the National Instruments eagle icon.

How can I determine which version of the NI-488.2M software I have installed?

Run the Diagnostic utility, as follows:

Windows NT version 3.51: Start the Diagnostic utility by double-clicking on the **Diagnostic** icon in the **NI-488.2M Software for Windows NT** group of the **Program Manager**.

Windows NT version 4.0 or later: Start the Diagnostic utility by choosing the **Diagnostic** item under **Start»Programs»NI-488.2M Software for Windows NT**.

Which GPIB interfaces does version 1.2 of the NI-488.2M Software for Windows NT support?

Version 1.2 of the NI-488.2M Software for Windows NT supports the AT-GPIB, AT-GPIB/TNT, PCMCIA-GPIB, and PCI-GPIB.

How many GPIB interfaces can I configure for use with my NI-488.2M Software for Windows NT?

You can configure the NI-488.2M Software for Windows NT to communicate with up to 4 GPIB interfaces.

How many devices can I configure for use with my NI-488.2M Software for Windows NT?

> The NI-488.2M Software for Windows NT provides a total of 100 logical devices for applications to use. The default number of devices is 32.

Are interrupts and DMA required with the NI-488.2M Software for Windows NT?

> Interrupts are required, but DMA is not.

How can I determine if my GPIB hardware and software are correctly installed?

> Run the Diagnostic utility, as follows:
>
> Windows NT version 3.51: Start the Diagnostic utility by double-clicking on the **Diagnostic** icon in the **NI-488.2M Software for Windows NT** group of the **Program Manager**.
>
> Windows NT version 4.0 or later: Start the Diagnostic utility by choosing the **Diagnostic** item under **Start»Programs»NI-488.2M Software for Windows NT**.

When should I use the Win32 Interactive Control utility?

> You can use the Win32 Interactive Control utility to test and verify instrument communication, troubleshoot problems, and develop your application. For more information, refer to Chapter 6, *Win32 Interactive Control Utility* in the *NI-488.2M User Manual for Windows 95 and Windows NT*.

How do I use an NI-488.2M language interface?

> For information about using NI-488.2M language interfaces, refer to Chapter 3, *Developing Your Application* in the *NI-488.2M User Manual for Windows 95 and Windows NT*.

What do I do if the Diagnostic utility fails with an error?

> Use the Diagnostic online help, or refer to the getting started manual, to troubleshoot specific problems. If you have already completed the troubleshooting steps, fill out the support forms in Appendix C, *Customer Communication*, and contact National Instruments.

How do I communicate with my instrument over the GPIB?

Refer to the documentation that came from the instrument manufacturer. The command sequences you use are totally dependent on the specific instrument. The documentation for each instrument should include the GPIB commands you need to communicate with it. In most cases, NI-488 device-level calls are sufficient for communicating with instruments. Refer to Chapter 3, *Developing Your Application* in the *NI-488.2M User Manual for Windows 95 and Windows NT*, for more information.

Can I use the NI-488 and NI-488.2 calls together in the same application?

Yes, you can mix NI-488 functions and NI-488.2 routines.

What can I do to check for errors in my GPIB application?

Examine the value of `ibsta` after each NI-488 or NI-488.2 call. If a call fails, the ERR bit of `ibsta` is set and an error code is stored in `iberr`. For more information about global status variables, refer to Chapter 3, *Developing Your Application* in the *NI-488.2M User Manual for Windows 95 and Windows NT*.

What information should I have before I call National Instruments?

When you call National Instruments, you should have the results of the Diagnostic test. Also, make sure you have filled out the technical support form in Appendix C, *Customer Communication*.

Customer Communication
For your convenience, this appendix contains forms to help you gather the information necessary to help us solve technical problems you might have as well as a form you can use to comment on the product documentation. Filling out a copy of the *Technical Support Form* before contacting National Instruments helps us help you better and faster.

National Instruments provides comprehensive technical assistance around the world. In the U.S. and Canada, applications engineers are available Monday through Friday from 8:00 a.m. to 6:00 p.m. (central time). In other countries, contact the nearest branch office. You may fax questions to us at any time.

Electronic Services

Bulletin Board Support

National Instruments has BBS and FTP sites dedicated for 24-hour support with a collection of files and documents to answer most common customer questions. From these sites, you can also download the latest instrument drivers, updates, and example programs. For recorded instructions on how to use the bulletin board and FTP services and for BBS automated information, call (512) 795-6990. You can access these services at:

United States: (512) 794-5422 or (800) 327-3077
   Up to 14,400 baud, 8 data bits, 1 stop bit, no parity

United Kingdom: 01635 551422
   Up to 9,600 baud, 8 data bits, 1 stop bit, no parity

France: 1 48 65 15 59
   Up to 9,600 baud, 8 data bits, 1 stop bit, no parity

FTP Support

To access our FTP site, log on to our Internet host, `ftp.natinst.com`, as `anonymous` and use your Internet address, such as `joesmith@anywhere.com`, as your password. The support files and documents are located in the `/support` directories.

FaxBack Support

FaxBack is a 24-hour information retrieval system containing a library of documents on a wide range of technical information. You can access FaxBack from a touch-tone telephone at (512) 418-1111.

E-Mail Support (currently U.S. only)

You can submit technical support questions to the appropriate applications engineering team through e-mail at the Internet addresses listed below. Remember to include your name, address, and phone number so we can contact you with solutions and suggestions.

GPIB: gpib.support@natinst.com
DAQ: daq.support@natinst.com
VXI: vxi.support@natinst.com
LabWindows: lw.support@natinst.com

LabVIEW: lv.support@natinst.com
HiQ: hiq.support@natinst.com
VISA: visa.support@natinst.com

Telephone and Fax Support

National Instruments has branch offices all over the world. Use the list below to find the technical support number for your country. If there is no National Instruments office in your country, contact the source from which you purchased your software to obtain support.

Technical Support Form

Photocopy this form and update it each time you make changes to your software or hardware, and use the completed copy of this form as a reference for your current configuration. Completing this form accurately before contacting National Instruments for technical support helps our applications engineers answer your questions more efficiently.

If you are using any National Instruments hardware or software products related to this problem, include the configuration forms from their user manuals. Include additional pages if necessary.
