Important Information

Warranty

The PXI-1010 is warranted against defects in materials and workmanship for a period of one year from the date of shipment, as evidenced by receipts or other documentation. National Instruments will, at its option, repair or replace equipment that proves to be defective during the warranty period. This warranty includes parts and labor.

The media on which you receive National Instruments software are warranted not to fail to execute programming instructions, due to defects in materials and workmanship, for a period of 90 days from date of shipment, as evidenced by receipts or other documentation. National Instruments will, at its option, repair or replace software media that do not execute programming instructions if National Instruments receives notice of such defects during the warranty period. National Instruments does not warrant that the operation of the software shall be uninterrupted or error free.

A Return Material Authorization (RMA) number must be obtained from the factory and clearly marked on the outside of the package before any equipment will be accepted for warranty work. National Instruments will pay the shipping costs of returning to the owner parts which are covered by warranty.

National Instruments believes that the information in this document is accurate. The document has been carefully reviewed for technical accuracy. In the event that technical or typographical errors exist, National Instruments reserves the right to make changes to subsequent editions of this document without prior notice to holders of this edition. The reader should consult National Instruments if errors are suspected. In no event shall National Instruments be liable for any damages arising out of or related to this document or the information contained in it.

EXCEPT AS SPECIFIED HEREIN, NATIONAL INSTRUMENTS MAKES NO WARRANTIES, EXPRESS OR IMPLIED, AND SPECIFICALLY DISCLAIMS ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. CUSTOMER'S RIGHT TO RECOVER DAMAGES CAUSED BY FAULT OR NEGLIGENCE ON THE PART OF NATIONAL INSTRUMENTS SHALL BE LIMITED TO THE AMOUNT THERETOFORE PAID BY THE CUSTOMER. NATIONAL INSTRUMENTS WILL NOT BE LIABLE FOR DAMAGES RESULTING FROM LOSS OF DATA, PROFITS, USE OF PRODUCTS, OR INCIDENTAL OR CONSEQUENTIAL DAMAGES, EVEN IF ADVISED OF THE POSSIBILITY THEREOF. This limitation of the liability of National Instruments will apply regardless of the form of action, whether in contract or tort, including negligence. Any action against National Instruments must be brought within one year after the cause of action accrues. National Instruments shall not be liable for any delay in performance due to causes beyond its reasonable control. The warranty provided herein does not cover damages, defects, malfunctions, or service failures caused by owner's failure to follow the National Instruments installation, operation, or maintenance instructions; owner's modification of the product; owner's abuse, misuse, or negligent acts; and power failure or surges, fire, flood, accident, actions of third parties, or other events outside reasonable control.

Patents

For patents covering National Instruments products, refer to the appropriate location: **Help»Patents** in your software, the `patents.txt` file on your CD, or `ni.com/patents`.

WARNING REGARDING USE OF NATIONAL INSTRUMENTS PRODUCTS

(1) NATIONAL INSTRUMENTS PRODUCTS ARE NOT DESIGNED WITH COMPONENTS AND TESTING FOR A LEVEL OF RELIABILITY SUITABLE FOR USE IN OR IN CONNECTION WITH SURGICAL IMPLANTS OR AS CRITICAL COMPONENTS IN ANY LIFE SUPPORT SYSTEMS WHOSE FAILURE TO PERFORM CAN REASONABLY BE EXPECTED TO CAUSE SIGNIFICANT INJURY TO A HUMAN.

(2) IN ANY APPLICATION, INCLUDING THE ABOVE, RELIABILITY OF OPERATION OF THE SOFTWARE PRODUCTS CAN BE IMPAIRED BY ADVERSE FACTORS, INCLUDING BUT NOT LIMITED TO FLUCTUATIONS IN ELECTRICAL POWER SUPPLY, COMPUTER HARDWARE MALFUNCTIONS, COMPUTER OPERATING SYSTEM SOFTWARE FITNESS, FITNESS OF COMPILERS AND DEVELOPMENT SOFTWARE USED TO DEVELOP AN APPLICATION, INSTALLATION ERRORS, SOFTWARE AND HARDWARE COMPATIBILITY PROBLEMS, MALFUNCTIONS OR FAILURES OF ELECTRONIC MONITORING OR CONTROL DEVICES, TRANSIENT FAILURES OF ELECTRONIC SYSTEMS (HARDWARE AND/OR SOFTWARE), UNANTICIPATED USES OR MISUSES, OR ERRORS ON THE PART OF THE USER OR APPLICATIONS DESIGNER (ADVERSE FACTORS SUCH AS THESE ARE HEREAFTER COLLECTIVELY TERMED "SYSTEM FAILURES"). ANY APPLICATION WHERE A SYSTEM FAILURE WOULD CREATE A RISK OF HARM TO PROPERTY OR PERSONS (INCLUDING THE RISK OF BODILY INJURY AND DEATH) SHOULD NOT BE RELIANT SOLELY UPON ONE FORM OF ELECTRONIC SYSTEM DUE TO THE RISK OF SYSTEM FAILURE. TO AVOID DAMAGE, INJURY, OR DEATH, THE USER OR APPLICATION DESIGNER MUST TAKE REASONABLY PRUDENT STEPS TO PROTECT AGAINST SYSTEM FAILURES, INCLUDING BUT NOT LIMITED TO BACK-UP OR SHUT DOWN MECHANISMS. BECAUSE EACH END-USER SYSTEM IS CUSTOMIZED AND DIFFERS FROM NATIONAL INSTRUMENTS' TESTING PLATFORMS AND BECAUSE A USER OR APPLICATION DESIGNER MAY USE NATIONAL INSTRUMENTS PRODUCTS IN COMBINATION WITH OTHER PRODUCTS IN A MANNER NOT EVALUATED OR CONTEMPLATED BY NATIONAL INSTRUMENTS, THE USER OR APPLICATION DESIGNER IS ULTIMATELY RESPONSIBLE FOR VERIFYING AND VALIDATING THE SUITABILITY OF NATIONAL INSTRUMENTS PRODUCTS WHENEVER NATIONAL INSTRUMENTS PRODUCTS ARE INCORPORATED IN A SYSTEM OR APPLICATION, INCLUDING, WITHOUT LIMITATION, THE APPROPRIATE DESIGN, PROCESS AND SAFETY LEVEL OF SUCH SYSTEM OR APPLICATION.

Compliance

Compliance with FCC/Canada Radio Frequency Interference Regulations

Determining FCC Class

The Federal Communications Commission (FCC) has rules to protect wireless communications from interference. The FCC places digital electronics into two classes. These classes are known as Class A (for use in industrial-commercial locations only) or Class B (for use in residential or commercial locations). All National Instruments (NI) products are FCC Class A products.

Depending on where it is operated, this Class A product could be subject to restrictions in the FCC rules. (In Canada, the Department of Communications (DOC), of Industry Canada, regulates wireless interference in much the same way.) Digital electronics emit weak signals during normal operation that can affect radio, television, or other wireless products.

All Class A products display a simple warning statement of one paragraph in length regarding interference and undesired operation. The FCC rules have restrictions regarding the locations where FCC Class A products can be operated.

Consult the FCC Web site at www.fcc.gov for more information.

FCC/DOC Warnings

This equipment generates and uses radio frequency energy and, if not installed and used in strict accordance with the instructions in this manual and the CE marking Declaration of Conformity*, may cause interference to radio and television reception. Classification requirements are the same for the Federal Communications Commission (FCC) and the Canadian Department of Communications (DOC).

