Preface

Profile

Before You Begin This Course

Before you begin this course, you should have the following qualifications:

- Thorough knowledge of Oracle navigation
- Working experience with inventory transactions

Prerequisites

- There are no prerequisites for this course.

How This Course Is Organized

R11i Cycle Counting is an instructor-led course featuring lecture and hands-on exercises. Online demonstrations and written practice sessions reinforce the concepts and skills introduced.

Typographic Conventions

Typographic Conventions in Text

Convention	Element	Example
Bold italic	Glossary term (if there is a glossary)	The <i>algorithm</i> inserts the new key.
Caps and lowercase	Buttons, check boxes, triggers, windows	Click the Executable button. Select the Can't Delete Card check box. Assign a When-Validate-Item trigger to the ORD block. Open the Master Schedule window.
Courier new, case sensitive (default is lowercase)	Code output, directory names, filenames, passwords, pathnames, URLs, user input, usernames	Code output: <code>debug.set ('I', 300);</code> Directory: <code>bin (DOS), \$FMHOME (UNIX)</code> Filename: Locate the <code>init.ora</code> file. Password: User <code>tiger</code> as your password. Pathname: Open <code>c:\my_docs\projects</code> URL: Go to <code>http://www.oracle.com</code> User input: Enter <code>300</code> Username: Log on as <code>scott</code>
Initial cap	Graphics labels (unless the term is a proper noun)	Customer address (<i>but</i> Oracle Payables)
Italic	Emphasized words and phrases, titles of books and courses, variables	Do <i>not</i> save changes to the database. For further information, see <i>Oracle7 Server SQL Language Reference Manual</i> . Enter <code>user_id@us.oracle.com</code> , where <i>user_id</i> is the name of the user.
Quotation marks	Interface elements with long names that have only initial caps; lesson and chapter titles in cross-references	Select "Include a reusable module component" and click Finish. This subject is covered in Unit II, Lesson 3, "Working with Objects."
Uppercase	SQL column names, commands, functions, schemas, table names	Use the SELECT command to view information stored in the LAST_NAME column of the EMP table.

Convention	Element	Example
Arrow	Menu paths	Select File—> Save.

Brackets	Key names	Press [Enter].
Commas	Key sequences	Press and release keys one at a time: [Alternate], [F], [D]
Plus signs	Key combinations	Press and hold these keys simultaneously: [Ctrl]+[Alt]+[Del]

Typographic Conventions in Code

Convention	Element	Example
Caps and lowercase	Oracle Forms triggers	When-Validate-Item
Lowercase	Column names, table names	SELECT last_name FROM s_emp;
	Passwords	DROP USER scott IDENTIFIED BY tiger;
	PL/SQL objects	OG_ACTIVATE_LAYER (OG_GET_LAYER ('prod_pie_layer'))
Lowercase italic	Syntax variables	CREATE ROLE <i>role</i>
Uppercase	SQL commands and functions	SELECT userid FROM emp;

Typographic Conventions in Navigation Paths

This course uses simplified navigation paths, such as the following example, to direct you through Oracle Applications.

(N) Invoice > Entry > Invoice Batches Summary (M) Query > Find (B) Approve

This simplified path translates to the following:

1. (N) From the Navigator window, select Invoice > Entry > Invoice Batches Summary.
2. (M) From the menu, select Query > Find.
3. (B) Click the Approve button.

Notations :

(N) = Navigator

(M) = Menu

(T) = Tab

(I) = Icon

(H) = Hyperlink

(B) = Button

Typographical Conventions in Help System Paths

This course uses a “navigation path” convention to represent actions you perform to find pertinent information in the Oracle Applications Help System.

The following help navigation path, for example—

(Help) General Ledger > Journals > Enter Journals

—represents the following sequence of actions:

1. In the navigation frame of the help system window, expand the General Ledger entry.
2. Under the General Ledger entry, expand Journals.
3. Under Journals, select Enter Journals.
4. Review the Enter Journals topic that appears in the document frame of the help system window.

Getting Help

Oracle Applications provides you with a complete online help facility.

Whenever you need assistance, simply choose an item from the Help menu to pinpoint the type of information you want.

To display help for a current window:

1. Choose Window Help from the Help menu, click the Help button on the toolbar, or hold down the Control key and type 'h'.

A web browser window appears, containing search and navigation frames on the left, and a frame that displays help documents on the right.

The document frame provides information on the window containing the cursor. The navigation frame displays the top-level topics for your responsibility, arranged in a tree control.

2. If the document frame contains a list of topics associated with the window, click on a topic of interest to display more detailed information.

3. You can navigate to other topics of interest in the help system, or choose Close from your web browser's File menu to close help.

Searching for Help

You can perform a search to find the Oracle Applications help information you want. Simply enter your query in the text field located in the top-left frame of the browser window when viewing help, then click the adjacent Find button.

A list of titles, ranked by relevance and linked to the documents in question, is returned from your search in the right-hand document frame. Click on whichever title seems to best answer your needs to display the complete document in this frame. If the document doesn't fully answer your questions, use your browser's Back button to return to the list of titles and try another.

