| <code>force</code>                 | Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.                                                                                                                                                                                                                                                                                                                                                                 |
| <code>no_invalidate</code>         | Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.109 RESUME\_ADVISOR\_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

### Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (
 task_name IN VARCHAR2);
```

### Parameters

**Table 166-116 RESUME\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Example 166-14 Resuming an Interrupted Task

In this example, you start a SQL\*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
 v_tname VARCHAR2(128) := 'my_task';
 v_ename VARCHAR2(128) := NULL;
BEGIN
 -- create a task
 v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
```

```
-- execute the task
v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL\*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

In the second SQL\*Plus session, you resume the task execution as follows:

```
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');
```

## 166.7.110 SCRIPT\_ADVISOR\_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

### Syntax

```
DBMS_STATS.SCRIPT_ADVISOR_TASK (
 task_name IN VARCHAR2,
 execution_name IN VARCHAR2 := NULL,
 dir_name IN VARCHAR2 := NULL,
 level IN VARCHAR2 := 'TYPICAL')
RETURN CLOB;
```

### Parameters

**Table 166-117** SCRIPT\_ADVISOR\_TASK Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                         |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error. |

**Table 166-117 (Cont.) SCRIPT\_ADVISOR\_TASK Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dir_name  | Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory. |
| level     | The level of the script to generate. Possible values are <ul style="list-style-type: none"> <li>• ALL: Ignores the filter and generates a script for all findings</li> <li>• TYPICAL: Generates a script according to the filters in place</li> </ul>                          |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- `Operation` level

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- `Object` level

Users can perform this task for any object for which they have statistics collection privileges.

### Return Values

This function returns a CLOB that contains the script.

## Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Example 166-15 Creating an Optimizer Statistics Advisor Script

This example creates a procedure named `myrep`, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fotype VARCHAR2,
which VARCHAR2)
IS
 v_report CLOB := null;
 v_script CLOB := null;
 v_fotype VARCHAR2(400) := p_fotype;
 v_tname VARCHAR2(400) := p_tname;
 v_len NUMBER(10);
 v_ps NUMBER(10) := 10000;
 v_pn NUMBER(10) := 1;
 v_ret VARCHAR2(32767);
BEGIN
 IF which = 'REPORT'
 THEN
 -- generate a report
 v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
 task_name => v_tname,
 type => v_fotype,
 section => 'ALL',
 level => 'ALL');
 v_len := DBMS_LOB.getlength(v_report);
 WHILE (v_pn < v_len)
 LOOP
 DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
 v_pn := v_pn + v_ps;
 END LOOP;
 ELSE
 -- generate a script
 v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
 v_len := DBMS_LOB.getlength(v_script);
 WHILE (v_pn < v_len)
 LOOP
 DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
 v_pn := v_pn + v_ps;
 END LOOP;
 END IF;
END;
```

```

 END IF;
 END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','-','SCRIPT');
SPOOL OFF

```

## 166.7.111 SEED\_COL\_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

### Syntax

```

DBMS_STATS.SEED_COL_USAGE (
 sqlset_name IN VARCHAR2,
 owner_name IN VARCHAR2,
 time_limit IN POSITIVE DEFAULT NULL);

```

### Parameters

**Table 166-118 SEED\_COL\_USAGE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name | Name of the SQL tuning set that contains the statements to be monitored.<br><br>If this parameter and owner_name are both null, then the procedure monitors all statements in the database for the specified time limit.   |
| owner_name  | Owner of the SQL tuning set that contains the statements to be monitored.<br><br>If this parameter and sqlset_name are both null, then the procedure monitors all statements in the database for the specified time limit. |
| time_limit  | Time limit (in seconds).                                                                                                                                                                                                   |

### Security Model

To invoke this procedure you must have the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

## Exceptions

ORA-20000: Insufficient privileges

## Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the [CREATE\\_EXTENDED\\_STATS Function](#) procedure. If `sqlset_name` and `owner_name` are `NULL`, then the procedure records the column (group) usage information for the statements executed in the system in next `time_limit` seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in `SYS.COL_USAGE$`. The procedure stores information in `SYS.COL_GROUP_USAGE$`.

## Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
 DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

## 166.7.112 SET\_ADVISOR\_TASK\_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

### Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (
 task_name IN VARCHAR2,
 parameter IN VARCHAR2,
 value IN VARCHAR2);
```

### Parameters

**Table 166-119** SET\_ADVISOR\_TASK\_PARAMETER Procedure Parameters

| Parameter              | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <code>task_name</code> | The name of the Optimizer Statistics Advisor task.                                                         |
| <code>parameter</code> | The name of the parameter to set. The function returns an error if the specified parameter does not exist. |
| <code>value</code>     | The new value of the parameter.                                                                            |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

## Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

*Oracle Database SQL Tuning Guide* to learn how to manage Optimizer Statistics Advisor

## 166.7.113 SET\_COLUMN\_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

### Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 colname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 distcnt NUMBER DEFAULT NULL,
 density NUMBER DEFAULT NULL,
 nullcnt NUMBER DEFAULT NULL,
 srec StatRec DEFAULT NULL,
 avgclen NUMBER DEFAULT NULL,
 flags NUMBER DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 colname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 ext_stats RAW,
 statypown VARCHAR2 DEFAULT NULL,
 statypname VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
```

```

 get_param('NO_INVALIDATE')),
force BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 166-120 SET\_COLUMN\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| tablename     | Name of the table to which this column belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| colname       | Name of the column or extension                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| partname      | Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.                                                                                                                                                                                                                                                                                                           |
| stattab       | User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.                                                                                                                                                                                                                                                                                                                           |
| statid        | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)                                                                                                                                                                                                                                                                                                                                                                     |
| ext_stats     | User-defined statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| stattypown    | Schema of the statistics type                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| stattypname   | Name of the statistics type                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| distcnt       | Number of distinct values                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| density       | Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.                                                                                                                                                                                                                                                                                                                                                                             |
| nullcnt       | Number of NULLs                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| srec          | StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS                                                                                                                                                                                                                                                                                                                                                                                                  |
| avgclen       | Average length for the column (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| flags         | For internal Oracle use (should be left as NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| statown       | Schema containing stattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                               |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Sets the values even if statistics of the column are locked                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent input values
- ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.114 SET\_DATABASE\_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
 pname IN VARCHAR2,
 pvalue IN VARCHAR2,
 add_sys IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-121 SET\_DATABASE\_PREFS Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pname</code>   | <p>Preference name. The existing value for following preferences can be set and default preference values will be used:</p> <ul style="list-style-type: none"> <li>• APPROXIMATE_NDV_ALGORITHM</li> <li>• AUTO_STAT_EXTENSIONS</li> <li>• CASCADE</li> <li>• DEGREE</li> <li>• ESTIMATE_PERCENT</li> <li>• GLOBAL_TEMP_TABLE_STATS</li> <li>• GRANULARITY</li> <li>• INCREMENTAL</li> <li>• INCREMENTAL_STALENESS</li> <li>• INCREMENTAL_LEVEL</li> <li>• METHOD_OPT</li> <li>• NO_INVALIDATE</li> <li>• OPTIONS</li> <li>• PREFERENCE_OVERRIDES_PARAMETER</li> <li>• PUBLISH</li> <li>• STALE_PERCENT</li> <li>• STAT_CATEGORY</li> <li>• TABLE_CACHED_BLOCKS</li> </ul> |
| <code>pvalue</code>  | Preference value. If <code>NULL</code> is specified, it will set the Oracle default values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>add_sys</code> | Value <code>TRUE</code> will include the Oracle-owned tables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 166-122 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>• REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>• ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>• HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>– The accuracy of the new algorithm is similar to the original algorithm.</li> <li>– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>• OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CASCADE                   | Determines whether to collect index statistics as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DEGREE                    | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 166-122 (Cont.) Statistics Preferences

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTIMATE_PERCENT        | <p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| GLOBAL_TEMP_TABLE_STATS | <p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none"> <li>• <code>SHARED</code> — All sessions see the same set of statistics</li> <li>• <code>SESSION</code> — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| GRANULARITY             | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <code>ALL</code> — Gathers all statistics: subpartition, partition, and global.</li> <li>• <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality.</li> <li>• <code>GLOBAL</code> — Gathers global statistics.</li> <li>• <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• <code>PARTITION</code> — Gathers partition-level statistics.</li> <li>• <code>SUBPARTITION</code> — Gathers subpartition-level statistics.</li> </ul> |

Table 166-122 (Cont.) Statistics Preferences

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL       | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> <li>• The INCREMENTAL value for the partitioned table is set to TRUE.</li> <li>• The PUBLISH value for the partitioned table is set to TRUE.</li> <li>• The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> <li>• PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</li> <li>• TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</li> </ul>                                                                                                                                               |

**Table 166-122 (Cont.) Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> |

Table 166-122 (Cont.) Statistics Preferences

| Preference    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METHOD_OPT    | <p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed:</p> <ul style="list-style-type: none"> <li><code>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</code></li> </ul> <p>The <code>size_clause</code> is defined as <code>size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</code></p> <p><code>integer</code> — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p><code>REPEAT</code> — Collects histograms only on the columns that already have histograms.</p> <p><code>AUTO</code> — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p><code>SKEWONLY</code> — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. You can change the value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is <code>DBMS_STATS.AUTO_INVALIDATE</code>, which means the database decides when to invalidate dependent cursors.</p> <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OPTIONS       | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics on all objects in the database. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. This is the default.</li> </ul> <p>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 166-122 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li>TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li>FALSE — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p> |
| PUBLISH                        | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>                                                                                                                                                                                                                 |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>                                                                                                                                   |
| STAT_CATEGORY                  | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics (default)</li> <li>SYNOPSIS - information to support incremental statistics</li> </ul> <p>The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopsis.</p>                |
| TABLE_CACHED_BLOCKS            | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                   |

**Security Model**

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

**Usage Notes**

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

### Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```

## 166.7.115 SET\_GLOBAL\_PREFS Procedure

This procedure sets statistics preferences at the global level.

### Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
 pname IN VARCHAR2,
 pvalue IN VARCHAR2);
```

## Parameters

**Table 166-123 SET\_GLOBAL\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>Preference name. The default value for the following preferences can be set:</p> <ul style="list-style-type: none"> <li>• APPROXIMATE_NDV_ALGORITHM</li> <li>• AUTO_STAT_EXTENSIONS</li> <li>• AUTO_TASK_STATUS</li> <li>• AUTO_TASK_MAX_RUN_TIME</li> <li>• AUTO_TASK_INTERVAL</li> <li>• AUTOSTATS_TARGET</li> <li>• CASCADE</li> <li>• CONCURRENT</li> <li>• DEGREE</li> <li>• ESTIMATE_PERCENT</li> <li>• GLOBAL_TEMP_TABLE_STATS</li> <li>• GRANULARITY</li> <li>• INCREMENTAL</li> <li>• INCREMENTAL_LEVEL</li> <li>• INCREMENTAL_STALENESS</li> <li>• METHOD_OPT</li> <li>• NO_INVALIDATE</li> <li>• OPTIONS</li> <li>• PREFERENCE_OVERRIDES_PARAMETER</li> <li>• PUBLISH</li> <li>• STALE_PERCENT</li> <li>• STAT_CATEGORY</li> <li>• TABLE_CACHED_BLOCKS</li> <li>• WAIT_TIME_TO_UPDATE_STATS</li> </ul> |
| pvalue    | <p>Preference value. If NULL is specified, it will set the Oracle default values</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 166-124 Global Statistics Preferences

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>• REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>• ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>• HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>– The accuracy of the new algorithm is similar to the original algorithm.</li> <li>– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>• OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 166-124 (Cont.) Global Statistics Preferences**

| Preference             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTO_TASK_STATUS       | Enables or disables the high-frequency automatic optimizer statistics collection. Values are: <ul style="list-style-type: none"> <li>ON — Enables high-frequency automatic optimizer statistics collection.</li> <li>OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.</li> </ul>                                                                                                                                                                                                 |
| AUTO_TASK_MAX_RUN_TIME | Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.                                                                                                                                                                                                                                                                                                                                    |
| AUTO_TASK_INTERVAL     | Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).                                                                                                                                                                                                                                                                                                                                          |
| AUTOSTATS_TARGET       | Controls the objects considered for statistics collection. It takes the following values: <ul style="list-style-type: none"> <li>'ALL' - Statistics collected for all objects in system</li> <li>'ORACLE' - Statistics collected for all Oracle owned objects</li> <li>'AUTO' - Oracle decides on which objects to collect statistics</li> </ul> This preference is applicable only for automatic statistics collection.                                                                                                      |
| CASCADE                | Determines whether to collect index statistics as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CONCURRENT             | Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: <ul style="list-style-type: none"> <li>MANUAL — Concurrency is enabled only for manual statistics gathering.</li> <li>AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering.</li> <li>ALL — Concurrency is enabled for both manual and automatic statistics gathering.</li> <li>OFF — Concurrency is disabled for both manual and automatic statistics.</li> </ul> |
| DEGREE                 | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ESTIMATE_PERCENT       | Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.                                                                                                                                                                                                                                                                           |

**Table 166-124 (Cont.) Global Statistics Preferences**

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GLOBAL_TEMP_TABLE_STATS | <p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none"> <li>• SHARED — All sessions see the same set of statistics</li> <li>• SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                    |
| GRANULARITY             | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>• ALL — Gathers all statistics: subpartition, partition, and global.</li> <li>• AUTO — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.</li> <li>• GLOBAL — Gathers global statistics.</li> <li>• GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• PARTITION — Gathers partition-level statistics.</li> <li>• SUBPARTITION — Gathers subpartition-level statistics.</li> </ul> |

**Table 166-124 (Cont.) Global Statistics Preferences**

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL       | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> <li>• The INCREMENTAL value for the partitioned table is set to TRUE.</li> <li>• The PUBLISH value for the partitioned table is set to TRUE.</li> <li>• The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> <li>• PARTITION — Gathers partition-level synopses.<br/>This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</li> <li>• TABLE — Gathers table-level synopses.<br/>Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</li> </ul>                                                                                                                                              |

Table 166-124 (Cont.) Global Statistics Preferences

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/> <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> </li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/> <p>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> </li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/> <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p> </li> </ul> |

| Preference    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| METHOD_OPT    | <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT: Collects histograms only on the columns that already have histograms</li> <li>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</li> <li>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns</li> <li>- column_name: name of a column</li> <li>- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors.</p> <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 166-124 (Cont.) Global Statistics Preferences

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIONS                        | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                       |
| PUBLISH                        | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes.</p> <p>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STAT_CATEGORY                  | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> <li><code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (default)</li> <li><code>SYNOPSIS</code> - information to support incremental statistics</li> </ul> <p>The value <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopses.</p>                                                                                                                                                                                                                                                                         |
| TABLE_CACHED_BLOCKS            | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 166-124 (Cont.) Global Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WAIT_TIME_TO_UPDATE_STATS | Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode. |

**Security Model**

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

**Usage Notes**

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

**Example 166-16 Overriding Statistics Preferences at the Global Level**

You use the SET\_GLOBAL\_PREFS procedure to set the ESTIMATE\_PERCENT preference to 5 for every table in the database that does not have a table preference set. Because sh.costs does not have a preference set, the global setting applies to this table.

```
SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');
```

PL/SQL procedure successfully completed.

You use SET\_TABLE\_PREFS to set the PREFERENCE\_OVERRIDES\_PARAMETER preference to true for the sh.sales table only.

```
SQL> EXEC
DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER',
,'TRUE');
```

PL/SQL procedure successfully completed.

A script attempts to set ESTIMATE\_PERCENT to 10 when gathering statistics for sh.sales. However, because PREFERENCE\_OVERRIDES\_PARAMETER is TRUE for this table, and because a global preference is defined, Oracle Database gathers statistics using the global setting of 5 rather than the specified setting of 10:

```
SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs',
ESTIMATE_PERCENT=>10);
```

PL/SQL procedure successfully completed.

### Example 166-17 Configuring High-Frequency Automatic Optimizer Statistics Collection

Oracle Database 19c introduces high-frequency automatic optimizer statistics collection. This lightweight task periodically gathers statistics for stale objects. The default interval is 15 minutes. In contrast to the automated statistics collection job, the high-frequency task does not perform actions such as purging statistics for non-existent objects or invoking Optimizer Statistics Advisor.

In this example, you enable high-frequency collection, set its maximum run time to a half hour, and then set the frequency interval to 10 minutes:

```
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_STATUS','ON');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_MAX_RUN_TIME','1800');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_INTERVAL','600');
```

## 166.7.116 SET\_INDEX\_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts `ext_stats` sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

### Syntax

```
DBMS_STATS.SET_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 numrows NUMBER DEFAULT NULL,
 numlblks NUMBER DEFAULT NULL,
 numdist NUMBER DEFAULT NULL,
 avglblk NUMBER DEFAULT NULL,
 avgdblk NUMBER DEFAULT NULL,
 clstfct NUMBER DEFAULT NULL,
 indlevel NUMBER DEFAULT NULL,
 flags NUMBER DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
```

```

guessq NUMBER DEFAULT NULL,
cachedblk NUMBER DEFAULT NULL,
cachehit NUMBER DEFAULT NULL,
force BOOLEAN DEFAULT FALSE);

```

Use the following syntax for user-defined domain index statistics:

```

DBMS_STATS.SET_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 ext_stats RAW,
 stattyrown VARCHAR2 DEFAULT NULL,
 stattyname VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 166-125 SET\_INDEX\_STATS Procedure Parameters**

| Parameter  | Description                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname    | Name of the schema                                                                                                                                                                 |
| indname    | Name of the index                                                                                                                                                                  |
| partname   | Name of the index partition in which to store the statistics. If the index is partitioned and if partname is NULL, then the statistics are stored at the global index level.       |
| statab     | User statistics table identifier describing where to store the statistics. If statab is NULL, then the statistics are stored directly in the dictionary.                           |
| statid     | Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)                                                                      |
| ext_stats  | User-defined statistics                                                                                                                                                            |
| stattyrown | Schema of the statistics type                                                                                                                                                      |
| stattyname | Name of the statistics type                                                                                                                                                        |
| numrows    | Number of rows in the index (partition)                                                                                                                                            |
| numlblks   | Number of leaf blocks in the index (partition)                                                                                                                                     |
| numdist    | Number of distinct keys in the index (partition)                                                                                                                                   |
| avglblk    | Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from numlblks and numdist.       |
| avgdblk    | Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist. |

**Table 166-125 (Cont.) SET\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clstfct       | See <code>clustering_factor</code> column of the <code>all_indexes</code> view for a description                                                                                                                                                                                                                                                                                                                                                                                                |
| indlevel      | Height of the index (partition)                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| flags         | For internal Oracle use (should be left as NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| statown       | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                                                                                                                                                                                                                                                                                                                |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| guessq        | Guess quality. See the <code>pct_direct_access</code> column of the <code>all_indexes</code> view for a description.                                                                                                                                                                                                                                                                                                                                                                            |
| cachedblk     | Internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| cachehit      | Internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| force         | Sets the values even if statistics of the index are locked                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

### Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this

workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

## 166.7.117 SET\_PARAM Procedure

This deprecated procedure sets default values for parameters of DBMS\_STATS procedures.

 **Note:**

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [SET\\_GLOBAL\\_PREFS Procedure](#).

See also [DBMS\\_STATS Deprecated Subprograms](#).

You can use the `GET_PARAM` Function to get the current default value of a parameter.

### Syntax

```
DBMS_STATS.SET_PARAM (
 pname IN VARCHAR2,
 pval IN VARCHAR2);
```

## Parameters

**Table 166-126 SET\_PARAM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>The parameter name. The default value for following parameters can be set.</p> <ul style="list-style-type: none"> <li>CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures. It is used only by gather procedures.</li> <li>DEGREE</li> <li>ESTIMATE_PERCENT</li> <li>METHOD_OPT</li> <li>NO_INVALIDATE</li> <li>GRANULARITY</li> <li>AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)</li> </ul> |
| pval      | <p>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</p> <ul style="list-style-type: none"> <li>'ALL' - Statistics are collected for all objects in the system</li> <li>'ORACLE' - Statistics are collected for all Oracle owned objects</li> <li>'AUTO' - Oracle decides for which objects to collect statistics</li> </ul>                                                                                                                                            |

### Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':
  - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
  - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

### Examples

```
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```

## 166.7.118 SET\_PROCESSING\_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

### Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (
 opname IN VARCHAR2,
 procrate IN NUMBER);
```

### Parameters

**Table 166-127 SET\_PROCESSING\_RATE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| opname    | Name of the operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| procrate  | Processing rate. Valid values are as follows: <ul style="list-style-type: none"> <li>• AGGR</li> <li>• ALL</li> <li>• CPU</li> <li>• CPU_ACCESS</li> <li>• CPU_AGGR</li> <li>• CPU_BYTES_PER_SEC</li> <li>• CPU_FILTER</li> <li>• CPU_GBY</li> <li>• CPU_HASH_JOIN</li> <li>• CPU_JOIN</li> <li>• CPU_NL_JOIN</li> <li>• CPU_RANDOM_ACCESS</li> <li>• CPU_SEQUENTIAL_ACCESS</li> <li>• CPU_SM_JOIN</li> <li>• CPU_SORT</li> <li>• HASH</li> <li>• IO</li> <li>• IO_ACCESS</li> <li>• IO_BYTES_PER_SEC</li> <li>• IO_RANDOM_ACCESS</li> <li>• IO_SEQUENTIAL_ACCESS</li> <li>• MEMCMP</li> <li>• MEMCPY</li> </ul> |

### Security Model

You must have the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.

### Usage Notes

`AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## 166.7.119 SET\_SCHEMA\_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

### Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
 ownname IN VARCHAR2,
 pname IN VARCHAR2,
 pvalue IN VARCHAR2);
```

### Parameters

**Table 166-128 SET\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| pname     | Preference name. You can set the default value for the following preferences: <ul style="list-style-type: none"> <li>• AUTO_STAT_EXTENSIONS</li> <li>• CASCADE</li> <li>• DEGREE</li> <li>• ESTIMATE_PERCENT</li> <li>• GLOBAL_TEMP_TABLE_STATS</li> <li>• GRANULARITY</li> <li>• INCREMENTAL</li> <li>• INCREMENTAL_LEVEL</li> <li>• INCREMENTAL_STALENESS</li> <li>• METHOD_OPT</li> <li>• NO_INVALIDATE</li> <li>• OPTIONS</li> <li>• PREFERENCE_OVERRIDES_PARAMETER</li> <li>• PUBLISH</li> <li>• STALE_PERCENT</li> <li>• TABLE_CACHED_BLOCKS</li> </ul> |
| pvalue    | Preference value. If NULL is specified, it sets the database default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 166-129 Statistics Preferences**

| Preference           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTO_STAT_EXTENSIONS | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following preferences:</p> <ul style="list-style-type: none"><li>• REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li><li>• ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li><li>• HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:<ul style="list-style-type: none"><li>– The accuracy of the new algorithm is similar to the original algorithm.</li><li>– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li></ul></li></ul> |
| CASCADE              | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DEGREE               | Determines degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ESTIMATE_PERCENT     | Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 166-129 (Cont.) Statistics Preferences

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GLOBAL_TEMP_TABLE_STATS | <p>This preference takes the following values:</p> <ul style="list-style-type: none"><li>• SHARED - All sessions see the same set of statistics</li><li>• SESSION - Statistics gathered by the <a href="#">GATHER_TABLE_STATS Procedure</a> on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| GRANULARITY             | <p>Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are:</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p> |

**Table 166-129 (Cont.) Statistics Preferences**

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL       | <p>Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>• INCREMENTAL value for the partitioned table is set to TRUE</li> <li>• PUBLISH value for the partitioned table is set to TRUE;</li> <li>• User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INCREMENTAL_LEVEL | <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p> <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE It takes two values:</p> <ul style="list-style-type: none"> <li>• TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the <a href="#">SET_TABLE_PREFS Procedure</a>. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.</li> <li>• PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.</li> </ul> |

Table 166-129 (Cont.) Statistics Preferences

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> </li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <p>Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> </li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes. <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p> </li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales',</pre> |

**Table 166-129 (Cont.) Statistics Preferences**

| Preference    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>'INCREMENTAL_STALENESS', 'NULL'); EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales',  'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| METHOD_OPT    | <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>• FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT: Collects histograms only on the columns that already have histograms</li> <li>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</li> <li>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns</li> <li>- column_name: name of a column</li> <li>- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors of the tables for which statistics are gathered. If set to TRUE, then this parameter does not invalidate the dependent cursors. If set to FALSE, then this procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let the database decide when to invalidate dependent cursors. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 166-129 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIONS                        | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                       |
| PUBLISH                        | <p>Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11g Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                      |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10%. Note that if you set <code>stale_percent</code> to zero the <code>AUTO STATS</code> gathering job will gather statistics for this table every time a row in the table is modified.</p>                                                                                                                                                                                                                                                                                                                           |
| TABLE_CACHED_BLOCKS            | <p>Specifies the average number of blocks cached in the buffer cache for any table when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Security Model**

To run this procedure, you must be the schema owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## Usage Notes

Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH','DEGREE','99');
```

## 166.7.120 SET\_SYSTEM\_STATS Procedure

This procedure sets systems statistics.

### Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
 pname VARCHAR2,
 pvalue NUMBER,
 statab IN VARCHAR2 DEFAULT NULL,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-130 SET\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> <li>iotfrspeed—I/O transfer speed in bytes for each millisecond</li> <li>ioseektim - Seek time + latency time + operating system overhead time, in milliseconds</li> <li>sreadtim - Average time to read single block (random read), in milliseconds</li> <li>mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds</li> <li>cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</li> <li>cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option).</li> <li>mbrc - Average multiblock read count for sequential read, in blocks</li> <li>maxthr - Maximum I/O system throughput, in bytes/second</li> <li>slavethr - Average slave I/O throughput, in bytes/second</li> </ul> |
| pvalue    | Parameter value to get                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| stattab   | Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| statid    | Optional identifier associated with the statistics saved in the stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| statown   | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

## Usage Notes

To run this procedure, you need the GATHER\_SYSTEM\_STATISTICS role.

## 166.7.121 SET\_TABLE\_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

### Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
 ownname IN VARCHAR2,
 tabname IN VARCHAR2,
 pname IN VARCHAR2,
 pvalue IN VARCHAR2);
```

### Parameters

**Table 166-131 SET\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| tabname   | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| pname     | Preference name. You can set the default value for following preferences: <ul style="list-style-type: none"><li>• APPROXIMATE_NDV_ALGORITHM</li><li>• AUTO_STAT_EXTENSIONS</li><li>• CASCADE</li><li>• DEGREE</li><li>• ESTIMATE_PERCENT</li><li>• GRANULARITY</li><li>• INCREMENTAL</li><li>• INCREMENTAL_LEVEL</li><li>• INCREMENTAL_STALENESS</li><li>• METHOD_OPT</li><li>• NO_INVALIDATE</li><li>• OPTIONS</li><li>• PREFERENCE_OVERRIDES_PARAMETER</li><li>• PUBLISH</li><li>• STALE_PERCENT</li><li>• TABLE_CACHED_BLOCKS</li></ul> |
| pvalue    | Preference value. If NULL is specified, it will set the Oracle default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 166-132 Statistics Preferences

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>• REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>• ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>• HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>– The accuracy of the new algorithm is similar to the original algorithm.</li> <li>– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>• OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CASCADE                   | <p>Determines whether to collect index statistics as part of gathering table statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 166-132 (Cont.) Statistics Preferences

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONCURRENT              | <p>This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:</p> <ul style="list-style-type: none"><li>'MANUAL' - Concurrency will be turned on only for manual statistics gathering.</li><li>'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering.</li><li>'ALL': Concurrency will be turned on for both manual and automatic statistics gathering.</li><li>'OFF': Concurrency will be turned off for both manual and automatic statistics</li></ul>                                        |
| DEGREE                  | <p>Determines degree of parallelism used for gathering statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTIMATE_PERCENT        | <p>Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| GLOBAL_TEMP_TABLE_STATS | <p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</p> <ul style="list-style-type: none"><li>SHARED - All sessions see the same set of statistics</li><li>SESSION - Statistics gathered by the <a href="#">GATHER_TABLE_STATS Procedure</a> on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</li></ul> |

Table 166-132 (Cont.) Statistics Preferences

| Preference  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANULARITY | <p>Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>                                                                                                                   |
| INCREMENTAL | <p>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>• INCREMENTAL value for the partitioned table is set to TRUE;</li> <li>• PUBLISH value for the partitioned table is set to TRUE;</li> <li>• User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p> |

Table 166-132 (Cont.) Statistics Preferences

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_LEVEL | <p>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</p> <ul style="list-style-type: none"><li>• <b>TABLE</b> - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run <code>GATHER_TABLE_STATS</code> on this table with <code>INCREMENTAL</code> to <code>TRUE</code> and <code>INCREMENTAL_LEVEL</code> to <code>TABLE</code> before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the <a href="#">SET_TABLE_PREFS Procedure</a>. It is not allowed in the <code>SET_GLOBAL/DATABASE/SCHEMA_PREFS</code> procedures.</li><li>• <b>PARTITION</b> - partition level synopses are gathered. This is the default value. If <code>PARTITION</code> is set on a non partitioned table, no synopses are gathered.</li></ul> |

Table 166-132 (Cont.) Statistics Preferences

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> </li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> </li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes. <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics.</p> </li> </ul> |

**Table 166-132 (Cont.) Statistics Preferences**

| Preference    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| METHOD_OPT    | <p>The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>• FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT: Collects histograms only on the columns that already have histograms</li> <li>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</li> <li>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns</li> <li>- column_name: name of a column</li> <li>- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |
| NO_INVALIDATE | <p>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 166-132 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIONS                        | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                       |
| PUBLISH                        | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes.</p> <p>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

**Usage Notes**

- To run this procedure, you must connect as owner of the table or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

### Example 166-18 Overriding Statistics Preferences

In this example, legacy scripts set `ESTIMATE_PERCENT` explicitly rather than using the recommended `AUTO_SAMPLE_SIZE`. Your goal is to prevent users from using these scripts to set preferences on the `sh.costs` table.

No preference for `ESTIMATE_PERCENT` is set for `sh.costs` or at the global level, so the preference defaults to `AUTO_SAMPLE_SIZE`:

```
SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh', 'costs') AS
"STAT_PREFS" FROM DUAL;
```

```
STAT_PREFS

DBMS_STATS.AUTO_SAMPLE_SIZE
```

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to `TRUE` for the `costs` table only:

```
EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs',
'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');
```

A user-created script attempts to set `estimate_percent` to 100 when gathering statistics for `sh.costs`.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs',
ESTIMATE_PERCENT=>100);
```

However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, Oracle Database gathers statistics using `AUTO_SAMPLE_SIZE`, which is the default, rather than the specified value of 100.

## 166.7.122 SET\_TABLE\_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

### Syntax

```
DBMS_STATS.SET_TABLE_STATS (
 ownname VARCHAR2,
 tablename VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 numRows NUMBER DEFAULT NULL,
 numblks NUMBER DEFAULT NULL,
 avgrlen NUMBER DEFAULT NULL,
 flags NUMBER DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 cachedblk NUMBER DEFAULT NULL,
 cachehit NUMBER DEFAULT NULL,
 force BOOLEAN DEFAULT FALSE,
 im_imcu_count NUMBER DEFAULT NULL,
 im_block_count NUMBER DEFAULT NULL,
 scanrate NUMBER DEFAULT NULL);
```

### Parameters

**Table 166-133 SET\_TABLE\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Name of the schema.                                                                                                                                                       |
| tablename | Name of the table.                                                                                                                                                        |
| partname  | Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level. |
| stattab   | Table in which to store the statistics. If stattab is NULL, then the database stores the statistics in the data dictionary.                                               |
| statid    | Identifier (optional) to associate with these statistics within stattab. This identifier is only relevant if stattab is not NULL.                                         |
| numrows   | Number of rows in the table or partition.                                                                                                                                 |
| numblks   | Number of blocks that the table or partition occupies.                                                                                                                    |
| avgrlen   | Average row length for the table or partition.                                                                                                                            |
| flags     | For internal use only. Do not set.                                                                                                                                        |
| statown   | Schema containing stattab (if different than ownname).                                                                                                                    |

**Table 166-133 (Cont.) SET\_TABLE\_STATS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate  | The validation setting for dependent cursors. If set to TRUE, then the procedure does not invalidate the dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let the database decide when to invalidate dependent cursors. This is the default. You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| cachedblk      | For internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| cachehit       | For internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| force          | A flag that determines the behavior when statistics are locked. If TRUE, then the procedure sets the values even if the table statistics are locked. By default, the setting is FALSE.                                                                                                                                                                                                                                                                                                                                                                          |
| im_imcu_count  | The number of In-Memory Compression Units (IMCUs) in the table or partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| im_block_count | The number of In-Memory blocks in the table or partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| scanrate       | The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Security Model

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to upgrade it

ORA-20005: Object statistics are locked

### Usage Notes

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the `DBMS_STATS.SET_*_STATS` procedures. These procedures insert the artificial statistics into the data dictionary directly (when `stattab` is null) or into a user-created table.

 **Note:**

The `DBMS_STATS.SET*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the “real” statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the database does not have one major workload, resulting in averages that do not correspond to real values

## 166.7.123 SHOW\_EXTENDED\_STATS\_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

### Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
 ownname VARCHAR2,
 tabname VARCHAR2,
 extension VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 166-134** SHOW\_EXTENDED\_STATS\_NAME Function Parameters

| Parameter | Description                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name of a table                                                                                                                                                                     |
| tabname   | Name of the table                                                                                                                                                                         |
| extension | Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)". |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.124 TRANSFER\_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

### Syntax

```
DBMS_STATS.TRANSFER_STATS (
 ownname IN VARCHAR2,
 tabname IN VARCHAR2,
 dblink IN VARCHAR2, options IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 166-135 TRANSFER\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well. |
| tablename | Name of the table. If NULL, all tables in OWNNAME.                                                                           |
| dblink    | Database link name                                                                                                           |
| options   | By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences.    |

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.125 UNLOCK\_PARTITION\_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

### Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
 ownname VARCHAR2,
 tablename VARCHAR2,
 partname VARCHAR2);
```

## Parameters

**Table 166-136 UNLOCK\_PARTITION\_STATS Procedure Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| ownname   | Name of the schema to unlock |
| tablename | Name of the table            |
| partname  | [Sub]Partition name          |

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.126 UNLOCK\_SCHEMA\_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

### Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
 ownname VARCHAR2);
```

### Parameters

**Table 166-137 UNLOCK\_SCHEMA\_STATS Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |

### Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 166.7.127 UNLOCK\_TABLE\_STATS Procedure

This procedure unlocks the statistics on the table.

### Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2);
```

## Parameters

**Table 166-138 UNLOCK\_TABLE\_STATS Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |
| tabname   | Name of the table  |

## Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 166.7.128 UPGRADE\_STAT\_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

### Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
 ownname VARCHAR2,
 stattab VARCHAR2);
```

## Parameters

**Table 166-139 UPGRADE\_STAT\_TABLE Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |
| stattab   | Name of the table  |

### **Exceptions**

ORA-20000: Unable to upgrade table

### **Usage Notes**

To invoke this procedure you need the privileges to drop and create a table.

# DBMS\_STORAGE\_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS\\_STORAGE\\_MAP Subprograms](#)

## 167.1 DBMS\_STORAGE\_MAP Overview

This terminology and descriptions will help you understand the `DBMS_STORAGE_MAP` API.

- Mapping libraries

Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

 **See Also:**

- *Oracle Database Administrator's Guide* for more information
- *Oracle Database Reference* for V\$MAP views, including V\$MAP\_FILE, V\$MAP\_ELEMENT, V\$MAP\_SUBELEMENT, V\$MAP\_FILE\_EXTENT

## 167.2 DBMS\_STORAGE\_MAP Operational Notes

Invoking the MAP\_ELEMENT, MAP\_FILE, and MAP\_ALL functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

 **See Also:**

*Oracle Database Administrator's Guide* for a discussion of the configuration ID, an attribute of the element or file that is changed.

## 167.3 Summary of DBMS\_STORAGE\_MAP Subprograms

This table lists the DBMS\_STORAGE\_MAP subprograms and briefly describes them.