Changes or modifications not expressly approved by NI could void the user's authority to operate the equipment under the FCC Rules.

Class A
Federal Communications Commission

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user is required to correct the interference at their own expense.

Canadian Department of Communications

This Class A digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de la classe A respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.

Compliance with EU Directives

Users in the European Union (EU) should refer to the Declaration of Conformity (DoC) for information* pertaining to the CE marking. Refer to the Declaration of Conformity (DoC) for this product for any additional regulatory compliance information. To obtain the DoC for this product, visit ni.com/hardref.nsf, search by model number or product line, and click the appropriate link in the Certification column.

---

* The CE marking Declaration of Conformity contains important supplementary information and instructions for the user or installer.

About This Manual

The *PXI-1010 Chassis User Manual* describes the features of the PXI-1010 chassis and contains information about configuring the chassis, installing the modules, and operating the chassis.

How To Use the Manual Set

The *PXI-1010 Chassis User Manual* is one piece of the documentation set for your PXI system. You could have any of several types of documents, depending on the hardware and software in your system. Use the documents you have as follows:

- *Getting Started with SCXI*—This is the first manual you should read. It gives an overview of the SCXI system and contains the most commonly needed information for the modules, chassis, and software.

- Your SCXI hardware documentation—Read these next for detailed information about signal connections and module configuration. They also explain in greater detail how the module works and contain application hints.

- Your data acquisition (DAQ) hardware documentation—This documentation has detailed information about the DAQ hardware that plugs into or is connected to your computer. Use these documents for hardware installation and configuration instructions, specification information about your DAQ hardware, and application hints.

- Software documentation—You might have several sets of software documentation, including LabVIEW, LabWindows™/CVI™, and NI-DAQ. After you have set up your hardware system, use either the application software (LabVIEW or LabWindows/CVI) or the NI-DAQ documentation to help you write your application. If you have a large and complicated system, it is worthwhile to look through the software documentation before you configure your hardware.

- Accessory installation guides or manuals—If you are using accessory products, read the terminal block and cable assembly installation guides or accessory user manuals. They explain how to physically connect the relevant pieces of the system. Consult these guides when you are making your connections.

- *PXI-1010 Chassis User Manual*—Read this manual for maintenance information on the chassis and installation instructions. This manual serves as your SCXI chassis manual.

Conventions

The following conventions appear in this manual:

» The **»** symbol leads you through nested menu items and dialog box options to a final action. The sequence **File»Page Setup»Options** directs you to pull down the **File** menu, select the **Page Setup** item, and select **Options** from the last dialog box.

This icon denotes a note, which alerts you to important information.

This icon denotes a caution, which advises you of precautions to take to avoid injury, data loss, or a system crash.

bold Bold text denotes items that you must select or click on in the software, such as menu items and dialog box options. Bold text also denotes parameter names.

italic Italic text denotes variables, emphasis, a cross reference, or an introduction to a key concept. This font also denotes text that is a placeholder for a word or value that you must supply.

`monospace` Text in this font denotes text or characters that you should enter from the keyboard, sections of code, programming examples, and syntax examples. This font is also used for the proper names of disk drives, paths, directories, programs, subprograms, subroutines, device names, functions, operations, variables, filenames, and extensions.

NI-DAQ NI-DAQ is used throughout this manual to refer to the NI-DAQ software.

PXI chassis PXI chassis or simply *chassis* refers to the PXI-1010.

SCXIbus SCXIbus refers to the backplane in the chassis SCXI subsystem. A signal on the backplane is referred to as the SCXIbus <signal name> line (or signal). The SCXIbus descriptor may be omitted when the meaning is clear.

Slot 0 Slot 0 refers to the power supply and control circuitry in the SCXI subsystem.

Related Documentation

The following document contains information that you might find helpful as you read this manual:

- Your computer technical reference manual

If you are designing your own module, the following National Instruments specification, available by request, describes the physical, electrical, and timing requirements for PXI:

- *PXI Specification*, Revision 2.0

1

Introduction

This chapter describes the PXI-1010, lists what you need to get started, describes the optional equipment, and explains how to unpack the PXI-1010 chassis.

About the PXI-1010 Chassis

Thank you for purchasing the National Instruments PXI-1010 chassis. This chassis integrates a high-performance 8-slot PXI subsystem with a 4-slot SCXI subsystem to offer a complete solution for signal conditioning applications. The PXI section of the chassis accepts an embedded controller and a wide variety of peripheral modules (such as multifunction I/O, digital I/O, and instrument modules). The four SCXI slots integrate signal conditioning modules into your PXI system. These modules provide analog and digital input conditioning, isolation, and other functions. The PXI-1010 is ideal for applications where rack-mount space is limited because it combines the computer, plug-in devices, and signal conditioning in a single chassis. You can daisy-chain additional SCXI chassis to the PXI-1010 to build very high channel-count systems.

What You Need to Get Started

To set up and use your PXI-1010 chassis, you will need the following items:

❑ PXI-1010 chassis

❑ Power cable (refer to Table 1-1)

❑ *PXI-1010 Chassis User Manual*

❑ One of the following software packages and documentation:

–   BridgeVIEW

–   ComponentWorks

–   LabVIEW for Windows

–   LabWindows/CVI for Windows

- – Measure

- – NI-DAQ for PC compatibles

- – VirtualBench

❏ PXI Chassis Initialization File for PXI-1010, version 1.0 (floppy disk) with `chassis.ini`

❏ PXI system controller and software

❏ PXI DAQ module

❏ SCXI module

❏ Flathead screwdriver

❏ Needle-nose pliers

Table 1-1. Power Cables

Power Cable	Reference Standards
Standard 120 V (USA)	ANSI C73.11/NEMA 5-15-P/IEC83
Switzerland 220 V	SEV
Australia 240 V	AS C112
Universal Euro 240 V	CEE (7), II, IV, VII IEC83
North America 240 V	ANSI C73.20/NEMA 5-15-P/IEC83
United Kingdom 240 V	BS 1363/IEC83

If you are missing any of the items listed or if you have the incorrect power cable, contact National Instruments.

Unpacking

Carefully inspect the shipping container and the chassis for damage. Check for visible damage to the metal work. Check to make sure all handles, hardware, and switches are undamaged. Inspect the inner chassis for any possible damage, debris, or detached components. If damage appears to have been caused in shipment, file a claim with the carrier. Retain the packing material for possible inspection and/or reshipment.

Software Programming Choices

You have several options to choose from when programming your National Instruments DAQ and SCXI hardware. You can use National Instruments application software, NI-DAQ, or register-level programming.

National Instruments Application Software

ComponentWorks contains tools for data acquisition and instrument control built on NI-DAQ driver software. ComponentWorks provides a higher-level programming interface for building virtual instruments through standard OLE controls and DLLs. With ComponentWorks, you can use all of the configuration tools, resource management utilities, and interactive control utilities included with NI-DAQ.

LabVIEW features interactive graphics, a state-of-the-art user interface, and a powerful graphical programming language. The LabVIEW Data Acquisition VI Library, a series of VIs for using LabVIEW with National Instruments DAQ hardware, is included with LabVIEW. The LabVIEW Data Acquisition VI Library is functionally equivalent to NI-DAQ software.