R11i Cycle Counting

Chapter 1

R11i Cycle Counting

**Oracle Inventory
Release 11i**

ORACLE

Objectives

After completing this course you should be able to do the following:

- **Create an ABC Compile**
- **Define and Maintain a Cycle Count**
- **Describe Serialized Cycle Counting**
- **Demonstrate Count Adjustments and Approvals**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Agenda

Agenda

- Overview of Cycle Counting and ABC Analysis
- Defining an ABC Analysis
- Defining and Maintaining a Cycle Count
- Understanding Serialized Cycle Counts
- Count Adjustments and Approvals
- Summary

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Overview of Cycle Counting

- **Cycle counting is the periodic counting of individual items throughout the course of the year to ensure the accuracy of inventory quantities and values.**
- **You can perform cycle counting instead of taking complete physical inventories, or you can use both techniques to verify the accuracy of inventory quantities and values.**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Overview of Cycle Counting

- Inventory items are categorized by the system according to the criterion designated (such as Current Value or Forecasted Usage Quantity), into as many ABC Classes as are specified (usually between 3 and 6). This process is called an “ABC Compile”, and is used to get an overview of existing inventory.
- ABC Classes can be used as they are by copying them directly into ABC Assignment Groups, or they can be adjusted to enhance cycle counting:
 - Multiple ABC Classes can be combined into a single ABC Assignment Group
 - Individual items can be moved into a different ABC Assignment Group than would otherwise be assigned

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Overview of Cycle Counting

- **Items are loaded into Cycle Count Classes based on their ABC Assignment Groups. Cycle Count Classes are the basis of all cycle count activity. Cycle Count Classifications can be manually adjusted.**
- **Count parameters (such as count frequency and tolerance limits) are assigned to Cycle Count Classes, which then drive count schedules and the treatment of items with variances.**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Overview of Cycle Counting

- You can manually schedule cycle counts (ie: for specific high-value subinventories or items) in addition to automatically scheduled counts.
- Serialized items have additional support available during the cycle count process, according to the level specified. This support ranges from “ignore serial numbers” to “verify each serial number and resolve any discrepancies”.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Overview of Cycle Counting

- **Items with count variances outside of specified tolerance limits must be followed up as designated:**
 - recount
 - adjust
 - approve adjustment (optional)
- **Reports are available to manage the cycle count process, ensure all items are counted, identify variances for followup and to report results.**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Overview of ABC Analysis

- **An ABC Analysis determines the relative importance of a group of inventory items based on user-specified criteria.**
- **An ABC Analysis is often used to drive cycle counts, where you might count items of high value (A items) frequently, items of lower value less frequently (B items) and items of lowest value very infrequently (C items).**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

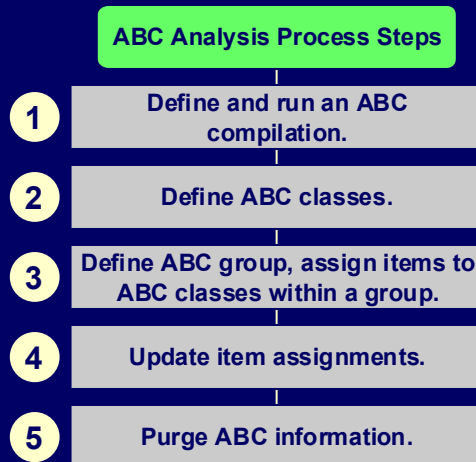

Agenda

- Overview of Cycle Counting and ABC Analysis
- **Defining an ABC Analysis**
- Defining and Maintaining a Cycle Count
- Understanding Serialized Cycle Counts
- Count Adjustments and Approvals
- Summary

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

ABC Process Flow

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Defining an ABC Analysis

The steps involved in performing a successful ABC Analysis are:

- Define and run an ABC compilation.
- Run the Descending Value Report.
- Define ABC Classes.
- Define ABC Groups.
- Assign items to ABC classes within a group.
- Update item assignments.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Define and Run an ABC Compilation

Define and Run an ABC Compilation

- An ABC Compile is a ranking of your items based upon selected criteria.
- You can define and compile an ABC analysis for your entire organization or for a specific subinventory within your organization.
- You choose the compilation criterion, the scope of your analysis, the cost type to use in determining item values and any additional information that may be conditionally necessary based on your compilation criterion.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

(N) Inventory > ABC Codes > ABC Compiles

ABC Compilation Criteria

- For each distinct compile, you can choose one criterion (such as *Current On-Hand Value* or *MRP Demand Usage Value* - see following pages) to value and rank each item included in the ABC compile.
- The criterion that you choose defines what the rank of a particular item will be in the ABC Compile.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

For example: If you use *Current on-hand quantity* as your compile criterion, then item X with an on-hand quantity of 10 units is of higher rank than item Y with a quantity of 5 units. If you use *Current on-hand value* criterion item X has a cost of \$10 per unit and item Y has a cost of \$25 per unit, item Y has a higher value than item X since Oracle Inventory compares \$100 (\$10x10 units) to \$125 (\$25x5 units).

ABC Compilation Criteria

- ***Current on-hand Quantity:*** Use the current on-hand quantity of inventory. Assign the sequence number by descending quantity.
- ***Current on-hand Value:*** Use the current on-hand quantity of inventory multiplied by the cost for the cost type. Assign the sequence number by descending value.
- ***Historical Usage Value:*** Use the historical usage value (transaction history). This is the sum of the transaction quantities times the unit cost of the transactions for the time period you specify. Assign the sequence number by descending value.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Note: Any value based criterion requires you to nominate a cost type.

ABC Compilation Criteria

- ***Historical Usage Quantity:*** Use the historical usage quantity (transaction history) for the time period you specify. Assign the sequence number by descending quantity.
- ***Historical Number of Transactions:*** Use the historical number of transactions (transaction history) for the time period you specify. Assign the sequence number by descending number of transactions.
- ***Forecasted Usage Value:*** Use the forecasted usage value based on the forecast quantity calculated and the cost type you specify. Assign the sequence number by descending value.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

ABC Compilation Criteria

- **Forecasted Usage Quantity:** Use the forecasted usage quantity. Assign the sequence number by descending quantity.
- **Previous Cycle Count Adjustment Quantity:** Oracle Inventory sums the value of all cycle count adjustments since the last ABC compile date. Assign the sequence number by descending quantity.
- **Previous Cycle Count Adjustment Value:** Oracle Inventory sums the value of all cycle count adjustments since the last ABC compile date. Assign the sequence number by descending value.