**Table 167-1 DBMS\_STORAGE\_MAP Package Subprograms**

| Subprogram                            | Description                                                                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DROP_ALL Function</a>     | Drops all mapping information in the shared memory of the instance                                                                             |
| <a href="#">DROP_ELEMENT Function</a> | Drops the mapping information for the element defined by <code>elemname</code>                                                                 |
| <a href="#">DROP_FILE Function</a>    | Drops the file mapping information defined by <code>filename</code>                                                                            |
| <a href="#">LOCK_MAP Procedure</a>    | Locks the mapping information in the shared memory of the instance                                                                             |
| <a href="#">MAP_ALL Function</a>      | Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements |
| <a href="#">MAP_ELEMENT Function</a>  | Builds mapping information for the element identified by <code>elemname</code>                                                                 |
| <a href="#">MAP_FILE Function</a>     | Builds mapping information for the file identified by <code>filename</code>                                                                    |
| <a href="#">MAP_OBJECT Function</a>   | Builds the mapping information for the Oracle object identified by the object name, owner, and type                                            |
| <a href="#">RESTORE Function</a>      | Loads the entire mapping information from the data dictionary into the shared memory of the instance                                           |
| <a href="#">SAVE Function</a>         | Saves information needed to regenerate the entire mapping into the data dictionary                                                             |

**Table 167-1 (Cont.) DBMS\_STORAGE\_MAP Package Subprograms**

| Subprogram                           | Description                                                           |
|--------------------------------------|-----------------------------------------------------------------------|
| <a href="#">UNLOCK_MAP Procedure</a> | Unlocks the mapping information in the shared memory of the instance. |

## 167.3.1 DROP\_ALL Function

This function drops all mapping information in the shared memory of the instance.

### Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
 dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 167-2 DROP\_ALL Function Parameters**

| Parameter         | Description                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

## 167.3.2 DROP\_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

### Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
 elemname IN VARCHAR2,
 cascade IN BOOLEAN,
 dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 167-3 DROP\_ELEMENT Function Parameters**

| Parameter         | Description                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| elemname          | The element for which mapping information is dropped.                                                                                                          |
| cascade           | If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by <code>elemname</code> , if possible.                                   |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

### 167.3.3 DROP\_FILE Function

This function drops the file mapping information defined by `filename`.

#### Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
 filename IN VARCHAR2,
 cascade IN BOOLEAN,
 dictionary_update IN BOOLEAN DEFAULT TRUE);
```

#### Parameters

**Table 167-4** DROP\_FILE Function Parameters

| Parameter                      | Description                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>filename</code>          | The file for which file mapping information is dropped.                                                                                                                                                 |
| <code>cascade</code>           | If <code>TRUE</code> , then the mapping DAGs for the elements where the file resides are also dropped, if possible.                                                                                     |
| <code>dictionary_update</code> | If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument. |

### 167.3.4 LOCK\_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the `V$MAP` tables. Without locking the mapping information, `V$MAP_ELEMENT` and `V$MAP_SUBELEMENT`, for example, may be inconsistent.

#### Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

### 167.3.5 MAP\_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

#### Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
 max_num_fileext IN NUMBER DEFAULT 100,
 dictionary_update IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 167-5 MAP\_ALL Function Parameters**

| Parameter         | Description                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_num_fileext   | Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument. |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.                                    |

## Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.

## 167.3.6 MAP\_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is TRUE), is owned by a library that must be explicitly synchronized.

## Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT(
 elemname IN VARCHAR2,
 cascade IN BOOLEAN,
 dictionary_update IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 167-6 MAP\_ELEMENT Function Parameters**

| Parameter         | Description                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| elemname          | The element for which mapping information is built.                                                                                                            |
| cascade           | If TRUE, all elements within the <code>elemname</code> I/O stack DAG are mapped.                                                                               |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

## 167.3.7 MAP\_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

### Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
 filename IN VARCHAR2,
 filetype IN VARCHAR2,
 cascade IN BOOLEAN,
 max_num_fileextent IN NUMBER DEFAULT 100,
 dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 167-7** MAP\_FILE Function Parameters

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>filename</code>           | The file for which mapping information is built.                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>filetype</code>           | Defines the type of the file to be mapped. It can be "DATAFILE", "SPFILE", "TEMPFILE", "CONTROLFILE", "LOGFILE", or "ARCHIVEFILE".                                                                                                                                                                                                                                                                                                           |
| <code>cascade</code>            | Should be <code>TRUE</code> only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an <code>ALTER SYSTEM</code> command or DML operations on extended files), <code>cascade</code> can be set to <code>FALSE</code> because the mapping changes are limited to the file extents only.<br><br>If <code>TRUE</code> , mapping DAGs are also built for the elements where the file resides. |
| <code>max_num_fileextent</code> | Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; <code>max_num_fileextent</code> is an overloaded argument.                                                                                                                                                                                                                               |
| <code>dictionary_update</code>  | If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.                                                                                                                                                                                                                                      |

### Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

## 167.3.8 MAP\_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

### Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
 objname IN VARCHAR2,
 owner IN VARCHAR2,
 objtype IN VARCHAR2);
```

### Parameters

**Table 167-8** MAP\_OBJECT Function Parameters

| Parameter | Description              |
|-----------|--------------------------|
| objname   | The name of the object.  |
| owner     | The owner of the object. |
| objtype   | The type of the object.  |

## 167.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

### Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

## 167.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

### Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

## 167.3.11 UNLOCK\_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

### Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

# DBMS\_SYNC\_REFRESH

The `DBMS_SYNC_REFRESH` package provides an interface to perform a synchronous refresh of materialized views.

 **See Also:**

*Oracle Database Data Warehousing Guide* for more information on using `DBMS_SYNC_REFRESH`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_SYNC\\_REFRESH Subprograms](#)

## 168.1 DBMS\_SYNC\_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12c, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

 **See Also:**

*Oracle Database Data Warehousing Guide* for more information about using synchronous refresh

## 168.2 DBMS\_SYNC\_REFRESH Security Model

The execute privilege for this package is granted to `PUBLIC`, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the `DBA` privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that is, the user must have the `SELECT` or `READ`, `INSERT`, `UPDATE`, and `DELETE` privileges on that table or materialized view. A couple of exceptions are:

- `PURGE_REFRESH_STATS` and `ALTER_REFRESH_STATS_RETENTION` Functions

These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The `CAN_SYNCREF_TABLE` Function  
This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the `SELECT` or `READ` privilege on all materialized views associated with the specified table.

## 168.3 Summary of DBMS\_SYNC\_REFRESH Subprograms

This table lists and briefly describes the `DBMS_SYNC_REFRESH` package subprograms.

**Table 168-1 DBMS\_SYNC\_REFRESH Package Subprograms**

| Subprogram                                               | Description                                                                                                    |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">ABORT_REFRESH Procedure</a>                  | Aborts a refresh.                                                                                              |
| <a href="#">ALTER_REFRESH_STATS_RETENTION Procedure</a>  | Alters the refresh history retention value, specified in days.                                                 |
| <a href="#">CAN_SYNCREF_TABLE Procedure</a>              | Advises on whether a table and its dependent materialized views are eligible for synchronous refresh.          |
| <a href="#">EXECUTE_REFRESH Procedure</a>                | Executes synchronous refresh on the synchronous refresh groups.                                                |
| <a href="#">GET_ALL_GROUP_IDS Function</a>               | Returns the group IDs of all the synchronous refresh groups in the database.                                   |
| <a href="#">GET_GROUP_ID Function</a>                    | Returns the group ID of a table or materialized view.                                                          |
| <a href="#">GET_GROUP_ID_LIST Function</a>               | Returns the group IDs of the tables in a given list of objects (tables or materialized views).                 |
| <a href="#">PREPARE_REFRESH Procedure</a>                | Prepares the sync refresh groups for refresh.                                                                  |
| <a href="#">PREPARE_STAGING_LOG Procedure</a>            | Validates and collects statistics on the data in the staging log.                                              |
| <a href="#">PURGE_REFRESH_STATS Procedure</a>            | Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter. |
| <a href="#">REGISTER_MVIEWS</a>                          | Registers materialized views for synchronous refresh.                                                          |
| <a href="#">REGISTER_PARTITION_OPERATION Procedure</a>   | Registers a partition maintenance operation on a partition of a base table.                                    |
| <a href="#">UNREGISTER_MVIEWS</a>                        | Unregisters materialized views from synchronous refresh.                                                       |
| <a href="#">UNREGISTER_PARTITION_OPERATION Procedure</a> | Unregisters a partition maintenance operation on a partition of a base table.                                  |

### 168.3.1 ABORT\_REFRESH Procedure

This procedure undoes all the changes made by `PREPARE_REFRESH` or `EXECUTE_REFRESH` for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

**Syntax**

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
 group_id IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
 group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

**Parameters****Table 168-2 ABORT\_REFRESH Procedure Parameters**

| Parameter     | Description                                                                      |
|---------------|----------------------------------------------------------------------------------|
| group_id      | The group ID of a sync refresh group.                                            |
| group_id_list | An array of group IDs of the sync refresh groups to be aborted for sync refresh. |

**Usage Notes**

If called after `PREPARE_REFRESH`, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after `EXECUTE_REFRESH` fails, this procedure restores the state of tables to before `EXECUTE_REFRESH` by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE\\_REFRESH Procedure](#)" for a description of these locks.

`ABORT_REFRESH` will work only if a `PREPARE_REFRESH` or `EXECUTE_REFRESH` statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

## 168.3.2 ALTER\_REFRESH\_STATS\_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with `PURGE_REFRESH_HISTORY`. It also requires the `SYSDBA` privilege in addition to the privilege to execute it.

**Syntax**

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
 retention IN NUMBER);
```

## Parameters

**Table 168-3 ALTER\_REFRESH\_STATS\_RETENTION Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| retention | <p>The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000.</p> <p>You can use the following values for special purposes:</p> <ul style="list-style-type: none"> <li>• -1 - Refresh history is never purged by PREPARE_REFRESH.</li> <li>• 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history.</li> <li>• NULL - Change refresh history retention to default value.</li> </ul> |

## 168.3.3 CAN\_SYNCREF\_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide*.

You can invoke `CAN_SYNCREF_TABLE` in two ways. The first is to use a table, while the second is to create a `VARRAY`.

### Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
 schema_name IN VARCHAR2,
 table_name IN VARCHAR2,
 statement_id IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
 schema_name IN VARCHAR2,
 table_name IN VARCHAR2,
 output_array IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of `statement_id` or `output_array` need be provided to `CAN_SYNCREF_TABLE`.

## Parameters

**Table 168-4 CAN\_SYNCREF\_TABLE Procedure Parameters**

| Parameter   | Description                               |
|-------------|-------------------------------------------|
| schema_name | The name of the schema of the base table. |
| table_name  | The name of the base table.               |

**Table 168-4 (Cont.) CAN\_SYNCREF\_TABLE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statement_id | A string (VARCHAR2(30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema. |
| output_array | The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.       |

### Using SYNCREF\_TABLE

The output of CAN\_SYNCREF\_TABLE can be directed to a table named SYNCREF\_TABLE. The user is responsible for creating the SYNCREF\_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
 statement_id VARCHAR2(30),
 schema_name VARCHAR2(30),
 table_name VARCHAR2(30),
 mv_schema_name VARCHAR2(30),
 mv_name VARCHAR2(30),
 eligible VARCHAR2(1),
 seq_num NUMBER,
 msg_number NUMBER,
 message VARCHAR2(4000));
```

### Using a VARRAY

You can save the output of CAN\_SYNCREF\_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
 schema_name VARCHAR2(30),
 table_name VARCHAR2(30),
 mv_schema_name VARCHAR2(30),
 mv_name VARCHAR2(30),
 eligible VARCHAR2(1),
 seq_num NUMBER,
 msg_number NUMBER,
 message VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF\_TABLE. However, the SYNCREF\_TABLE has a statement\_id field which is absent in CanSyncRefMessage because no statement\_id is supplied (because it is not required) when CAN\_SYNCREF\_TABLE is called with a VARRAY parameter.

## 168.3.4 EXECUTE\_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by `DBMS_SYNC_REFRESH.PREPARE_REFRESH`. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

This procedure is overloaded.

### Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
 group_id IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
 group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

### Parameters

**Table 168-5 EXECUTE\_REFRESH Procedure Parameters**

| Parameter                  | Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------|
| <code>group_id</code>      | The group ID of a sync refresh group.                                             |
| <code>group_id_list</code> | An array of group IDs of the sync refresh groups to be executed for sync refresh. |

### Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE\\_REFRESH Procedure](#)" for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after `DBMS_SYNC_REFRESH.EXECUTE_REFRESH`.

## 168.3.5 GET\_ALL\_GROUP\_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

### Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
 RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

## Parameters

**Table 168-6** GET\_ALL\_GROUP\_IDS Function Parameter

| Parameter         | Description                                                           |
|-------------------|-----------------------------------------------------------------------|
| get_all_group_ids | Returns the group IDs of all the sync refresh groups in the database. |

## 168.3.6 GET\_GROUP\_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

### Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
 object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

## Parameters

**Table 168-7** GET\_GROUP\_ID Function Parameter

| Parameter        | Description                                                          |
|------------------|----------------------------------------------------------------------|
| object_name_list | The name of the materialized view. The name can be schema-qualified. |

## 168.3.7 GET\_GROUP\_ID\_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

### Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
 object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

## Parameters

**Table 168-8** GET\_GROUP\_ID\_LIST Function Parameter

| Parameter        | Description                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------|
| object_name_list | A comma-separated list of object names (materialized views). Each name can be schema-qualified. |

## 168.3.8 PREPARE\_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

### Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
 group_id IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

### Parameters

**Table 168-9** PREPARE\_REFRESH Procedure Parameters

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| group_id  | The group ID of the sync refresh group to be prepared for sync refresh. |

### Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the `EXECUTE_REFRESH`.

Before running this procedure, the user must run `PREPARE_STAGING_LOG` on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the `REGISTER_PARTITION_OPERATION`.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an `EXECUTE_REFRESH` statement. Alternatively, you can issue an `ABORT_REFRESH` operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an `ALTER SESSION` statement.

The group ID of a table can be found using `GET_GROUP_ID(table_name)`. The group IDs of a list of tables can be found with `GET_GROUP_ID_LIST(table_name_list)`. The group IDs of all the lists of tables can be retrieved with `GET_ALL_GROUP_IDS`.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing `PREPARE_REFRESH`. This will cause the partition exchange DDL statements generated by `PREPARE_REFRESH` to have the `UPDATE INDEXES` clause appended to them, and when they are executed by `EXECUTE_REFRESH`, the global indexes will be maintained.

## 168.3.9 PREPARE\_STAGING\_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide*.

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$$` is 'D'), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$$` is 'UO' or 'UN'), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$$` is 'UO'), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$$` is 'UN'), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (`DMLTYPE$$` is 'UN'), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to `NULL`.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows 'UO' and 'UN'; multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE\$\$ is 'I') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.INSERT_TRUSTED`
- trust all the delete rows (DMLTYPE\$\$ is 'D') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.DELETE_TRUSTED`
- trust all the update rows (DMLTYPE\$\$ is 'UO' or 'UN') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.UPDATE_TRUSTED`
- trust all three types of DMLs by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.TRUSTED`.

In addition, you can specify the `psl_mode` as a bitmask of the flags described above. For example, `DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH.DELETE_TRUSTED` will treat inserts and deletes to be trusted but not updates.

### Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
 schema_name IN VARCHAR2,
 base_table_name IN VARCHAR2,
 psl_mode IN NUMBER DEFAULT
 DBMS_SYNC_REFRESH.ENFORCED);
```

### Parameters

**Table 168-10** PREPARE\_STAGING\_LOG Procedure Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>schema_name</code>     | The name of the schema of the base table.                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>base_table_name</code> | The name of the base table.                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>psl_mode</code>        | The mode in which staging log preparation should be done. The possible values are: <ul style="list-style-type: none"> <li>• <code>DBMS_SYNC_REFRESH.ENFORCED</code> (the default)</li> <li>• <code>DBMS_SYNC_REFRESH.INSERT_TRUSTED</code></li> <li>• <code>DBMS_SYNC_REFRESH.DELETE_TRUSTED</code></li> <li>• <code>DBMS_SYNC_REFRESH.UPDATE_TRUSTED</code></li> <li>• <code>DBMS_SYNC_REFRESH.TRUSTED</code></li> </ul> |

## 168.3.10 PURGE\_REFRESH\_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the `BEFORE_TIMESTAMP` parameter.

This procedure requires the `SYSDBA` privilege in addition to the privilege to execute it.

### Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
 before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

## Parameters

**Table 168-11 PURGE\_REFRESH\_STATS Procedure Parameter**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| before_timestamp | Records of sync refreshes saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using ALTER_REFRESH_STATS_RETENTION. The default is 31 days. |

## 168.3.11 REGISTER\_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide*. The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the USING TRUSTED CONSTRAINTS clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as ON DEMAND.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (mv\_list), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

### Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (
 mv_list IN VARCHAR2);
```

### Parameter

**Table 168-12 REGISTER\_MVIEWS Procedure Parameter**

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| mv_list   | A comma-delimited list of materialized views to register. These names are optionally schema-qualified. |

## 168.3.12 REGISTER\_PARTITION\_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

### Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (
 partition_op IN VARCHAR2,
 schema_name IN VARCHAR2,
 base_table_name IN VARCHAR2,
 partition_name IN VARCHAR2,
 outside_partn_table_schema IN VARCHAR2,
 outside_partn_table_name IN VARCHAR2);
```

### Parameters

**Table 168-13 REGISTER\_PARTITION\_OPERATION Procedure Parameters**

| Parameter                  | Description                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|
| partition_op               | The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).                                                  |
| schema_name                | The name of the schema of the base table.                                                                           |
| base_table_name            | The name of the base table.                                                                                         |
| partition_name             | The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated. |
| outside_partn_table_schema | The name of the schema of the outside partition table (required for EXCHANGE only).                                 |
| outside_partn_table_name   | The name of the outside partition table (required for EXCHANGE only).                                               |

### Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE\_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE\_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

## 168.3.13 UNREGISTER\_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

### Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
 mv_list IN VARCHAR20;
```

### Parameter

**Table 168-14 UNREGISTER\_MVIEWS Parameter**

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| mv_list   | A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified. |

## 168.3.14 UNREGISTER\_PARTITION\_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER\_PARTITION\_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

### Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
 partition_op IN VARCHAR2,
 schema_name IN VARCHAR2,
 base_table_name IN VARCHAR2,
 partition_name IN VARCHAR2);
```

### Parameters

**Table 168-15 UNREGISTER\_PARTITION\_OPERATION Procedure Parameters**

| Parameter       | Description                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------|
| partition_op    | The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).                                                  |
| schema_name     | The name of the schema of the base table.                                                                           |
| base_table_name | The name of the base table.                                                                                         |
| partition_name  | The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated. |

## DBMS\_TDB

The `DBMS_TDB` package reports whether a database can be transported between platforms using the `RMAN CONVERT DATABASE` command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

### See Also:

*Oracle Database Backup and Recovery User's Guide* regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- [Overview](#)
- [DBMS\\_TDB Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS\\_TDB Subprograms](#)

### 169.1 DBMS\_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

## 169.2 DBMS\_TDB Security Model

Use of this package requires the DBA privilege.

## 169.3 DBMS\_TDB Constants

The DBMS\_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS\_TDB.SKIP\_NONE.

The DBMS\_TDB package uses the constants shown in [Table 169-1](#).

**Table 169-1 DBMS\_TDB Constants**

| Name          | Type   | Value | Description                                                                                  |
|---------------|--------|-------|----------------------------------------------------------------------------------------------|
| SKIP_NONE     | NUMBER | 0     | Check all files when checking whether a database is ready for transport.                     |
| SKIP_OFFLINE  | NUMBER | 2     | Skip files in offline tablespaces when checking whether a database is ready for transport.   |
| SKIP_READONLY | NUMBER | 3     | Skip files in read-only tablespaces when checking whether a database is ready for transport. |

## 169.4 DBMS\_TDB Views

The DBMS\_TDB package uses the V\$DB\_TRANSPORTABLE\_PLATFORM view.

This view is described in *Oracle Database Reference*.

- V\$DB\_TRANSPORTABLE\_PLATFORM, which specifies which combinations of source and target platforms support database transport

## 169.5 DBMS\_TDB Operational Notes

The following notes apply to DBMS\_TDB.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple TRUE or FALSE results to indicate whether database transport is possible. Use the subprograms with SERVEROUTPUT ON for informative messages about why transport is not possible.

## 169.6 Summary of DBMS\_TDB Subprograms

This table lists the DBMS\_TDB subprograms and briefly describes them.

**Table 169-2 DBMS\_TDB Package Subprograms**

| Subprogram                              | Description                                                        |
|-----------------------------------------|--------------------------------------------------------------------|
| <a href="#">CHECK_DB Function</a>       | Checks whether a database can be transported to a target platform  |
| <a href="#">CHECK_EXTERNAL Function</a> | Checks whether a database has external tables, directory or BFILEs |

## 169.6.1 CHECK\_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

### Syntax

```
DBMS_TDB.CHECK_DB (
 target_platform_name IN VARCHAR2,
 skip_option IN NUMBER)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
 target_platform_name IN VARCHAR2)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
RETURN BOOLEAN;
```

### Parameters

**Table 169-3 CHECK\_DB Function Parameters**

| Parameter            | Description                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| target_platform_name | The name of the destination platform, as it appears in V\$DB_TRANSPORTABLE_PLATFORM.                                                                                       |
| skip_option          | Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in <a href="#">Table 169-1</a> . |

### Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`.

## Usage Notes

- If `SERVEROUTPUT` is `ON`, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see [Table 169-4](#).

**Table 169-4 Reasons for CHECK\_DB Function to Return FALSE**

| Cause                                                                                          | Action                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unrecognized target platform name.                                                             | Check <code>V\$DB_TRANSPORTABLE_PLATFORM</code> for recognized platform names.                                                                                                                                                                                                                         |
| Target platform has a different endian format.                                                 | Conversion is not supported.                                                                                                                                                                                                                                                                           |
| Database is not open read-only.                                                                | Open database read-only and retry.                                                                                                                                                                                                                                                                     |
| There are active or in-doubt transactions in the database.                                     | Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write. |
| Deferred transaction rollback needs to be done.                                                | Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.                                                                                                                      |
| Database compatibility version is below 10.0.0.                                                | Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.                                                                                                                                                                 |
| Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher. | Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.                                                                                                    |

## Examples

This example illustrates the use of `CHECK_DB` with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
 db_ready BOOLEAN;
BEGIN
 db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.

## 169.6.2 CHECK\_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

### Syntax

```
DBMS_TDB.CHECK_EXTERNAL
 RETURN BOOLEAN;
```

### Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

### Usage Notes

- If `SERVEROUTPUT` is `ON`, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

### Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
 external BOOLEAN;
BEGIN
 external := DBMS_TDB.CHECK_EXTERNAL;
END;
/
```

The following external tables exist in the database:

```
SH.SALES_TRANSACTIONS_EXT
```

The following directories exist in the database:

```
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
```

The following BFILEs exist in the database:

```
PM.PRINT_MEDIA
```

PL/SQL procedure successfully completed.

## DBMS\_TF

The DBMS\_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS\_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

### See Also:

- *Oracle Database PL/SQL Language Reference* for an overview of Polymorphic Table Function (PTF) concepts
- *Oracle Database PL/SQL Language Reference* for more information about `CREATE FUNCTION PIPELINED` clause syntax and semantics

This chapter contains the following topics:

- [DBMS\\_TF Overview](#)
- [DBMS\\_TF Security Model](#)
- [DBMS\\_TF Constants](#)
- [DBMS\\_TF Operational Notes](#)
- [DBMS\\_TF Execution Flow](#)
- [DBMS\\_TF Restrictions](#)
- [DBMS\\_TF Examples](#)
- [DBMS\\_TF Data Structures](#)
- [Summary of DBMS\\_TF Subprograms](#)

### 170.1 DBMS\_TF Overview

The DBMS\_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS\_TF package provides these server and client interfaces utilities.

## 170.2 DBMS\_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS\_TF. Its subprograms execute with invoker's rights privileges.

## 170.3 DBMS\_TF Constants

This topic describes useful constants defined in the DBMS\_TF package.

The DBMS\_TF package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, DBMS\_TF.TYPE\_DATE.

**Table 170-1 DBMS\_TF Supported Types**

| Name               | Description                 |
|--------------------|-----------------------------|
| TYPE_BINARY_DOUBLE | Type code for BINARY_DOUBLE |
| TYPE_BINARY_FLOAT  | Type code for BINARY_FLOAT  |
| TYPE_BLOB          | Type code for BLOB          |
| TYPE_CHAR          | Type code for CHAR          |
| TYPE_CLOB          | Type code for CLOB          |
| TYPE_DATE          | Type code for DATE          |
| TYPE_INTERVAL_DS   | Type code for INTERVAL_DS   |
| TYPE_INTERVAL_YM   | Type code for INTERVAL_YM   |
| TYPE_NUMBER        | Type code for NUMBER        |
| TYPE_ROWID         | Type code for ROWID         |
| TYPE_RAW           | Type code for RAW           |
| TYPE_TIMESTAMP     | Type code for TIMESTAMP     |
| TYPE_TIMESTAMP_TZ  | Type code for TIMESTAMP_TZ  |
| TYPE_VARCHAR2      | Type code for VARCHAR2      |

Additional constants are defined for use with specific subprograms.

## 170.4 DBMS\_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

### 170.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow :

- DESCRIBE function (Required)
- OPEN procedure (Optional)
- FETCH\_ROWS procedure (Optional)
- CLOSE procedure (Optional)

The function DESCRIBE is invoked during SQL cursor compilation.

The procedures OPEN, FETCH\_ROWS, and CLOSE are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type TABLE and COLUMNS are skipped for the execution procedures OPEN, FETCH\_ROWS, and CLOSE.
2. The TABLE and COLUMNS arguments have descriptor types for the DESCRIBE function.
3. Scalar arguments that are not available during compilation are passed as NULL values (when using bind variables for instance). During execution, the actual values are passed in.

#### DESCRIBE Function

The DESCRIBE function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a DBMS\_TF.DESCRIBE\_T table.

The function DESCRIBE is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the DESCRIBE function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the DESCRIBE function. Like any PLSQL function, the DESCRIBE function can be overloaded and can have arguments default values.

The arguments of the PTF function and DESCRIBE function must match, but with the type of any TABLE argument replaced with the DBMS\_TF.TABLE\_T descriptor type, and the type of any COLUMNS argument replaced with DBMS\_TF.COLUMN\_T descriptor.

The DESCRIBE function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the DESCRIBE function indicates any input columns that the PTF will use for its computation (Read columns).

Finally, the `DESCRIBE` function returns the list of any new columns that the PTF will create (or `NULL` if no new columns are being produced) using the `DBMS_TF.DESCRIBE_T` descriptor.

### OPEN Procedure

The `OPEN` procedure purpose is to initialize and allocate any execution specific state. The `OPEN` procedure is most useful when you implement a Table Semantics PTF. The function typically calls the `GET_XID` function to get a unique ID for managing the execution state.

`OPEN` procedure is generally invoked before calling the `FETCH_ROWS` procedure.

### FETCH\_ROWS Procedure

The `FETCH_ROWS` procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

### CLOSE Procedure

The `CLOSE` procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

### Example 170-1 Noop Polymorphic Table Function Example

This example creates a PTF called `noop`. This PTF returns the input rows as the output rows without any modification or filtering. `Noop` is one of the smallest PTF you can write.

#### Live SQL:

You can view and run this example on Oracle Live SQL at [Noop Polymorphic Table Function](#)

To implement the `noop` PTF, you first create the implementation package `noop_package`.

```
CREATE PACKAGE noop_package AS
 FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
 RETURN DBMS_TF.DESCRIBE_T;

 PROCEDURE fetch_rows;
END noop_package;
```

The `DESCRIBE` function does not produce any new columns and hence, returns `NULL`. Executing `FETCH_ROWS` also results in `NULL`.

```
CREATE PACKAGE BODY noop_package AS
 FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
 RETURN DBMS_TF.DESCRIBE_T AS
 BEGIN
 RETURN NULL;
 END;
```

```

END;

PROCEDURE fetch_rows AS
BEGIN
RETURN;
END;
END noop_package;

```

The noop PTF is defined to execute the noop\_package when it is invoked.

```

CREATE FUNCTION noop (t TABLE)
RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;

```

The PTF can be invoked in queries. For example:

```

SELECT *
FROM NOOP(emp)
WHERE deptno = 10;

```

|      |        |           |      |           |      |    |
|------|--------|-----------|------|-----------|------|----|
| 7782 | CLARK  | MANAGER   | 7839 | 09-JUN-81 | 2450 | 10 |
| 7839 | KING   | PRESIDENT |      | 17-NOV-81 | 5000 | 10 |
| 7934 | MILLER | CLERK     | 7782 | 23-JAN-82 | 1300 | 10 |

```

WITH e
AS (SELECT *
FROM emp
NATURAL JOIN dept
WHERE dname = 'SALES')
SELECT t.*
FROM NOOP(e) t;

```

|       |      |         |          |      |           |      |      |
|-------|------|---------|----------|------|-----------|------|------|
| 30    | 7499 | ALLEN   | SALESMAN | 7698 | 20-FEB-81 | 1600 | 300  |
| SALES |      | CHICAGO |          |      |           |      |      |
| 30    | 7521 | WARD    | SALESMAN | 7698 | 22-FEB-81 | 1250 | 500  |
| SALES |      | CHICAGO |          |      |           |      |      |
| 30    | 7654 | MARTIN  | SALESMAN | 7698 | 28-SEP-81 | 1250 | 1400 |
| SALES |      | CHICAGO |          |      |           |      |      |
| 30    | 7698 | BLAKE   | MANAGER  | 7839 | 01-MAY-81 | 2850 |      |
| SALES |      | CHICAGO |          |      |           |      |      |
| 30    | 7844 | TURNER  | SALESMAN | 7698 | 08-SEP-81 | 1500 | 0    |
| SALES |      | CHICAGO |          |      |           |      |      |
| 30    | 7900 | JAMES   | CLERK    | 7698 | 03-DEC-81 | 950  |      |
| SALES |      | CHICAGO |          |      |           |      |      |

### 170.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch\_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

## 170.4.2 PTF Server Side Interface

The `DBMS_TF` package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.

**Table 170-2 Summary of Commonly Used Types and Subprograms in PTF Server Side Interface**

| NAME                                 | DESCRIPTION                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>COLUMN_METADATA_T</code>       | Column metadata record                                                                                           |
| <code>COLUMN_T</code>                | Column descriptor record                                                                                         |
| <code>TABLE_T</code>                 | Table descriptor record                                                                                          |
| <code>COLUMNS_T</code>               | Collection containing column names                                                                               |
| <code>COLUMNS_NEW_T</code>           | Collection for new columns                                                                                       |
| <code>TAB_&lt;typ&gt;_T</code>       | Collection for each supported types, where <typ> is described in " <a href="#">Supported Types Collections</a> " |
| <code>ROW_SET_T</code>               | Data for a rowset record                                                                                         |
| <code>GET_COL</code> Procedure       | Fetches data for a specified (input) column                                                                      |
| <code>PUT_COL</code> Procedure       | Returns data for a specified (new) column                                                                        |
| <code>GET_ROW_SET</code> Procedure   | Fetches the input rowset of column values                                                                        |
| <code>PUT_ROW_SET</code> Procedure   | Returns data for ALL (new) columns                                                                               |
| <code>SUPPORTED_TYPE</code> Function | Verifies if a type is supported by <code>DBMS_TF</code> subprograms                                              |
| <code>GET_XID</code> Function        | Returns a unique execution ID to index PTF state in a session                                                    |

- [Summary of DBMS\\_TF Subprograms](#) for the complete list of subprograms

## 170.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the `FETCH_ROWS` procedure.

The PTF indicates the read columns inside `DESCRIBE` by annotating them in the input table descriptor, `TABLE_T`. Only the indicated read columns will be fetched and thus available for processing during `FETCH_ROWS`.

The PTF invocation in a query will typically use the `COLUMNS` operator to indicate which columns the query wants the PTF to read, and this information is passed to the `DESCRIBE` function which then in turn sets the `COLUMN_T.FOR_READ` boolean flag.

Only scalar SQL data types are allowed for the read columns.

The [Echo Polymorphic Table Function Example](#) takes a table and a list of columns and produces new columns with the same values.

## 170.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The `DESCRIBE` function indicates the pass-through columns by setting the `COLUMN_T.PASS_THROUGH` boolean flag on the input table descriptor, `DBMS_TF.TABLE_T`.

All columns in the `Row Semantics` PTF are marked as pass-through by default. For `Table Semantics` PTF, the default value for pass-through is set to false. For the `Table Semantics` PTF, the partitioning columns are always pass-through and this cannot be changed by the `DESCRIBE` function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

## 170.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. **Compilation State** : This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. **Execution State**: This is the state used by the execution time procedures (`OPEN`, `FETCH_ROWS`, and `CLOSE`) of a `Table semantics` PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a `Table Semantics` PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

### 170.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.

The compilation state information is retrieved during execution procedures such as `OPEN`, `FETCH_ROWS` and `CLOSE`.

### CSTORE Subprograms

The CSTORE interface consists of the following subprograms.

| Name                   | Description                                                                     |
|------------------------|---------------------------------------------------------------------------------|
| CSTORE_GET procedure   | Fetches item of specified type. If not found, the OUT value remains unchanged.  |
| CSTORE_EXISTS function | If an item with the given key exists in the CSTORE, this function returns TRUE. |

### CSTORE Supported Types

The `DBMS_TF.DESCRIBE_T` supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, `BOOLEAN`.

**Table 170-3 DBMS\_TF CSTORE Scalar Supported Types**

| Name                 | Description               |
|----------------------|---------------------------|
| CSTORE_TYPE_VARCHAR2 | CSTORE VARCHAR2 type code |
| CSTORE_TYPE_NUMBER   | CSTORE NUMBER type code   |
| CSTORE_TYPE_DATE     | CSTORE DATE type code     |
| CSTORE_TYPE_BOOLEAN  | CSTORE BOOLEAN type code  |

### Collections For Compilation Storage

These predefined collection types are used for compilation state management.

```
TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767) INDEX BY VARCHAR2(32767);
TYPE CSTORE_NUM_T IS TABLE OF NUMBER INDEX BY VARCHAR2(32767);
TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN INDEX BY VARCHAR2(32767);
TYPE CSTORE_DAT_T IS TABLE OF DATE INDEX BY VARCHAR2(32767);
```

### DBMS\_TF Method Names

The method names are also stored in the `DBMS_TF.DESCRIBE_T` record. These predefined values for the method names can be customized by the PTF author.

See [Method Name Overrides](#) for more information about changing the default method names

**Table 170-4 DBMS\_TF Method Names Constants**

| Name       | Type           | Value        | Description                                            |
|------------|----------------|--------------|--------------------------------------------------------|
| CLOSE      | DBMS_QUOTED_ID | 'CLOSE'      | Predefined index value for the method named CLOSE      |
| FETCH_ROWS | DBMS_QUOTED_ID | 'FETCH_ROWS' | Predefined index value for the method named FETCH_ROWS |
| OPEN       | DBMS_QUOTED_ID | 'OPEN'       | Predefined index value for the method named OPEN       |

## 170.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The XSTORE key-value interface simplifies the implementation of Table Semantics PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

### XSTORE Subprograms

The execution state management interface consists of the following subprograms.

**Table 170-5 DBMS\_TF XSTORE Subprograms**

| Name                    | Description                                                         |
|-------------------------|---------------------------------------------------------------------|
| XSTORE_CLEAR procedure  | Removes all key-value pairs from the XSTORE execution state         |
| XSTORE_EXISTS function  | Returns TRUE if an item with a given key exists in the XSTORE       |
| XSTORE_GET procedure    | Gets the associated value for a given key stored in the XSTORE      |
| XSTORE_REMOVE procedure | Removes an item associated with the given key and key_type          |
| XSTORE_SET procedure    | Sets the value for the given key for PTF Execution State Management |

### XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, and BOOLEAN.

**Table 170-6 DBMS\_TF XSTORE Scalar Supported Types**

| Name                 | Description               |
|----------------------|---------------------------|
| XSTORE_TYPE_VARCHAR2 | XSTORE VARCHAR2 type code |
| XSTORE_TYPE_NUMBER   | XSTORE NUMBER type code   |
| XSTORE_TYPE_DATE     | XSTORE DATE type code     |
| XSTORE_TYPE_BOOLEAN  | XSTORE BOOLEAN type code  |

## 170.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (`OPEN`, `FETCH_ROWS`, and `CLOSE`) with your PTF specific names.

To override a method name, the application can specify the new method names using `DBMS_TF.METHOD_NAMES` collection ( see [DESCRIBE\\_T Record Type](#)).