LabWindows/CVI features interactive graphics, state-of-the-art user interface, and uses the ANSI standard C programming language. The LabWindows/CVI Data Acquisition Library, a series of functions for using LabWindows/CVI with National Instruments DAQ hardware, is included with the NI-DAQ software kit. The LabWindows/CVI Data Acquisition Library is functionally equivalent to the NI-DAQ software.

VirtualBench features virtual instruments that combine DAQ products, software, and your computer to create a stand-alone instrument with the added benefit of the processing, display, and storage capabilities of your computer. VirtualBench instruments load and save waveform data to disk in the same forms that can be used in popular spreadsheet programs and word processors.

Using ComponentWorks, LabVIEW, LabWindows/CVI, or VirtualBench software will greatly reduce the development time for your data acquisition and control application.

NI-DAQ Driver Software

The NI-DAQ driver software is included at no charge with all National Instruments DAQ hardware. NI-DAQ has an extensive library of functions that you can call from your application programming environment. These functions include routines for analog input (A/D conversion), buffered data acquisition (high-speed A/D conversion), analog output (D/A conversion), waveform generation, digital I/O, counter/timer operations, SCXI, PXI Trigger Bus (RTSI), self-calibration, messaging, and acquiring data to extended memory.

NI-DAQ also internally addresses many of the complex issues between the computer and the plug-in board, such as programming interrupts and DMA controllers. NI-DAQ maintains a consistent software interface among its different versions so that you can change platforms with minimal modifications to your code. Whether you are using conventional programming languages or National Instruments application software, your application uses the NI-DAQ driver software, as illustrated in Figure 1-1.
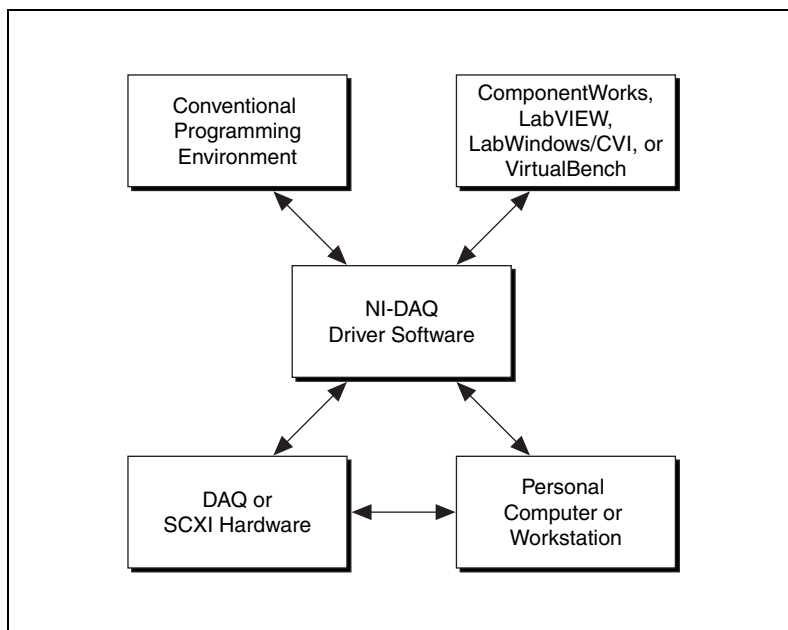

Figure 1-1. The Relationship among the Programming Environment, NI-DAQ, and Your Hardware

Register-Level Programming

Another option for programming any National Instruments DAQ hardware is to write register-level software. Writing register-level programming software can be very time-consuming and inefficient and is not recommended.

Even if you are an experienced register-level programmer, consider using National Instruments application software to program your National Instruments DAQ hardware. Using National Instruments application software is easier than and as flexible as register-level programming and can save weeks of development time.

Optional Equipment

National Instruments offers a variety of products to use with your PXI-1010 chassis, including cables and other accessories, as follows:

• Cables and cable accessories, shielded and ribbon

• Shielded and unshielded 68- and 100-pin screw terminals

• SCXI modules and accessories for isolating, amplifying, exciting, and multiplexing signals for relays and analog output

• PXI modules and accessories for multifunction I/O and instrumentation

For more specific information about these products, refer to your National Instruments catalog or call the office nearest you.

Key Features

The PXI-1010 combines a high-performance 8-slot PXI subsystem with a 4-slot SCXI subsystem. The PXI-1010 has a structural design that is optimized for maximum use in a wide range of applications. The PXI-1010 fully complies with the *PXI Specification*, Revision 2.0, offering advanced timing and synchronization features.

The SCXI subsystem supplies a low-noise environment for signal conditioning, supplying power and control circuitry for the SCXI modules. Use this general-purpose chassis with current and future SCXI modules.

The PXI-1010 has a built-in interconnect between the PXI and SCXI subsystems that allows a DAQ device in the eighth PXI slot to control the SCXI subsystem without additional cables.

Chassis Description

Figure 1-2 shows the front view of the PXI-1010. Table 1-2 describes the front view items.

1	PXI Module Guides	7	SCXI Power Switch	13	PXI SCXI Control Slot
2	PXI Backplane Connectors	8	SCXI Reset Button	14	PXI Peripheral Slots
3	PXI Indicator Light	9	DIP Switches	15	PXI Star Trigger Slot
4	PXI Power Switch	10	SCXI Module Guides	16	PXI System Controller Slot
5	Front Threaded Strips	11	SCXI Backplane	17	PXI Controller Expansion Slots
6	SCXI Indicator Light	12	SCXI Slot 0/Power Supply		
Figure 1-2. Front View of the PXI-1010 Chassis

Table 1-2. PXI-1010 Chassis Front View Items

Item	Description
PXI module guides	Guide PXI modules to mate with PXIbus connectors
PXI backplane connectors	Connects PXI modules to the PXIbus
PXI indicator light	When lit, indicates that the PXI subsystem is powered on
PXI power switch	Turns the PXI subsystem on and off
Front-threaded strips	Secure modules in the chassis and attach front panels
SCXI indicator light	When lit, indicates that the SCXI subsystem is powered on

Table 1-2. PXI-1010 Chassis Front View Items (Continued)

Item	Description
SCXI power switch	Turns the SCXI subsystem on and off
SCXI reset button	Reinitializes Slot 0 and all SCXI modules to their power-on state when pressed
DIP switches	Determine the SCXI subsystem address
SCXI module guides	Guide modules to mate with the SCXIbus connector
SCXI backplane	Brings power, control lines, and analog bus connections to SCXI modules
SCXI Slot 0/power supply	Contains the power supply and control circuitry for the SCXI subsystem
PXI SCXI Control slot	Device in this slot can control SCXI subsystem
PXI peripheral slots	Hold PXI peripheral modules
PXI Star Trigger slot	Holds PXI star trigger controller or any PXI peripheral module
PXI System Controller slot	Holds PXI system controller
PXI controller expansion slots	Provide space for large controllers

Figure 1-3 shows the chassis rear view items that are then described in Table 1-3.