Copyright © Oracle Corporation, 2000. All rights reserved.

ABC Compilation Criteria

- ***MRP Demand Usage Quantity:*** Oracle Inventory sums the MRP gross requirements for the MRP plan you specify. Assign the sequence number by descending quantity.
- ***MRP Demand Usage Value:*** Oracle Inventory sums the MRP gross requirements for the MRP plan you specify, then multiplies each by the item cost type you choose in the ABC compile form. Assign the sequence number by descending value.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

ABC Valuation Scope

- You select a valuation scope for determining the ranking of items.
- Valuation Scope is chosen in the Define ABC Compile window.
- If you choose to restrict your ABC compile to items within a particular subinventory, you have the option of valuing your items across all subinventories in the organization or just the one for which you have restricted the ABC compile.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

The Descending Value Report

The Descending Value Report

- You use the ABC Descending Value Report to view the results of your ABC compile.
- The report is sorted by descending value or quantity, depending on the compile criterion.
- You use this report to evaluate the break points for assigning your ABC item to classes.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

(N) Inventory > Reports > ABC and Counting

Defining ABC Classes

- You use ABC classes to identify the value groupings to which your items belong.
- You define these classes using your own terminology. For example, you might define classes High, Medium, Low. Later assign your items of highest rank to the High class, those of lower rank to the Medium class and those of lowest rank to the Low class.
- You can add to the list of classes you have already defined at any time.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Defining ABC Classes

- You can use ABC classes to group items for a cycle count where you count “A” items more frequently than “B” items. When you use ABC classes in this way, you perform an ABC analysis and assign items to classes based on the results of that analysis.
- You can also use ABC classes to group items for planning purposes. For example, the Planning Detail Report allows you to choose an ABC class to report on.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Defining ABC Classes

- You can delete an ABC class as long as the class is not in use in a cycle count or ABC assignment group.
- You can make an ABC class inactive by entering a date on which the class becomes inactive. As of this date, you can no longer assign the ABC class to an ABC group.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Defining ABC Groups

Defining ABC Groups

- **ABC assignment groups link a particular ABC compile with a valid set of ABC classes. This allows you to selectively reduce or increase the number of ABC classes you want to use in your item assignments for a particular ABC compile.**
- **Oracle Inventory uses these groups when you automatically assign your items to ABC classes. It ensures that you divide your items into the exact number of groupings you specified in the ABC group.**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

(N) Inventory > ABC Codes > ABC Assignment Groups

Defining ABC Groups

- You must also assign a sequence number to each class associated with the ABC group. The class with the lowest sequence number is assumed to have the highest rank and will have higher rank items assigned to that class than the next higher sequence number.
- You may update an assignment group to add new classes, however you cannot delete a class. If you need to delete a class, you must create a new assignment group with only the desired classes.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

ABC Item Assignments

- When you define ABC assignments you specify the cutoff point for each ABC class. Each ABC class must have at least one item assigned to it and all items in the ABC compile must be assigned to an ABC class. You can use any of the following fields to determine the cutoff points:

Seq: You can enter the sequence number from the ABC Descending Value Report for the last item to be included in each ABC class. Oracle Inventory automatically calculates this value if you choose to assign classes by another method. Oracle Inventory displays the last sequence number as the default of the last class.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

(N) Inventory > ABC Codes > Assign Items

ABC Item Assignments

Inventory Value: You can enter the cumulative value from the ABC Descending Value Report for the last item to include in each ABC class. Oracle Inventory automatically calculates the maximum value. This maximum value is restricted to the total inventory value compiled and is displayed in the Total Compile Value field. Oracle Inventory displays the total inventory value as the default for the last class.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

ABC Item Assignments

ABC Item Assignments

% Items: You can enter the percent of number of items compiled from the ABC Descending Value Report to include in each class. Oracle Inventory automatically calculates this value if you choose to assign classes by another method.

% Value: You can enter the percent of total compile value from the ABC Descending Value Report to include in each class. Oracle Inventory automatically calculates this value if you choose to assign classes by another method.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Note: It is possible to have several items in the ABC compile with zero value. If any item with zero value is in a class other than the last class, you may only assign items using the sequence number or item percent. For the Inventory Value, % Item and % Value fields, if the value entered does not exactly match any item, Oracle Inventory chooses the first item with a value greater than the value entered. For example, if you choose 20% to be A items, inventory calculates which items comprise 20% and will include the next item if a partial is in the calculation. If 20% = the first 10 items in my compile, plus part of the 11th item, then items 1-11 are A items.

ABC Item Assignments

ABC Item Assignments

If you are not satisfied with the class into which an item falls as a result of the automatic ABC assignment process, you can change it. For example, you compile your ABC analysis based on historical usage value. A new item in your inventory is ranked low because it has little transaction history. However, you know that for the future this item should really be ranked higher. Use the *Update ABC Assignments* form to reclassify this item.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

(N) Inventory > ABC Codes > Update Item Assignments

Note: Whenever you recompile an ABC analysis or change the method by which you assign your ABC classifications, you lose any changes you might have made to your item assignments. All items are reclassified based on their new ranks in the ABC Descending Value Report and the method you choose to determine cutoff points.

ABC Item Assignments

You can also update an ABC group to include those items that were not a part of the initial ABC compile. This allows you to expand the scope of your existing ABC compiles without having to rerun any processes.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Purging ABC Information

Purging ABC Information

- You can submit a request to purge either an ABC assignment group or ABC compile information.
- Purging an ABC group deletes all item assignments to ABC classes for the assignment group you specify, as well as the ABC group itself.
- Purging an ABC compile deletes all item values and rankings for the ABC compile you specify, as well as the ABC compile itself.
- You can purge an ABC compile only if no ABC groups are using it.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Follow this navigational path to purge an ABC Assignment Group:

(N) Inventory > ABC Codes > ABC Assignment Groups

From the “Tools” pull down menu select Purge Group.