**See Also:**

[Table 170-4](#)

### Example 170-2 DBMS\_TF Method Name Overrides

This example shows how to change the default method name of the `noop_p` PTF `fetch_rows` method to `noop_fetch`.

**Live SQL:**

You can view and run this example on Oracle Live SQL at [DBMS\\_TF Method Name Overrides](#)

Create the PTF implementation package `noop_p`.

```
CREATE PACKAGE noop_p AS
 FUNCTION describe(tab IN OUT DBMS_TF.table_t)
 RETURN DBMS_TF.describe_t;
 PROCEDURE noop_fetch;
END noop_p;
```

To provide a method name override, you can specify the new method names using `DBMS_TF.Method_Names` collection. The `FETCH_ROWS` method name is changed

to 'Noop\_Fetch'. The procedure `noop_fetch` to implement this method is defined in the package.

```
CREATE OR replace PACKAGE BODY noop_p
AS
 FUNCTION describe(tab IN OUT DBMS_TF.table_t)
 RETURN DBMS_TF.describe_t AS
 methods DBMS_TF.methods_t := DBMS_TF.methods_t(DBMS_TF.fetch_rows
=> 'Noop_Fetch');
 BEGIN
 RETURN DBMS_TF.describe_t(method_names => methods);
 END;
 PROCEDURE noop_fetch AS
 BEGIN
 RETURN;
 END;
END noop_p;
```

The noop PTF is defined to execute the `noop_p` when it is invoked.

```
CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC
USING noop_p;
```

The PTF is invoked in the FROM clause of a query block.

```
SELECT *
FROM noop(scott.emp)
WHERE deptno =10;
```

## 170.4.7 Using the COLUMNS Pseudo-Operator

The `COLUMNS` pseudo-operator is an addition to the SQL expression language.

Use the `COLUMNS` pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the FROM clause. The `COLUMNS` pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

### See Also:

*Oracle Database PL/SQL Language Reference* for more information about the `COLUMNS` pseudo-operator syntax and semantics

## 170.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a Row Semantics PTF, and the `PARTITION BY` key columns of a Table Semantics PTF can be used for projection and predicate pushdown.

**Example 170-3 Query Transformations**

This example illustrates the predicate and projection pushdown for a Row Semantics PTF.

This query calls the echo PTF created in [Echo Polymorphic Table Function Example](#).

```
SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))
WHERE deptno = 30
 AND echo_sal > 1000;
```

| EMPNO | ENAME  | SAL  | COMM | ECHO_SAL |
|-------|--------|------|------|----------|
| 7499  | ALLEN  | 1600 | 300  | 1600     |
| 7521  | WARD   | 1250 | 500  | 1250     |
| 7654  | MARTIN | 1250 | 1400 | 1250     |
| 7698  | BLAKE  | 2850 |      | 2850     |
| 7844  | TURNER | 1500 | 0    | 1500     |

Conceptually, this query will get rewritten as:

```
WITH t AS (SELECT empno, ename, sal, comm
FROM emp
WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

## 170.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

**Row Semantics PTF**

Under Row Semantics PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table emp has been set to 5, the following is an example that shows this parallelization:

```
EXPLAIN PLAN FOR
SELECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
```

| Id  | Operation                  | Name     |
|-----|----------------------------|----------|
| 0   | SELECT STATEMENT           |          |
| 1   | PX COORDINATOR             |          |
| 2   | PX SEND QC (RANDOM)        | :TQ10000 |
| 3   | POLYMORPHIC TABLE FUNCTION | ECHO     |
| 6   | PX BLOCK ITERATOR          |          |
| * 7 | TABLE ACCESS FULL          | EMP      |

```

Predicate Information (identified by operation id):

```

```
5 - filter("EMP"."DEPTNO"<>20)
```

### **Table Semantics PTF**

Table Semantics PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.

## 170.5 DBMS\_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (`OPEN`, `FETCH_ROWS` and `CLOSE`) are called by the database during query execution.

The PTF execution follows this flow :

1. `OPEN` (if present)
2. `FETCH_ROWS` (can be invoked multiple times)
3. `CLOSE` (if present)

The `FETCH_ROWS` procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to `FETCH_ROWS` is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The `GET_ROW_SET` or `GET_COL` is used to read the input rowset.

The `PUT_ROW_SET` or `PUT_COL` is used to produce an output rowset, that is written back to the database.

`PUT_ROW_SET` is used to set all the new columns in a single call.

The `ROWSET_T` record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use `PUT_COL` to produce a single column. A given column can only be produced once within a call to `FETCH_ROWS`.

For a Row Semantics PTF, the `FETCH_ROWS` procedure will return the new rows using the PTF Server interface before returning back to the database.

## 170.6 DBMS\_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the `DBMS_TF` package.

### Type Restrictions

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the `PUT_ROW_SET`, `PUT_COL`, `GET_ROW_SET` and `GET_COL` procedures. All SQL types can be used with pass-through columns. The `DESCRIBE` function can determine the supported types using the `DBMS_TF.SUPPORTED_TYPE` function.

### PTF Invocation and Execution Restrictions

Polymorphic table functions cannot be nested in the `FROM` clause of a query. Nesting PTF is only allowed using `WITH` clause.

Nesting table function with polymorphic table function is only allowed using `CURSOR` expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The `PARTITION BY` and the `ORDER BY` clause can only be specified on an argument of a Table Semantics PTF.

The PTF execution methods `OPEN`, `FETCH_ROWS`, and `CLOSE` must be invoked in the polymorphic table function execution context only.

You cannot invoke the `DESCRIBE` method directly.

This example shows ten PTF nested invocation.

```
WITH t0
 AS (SELECT /*+ parallel */ *
```

```
 FROM noop(dept)),
t1
AS (SELECT *
 FROM noop(t0)),
t2
AS (SELECT *
 FROM noop(t1)),
t3
AS (SELECT *
 FROM noop(t2)),
t4
AS (SELECT *
 FROM noop(t3)),
t5
AS (SELECT *
 FROM noop(t4)),
t6
AS (SELECT *
 FROM noop(t5)),
t7
AS (SELECT *
 FROM noop(t6)),
t8
AS (SELECT *
 FROM noop(t7)),
t9
AS (SELECT *
 FROM noop(t8))
SELECT *
FROM noop(t9)
WHERE deptno = 10;
```

10 ACCOUNTING NEW YORK

## 170.7 DBMS\_TF Examples

These examples use DBMS\_TF subprograms.

### Summary of DBMS\_TF Examples

These examples are incomplete and for demonstration purpose only.

- *Oracle PL/SQL Language Reference*, "To\_doc Polymorphic Table Function Example"

## 170.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with same values.

This PTF returns all the columns in the input table `tab`, and adds to it the columns listed in `cols` but with the column names prefixed with "ECHO\_".

### Live SQL:

You can view and run this example on Oracle Live SQL at [Echo Polymorphic Table Function](#)

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));
```

| DEPTNO | DNAME      | LOC      | ECHO_DNAME | ECHO_LOC |
|--------|------------|----------|------------|----------|
| 10     | ACCOUNTING | NEW YORK | ACCOUNTING | NEW YORK |
| 20     | RESEARCH   | DALLAS   | RESEARCH   | DALLAS   |
| 30     | SALES      | CHICAGO  | SALES      | CHICAGO  |
| 40     | OPERATIONS | BOSTON   | OPERATIONS | BOSTON   |

A PTF consists of the following :

- PTF implementation package specification : The specification must have the DESCRIBE method. The OPEN, FETCH\_ROWS and CLOSE methods are optional.
- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.
- PTF Function: The PTF function has a reference to the implementation package.

The echo\_package package specification defines the DESCRIBE and FETCH\_ROWS methods.

```
CREATE PACKAGE echo_package
AS
 prefix DBMS_ID := 'ECHO_';
 FUNCTION describe(
 tab IN OUT DBMS_TF.TABLE_T,
 cols IN DBMS_TF.COLUMNS_T)
 RETURN DBMS_TF.DESCRIBE_T;
 PROCEDURE fetch_rows;
END echo_package;
```

The echo\_package package body contains the PTF implementation.

```
CREATE PACKAGE BODY echo_package
AS
 FUNCTION describe(tab IN OUT DBMS_TF.TABLE_T,
 cols IN DBMS_TF.COLUMNS_T)
 RETURN DBMS_TF.DESCRIBE_T
 AS
 new_cols DBMS_TF.COLUMNS_NEW_T;
 col_id PLS_INTEGER := 1;
 BEGIN
 FOR I IN 1 .. tab.COLUMN.COUNT LOOP
 FOR J IN 1 .. cols.COUNT LOOP
 IF (tab.COLUMN(i).description.name = cols(j)) THEN
 IF (NOT
DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE))
 THEN
 RAISE_APPLICATION_ERROR(-20102, 'Unsupported column
type [' ||
 TAB.COLUMN(i).description.TYPE||']');
 END IF;

 TAB.COLUMN(i).for_read := TRUE;
 NEW_COLS(col_id) := TAB.COLUMN(i).description;
 NEW_COLS(col_id).name := prefix ||
TAB.COLUMN(i).description.name;
 col_id := col_id + 1;

 EXIT;
 END IF;
 END LOOP;
 END LOOP;
 END LOOP;
```

```

 /* Verify all columns were found */
 IF (col_id - 1 != cols.COUNT) THEN
 RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id -
1||'], ['||cols.COUNT||']');
 END IF;

 RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
 END;
 PROCEDURE FETCH_ROWS
 AS
 ROWSET DBMS_TF.ROW_SET_T;
 BEGIN
 DBMS_TF.GET_ROW_SET(rowset);
 DBMS_TF.PUT_ROW_SET(rowset);
 END;
END echo_package;

```

The PTF echo references the implementation package echo\_package.

```

CREATE FUNCTION echo(tab TABLE,
 cols COLUMNS)
 RETURN TABLE
 PIPELINED ROW POLYMORPHIC USING echo_package;

```

#### Example 170-4 Using the Echo PTF in Queries

This example selects all employees in department 20. The resulting rows have three new columns ECHO\_ENAME, ECHO\_HIREDATE, and ECHO\_SAL.

```

SELECT *
FROM echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE deptno = 20;

```

| EMPNO | ENAME | JOB     | MGR  | HIREDATE  | SAL  | COMM | DEPTNO | ECHO_ENAME | ECHO_HIREDATE |
|-------|-------|---------|------|-----------|------|------|--------|------------|---------------|
| 7369  | SMITH | CLERK   | 7902 | 17-DEC-80 | 800  |      | 20     | SMITH      | 17-DEC-80     |
| 7566  | JONES | MANAGER | 7839 | 02-APR-81 | 2975 |      | 20     | JONES      | 02-APR-81     |
| 7788  | SCOTT | ANALYST | 7566 | 19-APR-87 | 3000 |      | 20     | SCOTT      | 19-APR-87     |
| 7876  | ADAMS | CLERK   | 7788 | 23-MAY-87 | 1100 |      | 20     | ADAMS      | 23-MAY-87     |
| 7902  | FORD  | ANALYST | 7566 | 03-DEC-81 | 3000 |      | 20     | FORD       | 03-DEC-81     |

Using subquery w, display ENAME, ECHO\_LOC and DNAME columns for all employees in department 30 with a salary greater than 1000.

```

WITH w
AS (SELECT e.*,
 dname,

```

```

 loc
 FROM scott.emp e,
 scott.dept d
 WHERE e.deptno = d.deptno)
SELECT ename,
 echo_loc,
 dname
FROM echo(w, COLUMNS(sal, dname, loc, hiredate))
WHERE deptno = 30
 AND echo_sal > 1000;

```

| ENAME  | ECHO_LOC | DNAME |
|--------|----------|-------|
| ALLEN  | CHICAGO  | SALES |
| WARD   | CHICAGO  | SALES |
| MARTIN | CHICAGO  | SALES |
| BLAKE  | CHICAGO  | SALES |
| TURNER | CHICAGO  | SALES |

Using subquery w, display ENAME and DNAME columns for all employees with a salary greater than 1000.

```

WITH w
 AS (SELECT e.*,
 dname,
 loc
 FROM scott.emp e,
 scott.dept d
 WHERE e.deptno = d.deptno)
SELECT echo_ename,
 dname
FROM echo(w, COLUMNS(loc, deptno, dname, ename)) e
WHERE ename IN (SELECT echo_ename
 FROM echo(scott.emp, COLUMNS(sal, deptno, ename,
 hiredate))
 WHERE deptno = e.echo_deptno
 AND sal > 1000);

```

| ECHO_ENAME | DNAME      |
|------------|------------|
| ALLEN      | SALES      |
| MILLER     | ACCOUNTING |
| CLARK      | ACCOUNTING |
| WARD       | SALES      |
| ADAMS      | RESEARCH   |
| TURNER     | SALES      |
| SCOTT      | RESEARCH   |
| BLAKE      | SALES      |
| JONES      | RESEARCH   |
| KING       | ACCOUNTING |
| FORD       | RESEARCH   |
| MARTIN     | SALES      |

## 170.8 DBMS\_TF Data Structures

The DBMS\_TF package defines these RECORD types, TABLE types and subtype.

### RECORD Types

- [COLUMN\\_DATA\\_T Record Type](#)
- [COLUMN\\_METADATA\\_T Record Type](#)
- [COLUMN\\_T Record Type](#)
- [DESCRIBE\\_T Record Type](#)
- [ENV\\_T Record Type](#)
- [PARALLEL\\_ENV\\_T Record Type](#)
- [TABLE\\_T Record Type](#)

### TABLE Types

- [Supported Types Collections \(TAB\\_<typ>\\_T\)](#)
- [COLUMNS\\_NEW\\_T Table Type](#)
- [COLUMNS\\_T Table Type](#)
- [COLUMNS\\_WITH\\_TYPE\\_T Table Type](#)
- [TABLE\\_COLUMNS\\_T Table Type](#)
- [ROW\\_SET\\_T Table Type](#)

### Types

- [XID\\_T Subtype](#)

### CSTORE and XSTORE Data Structures

The compilation and execution state management interfaces use data structures internally.

See [Collections For Compilation Storage](#) for more information.

### 170.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

#### Syntax

```
TYPE TAB_BOOLEAN_T IS TABLE OF BOOLEAN INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_FLOAT_T IS TABLE OF BINARY_FLOAT INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_DOUBLE_T IS TABLE OF BINARY_DOUBLE INDEX BY PLS_INTEGER;
TYPE TAB_BLOB_T IS TABLE OF BLOB INDEX BY PLS_INTEGER;
TYPE TAB_CHAR_T IS TABLE OF CHAR(32767) INDEX BY PLS_INTEGER;
TYPE TAB_CLOB_T IS TABLE OF CLOB INDEX BY PLS_INTEGER;
```

```

TYPE TAB_DATE_T IS TABLE OF DATE INDEX BY PLS_INTEGER;

TYPE TAB_INTERVAL_YM_T IS TABLE OF YMINTERVAL_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_INTERVAL_DS_T IS TABLE OF DSINTERVAL_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_NATURALN_T IS TABLE OF NATURALN INDEX BY PLS_INTEGER;

TYPE TAB_NUMBER_T IS TABLE OF NUMBER INDEX BY PLS_INTEGER;

TYPE TAB_RAW_T IS TABLE OF RAW(32767) INDEX BY PLS_INTEGER;

TYPE TAB_ROWID_T IS TABLE OF ROWID INDEX BY PLS_INTEGER;

TYPE TAB_VARCHAR2_T IS TABLE OF VARCHAR2(32767) INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_T IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_TZ_T IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_LTZ_T IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

```

**See Also:**

[Table 170-1](#) for more information about the DBMS\_TF supported types

## 170.8.2 COLUMN\_DATA\_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See [Table 170-1](#) for the list of supported types.

**Syntax**

```

TYPE COLUMN_DATA_T IS RECORD
(description COLUMN_METADATA_T,
 tab_varchar2 TAB_VARCHAR2_T,
 tab_number TAB_NUMBER_T,
 tab_date TAB_DATE_T,
 tab_binary_float TAB_BINARY_FLOAT_T,
 tab_binary_double TAB_BINARY_DOUBLE_T,
 tab_raw TAB_RAW_T,
 tab_char TAB_CHAR_T,
 tab_clob TAB_CLOB_T,
 tab_blob TAB_BLOB_T,
 tab_timestamp TAB_TIMESTAMP_T,
 tab_timestamp_tz TAB_TIMESTAMP_TZ_T,

```

```

tab_interval_ym TAB_INTERVAL_YM_T,
tab_interval_ds TAB_INTERVAL_DS_T,
tab_timestamp_ltz TAB_TIMESTAMP_LTZ_T,
tab_rowid TAB_ROWID_T);

```

## Fields

**Table 170-7 COLUMN\_DATA\_T Fields**

| Field             | Description                                                                           |
|-------------------|---------------------------------------------------------------------------------------|
| description       | The tag defines the metadata for the column indicating which variant field is active. |
| tab_varchar2      | Variant field                                                                         |
| tab_number        | Variant field                                                                         |
| tab_date          | Variant field                                                                         |
| tab_binary_float  | Variant field                                                                         |
| tab_binary_double | Variant field                                                                         |
| tab_raw           | Variant field                                                                         |
| tab_char          | Variant field                                                                         |
| tab_clob          | Variant field                                                                         |
| tab_blob          | Variant field                                                                         |
| tab_timestamp     | Variant field                                                                         |
| tab_timestamp_tz  | Variant field                                                                         |
| tab_interval_ym   | Variant field                                                                         |
| tab_interval_ds   | Variant field                                                                         |
| tab_timestamp_ltz | Variant field                                                                         |
| tab_rowid         | Variant field                                                                         |

### 170.8.3 COLUMN\_METADATA\_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.

#### Syntax

```

TYPE COLUMN_METADATA_T IS RECORD
(type PLS_INTEGER,
 max_len PLS_integer DEFAULT -1,
 name VARCHAR2(32767),
 name_len PLS_INTEGER,
 precision PLS_INTEGER,
 scale PLS_INTEGER,
 charsetid PLS_INTEGER,
 charsetform PLS_INTEGER,
 collation PLS_INTEGER);

```

## Fields

**Table 170-8 COLUMN\_METADATA\_T Fields**

| Field       | Description                                                                                                                                                                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | Internal Oracle typecode for the column's type                                                                                                                                                                                                                                                                |
| max_len     | Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date,float), does not care about length, then this value will be ignored. |
| name        | Name of the column                                                                                                                                                                                                                                                                                            |
| name_len    | Length of the name                                                                                                                                                                                                                                                                                            |
| precision   | The precision, or the maximum number of significant decimal digits (for numeric data types)                                                                                                                                                                                                                   |
| scale       | Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types)                                                                                                                                                                                                 |
| charsetid   | Character set id (internal Oracle code, applies to string types)                                                                                                                                                                                                                                              |
| charsetform | Character set form (internal Oracle code, applies to string types)                                                                                                                                                                                                                                            |
| collation   | Collation id (internal Oracle code, applies to string types)                                                                                                                                                                                                                                                  |

## 170.8.4 COLUMN\_T Record Type

The column descriptor record for the type COLUMN\_METADATA\_T that contains PTF specific attributes.

### Syntax

```
TYPE column_t IS RECORD (
 description COLUMN_METADATA_T,
 pass_through BOOLEAN,
 for_read BOOLEAN);
```

## Fields

**Table 170-9 COLUMN\_T Fields**

| Field        | Description                    |
|--------------|--------------------------------|
| description  | Column metadata                |
| pass_through | Is this a pass through column  |
| for_read     | Is this column read by the PTF |

## 170.8.5 DESCRIBE\_T Record Type

The return type from the DESCRIBE method of PTF.

**Syntax**

```

TYPE DESCRIBE_T IS RECORD
(NEW_COLUMNS COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),
 CSTORE_CHR CSTORE_CHR_T DEFAULT CSTORE_CHR_T(),
 CSTORE_NUM CSTORE_NUM_T DEFAULT CSTORE_NUM_T(),
 CSTORE_BOL CSTORE_BOL_T DEFAULT CSTORE_BOL_T(),
 CSTORE_DAT CSTORE_DAT_T DEFAULT CSTORE_DAT_T(),
 METHOD_NAMES METHODS_T DEFAULT METHODS_T());

```

**Fields****Table 170-10 DESCRIBE\_T Fields**

| Field        | Description                                                             |
|--------------|-------------------------------------------------------------------------|
| NEW_COLUMNS  | New columns description that will be produced by the PTF                |
| CSTORE_CHR   | CStore array key type : VARCHAR2 (optional)                             |
| CSTORE_NUM   | CStore array key type : NUMBER (optional)                               |
| CSTORE_BOL   | CStore array key type : BOOLEAN (optional)                              |
| CSTORE_DAT   | CStore array key type : DATE (optional)                                 |
| METHOD_NAMES | Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods |

## 170.8.6 ENV\_T Record Type

This record contains metadata about the polymorphic table function execution state.

**Syntax**

```

TYPE ENV_T IS RECORD (
 get_columns TABLE_METADATA_T,
 put_columns TABLE_METADATA_T,
 ref_put_col REFERENCED_COLS_T,
 parallel_env PARALLEL_ENV_T,
 query_optim BOOLEAN,
 row_count PLS_INTEGER,
 row_replication BOOLEAN,
 row_insertion BOOLEAN);

```

**Fields****Table 170-11 ENV\_T Fields**

| Field        | Description                                                       |
|--------------|-------------------------------------------------------------------|
| get_columns  | Metadata about the columns read by PTF GET_COL procedure          |
| put_columns  | Metadata about columns sent back to database by PUT_COL procedure |
| ref_put_col  | TRUE if the put column was referenced in the query                |
| parallel_env | Parallel execution information (when a query runs in parallel)    |

**Table 170-11 (Cont.) ENV\_T Fields**

| Field           | Description                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------|
| query_optim     | Is this execution for query optimization?<br>TRUE, if the query was running on behalf of optimizer |
| row_count       | Number of rows in current row set                                                                  |
| row_replication | Is Row Replication Enabled?                                                                        |
| row_insertion   | Is Row Insertion Enabled?                                                                          |

## 170.8.7 PARALLEL\_ENV\_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

### Syntax

```
TYPE PARALLEL_ENV_T IS RECORD
(instance_id PLS_INTEGER,
 session_id PLS_INTEGER,
 slave_svr_grp PLS_INTEGER,
 slave_set_no PLS_INTEGER,
 no_slocal_slaves PLS_INTEGER,
 global_slave_no PLS_INTEGER,
 no_local_slaves PLS_INTEGER,
 local_slave_no PLS_INTEGER);
```

### Fields

**Table 170-12 PARALLEL\_ENV\_T Fields**

| Field            | Description                                  |
|------------------|----------------------------------------------|
| instance_id      | QC instance ID                               |
| session_id       | QC session ID                                |
| slave_svr_grp    | Slave server group                           |
| slave_set_no     | Slave server set number                      |
| no_slocal_slaves | Number of sibling slaves (including self)    |
| global_slave_no  | Global slave number (base 0)                 |
| no_local_slaves  | Number of sibling slaves running on instance |
| local_slave_no   | Local slave number (base 0)                  |

## 170.8.8 TABLE\_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE\_T record type.

### Syntax

```
TYPE TABLE_T IS RECORD(
 column TABLE_COLUMNS_T,
 schema_name DBMS_id,
```

```
package_name DBMS_id,
ptf_name DBMS_id);
```

**Fields****Table 170-13** TABLE\_T Fields

| Field        | Description                         |
|--------------|-------------------------------------|
| column       | Column information                  |
| schema_name  | The PTF schema name                 |
| package_name | The PTF implementation package name |
| ptf_name     | The PTF name invoked                |

## 170.8.9 COLUMNS\_NEW\_T Table Type

Collection for new columns

**Syntax**

```
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

## 170.8.10 COLUMNS\_T Table Type

Collection containing column names

**Syntax**

```
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

## 170.8.11 COLUMNS\_WITH\_TYPE\_T Table Type

Collection containing columns metadata

**Syntax**

```
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

## 170.8.12 TABLE\_COLUMNS\_T Table Type

A collection of columns(COLUMN\_T)

**Syntax**

```
TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;
```

## 170.8.13 ROW\_SET\_T Table Type

Data for a rowset

**Syntax**

```
TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;
```

## 170.8.14 XID\_T Subtype

The XID\_T subtype is defined to store the execution unique ID returned by function GET\_XID.

### Syntax

```
SUBTYPE XID_T IS VARCHAR2(1024);
```

## 170.9 Summary of DBMS\_TF Subprograms

This summary briefly describes the DBMS\_TF package subprograms.

**Table 170-14 DBMS\_TF Subprograms**

| Subprogram                | Description                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------|
| COLUMN_TYPE_NAME Function | Returns the type name of the specified column type                                                             |
| COL_TO_CHAR Function      | Returns the string representation of the specified column                                                      |
| CSTORE_EXISTS Function    | Returns TRUE if an item with a given key exists in the PTF Compilation State management Store                  |
| CSTORE_GET Procedure      | Gets item(s) of specified type from the PTF Compilation State management Store                                 |
| GET_COL Procedure         | Gets read column values                                                                                        |
| GET_ENV Function          | Returns information about the PTF runtime environment                                                          |
| GET_ROW_SET Procedure     | Gets read set of column values in the collection                                                               |
| GET_XID Function          | Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state |
| PUT_COL Procedure         | Puts column values in the database                                                                             |
| PUT_ROW_SET Procedure     | Puts the collection read set of column values in the database                                                  |
| ROW_REPLICATION Procedure | Sets the row replication factor                                                                                |
| ROW_TO_CHAR Function      | Returns the string representation of a row in a rowset                                                         |
| SUPPORTED_TYPE Function   | Returns TRUE if a specified type is supported by PTF infrastructure                                            |
| TRACE Procedure           | Prints data structures to help development and problem diagnosis                                               |
| XSTORE_CLEAR Procedure    | Removes all key-value pairs from XStore                                                                        |
| XSTORE_EXISTS Procedure   | Returns TRUE if the key has an associated value                                                                |
| XSTORE_GET Procedure      | Gets a key-value store for PTF Execution State Management                                                      |

**Table 170-14 (Cont.) DBMS\_TF Subprograms**

| Subprogram              | Description                                                               |
|-------------------------|---------------------------------------------------------------------------|
| XSTORE_REMOVE Procedure | Removes any value associated with the given key                           |
| XSTORE_SET Procedure    | Sets the value for the given key store for PTF Execution State Management |

## 170.9.1 COLUMN\_TYPE\_NAME Function

Returns the type name for the specified column type.

### Syntax

```
FUNCTION COLUMN_TYPE_NAME(
 col COLUMN_METADATA_T)
 RETURN VARCHAR2;
```

### Parameters

**Table 170-15 DBMS\_TF.COLUMN\_TYPE\_NAME Function Parameters**

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| col       | The column metadata. See <a href="#">COLUMN_METADATA_T Record Type</a> |

### Return Values

Returns the column type converted as text.

### Example 170-5 DBMS\_TF.COLUMN\_TYPE\_NAME Example

This example shows an application type check that invokes `COLUMN_TYPE_NAME` to compare the column type and raise an application error if the column type is not `VARCHAR2`.

```
FUNCTION describe(
 tab IN OUT DBMS_TF.table_t,
 cols IN DBMS_TF.columns_t)
 RETURN DBMS_TF.describe_t
AS
 new_cols DBMS_TF.columns_new_t;
 col_id PLS_INTEGER := 1;
BEGIN
 FOR i IN 1 .. tab.count LOOP
 FOR j IN 1 .. cols.count LOOP
 IF (tab(i).description.name = cols(j)) THEN
 IF (DBMS_TF.column_type_name(tab(i).description.type) !=
'VARCHAR2') THEN
 raise_application_error(-20102,
 'Unsupported column type [|]|tab(i).description.type|'|');
 END IF;
 tab(i).for_read := true;
 new_cols(col_id) := tab(i).description;
 END IF;
 END LOOP;
 END LOOP;
```

```

 new_cols(col_id).name := 'ECHO_' || tab(i).description.name;
 col_id := col_id + 1;
 EXIT;
 END IF;
END LOOP;
END LOOP;

-- Verify all columns were found
IF (col_id - 1 != cols.count) THEN
 raise_application_error(-20101,
 'Column mismatch [' || col_id - 1 ||'], [' || cols.count ||']);
END IF;

RETURN DBMS_TF.describe_t(new_columns => new_cols);
END;
```

## 170.9.2 COL\_TO\_CHAR Function

Returns the string representation of the specified column.

### Syntax

```

FUNCTION COL_TO_CHAR(
 col COLUMN_DATA_T,
 rid PLS_INTEGER,
 quote VARCHAR2 DEFAULT '')
RETURN VARCHAR2;
```

### Parameters

**Table 170-16 DBMS\_TF.COL\_TO\_CHAR Function Parameters**

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| col       | The column whose value is to be converted    |
| rid       | Row number                                   |
| quote     | Quotation mark to use for non-numeric values |

### Return Values

The string representation of a column data value.

### Example 170-6 DBMS\_TF.COL\_TO\_CHAR Example

```

PROCEDURE Fetch_Rows AS
 rowset DBMS_TF.rROW_SET_T;
 str VARCHAR2(32000);
BEGIN
 DBMS_TF.GET_ROW_SET(rowset);
 str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)
END;
```

## 170.9.3 CSTORE\_EXISTS Function

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

## Syntax

```
FUNCTION CSTORE_EXISTS
 (key IN VARCHAR2,
 key_type IN PLS_INTEGER default NULL)
 return BOOLEAN;
```

## Parameters

**Table 170-17 CSTORE\_EXISTS Function Parameters**

| Parameter | Description                               |
|-----------|-------------------------------------------|
| key       | A unique character key                    |
| key_type  | The type of key (optional) Default : NULL |

## Return Values

Returns TRUE if the key has an associated value. When the `key_type` is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a `key_type` parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

## Example 170-7 DBMS\_TF.CSTORE\_EXISTS Example

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```
IF (DBMS_TF.CSTORE_EXISTS('min' || j)) THEN
 DBMS_TF.CSTORE_GET('min' || j, min_col);
END IF;
```

## 170.9.4 CSTORE\_GET Procedure

You can use the `CSTORE_GET` procedure to get the associated value for a given key stored for PTF Compilation State.

`CSTORE` is the PTF compilation state management interface. The `CSTORE` interface is used to set and store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE` function.

You can get the PTF compilation state during runtime procedures such as `OPEN`, `FETCH_ROWS` and `CLOSE`.

This procedure is overloaded. The `DESCRIBE_T` supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, `BOOLEAN`.

See [Table 170-3](#) for more information.

## Syntax

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

```
PROCEDURE CSTORE_GET(
 key IN VARCHAR2,
 value IN OUT VARCHAR2);
```

```
PROCEDURE CSTORE_GET(
 key IN VARCHAR2,
 value IN OUT NUMBER);
```

```
PROCEDURE CSTORE_GET(
 key IN VARCHAR2,
 value IN OUT DATE);
```

```
PROCEDURE CSTORE_GET(
 key IN VARCHAR2,
 value IN OUT BOOLEAN);
```

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);
```

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);
```

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);
```

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);
```

### Parameters

**Table 170-18 DBMS\_TF.CSTORE\_GET Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| key       | A unique character key                             |
| value     | Value corresponding to the key for supported types |
| key_value | Key value                                          |

## 170.9.5 GET\_COL Procedure

Get Read Column Values

### Syntax

```
PROCEDURE GET_COL(
 columnId NUMBER,
 collection IN OUT NOCOPY <datatype>);
```

Where <datatype> can be any one of the supported types.

See [Table 170-1](#) for the list of supported types.

## Parameters

**Table 170-19 GET\_COL Procedure Parameters**

| Parameter  | Description             |
|------------|-------------------------|
| columnid   | The id for the column   |
| collection | The data for the column |

## Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same ColumnId, GET\_COL and PUT\_COL may correspond to different column.

### Example 170-8 DBMS\_TF.GET\_COL Example

This example is an excerpt of a fetch\_rows procedure defined in the PTF implementation package.

```
PROCEDURE fetch_rows
IS
 col1 DBMS_TF.TAB_CLOB_T;
 col2 DBMS_TF.TAB_CLOB_T;
 out1 DBMS_TF.TAB_CLOB_T;
 out2 DBMS_TF.TAB_CLOB_T;
BEGIN
 DBMS_TF.GET_COL(1, col1);
 DBMS_TF.GET_COL(2, col2);

 FOR I IN 1 .. col1.COUNT LOOP
 out1(i) := 'ECHO-' || col1(i);
 END LOOP;

 FOR I IN 1 .. col2.COUNT LOOP
 out2(i) := 'ECHO-' || col2(i);
 END LOOP;

 DBMS_TF.PUT_COL(1, out1);
 DBMS_TF.PUT_COL(2, out2);
END;
```

Note, invoking the DBMS\_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.

```
exec fetch_rows
```

```
ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a
polymorphic table function.
```

## 170.9.6 GET\_ENV Function

Returns information about the PTF runtime environment

### Syntax

```
FUNCTION GET_ENV
 RETURN ENV_T;
```

### Return Values

Returns information about the PTF runtime environment.

### Example 170-9 DBMS\_TF.GET\_ENV Example

This line shows how you could initialize a local variable env of type ENV\_T with the PTF execution information in a FETCH\_ROWS implementation procedure.

```
env DBMS_TF.ENV_T := DBMS_TF.GET_ENV();
```

## 170.9.7 GET\_ROW\_SET Procedure

Get Read Column Values

The FETCH\_ROW procedure can call the GET\_ROW\_SET procedure to read the input rowset set of column values in the collection of supported scalar type. This procedure is overloaded.

### Syntax

```
PROCEDURE GET_ROW_SET(
 rowset OUT NOCOPY ROW_SET_T);

PROCEDURE GET_ROW_SET(
 rowset OUT NOCOPY ROW_SET_T,
 row_count OUT PLS_INTEGER);

PROCEDURE GET_ROW_SET(
 rowset OUT NOCOPY ROW_SET_T,
 row_count OUT PLS_INTEGER,
 col_count OUT PLS_INTEGER);
```

### Parameters

**Table 170-20 GET\_ROW\_SET Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| rowset    | The collection of data and metadata |
| row_count | The number of rows in the columns   |
| col_count | The number of columns               |

**Example 170-10 DBMS\_TF.GET\_ROW\_SET Example**

This example is an excerpt from a PTF implementation package for demonstration purpose.

```

PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
 rowset DBMS_TF.ROW_SET_T;
 accumulator DBMS_TF.TAB_VARCHAR2_T;
 row_count PLS_INTEGER;

 FUNCTION get_value(col PLS_INTEGER,
 ROW PLS_INTEGER)
 RETURN VARCHAR2
 AS
 col_type PLS_INTEGER := rowset(col).description.TYPE;
 BEGIN
 CASE col_type
 WHEN DBMS_TF.TYPE_VARCHAR2 THEN
 RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
 ELSE
 RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type=' ||
col_type);
 END CASE;
 END;
BEGIN
 DBMS_TF.GET_ROW_SET(rowset, row_count);

 IF (rowset.count = 0) THEN
 RETURN;
 END IF;

 FOR row_num IN 1 .. row_count LOOP
 accumulator(row_num) := 'empty';
 END LOOP;

 FOR col_num IN 1 .. rowset.count LOOP
 FOR row_num IN 1 .. row_count LOOP
 accumulator(row_num) := accumulator(row_num) ||
get_value(col_num, row_num);
 END LOOP;
 END LOOP;
 -- Pushout the accumulator
 DBMS_TF.PUT_COL(1, accumulator);
END;

```

**170.9.7.1 Stack Polymorphic Table Function Example**

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

**Example 170-11 Stack Polymorphic Table Function Example****Live SQL:**

You can view and run this example on Oracle Live SQL at [Stack Polymorphic Table Function](#)

Create the PTF implementation package `stack_p`.

The parameters are :

- `tab` - Input table
- `col` - The names of numeric (input) table columns to stack

```
CREATE PACKAGE stack_p AS

 FUNCTION describe(tab IN OUT dbms_tf.table_t,
 col dbms_tf.columns_t)
 RETURN dbms_tf.describe_t;

 PROCEDURE fetch_rows;

END stack_p;
```

Create the PTF implementation package body `stack_p`.