1	Rear Threaded Strips	4	Voltage Selection Wheel	7	Fans and Filters
2	Rear Connector Space	5	Fuse	8	Backplane Fuses (behind fan)
3	Power Entry Module	6	Circuit Breaker		
Figure 1-3. Rear View of the PXI-1010 Chassis

Table 1-3. PXI-1010 Chassis Rear View Items

Item	Description
Rear-threaded strips	Secure cable connections, mounting brackets, or filler panels to the chassis
Rear connector space	For module space, connector mounting brackets, or adapter boards
Power entry module	IEC receptacle for power input, voltage selection wheel, and fuse
Voltage selection wheel	Configures the chassis for the AC line voltage
Fuse	Protects both you and the SCXI subsystem in case of a fault in the SCXI subsystem
Circuit breaker	Protects both you and the PXI subsystem in case of a PXI subsystem fault
Fans and filters	Cool the chassis; prevents dirt from contaminating the chassis circuitry
Backplane fuses	Protect the SCXI subsystem power supply from module shorts

SCXI Subsystem Backplane Overview

You can use the SCXI subsystem in the following ways:

- Install several SCXI modules and a PXI DAQ device in Slot 8 of the PXI backplane to control and/or acquire data from all the SCXI modules.

- Install several SCXI modules and cable one of them to a DAQ device that controls and/or acquires data from all of the SCXI modules.

- Install several SCXI modules and an SCXI-1200 module that operates similarly to a DAQ device, except that it communicates with the host computer through a parallel port instead of the computer plug-in bus.

- Install SCXI modules that are each dedicated to conditioning signals for only a single DAQ device (for example, in parallel mode), or that operate independently and only use the SCXI subsystem as a power source and/or container. You can use the chassis this way in addition to or instead of one of the first three methods.

PXI Subsystem Backplane Overview

The following sections describe the PXI subsystem backplane.

Interoperability with CompactPCI

The PXI backplane is interoperable with PXI-compatible products and standard CompactPCI products. This is an important feature, because many PXI-compatible systems may require components that do not implement PXI-specific features.

For example, you may want to use a standard CompactPCI network interface card in a PXI chassis. The signals on the PXI-1010 backplane P1 connector meet the requirements of the CompactPCI specification for both the peripheral and system modules. The PXI-specific signals are located on the P2 connector and are found only on the signals that are reserved or not used in the CompactPCI 64-bit specification. Therefore, all modules that meet the CompactPCI 64-bit specification requirements will function in the PXI-1010.

System Controller Slot

The System Controller slot is located in Slot 1 of the chassis as defined by the PXI specification. It has three controller expansion slots, which are used for system controller modules wider than one slot. As defined in the PXI specification, these slots allow the controller to expand to the left so it does not use up peripheral slots.

Peripheral Slots

The PXI-1010 has seven peripheral slots located in Slots 2 through 8. You can use PXI modules in peripheral slots to add functionality to the PXI subsystem not already provided by the system controller. Examples of PXI peripheral modules are multifunction I/O, digital I/O, and instrument modules. Some peripheral slots also have special capabilities, such as the Star Trigger slot and the SCXI Control slot, which are explained in the following sections.

Star Trigger Slot

The Star Trigger slot is located at Slot 2. This slot has a dedicated trigger line between each peripheral slot (refer to Figure 1-4) and is intended for modules with Star Trigger functionality to provide individual triggers to all other peripherals. However, if you do not require advanced trigger functionality, you can install any standard peripheral module into this slot.

Local Bus

The PXI backplane local bus is a daisy-chained bus that connects each peripheral slot with its adjacent left and right peripheral slots, as shown in Figure 1-4.

For example, a given peripheral slot's right local bus connects to the adjacent slot's left local bus and so on. Each local bus is 13 lines wide and can pass analog signals between modules or provide a high-speed side-band communication path that does not affect the PXI bandwidth.

Local bus signals may range from high-speed TTL signals to analog signals as high as 42 V. Initialization software keys adjacent modules to prohibit the use of incompatible devices. This software uses the configuration information specific to each peripheral module to evaluate compatibility. This method is a flexible way to define local bus functionality that is not limited by keying hardware.

1	Star Triggers	5	Peripheral Slot [3]	9	Local Bus
2	PCI Arbitration and Clock Signals	6	Peripheral Slot [4]	10	SCXI Connection
3	System Controller Slot [1]	7	Peripheral Slot [7]		
4	Star Trigger/Peripheral Slot [2]	8	Peripheral Slot [8]		
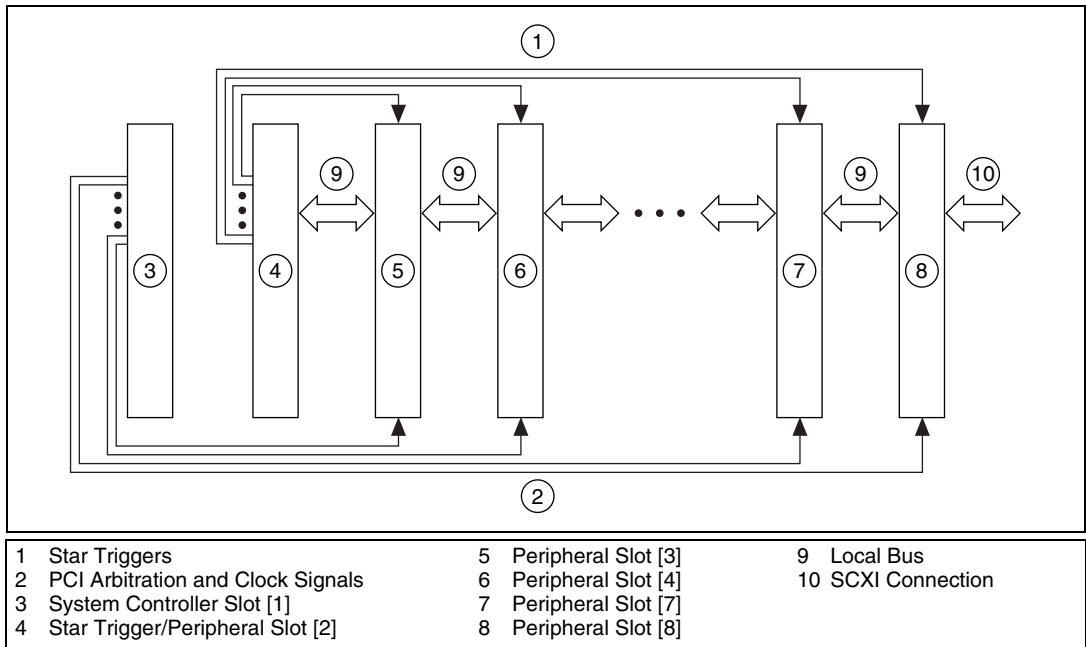

Figure 1-4. PXI Star Trigger and Local Bus Routing

SCXI Connection

Slot 8 of the PXI backplane has connections for a PXI peripheral module to control the SCXI subsystem. These connections use the available local bus right pins (PXI_LBR0:12). The SCXI connection passes communication, timing, and analog signals between the SCXI backplane and the PXI module in Slot 8.

Trigger Bus

The eight PXI trigger lines are bused to each slot. You can use the trigger lines in a variety of ways. For example, you can use triggers to synchronize the operation of several different PXI peripheral modules. In other applications, one module can control carefully timed sequences of operations performed on other modules in the system. Modules can pass triggers to one another, allowing precisely timed responses to asynchronous external events the system is monitoring or controlling.