Follow this navigational path to purge an ABC Compile:

(N) Inventory > ABC Codes > ABC Compiles

From the “Tools” pull down menu select Purge Compile

Practice 1-1 Overview

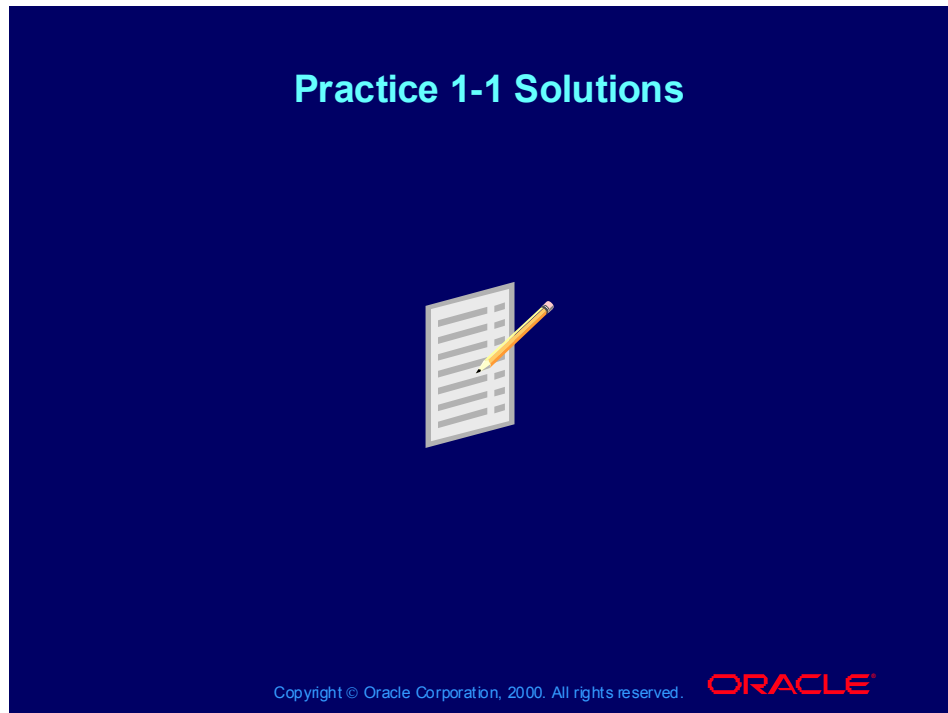

Practice 1-1 Agenda

- Define and run an ABC Compile
- Run the Descending Value Report
- Define ABC Classes
- Define ABC Groups
- Assign Items

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 1-1 Solutions

Practice 1-1 Solutions

1. Define and Run an ABC Compile

(N)Inventory > ABC Codes > ABC Compile

(B)New

Enter a unique name and description.

Select "Subinventory" under Content Scope.

From the list of values, choose a subinventory.

Select "Subinventory" under Valuation Scope.

Select "Current On-Hand Value" under Compile Specification.

Select "Frozen" under Cost Type. (Frozen is only a valid option when the organization is standard costed)

Press the "Compile" button.

Press "OK" in the confirmation window.

Select "NO" when asked to print.

View your request to make sure it completed without error.

(N)View > Requests

Practice 1-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 1-1 Solutions

2. Run the Descending Value Report

(N)Inventory > reports > ABC and Counting

Select Single Request

Report Name = ABC Descending Value Report

ABC Compile Header = Your Compile Name from step 1

Cumulative Display Criteria = Cumulative By Value

(B)OK

(B)Submit

When asked to Submit Another Request, select "NO"

View your request to make sure it completed without error.

(N)View > Requests

Practice 1-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Practice 1-1 Solutions

3. Define ABC Classes

(N)Inventory > ABC Codes > ABC Classes

DO NOT TYPE OVER EXISTING DATA!

You will enter three classes in this screen.

Enter a unique name and description for your “A” class.

Enter a unique name and description for your “B” class.

Enter a unique name and description for your “C” class.

Save your work.

Practice 1-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 1-1 Solutions

4. Define ABC Groups

(N)Inventory > ABC Codes > ABC Assignment Group

Enter a unique Group Name.

Enter your ABC Compile Name.

The “Subinventory” and “Valuation Scope” information will be populated by with default information.

Save your work.

(B)Group Classes

The Priority fields will populate with default numbers.

Tab to Class Name field

Enter your “A” Class Name or choose it from the list of values

Repeat for your “B” and “C” Class Names

Save your work.

Close the Group Class Assignment Window.

Practice 1-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 1-1 Solutions

5. Assign Items

(N)Inventory > ABC Codes > ABC Assignment Group

(B)Assign Items

Enter the following In the “% Items” field: (This is a cumulative column)

60, 80, 100

(B)Assign

A concurrent request will be submitted

(B)OK

Note your request number

Close the Assign ABC Items Window

View your request to make sure it completed without error.

(N)View > Requests

After your request has completed, press the “Update Items” button.

Review the results of the item assignment.