This PTF produces two new columns, `COLUMN_NAME` and `COLUMN_VALUE`, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

```
CREATE PACKAGE BODY stack_p AS

 FUNCTION describe(tab IN OUT dbms_tf.table_t,
 col dbms_tf.columns_t)
 RETURN dbms_tf.describe_t AS
 BEGIN
 FOR i IN 1 .. tab.column.count LOOP
 FOR j IN 1 .. col.count LOOP
 IF (tab.column(i).description.name = col(j) AND
 tab.column(i).description.TYPE = dbms_tf.type_number) THEN
 tab.column(i).pass_through := false;
 tab.column(i).for_read := true;
 END IF;
 END LOOP;
 END LOOP;

 RETURN dbms_tf.describe_t(
 new_columns => dbms_tf.columns_new_t(
 1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
 TYPE =>
dbms_tf.type_varchar2),
```

```

 2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
 TYPE =>
dbms_tf.type_number)),
 row_replication => true);
END;

PROCEDURE fetch_rows AS
 env dbms_tf.env_t := dbms_tf.get_env();
 rowset dbms_tf.row_set_t;
 colcnt PLS_INTEGER;
 rowcnt PLS_INTEGER;
 repfac dbms_tf.tab_naturaln_t;
 namcol dbms_tf.tab_varchar2_t;
 valcol dbms_tf.tab_number_t;
BEGIN
 dbms_tf.get_row_set(rowset, rowcnt, colcnt);

 FOR i IN 1 .. rowcnt LOOP
 repfac(i) := 0;
 END LOOP;

 FOR r IN 1 .. rowcnt LOOP
 FOR c IN 1 .. colcnt LOOP
 IF rowset(c).tab_number(r) IS NOT NULL THEN
 repfac(r) := repfac(r) + 1;
 namcol(nvl(namcol.last+1,1)) :=
 INITCAP(regexp_replace(env.get_columns(c).name, '^"|"$'));
 valcol(nvl(valcol.last+1,1)) := rowset(c).tab_number(r);
 END IF;
 END LOOP;
 END LOOP;

 dbms_tf.row_replication(replication_factor => repfac);
 dbms_tf.put_col(1, namcol);
 dbms_tf.put_col(2, valcol);

END;

END stack_p;

```

Create the standalone PTF named `stack`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `stack_p`.

```

CREATE FUNCTION stack(tab TABLE,
 col columns)
 RETURN TABLE
PIPELINED ROW POLYMORPHIC USING stack_p;

```

For all employees in departments 10 and 30, report values of columns `MGR`, `SAL`, and `COMM` ordered by department number and employee name.

```

SELECT deptno, ename, column_name, column_value
FROM stack(scott.emp, COLUMNS(mgr, sal, comm))

```

```
WHERE deptno IN (10, 30)
ORDER BY deptno, ename;
```

| DEPTNO | ENAME  | COLUMN_NAME | COLUMN_VALUE |
|--------|--------|-------------|--------------|
| 10     | CLARK  | Mgr         | 7839         |

| 30     | WARD   | Mgr         | 7698         |
| 30     | WARD   | Sal         | 1250         |

## 170.9.8 GET\_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

### Syntax

```
FUNCTION GET_XID
RETURN XID_T;
```

### Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

### Example 170-12 DBMS\_TF.GET\_XID Example

This is an excerpt of code showing an invocation of GET\_XID to initialize a local variable indexed using the execution id to a zero value.

```
PROCEDURE open IS
BEGIN
 xst(DBMS_TF.GET_XID()) := 0;
END;
```

## 170.9.9 PUT\_COL Procedure

Put Column Values

**Syntax**

```
PROCEDURE PUT_COL(
 columnid NUMBER,
 collection IN <datatype>);
```

Where *<datatype>* can be any one of the supported types.

See [Table 170-1](#) for the list of supported types.

**Parameters****Table 170-21 PUT\_COL Procedure Parameters**

| Parameter  | Description             |
|------------|-------------------------|
| columnid   | The id for the column   |
| collection | The data for the column |

**Usage Notes**

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same columnid, GET\_COL and PUT\_COL may correspond to different column.

### 170.9.9.1 Rand\_col Polymorphic Table Function Example

The rand\_col PTF appends specified number of random-valued columns to the output.

**Example 170-13 Rand\_col Polymorphic Table Function Example** **Live SQL:**

You can view and run this example on Oracle Live SQL at [Rand\\_col Polymorphic Table Function](#)

This rand\_col PTF example appends col\_count number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND\_<n>"

Create the PTF implementation package rand\_col\_p.

The parameters are :

- tab : Input table
- col\_count (optional) : Number of random-valued columns to generate [Default = 1]
- low (optional) : Lower bound for the random numbers [Default = Null]

- **high (optional)** : Upper bound for the random numbers [Default = Null]

```
CREATE PACKAGE rand_col_p AS

 FUNCTION describe(tab IN OUT DBMS_TF.table_t,
 col_count NATURALN DEFAULT 1,
 low NUMBER DEFAULT NULL,
 high NUMBER DEFAULT NULL)
 RETURN DBMS_TF.describe_t;

 PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
 low NUMBER DEFAULT NULL,
 high NUMBER DEFAULT NULL);

END rand_col_p;
```

Create the PTF implementation package body `rand_col_p`.

The parameter `col_count` is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of `col_count` to be `NATURALN`, which has an implicit `NOT NULL` constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

```
CREATE PACKAGE BODY rand_col_p AS
 col_name_prefix CONSTANT dbms_id := 'RAND_';

 FUNCTION describe(tab IN OUT DBMS_TF.table_t,
 col_count NATURALN DEFAULT 1,
 low NUMBER DEFAULT NULL,
 high NUMBER DEFAULT NULL)
 RETURN DBMS_TF.describe_t
 AS
 cols DBMS_TF.columns_new_t;
 BEGIN
 FOR i IN 1 .. col_count LOOP
 cols(i) := DBMS_TF.column_metadata_t(name=>col_name_prefix||i,
 TYPE=>DBMS_TF.type_number);
 END LOOP;

 RETURN DBMS_TF.describe_t(new_columns => cols);
 END;

 PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
 low NUMBER DEFAULT NULL,
 high NUMBER DEFAULT NULL)
 AS
 row_count CONSTANT PLS_INTEGER := DBMS_TF.get_env().row_count;
 col DBMS_TF.tab_number_t;
 BEGIN
 FOR c IN 1 .. col_count LOOP
 FOR i IN 1 .. row_count LOOP
 col(i) := CASE WHEN (low IS NULL OR high IS NULL)
 THEN dbms_random.VALUE
 ELSE dbms_random.VALUE(low,
```

```

high)
 END;
 END LOOP;
 DBMS_TF.put_col(c, col);
 END LOOP;
 END;

END rand_col_p;

```

Create the standalone rand\_col PTF. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is rand\_col\_p.

```

CREATE FUNCTION rand_col(tab TABLE,
 col_count NATURALN DEFAULT 1,
 low NUMBER DEFAULT NULL,
 high NUMBER DEFAULT NULL)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING rand_col_p;

```

Invoke the rand\_col PTF to display all columns of table SCOTT.DEPT with one produced RAND\_1 column.

```

SELECT *
FROM rand_col(scott.dept);

```

| DEPTNO | DNAME      | LOC      | RAND_1     |
|--------|------------|----------|------------|
| 10     | ACCOUNTING | NEW YORK | .738666262 |
| 20     | RESEARCH   | DALLAS   | .093256312 |
| 30     | SALES      | CHICAGO  | .992944835 |
| 40     | OPERATIONS | BOSTON   | .397948124 |

Invoke the rand\_col PTF to display all columns of table SCOTT.DEPT with two produced RAND\_1 and RAND\_2 columns.

```

SELECT *
FROM rand_col(scott.dept, col_count => 2);

```

| DEPTNO | DNAME      | LOC      | RAND_1     | RAND_2     |
|--------|------------|----------|------------|------------|
| 10     | ACCOUNTING | NEW YORK | .976521361 | .209802028 |
| 20     | RESEARCH   | DALLAS   | .899577891 | .10050334  |
| 30     | SALES      | CHICAGO  | .277238362 | .110736583 |
| 40     | OPERATIONS | BOSTON   | .989839995 | .164822363 |

For all employees for which their job is not being a SALESMAN, display the employee name, job, and produce three RAND columns generating random values between — 10 and 10.

```

SELECT ename, job, rand_1, rand_2, rand_3
FROM rand_col(scott.emp, col_count => 3, low => -10, high => +10)
WHERE job != 'SALESMAN';

```

| ENAME  | JOB       | RAND_1     | RAND_2     | RAND_3     |
|--------|-----------|------------|------------|------------|
| SMITH  | CLERK     | 8.91760464 | 6.67366638 | -9.2789076 |

## 170.9.10 PUT\_ROW\_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the ROW\_REPLICATION procedure to set the replication factor.

### Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(
 rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
PROCEDURE PUT_ROW_SET(
 rowset IN ROW_SET_T,
 replication_factor IN NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(
 rowset IN ROW_SET_T,
 replication_factor IN TAB_NATURALN_T);
```

### Parameters

**Table 170-22 PUT\_ROW\_SET Procedure Parameters**

| Parameter          | Description                         |
|--------------------|-------------------------------------|
| rowset             | The collection of data and metadata |
| replication_factor | The replication factor per row      |

**Example 170-14 DBMS\_TF.PUT\_ROW\_SET Example**

This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```
PROCEDURE fetch_rows
AS
 rowset DBMS_TF.ROW_SET_T;
BEGIN
 DBMS_TF.GET_ROW_SET(rowset);
 DBMS_TF.PUT_ROW_SET(rowset);
END;
```

### 170.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

**Example 170-15 Split Polymorphic Table Function Example**

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

 **Live SQL:**

You can view and run this example on Oracle Live SQL at [Split Polymorphic Table Function](#)

Create the PTF implementation package split\_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```
CREATE PACKAGE split_p AS

 FUNCTION describe(tab IN OUT DBMS_TF.table_t,
 col DBMS_TF.columns_t,
 cnt NATURALN)
 RETURN DBMS_TF.describe_t;

 PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```

Create the PTF implementation package body split\_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

```
CREATE PACKAGE BODY split_p AS
```

```

FUNCTION describe(tab IN OUT DBMS_TF.Table_t,
 col DBMS_TF.Columns_t,
 cnt NATURALN)
 RETURN DBMS_TF.describe_t
AS
 new_cols DBMS_TF.columns_new_t;
 col_id PLS_INTEGER := 1;
BEGIN
 FOR i IN 1 .. tab.column.count LOOP
 FOR j IN 1 .. col.count LOOP
 IF (tab.column(i).description.name = col(j) AND
 tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
 tab.column(i).pass_through := FALSE;
 tab.column(i).for_read := TRUE;
 new_cols(col_id) := tab.column(i).description;
 col_id := col_id + 1;
 END IF;
 END LOOP;
 END LOOP;

 RETURN DBMS_TF.describe_t(new_columns=>new_cols,
row_replication=>true);
END;
PROCEDURE fetch_rows(cnt NATURALN)
AS
 inp_rs DBMS_TF.row_set_t;
 out_rs DBMS_TF.row_set_t;
 rows PLS_INTEGER;
BEGIN
 DBMS_TF.get_row_set(inp_rs, rows);

 FOR c IN 1 .. inp_rs.count() LOOP
 FOR r IN 1 .. rows LOOP
 FOR i IN 1 .. cnt LOOP
 out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/
cnt;
 END LOOP;
 END LOOP;
 END LOOP;

 DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
END;

END split_p;

```

Create the standalone PTF named `split`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `split_p`.

```

CREATE FUNCTION split(tab TABLE, col columns, cnt NATURALN)
 RETURN TABLE
PIPELINED ROW POLYMORPHIC USING split_p;

```

For all employees in department 30, display the ENAME, SAL, and COMM columns. Invoke the split PTF with the COLUMNS pseudo-operator to divide the value of SAL and COMM by 2 for each replicated row returned by the query. Each row is replicated twice.

```
SELECT ename, sal, comm
FROM split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE deptno=30;
```

| ENAME  | SAL  | COMM |
|--------|------|------|
| ALLEN  | 800  | 150  |
| ALLEN  | 800  | 150  |
| WARD   | 625  | 250  |
| WARD   | 625  | 250  |
| MARTIN | 625  | 700  |
| MARTIN | 625  | 700  |

| JAMES  | 475  |      |

## 170.9.11 ROW\_REPLICATION Procedure

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A Row Semantics polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

### Syntax

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(
 replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(
 replication_factor IN TAB_NATURALN_T);
```

### Parameters

**Table 170-23 ROW\_REPLICATION Procedure Parameters**

| Parameter          | Description                    |
|--------------------|--------------------------------|
| replication_factor | The replication factor per row |

### Example 170-16 Replicate Polymorphic Table Function Example

This example creates a PTF that replicates each input row by the replication\_factor that is given as a parameter.

 **Live SQL:**

You can view and run this example on Oracle Live SQL at [Replicate Polymorphic Table Function](#)

Create the PTF implementation package replicate\_p.

```
CREATE PACKAGE replicate_p
AS

 FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,
 replication_factor NATURAL)
 RETURN DBMS_TF.describe_t;

 PROCEDURE Fetch_Rows(replication_factor NATURALN);

END replicate_p;
```

Create the PTF implementation package body replicate\_p. The PTF replicates each input row by the replication\_factor that is given as a parameter.

```
CREATE PACKAGE body replicate_p
AS

 FUNCTION Describe(tab IN OUT DBMS_TF.Table_t
 , replication_factor NATURAL)
 RETURN DBMS_TF.describe_t AS
 BEGIN
 RETURN DBMS_TF.describe_t(row_replication => True);
 END;

 PROCEDURE Fetch_Rows(replication_factor NATURALN)
 AS
 BEGIN
 DBMS_TF.ROW_REPLICATION(replication_factor);
 END;

END replicate_p;
```

Create a standalone PTF named replicate. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is replicate\_p.

```
CREATE FUNCTION replicate(tab TABLE,
 replication_factor NATURAL)
 RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;
```

This example sets the `replication_factor` to 2 which results in doubling the number of rows.

```
SELECT *
FROM replicate(dept, replication_factor => 2);
```

| DEPTNO | DNAME      | LOC      |
|--------|------------|----------|
| 10     | ACCOUNTING | NEW YORK |
| 10     | ACCOUNTING | NEW YORK |
| 20     | RESEARCH   | DALLAS   |
| 20     | RESEARCH   | DALLAS   |
| 30     | SALES      | CHICAGO  |
| 30     | SALES      | CHICAGO  |
| 40     | OPERATIONS | BOSTON   |
| 40     | OPERATIONS | BOSTON   |

This example sets the `replication_factor` to zero.

```
SELECT *
FROM replicate(dept, replication_factor => 0);
```

no rows selected

Count the number of employees in each department. Invoke the replicate PTF to report from the `SCOTT.EMP` table to set the `replication_factor` to 1000000.

```
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;
```

| DEPTNO | COUNT(*) |
|--------|----------|
| 30     | 6000000  |
| 10     | 3000000  |
| 20     | 5000000  |

This sets the `replication_factor` to 1000000000.

```
SELECT COUNT(*)
FROM replicate(dual, 1e9);
```

| COUNT(*)   |
|------------|
| 1000000000 |

## 170.9.12 ROW\_TO\_CHAR Function

The `ROW_TO_CHAR` function converts a row data value to a string representation.

### Syntax

```
FUNCTION ROW_TO_CHAR(
 rowset ROW_SET_T,
 rid PLS_INTEGER,
```

```
format PLS_INTEGER DEFAULT FORMAT_JSON)
RETURN VARCHAR2;
```

### Parameters

**Table 170-24 DBMS\_TF.ROW\_TO\_CHAR Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| rowset    | The rowset whose value is to be converted  |
| rid       | Row number                                 |
| format    | The string format (default is FORMAT_JSON) |

### Usage Notes

Only the JSON format is supported.

### Return Values

The string representation in JSON format.

### Example 170-17 DBMS\_TF.ROW\_TO\_CHAR Example

```
PROCEDURE Fetch_Rows as
rowset DBMS_TF.ROW_SET_T;
str VARCHAR2(32000);
BEGIN
DBMS_TF.GET_ROW_SET(rowset);
str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;
```

## 170.9.13 SUPPORTED\_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

### Syntax

```
FUNCTION SUPPORTED_TYPE(
type_id PLS_INTEGER)
RETURN BOOLEAN;
```

### Parameters

**Table 170-25 DBMS\_TF.SUPPORTED\_TYPE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| type_id   | The type    |

### Return Values

Returns TRUE if the type\_id is a scalar supported by PUT\_COL and GET\_COL.

 **See Also:**

[Echo Polymorphic Table Function Example](#) for an example of DBMS\_TF.SUPPORTED\_TYPE use.

## 170.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

### Syntax

```
PROCEDURE TRACE(
 msg VARCHAR2,
 with_id BOOLEAN DEFAULT FALSE,
 separator VARCHAR2 DEFAULT NULL,
 prefix VARCHAR2 DEFAULT NULL);

PROCEDURE TRACE(
 rowset IN ROW_SET_T);

PROCEDURE TRACE(
 env IN ENV_T);

PROCEDURE TRACE(
 columns_new IN COLUMNS_NEW_T);

PROCEDURE trace(
 cols IN COLUMNS_T);

PROCEDURE trace(
 columns_with_type IN COLUMNS_WITH_TYPE_T);

PROCEDURE trace(
 tab IN TABLE_T);

PROCEDURE trace(
 col IN COLUMN_METADATA_T);
```

### Parameters

**Table 170-26 TRACE Procedure Parameters**

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| msg         | Custom user tracing message                                   |
| with_id     | Include the unique execution ID in the trace?                 |
| separator   | Specify a string to use to separate values                    |
| prefix      | Specify a string to prefix the actual values                  |
| rowset      | Data for a rowset                                             |
| env         | Metadata about the polymorphic table function execution state |
| columns_new | Collection for new columns                                    |

**Table 170-26 (Cont.) TRACE Procedure Parameters**

| Parameter         | Description                                                      |
|-------------------|------------------------------------------------------------------|
| cols              | Collection containing column names                               |
| columns_with_type | Collection containing columns metadata                           |
| tab               | Table descriptor                                                 |
| col               | Metadata about an existing table column or a new column produced |

**Example 170-18 DBMS\_TF.TRACE Example**

This example adds tracing to a fetch\_rows procedure.

```
PROCEDURE fetch_rows
AS
 rowset DBMS_TF.ROW_SET_T;
BEGIN
 DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);
 DBMS_TF.TRACE(rowset);
 DBMS_TF.GET_ROW_SET(rowset);
 DBMS_TF.TRACE(rowset);
 DBMS_TF.PUT_ROW_SET(rowset);
 DBMS_TF.TRACE(DBMS_TF.GET_ENV);
END;
```

### 170.9.15 XSTORE\_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

**Syntax**

```
PROCEDURE XSTORE_CLEAR;
```

### 170.9.16 XSTORE\_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

**Syntax**

```
FUNCTION XSTORE_EXISTS(
 key IN VARCHAR2,
 key_type IN PLS_INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

**Parameters**

**Table 170-27 DBMS\_TF.XSTORE\_EXISTS Function Parameters**

| Parameter | Description            |
|-----------|------------------------|
| key       | A unique character key |

**Table 170-27 (Cont.) DBMS\_TF.XSTORE\_EXISTS Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| key_type  | The type of key (optional). Default : NULL |

**Return Values**

Returns TRUE if the key has an associated value. When the key\_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key\_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

**See Also:**

[Table 170-6](#) for more information about supported key types.

## 170.9.17 XSTORE\_GET Procedure

You can use the XSTORE\_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 170-6](#) for more information about supported key types.

**Syntax**

```
PROCEDURE XSTORE_GET(
 key IN VARCHAR2,
 value IN OUT VARCHAR2);
```

```
PROCEDURE XSTORE_GET(
 key IN VARCHAR2,
 value IN OUT NUMBER);
```

```
PROCEDURE XSTORE_GET(
 key IN VARCHAR2,
 value IN OUT DATE);
```

```
PROCEDURE XSTORE_GET(
 key IN VARCHAR2,
 value IN OUT BOOLEAN);
```

## Parameters

**Table 170-28 DBMS\_TF.XSTORE\_GET Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| key       | A unique character key                             |
| value     | Value corresponding to the key for supported types |

## Usage Notes

If the key is not found, the value is unchanged.

### 170.9.17.1 Row\_num Polymorphic Table Function Example

The row\_num PTF example appends a sequence column to a table.

#### Example 170-19 Row\_num Polymorphic Table Function Example

 **Live SQL:**

You can view and run this example on Oracle Live SQL at [Row\\_num Polymorphic Table Function](#)

Create the PTF implementation package row\_num\_p.

The parameters are :

- tab - The input table
- ini - The initial value (Default = 1)
- inc - The amount to increment (Default = 1)

```
CREATE PACKAGE row_num_p IS
 FUNCTION describe(tab IN OUT dbms_tf.table_t,
 ini NUMBER DEFAULT 1,
 inc NUMBER DEFAULT 1)
 RETURN dbms_tf.describe_t;

 PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);
END;
```

This PTF accepts any input table and appends the sequence column ROW\_ID to the table. The sequence values start with the specified value (ini) and each time it is incremented by the specified value (inc).

```
CREATE PACKAGE BODY row_num_p IS
 FUNCTION describe(tab IN OUT dbms_tf.table_t,
 ini NUMBER DEFAULT 1,
 inc NUMBER DEFAULT 1)
 RETURN dbms_tf.describe_t AS
```

```

BEGIN
 RETURN dbms_tf.describe_t(new_columns =>
 dbms_tf.columns_new_t(1 =>
 dbms_tf.column_metadata_t(name => 'ROW_ID',
 TYPE => dbms_tf.type_number)));
END;

PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
 row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
 rid NUMBER := ini;
 col dbms_tf.tab_number_t;
BEGIN
 dbms_tf.xstore_get('rid', rid);
 FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
 dbms_tf.put_col(1, col);
 dbms_tf.xstore_set('rid', rid + inc*row_cnt);
END;

END;
```

Create a standalone polymorphic table function named `row_num`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is `row_num_p`.

```

CREATE FUNCTION row_num(tab TABLE,
 ini NUMBER DEFAULT 1,
 inc NUMBER DEFAULT 1)
 RETURN TABLE
PIPELINED TABLE POLYMORPHIC USING row_num_p;
```

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 1 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept);
```

| DEPTNO | DNAME      | LOC      | ROW_ID |
|--------|------------|----------|--------|
| 10     | ACCOUNTING | NEW YORK | 1      |
| 20     | RESEARCH   | DALLAS   | 2      |
| 30     | SALES      | CHICAGO  | 3      |
| 40     | OPERATIONS | BOSTON   | 4      |

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 100 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, 100);
```

| DEPTNO | DNAME      | LOC      | ROW_ID |
|--------|------------|----------|--------|
| 10     | ACCOUNTING | NEW YORK | 100    |
| 20     | RESEARCH   | DALLAS   | 101    |
| 30     | SALES      | CHICAGO  | 102    |
| 40     | OPERATIONS | BOSTON   | 103    |

The row\_num PTF invocation reporting from the SCOTT.DEPT table produces a new column ROW\_ID with value starting at 0 and decremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);
```

| DEPTNO | DNAME      | LOC      | ROW_ID |
|--------|------------|----------|--------|
| 10     | ACCOUNTING | NEW YORK | 0      |
| 20     | RESEARCH   | DALLAS   | -1     |
| 30     | SALES      | CHICAGO  | -2     |
| 40     | OPERATIONS | BOSTON   | -3     |

The row\_num PTF invocation reporting from the SCOTT.EMP table produces a new column ROW\_ID with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

```
SELECT deptno, ename, job, sal, row_id
FROM row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini =>
0, inc => 0.25)
WHERE deptno IN (10, 30);
```

| DEPTNO | ENAME  | JOB       | SAL  | ROW_ID |
|--------|--------|-----------|------|--------|
| 10     | CLARK  | MANAGER   | 2450 | 0      |
| 10     | KING   | PRESIDENT | 5000 | .25    |
| 10     | MILLER | CLERK     | 1300 | .5     |
| 30     | ALLEN  | SALESMAN  | 1600 | 0      |
| 30     | BLAKE  | MANAGER   | 2850 | .25    |
| 30     | JAMES  | CLERK     | 950  | .5     |
| 30     | MARTIN | SALESMAN  | 1250 | .75    |
| 30     | TURNER | SALESMAN  | 1500 | 1      |
| 30     | WARD   | SALESMAN  | 1250 | 1.25   |

## 170.9.18 XSTORE\_REMOVE Procedure

Removes an item associated with the given key and key\_type.

### Syntax

```
PROCEDURE XSTORE_REMOVE(
 key IN VARCHAR2,
 key_type IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 170-29 DBMS\_TF.XSTORE\_REMOVE Function Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| key       | A unique character key               |
| key_type  | The type of key to remove (optional) |

### Usage Notes

When a `key_type` parameter value is passed, it removes the associated item for the key and specified type of key.

## 170.9.19 XSTORE\_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store an item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

### Syntax

```
PROCEDURE XSTORE_SET (
 key IN VARCHAR2,
 value IN VARCHAR2);
```

```
PROCEDURE XSTORE_SET (
 key IN VARCHAR2,
 value IN NUMBER);
```

```
PROCEDURE XSTORE_SET (
 key IN VARCHAR2,
 value IN DATE);
```

```
PROCEDURE XSTORE_SET (
 key IN VARCHAR2,
 value IN BOOLEAN);
```

### Parameters

**Table 170-30** DBMS\_TF.XSTORE\_SET Procedure Parameters

| Parameter          | Description                                        |
|--------------------|----------------------------------------------------|
| <code>key</code>   | A unique character key                             |
| <code>value</code> | Value corresponding to the key for supported types |

### Usage Notes

If an item for a given key already exists, the value is replaced.

# DBMS\_TNS

The `DBMS_TNS` package provides the `RESOLVE_TNSNAME` function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- [DBMS\\_TNS Overview](#)
- [DBMS\\_TNS Security Model](#)
- [Summary of DBMS\\_TNS Subprograms](#)

## 171.1 DBMS\_TNS Overview

The `DBMS_TNS` package contains one function, `RESOLVE_TNSNAME`, which returns the resolved connect string from configured sources that have been defined in the `names.directory_path` parameter in the `sqlnet.ora` file.

The `RESOLVE_TNSNAME` function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

### See Also:

- *Oracle Database Administrator's Guide* for more information about finding database link information
- *Oracle Database Reference* for information about the `ALL_DB_LINKS` data dictionary view

## 171.2 DBMS\_TNS Security Model

You must be granted the `EXECUTE` privilege on the `DBMS_TNS` package.

## 171.3 Summary of DBMS\_TNS Subprograms

This table lists the DBMS\_TNS subprograms and briefly describes them.

**Table 171-1 DBMS\_TNS Parameters**

| Subprogram                               | Description                                                                                                                                                                            |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">RESOLVE_TNSNAME Function</a> | Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the <code>sqlnet.ora</code> <code>names.directory_path</code> parameter) |

### 171.3.1 RESOLVE\_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the `sqlnet.ora` `names.directory_path` parameter.

#### Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (
 tns_name VARCHAR2)
RETURN VARCHAR2;
```

#### RESOLVE\_TNSNAME Function Parameters

| Parameter             | Description                                      |
|-----------------------|--------------------------------------------------|
| <code>tns_name</code> | Database address for establishing the connection |

#### Usage Notes

- Database administrators and system management tools can explicitly call the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve a `tns_name`:
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve TNS names that were referred to by other data dictionary views such as `ALL_DB_LINKS` and `USER_DB_LINKS`. In addition, you can use it to find any TNS name entry in the `tnsnames.ora` file.

#### Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;
```

```
DB_LINK
```

```

```

```
DBMS_TNS.RESOLVE_TNSNAME(HOST)
```

```

US.EXAMPLE.COM
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=may))
(CONNECT_DATA=(SERVICE_NAME=us.example.com)(CID=(PROGRAM=oracle)
(HOST=juno)(USER=psmith))
))
```

# DBMS\_TRACE

The `DBMS_TRACE` package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Operational Notes](#)
- [Summary of DBMS\\_TRACE Subprograms](#)

## 172.1 DBMS\_TRACE Overview

`DBMS_TRACE` provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.  
Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.
2. Starting PL/SQL tracing in session (`DBMS_TRACE.SET_PLSQL_TRACE`).
3. Running an application to be traced.
4. Stopping PL/SQL tracing in session (`DBMS_TRACE.CLEAR_PLSQL_TRACE`).

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

## 172.2 DBMS\_TRACE Security Model

This package must be created under `sys`.

## 172.3 DBMS\_TRACE Constants

`DBMS_TRACE` defines constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 172-1 DBMS\_TRACE Event Constants**

| Name                        | Type    | Value | Description                                                                                                                                                                                                                                                                    |
|-----------------------------|---------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRACE_ALL_CALLS             | INTEGER | 1     | Traces calls or returns                                                                                                                                                                                                                                                        |
| TRACE_ENABLED_CALLS         | INTEGER | 2     |                                                                                                                                                                                                                                                                                |
| TRACE_ALL_EXCEPTIONS        | INTEGER | 4     | Traces exceptions                                                                                                                                                                                                                                                              |
| TRACE_ENABLED_EXCEPTIONS    | INTEGER | 8     | Traces exceptions and handlers                                                                                                                                                                                                                                                 |
| TRACE_LIMIT                 | INTEGER | 16    | Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag. |
| TRACE_ALL_SQL               | INTEGER | 32    | Traces SQL statements                                                                                                                                                                                                                                                          |
| TRACE_ENABLED_SQL           | INTEGER | 64    | Traces SQL statements at PL/SQL level. This does not invoke SQL Trace                                                                                                                                                                                                          |
| TRACE_ALL_LINES             | INTEGER | 128   | Traces each line                                                                                                                                                                                                                                                               |
| TRACE_ENABLED_LINES         | INTEGER | 256   |                                                                                                                                                                                                                                                                                |
| TRACE_PAUSE                 | INTEGER | 4096  | Pauses tracing                                                                                                                                                                                                                                                                 |
| TRACE_RESUME                | INTEGER | 8192  | Resume tracing                                                                                                                                                                                                                                                                 |
| TRACE_STOP                  | INTEGER | 16384 | Stops tracing                                                                                                                                                                                                                                                                  |
| NO_TRACE_ADMINISTRATIVE     | INTEGER | 32768 | Prevents tracing of 'administrative events such as <ul style="list-style-type: none"> <li>• PL/SQL Trace Tool started</li> <li>• Trace flags changed</li> <li>• PL/SQL Virtual Machine started</li> <li>• PL/SQL Virtual Machine stopped</li> </ul>                            |
| NO_TRACE_HANDLED_EXCEPTIONS | INTEGER | 65536 | Prevents tracing of handled exceptions                                                                                                                                                                                                                                         |

**Table 172-2 DBMS\_TRACE Version Constants**

| Name                | Type    | Value | Description |
|---------------------|---------|-------|-------------|
| TRACE_MINOR_VERSION | INTEGER | 0     |             |
| TRACE_MAJOR_VERSION | INTEGER | 1     |             |

Oracle recommends using the symbolic form for all these constants.

## 172.4 DBMS\_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

## 172.5 DBMS\_TRACE Operational Notes

Certain operational notes apply to DBMS\_TRACE.

These are described in the following sections:

- [Controlling Data Volume](#)
- [Creating Database Tables to Collect DBMS\\_TRACE Output](#)
- [Collecting Trace Data](#)
- [Collected Data](#)
- [Trace Control](#)

### Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

#### Note:

You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including TRACE\_LIMIT in the TRACE\_LEVEL parameter of the SET\_PLSQL\_TRACE procedure.

### Creating Database Tables to Collect DBMS\_TRACE Output

You must create database tables into which the DBMS\_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script TRACETAB.SQL. The tables this script creates are owned by SYS.

### Collecting Trace Data

The PL/SQL features you can trace are described in the script DBMSPBT.SQL. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS\_TRACE also allow pausing and resuming trace, and limiting the output.

### Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

### Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

### Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

### Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

 **Note:**

For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

### Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling `NO_TRACE_HANDLED_EXCEPTIONS` limits data collection to unhandled exceptions

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

### Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level  $n$  changes the record limit to  $1024 * n$ .

Enabling `NO_TRACE_ADMINISTRATIVE` prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.

## 172.6 Summary of DBMS\_TRACE Subprograms

This table lists the `DBMS_TRACE` subprograms and briefly describes them.

**Table 172-3 DBMS\_TRACE Package Subprograms**

| Subprogram                                  | Description                         |
|---------------------------------------------|-------------------------------------|
| <a href="#">CLEAR_PLSQL_TRACE Procedure</a> | Stops trace data dumping in session |

**Table 172-3 (Cont.) DBMS\_TRACE Package Subprograms**

| Subprogram                                     | Description                                  |
|------------------------------------------------|----------------------------------------------|
| <a href="#">GET_PLSQL_TRACE_LEVEL Function</a> | Gets the trace level                         |
| <a href="#">PLSQL_TRACE_VERSION Procedure</a>  | Gets the version number of the trace package |
| <a href="#">SET_PLSQL_TRACE Procedure</a>      | Starts tracing in the current session        |

### 172.6.1 CLEAR\_PLSQL\_TRACE Procedure

This procedure disables trace data collection.

#### Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

### 172.6.2 GET\_PLSQL\_TRACE\_LEVEL Function

This procedure returns the current trace level as the sum of one or more DBMS\_TRACE constants.

See [Table 172-1](#) for a list of the constants.

#### Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
RETURN BINARY_INTEGER;
```

### 172.6.3 PLSQL\_TRACE\_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS\_TRACE package.

#### Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (
 major OUT BINARY_INTEGER,
 minor OUT BINARY_INTEGER);
```

#### Parameters

**Table 172-4 PLSQL\_TRACE\_VERSION Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| major     | Major version number of DBMS_TRACE. |
| minor     | Minor version number of DBMS_TRACE. |

## 172.6.4 SET\_PLSQL\_TRACE Procedure

This procedure enables PL/SQL trace data collection.

### Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (
 trace_level INTEGER);
```

### Parameters

**Table 172-5** *SET\_PLSQL\_TRACE Procedure Parameters*

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trace_level | You must supply one or more of the constants as listed in <a href="#">Table 172-1</a> . By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants.<br><br>Also see <a href="#">DBMS_TRACE Operational Notes: Collecting Trace Data</a> for more information. |

# DBMS\_TRANSACTION

The DBMS\_TRANSACTION package provides access to SQL transaction statements from stored procedures.

## See Also:

*Oracle Database SQL Language Reference*

This chapter contains the following topics:

- [DBMS\\_TRANSACTION Security Model](#)
- [Summary of DBMS\\_TRANSACTION Subprograms](#)

## 173.1 DBMS\_TRANSACTION Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

## 173.2 Summary of DBMS\_TRANSACTION Subprograms

This table lists the DBMS\_TRANSACTION subprograms and briefly describes them.

**Table 173-1 DBMS\_TRANSACTION Package Subprograms**

| Subprogram                                    | Description                                                                   |
|-----------------------------------------------|-------------------------------------------------------------------------------|
| <a href="#">ADVISE_COMMIT Procedure</a>       | Equivalent to the SQL statement:<br>ALTER SESSION ADVISE COMMIT               |
| <a href="#">ADVISE_NOTHING Procedure</a>      | Equivalent to the SQL statement:<br>ALTER SESSION ADVISE NOTHING              |
| <a href="#">ADVISE_ROLLBACK Procedure</a>     | Equivalent to the SQL statement:<br>ALTER SESSION ADVISE ROLLBACK             |
| <a href="#">COMMIT Procedure</a>              | Equivalent to the SQL statement:<br>COMMIT                                    |
| <a href="#">COMMIT_COMMENT Procedure</a>      | Equivalent to the SQL statement:<br>COMMIT COMMENT <text>                     |
| <a href="#">COMMIT_FORCE Procedure</a>        | Equivalent to the SQL statement:<br>COMMIT FORCE <text>, <number>"            |
| <a href="#">LOCAL_TRANSACTION_ID Function</a> | Returns the local (to instance) unique identifier for the current transaction |

**Table 173-1 (Cont.) DBMS\_TRANSACTION Package Subprograms**

| Subprogram                                     | Description                                                                                                                                  |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PURGE_LOST_DB_ENTRY Procedure</a>  | Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes |
| <a href="#">PURGE_MIXED Procedure</a>          | Deletes information about a given mixed outcome transaction                                                                                  |
| <a href="#">READ_ONLY Procedure</a>            | Equivalent to the SQL statement:<br>SET TRANSACTION READ ONLY                                                                                |
| <a href="#">READ_WRITE Procedure</a>           | equivalent to the SQL statement:<br>SET TRANSACTION READ WRITE                                                                               |
| <a href="#">ROLLBACK Procedure</a>             | Equivalent to the SQL statement:<br>ROLLBACK                                                                                                 |
| <a href="#">ROLLBACK_FORCE Procedure</a>       | Equivalent to the SQL statement:<br>ROLLBACK FORCE <text>                                                                                    |
| <a href="#">ROLLBACK_SAVEPOINT Procedure</a>   | Equivalent to the SQL statement:<br>ROLLBACK TO SAVEPOINT<br><savepoint_name>                                                                |
| <a href="#">SAVEPOINT Procedure</a>            | Equivalent to the SQL statement:<br>SAVEPOINT <savepoint_name>                                                                               |

## 173.2.1 ADVISE\_COMMIT Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT

### Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

## 173.2.2 ADVISE\_NOTHING Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING

### Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

## 173.2.3 ADVISE\_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK

### Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

## 173.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.COMMIT;
```

## 173.2.5 COMMIT\_COMMENT Procedure

This procedure is equivalent to the SQL statement: COMMIT COMMENT <text>

### Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (
 cmnt VARCHAR2);
```

### Parameters

**Table 173-2 COMMIT\_COMMENT Procedure Parameters**

| Parameter | Description                            |
|-----------|----------------------------------------|
| cmnt      | Comment to associate with this commit. |

## 173.2.6 COMMIT\_FORCE Procedure

This procedure is equivalent to the SQL statement: COMMIT FORCE <text>, <number>"

### Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
 xid VARCHAR2,
 scn VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 173-3 COMMIT\_FORCE Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| xid       | Local or global transaction ID. |
| scn       | System change number.           |

## 173.2.7 LOCAL\_TRANSACTION\_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

### Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
 create_transaction BOOLEAN := FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 173-4 LOCAL\_TRANSACTION\_ID Function Parameters**

| Parameter          | Description                                                       |
|--------------------|-------------------------------------------------------------------|
| create_transaction | If true, then start a transaction if one is not currently active. |

## 173.2.8 PURGE\_LOST\_DB\_ENTRY Procedure

Procedure PURGE\_LOST\_DB\_ENTRY purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in DBA\_2PC\_PENDING and associated tables are never removed, and recovery will periodically retry. Procedure PURGE\_LOST\_DB\_ENTRY enables removal of such transactions from the local site.

### Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
 xid VARCHAR2);
```

### Parameters

**Table 173-5 PURGE\_LOST\_DB\_ENTRY Procedure Parameters**

| Parameter | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| xid       | Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table. |

### Usage Notes

 **WARNING:**

PURGE\_LOST\_DB\_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA\_2PC\_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE\_LOST\_DB\_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

**Table 173-6 PURGE\_LOST\_DB\_ENTRY Procedure States**

| State of Column         | State of Global Transaction | State of Local Transaction | Normal DBA Action | Alternative DBA Action           |
|-------------------------|-----------------------------|----------------------------|-------------------|----------------------------------|
| Collecting              | Rolled back                 | Rolled back                | None              | PURGE_LOST_DB_ENTRY (See Note 1) |
| Committed               | Committed                   | Committed                  | None              | PURGE_LOST_DB_ENTRY (See Note 1) |
| Prepared                | Unknown                     | Prepared                   | None              | FORCE COMMIT or ROLLBACK         |
| Forced commit           | Unknown                     | Committed                  | None              | PURGE_LOST_DB_ENTRY (See Note 1) |
| Forced rollback         | Unknown                     | Rolled back                | None              | PURGE_LOST_DB_ENTRY (See Note 1) |
| Forced commit (mixed)   | Mixed                       | Committed                  | (See Note 2)      |                                  |
| Forced rollback (mixed) | Mixed                       | Rolled back                | (See Note 2)      |                                  |

 **Note:**

Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

**Note:**

Examine and take any manual action to remove inconsistencies; then use the procedure `PURGE_MIXED`.

## 173.2.9 PURGE\_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

### Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
 xid VARCHAR2);
```

### Parameters

**Table 173-7 PURGE\_MIXED Procedure Parameters**

| Parameter | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| xid       | Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table. |

## 173.2.10 READ\_ONLY Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION READ ONLY`.

### Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

## 173.2.11 READ\_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

### Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

## 173.2.12 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

## 173.2.13 ROLLBACK\_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (
 xid VARCHAR2);
```

### Parameters

**Table 173-8 ROLLBACK\_FORCE Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| xid       | Local or global transaction ID. |

## 173.2.14 ROLLBACK\_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
 savept VARCHAR2);
```

### Parameters

**Table 173-9 ROLLBACK\_SAVEPOINT Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| savept    | Savepoint identifier. |

## 173.2.15 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
 savept VARCHAR2);
```

### Parameters

**Table 173-10** SAVEPOINT Procedure Parameters

| Parameter | Description           |
|-----------|-----------------------|
| savept    | Savepoint identifier. |

## 173.2.16 STEP\_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

### Syntax

```
DBMS_TRANSACTION.STEP_ID
 RETURN NUMBER;
```

## 173.2.17 USE\_ROLLBACK\_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`.

### Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
 rb_name VARCHAR2);
```

### Parameters

**Table 173-11** USE\_ROLLBACK\_SEGMENT Procedure Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| rb_name   | Name of rollback segment to use. |

# DBMS\_TRANSFORM

The `DBMS_TRANSFORM` package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- [Summary of DBMS\\_TRANSFORM Subprograms](#)

## See Also:

*Oracle Database Advanced Queuing User's Guide* for more on message format transformations.

## 174.1 Summary of DBMS\_TRANSFORM Subprograms

This table lists the `DBMS_TRANSFORM` subprograms and briefly describes them.

**Table 174-1 DBMS\_TRANSFORM Package Subprograms**

| Subprograms                                     | Description                                                                                          |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <a href="#">CREATE_TRANSFORMATION Procedure</a> | Creates a transformation that maps an object of the source type to an object of the destination type |
| <a href="#">DROP_TRANSFORMATION Procedure</a>   | Drops the given transformation                                                                       |
| <a href="#">MODIFY_TRANSFORMATION Procedure</a> | Modifies an existing transformation                                                                  |

### 174.1.1 CREATE\_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

#### Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
 schema VARCHAR2(30),
 name VARCHAR2(30),
 from_schema VARCHAR2(30),
 from_type VARCHAR2(30),
 to_schema VARCHAR2(30),
 to_type VARCHAR2(30),
 transformation VARCHAR2(4000));
```

## Parameters

**Table 174-2 CREATE\_TRANSFORM Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema         | Specifies the schema of the transformation.                                                                                                                                                                                                                                                                                                                        |
| name           | Specifies the name of the transformation.                                                                                                                                                                                                                                                                                                                          |
| from_schema    | Specifies the schema of the source type.                                                                                                                                                                                                                                                                                                                           |
| from_type      | Specifies the source type.                                                                                                                                                                                                                                                                                                                                         |
| to_schema      | Specifies the target type schema.                                                                                                                                                                                                                                                                                                                                  |
| to_type        | Specifies the target type.                                                                                                                                                                                                                                                                                                                                         |
| transformation | Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORM. |

## Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS\_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user\_data*.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

## 174.1.2 DROP\_TRANSFORM Procedure

This procedure drops the given transformation.

### Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORM (
 schema VARCHAR2(30),
```

```
name VARCHAR2(30);
```

## Parameters

**Table 174-3 DROP\_TRANSFORMATION Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| schema    | Specifies the schema of the transformation. |
| name      | Specifies the name of the transformation.   |

## 174.1.3 MODIFY\_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

### Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
 schema VARCHAR2(30),
 name VARCHAR2(30),
 attribute_number INTEGER,
 transformation VARCHAR2(4000));
```

## Parameters

**Table 174-4 MODIFY\_TRANSFORMATION Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema           | Specifies the schema of the transformation.                                                                                                                                                                                                                                                                       |
| name             | Specifies the name of the transformation.                                                                                                                                                                                                                                                                         |
| attribute_number | The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.                                                                                                          |
| transformation   | The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type. |

### Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute\_number of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

# DBMS\_TSDP\_MANAGE

The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

`DBMS_TSDP_MANAGE` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_TSDP\\_MANAGE Subprograms](#)

## Related Topics

- [DBMS\\_TSDP\\_PROTECT](#)  
The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

### See Also:

*Oracle Database Security Guide*

## 175.1 DBMS\_TSDP\_MANAGE Overview

The `DBMS_TSDP_MANAGE` package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the [DBMS\\_TSDP\\_PROTECT](#) package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

## 175.2 DBMS\_TSDP\_MANAGE Security Model

All procedures are executed with invoker's rights. The `DBMS_TSDP_MANAGE` package is owned by `SYS`.

The `EXECUTE` privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the `EXECUTE` privilege for this package, while the `DBMS_TSDP_PROTECT` package would be governed by a security administrator.

## 175.3 Summary of DBMS\_TSDP\_MANAGE Subprograms

This table lists the `DBMS_TSDP_MANAGE` subprograms and briefly describes them.

**Table 175-1 DBMS\_TSDP\_MANAGE Package Subprograms**

| Subprogram                                        | Description                                                                                                                                             |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ADD_SENSITIVE_COLUMN Procedure</code>       | Adds a column to the sensitive column list                                                                                                              |
| <code>ADD_SENSITIVE_TYPE Procedure</code>         | Creates and adds a sensitive column type to the list of sensitive column types in the database                                                          |
| <code>ALTER_SENSITIVE_COLUMN Procedure</code>     | Alters the sensitive type and/or the comment of a column in the sensitive column list.                                                                  |
| <code>DROP_SENSITIVE_COLUMN Procedure</code>      | Removes columns from the sensitive column list                                                                                                          |
| <code>DROP_SENSITIVE_TYPE Procedure</code>        | Drops a sensitive column type from the list sensitive column types in the database                                                                      |
| <code>DROP_SENSITIVE_TYPE_SOURCE Procedure</code> | Drops sensitive column types corresponding to a source from the list sensitive column types in the database                                             |
| <code>IMPORT_DISCOVERY_RESULT Procedure</code>    | Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance |
| <code>IMPORT_SENSITIVE_TYPES Procedure</code>     | Imports a list of sensitive column types from a source                                                                                                  |
| <code>REMOVE_DISCOVERY_RESULT Procedure</code>    | Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.                    |

### 175.3.1 ADD\_SENSITIVE\_COLUMN Procedure

This procedure adds a column to the sensitive column list.

#### Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
 schema_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 sensitive_type IN VARCHAR2,
 user_comment IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 175-2** *ADD\_SENSITIVE\_COLUMN Procedure Parameters*

| Parameter      | Description                                 |
|----------------|---------------------------------------------|
| schema_name    | Schema to which the column belongs          |
| table_name     | Table containing the column                 |
| column_name    | Sensitive column name                       |
| sensitive_type | Identifier of the sensitive column type     |
| user_comment   | User comment regarding the sensitive column |

## Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
 schema_name => 'SCOTT',
 table_name => 'EMP',
 column_name => 'SAL',
 sensitive_type => 'SALARY_TYPE',
 user_comment => 'Salary column');
```

## 175.3.2 ALTER\_SENSITIVE\_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

## Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
 schema_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 sensitive_type IN VARCHAR2,
 user_comment IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 175-3** *ALTER\_SENSITIVE\_COLUMN Procedure Parameters*

| Parameter      | Description                                 |
|----------------|---------------------------------------------|
| schema_name    | Schema to which the column belongs          |
| table_name     | Table containing the column                 |
| column_name    | Sensitive column name                       |
| sensitive_type | Identifier of the sensitive column type     |
| user_comment   | User comment regarding the sensitive column |

## Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
 schema_name => 'SCOTT',
 table_name => 'EMP',
 column_name => 'SAL',
 sensitive_type => 'FINANCE_Type',
 user_comment => 'Finance Type. Earlier categorized as Salary Type');
```

### 175.3.3 ADD\_SENSITIVE\_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

#### Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
 sensitive_type IN VARCHAR2,
 user_comment IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 175-4 ADD\_SENSITIVE\_TYPE Procedure Parameters**

| Parameter      | Description                                 |
|----------------|---------------------------------------------|
| sensitive_type | Name of the sensitive column type           |
| user_comment   | User comment regarding the sensitive column |

#### Examples

Add a sensitive column type called SALARY\_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
 sensitive_type => 'SALARY_TYPE',
 user_comment => 'Salary data');
```

### 175.3.4 DROP\_SENSITIVE\_COLUMN Procedure

This procedure removes columns from the sensitive column list.

#### Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
 schema_name IN VARCHAR2 DEFAULT '%',
 table_name IN VARCHAR2 DEFAULT '%',
 column_name IN VARCHAR2 DEFAULT '%');
```

#### Parameters

**Table 175-5 DROP\_SENSITIVE\_COLUMN Procedure Parameters**

| Parameter   | Description                        |
|-------------|------------------------------------|
| schema_name | Schema to which the column belongs |
| table_name  | Table containing the column        |

**Table 175-5 (Cont.) DROP\_SENSITIVE\_COLUMN Procedure Parameters**

| Parameter   | Description           |
|-------------|-----------------------|
| column_name | Sensitive column name |

### Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
 schema_name => 'SCOTT',
 table_name => 'EMP',
 column_name => 'SAL');
```

## 175.3.5 DROP\_SENSITIVE\_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

### Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
 sensitive_type IN VARCHAR2);
```

### Parameters

**Table 175-6 DROP\_SENSITIVE\_TYPE Procedure Parameters**

| Parameter      | Description                                     |
|----------------|-------------------------------------------------|
| sensitive_type | Name of the sensitive column type to be dropped |

### Examples

To drop SALARY\_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
 sensitive_type => 'SALARY_TYPE');
```

## 175.3.6 DROP\_SENSITIVE\_TYPE\_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

### Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
 source IN VARCHAR2);
```

## Parameters

**Table 175-7** *DROP\_SENSITIVE\_TYPE\_SOURCE Procedure Parameters*

| Parameter | Description        |
|-----------|--------------------|
| source    | Name of the source |

## Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM\_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
 source => 'ADM_DEMO');
```

## 175.3.7 IMPORT\_DISCOVERY\_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

### Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
 discovery_result IN CLOB,
 discovery_source IN VARCHAR2,
 force IN FORCE DEFAULT FALSE);
```

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
 discovery_result IN XMLTYPE,
 discovery_source IN VARCHAR2,
 force IN FORCE DEFAULT FALSE);
```

## Parameters

**Table 175-8** *IMPORT\_DISCOVERY\_RESULT Procedure Parameters*

| Parameter        | Description                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| discovery_result | List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB). |
| discovery_source | Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name. |

**Table 175-8 (Cont.) IMPORT\_DISCOVERY\_RESULT Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force     | <p>Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source.</p> <ul style="list-style-type: none"> <li>FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported.</li> <li>TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result</li> </ul> |

### Examples

Import the list of sensitive columns of ADM instance, ADM\_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
 discovery_results => xml_adm_result,
 discovery_source => 'ADM_Demo');
```

## 175.3.8 IMPORT\_SENSITIVE\_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

### Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
 sensitive_types IN CLOB,
 source IN VARCHAR2);
```

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
 sensitive_types IN XMLTYPE,
 source IN VARCHAR2);
```

### Parameters

**Table 175-9 IMPORT\_SENSITIVE\_TYPES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sensitive_types | List of sensitive column types in XML Format (possibly as a CLOB)                                                                                                                                                       |
| source          | Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name. |

### Examples

Import the list of sensitive column types of ADM instance, ADM\_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
 sensitive_types => xml_adm_result,
 source => 'ADM_Demo');
```

## 175.3.9 REMOVE\_DISCOVERY\_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

### Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
 discovery_source IN VARCHAR2);
```

### Parameters

**Table 175-10** REMOVE\_DISCOVERY\_RESULT Procedure Parameters

| Parameter        | Description                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------|
| discovery_source | Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed. |

### Examples

Remove the sensitive columns corresponding to ADM instance, ADM\_Demo:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
 discovery_source => 'ADM_Demo');
```

# DBMS\_TSDP\_PROTECT

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

`DBMS_TSDP_PROTECT` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS\\_TSDP\\_PROTECT Subprograms](#)

## Related Topics

- [DBMS\\_TSDP\\_MANAGE](#)  
The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

### See Also:

*Oracle Database Security Guide*

## 176.1 DBMS\_TSDP\_PROTECT Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the `DBMS_TSDP_MANAGE` package.

## 176.2 DBMS\_TSDP\_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.

## 176.3 DBMS\_TSDP\_PROTECT Constants

DBMS\_TSDP\_PROTECT defines the TSDP\_PARAM\_MAX constant for use when specifying parameter values.

This constant is described in the following table.

**Table 176-1 DBMS\_TSDP\_PROTECT Constants - Compression Types**

| Constant       | Type    | Value | Description                                                                    |
|----------------|---------|-------|--------------------------------------------------------------------------------|
| TSDP_PARAM_MAX | INTEGER | 4000  | Maximum length of the parameter value that can be specified in FEATURE_OPTIONS |

## 176.4 DBMS\_TSDP\_PROTECT Data Structures

The DBMS\_TSDP\_PROTECT package defines two TABLE types.

### Table Types

- [FEATURE\\_OPTIONS Table Type](#)
- [POLICY\\_CONDITIONS Table Type](#)

### 176.4.1 FEATURE\_OPTIONS Table Type

The following type is an associative array of VARCHAR2(TSDP\_PARAM\_MAX) that is indexed by VARCHAR2(M\_IDEN).

#### Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY VARCHAR2(M_IDEN);
```

### 176.4.2 POLICY\_CONDITIONS Table Type

The following type is an associative array of VARCHAR2(TSDP\_PARAM\_MAX) that is indexed by PLS\_INTEGER.

#### Syntax

```
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2(TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

## 176.5 Summary of DBMS\_TSDP\_PROTECT Subprograms

This table lists the DBMS\_TSDP\_PROTECT subprograms and briefly describes them.

**Table 176-2 DBMS\_TSDP\_PROTECT Package Subprograms**

| Subprogram                                          | Description                                                                |
|-----------------------------------------------------|----------------------------------------------------------------------------|
| <a href="#">ADD_POLICY Procedure</a>                | Creates a TSDP policy                                                      |
| <a href="#">ALTER_POLICY Procedure</a>              | Alters a TSDP policy                                                       |
| <a href="#">ASSOCIATE_POLICY Procedure</a>          | Associates or disassociates a TSDP policy with a sensitive column type     |
| <a href="#">DISABLE_PROTECTION_COLUMN Procedure</a> | Disables protection for columns                                            |
| <a href="#">DISABLE_PROTECTION_SOURCE Procedure</a> | Disables protection based on the source of truth for the sensitive columns |
| <a href="#">DISABLE_PROTECTION_TYPE Procedure</a>   | Disables protection for a sensitive column type                            |

## 176.5.1 ADD\_POLICY Procedure

This procedure creates a TSDP policy.

### Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
 policy_name IN VARCHAR2,
 security_feature IN PLS_INTEGER,
 policy_enable_options IN FEATURE_OPTIONS,
 policy_apply_condition IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

### Parameters

**Table 176-3 ADD\_POLICY Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| policy_name      | Name of the policy being created. The maximum length for this identifier is M_IDEN. This follows the Oracle naming convention.                                                                                                                                                                                                |
| security_feature | Oracle security feature with which the policy is associated.<br>Allowed values: <ul style="list-style-type: none"> <li>DBMS_TSDP_PROTECT.REDACT</li> <li>DBMS_TSDP_PROTECT.VPD</li> <li>DBMS_TSDP_PROTECT.UNIFIED_AUDIT</li> <li>DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT</li> <li>DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION</li> </ul> |

**Table 176-3 (Cont.) ADD\_POLICY Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| policy_enable_options  | Initialized with the parameter-value pairs corresponding to the security_feature setting                                                                                                                                                                                                                                                                                                                                                                                                                                |
| policy_apply_condition | <p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).</p> <p>Example: example_policy_condition(Property)=property_value. Permissible values for Property:</p> <ul style="list-style-type: none"> <li>• DBMS_TSDP_PROPERTY.DATATYPE</li> <li>• DBMS_TSDP_PROPERTY.LENGTH</li> <li>• DBMS_TSDP_PROPERTY.PARENT_SCHEMA</li> <li>• DBMS_TSDP_PROPERTY.PARENT_TABLE</li> </ul> |

### Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

### Examples

Create a policy PARTIAL\_MASK\_POLICY:

```

DECLARE
 redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
 policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
 redact_feature_options ('expression') :=
 'SYS_CONTEXT(''USERENV'', ''SESSION_USER'') = ''APPUSER''';
 redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
 redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV, VVVVVVVVV,
*, 1, 6';
 policy_conditions(DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
 DBMS_TSDP_PROTECT.ADD_POLICY
 ('PARTIAL_MASK_POLICY', DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
policy_conditions);
END;

```

## 176.5.2 ALTER\_POLICY Procedure

This procedure alters an existing TDSP policy

### Syntax

```

DBMS_TSDP_PROTECT.ALTER_POLICY (
 policy_name IN VARCHAR2,
 policy_enable_options IN FEATURE_OPTIONS,
 policy_apply_condition IN POLICY_CONDITION default TSDP$default_condition);

```

## Parameters

**Table 176-4 ALTER\_POLICY Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| policy_name            | Name of the policy to alter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| policy_enable_options  | Initialized with the parameter-value pairs corresponding to the security feature                                                                                                                                                                                                                                                                                                                                                                                                                                |
| policy_apply_condition | <p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).</p> <p>Example: example_policy_condition(Property)=property_value. Permissible values for Property:</p> <ul style="list-style-type: none"> <li>DBMS_TSDP_PROPERTY.DATATYPE</li> <li>DBMS_TSDP_PROPERTY.LENGTH</li> <li>DBMS_TSDP_PROPERTY.PARENT_SCHEMA</li> <li>DBMS_TSDP_PROPERTY.PARENT_TABLE</li> </ul> |

## Usage Notes

- If the policy\_apply\_condition matches an existing condition for the policy, then the corresponding enable options are updated with policy\_enable\_options.
- If the policy\_apply\_condition does not match any existing condition for the policy, the combination of policy\_enable\_options and policy\_apply\_condition is added to the policy.

## Examples

Add a new combination of policy\_apply\_condition and policy\_enable\_options to an existing policy PARTIAL\_MASK\_POLICY:

```

DECLARE
 redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
 policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
 redact_feature_options ('expression') :=
 'SYS_CONTEXT(''USERENV'', ''SESSION_USER'')='''APPUSER''';
 redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
 redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV, VVVVVVVVV,
*,
 1, 6';
 policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
 DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY',
redact_feature_options, policy_conditions);
END;

```

## 176.5.3 ASSOCIATE\_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

### Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
 policy_name IN VARCHAR2,
 sensitive_type IN VARCHAR2,
 associate IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 176-5 ASSOCIATE\_POLICY Procedure Parameters**

| Parameter      | Description                                       |
|----------------|---------------------------------------------------|
| policy_name    | Name of the TDSP policy                           |
| sensitive_type | Name of the sensitive column type:                |
| associate      | Associate or Disassociate. TRUE implies Associate |

### Usage Notes

Both the policy and the sensitive column type should exist in the database.

### Examples

Associate PARTIAL\_MASK\_POLICY with SSN\_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

## 176.5.4 DISABLE\_PROTECTION\_COLUMN Procedure

This procedure disables protection for columns.

### Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (
 schema_name IN VARCHAR2 DEFAULT '%',
 table_name IN VARCHAR2 DEFAULT '%',
 column_name IN VARCHAR2 DEFAULT '%',
 policy_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 176-6 DISABLE\_PROTECTION\_COLUMN Procedure Parameters**

| Parameter   | Description                              |
|-------------|------------------------------------------|
| schema_name | Name of the schema containing the column |
| table_name  | Table containing the column              |
| column_name | Column name                              |

**Table 176-6 (Cont.) DISABLE\_PROTECTION\_COLUMN Procedure Parameters**

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| policy_name | Optional policy name. If given, only this policy is disabled. |

**Examples**

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

## 176.5.5 DISABLE\_PROTECTION\_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

**Syntax**

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
 discovery_sourcename IN VARCHAR2);
```

**Parameters****Table 176-7 DISABLE\_PROTECTION\_SOURCE Procedure Parameters**

| Parameter            | Description                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------|
| discovery_sourcename | Name of the discovery source. This could be the Application Data Model (ADM) name or the database user. |

**Examples**

Disable protection for all columns corresponding to ADM\_Demo:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

## 176.5.6 DISABLE\_PROTECTION\_TYPE Procedure

This procedure disables protection for a sensitive column type.

**Syntax**

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
 sensitive_type IN VARCHAR2);
```

**Parameters****Table 176-8 DISABLE\_PROTECTION\_TYPE Procedure Parameters**

| Parameter      | Description                       |
|----------------|-----------------------------------|
| sensitive_type | Name of the sensitive column type |

## Examples

Disable protection for all columns identified by `SSN_TYPE`:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

## 176.5.7 DROP\_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable\_options combinations.

### Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (
 policy_name IN VARCHAR2,
 policy_apply_condition IN POLICY_CONDITIONS);

DBMS_TSDP_PROTECT.DROP_POLICY (
 policy_name IN VARCHAR2);
```

### Parameters

**Table 176-9** *DROP\_POLICY Procedure Parameters*

| Parameter                           | Description                                   |
|-------------------------------------|-----------------------------------------------|
| <code>policy_name</code>            | Name of the policy to drop                    |
| <code>policy_apply_condition</code> | To be initialized with the relevant condition |

### Usage Notes

- The combination of `policy_conditions` and `policy_enable_options` can be dropped from a TSDP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable\_options combination that is being dropped is the last condition-enable\_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

## Examples

Dropping the condition-enable\_options combination based on a specific condition:

```
DECLARE
 policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
 policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
 DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;
```

The default condition-enable\_options combination can be dropped by passing an empty associative array of type DBMS\_TSDP\_PROTECT.POLICY\_CONDITIONS for the policy\_apply\_condition parameter:

```
DECLARE
 policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
 DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;
```

Dropping a TSDP policy:

```
BEGIN
 DBMS_TSDP_PROTECT.DROP_POLICY(
 policy_name => 'PARTIAL_MASK_POLICY');
END;
```

## 176.5.8 ENABLE\_PROTECTION\_COLUMN Procedure

This procedure enables protection for columns.

### Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
 schema_name IN VARCHAR2 DEFAULT '%',
 table_name IN VARCHAR2 DEFAULT '%',
 column_name IN VARCHAR2 DEFAULT '%',
 policy_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 176-10** *ENABLE\_PROTECTION\_COLUMN Procedure Parameters*

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| schema_name | Name of the schema containing the column                     |
| table_name  | Table containing the column                                  |
| column_name | Column name                                                  |
| policy_name | Optional policy name. If given, only this policy is enabled. |

### Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema\_name, table\_name and column\_name. AND semantics is followed.

### Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

## 176.5.9 ENABLE\_PROTECTION\_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

### Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
 discovery_sourcename IN VARCHAR2);
```

### Parameters

**Table 176-11** *ENABLE\_PROTECTION\_SOURCE Procedure Parameters*

| Parameter            | Description                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------|
| discovery_sourcename | Name of the discovery source. This could be the Application Data Model (ADM) name or the database user. |

### Examples

Enable protection for all columns corresponding to ADM\_Demo:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

## 176.5.10 ENABLE\_PROTECTION\_TYPE Procedure

This procedure enables protection for a sensitive column type.

### Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (
 sensitive_type IN VARCHAR2);
```

### Parameters

**Table 176-12** *ENABLE\_PROTECTION\_TYPE Procedure Parameters*

| Parameter      | Description                       |
|----------------|-----------------------------------|
| sensitive_type | Name of the sensitive column type |

### Examples

Enable protection for all columns identified by SSN\_TYPE:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

# DBMS\_TTS

The DBMS\_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view TRANSPORT\_SET\_VIOLATIONS.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of DBMS\\_TTS Subprograms](#)

## See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

## 177.1 DBMS\_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

## 177.2 DBMS\_TTS Exceptions

The DBMS\_TTS package creates exceptions for missing or invalid transportable tablespaces.

```
ts_not_found EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

## 177.3 DBMS\_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

## 177.4 Summary of DBMS\_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

**Table 177-1 DBMS\_TTS Package Subprograms**

| Subprogram                                    | Description                                                          |
|-----------------------------------------------|----------------------------------------------------------------------|
| <a href="#">DOWNGRADE Procedure</a>           | Downgrades transportable tablespace-related data                     |
| <a href="#">TRANSPORT_SET_CHECK Procedure</a> | Checks if a set of tablespaces (to be transported) is self-contained |

### 177.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

#### Syntax

```
DBMS_TTS.DOWNGRADE;
```

### 177.4.2 TRANSPORT\_SET\_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

#### Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
 ts_list IN CLOB,
 incl_constraints IN BOOLEAN DEFAULT FALSE,
 full_check IN BOOLEAN DEFAULT FALSE);
```

#### Parameters

**Table 177-2 TRANSPORT\_SET\_CHECK Procedure Parameters**

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| ts_list   | List of one or more tablespaces, separated by comma. |

**Table 177-2 (Cont.) TRANSPORT\_SET\_CHECK Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>incl_constraints</code> | TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The <code>incl_constraints</code> parameter is a default so that <code>TRANSPORT_SET_CHECK</code> will work if it is called with only the <code>ts_list</code> argument.)                                                                                                            |
| <code>full_check</code>       | Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations. |

### Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

# DBMS\_TYPES

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)

## 178.1 DBMS\_TYPES Constants

The `DBMS_TYPES` package defines several constants to use when specifying parameter values.

These constants are listed in following table .

**Table 178-1** *DBMS\_TYPES Constants*

| Constant                              | Description                                                                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>NO_DATA</code>                  | Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed |
| <code>SUCCESS</code>                  | The operation succeeded                                                                                                                                      |
| <code>TYPECODE_BDOUBLE</code>         | A NUMBER type                                                                                                                                                |
| <code>TYPECODE_BFILE</code>           | A BFILE type                                                                                                                                                 |
| <code>TYPECODE_BFLOAT</code>          | A NUMBER type                                                                                                                                                |
| <code>TYPECODE_BLOB</code>            | A BLOB type                                                                                                                                                  |
| <code>TYPECODE_CFILE</code>           | A CFILE type                                                                                                                                                 |
| <code>TYPECODE_CHAR</code>            | A CHAR type                                                                                                                                                  |
| <code>TYPECODE_CLOB</code>            | A CLOB type                                                                                                                                                  |
| <code>TYPECODE_DATE</code>            | A DATE type                                                                                                                                                  |
| <code>TYPECODE_INTERVAL_DS</code>     | An INTERVAL_DS type                                                                                                                                          |
| <code>TYPECODE_INTERVAL_YM</code>     | A INTERVAL_YM type                                                                                                                                           |
| <code>TYPECODE_MLSLABEL</code>        | An MLSLABEL type                                                                                                                                             |
| <code>TYPECODE_NAMEDCOLLECTION</code> | A named collection (VARRAY/nested table) type                                                                                                                |
| <code>TYPECODE_NCHAR</code>           | A NCHAR type                                                                                                                                                 |
| <code>TYPECODE_NCLOB</code>           | A NCLOB type                                                                                                                                                 |
| <code>TYPECODE_NUMBER</code>          | A NUMBER type                                                                                                                                                |
| <code>TYPECODE_NVARCHAR2</code>       | A NVARCHAR2 type                                                                                                                                             |
| <code>TYPECODE_OBJECT</code>          | An OBJECT type                                                                                                                                               |

**Table 178-1 (Cont.) DBMS\_TYPES Constants**

| Constant               | Description                    |
|------------------------|--------------------------------|
| TYPECODE_OPAQUE        | An OPAQUE type                 |
| TYPECODE_RAW           | A RAW type                     |
| TYPECODE_REF           | A REF type                     |
| TYPECODE_TABLE         | A nested table collection type |
| TYPECODE_TIMESTAMP     | A TIMESTAMP type               |
| TYPECODE_TIMESTAMP_LTZ | A TIMESTAMP_LTZ type           |
| TYPECODE_TIMESTAMP_TZ  | A TIMESTAMP_TZ type            |
| TYPECODE_UROWID        | A UROWID type                  |
| TYPECODE_VARCHAR2      | A VARCHAR2 type                |
| TYPECODE_VARCHAR       | A VARCHAR type                 |
| TYPECODE_VARRAY        | A VARRAY collection type       |

## 178.2 DBMS\_TYPES Exceptions

DBMS\_TYPES throws these exceptions.

- INVALID\_PARAMETERS
- INCORRECT\_USAGE
- TYPE\_MISMATCH

# DBMS\_UMF

The `DBMS_UMF` package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

## See Also:

*Oracle Database Performance Tuning Guide* for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- [Summary of DBMS\\_UMF Subprograms](#)

## 179.1 Summary of DBMS\_UMF Subprograms

This topic lists the `DBMS_UMF` subprograms in alphabetical order and briefly describes them.

**Table 179-1 DBMS\_UMF Package Subprograms**

| Subprogram                                       | Description                                                       |
|--------------------------------------------------|-------------------------------------------------------------------|
| <a href="#">CONFIGURE_NODE Procedure</a>         | Configures a node in the RMF topology                             |
| <a href="#">CREATE_LINK Procedure</a>            | Creates a database link between two nodes in the RMF topology     |
| <a href="#">CREATE_TOPOLOGY Procedure</a>        | Creates the RMF topology                                          |
| <a href="#">DROP_LINK Procedure</a>              | Removes a database link between two nodes in the RMF topology     |
| <a href="#">DROP_TOPOLOGY Procedure</a>          | Deletes the RMF topology                                          |
| <a href="#">ENABLE_SERVICE Procedure</a>         | Enables a service on a node in the RMF topology                   |
| <a href="#">GET_NODE_ID_LOCAL Function</a>       | Returns the node ID of a node in the RMF topology                 |
| <a href="#">GET_NODE_NAME_LOCAL Function</a>     | Returns the node name of a node in the RMF topology               |
| <a href="#">GET_TARGET_ID Function</a>           | Returns the destination ID in the RMF topology                    |
| <a href="#">GET_TOPOLOGY_NAME_LOCAL Function</a> | Returns the RMF topology name of the local node                   |
| <a href="#">QUERY_LINK_INFO Procedure</a>        | Returns the information about a database link in the RMF topology |

**Table 179-1 (Cont.) DBMS\_UMF Package Subprograms**

| Subprogram                                           | Description                                                        |
|------------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">QUERY_NODE_INFO Procedures</a>           | Returns the information about a node in the RMF topology           |
| <a href="#">REGISTER_NODE Function and Procedure</a> | Registers a node in the RMF topology                               |
| <a href="#">SWITCH_DESTINATION Procedure</a>         | Designates a source node as a destination node in the RMF topology |
| <a href="#">UNCONFIGURE_NODE Procedure</a>           | Resets the configuration of a node in the RMF topology             |
| <a href="#">UNREGISTER_NODE Procedure</a>            | Removes the registration of a node in the RMF topology             |

### 179.1.1 CONFIGURE\_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

#### Syntax

```
DBMS_UMF.CONFIGURE_NODE(
 node_name IN VARCHAR2 DEFAULT NULL,
 dblink_to_target IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 179-2 CONFIGURE\_NODE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name        | Name of the node.<br>Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter DB_UNIQUE_NAME is assigned as the name for the node by default. |
| dblink_to_target | Database link from this node to the destination node.                                                                                                                                                                                                     |

#### Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

## 179.1.2 CREATE\_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

### Syntax

```
DBMS_UMF.CREATE_LINK(
 topology_name IN VARCHAR2,
 node_a_name IN VARCHAR2,
 node_b_name IN VARCHAR2,
 dblink_a_to_b IN VARCHAR2,
 dblink_b_to_a IN VARCHAR2);
```

### Parameters

**Table 179-3 CREATE\_LINK Procedure Parameters**

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| topology_name | Name of the RMF topology.                             |
| node_a_name   | Name of the first node.                               |
| node_b_name   | Name of the second node.                              |
| dblink_a_to_b | Database link from the first node to the second node. |
| dblink_b_to_b | Database link from the second node to the first node. |

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.3 CREATE\_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

### Syntax

```
DBMS_UMF.CREATE_TOPOLOGY(
 topology_name IN VARCHAR2);
```

### Parameters

**Table 179-4 CREATE\_TOPOLOGY Procedure Parameters**

| Parameter     | Description               |
|---------------|---------------------------|
| topology_name | Name of the RMF topology. |

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.4 DROP\_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

### Syntax

```
DBMS_UMF.DROP_LINK(
 topology_name IN VARCHAR2,
 node_a_name IN VARCHAR2,
 node_b_name IN VARCHAR2);
```

### Parameters

**Table 179-5 DROP\_LINK Procedure Parameters**

| Parameter                  | Description               |
|----------------------------|---------------------------|
| <code>topology_name</code> | Name of the RMF topology. |
| <code>node_a_name</code>   | Name of the first node.   |
| <code>node_b_name</code>   | Name of the second node.  |

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.5 DROP\_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

### Syntax

```
DBMS_UMF.DROP_TOPOLOGY(
 topology_name IN VARCHAR2);
```

### Parameters

**Table 179-6 DROP\_TOPOLOGY Procedure Parameters**

| Parameter                  | Description                     |
|----------------------------|---------------------------------|
| <code>topology_name</code> | Name of the topology to delete. |

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.6 ENABLE\_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

### Syntax

```
DBMS_UMF.ENABLE_SERVICE(
 topology_name IN VARCHAR2,
 node_name IN VARCHAR2,
 service_type IN NUMBER);
```

### Parameters

**Table 179-7** ENABLE\_SERVICE Procedure Parameters

| Parameter     | Description                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| topology_name | Name of the RMF topology.                                                                                                                                          |
| node_name     | Name of the node on which a specific service needs to be enabled.                                                                                                  |
| service_type  | Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service. |

### Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

## 179.1.7 GET\_NODE\_ID\_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

### Syntax

```
DBMS_UMF.GET_NODE_ID_LOCAL(
 topology_name IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

### Parameters

**Table 179-8** GET\_NODE\_ID\_LOCAL Function Parameters

| Parameter     | Description                                                 |
|---------------|-------------------------------------------------------------|
| topology_name | Name of the RMF topology with which the node is registered. |

**Return Value**

Returns the node ID of the node in the RMF topology on which this function is executed.