System Reference Clock

The PXI-1010 supplies the PXI 10 MHz system clock signal (PXI_CLK10) independently to each peripheral slot. An independent buffer (having a source impedance matched to the backplane and a skew of less than 1 ns between slots) drives the clock signal to each peripheral slot. You can use this common reference clock signal to synchronize multiple modules in a measurement or control system. You can drive PXI_CLK10 from an external source through the PXI_CLK10_IN pin on the P2 connector of the Star Trigger slot. (Refer to Table B-4, *P2 (J2) Connector Pin Assignments for the Star Trigger Slot*.) Sourcing an external clock on this pin automatically disables the backplane 10 MHz source.

2

Installation and Configuration

This chapter describes how to prepare and operate your PXI-1010 chassis.

Mounting Information

The PXI-1010 is designed to operate on a bench or in an instrument rack. Determine how you want to use your PXI-1010 and follow the appropriate installation instructions.

Apertures in the rear and along both sides of the chassis facilitate power supply and module cooling. Air enters through filters and fan inlets located in the lower rear of the chassis and exits through the upper sections through the side. Place your PXI-1010 on a bench top or in an instrument rack so that the fans (air inlets) and the air outlet apertures along both sides of the chassis have adequate ventilation. Keep other equipment a minimum of 3.0 in. (76.2 mm) away from the air inlets and outlets.

Install your chassis for easy access to the rear panel. This simplifies the air filter replacement.

Rack-mount applications require the optional rack-mount kit available from National Instruments. Refer to the rack-mount kit documentation to install your PXI-1010 in an instrument rack.

Chassis Configuration

Chassis configuration involves selecting an SCXI subsystem address, line voltage, and fuse value, described briefly in the following sections.

SCXI Subsystem Address Selection

Note Unless you are using multiple chassis and need to configure one or more SCXI chassis for a different address, you can skip this section. The SCXI subsystem will have the factory-default address of 0.

You can configure the SCXI subsystem for one of 32 different addresses so that you can connect multiple SCXI chassis to the same control source. The five switches on the front panel of Slot 0 determine the chassis address. Switches one through five represent the values 1, 2, 4, 8, and 16 respectively, when set to the ON position. When set to the OFF position, their value is 0. The chassis address is the sum of the switch values. Figure 2-1 shows examples of both the factory-default setting of the chassis address 0 and the switch setting for chassis address 19.

| 1 Chassis Default Address = 0 | 2 Address = 19 | 3 ON |
Figure 2-1. Address Setting Examples

Line Voltage Selection and Fuse Values

The voltage selection wheel and fuse should be correct for operation in your geographical region (the -0x extension of the kit part number corresponds to your geographical region). Check the voltage on the voltage selection wheel to ensure that you have the correct voltage setting and fuse.

The PXI-1010 chassis can operate with line voltages of 100, 120, 220, and 240 VAC. The voltage selection wheel in the power entry module determines the voltage for which the chassis is configured. Identify the operating voltage by looking at the number on the power entry module when the selection wheel door is closed. The fuse is a 5 by 20 mm SLO-BLO type, which has a current rating relative to the operating voltage. Table 2-1 shows the proper voltage selection and fuse ratings for different geographical regions.

⚠ **Caution**   For continued protection against fire, replace fuses only with fuses of the same type and rating.

Table 2-1. PXI-1010 Voltage Selection and Fuse Ratings by Region

Region	Line Voltage	Fuse Rating
North America	120 VAC	1/2 A
Japan	100 VAC	3/4 A
Europe	240 VAC	1/4 A
Switzerland	220 VAC	1/4 A

Table 2-2 shows the manufacturer part numbers National Instruments uses for these fuses.

Table 2-2. PXI-1010 Fuse Part Numbers

Fuse Rating	Manufacturer	Part Number
1/4 A	Littelfuse	218.250
1/2 A	Littelfuse	239.500
3/4 A	Littelfuse	239.750

To select a line voltage, refer to Figure 1-3, *Rear View of the PXI-1010 Chassis*, as needed and complete the following steps:

1. Turn off the PXI-1010 power.

2. Remove the power cable from the power-entry module.

3. Using a flathead screwdriver, pry the door to the selection wheel open from the top.

4. Remove the selection wheel.

5. Rotate the wheel for the appropriate voltage and reinsert it into the power-entry module.

6. Close the door.

7. Check that the voltage showing on the selection wheel is correct.

8. Reinsert the power cable.

PXI-1010 Chassis Installation

⚠️ **Caution**   Equipment described in this document must be used in an Installation Category II environment per IEC 644. This category requires local level supply mains-connected installation.

Complete the following steps to install the PXI-1010 chassis:

1. If you are *not* using multiple chassis, skip this step and leave the address at its factory-default setting of 0. If you are using multiple chassis, change the SCXI chassis address of the SCXI subsystem by following the instructions in the *SCXI Subsystem Address Selection* section earlier in this chapter.

2. Place the PXI chassis on a sturdy, level surface. Leave at least 10 cm (4 in.) of space behind the chassis for adequate air circulation.

3. Turn off the power switches.

4. Check that the voltage selection wheel in the power-entry module is set for your outlet line voltage. Refer to the *Line Voltage Selection and Fuse Values* section earlier in this chapter, if necessary.

5. Insert the female end of your power cable into the power-entry module.

6. Insert the male end of your power cable into the wall outlet.

7. Install the SCXI and PXI modules into the chassis (refer to the appropriate sections later in this chapter).

   If you are *not* using a DAQ device in Slot 8 of the PXI backplane to control the SCXI modules, install the necessary cabling for your modules. Consult your SCXI module documentation for cabling installation instructions.

8. Install any front and rear filler panels (refer to the appropriate sections later in this chapter).

9. Turn on the chassis power switches.

PXI Module Installation

⚠️ **Caution**   Turn off the PXI subsystem power using the power switch shown in Figure 1-2, *Front View of the PXI-1010 Chassis*, before installing CompactPCI or PXI modules.

Complete the following steps to install a PXI module into a chassis slot:

1. Place the module edges into the PXI module guides (top and bottom), as shown in Figure 1-2, *Front View of the PXI-1010 Chassis*.

2. Slide the module to the rear of the chassis, making sure that the injector/ejector handle is pushed down as shown in Figure 2-3.

3. When you begin to feel resistance, push up on the injector/ejector handle to inject the module into the frame.

4. Secure the module's front panel to the chassis using the module front-panel mounting screws.

| 1 | PXI-1010 Chassis | 3 | PXI Module | 5 | Injector/Ejector Rail |
| 2 | System Controller | 4 | Injector/Ejector Handle | | |
Figure 2-2. Installing PXI or CompactPCI Modules (PXI Module Shown)
Figure 2-3. Injector/Ejector Handle Position during Module Insertion

PXI Filler Panel Installation

To optimize module cooling performance, install filler panels into unused or empty slots. Secure the filler panels with the captive mounting screws.

SCXI Module Installation

Complete the following steps to install SCXI modules:

1. Power off the SCXI subsystem using the switch shown in Figure 1-2, *Front View of the PXI-1010 Chassis*.

2. Remove the front filler panel of an empty SCXI slot.

3. Insert the module into the module guide rails and slide the module to the back of the chassis. Do *not* force the module into place.

4. Screw the front mounting panel of the module to the top and bottom threaded strips of the SCXI chassis using the thumbscrews on the module front panel.

5. Install any necessary cabling.

The installation is complete.

Refer to your SCXI module documentation for specific instructions pertaining to the module, especially module cabling.