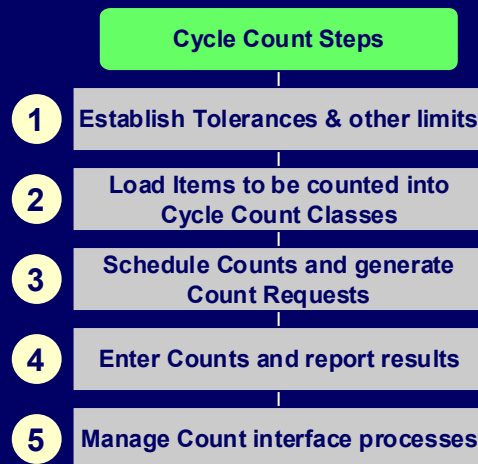

Agenda

- Overview of Cycle Counting and ABC Analysis
- Defining an ABC Analysis
- **Defining and Maintaining a Cycle Count**
- Understanding Serialized Cycle Counts
- Count Adjustments and Approvals
- Summary

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Defining and Maintining a Cycle Count

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Cycle Count Approval Tolerance

- A cycle count is a count of a subset of items, counted during the working day, rather than after freezing stock levels.
- When the actual count and the system's on-hand quantity do not exactly agree, it will be compared to an approval tolerance.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Approval Tolerances

- Oracle Inventory supports two types of cycle count approval tolerances, *Quantity Variance Tolerance* and *Adjustment Value Tolerance*. For each type, you can specify a positive and a negative limit which can differ from each other.
- When a particular cycle count entry results in an adjustment that exceeds any one of these limits, you have a cycle count adjustment that exceeds approval tolerances.
- Based on the approval option you choose when you define your cycle count, this adjustment is either posted automatically or held for approval.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Quantity Variance Tolerance

Quantity Variance Tolerance:

- The quantity variance tolerance is a user-defined limit for the difference between the actual cycle count quantity and the system tracked on-hand quantity. You express positive and negative quantity variance tolerances as percentages of the system on-hand quantity.
- You enter these percentages when you define your:
 - Cycle Count Header
 - Cycle Count Classes
 - Cycle Count Items

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Note: Inventory uses any percentages you define at the cycle count item level first. If you do not have any defined for an item, it uses the tolerances defined for that item's cycle count class. If you do not have any defined for the class, it uses the tolerances at the cycle count header level. If you have no tolerances defined for the header, Inventory assumes that there is no limit to the approval tolerance.

Adjustment Value Tolerance

Adjustment Value Tolerance

Adjustment Value Tolerance:

- The Adjustment Value Tolerance is a user-defined limit for the total value of a cycle count adjustment.
 - The adjustment value is calculated as:
$$\text{adjusted value} = (\text{count qty} - \text{system on-hand qty}) * \text{current item cost}$$
- The Adjustment Value Tolerance is expressed as positive and negative amounts in your functional currency. An adjustment value is out of tolerance if it falls outside of these amounts.
- You enter these tolerances when you define your cycle count header and cycle count classes.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Note: Inventory uses the values you define at the cycle count class level first. If you do not have any defined for an item's class, it uses the values at the cycle count header level. If you have no tolerances defined for the header, Inventory assumes that there is no limit to the approval tolerance.

Hit/Miss Tolerance

Hit/Miss Tolerance:

- The Hit/Miss Tolerance is a user-defined limit for the difference between the system tracked on-hand quantity and the actual cycle count quantity.
- You express positive and negative hit/miss tolerances as percentages of the system on-hand quantity.
- A count is considered a “hit” if it is within these tolerances, and a “miss” if it is outside them.
- The Hit/Miss Tolerance allows you to evaluate the actual accuracy of your inventory.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Note: You enter hit/miss tolerance percentages when you define your cycle count header and when you define your cycle count classes. Inventory uses the percentages you define at the cycle count class level first. If you do not have any defined for an item's class, it uses the tolerances at the cycle count header level. If you have no tolerances defined for the header, Inventory assumes that there is no limit to the hit/miss tolerance, and all variances are therefore “hits” regardless of the size.

Inventory uses these tolerances to generate the Cycle Count Hit/Miss Analysis report which will be covered later in this course.

Measurement Errors

Measurement Errors:

- **Negative and positive measurement errors are user-defined limits for the difference between the cycle count quantity and the system tracked on-hand quantity. Measurement Error limits are assigned by Item.**
- **Inventory does not make any adjustments to an item whose cycle count quantity differs from the system tracked on-hand quantity by less than the measurement error. *Because of this, measurement errors implicitly override any approval tolerances you specify.***

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Note: You specify measurement errors when you define or update an item at the Master Item or Organizational Item level. Use measurement errors with extreme caution since they actually prevent cycle count adjustments from taking place. You would typically use this feature on an exception basis for items you cannot accurately count. For example, if you visually check the level of bolts in a bin to estimate the quantity, or you use their weight to approximate the quantity, you might want to allow for measurement errors. Therefore, if your system tracked on-hand quantity for the bolts in that bin is within an acceptable range, you do not perform a cycle count adjustment.

Cycle Count Items

Cycle Count Items

- You need to load items into your cycle count before you can schedule or count them. There are two methods you can use to do this.
 - specify an existing ABC group from which to automatically load your items
 - manually enter, delete or update the items you want included/excluded

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

When you ***specify an existing ABC group***, Oracle Inventory automatically includes all items in the ABC group you choose in your cycle count. Inventory also copies the ABC classes for that ABC group into the current cycle count classes and maintains the same classifications for the included items. You can change the classifications of your items for your cycle count independent of the ABC classes

Once you have generated your list of items to count from an ABC group, you can periodically refresh the item list with new or reclassified items from a regenerated ABC group. Using the Cycle Counts window, you can choose whether to automatically update class information for existing items in the cycle count based on the new ABC assignments. You can also choose to have any items that are no longer in the ABC group automatically deleted from the cycle count list.

You ***manually enter, delete, or update the items you want included/excluded*** using the Cycle Count Items window. You may want to use this form to load all your items for a cycle count or to simply add items as they are defined in the system rather than recompiling your ABC group and doing a complete reinitialization.

Automatic Scheduling

Oracle inventory uses the number of items in each cycle count class, the frequency of each class, and the workday calendar of your organization to determine how many and which items you need to count during the scheduling frequency.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

In order for Inventory to perform automatic scheduling you must:

- Set the Cycle Count Enabled item attribute to Yes for the items you want to include in the cycle count.
 - Enable automatic scheduling when you define your cycle count.
 - Request the schedule using the Generate Automatic Schedule Requests window.
- Each time the auto scheduler runs, it schedules counts only for the schedule interval you defined for the cycle count header. So if your schedule interval is weeks, Inventory schedules all items that you need to be counted on all of the workdays in the current week. If your schedule interval is days, then Inventory only schedules those items that are due for counting on the current date.