**Security Model**

Only the database users `SYS` and `SYS$UMF` can execute this function.

## 179.1.8 GET\_NODE\_NAME\_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

**Syntax**

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

**Return Value**

Returns the name of the node in the RMF topology on which this function is executed.

**Security Model**

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.9 GET\_TARGET\_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

**Syntax**

```
DBMS_UMF.GET_TARGET_ID(
 topology_name IN VARCHAR2)
RETURN NUMBER;
```

**Parameters**

**Table 179-9 GET\_TARGET\_ID Function Parameters**

| Parameter                  | Description               |
|----------------------------|---------------------------|
| <code>topology_name</code> | Name of the RMF topology. |

**Return Value**

Returns the ID of the destination node in the RMF topology.

**Security Model**

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.10 GET\_TOPOLOGY\_NAME\_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

### Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```

### Return Value

Returns the name of the active RMF topology of the node on which this function is executed.

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.11 QUERY\_LINK\_INFO Procedure

This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

### Syntax

```
DBMS_UMF.QUERY_LINK_INFO(
 topology_name IN VARCHAR2,
 from_node_id IN NUMBER,
 to_node_id IN NUMBER,
 link_name OUT VARCHAR2);
```

### Parameters

**Table 179-10** QUERY\_LINK\_INFO Procedure Parameters

| Parameter                  | Description                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------|
| <code>topology_name</code> | Name of the RMF topology.                                                                   |
| <code>from_node_id</code>  | Node ID of the first node.                                                                  |
| <code>to_node_id</code>    | Node ID of the second node.                                                                 |
| <code>link_name</code>     | Name of the database link from the first node to the second node returned by the procedure. |

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.12 QUERY\_NODE\_INFO Procedures

This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

### Syntax

```
DBMS_UMF.QUERY_NODE_INFO(
 topology_name IN VARCHAR2 DEFAULT NULL,
 node_name IN VARCHAR2,
 node_id OUT NUMBER);
```

```
DBMS_UMF.QUERY_NODE_INFO(
 node_id IN NUMBER,
 topology_name OUT VARCHAR2,
 node_name OUT VARCHAR2);
```

### Parameters

**Table 179-11** QUERY\_NODE\_INFO Procedure Parameters

| Parameter     | Description                                                 |
|---------------|-------------------------------------------------------------|
| topology_name | Name of the RMF topology with which the node is registered. |
| node_name     | Name of the node.                                           |
| node_id       | Identifier of the node.                                     |

### Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

## 179.1.13 REGISTER\_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

### Syntax

```
DBMS_UMF.REGISTER_NODE(
 topology_name IN VARCHAR2,
 node_name IN VARCHAR2,
 dblink_to_node IN VARCHAR2 DEFAULT NULL,
 dblink_from_node IN VARCHAR2 DEFAULT NULL,
 as_source IN VARCHAR2 DEFAULT 'TRUE',
 as_candidate_target IN VARCHAR2 DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE(
 topology_name IN VARCHAR2,
 node_name IN VARCHAR2,
 dblink_to_node IN VARCHAR2 DEFAULT NULL,
 dblink_from_node IN VARCHAR2 DEFAULT NULL,
```

```

as_source IN VARCHAR2 DEFAULT 'TRUE',
as_candidate_target IN VARCHAR2 DEFAULT 'FALSE');
node_id OUT VARCHAR2);

DBMS_UMF.REGISTER_NODE(
 topology_name IN VARCHAR2,
 node_name IN VARCHAR2,
 dblink_to_node IN VARCHAR2 DEFAULT NULL,
 dblink_from_node IN VARCHAR2 DEFAULT NULL,
 as_source IN VARCHAR2 DEFAULT 'TRUE',
 as_candidate_target IN VARCHAR2 DEFAULT 'FALSE')
RETURN NUMBER;

```

## Parameters

**Table 179-12 REGISTER\_NODE Function and Procedure Parameters**

| Parameter           | Description                                                             |
|---------------------|-------------------------------------------------------------------------|
| topology_name       | Name of the RMF topology.                                               |
| node_name           | Name of the node to register.                                           |
| dblink_to_node      | Name for the database link from the destination to the node.            |
| dblink_from_node    | Name for the database link from the node to the destination.            |
| as_source           | Set to TRUE, if the node is a source, else set to FALSE.                |
| as_candidate_target | Set to TRUE, if the node is a candidate destination, else set to FALSE. |
| node_id             | Node ID returned by the procedure.                                      |

## Return Value

Returns the node ID of the registered node.

## Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

## 179.1.14 SWITCH\_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

## Syntax

```

DBMS_UMF.SWITCH_DESTINATION(
 topology_name IN VARCHAR2,
 force_switch IN BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 179-13 SWITCH\_DESTINATION Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| topology_name | Name of the RMF topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| force_switch  | <p>If set to <code>FALSE</code>, the execution of this procedure fails in the following situations:</p> <ul style="list-style-type: none"> <li>• Candidate destination is a read-only database, and hence it cannot become the new destination.</li> <li>• Candidate destination does not have database links to one or more sources in the topology.</li> <li>• Candidate destination is unable to get the latest AWR data from the old destination.</li> </ul> <p>If set to <code>TRUE</code>, the execution of this procedure fails in the following situation:</p> <ul style="list-style-type: none"> <li>• Candidate destination is a read-only database, and hence it cannot become the new destination.</li> </ul> |

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.15 UNCONFIGURE\_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

### Syntax

```
DBMS_UMF.UNCONFIGURE_NODE;
```

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 179.1.16 UNREGISTER\_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

### Syntax

```
DBMS_UMF.UNREGISTER_NODE(
 topology_name IN VARCHAR2,
 node_name IN VARCHAR2);
```

## Parameters

**Table 179-14 UNREGISTER\_NODE Procedure Parameters**

| Parameter     | Description                                                   |
|---------------|---------------------------------------------------------------|
| topology_name | Name of the RMF topology.                                     |
| node_name     | Name of the node which needs to be removed from the topology. |

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

# 180

## DBMS\_UTILITY

The `DBMS_UTILITY` package provides various utility subprograms.

This chapter contains the following topics:

- [DBMS\\_UTILITY Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Data Structures](#)
- [Summary of DBMS\\_UTILITY Subprograms](#)

### 180.1 DBMS\_UTILITY Deprecated Subprograms

These `DBMS_UTILITY` subprograms are deprecated in Oracle Database 12c release 12.2.

 **Note:**

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [GET\\_PARAMETER\\_VALUE Function](#)  
Query `v$_parameter` directly to find the value of an `init.ora` parameter.
- [ANALYZE\\_PART\\_OBJECT Procedure](#)  
Use `DBMS_STATS` to gather statistics.
- [GET\\_DEPENDENCY Procedure](#)  
There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

### 180.2 DBMS\_UTILITY Security Model

`DBMS_UTILITY` runs with the privileges of the calling user for the `NAME_RESOLVE` procedure and the `COMPILE_SCHEMA` procedure. This is necessary so that the SQL works correctly.

The package does not run as `SYS`. The privileges are checked using `DBMS_DDL`.

**Related Topics**

- [NAME\\_RESOLVE Procedure](#)  
This procedure resolves the given name, including synonym translation and authorization checking as necessary.
- [COMPILE\\_SCHEMA Procedure](#)  
This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

## 180.3 DBMS\_UTILITY Constants

The `DBMS_UTILITY` package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

**Table 180-1 DBMS\_UTILITY Constants**

| Name                                   | Type                     | Value | Description                                                                                                                   |
|----------------------------------------|--------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>INV_ERROR_ON_RESTRICTIONS</code> | <code>PLS_INTEGER</code> | 1     | This constant is the only legal value for the <code>p_option_flags</code> parameter of the <code>INVALIDATE</code> subprogram |

## 180.4 DBMS\_UTILITY Exceptions

This table lists the exceptions raised by `DBMS_UTILITY`.

**Table 180-2 Exceptions Raised by DBMS\_UTILITY**

| Exception                             | Error Code | Description                                                                                                                                                                                                                |
|---------------------------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>INV_NOT_EXIST_OR_NO_PRIV</code> | -24237     | Raised by the <code>INVALIDATE</code> subprogram when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated |
| <code>INV_MALFORMED_SETTINGS</code>   | -24238     | Raised by the <code>INVALIDATE</code> subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter                                                                   |
| <code>INV_RESTRICTED_OBJECT</code>    | -24239     | Raised by the <code>INVALIDATE</code> subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened                                                            |

## 180.5 DBMS\_UTILITY Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

**Record Types**

- [INSTANCE\\_RECORD Record Type](#)

**Table Types**

- [DBLINK\\_ARRAY TABLE Type](#)
- [INDEX\\_TABLE\\_TYPE Table Type](#)
- [INSTANCE\\_TABLE Table Type](#)
- [LNAME\\_ARRAY Table Type](#)
- [NAME\\_ARRAY Table Type](#)
- [NUMBER\\_ARRAY Table Type](#)
- [UNCL\\_ARRAY Table Type](#)

## 180.5.1 DBMS\_UTILITY INSTANCE\_RECORD Record Type

This type describes a list of active instance number-name pairs.

**Syntax**

```
TYPE INSTANCE_RECORD IS RECORD (
 inst_number NUMBER,
 inst_name VARCHAR2(60));
```

**Fields****Table 180-3** INSTANCE\_RECORD Record Type Fields

| Field       | Description            |
|-------------|------------------------|
| inst_number | Active instance number |
| inst_name   | Instance name          |

## 180.5.2 DBMS\_UTILITY DBLINK\_ARRAY TABLE Type

This type stores a list of database links.

**Syntax**

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

## 180.5.3 DBMS\_UTILITY INDEX\_TABLE\_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

**Syntax**

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

## 180.5.4 DBMS\_UTILITY INSTANCE\_TABLE Table Type

This type describes a table of INSTANCE\_RECORD Record Type.

### Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

### Usage Notes

The starting index of INSTANCE\_TABLE is 1; INSTANCE\_TABLE is Dense.

### Related Topics

- [DBMS\\_UTILITY INSTANCE\\_RECORD Record Type](#)  
This type describes a list of active instance number-name pairs.

## 180.5.5 DBMS\_UTILITY LNAME\_ARRAY Table Type

This type stores lists of LONG NAME including fully qualified attribute names.

### Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

## 180.5.6 DBMS\_UTILITY NAME\_ARRAY Table Type

This type stores lists of NAME.

### Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

## 180.5.7 DBMS\_UTILITY NUMBER\_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

### Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

## 180.5.8 DBMS\_UTILITY UNCL\_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

### Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

## 180.6 Summary of DBMS\_UTILITY Subprograms

This table lists the DBMS\_UTILITY subprograms and briefly describes them.

**Table 180-4 DBMS\_UTILITY Package Subprograms**

| Subprogram                                              | Description                                                                                                                                                                                                 |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACTIVE_INSTANCES Procedure</a>              | Returns the active instance                                                                                                                                                                                 |
| <a href="#">ANALYZE_DATABASE Procedure</a>              | Analyzes all the tables, clusters and indexes in a database                                                                                                                                                 |
| <a href="#">ANALYZE_PART_OBJECT Procedure</a>           | Analyzes the given tables and indexes<br>This procedure is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. Use DBMS_STATS to gather statistics.                   |
| <a href="#">ANALYZE_SCHEMA Procedure</a>                | Analyzes all the tables, clusters and indexes in a schema                                                                                                                                                   |
| <a href="#">CANONICALIZE Procedure</a>                  | Canonicalizes a given string                                                                                                                                                                                |
| <a href="#">COMMA_TO_TABLE Procedures</a>               | Converts a comma-delimited list of names into a PL/SQL table of names                                                                                                                                       |
| <a href="#">COMPILE_SCHEMA Procedure</a>                | Compiles all procedures, functions, packages, views and triggers in the specified schema                                                                                                                    |
| <a href="#">CREATE_ALTER_TYPE_ERROR_TABLE Procedure</a> | Creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement                                                                                                                       |
| <a href="#">CURRENT_INSTANCE Function</a>               | Returns the current connected instance number                                                                                                                                                               |
| <a href="#">DATA_BLOCK_ADDRESS_BLOCK Function</a>       | Gets the block number part of a data block address                                                                                                                                                          |
| <a href="#">DATA_BLOCK_ADDRESS_FILE Function</a>        | Gets the file number part of a data block address                                                                                                                                                           |
| <a href="#">DB_VERSION Procedure</a>                    | Returns version information for the database                                                                                                                                                                |
| <a href="#">EXEC_DDL_STATEMENT Procedure</a>            | Executes the DDL statement in parse_string                                                                                                                                                                  |
| <a href="#">EXPAND_SQL_TEXT Procedure</a>               | Recursively replaces any view references in the input SQL query with the corresponding view subquery                                                                                                        |
| <a href="#">FORMAT_CALL_STACK Function</a>              | Formats the current call stack                                                                                                                                                                              |
| <a href="#">FORMAT_ERROR_BACKTRACE Function</a>         | Formats the backtrace from the point of the current error to the exception handler where the error has been caught                                                                                          |
| <a href="#">FORMAT_ERROR_STACK Function</a>             | Formats the current error stack                                                                                                                                                                             |
| <a href="#">GET_CPU_TIME Function</a>                   | Returns the current CPU time in 100th's of a second                                                                                                                                                         |
| <a href="#">GET_DEPENDENCY Procedure</a>                | Shows the dependencies on the object passed in.<br>This procedure is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram. |
| <a href="#">GET_ENDIANNESNESS Function</a>              | Gets the endianness of the database platform                                                                                                                                                                |
| <a href="#">GET_HASH_VALUE Function</a>                 | Computes a hash value for the given string                                                                                                                                                                  |
| <a href="#">GET_PARAMETER_VALUE Function</a>            | Gets the value of specified init.ora parameter.<br>This function is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. You can query v\$_parameter directly.         |
| <a href="#">GET_SQL_HASH Function</a>                   | Computes a hash value for the given string using MD5 algorithm                                                                                                                                              |
| <a href="#">GET_TIME Function</a>                       | Returns the current time in 100th's of a second                                                                                                                                                             |

**Table 180-4 (Cont.) DBMS\_UTILITY Package Subprograms**

| Subprogram                                       | Description                                                                                                                                                                    |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_TZ_TRANSITIONS Procedure</a>     | Returns time zone transitions by regionid from the <code>timezone.dat</code> file                                                                                              |
| <a href="#">INVALIDATE Procedure</a>             | Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings                                                                                 |
| <a href="#">IS_BIT_SET Function</a>              | Checks the bit setting for the given bit in the given RAW value                                                                                                                |
| <a href="#">IS_CLUSTER_DATABASE Function</a>     | Determines if the database is running in cluster database mode                                                                                                                 |
| <a href="#">MAKE_DATA_BLOCK_ADDRESS Function</a> | Creates a data block address given a file number and a block number                                                                                                            |
| <a href="#">NAME_RESOLVE Procedure</a>           | Resolves the given name                                                                                                                                                        |
| <a href="#">NAME_TOKENIZE Procedure</a>          | Calls the parser to parse the given name                                                                                                                                       |
| <a href="#">OLD_CURRENT_SCHEMA Function</a>      | Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')                                                                                                       |
| <a href="#">OLD_CURRENT_USER Function</a>        | Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER')                                                                                                         |
| <a href="#">PORT_STRING Function</a>             | Returns a string that uniquely identifies the version of Oracle and the operating system                                                                                       |
| <a href="#">SQLID_TO_SQLHASH Function</a>        | Converts a SQL ID into a hash value                                                                                                                                            |
| <a href="#">TABLE_TO_COMMA Procedures</a>        | Converts a PL/SQL table of names into a comma-delimited list of names                                                                                                          |
| <a href="#">VALIDATE Procedure</a>               | Makes invalid database objects valid                                                                                                                                           |
| <a href="#">WAIT_ON_PENDING_DML Function</a>     | Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back |

## 180.6.1 ACTIVE\_INSTANCES Procedure

This procedure returns the active instance.

### Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
 instance_table OUT INSTANCE_TABLE,
 instance_count OUT NUMBER);
```

### Parameters

**Table 180-5 ACTIVE\_INSTANCES Procedure Parameters**

| Procedure                   | Description                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------|
| <code>instance_table</code> | Contains a list of the active instance numbers and names. When no instance is up, the list is empty. |
| <code>instance_count</code> | Number of active instances                                                                           |

## 180.6.2 ANALYZE\_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

### Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
 method IN VARCHAR2,
 estimate_rows IN NUMBER DEFAULT NULL,
 estimate_percent IN NUMBER DEFAULT NULL,
 method_opt IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 180-6 ANALYZE\_DATABASE Procedure Parameters**

| Parameter        | Description                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| method           | One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.           |
| estimate_rows    | Number of rows to estimate                                                                                               |
| estimate_percent | Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.                                     |
| method_opt       | Method options of the following format:<br>[ FOR TABLE ]<br>[ FOR ALL [INDEXED] COLUMNS] [SIZE n]<br>[ FOR ALL INDEXES ] |

### Exceptions

ORA-20000: Insufficient privileges for some object in this database

## 180.6.3 ANALYZE\_PART\_OBJECT Procedure

This procedure is equivalent to SQL: "ANALYZE TABLE | INDEX [<schema>.]<object\_name> PARTITION <pname> [<command\_type>] [<command\_opt>] [<sample\_clause>]"

### Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use [DBMS\\_STATS](#) to gather statistics.

### Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
 schema IN VARCHAR2 DEFAULT NULL,
 object_name IN VARCHAR2 DEFAULT NULL,
 object_type IN CHAR DEFAULT 'T',
 command_type IN CHAR DEFAULT 'E',
```

```
command_opt IN VARCHAR2 DEFAULT NULL,
sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

### Parameters

**Table 180-7 ANALYZE\_PART\_OBJECT Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema        | Schema of the object_name                                                                                                                                                                                                                 |
| object_name   | Name of object to be analyzed, must be partitioned                                                                                                                                                                                        |
| object_type   | Type of object, must be T (table) or I (index)                                                                                                                                                                                            |
| command_type  | Must be V (validate structure)                                                                                                                                                                                                            |
| command_opt   | Other options for the command type.<br>For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table).<br>For V, it can be CASCADE when object_type is T. |
| sample_clause | Sample clause to use when command_type is 'E'                                                                                                                                                                                             |

### Usage Notes

For each partition of the object, run in parallel using job queues.

## 180.6.4 ANALYZE\_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

### Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
 schema IN VARCHAR2,
 method IN VARCHAR2,
 estimate_rows IN NUMBER DEFAULT NULL,
 estimate_percent IN NUMBER DEFAULT NULL,
 method_opt IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 180-8 ANALYZE\_SCHEMA Procedure Parameters**

| Parameter        | Description                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| schema           | Name of the schema                                                                                                       |
| method           | One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.           |
| estimate_rows    | Number of rows to estimate                                                                                               |
| estimate_percent | Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.                                     |
| method_opt       | Method options of the following format:<br>[ FOR TABLE ]<br>[ FOR ALL [INDEXED] COLUMNS] [SIZE n]<br>[ FOR ALL INDEXES ] |

## Exceptions

ORA-20000: Insufficient privileges for some object in this schema

## 180.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

### Syntax

```
DBMS_UTILITY.CANONICALIZE(
 name IN VARCHAR2,
 canon_name OUT VARCHAR2,
 canon_len IN BINARY_INTEGER);
```

### Parameters

**Table 180-9 CANONICALIZE Procedure Parameters**

| Parameter  | Description                                     |
|------------|-------------------------------------------------|
| name       | String to be canonicalized                      |
| canon_name | Canonicalized string                            |
| canon_len  | Length of the string (in bytes) to canonicalize |

### Return Values

Returns the first `canon_len` bytes in `canon_name`.

### Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS\_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS\_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after `a[.b]*` will be ignored.
- The procedure does not handle cases like 'A B.'

### Examples

- a becomes A
- "a" becomes a

- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with ",c.f" ignored.

## 180.6.6 COMMA\_TO\_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

### Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
 list IN VARCHAR2,
 tablen OUT BINARY_INTEGER,
 tab OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (
 list IN VARCHAR2,
 tablen OUT BINARY_INTEGER,
 tab OUT lname_array);
```

### Parameters

**Table 180-10 COMMA\_TO\_TABLE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| list      | Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c ]][ @ d ]<br>and the following format for the second overloading: a [. b]*<br>where a, b, c, d are simple identifiers (quoted or unquoted). |
| tablen    | Number of tables in the PL/SQL table                                                                                                                                                                                                                                      |
| tab       | PL/SQL table which contains list of names                                                                                                                                                                                                                                 |

### Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

### Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in tab are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

## 180.6.7 COMPILE\_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

### Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
 schema IN VARCHAR2,
 compile_all IN BOOLEAN DEFAULT TRUE,
 reuse_settings IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 180-11** COMPILE\_SCHEMA Procedure Parameters

| Parameter      | Description                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| schema         | Name of the schema                                                                                                                        |
| compile_all    | If TRUE, will compile everything within the schema regardless of whether it is VALID<br>If FALSE, will compile only INVALID objects       |
| reuse_settings | Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead |

### Exceptions

**Table 180-12** COMPILE\_SCHEMA Procedure Exceptions

| Exception | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| ORA-20000 | Insufficient privileges for some object in this schema                  |
| ORA-20001 | Cannot recompile SYS objects                                            |
| ORA-20002 | Maximum iterations exceeded. Some objects may not have been recompiled. |

### Usage Notes

- Note that this subprogram is a wrapper for the [RECOMP\\_SERIAL Procedure](#) included with the [UTL\\_RECOMP](#) package.
- After calling this procedure, you should select from view `ALL_OBJECTS` for items with status of `INVALID` to see if all objects were successfully compiled.
- To see the errors associated with `INVALID` objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

## 180.6.8 CREATE\_ALTER\_TYPE\_ERROR\_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

### Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
 schema_name IN VARCHAR2,
 table_name IN VARCHAR2);
```

### Parameters

**Table 180-13** CREATE\_ALTER\_TYPE\_ERROR\_TABLE Procedure Parameters

| Parameter   | Description               |
|-------------|---------------------------|
| schema_name | Name of the schema        |
| table_name  | Name of the table created |

### Exceptions

An error is returned if the table already exists.

## 180.6.9 CURRENT\_INSTANCE Function

This function returns the current connected instance number. It returns `NULL` when connected instance is down.

### Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
 RETURN NUMBER;
```

## 180.6.10 DATA\_BLOCK\_ADDRESS\_BLOCK Function

This function gets the block number part of a data block address.

### Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (
 dba NUMBER)
 RETURN NUMBER;
```

### Parameters

**Table 180-14** DATA\_BLOCK\_ADDRESS\_BLOCK Function Parameters

| Parameter | Description        |
|-----------|--------------------|
| dba       | Data block address |

**Pragmas**

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

**Return Values**

Block offset of the block.

**Usage Notes**

This function should not be used with datablocks which belong to bigfile tablespaces.

## 180.6.11 DATA\_BLOCK\_ADDRESS\_FILE Function

This function gets the file number part of a data block address.

**Syntax**

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (
 dba NUMBER)
 RETURN NUMBER;
```

**Parameters**

**Table 180-15 DATA\_BLOCK\_ADDRESS\_FILE Function Parameters**

| Parameter | Description        |
|-----------|--------------------|
| dba       | Data block address |

**Pragmas**

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

**Return Values**

File that contains the block.

**Usage Notes**

This function should not be used with datablocks which belong to bigfile tablespaces.

## 180.6.12 DB\_VERSION Procedure

This procedure returns version information for the database.

**Syntax**

```
DBMS_UTILITY.DB_VERSION (
 version OUT VARCHAR2,
 compatibility OUT VARCHAR2);
```

## Parameters

**Table 180-16 DB\_VERSION Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version       | A string which represents the internal software version of the database (for example, 7.1.0.0.0).<br>The length of this string is variable and is determined by the database version.                    |
| compatibility | The compatibility setting of the database determined by the "compatible" <code>init.ora</code> parameter.<br>If the parameter is not specified in the <code>init.ora</code> file, then NULL is returned. |

## 180.6.13 EXEC\_DDL\_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

### Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
 parse_string IN VARCHAR2);
```

### Parameters

**Table 180-17 EXEC\_DDL\_STATEMENT Procedure Parameters**

| Parameter                 | Description                  |
|---------------------------|------------------------------|
| <code>parse_string</code> | DDL statement to be executed |

## 180.6.14 EXPAND\_SQL\_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

### Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (
 input_sql_text IN CLOB,
 output_sql_text OUT NOCOPY CLOB);
```

### Parameters

**Table 180-18 EXPAND\_SQL\_TEXT Procedure Parameters**

| Parameter                    | Description              |
|------------------------------|--------------------------|
| <code>input_sql_text</code>  | Input SQL query text     |
| <code>output_sql_text</code> | View-expanded query text |

## Exceptions

**Table 180-19 EXPAND\_SQL\_TEXT Procedure Exceptions**

| Exception | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| ORA-00942 | Current user does not have select privileges on all the views and tables recursively referenced in the <code>input_sql_text</code> |
| ORA-24251 | <code>input_sql_text</code> is not a <code>SELECT</code> statement                                                                 |
| ORA-00900 | Input is not valid                                                                                                                 |
| ORA-29477 | Input LOB size exceeds maximum size of 4GB -1                                                                                      |

## Usage Notes

The expanded and merged SQL statement text is copied to `output_sql_text` on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic `WHERE` clause. This function would return differently, for example, if the `userid` caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

## 180.6.15 FORMAT\_CALL\_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

### Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

### Return Values

This returns the call stack, up to 2000 bytes.

## 180.6.16 FORMAT\_ERROR\_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the `SQLERRM` function, but not subject to the same size limitation.

## Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
 RETURN VARCHAR2;
```

## Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

## Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors (i_buff in varchar2) IS
 g_start_pos integer := 1;
 g_end_pos integer;

 FUNCTION Output_One_Line RETURN BOOLEAN IS
 BEGIN
 g_end_pos := Instr (i_buff, Chr(10), g_start_pos);

 CASE g_end_pos > 0
 WHEN true THEN
 DBMS_OUTPUT.PUT_LINE (Substr (i_buff, g_start_pos,
g_end_pos-g_start_pos));
 g_start_pos := g_end_pos+1;
 RETURN TRUE;

 WHEN FALSE THEN
 DBMS_OUTPUT.PUT_LINE (Substr (i_buff, g_start_pos,
(Length(i_buff)-g_start_pos)+1));
 RETURN FALSE;
 END CASE;
 END Output_One_Line;

 BEGIN
 WHILE Output_One_Line() LOOP NULL;
 END LOOP;
 END Log_Errors;
/

Set Doc Off
Set Feedback off
Set Echo Off

CREATE OR REPLACE PROCEDURE P0 IS

 or database administrator.
*/
```

## 180.6.17 FORMAT\_ERROR\_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

### Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;
```

### Return Values

This returns the error stack, up to 2000 bytes.

## 180.6.18 GET\_CPU\_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

### Syntax

```
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

### Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

### Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

## 180.6.19 GET\_DEPENDENCY Procedure

This **deprecated procedure** shows the dependencies on the object passed in.

 **Note:**

This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

### Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
type IN VARCHAR2,
schema IN VARCHAR2,
name IN VARCHAR2);
```

### Parameters

**Table 180-20 GET\_DEPENDENCY Procedure Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| type      | Type of the object, for example if the object is a table give the type as 'TABLE' |
| schema    | Schema name of the object                                                         |
| name      | Name of the object                                                                |

### Usage Notes

This procedure uses the [DBMS\\_OUTPUT](#) package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

## 180.6.20 GET\_ENDIANNES Function

This function gets the endianness of the database platform.

### Syntax

```
DBMS_UTILITY.GET_ENDIANNES
RETURN NUMBER;
```

**Return Values**

A `NUMBER` value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

## 180.6.21 GET\_HASH\_VALUE Function

This function computes a hash value for the given string.

**Syntax**

```
DBMS_UTILITY.GET_HASH_VALUE (
 name VARCHAR2,
 base NUMBER,
 hash_size NUMBER)
RETURN NUMBER;
```

**Parameters****Table 180-21** GET\_HASH\_VALUE Function Parameters

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| name      | String to be hashed.                                     |
| base      | Base value for the returned hash value at which to start |
| hash_size | Desired size of the hash table                           |

**Pragmas**

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

**Return Values**

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the `hash_size` value. Using a power of 2 for the `hash_size` parameter works best.

## 180.6.22 GET\_PARAMETER\_VALUE Function

This deprecated function gets the value of specified `init.ora` parameter.

**Note:**

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query `v${_parameter}` directly.

**Syntax**

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
 parnam IN VARCHAR2,
```

```

 intval IN OUT BINARY_INTEGER,
 strval IN OUT VARCHAR2,
 listno IN BINARY_INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;

```

## Parameters

**Table 180-22 GET\_PARAMETER\_VALUE Function Parameters**

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parnam    | Parameter name                                                                                                                                                                   |
| intval    | Value of an integer parameter or the value length of a string parameter                                                                                                          |
| strval    | Value of a string parameter                                                                                                                                                      |
| listno    | List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter. |

## Return Values

Parameter type:

- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

## Usage Notes

- To execute the this function, you must have the SELECT privilege on the V\$PARAMETER dynamic view.

## Examples

```

DECLARE
 parnam VARCHAR2(256);
 intval BINARY_INTEGER;
 strval VARCHAR2(256);
 partyp BINARY_INTEGER;
BEGIN
 partyp := dbms_utility.get_parameter_value('max_dump_file_size',
 intval, strval);

 dbms_output.put('parameter value is: ');
 IF partyp = 1 THEN
 dbms_output.put_line(strval);
 ELSE
 dbms_output.put_line(intval);
 END IF;
 IF partyp = 1 THEN
 dbms_output.put('parameter value length is: ');
 dbms_output.put_line(intval);
 END IF;
 dbms_output.put('parameter type is: ');
 IF partyp = 1 THEN
 dbms_output.put_line('string');
 ELSE
 dbms_output.put_line('integer');
 END IF;
END;

```

## 180.6.23 GET\_SQL\_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

### Syntax

```
Dbms_utility.get_sql_hash (
 name IN VARCHAR2,
 hash OUT RAW,
 pre10ihash OUT NUMBER)
RETURN NUMBER;
```

### Pragmas

Pragma Restrict\_references(Get\_sql\_hash, Wnds, Rnds, Wnps, Rnps);

### Parameters

**Table 180-23 GET\_SQL\_HASH Procedure Parameters**

| Parameter  | Description                                                     |
|------------|-----------------------------------------------------------------|
| name       | String to be hashed                                             |
| hash       | Optional field to store all 16 bytes of returned hash value     |
| pre10ihash | Optional field to store the pre 10i database version hash value |

### Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. one could use an optional raw parameter to get all 16 bytes and to store the pre 10i hash value of 4 bytes in the pre10i hash optional parameter.

## 180.6.24 GET\_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

### Syntax

```
DBMS_UTILITY.GET_TIME
RETURN NUMBER;
```

### Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

### Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers,

application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

## 180.6.25 GET\_TZ\_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

### Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
 regionid IN NUMBER,
 transitions OUT MAXRAW);
```

### Parameters

**Table 180-24** GET\_TZ\_TRANSITIONS Procedure Parameters

| Parameter                | Description                                       |
|--------------------------|---------------------------------------------------|
| <code>regionid</code>    | Number corresponding to the region                |
| <code>transitions</code> | Raw bytes from the <code>timezone.dat</code> file |

### Exceptions

**Table 180-25** GET\_TZ\_TRANSITIONS Procedure Exceptions

| Exception                                | Description                          |
|------------------------------------------|--------------------------------------|
| ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR | For an invalid <code>regionid</code> |

## 180.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

### Syntax

```
DBMS_UTILITY.INVALIDATE (
 p_object_id NUMBER,
 p_plsql_object_settings VARCHAR2 DEFAULT NULL,
 p_option_flags PLS_INTEGER DEFAULT 0);
```

## Parameters

**Table 180-26 INVALIDATE Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>p_object_id</code>             | ID number of object to be invalidated. This is the same as the value of the <code>OBJECT_ID</code> column from <code>ALL_OBJECTS</code> . If the <code>object_id</code> argument is <code>NULL</code> or invalid then the exception <code>inv_not_exist_or_no_priv</code> is raised. The caller of this procedure must have create privileges on the object being invalidated else the <code>inv_not_exist_or_no_priv</code> exception is raised.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>p_plsql_object_settings</code> | Optional parameter that ignored if the object specified by <code>p_object_id</code> is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to <code>REUSE SETTINGS</code> . If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else <code>inv_malformed_settings</code> exception will be raised. The setting values are changed only for the object specified by <code>p_object_id</code> and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and <code>REUSE SETTINGS</code> is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and <code>REUSE SETTINGS</code> was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment. |
| <code>p_option_flags</code>          | Optional parameter defaults to zero (no flags). Option flags supported by <code>invalidate</code> . <ul style="list-style-type: none"> <li><code>inv_error_on_restrictions</code> (see <a href="#">Constants</a>): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by <code>p_object_id</code> cannot be a table. By default, <code>invalidate</code> quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception <code>inv_restricted_object</code> is raised.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Exceptions

**Table 180-27 INVALIDATE Exceptions**

| Exception                             | Description                                                                                                                                                                      |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>INV_NOT_EXIST_OR_NO_PRIV</code> | Raised when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated |
| <code>INV_MALFORMED_SETTINGS</code>   | Raised if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter                                                                   |
| <code>INV_RESTRICTED_OBJECT</code>    | Raised when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened                                                            |

## Usage Notes

The object type (`object_type` column from `ALL_OBJECTS`) of the object specified by `p_object_id` must be a `PROCEDURE`, `FUNCTION`, `PACKAGE`, `PACKAGE BODY`, `TRIGGER`, `TYPE`, `TYPE BODY`, `LIBRARY`, `VIEW`, `OPERATOR`, `SYNONYM`, or `JAVA CLASS`. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of `STANDARD`, `DBMS_STANDARD`, or specification or body of `DBMS_UTILITY` and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

## Examples

### Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the `HR` schema. Then the above call will mark the `remove_emp` procedure invalid and change its `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

### Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_typ` in the `OE` schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to `NATIVE`. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

### Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

## 180.6.27 IS\_BIT\_SET Function

This function checks the bit setting for the given bit in the given RAW value.

### Syntax

```
DBMS_UTILITY.IS_BIT_SET (
 r IN RAW, n IN NUMBER)
RETURN NUMBER;
```

### Parameters

**Table 180-28 IS\_BIT\_SET Function Parameters**

| Parameter | Description       |
|-----------|-------------------|
| r         | RAW source        |
| n         | Bit in r to check |

### Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

## 180.6.28 IS\_CLUSTER\_DATABASE Function

This function finds out if this database is running in cluster database mode.

### Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

### Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.