SCXI Filler Panel Installation

The SCXI front and rear filler panel accessories protect the inside of the SCXI subsystem and installed modules by preventing unwanted material from entering the PXI chassis and damaging modules or forming conductive paths that may degrade performance. Install all SCXI modules first, then, in any unused SCXI slots, install filler panels from the edge of the module front panels.

Front Filler Panel Installation

Front filler panels are the height of a full slot. Complete the following steps to install SCXI front filler panels:

1. Place the filler panel with the captive screws to the right of the PXI chassis front. Line up the screws with the threaded strip holes.

2. Using a flathead screwdriver, screw the two captive screws into the threaded strip holes.

Rear Filler Panel Installation

Rear filler panels are half the height of front filler panels. To install SCXI rear filler panels, complete the following steps:

1. Place the filler panel at the rear of the chassis between the two threaded strips. Align the filler panel so that the serial number faces into the chassis and the screw holes are on the right of the rear panel.

2. Using a flathead screwdriver, screw the two screws through the rear panel into the threaded strip holes.

Using the PXI Chassis Initialization File

To assist system integrators, the PXI specification requires manufacturers of PXI chassis and system modules to document their product capabilities. The minimum documentation requirements are in .ini files, which consist of ASCII text. The system integrator can read the .ini file, and configuration utilities and device drivers can also use this file. The PXI-1010 chassis initialization file, chassis .ini, is included on the media for your PXI-1010.

3

Maintenance

This chapter describes basic maintenance procedures for the PXI-1010 chassis.

Maintenance Procedures

Service Interval

Clean the chassis fan filters at a maximum interval of six months. Depending upon the amount of use and ambient dust levels in the operating environment, the filters may require more frequent cleaning.

Clean dust from the chassis exterior and interior as needed, based on the operating environment. Periodic cleaning increases reliability.

Preparation

The information in this section is designed for use by qualified service personnel.

⚠ **Caution**   Many components within the chassis are susceptible to static discharge damage. Service the chassis only in a static-free environment. Observe standard handling precautions for static-sensitive devices while servicing the chassis. Always wear a grounded wrist strap or equivalent while servicing the chassis.

Cleaning

Cleaning procedures consist of cleaning the exterior and interior of the chassis and fan filters. Refer to your PXI module documentation for information on cleaning the individual CompactPCI or PXI modules.

⚠ **Caution**   Always power off the chassis and disconnect the power cable before cleaning or servicing the chassis.

Interior Cleaning

Use a dry, low-velocity stream of air to clean the chassis interior. Use a soft-bristle brush for cleaning around components.

Exterior Cleaning

Clean the exterior surfaces of the chassis with a dry lint-free cloth or a soft-bristle brush. If any dirt remains, wipe with a cloth moistened in a mild soap solution. Remove any soap residue by wiping with a cloth moistened with clear water.

⚠ **Cautions** Do *not* use abrasive compounds on any part of the chassis

Avoid getting moisture inside the chassis during exterior cleaning.

Do *not* wash the front- or rear-panel connectors or switches. Cover these components while cleaning the chassis.

Do *not* use chemical cleaning agents: they may damage the chassis. Avoid chemicals that contain benzene, toluene, xylene, acetone, or similar solvents.

PXI Subsystem Fan Filter Cleaning

To easily remove the chassis cooling filters from the rear of the chassis, remove the plastic housing attached to each fan.

To clean the fan filters, wash them in a mild soap solution and then vacuum or blow air through them. Rinse the filters with water and allow them to dry before reinstalling them onto the chassis.

SCXI Subsystem Fan Filter Cleaning

The fan on the rear of the SCXI subsystem cools the SCXI subsystem and its modules. To keep the fan effective, the fan filters must be clean. Dust and dirt accumulation reduces airflow, which makes the inside of the chassis hotter, shortening the life of the chassis and modules. Complete the following steps to clean the fan filters:

1. Power off the chassis.

2. Remove the power cable from the power-entry module.

3. Place the chassis face down on a flat surface so that the fan is on top. If the chassis is so heavily cabled that you cannot practically place it in this position, leave the chassis as it is but be careful to support the fan during removal and reinstallation to prevent breaking the fan wires.

   To remove the fan filter, remove the four screws that secure the fan and filter to the rear of the chassis. When removing the last screw, be careful to hold the fan to prevent breaking the fan wires.

4. Clean the fan filter by moving the filter around under a gentle stream of cold tap water until all the dust has been removed. Dry the filter.

5. Replace the fan filter by aligning the fan and filter with the fan holes, making sure that the label side of the fan is face down. Reinstall the four screws and make sure the assembly is secure.

Resetting the AC Main Circuit Breaker

If your PXI subsystem encounters an over-current condition, the circuit breaker located on the rear panel will trip to prevent chassis damage. Refer to Figure 1-2, *Front View of the PXI-1010 Chassis*, and Figure 1-3, *Rear View of the PXI-1010 Chassis*, as you complete the following steps:

1. Turn off the PXI power switch.

2. Depress the circuit breaker to reset it.

3. Turn on the PXI power switch.

If the circuit breaker trips again, complete the following steps:

1. Turn off the PXI power switch.

2. Remove all modules from the chassis.

3. Depress the circuit breaker to reset it.

4. Turn on the power switch and verify that the circuit breaker does not trip.

5. Verify that your PXI-1010 can meet the power requirements of your CompactPCI or PXI modules. Overloading the chassis can cause the breaker to trip. Refer to Appendix A, *Specifications*, for power requirements.

6. The over-current condition that caused the circuit breaker to trip may be due to a faulty CompactPCI or PXI module. Refer to your module documentation to troubleshoot your modules.

SCXI Subsystem Fuse Replacement

Power Entry Module Fuse Replacement

⚠️   **Caution**   Disconnect all power before removing cover.

Refer to Figure 1-3, *Rear View of the PXI-1010 Chassis*, as you complete the following steps to replace the power-entry module fuse:

1. Power off the chassis.

2. Remove the power cable from the power-entry module.

3. Using a flathead screwdriver, pry the door to the voltage selection wheel open from the top.

4. Pull out the fuse drawer.

5. Remove the fuse.

6. Install the new fuse in the drawer.

7. Reinsert the fuse drawer in the right side slot with the arrow pointing to the right.

8. Close the door.

9. Reinsert the power cable.

SCXI Subsystem Backplane Fuse Replacement and Check

In addition to the power entry module fuse, the analog supply lines on the backplane are fused at 1.5 A. The fuse manufacturer is Littelfuse, part number 251 01.5.

If you are going to make your own modules, fuse your module at 250 mA to avoid blowing the backplane fuses. Fusing your module also better protects your module because a failure can result in a large amount of current drawn, but not enough to blow the backplane fuses.

The backplane fuses are located behind the SCXI subsystem fan.

Complete the following steps to check or replace fuses:

1. Remove the appropriate fan and filter from the rear of the chassis, following the instructions in the *SCXI Subsystem Fan Filter Cleaning* section in this chapter. Make sure to power off the chassis and remove the power cable.

2. The fuse marked with a copper + on the backplane is for the positive analog supply, and the fuse marked with a copper – is for the negative analog supply. To check whether a fuse is blown, connect an ohmmeter across the leads. If the reading is not 0 Ω, replace the fuse.