Manual Scheduling

Manual Scheduling

You can manually schedule counts in addition to or instead of those generated with automatic scheduling.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

You can request counts for specific subinventories, locators and items, and set the count for any inventory date. For example, you could enter a request to count item A wherever it can be found in subinventory X. Or you could request to count all item quantities in subinventory Y, locator B-100.

Since manually scheduled counts have no impact on automatically scheduled counts, you can potentially count some items more frequently than you had initially planned.

Physical Location Scheduling

You can use this feature to execute location-based cycle counting. You first need to generate a schedule for counting each subinventory and locator. You then need to enter the schedule requests for each locator, specifying the schedule date.

Count Requests

Count Requests

After you have successfully scheduled your counts, you can submit the process to generate count requests.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

This process takes the output of the automatic scheduler and your manual schedule entries and generates a count request for each item number, revision, lot number, subinventory and locator combination for which on-hand quantities exist. These count requests are ordered first by subinventory and locator, then by item, revision and lot. Oracle Inventory assigns a unique sequence number to each count request that can be used for reporting, querying and rapid count entry.

Because the count requests are derived from the state of on-hand balances at the time the Generate Cycle count Requests process is run, you should wait to run it until you are ready to count.

Note: When you schedule an item to be counted using manual scheduling, some schedule requests may have overlapping count requirements. The count request generator does not create duplicate count requests, but instead cross-references one count request back to each associated schedule request.

Count Requests

Count Requests

By default Inventory does not automatically generate requests to count items with an on-hand quantity of zero. To include such items:

- **Define all sourcing details and inventory controls for the item. (For example, if an item is under predefined locator control be sure it is assigned to a subinventory and locator.)**
- **Select the Generate Zero Counts option when you define your cycle count.**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

The count request generation process automatically creates a count request. If a quantity is found and counted, an adjustment is made.

At count entry, you may receive a warning message stating “Zero count, no adjustment performed.” Inventory generates this warning if it cannot find all levels of inventory control defined for the item. In this situation, enter the count but no adjustment is performed. To make an adjustment and update the missing information, enter an unscheduled count using either the Cycle Count Entries or Approve Adjustments window.

Entering Cycle Counts

Entering Cycle Counts

- You can use the same window to enter counts of items requested via automatic or manual cycle count scheduling.
- You can also enter unscheduled count entries, if they are allowed for your cycle counts.
- You can use unscheduled counts to perform location based cycle counts.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Oracle Inventory automatically queries up all count requests for which you have not yet entered a count. You can use flexible search criteria to specify the group of count requests for which you want counts entered to speed up the count entry process. For example, you can specify a range of count request sequences assigned to one person so they can be entered in the same order they were printed on the count sheet.

Cycle Count Reports

You can use a number of reports to help you during the process of cycle counting and to analyze and report the results of cycle count transactions. You can submit a concurrent request for these reports from the Tools menu in most of the cycle counting windows as well as from the Submit Requests window.

Cycle Count Schedule Requests Report:

This report shows all scheduled requests for a specified time period. It includes both manually and automatically scheduled items.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Cycle Count Reports

Cycle Count Listing:

This report lists all of the items currently due for cycle counting, including their revision, lot number, subinventory and locator information. You can use this report as the document you give to the employees performing the cycle counts. Since the report leaves a blank line for the counter's name, the count date, and the actual count quantity, the counter can use this listing to write down and report his cycle count results.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Cycle Count Reports

Cycle Count Open Requests Listing:

This report shows count requests where no counts have been entered, or count entries where you have requested a recount. You can optionally report on late counts, where no counts have been entered and the due date for the count entry is before the date of the report.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Cycle Count Reports

Cycle Count Reports

Cycle Count Unscheduled Items Report:

This report shows those items that are currently not scheduled to be counted and were last scheduled a period of time in the past that is longer than expected, as dictated by the count frequency of the class to which the item belongs.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

You primarily use this report as an auditing tool. If you correctly set up your scheduling and counting, and are always current in your count, Inventory should not find any unscheduled items to report. However, if you do not run the auto scheduler as frequently as it needs to run, or if concurrent manager problems prevent its execution, you may fall behind in your count schedules.

Cycle Count Reports

Cycle Counts Pending Approval Report:

This report shows those counts that were entered and are currently pending approval. The supervisor with the authority to approve cycle count adjustments would typically run this report regularly to monitor the approval queue.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Cycle Count Reports

Cycle Count Entries and Adjustments Report:

This report shows all cycle count entries for a specified time period. It analyzes the number of cycle count transactions you make against an item, and the number of units you actually adjust. The report also calculates the value, in your functional currency, of the adjustments to inventory.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Cycle Count Reports

Cycle Count Hit/Miss Analysis:

This report shows, for each cycle count class, the total number of count entries and the number of counts outside the limits of the user-specified hit/miss tolerances. The report also calculates the overall accuracy percentages broken down by cycle count class and subinventory. This report is based on the first count only, not recounts.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Cycle Count Open Interface

Cycle Count Open Interface

You can import cycle count entries from external systems into Oracle Inventory using the Cycle Count Entries Open Interface.

You can also export cycle count requests with this interface to external systems.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Export Cycle Count Request:

This process allows you to export cycle count requests into external systems.

Update Cycle Count Open Interface:

This process allows you to update cycle count entries.

Import Cycle Count Entries from Open Interface:

This process allows you to import cycle count entries open interface records into the database.