## 180.6.29 MAKE\_DATA\_BLOCK\_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

### Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
 file NUMBER,
 block NUMBER)
RETURN NUMBER;
```

## Parameters

**Table 180-29 MAKE\_DATA\_BLOCK\_ADDRESS Function Parameters**

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| file      | File that contains the block                                     |
| block     | Offset of the block within the file in terms of block increments |

## Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

## Return Values

Data block address.

## 180.6.30 NAME\_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

## Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
 name IN VARCHAR2,
 context IN NUMBER,
 schema OUT VARCHAR2,
 part1 OUT VARCHAR2,
 part2 OUT VARCHAR2,
 dblink OUT VARCHAR2,
 part1_type OUT NUMBER,
 object_number OUT NUMBER);
```

## Parameters

**Table 180-30 NAME\_RESOLVE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | <p>Name of the object.</p> <p>This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in.</p> <p>a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</p> |

**Table 180-30 (Cont.) NAME\_RESOLVE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| context       | Must be an integer between 0 and 9. <ul style="list-style-type: none"> <li>• 0 - table</li> <li>• 1 - PL/SQL (for 2 part names)</li> <li>• 2 - sequences</li> <li>• 3 - trigger</li> <li>• 4 - Java Source</li> <li>• 5 - Java resource</li> <li>• 6 - Java class</li> <li>• 7 - type</li> <li>• 8 - Java shared data</li> <li>• 9 - index</li> </ul> |
| schema        | Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.                                                                                                                                                                                                                                      |
| part1         | First part of the name. The type of this name is specified part1_type (synonym or package).                                                                                                                                                                                                                                                           |
| part2         | If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.                                                                                                                                             |
| dblink        | If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.                                                          |
| part1_type    | Type of part1 is: <ul style="list-style-type: none"> <li>• 5 - synonym</li> <li>• 7 - procedure (top level)</li> <li>• 8 - function (top level)</li> <li>• 9 - package</li> </ul>                                                                                                                                                                     |
| object_number | Object identifier                                                                                                                                                                                                                                                                                                                                     |

**Exceptions**

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

## 180.6.31 NAME\_TOKENIZE Procedure

This procedure calls the parser to parse the given name as a [. b [. c ]][@ dblink ].

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

**Syntax**

```
DBMS_UTILITY.NAME_TOKENIZE (
 name IN VARCHAR2,
 a OUT VARCHAR2,
 b OUT VARCHAR2,
```

```
c OUT VARCHAR2,
dblink OUT VARCHAR2,
nextpos OUT BINARY_INTEGER);
```

### Parameters

**Table 180-31** NAME\_RESOLVE Procedure Parameters

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| name      | Input name, consisting of SQL identifiers (for example, scott.foo@dblink) |
| a         | Output for the first token of the name                                    |
| b         | Output for the second token of the name (if applicable)                   |
| c         | Output for the third token of the name (if applicable)                    |
| dblink    | Output for the dblink of the name                                         |
| nextpos   | Next position after parsing the input name                                |

## 180.6.32 OLD\_CURRENT\_SCHEMA Function

This function returns the session value from `sys_context ('userenv', 'current_schema')`.

### Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;
```

## 180.6.33 OLD\_CURRENT\_USER Function

This function returns the session value from `sys_context ('userenv', 'current_user')`.

### Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;
```

## 180.6.34 PORT\_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

### Syntax

```
DBMS_UTILITY.PORT_STRING
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

## 180.6.35 SQLID\_TO\_SQLHASH Function

This function converts a SQL ID into a hash value.

### Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
 sql_id IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 180-32 SQLID\_TO\_SQLHASH Function Parameters**

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| sql_id    | SQL ID of a SQL statement. Must be VARCHAR2(13). |

## 180.6.36 TABLE\_TO\_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

### Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
 tab IN UNCL_ARRAY,
 tablen OUT BINARY_INTEGER,
 list OUT VARCHAR2);
```

```
DBMS_UTILITY.TABLE_TO_COMMA (
 tab IN lname_array,
 tablen OUT BINARY_INTEGER,
 list OUT VARCHAR2);
```

### Parameters

**Table 180-33 TABLE\_TO\_COMMA Procedure Parameters**

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| tab       | PL/SQL table which contains list of table names |
| tablen    | Number of tables in the PL/SQL table            |
| list      | Comma separated list of tables                  |

### Return Values

A comma-delimited list and the number of elements found in the table.

## 180.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

### Syntax

```
DBMS_UTILITY.VALIDATE(
 object_id NUMBER);

DBMS_UTILITY.VALIDATE(
 owner VARCHAR2,
 objname VARCHAR2,
 namespace NUMBER, edition_name := SYS_CONTEXT ('USERENV',
'CURRENT_EDITION'));
```

### Parameters

**Table 180-34 VALIDATE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner        | Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| objname      | Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| namespace    | Namespace of the object. Same as the namespace field in obj\$. Equivalent numeric values are as follows: <ul style="list-style-type: none"> <li>• 1 — TABLE/PROCEDURE/TYPE</li> <li>• 2 — BODY</li> <li>• 3 — TRIGGER</li> <li>• 4 — INDEX</li> <li>• 5 — CLUSTER</li> <li>• 8 — LOB</li> <li>• 9 — DIRECTORY</li> <li>• 10 — QUEUE</li> <li>• 11 — REPLICATION OBJECT GROUP</li> <li>• 12 — REPLICATION PROPAGATOR</li> <li>• 13 — JAVA SOURCE</li> <li>• 14 — JAVA RESOURCE</li> <li>• 58 — (Data Mining) MODEL</li> </ul> |
| edition_name | [Note: Currently not operable. Reserved for future use]                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The [INVALIDATE Procedure](#) invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified

by its `object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

## 180.6.38 WAIT\_ON\_PENDING\_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified `scn` have either committed or been rolled back.

### Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
 tables IN VARCHAR2,
 timeout IN BINARY_INTEGER,
 scn IN OUT NUMBER)
RETURN BOOLEAN;
```

### Parameters

**Table 180-35** WAIT\_ON\_PENDING\_DML Function Parameters

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>tables</code>  | Comma-separated list of one or more table names. The list must be valid for <a href="#">COMMA_TO_TABLE Procedures</a> , and each item valid to the <a href="#">NAME_RESOLVE Procedure</a> . Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.              |
| <code>timeout</code> | Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.                                                                                                                                                                                                                                         |
| <code>scn</code>     | SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful <code>scn</code> on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output. |

### Return Values

TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back

# DBMS\_WARNING

The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_WARNING Subprograms](#)

## 181.1 DBMS\_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

## 181.2 Summary of DBMS\_WARNING Subprograms

This table lists the `DBMS_WARNING` subprograms and briefly describes them.

**Table 181-1** *DBMS\_WARNING Package Subprograms*

| Subprogram                                           | Description                                                                                                       |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_WARNING_SETTING_CAT Procedure</a>    | Modifies the current session or system warning settings of the <code>warning_category</code> previously supplied  |
| <a href="#">ADD_WARNING_SETTING_NUM Procedure</a>    | Modifies the current session or system warning settings of the or <code>warning_number</code> previously supplied |
| <a href="#">GET_CATEGORY Function</a>                | Returns the category name, given the message number                                                               |
| <a href="#">GET_WARNING_SETTING_CAT Function</a>     | Returns the specific warning category in the session                                                              |
| <a href="#">GET_WARNING_SETTING_NUM Function</a>     | Returns the specific warning number in the session                                                                |
| <a href="#">GET_WARNING_SETTING_STRING Function</a>  | Returns the entire warning string for the current session                                                         |
| <a href="#">SET_WARNING_SETTING_STRING Procedure</a> | Replaces previous settings with the new value                                                                     |

### 181.2.1 ADD\_WARNING\_SETTING\_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting

if the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE/DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

### Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
 warning_category IN VARCHAR2,
 warning_value IN VARCHAR2,
 scope IN VARCHAR2);
```

### Parameters

**Table 181-2 ADD\_WARNING\_SETTING\_CAT Procedure Parameters**

| Parameter                     | Description                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>warning_category</code> | Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.                                             |
| <code>warning_value</code>    | Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.                                                           |
| <code>scope</code>            | Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM. |

## 181.2.2 ADD\_WARNING\_SETTING\_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE / DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

### Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
 warning_number IN NUMBER,
 warning_value IN VARCHAR2,
 scope IN VARCHAR2);
```

### Parameters

**Table 181-3 ADD\_WARNING\_SETTING\_NUM Procedure Parameters**

| Parameter                   | Description                                                                                                                      |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>warning_number</code> | The warning number. Allowed values are all valid warning numbers.                                                                |
| <code>warning_value</code>  | Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.                                                           |
| <code>scope</code>          | Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM. |

**Example 181-1 Enabling the Deprecation Warnings**

This example shows how to enable the DEPRECATE pragma warnings using the DBMS\_WARNING package for the session.

```
BEGIN
 DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019 ,
 'ENABLE' ,
 'SESSION');

 DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020 ,
 'ENABLE' ,
 'SESSION');

 DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021 ,
 'ENABLE' ,
 'SESSION');

 DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022 ,
 'ENABLE' ,
 'SESSION');

END;
```

### 181.2.3 GET\_CATEGORY Function

This function returns the category name, given the message number.

**Syntax**

```
DBMS_WARNING.GET_CATEGORY (
 warning_number IN pls_integer)
RETURN VARCHAR2;
```

**Parameters****Table 181-4 GET\_CATEGORY Function Parameters**

| Parameter      | Description                 |
|----------------|-----------------------------|
| warning_number | The warning message number. |

### 181.2.4 GET\_WARNING\_SETTING\_CAT Function

This function returns the specific warning category setting for the current session.

**Syntax**

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (
 warning_category IN VARCHAR2)
RETURN warning_value;
```

## Parameters

**Table 181-5 GET\_WARNING\_SETTING\_CAT Function Parameters**

| Parameter        | Description                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| warning_category | Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE). |

## 181.2.5 GET\_WARNING\_SETTING\_NUM Function

This function returns the specific warning number setting for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (
 warning_number IN NUMBER)
RETURN warning_value;
```

## Parameters

**Table 181-6 GET\_WARNING\_SETTING\_NUM Function Parameters**

| Parameter      | Description                                                   |
|----------------|---------------------------------------------------------------|
| warning_number | Warning number. Allowed values are all valid warning numbers. |

## 181.2.6 GET\_WARNING\_SETTING\_STRING Function

This function returns the entire warning string for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING
RETURN VARCHAR2;
```

### Usage Notes

Use this function when you do not have `SELECT` or `READ` privilege on `v$parameter` or `v$parameter2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

## 181.2.7 SET\_WARNING\_SETTING\_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an `ALTER SESSION` or `SYSTEM SET PLSQL_WARNINGS` command. This will have same effect as `ALTER SESSION` or `ALTER SYSTEM` command.

### Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
 warning_value IN VARCHAR2,
 scope IN VARCHAR2);
```

### Parameters

**Table 181-7 SET\_WARNING\_SETTING\_STRING Procedure Parameters**

| Parameter     | Description                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|
| warning_value | The new string that will constitute the new value.                                                                               |
| scope         | This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM. |

# 182

## DBMS\_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.

# DBMS\_WORKLOAD\_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the [DBMS\\_WORKLOAD\\_REPLAY](#) package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_WORKLOAD\\_CAPTURE Subprograms](#)

## See Also:

*Oracle Database Testing Guide* for more information about database replay

## 183.1 DBMS\_WORKLOAD\_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

## 183.2 DBMS\_WORKLOAD\_CAPTURE Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_CAPTURE`.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER roml CASCADE;
CREATE USER roml IDENTIFIED BY roml;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO roml;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO roml;
```

```
GRANT CREATE SESSION TO roml;
```

```
GRANT CREATE ANY DIRECTORY TO roml;
GRANT SELECT_CATALOG_ROLE TO roml;
GRANT BECOME USER TO roml;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

## 183.3 Summary of DBMS\_WORKLOAD\_CAPTURE Subprograms

This table lists the DBMS\_WORKLOAD\_CAPTURE package subprograms in alphabetical order.

**Table 183-1 DBMS\_WORKLOAD\_CAPTURE Package Subprograms**

| Subprogram                                    | Description                                                                                                                                                                                                                                 |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_FILTER Procedures</a>         | Adds a specified filter                                                                                                                                                                                                                     |
| <a href="#">DECRYPT_CAPTURE Procedure</a>     | This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.                                                                                |
| <a href="#">DELETE_CAPTURE_INFO Procedure</a> | Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID                                                                                                              |
| <a href="#">DELETE_FILTER Procedure</a>       | Deletes a specified filter                                                                                                                                                                                                                  |
| <a href="#">ENCRYPT_CAPTURE Procedure</a>     | This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256.                                                                                                   |
| <a href="#">EXPORT_AWR Procedure</a>          | Exports the AWR snapshots associated with a given capture ID                                                                                                                                                                                |
| <a href="#">FINISH_CAPTURE Procedure</a>      | Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured                                                                                           |
| <a href="#">GET_CAPTURE_INFO Function</a>     | Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID |
| <a href="#">IMPORT_AWR Function</a>           | Imports the AWR snapshots associated with a given capture ID                                                                                                                                                                                |
| <a href="#">REPORT Function</a>               | Returns a report on the workload capture under consideration using one or more different sources                                                                                                                                            |
| <a href="#">START_CAPTURE Procedure</a>       | Initiates workload capture on all instances                                                                                                                                                                                                 |

## 183.3.1 ADD\_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
 fname IN VARCHAR2 NOT NULL,
 fattribute IN VARCHAR2 NOT NULL,
 fvalue IN VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
 fname IN VARCHAR2 NOT NULL,
 fattribute IN VARCHAR2 NOT NULL,
 fvalue IN NUMBER NOT NULL);
```

### Parameters

**Table 183-2 ADD\_FILTER Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fname      | Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)                                                                                                                                                                                                                                                                  |
| fattribute | Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: <ul style="list-style-type: none"> <li>INSTANCE_NUMBER - type NUMBER</li> <li>USER - type STRING</li> <li>MODULE - type STRING</li> <li>ACTION - type STRING</li> <li>PROGRAM - type STRING</li> <li>SERVICE - type STRING</li> <li>PDB_NAME - type STRING</li> </ul> |
| fvalue     | Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).          |

### Usage Notes

- The workload capture filters work in either the `DEFAULT INCLUSION` or the `DEFAULT EXCLUSION` mode as determined by the `default_action` input to the [START\\_CAPTURE Procedure](#).
- `ADD_FILTER` adds a new filter that affects the next workload capture, and whether the filters are considered as `INCLUSION` filters or `EXCLUSION` filters depends on the value of the `default_action` input to [START\\_CAPTURE Procedure](#).
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the [START\\_CAPTURE Procedure](#) is executed.
- All the filters are listed in the `DBA_WORKLOAD_FILTERS` view.

- You can capture the workload for a particular PDB by specifying a filter of PDB type.

### Examples

- By default, a capture works in an `INCLUSION` mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from `SCOTT`, you can add the following filter before starting a capture.

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
```

- Multiple filters are evaluated according to the logical disjunction operator `OR`. Therefore, if you want to record workload for both `SCOTT` and `JOHN`, you add an additional filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
```

- In a CDB, you exclude the workload of a particular PDB by the filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME', 'CDB1_PDB1');
```

- To use `DBMS_APPLICATION_INFO` to identify workload that is issued to the database:

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
-- run some SQL here
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
-- run logging SQL
```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION', 'ORDER_ENTRY_LOG');
```

- To filter out the full order entry transaction, define a filter:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_ENTRY');
```

## 183.3.2 DECRYPT\_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (
 src_dir IN VARCHAR2,
 dst_dir IN VARCHAR2);
```

## Parameters

**Table 183-3 DECRYPT\_CAPTURE Procedure Parameters**

| Parameter | Description                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir   | A directory object pointing to the workload capture to be decrypted.<br>This parameter is case sensitive.                                                                |
| dst_dir   | A directory object pointing to an OS path that has write permissions. The decrypted capture files will be written to this directory<br>This parameter is case sensitive. |

## Usage Notes

This procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encrypted` (case-sensitive).

## 183.3.3 DELETE\_CAPTURE\_INFO Procedure

This procedure deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
 capture_id IN NUMBER);
```

## Parameters

**Table 183-4 DELETE\_CAPTURE\_INFO Procedure Parameters**

| Parameter  | Description                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------|
| capture_id | ID of the workload capture that needs to be deleted.<br>Corresponds to <code>DBA_WORKLOAD_CAPTURES.ID</code> . (Mandatory) |

## Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

## 183.3.4 DELETE\_FILTER Procedure

This procedure deletes a specified filter.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
 filter_name IN VARCHAR2(40) NOT NULL);
```

## Parameters

**Table 183-5 DELETE\_FILTER Procedure Parameters**

| Parameter   | Description          |
|-------------|----------------------|
| filter_name | Filter to be deleted |

## Usage Notes

The DELETE\_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD\\_FILTER Procedures](#) after any capture has been completed. Filters that have been added using ADD\_FILTER before a START\_CAPTURE and FINISH\_CAPTURE cannot be deleted anymore using this subprogram.

## 183.3.5 ENCRYPT\_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in START\_CAPTURE procedure.

## Syntax

```
DBMS_WORKLOAD_CAPTURE. ENCRYPT_CAPTURE
 src_dir IN VARCHAR2,
 dst_dir IN VARCHAR2,
 encryption IN VARCHAR2 DEFAULT 'AES256');
```

## Parameters

**Table 183-6 ENCRYPT\_CAPTURE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir    | A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive.                                                                    |
| dst_dir    | A directory object pointing to an OS path that has write permissions.<br>The encrypted capture files will be written to this directory. The parameter value is case sensitive. |
| encryption | Specifies if sensitive data in workload capture is encrypted or not.<br>The possible values are: AES128, AES192, and AES256.<br>The default value is AES256.                   |

## Usage Notes

For encrypted capture, the ENCRYPT\_CAPTURE Procedure relies on a software keystore. The identifier is oracle.rat.database\_replay.encryption (case-sensitive).

## 183.3.6 EXPORT\_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
 capture_id IN NUMBER);
```

### Parameters

**Table 183-7 EXPORT\_AWR Procedure Parameters**

| Parameter  | Description                                                           |
|------------|-----------------------------------------------------------------------|
| capture_id | ID of the capture whose AWR snapshots are to be exported. (Mandatory) |

### Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_CAPTURES` was not created by calling the [GET\\_CAPTURE\\_INFO Function](#)) and the AWR snapshots that correspond to the original capture time period are still available.

## 183.3.7 FINISH\_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
 timeout IN NUMBER DEFAULT 30
 reason IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 183-8 FINISH\_CAPTURE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeout   | Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush its capture buffers. Default value: 30 seconds |
| reason    | Specifies a reason for calling the procedure. The reason appears in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code> .                                                                       |

### Usage Notes

- By default, `FINISH_CAPTURE` waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.

- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.
- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and does not send its acknowledgement to `FINISH_CAPTURE`.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`.

### 183.3.8 GET\_CAPTURE\_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`

#### Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
 dir IN VARCHAR2)
RETURN NUMBER;
```

#### Parameters

**Table 183-9 GET\_CAPTURE\_INFO Function Parameters**

| Parameter        | Description                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>dir</code> | Name of the <code>DIRECTORY</code> object (case sensitive) where all the workload capture files are located (Mandatory) |

#### Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in `DBA_WORKLOAD_CAPTURES`, the [GET\\_CAPTURE\\_INFO Function](#) simply returns that row's `DBA_WORKLOAD_CAPTURES.ID`. If no existing row matches the capture present in the stipulated directory a new row is inserted to `DBA_WORKLOAD_CAPTURES` and that row's `ID` is returned.

### 183.3.9 IMPORT\_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the `EXPORT_AWR` procedure.

#### Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
 capture_id IN NUMBER,
 staging_schema IN VARCHAR2,
 force_cleanup IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

## Parameters

**Table 183-10 IMPORT\_AWR Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_id     | ID of the capture whose AWR snapshots should be imported. (Mandatory)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| staging_schema | Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| force_cleanup  | <p>Values:</p> <ul style="list-style-type: none"> <li>TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL: <pre>SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_\$%';</pre> </li> <li>Use this option only if you are sure that there are no important data in any such tables in the staging_schema.</li> <li>FALSE - (default) no tables dropped from the staging_schema prior to the import operation</li> </ul> |

## Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR\_DBID column in the DBA\_WORKLOAD\_CAPTURES view.

## Usage Notes

IMPORT\_AWR fails if the staging\_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$\_SNAPSHOT or WRH\$\_PARAMETER. Please drop any such tables in the staging\_schema before invoking IMPORT\_AWR.

## Related Topics

- [EXPORT\\_AWR Procedure](#)  
This procedure exports the AWR snapshots associated with a given capture ID.

## 183.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
 capture_id IN NUMBER,
 format IN VARCHAR2)
RETURN CLOB;
```

## Parameters

**Table 183-11 REPORT Function Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_id | ID of the workload capture whose capture report is required. (Mandatory)<br><br>This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture. |
| format     | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)                                                                                                                                                                                        |

## Return Values

The report body in the desired format returned as a CLOB.

**Table 183-12 Constants Used by Report Function**

| Constant  | Type        | Value  | Description                                                                     |
|-----------|-------------|--------|---------------------------------------------------------------------------------|
| TYPE_HTML | VARCHAR2(4) | 'HTML' | Generates the HTML version of the report                                        |
| TYPE_TEXT | VARCHAR2(4) | 'TEXT' | Used as input to the format argument to generate the text version of the report |

## 183.3.11 START\_CAPTURE Procedure

This procedure initiates workload capture on all instances.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
 name IN VARCHAR2,
 dir IN VARCHAR2,
 duration IN NUMBER DEFAULT NULL,
 default_action IN VARCHAR2 DEFAULT 'INCLUDE',
 auto_unrestrict IN BOOLEAN DEFAULT TRUE,
 capture_sts IN BOOLEAN DEFAULT FALSE,
 sts_cap_interval IN NUMBER DEFAULT 300,
 plsqli_mode IN VARCHAR2 DEFAULT 'TOP_LEVEL',
 encryption IN VARCHAR2 DEFAULT NULL);
```

## Parameters

Table 183-13 START\_CAPTURE Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name            | Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| dir             | Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| duration        | Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| default_action  | Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. <ul style="list-style-type: none"> <li>If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the <a href="#">ADD_FILTER Procedures</a> are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.)</li> <li>If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the <a href="#">ADD_FILTER Procedures</a> are treated as INCLUSION filters, determining the workload that is captured.</li> </ul> |
| auto_unrestrict | Can be either TRUE or FALSE. <ul style="list-style-type: none"> <li>If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT)</li> <li>If FALSE, no database instance is automatically unrestricted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| capture_sts     | If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the <a href="#">EXPORT_AWR Procedure</a> along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET').<br><br>If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.                                                                                                                                                                                                                                                               |

**Table 183-13 (Cont.) START\_CAPTURE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sts_cap_interval | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.                                                                                                                                                                                                                                                                                              |
| plsql_mode       | Specifies the PL/SQL capture mode: <ul style="list-style-type: none"> <li>• TOP_LEVEL — only top-level PL/SQL calls are captured</li> <li>• EXTENDED — both top-level PL/SQL calls and SQL called from PL/SQL are captured</li> </ul>                                                                                                                                                                          |
| encryption       | Specify if sensitive data in workload capture is encrypted or not.<br><br>The possible values are: <ul style="list-style-type: none"> <li>• NULL — capture files are not encrypted</li> <li>• AES128 — capture files are encrypted using AES128</li> <li>• AES192 — capture files are encrypted using AES192</li> <li>• AES256 — capture files is encrypted using AES256</li> </ul> The default value is NULL. |

### Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` are recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the [FINISH\\_CAPTURE Procedure](#) is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the [ADD\\_FILTER Procedures](#)) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the [DBMS\\_SCHEDULER](#) package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are `UNRESTRICTED` upon a successful invocation of `START_CAPTURE`. Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.
- For encrypted capture, the `START_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

- You must configure a software keystore in `auto-login` mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.

# DBMS\_WORKLOAD\_REPLAY

The `DBMS_WORKLOAD_REPLAY` package provides a interface to replay a workload capture.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_WORKLOAD\\_REPLAY Subprograms](#)

## See Also:

## 184.1 DBMS\_WORKLOAD\_REPLAY Overview

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the `DBMS_WORKLOAD_CAPTURE` package.

Typically, the `DBMS_WORKLOAD_CAPTURE` package is used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package is subsequently used in a test system to replay the captured production workload for testing purposes.

### Related Topics

- [DBMS\\_WORKLOAD\\_CAPTURE](#)  
The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

## 184.2 DBMS\_WORKLOAD\_REPLAY Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_REPLAY`.

The following code sample shows the minimum set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO roml;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO roml;
```

```
GRANT CREATE SESSION TO roml;
GRANT CREATE ANY DIRECTORY TO roml;
GRANT SELECT_CATALOG_ROLE TO roml;
GRANT BECOME USER TO roml;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

## 184.3 Summary of DBMS\_WORKLOAD\_REPLAY Subprograms

This table lists the `DBMS_WORKLOAD_REPLAY` package subprograms in alphabetical order.

**Table 184-1 DBMS\_WORKLOAD\_REPLAY Package Subprograms**

| Subprogram                                         | Description                                                                                                                                                       |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_CAPTURE</a> Function               | Adds the given capture to the current schedule                                                                                                                    |
| <a href="#">ADD_FILTER</a> Procedure               | Adds a filter to replay only a subset of the captured workload                                                                                                    |
| <a href="#">ADD_SCHEDULE_ORDERING</a> Function     | Adds a schedule order between two captures                                                                                                                        |
| <a href="#">ASSIGN_GROUP_TO_INSTANCE</a> Procedure | Modifies the view <code>DBA_WORKLOAD_GROUP_ASSIGNMENTS</code>                                                                                                     |
| <a href="#">BEGIN_REPLAY_SCHEDULE</a> Procedure    | Initiates the creation of a reusable replay schedule                                                                                                              |
| <a href="#">CALIBRATE</a> Function                 | Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload     |
| <a href="#">CANCEL_REPLAY</a> Procedure            | Cancels the workload replay in progress                                                                                                                           |
| <a href="#">COMPARE_PERIOD_REPORT</a> Procedure    | Generates a report comparing a replay to its capture or to another replay of the same capture                                                                     |
| <a href="#">COMPARE_SQLSET_REPORT</a> Function     | Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture |
| <a href="#">CREATE_FILTER_SET</a> Procedure        | Uses the replay filters added to create a set of filters to use against the replay in <code>replay_dir</code>                                                     |
| <a href="#">DELETE_FILTER</a> Procedure            | Deletes the named filter                                                                                                                                          |
| <a href="#">DELETE_REPLAY_INFO</a> Procedure       | Deletes the rows in <code>DBA_WORKLOAD_REPLAYS</code> that corresponds to the given workload replay ID                                                            |

**Table 184-1 (Cont.) DBMS\_WORKLOAD\_REPLAY Package Subprograms**

| Subprogram                                               | Description                                                                                                                                                                                                  |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">END_REPLAY_SCHEDULE Procedure</a>            | Wraps up the creation of the current schedule                                                                                                                                                                |
| <a href="#">EXPORT_AWR Procedure</a>                     | Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID                                                                                                                  |
| <a href="#">GENERATE_CAPTURE_SUBSET Procedure</a>        | Creates a new capture from an existing workload capture                                                                                                                                                      |
| <a href="#">GET_DIVERGING_STATEMENT Function</a>         | Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID                                                                                                                  |
| <a href="#">GET_REPLAY_DIRECTORY Function</a>            | Returns the current replay directory set by the <a href="#">SET_REPLAY_DIRECTORY Procedure</a> .                                                                                                             |
| <a href="#">GET_REPLAY_INFO Function</a>                 | Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory                                                                              |
| <a href="#">GET_REPLAY_TIMEOUT Procedure</a>             | Retrieves the replay timeout setting                                                                                                                                                                         |
| <a href="#">IMPORT_AWR Function</a>                      | Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID                                                                                                                  |
| <a href="#">INITIALIZE_CONSOLIDATED_REPLAY Procedure</a> | Puts the database state in INIT for a multiple-capture replay                                                                                                                                                |
| <a href="#">INITIALIZE_REPLAY Procedure</a>              | Initializes replay, and loads specific data produced during processing into the database                                                                                                                     |
| <a href="#">IS_REPLAY_PAUSED Function</a>                | Reports whether the replay is currently paused                                                                                                                                                               |
| <a href="#">LOAD_LONG_SQLTEXT Procedure</a>              | Loads the captured SQL statements that are longer than 1000 characters to the DBA_WORKLOAD_LONG_SQLTEXT view                                                                                                 |
| <a href="#">PAUSE_REPLAY Procedure</a>                   | Pauses the in-progress workload replay                                                                                                                                                                       |
| <a href="#">POPULATE_DIVERGENCE Procedure</a>            | Precomputes the divergence information for the given call, stream, or the whole replay so that the <a href="#">GET_DIVERGING_STATEMENT Function</a> returns as quickly as possible for the precomputed calls |
| <a href="#">PREPARE_CONSOLIDATED_REPLAY Procedure</a>    | Puts the database in a special "Prepare" mode for a multiple-capture replay                                                                                                                                  |
| <a href="#">PREPARE_REPLAY Procedure</a>                 | Puts the database in a special "Prepare" mode                                                                                                                                                                |
| <a href="#">PROCESS_CAPTURE Procedure</a>                | Processes the workload capture found in <code>capture_dir</code> in place                                                                                                                                    |
| <a href="#">REMAP_CONNECTION Procedure</a>               | Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay                                                                    |
| <a href="#">REMOVE_CAPTURE Procedure</a>                 | Removes the given capture from the current schedule                                                                                                                                                          |
| <a href="#">REMOVE_SCHEDULE_ORDERING Procedure</a>       | Removes an existing schedule order from the current replay schedule                                                                                                                                          |
| <a href="#">REPORT Function</a>                          | Generates a report on the given workload replay                                                                                                                                                              |
| <a href="#">RESUME_REPLAY Procedure</a>                  | Resumes a paused workload replay                                                                                                                                                                             |

**Table 184-1 (Cont.) DBMS\_WORKLOAD\_REPLAY Package Subprograms**

| Subprogram                                          | Description                                                                                                                             |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REUSE_REPLAY_FILTER_SET Procedure</a>   | Reuses filters in the specified filter set as if each were added using the <a href="#">ADD_SCHEDULE_ORDERING Function</a>               |
| <a href="#">SET_ADVANCED_PARAMETER Procedure</a>    | Sets an advanced parameter for replay besides the ones used with the <a href="#">PREPARE_REPLAY Procedure</a>                           |
| <a href="#">SET_REPLAY_DIRECTORY Procedure</a>      | Sets a directory that contains multiple workload captures as the current replay directory                                               |
| <a href="#">SET_REPLAY_TIMEOUT Procedure</a>        | Sets the replay timeout setting                                                                                                         |
| <a href="#">SET_SQL_MAPPING Procedure</a>           | Specifies SQL statements to be skipped or replaced during a database replay operation                                                   |
| <a href="#">SET_USER_MAPPING Procedure</a>          | Sets a new schema or user name to be used during replay instead of the captured user                                                    |
| <a href="#">START_CONSOLIDATED_REPLAY Procedure</a> | Starts the replay of a multiple-capture capture                                                                                         |
| <a href="#">START_REPLAY Procedure</a>              | Starts the workload replay                                                                                                              |
| <a href="#">USE_FILTER_SET Procedure</a>            | Uses the given filter set that has been created by calling the <a href="#">CREATE_FILTER_SET Procedure</a> to filter the current replay |

## 184.3.1 ADD\_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

### Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
 capture_dir_name IN VARCHAR2,
 start_delay_seconds IN NUMBER DEFAULT 0,
 stop_replay IN BOOLEAN FALSE,
 take_begin_snapshot IN BOOLEAN TRUE,
 take_end_snapshot IN BOOLEAN TRUE,
 query_only IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
 capture_dir_name IN VARCHAR2,
 start_delay_seconds IN NUMBER DEFAULT 0,
 stop_replay IN BOOLEAN FALSE,
 take_begin_snapshot IN BOOLEAN TRUE,
 take_end_snapshot IN BOOLEAN TRUE,
 query_only IN VARCHAR2 DEFAULT 'N')
RETURN NUMBER;
```

## Parameters

**Table 184-2 ADD\_CAPTURE Function Parameters**

| Parameter           | Description                                                                          |
|---------------------|--------------------------------------------------------------------------------------|
| capture_dir_name    | Name of the OS directory containing the capture under the replay top-level directory |
| start_delay_seconds | Delay time in seconds before the replay of this capture starts                       |
| stop_replay         | Stop the replay after it finishes                                                    |
| take_begin_snapshot | Take an AWR snapshot when the replay of this capture starts                          |
| take_end_snapshot   | Take an AWR snapshot when the replay of this capture finishes                        |
| query_only          | Replay only the read-only queries of this workload capture                           |

## Usage Notes

The [SET\\_REPLAY\\_DIRECTORY Procedure](#) must have already been called.

## 184.3.2 ADD\_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the [CREATE\\_FILTER\\_SET Procedure](#). This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE\_FILTER\_SET when creating the filter set.

## Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
 fname IN VARCHAR2,
 fattribute IN VARCHAR2,
 fvalue IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
 fname IN VARCHAR2,
 fattribute IN VARCHAR2,
 fvalue IN NUMBER);
```

## Parameters

**Table 184-3 ADD\_FILTER Procedure Parameters**

| Parameter | Description                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------|
| fname     | (Mandatory) Name of the filter. Can be used to delete the filter later if it is not required. |

**Table 184-3 (Cont.) ADD\_FILTER Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                   |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fattribute | (Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type STRING : <ul style="list-style-type: none"> <li>• USER</li> <li>• MODULE</li> <li>• ACTION</li> <li>• PROGRAM</li> <li>• SERVICE</li> <li>• CONNECTION_STRING</li> </ul>                                                                            |
| fvalue     | (Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. Currently all the listed values of fattribute are of type STRING. INSTANCE_NUMBER is a NUMBER attribute. It is currently only supported for capture. |

### 184.3.3 ADD\_SCHEDULE\_ORDERING Function

This function adds a schedule order between two captures.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD\\_SCHEDULE\\_ORDERING Function](#). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
 schedule_capture_id IN VARCHAR2,
 waitfor_capture_id IN VARCHAR2)
RETURN NUMBER;
```

#### Parameters

**Table 184-4 ADD\_SCHEDULE\_ORDERING Function Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_capture_id | Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by <code>waitfor_capture_id</code> runs to completion.          |
| waitfor_capture_id  | Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by <code>schedule_capture_id</code> will not start until the replay of this capture runs to completion. |

### Return Values

Returns a non-zero error code if the constraint cannot be added

### Usage Notes

The two captures must have already been added to the replay schedule.

## 184.3.4 ASSIGN\_GROUP\_TO\_INSTANCE Procedure

This procedure modifies the view DBA\_WORKLOAD\_GROUP\_ASSIGNMENTS.