3. Use a pair of needle-nose pliers to carefully extract the fuse.

4. Take a new fuse and bend its leads so the component is 1.27 cm (0.5 in.) long (the dimension between the fuse sockets), and clip the leads to a length of 0.635 cm (0.25 in).

5. Using the needle-nose pliers, insert the fuse into the socket holes.

6. Repeat, if necessary, for the other fuse.

7. Check the fan filter and, if it is dirty, clean it as described in the *SCXI Subsystem Fan Filter Cleaning* section of this chapter.

8. Reinstall the fan and filter.

Troubleshooting the PXI-1010

Refer to Table 3-1 to troubleshoot the PXI-1010 chassis. The table lists possible causes for power failure and recommends ways to correct the problem.

Table 3-1. Troubleshooting Power Failure

Possible Cause	What to Do
PXI-1010 chassis is not connected to power source.	Make sure that the PXI-1010 is connected to a live electrical outlet. Try operating another piece of equipment from this outlet.
Power switch is not switched on.	Set the PXI power switch to the *On* position.
Circuit breaker is tripped.	Reset the circuit breaker. Refer to the *Resetting the AC Main Circuit Breaker* section of this chapter.
Power supply has failed.	Contact National Instruments.

A

Specifications

This appendix contains complete specifications for the PXI-1010 chassis.

PXI Subsystem Electrical Characteristics

AC Input

Input voltage range................................. 100 to 240 VAC

Operating voltage range[1]........................ 90 to 264 VAC

Input frequency .... 50/60 Hz

Operating frequency range[1] .... 47 to 63 Hz

Max current

    120 VAC, ±10% .... 8 A

    100 VAC, ±10% .... 8 A

    240 VAC, ±10% .... 4 A

    220 VAC, ±10% .... 4 A

Over-current protection......................... 10 A circuit breaker

Line regulation

    3.3 V... <±0.2%

    5 V.. <±0.1%

    ±12 V .... <±0.1%

Efficiency .... 70% typical

---

[1] The operating range is guaranteed by design.

Power disconnect...................................The AC power cable provides main power disconnect. The front-panel power switch causes the internal chassis power supply to provide DC power to the CompactPCI/PXI backplane.

PXI Subsystem DC Output

DC current capacity

Voltage	I_{MP} (Steady-state current)
+3.3 V	30 A
+5 V	20 A
+12 V	4 A
–12 V	2 A

Load regulation

Voltage	Load Regulation
+3.3 V	<5%
+12 V	<5%
+5 V	<5%
–12 V	<5%

Maximum ripple and noise (20 MHz bandwidth)

Voltage	Maximum Ripple and Noise
+3.3 V	50 mV_{pp}
+12 V	120 mV_{pp}
+5 V	50 mV_{pp}
–12 V	120 mV_{pp}

Over-current protection.......................... All outputs protected from short
                                                 circuit and overload with
                                                 automatic recovery

Over-voltage protection

    3.3 V and 5 V .... Clamped at 20 to 30% above
                                                 nominal output voltage

    +12 V and –12 V............................. Clamped at 26 to 29 V difference
                                                 between +12 and –12 V outputs

SCXI Subsystem Electrical Characteristics

DC Output

V+ output

    Tolerance limits include peaks .... +18.5 to +25 V

    Ripple (peak-to-peak) .... 1.5 V

    Max load .... 680 mA

V– output

    Tolerance limits include peaks .... –18.5 to –25 V

    Ripple (peak-to-peak) .... 1.5 V

    Max load .... 680 mA

+5 V output

    Tolerance limits include peaks .... +4.75 to +5.25 V

    Ripple (peak-to-peak) .... 50 mV

    Max load .... 200 mA

Maximum loads are the supply current for the entire chassis. Scaling the
maximum power gives the allotted current per slot, as follows:

V+ output .... 170 mA

V– output.. 170 mA

+5 V output .... 50 mA

PXI Subsystem Cooling

Per slot cooling capacity.........................Slot cooling capacity in worst-case slot is 20 W

Module cooling system...........................Forced air circulation (positive pressurization) from two fans

Slot airflow direction ....P1 to P2, bottom of module to top of module

Module cooling intake ....Bottom rear of chassis

Module cooling exhaust..........................Top sides of chassis

Power supply cooling system ....Forced air circulation from integrated fan

Power supply cooling intake...................Rear of chassis

Power supply cooling exhaust ....Sides of chassis

Module cooling fan MTBF.....................30,000 h

Environment

Temperature (IEC 60068-2-1, 2) ....0 to +50 °C, functional
–20 to +70 °C, storage

Humidity (IEC 60068-2-3) ....10 to 90% (noncondensing), functional

Random vibration
(IEC 60068-2-34) ....5 to 150 Hz at 0.005 g^2/Hz ASD, 0.837 g_{rms}, functional
10 to 500 Hz at 0.010 g^2/Hz ASD, 2.214 g_{rms}, survival

Random vibration (MIL-T-28800E, MIL-STD-810E Method 514)[1] ....5 to 500 Hz, 0.31 g_{rms}, 3 axes, operational
10 to 500 Hz, 2.46 g_{rms}, 3 axes, non-operational

---

[1] Test levels exceed those recommended in MIL-STD-810E for Category 1 (Basic Transportation, Figures 514.4-1 through 514.4-3).

Sine vibration (IEC 60068-2-6) .... 10 to 60 Hz at 0.15 mm
displacement,
60 to 500 Hz at 2 g, survival

Shock (IEC 60068-2-27)........................ 30 g, 11 ms, half sine pulse,
functional

Altitude... 2 km (1.24 mi)

Pollution Degree 2

Indoor use only.

Safety

The PXI-1010 is designed to meet the requirements of the following
standards of safety for electrical equipment for measurement, control,
and laboratory use:

- EN 61010-1, IEC 61010-1
- UL 3111-1, UL 61010B-1
- CAN/CSA C22.2 No. 1010.1

Note For UL and other safety certifications, refer to the product label, or visit
ni.com/hardref.nsf, search by model number or product line, and click the
appropriate link in the Certification column.

Electromagnetic Compatibility

Emissions .... EN 55011 Class A at 10 m
FCC Part 15A above 1 GHz

Immunity .... EN 61326:1997 + A2:2001,
Table 1

CE, C-Tick, and FCC Part 15 (Class A) Compliant

Note For EMC compliance, operate this device with shielded cabling. In addition, all
covers and filler panels must be installed.

CE Compliance

This product meets the essential requirements of applicable European Directives, as amended for CE marking, as follows:

Low-Voltage Directive (safety)..............73/23/EEC

Electromagnetic Compatibility
Directive (EMC) 89/336/EEC

📝 **Note**   Refer to the Declaration of Conformity (DoC) for this product for any additional regulatory compliance information. To obtain the DoC for this product, visit `ni.com/hardref.nsf`, search by model number or product line, and click the appropriate link in the Certification column.

Backplane

Size ....3U-sized; one system slot (with three system expansion slots) and seven peripheral slots.
Compliant with IEEE 1101.10 mechanical packaging.
PXI Specification Revision 1.0 compliant.
Accepts both PXI and CompactPCI (PICMG 2.0 R2.1) 3U modules.