Purge Cycle Count Entries Open Interface Data:

This process allows you to purge all cycle count entries from the open interface.

Print Cycle Count Entries Open Interface Data:

This process allows you to print cycle count entries open interface data.

Practice 2-1 Overview

Practice 2-1 Overview

- **Initialize a Cycle Count**
- **Define Cycle Count Classes**
- **Perform Full Cycle Count**
- **Enter Cycle Count Entries**

ORACLE

Practice 2-1 Solutions

1. Initialize a Cycle Count

(N)Inventory > Counting > Cycle Counting > Cycle Counts

(B)New

Enter a unique name and description

Select the Workday Calendar (use the default calendar for this practice).

For the Adjustment Account, use the list of values and choose the "Miscellaneous" alias.

Leave "Inactive On" blank.

Late Days = 1

Starting Seq = 1

Check the "Unscheduled Entries" Box.

Check the "Display System Qty" Box.

Under "Count Subinventories" select "Specific"

Enter the subinventory that you used for your ABC Analysis

Practice 2-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 2-1 Solutions

1. Initialize a Cycle Count (continued)

Leave "Automatic Recounts" unchecked.

Select the "Serial and Schedule" tabbed region.

Count = Not Allowed

Check the "Auto Schedule" box.

Frequency = Weekly

Leave "Count Zero Quantity" unchecked.

Leave "Last Date" and "Next Date" fields blank.

Select the "Adjustments and ABC" tabbed region.

Approval Required = If Out of Tolerance

Tolerance - Qty Variance = +3% -3%

Tolerance - Adjustment Value = +\$200 -\$200

Tolerance - Hit/Miss Analysis = +10% -10%

Practice 2-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 2-1 Solutions

1. Initialize a Cycle Count (continued)

ABC Initialization Group = Your ABC Group Name

Option = (Re)Initialize

Leave "Update Classes" and "Delete Unused Items" unchecked.

Save

Write down your Request ID#

View your request and verify that it has completed without error.

Practice 2-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Practice 2-1 Solutions

2. Define Cycle Count Classes

From the Cycle Counts window, re-query your count.

Select the “Classes” button.

Your A, B and C Classes should populate the name column.

Enter the “Counts Per Year” for each class.

A = 52

B = 26

C = 13

Save.

Close the Cycle Count Classes window.

Practice 2-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 2-1 Solutions

3. Perform Full Cycle Count

From the Cycle Counts Window, re-query your count.

From the “Tools” pull down menu, select “Perform Full Cycle Count”.

A Concurrent Request window will open.

There are three requests that need parameters specified.

Click in the “Parameters” field of Generate Automatic Schedule Request.

All Cycle Counts = No

Cycle Count Name = Your Cycle Count Name

Include Control Items = No

(B)OK

Practice 2-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 2-1 Solutions

3. Perform Full Cycle Count (continued)

Click in the “Parameters” field of Generate Cycle Count.

All Cycle Counts = No

Cycle Count Name = Your Cycle Count Name

(B)OK

Click in the “Parameters” field of Cycle Count Listing.

Cycle Count Name = Your Cycle Count Name

Start Date = Today’s Date

End Date = Today’s Date

Include Recounts Only = No

Subinventory = The Subinventory that you chose earlier in the lesson.

Display Serial Numbers = Yes

Display Onhand Quantities = No

Practice 2-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Practice 2-1 Solutions

3. Perform Full Cycle Count (continued)

Items to Include = All

(B)OK

(B)Submit

Write down your Request ID number

View your request and verify that it has completed without error.

Practice 2-1 Solutions

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Practice 2-1 Solutions

4. Enter Cycle Count Entries

(N)Inventory > Counting > Cycle Counting > Cycle Count Entries

Enter your Cycle Count Name

(B)Find

Find All Open Count Requests? = Yes

Navigate to the “Adjustments” Tabbed Region

Record some counts that will be out of the tolerances that you set up earlier in the lesson and record some counts that are within the tolerances or exactly correct.

Save

Agenda

- Overview of Cycle Counting and ABC Analysis

ORACLE®

Serialized Cycle Counts

- **Cycle counting of serial items takes place within the standard cycle counting functionality in Inventory. However, there are additional considerations specific to serialized cycle counting that will be discussed in this lesson:**
 - **Counting method**
 - **Detail level**
 - **Adjustment approach**
 - **Discrepancy treatment**

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Defining Serialized Cycle Counts

There are four options in the **Cycle Counts** window that govern the handling of serial controlled items.

- **Count:**

If this option is set to *Not Allowed*, then serialized items are excluded from the cycle count.

If this option is set to *One Per Request*, then a separate count request is generated for each serial number.

If this option is set to *Multiple Per Request*, then serial numbers for the same item/location are grouped into one count request.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Defining Serialized Cycle Counts

Defining Serialized Cycle Counts

- **Detail**

If this option is set to *Quantity and Serial Numbers* then Serial number and quantity are required and are validated when entering counts.

If this option is set to *Quantity Only*, then Serial number entry is required if the count quantity does not match the system quantity. Serial number entry is optional if the count quantity matches the system quantity, regardless of whether the serial numbers match.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Under the *Quantity Only* option: If you do not enter serial numbers, the count is marked as completed, and no adjustments are performed. If you do enter serial numbers, both quantity and serial numbers are validated when determining whether adjustments are required.

Defining Serialized Cycle Counts

- ***Adjustment***

If this option is set to *Review All Adjustments*, then no automatic adjustments are attempted. Serialized items that require adjustment must go to an approver for review.

If this option is set to *Adjust if Possible*, then if a discrepancy exists between the count quantity and system quantity or if the entered serial numbers do not correspond to the serial numbers already in the specified location, then the system will attempt to make adjustments if the adjustment variance and value are within tolerances, as long as serial uniqueness constraints are not violated.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Defining Serialized Cycle Counts

- ***Discrepancy***

If this option is set to *Allow Discrepancies*, then when a count includes a serial number already assigned to the same item elsewhere in the system, an adjustment is created if it would be within quantity or value tolerances. No adjustment is ever allowed for counts including serial numbers already assigned to another item.