Backplane bare-board material...............UL 94 V-0 recognized (File No. E 116551)

Backplane connectors ....Conform to IEC 917 and IEC 1076-4-101, and are UL 94 V-0 rated

10 MHz System Reference Clock (PXI_CLK10)

Maximum clock skew
between slots..250 ps

Built-in 10 MHz clock

    Accuracy...±25 ppm (guaranteed over the operating temperature range)

    Maximum jitter................................5 ps RMS in 10 Hz to 1 MHz range

External clock sources

    Connectors .... Slot 2 J2 (pin D17; refer to Table B-4, *P2 (J2) Connector Pin Assignments for the Star Trigger Slot*)

    Input frequency .... 10 MHz ±100 ppm or better

    Input amplitude

        Slot 2 .... 5 V or 3.3 V, 10 MHz TTL signal

    Maximum jitter introduced by backplane circuitry .... 1 ps RMS in 10 Hz to 1 MHz range

Mechanical

Overall dimensions .... Refer to Figure A-1 through Figure A-3 for the physical dimensions of the PXI-1010 chassis

Weight .... 4.5 kg (10 lb)

| 1   PXI Subsystem (8 slots) | 2   SCXI Subsystem (4 slots) |
**Figure A-1.** PXI-1010 Dimensions (Front View Shown)
Figure A-2. PXI-1010 Dimensions (Rear View Shown)
Figure A-3. PXI-1010 Dimensions (Top View Shown)

B

I/O Connector

This appendix describes the P1 and P2 connector pin assignments for the PXI subsystem backplane.

Table B-1 shows the P1 (J1) connector pin assignments for the System Controller slot.

Table B-2 shows the P2 (J2) connector pin assignments for the System Controller slot.

Table B-3 shows the P1 (J1) connector pin assignments for the Star Trigger slot.

Table B-4 shows the P2 (J2) connector pin assignments for the Star Trigger slot.

Table B-5 shows the P1 (J1) connector pin assignments for the peripheral slots.

Table B-6 shows the P2 (J2) connector pin assignments for the peripheral slots.

Note PXI signals are shown in **bold**.

C

Technical Support and Professional Services

Visit the following sections of the National Instruments Web site at `ni.com` for technical support and professional services:

- **Support**—Online technical support resources at `ni.com/support` include the following:

  - **Self-Help Resources**—For immediate answers and solutions, visit the award-winning National Instruments Web site for software drivers and updates, a searchable KnowledgeBase, product manuals, step-by-step troubleshooting wizards, thousands of example programs, tutorials, application notes, instrument drivers, and so on.

  - **Free Technical Support**—All registered users receive free Basic Service, which includes access to hundreds of Application Engineers worldwide in the NI Developer Exchange at `ni.com/exchange`. National Instruments Application Engineers make sure every question receives an answer.

- **Training and Certification**—Visit `ni.com/training` for self-paced training, eLearning virtual classrooms, interactive CDs, and Certification program information. You also can register for instructor-led, hands-on courses at locations around the world.

- **System Integration**—If you have time constraints, limited in-house technical resources, or other project challenges, NI Alliance Program members can help. To learn more, call your local NI office or visit `ni.com/alliance`.

- **Declaration of Conformity (DoC)**—A DoC is our claim of compliance with the Council of the European Communities using the manufacturer's declaration of conformity. This system affords the user protection for electronic compatibility (EMC) and product safety. You can obtain the DoC for your product by visiting `ni.com/hardref.nsf`.

If you searched `ni.com` and could not find the answers you need, contact your local office or NI corporate headquarters. Phone numbers for our worldwide offices are listed at the front of this manual. You also can visit

the Worldwide Offices section of `ni.com/niglobal` to access the branch office Web sites, which provide up-to-date contact information, support phone numbers, email addresses, and current events.

Glossary

Symbol	Prefix	Value
m	milli	10^{-3}
c	centi	10^{-2}
k	kilo	10^{3}
M	mega	10^{6}

Symbols

°	Degrees
%	Percent

A

A	Amperes
AC	Alternating current
ANSI	American National Standards Institute
asynchronous	1. Software—an action or event that occurs at an unpredictable time with respect to the execution of a program 2. Hardware—a property of an event that occurs at an arbitrary time, without synchronization to a reference clock

B

backplane	An assembly, typically a printed circuit board, with connectors and signal paths that bus the connector pins
bandwidth	The range of frequencies present in a signal, or the range of frequencies to which a measuring device can respond

bus	The group of connectors that interconnect individual circuitry in a computer. Typically, a bus is the expansion vehicle to which I/O or other devices are connected. Examples of PC buses are the ISA and PCI buses.

C

C	Celsius
CSA	Canadian Standards Association

D

daisy-chain	A method of propagating signals along a bus, in which the devices are prioritized on the basis of their position on the bus
DC	Direct current

E

EMC	Electromagnetic Compatibility

F

FCC	Federal Communications Commission

G

g	1. Grams 2. A measure of acceleration equal to 9.8 m/s^2
GND	Ground signal
g$_{rms}$	A measure of random vibration; the root mean square of acceleration levels in a random vibration test profile

H

h	Hour
Hz	Hertz; cycles per second

I

I/O	Input/output
IEC	International Electrotechnical Commission; an organization that sets international electrical and electronics standards
IEEE	Institute of Electrical and Electronics Engineers
I_{MP}	Mainframe peak current
in.	Inches

L

lb	Pounds
local bus	A group of signals that connect two peripheral slots

M

m	Meters
MTBF	Mean time between failure

N

NEMA	National Electrical Manufacturers Association

O

over-current condition	When the lead on a power supply draws more current than what the power supply is rated for

P

PXI	PCI eXtensions for Instrumentation
PXI 10 MHz system clock signal	A 10 MHz clock reference provided by the PXI backplane to all peripheral modules
PXI backplane	The board in the PXI subsystem that connects the PXI modules
PXI_CLK10	The pin that provides the PXI 10 MHz system clock signal to a peripheral slot
PXI_CLK_10_IN	The pin that a star trigger module uses to supply the PXI 10 MHz system clock signal
PXI module	A PXI module that plugs into a PXI slot
PXI peripheral module	A PXI module that plugs into a PXI peripheral slot
PXI peripheral slot	Holds PXI peripheral modules
PXI subsystem	The PXI-1010 chassis section that uses PXI modules

R

RMS	Root mean square—A method used to measure electrical output in volts and watts

S

s	Seconds
SCXI	SCXI stands for Signal Conditioning eXtensions for Instrumentation and is a National Instruments product line designed to perform front-end signal conditioning for National Instruments plug-in DAQ devices.
SCXI subsystem	The PXI-1010 chassis section that uses SCXI modules
slot	The slot in the chassis where a module is inserted
Slot 0	The power and control circuitry for the SCXI subsystem

Star Trigger slot	This slot is located at Slot 2 and has a dedicated trigger line between each peripheral slot. Use this slot for a module with Star Trigger functionality that can provide individual triggers to all other peripherals.
System Controller	A module configured for installation in Slot 0 of a VXIbus mainframe. This device is unique in the VXIbus system in that it performs the VMEbus system controller functions, including clock sourcing and arbitration for data transfers across the backplane. Installing such a device into any other slot can damage the device, the VXIbus backplane, or both.
system integrator	The party who connects pieces of hardware and software to create a complete system for the end user

T

| trigger | Any event that causes or starts some form of data capture |
| TTL | Transistor-transistor logic |

U

| UL | Underwriter's Laboratories |

V

V	Volts
VAC	Volts alternating current
voltage selection wheel	Configures the chassis for the AC line voltage

W

| W | Watts |