If this option is set to *Do Not Allow Discrepancies*, then adjustments are not made for items not found in the specified location. The items must then be recounted to eliminate discrepancies.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Entering Serialized Counts

Entering Serialized Counts

How you enter serialized cycle counts depends on the Count and Detail option settings in the count definition. When the Count option is set to *One Per Request* and the Detail option is set to *Quantity Only*, the count request itself contains the serial number, and you enter a count quantity of either present or missing.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

When the Count option is set to *Multiple Per Request* and the Detail option is set to *Quantity and Serial Numbers*, the Serial Number field in the count request is disabled, and you must use the Cycle Count Serial Detail window to specify whether the serial number is present. If you selected *Quantity Only* as the Detail option, you must use the Cycle Count Serial Number Details window if there is a quantity mismatch.

It is possible to have count requests for serial numbers with an on-hand quantity of zero. If you mark the serial number as present, then you will need to make an adjustment to your count.

Approving and Adjusting Serialized Counts

The approval process for serialized items differs from that for non-serialized items. Serial numbers that are misplaced (at a different location or for a different item) cannot be adjusted.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

Counts in which there is a misplaced serial number are sent for approval, regardless of whether the adjustment variances fall within tolerance if discrepancies are allowed. However, if a count entry contains a serial number found in another location, the count request cannot be approved until the discrepancy is corrected. You can make the correction manually in the Transaction window, or you can cycle count the other location (performing an issue, adjustment transaction) and then recount the first location.

For serial numbers that do not appear in the cycle count request but are entered by the counter, adjustment transactions are considered receipts. These receipt transactions are allowed for the serial statuses where the unit is defined but never used and where the unit has been issued out of stores. For serial numbers that appear in the count request but are not marked as present by the counter, adjustment transactions are considered issues. These issue transactions are allowed for the serial status where the unit is received into stores. Count requests whose serial adjustments fall into these two categories may have adjustment transactions performed against them and may complete normally.

ORACLE®

Count Adjustments and Approvals

Once you enter and save your cycle counts, Oracle Inventory determines whether any adjustments need to be made depending on the approval options and tolerances you set when you defined the cycle count.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Automatic Recounts

Automatic Recounts

- If you turned the Automatic Recount option on when you defined your cycle count, Inventory automatically submits recount requests for items that are outside the limits of the approval tolerances you specify.
- Inventory submits recounts as many times as necessary, limited by the maximum automatic recounts you specify for the cycle count.
- After you reach the maximum number of recounts, Inventory holds the count for approval.
- Any count request with the *Recount* status automatically appears on the next cycle count listing

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

You can manually request recounts when you are approving adjustments. This recount request will be included in the next cycle count listing.

Approving Cycle Counts Held for Approval

Approving Cycle Counts Held for Approval

- Employees with access to the Count Adjustments Approvals Summary window can query, request the recount of, or approve cycle counts pending approval.
- You can query all counts or only those pending approval.
- You can approve adjustments, recount an item in question, reject the count or take no action until further investigation takes place.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE®

(N) Inventory > Counting > Cycle Counting > Approve Counts

Approving Cycle Count Adjustments

Approving Cycle Count Adjustments

- You use the **Count Adjustment Approvals Summary** window to approve cycle count adjustments, to request/approve recounts, or to reject the adjustment.
- Inventory determines which counts need approval by using the approval tolerances you entered while defining your cycle count.
- You can use flexible search criteria to specify the cycle count adjustments you want to review or approve.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

(N) Inventory > Counting > Cycle Counting > Approve Counts

Approving Cycle Count Adjustments

Approving Cycle Count Adjustments

Inside the Count Adjustment Approvals Summary window, you can view a variety of current item information to help determine whether to approve an adjustment. Select the information from the following tabbed regions:

- **Adjustment:** View information for the count adjustment UOM, variance quantity, variance value, variance percentage and system quantity.
- **Revision, Subinventory, Locator:** View information for revision, subinventory, locator, unit of measure and adjustment quantity.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

(N) Inventory > Counting > Cycle Counting > Approve Counts

Approving Cycle Count Adjustments

- **Lot:** View information for a lot number, unit of measure, adjustment quantity and serial number.
- **Reason, Reference:** View or update the transaction reason and reference information. You can also view the unit of measure and adjustment quantity.
- **Count:** View information for UOM, count quantity, counter and count date.
- **Count Status, Class:** View information for the sequence number, count status and cycle count class
- **Approval:** View information for date approved and approver.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

Approval Actions and Adjustments

Approval Actions and Adjustments

- For items appearing in the Approval Actions, Adjustments region, you can approve, request a recount, or reject cycle count entries that are pending approval.
- You can also approve or reject any count for which a recount has already been requested.
- You can reject any cycle count request that has not yet been counted.
- You can display count history information or open the Count Adjustment Approvals window.

Copyright © Oracle Corporation, 2000. All rights reserved.

ORACLE

(N) Inventory > Counting > Cycle Counting > Approve Counts

Select *Approved* to approve the selected count entry and post the adjustment to the transaction manager for processing.

Select *Rejected* to reject the selected count record. An adjustment is not posted. No further processing of this count entry takes place.

Select *Recount* to process a recount request for the selected count request. An adjustment is not posted.

Select the *Count History* button to open the Count History window for the current item. For the current item, this window displays count and variance information for the current, prior and first counts.

Select the *Open* button to open the Count Adjustment Approvals window for the current line. This window is a combination block which you can use to view and enter approval and adjustment information for the current line instead of using the Count Adjustment Approvals Summary window.