### Syntax

```
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
 group_id IN INTEGER,
 instance_number IN INTEGER);
```

### Parameters

**Table 184-5** ASSIGN\_GROUP\_TO\_INSTANCE Procedure Parameters

| Parameter       | Description                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| group_id        | The identifier of the specified group of capture files                                                    |
| instance_number | The number used for instance registration. It is equivalent to the INSTANCE_NUMBER column in V\$INSTANCE. |

#### See Also:

- V\$INSTANCE in *Oracle Database Reference*

## 184.3.5 BEGIN\_REPLAY\_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

### Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE (
 replay_dir_obj IN VARCHAR2,
 schedule_name IN VARCHAR2);
```

## Parameters

**Table 184-6 BEGIN\_REPLAY\_SCHEDULE Procedure Parameters**

| Parameter      | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| replay_dir_obj | Directory object that points to the replay directory that contains all the capture directories involved in the schedule |
| schedule_name  | Name of the schedule to be replayed                                                                                     |

## Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
  - The workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
  - The user must have copied the capture directory appropriately.
  - The database is not in replay mode.
  - The [SET\\_REPLAY\\_DIRECTORY Procedure](#) has already been called.

## 184.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

### Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
 capture_dir IN VARCHAR2,
 process_per_cpu IN BINARY_INTEGER DEFAULT 4,
 threads_per_process IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

## Parameters

**Table 184-7 CALIBRATE Function Parameters**

| Parameter           | Description                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| capture_dir         | Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data |
| process_per_cpu     | Maximum number of processes allowed for each CPU (default is 4)                                                    |
| threads_per_process | Maximum number of threads allowed for each process (default is 50)                                                 |

## Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

#### Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

### 184.3.7 CANCEL\_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
 error_msg IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 184-8 CANCEL\_REPLAY Procedure Parameters**

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| error_msg | An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. |

#### Usage Notes

Prerequisite: A call to the [INITIALIZE\\_REPLAY Procedure](#), or [PREPARE\\_REPLAY Procedure](#), or [START\\_REPLAY Procedure](#) was already issued.

### 184.3.8 COMPARE\_PERIOD\_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
 replay_id1 IN NUMBER,
 replay_id2 IN NUMBER,
 format IN VARCHAR2,
 result OUT CLOB);
```

## Parameters

**Table 184-9 COMPARE\_PERIOD\_REPORT Procedure Parameters**

| Parameter  | Description                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------|
| replay_id1 | First ID of the workload replay whose report is requested                                                                  |
| replay_id2 | Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture. |
| format     | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.          |
| result     | Output of the report (CLOB)                                                                                                |

## 184.3.9 COMPARE\_SQLSET\_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

### Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
 replay_id1 IN NUMBER,
 replay_id2 IN NUMBER,
 format IN VARCHAR2,
 r_level IN VARCHAR2 DEFAULT 'ALL',
 r_sections IN VARCHAR2 DEFAULT 'ALL',
 result OUT CLOB)
RETURN VARCHAR2;
```

## Parameters

**Table 184-10 COMPARE\_SQLSET\_REPORT Function Parameters**

| Parameter  | Description                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_id1 | First ID of the workload replay after a change                                                                                                     |
| replay_id2 | Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.                                   |
| format     | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT. |
| r_level    | See level parameter in the <a href="#">REPORT_ANALYSIS_TASK Function</a> in the DBMS_SQLPA package                                                 |
| r_sections | See section parameter in the <a href="#">REPORT_ANALYSIS_TASK Function</a> in the DBMS_SQLPA package                                               |
| result     | Output of the report (CLOB)                                                                                                                        |

## 184.3.10 CREATE\_FILTER\_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`.

It includes all the replay filters that have already been added by the [ADD\\_FILTER Procedure](#). After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the [USE\\_FILTER\\_SET Procedure](#).

### Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
 replay_dir IN VARCHAR2,
 filter_set IN VARCHAR2,
 default_action IN VARCHAR2 DEFAULT 'INCLUDE');
```

### Parameters

**Table 184-11 CREATE\_FILTER\_SET Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>replay_dir</code>     | Object directory of the replay to be filtered                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>filter_set</code>     | Name of the filter set to create (to use in <a href="#">USE_FILTER_SET Procedure</a> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>default_action</code> | <p>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.)</p> <p>If it is <code>INCLUDE</code>, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the <a href="#">ADD_SCHEDULE_ORDERING Function</a> are treated as <code>EXCLUSION</code> filters, and will determine the workload that will not be replayed.</p> <p>If it is <code>EXCLUDE</code>, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the <a href="#">ADD_SCHEDULE_ORDERING Function</a> are treated as <code>INCLUSION</code> filters, and will determine the workload that is replayed.</p> <p>Default: <code>INCLUDE</code> and all the filters specified are assumed to be <code>EXCLUSION</code> filters</p> |

### Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

## 184.3.11 DELETE\_FILTER Procedure

This procedure deletes the named filter.

### Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
 fname IN VARCHAR2);
```

### Parameters

**Table 184-12** DELETE\_FILTER Procedure Parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| fname     | (Mandatory) Name of the filter that must be deleted |

## 184.3.12 DELETE\_REPLAY\_INFO Procedure

This procedure deletes the rows in DBA\_WORKLOAD\_REPLAYS that correspond to the given workload replay ID.

### Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
 replay_id IN NUMBER);
```

### Parameters

**Table 184-13** DELETE\_REPLAY\_INFO Procedure Parameters

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| replay_id | (Mandatory) ID of the workload replay that must be deleted.<br>Corresponds to DBA_WORKLOAD_REPLAYS.ID |

## 184.3.13 END\_REPLAY\_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

### Usage Notes

The [BEGIN\\_REPLAY\\_SCHEDULE Procedure](#) must have already been called.

## 184.3.14 EXPORT\_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

### Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
 replay_id IN NUMBER);
```

### Parameters

**Table 184-14 EXPORT\_AWR Function Parameters**

| Parameter | Description                                                         |
|-----------|---------------------------------------------------------------------|
| replay_id | (Mandatory) ID of the replay whose AWR snapshots are to be exported |

### Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT\_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA\_WORKLOAD\_REPLAYS was not created by calling the [GET\\_REPLAY\\_INFO Function](#)) and the AWR snapshots that correspond to that replay time period are still available.

## 184.3.15 GENERATE\_CAPTURE\_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
 input_capture_dir IN VARCHAR2,
 output_capture_dir IN VARCHAR2,
 new_capture_name IN VARCHAR2,
 begin_time IN NUMBER,
 begin_include_incomplete IN BOOLEAN DEFAULT TRUE,
 end_time IN NUMBER,
 end_include_incomplete IN BOOLEAN DEFAULT FALSE,
 parallel_level IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 184-15 GENERATE\_CAPTURE\_SUBSET Procedure Parameters**

| Parameter         | Description                                                                          |
|-------------------|--------------------------------------------------------------------------------------|
| input_capture_dir | (Mandatory) Name of the directory object that points to an existing workload capture |

**Table 184-15 (Cont.) GENERATE\_CAPTURE\_SUBSET Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| output_capture_dir       | (Mandatory) Name of the directory object that points to the new capture                                                                                                                                                                             |
| new_capture_name         | (Mandatory) Name of new capture                                                                                                                                                                                                                     |
| begin_time               | Start of the time range - time offset in seconds from the start of a workload capture                                                                                                                                                               |
| begin_include_incomplete | Column to include incomplete calls caused by begin_time                                                                                                                                                                                             |
| end_time                 | End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture. |
| end_include_incomplete   | Column to include incomplete calls caused by end_time                                                                                                                                                                                               |
| parallel_level           | Number of Oracle processes used to process the input captures in a parallel fashion. The NULL default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.                    |

## 184.3.16 GET\_DIVERGING\_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
 replay_id IN NUMBER,
 stream_id IN NUMBER,
 call_counter IN NUMBER)
RETURN CLOB;
```

### Parameters

**Table 184-16 GET\_DIVERGING\_STATEMENT Function Parameters**

| Parameter    | Description                                  |
|--------------|----------------------------------------------|
| replay_id    | ID of the replay in which that call diverged |
| stream_id    | Stream ID of the diverging call              |
| call_counter | Call counter of the diverging call           |

### Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value

- This function will silently invoke the [POPULATE\\_DIVERGENCE Procedure](#) to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

## 184.3.17 GET\_REPLAY\_DIRECTORY Function

This function returns the current replay directory set by the SET\_REPLAY\_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
RETURN VARCHAR2;
```

### Related Topics

- [SET\\_REPLAY\\_DIRECTORY Procedure](#)  
This procedure sets a directory that contains multiple workload captures as the current replay directory.

## 184.3.18 GET\_REPLAY\_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
 replay_dir IN VARCHAR2,
 load_details IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

### Parameters

**Table 184-17 GET\_REPLAY\_INFO Function Parameters**

| Parameter    | Description                                                                |
|--------------|----------------------------------------------------------------------------|
| replay_dir   | (Mandatory) Name of the workload replay directory object (case sensitive). |
| load_details | Load the divergence and tracked commits data. The default value is FALSE.  |

### Return Values

The procedure returns the CAPTURE\_ID, which can be associated with both DBA\_WORKLOAD\_CAPTURES.ID and DBA\_WORKLOAD\_REPLAYS.CAPTURE\_ID to access the imported information.

### Usage Notes

- The procedure first imports a row into DBA\_WORKLOAD\_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA\_WORKLOAD\_REPLAYS.

- The procedure will not insert new rows to DBA\_WORKLOAD\_CAPTURES and DBA\_WORKLOAD\_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

## 184.3.19 GET\_REPLAY\_TIMEOUT Procedure

This procedure gets the replay timeout setting.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
 enabled OUT BOOLEAN,
 min_delay OUT NUMBER,
 max_delay OUT NUMBER,
 delay_factor OUT NUMBER);
```

### Parameters

**Table 184-18** GET\_REPLAY\_TIMEOUT Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enabled      | TRUE if the timeout action is enabled, FALSE otherwise.                                                                                                                                                        |
| min_delay    | Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay.                                                                                   |
| max_delay    | Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay.                                                                                               |
| delay_factor | Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. |

### Usage Notes

This procedure can be called anytime during replay.

## 184.3.20 IMPORT\_AWR Function

This procedure imports the AWR snapshots from a given replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
 replay_id IN NUMBER,
 staging_schema IN VARCHAR2)
RETURN NUMBER;
```

## Parameters

**Table 184-19** IMPORT\_AWR Function Parameters

| Parameter      | Description                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_id      | (Mandatory) ID of the replay whose AWR snapshots must be imported                                                                                                                                                      |
| staging_schema | (Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. |

## Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR\_DBID column in the DBA\_WORKLOAD\_REPLAYS view.

## Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT\\_AWR Procedure](#).
- IMPORT\_AWR will fail if the staging\_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$\_SNAPSHOT or WRH\$\_PARAMETER. Drop any such tables in the staging\_schema before invoking IMPORT\_AWR.

## 184.3.21 INITIALIZE\_CONSOLIDATED\_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay\_dir which has already been defined by the [SET\\_REPLAY\\_DIRECTORY Procedure](#), pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule\_name from the directory, and loads required connection data into the replay system.

## Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
 replay_name IN VARCHAR2,
 schedule_name IN VARCHAR2,
 plsqli_mode IN VARCHAR2 DEFAULT 'TOP_LEVEL');
```

## Parameters

**Table 184-20** INITIALIZE\_CONSOLIDATED\_REPLAY Procedure Parameters

| Parameter   | Description                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------|
| replay_name | (Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name. |

**Table 184-20 (Cont.) INITIALIZE\_CONSOLIDATED\_REPLAY Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_name | Name of the schedule to be replayed. It must have been created through the <a href="#">BEGIN_REPLAY_SCHEDULE Procedure</a> for the replay directory replay_dir.                                                                                                                                                                                        |
| plsql_mode    | Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> <li>• TOP_LEVEL — only top-level PL/SQL calls are replayed</li> <li>• EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.</li> </ul> |

### Usage Notes

#### Prerequisites:

- Workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The [SET\\_REPLAY\\_DIRECTORY Procedure](#) has been called.

## 184.3.22 INITIALIZE\_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE\_REPLAY Procedure).

### Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
 replay_name IN VARCHAR2,
 replay_dir IN VARCHAR2,
 plsql_mode IN VARCHAR2 DEFAULT 'TOP_LEVEL',
 rac_inst_list IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 184-21 INITIALIZE\_REPLAY Procedure Parameters**

| Parameter   | Description                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| replay_name | (Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.         |
| replay_dir  | Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data |

**Table 184-21 (Cont.) INITIALIZE\_REPLAY Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plsql_mode    | Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> <li>• TOP_LEVEL — only top-level PL/SQL calls are replayed</li> <li>• EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.</li> </ul> |
| rac_inst_list | Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example:<br><br>rac_inst_list='1,3,5'                                                                                                                        |

### Usage Notes

- Prerequisites:
  - Workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.

- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE\_REPLAY Procedure.

For instance, during capture the user may record the connection string each session used to connect to the server. The INITIALIZE\_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the PROCESS\_CAPTURE Procedure, the user could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to NULL. A NULL replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP\_CONNECTION Procedure.

- For encrypted capture, the INITIALIZE\_REPLAY Procedure relies on Oracle wallet. The identifier is oracle.rat.database\_replay.encrypted (case-sensitive).

### Related Topics

- [PAUSE\\_REPLAY Procedure](#)  
This procedure pauses the in-progress workload replay.
- [INITIALIZE\\_REPLAY Procedure](#)  
This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE\_REPLAY Procedure).

- [PROCESS\\_CAPTURE Procedure](#)  
This procedure processes the workload capture found in `capture_dir` in place.
- [REMAP\\_CONNECTION Procedure](#)  
This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

### 184.3.23 IS\_REPLAY\_PAUSED Function

This function reports whether the replay is currently paused.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
 RETURN BOOLEAN;
```

#### Return Values

Returns `TRUE` if the [PAUSE\\_REPLAY Procedure](#) has been called successfully and the [RESUME\\_REPLAY Procedure](#) has not been called yet.

#### Usage Notes

A call to the [START\\_REPLAY Procedure](#) must have already been issued as a prerequisite.

### 184.3.24 LOAD\_LONG\_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (
 capture_id IN NUMBER);
```

#### Parameters

**Table 184-22** LOAD\_LONG\_SQLTEXT Procedure Parameters

| Parameter               | Description                           |
|-------------------------|---------------------------------------|
| <code>capture_id</code> | Internal key for the workload capture |

#### Note:

This procedure is available starting with Oracle Database Release 18c.

#### See Also:

`DBA_WORKLOAD_LONG_SQLTEXT` in *Oracle Database Reference*

## 184.3.25 PAUSE\_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME\\_REPLAY Procedure](#) is issued or the replay is cancelled.

### Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

### Usage Notes

- Prerequisite: A call to the [START\\_REPLAY Procedure](#) must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

## 184.3.26 POPULATE\_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the `GET_DIVERGING_STATEMENT` Function returns as quickly as possible for the precomputed calls.

### Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
 replay_id IN NUMBER,
 stream_id IN NUMBER DEFAULT NULL,
 call_counter IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 184-23 POPULATE\_DIVERGENCE Procedure Parameters**

| Parameter    | Description                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_id    | ID of the replay                                                                                                                                 |
| stream_id    | Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.    |
| call_counter | Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream. |

### Related Topics

- [GET\\_DIVERGING\\_STATEMENT Function](#)  
This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

## 184.3.27 PREPARE\_CONSOLIDATED\_REPLAY Procedure

Similar to the `PREPARE_REPLAY` Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

### Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
 synchronization IN BOOLEAN,
 connect_time_scale IN NUMBER DEFAULT 100,
 think_time_scale IN NUMBER DEFAULT 100,
 think_time_auto_correct IN BOOLEAN DEFAULT TRUE,
 capture_sts IN BOOLEAN DEFAULT FALSE,
 sts_cap_interval IN NUMBER DEFAULT 300);
```

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
 synchronization IN VARCHAR2 DEFAULT 'SCN',
 connect_time_scale IN NUMBER DEFAULT 100,
 think_time_scale IN NUMBER DEFAULT 100,
 think_time_auto_correct IN BOOLEAN DEFAULT TRUE,
 capture_sts IN BOOLEAN DEFAULT FALSE,
 sts_cap_interval IN NUMBER DEFAULT 300);
```

### Parameters

**Table 184-24** PREPARE\_CONSOLIDATED\_REPLAY Procedure Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>synchronization</code> | <p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> <li>'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time).</li> <li>'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.</li> <li>'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables.</li> </ul> <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses <code>BOOLEAN</code> for this parameter:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> means 'SCN'</li> <li><code>FALSE</code> means 'TIME'</li> </ul> |

**Table 184-24 (Cont.) PREPARE\_CONSOLIDATED\_REPLAY Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| connect_time_scale      | Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 184-1".                                                                                                                                                                                                           |
| think_time_scale        | Scales the time elapsed between two successive user calls "Example 184-1" from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 184-2".                                                                                                                                                                                                                                      |
| think_time_auto_correct | Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Example 184-3".                                                                                                                                                                                                                                                                           |
| capture_sts             | If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the <a href="#">EXPORT_AWR Procedure</a> along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE. |
| sts_cap_interval        | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

## 184.3.28 PREPARE\_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

### Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
 synchronization IN BOOLEAN,
 connect_time_scale IN NUMBER DEFAULT 100,
 think_time_scale IN NUMBER DEFAULT 100,
 think_time_auto_correct IN BOOLEAN DEFAULT TRUE,
```

```

scale_up_multiplier IN NUMBER DEFAULT 1,
capture_sts IN BOOLEAN DEFAULT FALSE,
sts_cap_interval IN NUMBER DEFAULT 300,
rac_mode IN NUMBER DEFAULT GLOBAL_SYNC,
query_only IN BOOLEAN DEFAULT FALSE);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
 synchronization IN VARCHAR2 DEFAULT 'SCN',
 connect_time_scale IN NUMBER DEFAULT 100,
 think_time_scale IN NUMBER DEFAULT 100,
 think_time_auto_correct IN BOOLEAN DEFAULT TRUE,
 scale_up_multiplier IN NUMBER DEFAULT 1,
 capture_sts IN BOOLEAN DEFAULT FALSE,
 sts_cap_interval IN NUMBER DEFAULT 300),
 rac_mode IN NUMBER DEFAULT GLOBAL_SYNC,
 query_only IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 184-25** PREPARE\_REPLAY Procedure Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| think_time_scale   | <p>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 184-2".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 184-25 (Cont.) PREPARE\_REPLAY Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| think_time_auto_correct | Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Example 184-3".                                                                                                                                                                                                                                                                                                                                           |
| scale_up_multiplier     | Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the scale_up_multiplier. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.                                                                                                                                                                                                                                                         |
| capture_sts             | If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.                                                                                                                  |
| sts_cap_interval        | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| rac_mode                | Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: <ul style="list-style-type: none"> <li>GLOBAL_SYNC — Synchronization across all Oracle RAC instances. This is the default value.</li> <li>PER_INSTANCE_CLIENT — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance.</li> <li>PER_INSTANCE_SYNC — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance</li> </ul> |
| query_only              | Replays only the read-only queries of the workload capture. The default value is FALSE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the INITIALIZE\_REPLAY Procedure.
  - Any capture time connection strings that require remapping have been already done using the REMAP\_CONNECTION Procedure.
- One or more external replay clients (WRC) can be started once the PREPARE\_REPLAY procedure has been executed.
- With regard to scale\_up\_multiplier:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.

- The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
- Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
- No replay data or error divergence records are generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

#### Example 184-1 Application of the `connect_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the `connect_time_scale` is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect (5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the `connect_time_scale` is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

#### Example 184-2 Application of the `think_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued (2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
 previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
 call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
 call
12:35 : Third user call completes in 9m (takes a minute longer)
```

**Example 184-3 Application of the think\_time\_auto\_correct Parameter**

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued (2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think\_time\_scale is 100 and the think\_time\_auto\_correct is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
 call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the
 prev
 call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

## 184.3.29 PROCESS\_CAPTURE Procedure

This procedure processes the workload capture found in capture\_dir in place.

**Syntax**

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
 capture_dir IN VARCHAR2,
 parallel_level IN NUMBER DEFAULT NULL,
 synchronization IN VARCHAR2 DEFAULT 'SCN',
 plsqli_mode IN VARCHAR2 DEFAULT 'TOP_LEVEL');
```

**Parameters****Table 184-26 PROCESS\_CAPTURE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_dir    | (Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory. |
| parallel_level | Number of Oracle processes used to process the capture in parallel. The NULL default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.                          |

**Table 184-26 (Cont.) PROCESS\_CAPTURE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| synchronization | <p>Determines the synchronization mode that the user will be able to use for replay:</p> <ul style="list-style-type: none"> <li>'TIME' — When 'TIME' is selected, the replay can use 'TIME' synchronization mode only.<br/>           When 'TIME' synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time).</li> <li>'SCN' — When 'SCN' is selected, the replay can use the 'TIME' or 'SCN' synchronization mode. This is the default.<br/>           When 'SCN' synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.</li> <li>'OBJECT_ID' — When 'OBJECT_ID' is selected, replay can use the 'TIME', 'SCN', or 'OBJECT_ID' synchronization mode.<br/>           When 'OBJECT_ID' synchronization mode is used for replay, every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables.<br/>           This synchronization mode is deprecated.</li> </ul> |
| plsql_mode      | <p>Specifies the processing mode for PL/SQL:</p> <ul style="list-style-type: none"> <li>'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay.</li> <li>'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Usage Notes**

- This subprogram analyzes the workload capture found in the capture\_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture\_dir can be used as input to the [INITIALIZE\\_REPLAY Procedure](#) in order to replay the captured workload present in capture\_dir.

- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

- For encrypted capture, the `PROCESS_CAPTURE` procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encrypted` (case-sensitive).

### 184.3.30 REMAP\_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
 connection_id IN NUMBER,
 replay_connection IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
 capture_number IN VARCHAR2,
 connection_id IN NUMBER,
 replay_connection IN VARCHAR2);
```

#### Parameters

**Table 184-27** REMAP\_CONNECTION Procedure Parameters

| Parameter                      | Description                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>capture_number</code>    | Pointing to a capture of the current replay schedule                                                   |
| <code>connection_id</code>     | ID of the connection to be remapped. Corresponds to <code>DBA_WORKLOAD_CONNECTION_MAP.CONN_ID</code> . |
| <code>replay_connection</code> | New connection string to be used during replay                                                         |

#### Usage Notes

- Prior to calling `REMAP_CONNECTION` all replay connection strings are set to `NULL` by default. If a `replay_connection` is `NULL`, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable `TNS_ADMIN` is defined and the user does not call the [REMAP\\_CONNECTION Procedure](#), then the `wrc` executable will connect to the server specified in the `tnsnames.ora` file pointed to by `TNS_ADMIN`.

- A valid `replay_connection` must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

### 184.3.31 REMOVE\_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
 schedule_capture_number IN NUMBER);
```

#### Parameters

**Table 184-28 REMOVE\_CAPTURE Procedure Parameters**

| Parameter                            | Description                                                 |
|--------------------------------------|-------------------------------------------------------------|
| <code>schedule_capture_number</code> | Unique ID that identifies this capture within this schedule |

### 184.3.32 REMOVE\_SCHEDULE\_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD\\_SCHEDULE\\_ORDERING Function](#) (`schedule_capture_id`, `waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
 schedule_capture_id IN NUMBER,
 waitfor_capture_id IN NUMBER);
```

#### Parameters

**Table 184-29 REMOVE\_SCHEDULE\_ORDERING Procedure Parameters**

| Parameter                        | Description                                                                                         |
|----------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>schedule_capture_id</code> | Points to a capture that has been added to the current replay schedule (see procedure description). |
| <code>waitfor_capture_id</code>  | Points to a capture that has been added to the current replay schedule.                             |

### Usage Notes

Prerequisites:

- The [BEGIN\\_REPLAY\\_SCHEDULE Procedure](#) must have been called.
- The replay schedule order should have already been added using the [ADD\\_SCHEDULE\\_ORDERING Function](#).

## 184.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
 replay_id IN NUMBER,
 format IN VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 184-30** REPORT Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_id | (Mandatory) Specifies the ID of the workload replay whose report is requested.                                                                                                                                                                                                 |
| format    | (Mandatory) Specifies the report format. Valid values: <ul style="list-style-type: none"> <li>• HTML - Generates the HTML version of the report</li> <li>• XML - Generates the XML version of the report</li> <li>• TEXT - Generates the text version of the report</li> </ul> |

### Return Values

The report body in the desired format returned as a CLOB

## 184.3.34 RESUME\_REPLAY Procedure

This procedure resumes a paused workload replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

### Usage Notes

Prerequisite: A call to the [PAUSE\\_REPLAY Procedure](#) must have already been issued.

### 184.3.35 REUSE\_REPLAY\_FILTER\_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the `ADD_SCHEDULE_ORDERING` Function.

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the [CREATE\\_FILTER\\_SET Procedure](#) to create a new filter set.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
 replay_dir IN VARCHAR2,
 filter_set IN VARCHAR2);
```

#### Parameters

**Table 184-31 REUSE\_REPLAY\_FILTER\_SET Procedure Parameters**

| Parameter               | Description                                                       |
|-------------------------|-------------------------------------------------------------------|
| <code>replay_dir</code> | Capture ID of the existing filter set with which it is associated |
| <code>filter_set</code> | Name of the filter set to be reused                               |

#### Related Topics

- [ADD\\_SCHEDULE\\_ORDERING Function](#)  
This function adds a schedule order between two captures.

### 184.3.36 SET\_ADVANCED\_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the `PREPARE_REPLAY` Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
 pname IN VARCHAR2,
 pvalue IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
 pname IN VARCHAR2,
 pvalue IN NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
 pname IN VARCHAR2,
 pvalue IN BOOLEAN);
```

## Parameters

**Table 184-32 SET\_ADVANCED\_PARAMETER Procedure Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| pname     | Name of the parameter (case insensitive) |
| pvalue    | Value of the parameter                   |

## Usage Notes

The current parameters and values that can be used are:

```
'DO_NO_WAIT_COMMITS': (default: FALSE)
```

This parameter controls whether the COMMIT issued by replay sessions is NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITS are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITS are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITS. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

## Related Topics

- [PREPARE\\_REPLAY Procedure](#)  
This procedure puts the database state in PREPARE FOR REPLAY mode.

## 184.3.37 SET\_REPLAY\_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
 replay_dir IN VARCHAR2);
```

## Parameters

**Table 184-33 SET\_REPLAY\_DIRECTORY Procedure Parameters**

| Parameter  | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| replay_dir | Name of the OS directory containing the captures for a workload consolidation |

## 184.3.38 SET\_REPLAY\_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
 enabled OUT BOOLEAN DEFAULT TRUE,
 min_delay OUT NUMBER DEFAULT 10,
 max_delay OUT NUMBER DEFAULT 120,
 delay_factor OUT NUMBER DEFAULT 8);
```

### Parameters

**Table 184-34 SET\_REPLAY\_TIMEOUT Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enabled      | TRUE to enable the timeout action, and FALSE to disable.                                                                                                                                                                    |
| min_delay    | Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.                                                                                  |
| max_delay    | Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.                                                                                             |
| delay_factor | Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8. |

### Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter min\_delay, then the timeout action is non-operational.
  - If the delay in minutes is more than an upper bound specified by parameter max\_delay, the timeout action will abort the user call and throw ORA-15569.
  - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay\_factor.

## 184.3.39 SET\_SQL\_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

### Syntax

```
PROCEDURE SET_SQL_MAPPING (
 schedule_cap_id IN NUMBER,
 sql_id IN VARCHAR2,
 operation IN VARCHAR2,
 replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

```
PROCEDURE SET_SQL_MAPPING (
 sql_id IN VARCHAR2,
 operation IN VARCHAR2,
 replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 184-35 SET\_SQL\_MAPPING Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_cap_id | ID of a capture in the schedule                                                                                                                                                                                                                                                                                                                     |
| sql_id          | SQL identifier of the SQL statement at the time of capture                                                                                                                                                                                                                                                                                          |
| operation       | Directs that one of the following actions be performed for the specified statement during database replay: <ul style="list-style-type: none"> <li>'SKIP' — Skip the SQL statement identified by sql_id</li> <li>'REPLACE' — Replace this SQL statement identified by sql_id with the SQL statement in the replacement_sql_text parameter</li> </ul> |

### Usage Notes

- replacement\_sql\_text: When 'SKIP' is specified for the operation parameter, this parameter is NULL. When 'REPLACE' is specified for the operation parameter, this parameter's value is the SQL statement to be used.
- schedule\_cap\_id is used for consolidated replay.

## 184.3.40 SET\_USER\_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
 schedule_cap_id IN NUMBER,
 capture_user IN VARCHAR2,
```

```

replay_user IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
 capture_user IN VARCHAR2,
 replay_user IN VARCHAR2);

```

### Parameters

**Table 184-36 SET\_USER\_MAPPING Procedure Parameters**

| Parameter       | Description                                                 |
|-----------------|-------------------------------------------------------------|
| schedule_cap_id | ID of the a capture in the schedule                         |
| capture_user    | User name during the time of the workload capture           |
| replay_user     | User name to which captured user is remapped during replay. |

### Usage Notes

- A `schedule_cap_id` of `NULL` is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If `replay_user` is set to `NULL`, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

```
SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
```

- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in `NULL`.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute

```
DELETE * FROM DBA_WORKLOAD_USER_MAP
```

## 184.3.41 START\_CONSOLIDATED\_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

### Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

### Usage Notes

Prerequisites:

- The call to the [PREPARE\\_REPLAY Procedure](#) was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

## 184.3.42 START\_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

### Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

### Usage Notes

- Prerequisites:
  - The call to the [PREPARE\\_REPLAY Procedure](#) was already issued.
  - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:
 

```
$ wrc mode=calibrate replaydir=.
```

## 184.3.43 USE\_FILTER\_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the [CREATE\\_FILTER\\_SET Procedure](#).

### Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
 capture_number IN VARCHAR2,
 filter_set IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
 filter_set IN VARCHAR2);
```

### Parameters

**Table 184-37 USE\_FILTER\_SET Procedure Parameters**

| Parameter                   | Description                                          |
|-----------------------------|------------------------------------------------------|
| <code>capture_number</code> | Pointing to a capture of the current replay schedule |
| <code>filter_set</code>     | Name of the filter set                               |

### Usage Notes

The filter set must have been created by calling the [CREATE\\_FILTER\\_SET Procedure](#).

# DBMS\_WORKLOAD\_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS\\_WORKLOAD\\_REPOSITORY Subprograms](#)

## See Also:

*Oracle Database Performance Tuning Guide* for more information about the Automatic Workload Repository

## 185.1 DBMS\_WORKLOAD\_REPOSITORY Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
 DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
 1557521192, 1, 5390, 5392));
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

## 185.2 DBMS\_WORKLOAD\_REPOSITORY Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

### OBJECT Types

- [AWR\\_BASELINE\\_METRIC\\_TYPE](#) Object Type

### TABLE Types

- [AWR\\_BASELINE\\_METRIC\\_TYPE\\_TABLE](#) Table Type

- [AWRRPT\\_INSTANCE\\_LIST\\_TYPE Table Type](#)

## 185.2.1 DBMS\_WORKLOAD\_REPOSITORY AWR\_BASELINE\_METRIC\_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

### Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (
 baseline_name VARCHAR2(64),
 dbid NUMBER NOT NULL,
 instance_number NUMBER NOT NULL,
 beg_time DATE NOT NULL,
 end_time DATE NOT NULL,
 metric_id NUMBER NOT NULL,
 metric_name VARCHAR2(64) NOT NULL,
 metric_unit VARCHAR2(64) NOT NULL,
 num_interval NUMBER NOT NULL,
 interval_size NUMBER NOT NULL,
 average NUMBER NOT NULL,
 minimum NUMBER NOT NULL,
 maximum NUMBER NOT NULL);
```

### Fields

**Table 185-1 AWR\_BASELINE\_METRIC\_TYPE Fields**

| Field           | Description                               |
|-----------------|-------------------------------------------|
| baseline_name   | Name of the Baseline                      |
| dbid            | Database ID for the snapshot              |
| instance_number | Instance number for the snapshot          |
| beg_time        | Begin time of the interval                |
| end_time        | End time of the interval                  |
| metric_id       | Metric ID                                 |
| metric_name     | Metric name                               |
| metric_unit     | Unit of measurement                       |
| num_interval    | Number of intervals observed              |
| interval_size   | Interval size (in hundredths of a second) |
| average         | Average over the period                   |
| minimum         | Minimum value observed                    |
| maximum         | Maximum value observed                    |

## 185.2.2 DBMS\_WORKLOAD\_REPOSITORY AWR\_BASELINE\_METRIC\_TYPE\_TABLE Table Type

This type is used by the SELECT\_BASELINE\_METRIC Function.

### Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

### Related Topics

- [SELECT\\_BASELINE\\_METRIC Function](#)  
This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

## 185.2.3 DBMS\_WORKLOAD\_REPOSITORY AWRRPT\_INSTANCE\_LIST\_TYPE Table Type

This type provides an alternative to a comma-separated list.

### Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

## 185.3 Summary of DBMS\_WORKLOAD\_REPOSITORY Subprograms

This table lists the DBMS\_WORKLOAD\_REPOSITORY subprograms and briefly describes them.

**Table 185-2 DBMS\_WORKLOAD\_REPOSITORY Package Subprograms**

| Subprogram                                            | Description                                                                                        |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">ADD_COLORED_SQL Procedure</a>             | Adds a colored SQL ID                                                                              |
| <a href="#">ASH_GLOBAL_REPORT_HTML Function</a>       | Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format. |
| <a href="#">ASH_GLOBAL_REPORT_TEXT Function</a>       | Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format. |
| <a href="#">ASH_REPORT_ANALYTICS Function</a>         | Displays the ASH Analytics active report                                                           |
| <a href="#">ASH_REPORT_HTML Function</a>              | Displays the ASH report in HTML                                                                    |
| <a href="#">ASH_REPORT_TEXT Function</a>              | Displays the ASH report in text                                                                    |
| <a href="#">AWR_DIFF_REPORT_HTML Function</a>         | Displays the AWR Diff-Diff report in HTML                                                          |
| <a href="#">AWR_DIFF_REPORT_TEXT Function</a>         | Displays the AWR Diff-Diff report in text                                                          |
| <a href="#">AWR_GLOBAL_DIFF_REPORT_HTML Functions</a> | Displays the Global AWR Compare Periods Report in HTML                                             |

**Table 185-2 (Cont.) DBMS\_WORKLOAD\_REPOSITORY Package Subprograms**

| Subprogram                                                    | Description                                                                                                                                                                              |
|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">AWR_GLOBAL_DIFF_REPORT_TEXT Functions</a>         | Displays the Global AWR Compare Periods Report in text                                                                                                                                   |
| <a href="#">AWR_GLOBAL_REPORT_HTML Functions</a>              | Displays the Global AWR report in HTML                                                                                                                                                   |
| <a href="#">AWR_GLOBAL_REPORT_TEXT Functions</a>              | Displays the Global AWR report in text                                                                                                                                                   |
| <a href="#">AWR_REPORT_HTML Function</a>                      | Displays the AWR report in HTML                                                                                                                                                          |
| <a href="#">AWR_REPORT_TEXT Function</a>                      | Displays the AWR report in text                                                                                                                                                          |
| <a href="#">AWR_SET_REPORT_THRESHOLD Procedure</a>            | Configures specified report thresholds, including the number of rows in the report                                                                                                       |
| <a href="#">AWR_SQL_REPORT_HTML Function</a>                  | Displays the AWR SQL Report in HTML format                                                                                                                                               |
| <a href="#">AWR_SQL_REPORT_TEXT Function</a>                  | Displays the AWR SQL Report in text format                                                                                                                                               |
| <a href="#">CONTROL_RESTRICTED_SNAPSHOT Procedure</a>         | Controls the AWR snapshot creation for a database in the <i>restricted session</i> mode.                                                                                                 |
| <a href="#">CREATE_BASELINE Functions &amp; Procedures</a>    | Creates a single baseline                                                                                                                                                                |
| <a href="#">CREATE_BASELINE_TEMPLATE Procedures</a>           | Creates a baseline template                                                                                                                                                              |
| <a href="#">CREATE_REMOTE_SNAPSHOT Function and Procedure</a> | Creates a manual <i>remote</i> snapshot immediately using the Remote Management Framework (RMF)                                                                                          |
| <a href="#">CREATE_SNAPSHOT Function and Procedure</a>        | Creates a manual <i>local</i> snapshot immediately                                                                                                                                       |
| <a href="#">DROP_BASELINE Procedure</a>                       | Drops a previously-defined baseline                                                                                                                                                      |
| <a href="#">DROP_BASELINE_TEMPLATE Procedure</a>              | Removes a baseline template that is no longer needed                                                                                                                                     |
| <a href="#">DROP_SNAPSHOT_RANGE Procedure</a>                 | Drops a range of snapshots                                                                                                                                                               |
| <a href="#">LOCAL_AWR_DBID Function</a>                       | Returns the database identifier for the local AWR database                                                                                                                               |
| <a href="#">MODIFY_BASELINE_WINDOW_SIZE Procedure</a>         | Modifies the window size for the Default Moving Window Baseline                                                                                                                          |
| <a href="#">MODIFY_SNAPSHOT_SETTINGS Procedures</a>           | Modifies the snapshot settings                                                                                                                                                           |
| <a href="#">PURGE_SQL_DETAILS Procedure</a>                   | Purges SQL details, specifically rows from <code>WRH\$_SQLTEXT</code> and <code>WRH\$_SQL_PLAN</code> that do not have corresponding rows (DBID, SQL_ID) in <code>WRH\$_SQLSTAT</code> . |
| <a href="#">REGISTER_REMOTE_DATABASE Procedures</a>           | Registers a remote database in the AWR using the Remote Management Framework (RMF)                                                                                                       |
| <a href="#">REMOVE_COLORED_SQL Procedure</a>                  | Removes a colored SQL ID                                                                                                                                                                 |
| <a href="#">RENAME_BASELINE Procedure</a>                     | Renames a baseline                                                                                                                                                                       |
| <a href="#">SELECT_BASELINE_DETAILS Function</a>              | Shows the values of the metrics corresponding to a baseline for a range of snapshots                                                                                                     |

**Table 185-2 (Cont.) DBMS\_WORKLOAD\_REPOSITORY Package Subprograms**

| Subprogram                                             | Description                                                                                                                        |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SELECT_BASELINE_METRIC Function</a>        | Shows the values of the metrics corresponding to a baseline for all the snapshots                                                  |
| <a href="#">UNREGISTER_REMOTE_DATAB ASE Procedures</a> | Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF) |
| <a href="#">UPDATE_DATAFILE_INFO Procedure</a>         | Updates the data file and tablespace information stored in the AWR with the current information in the database                    |
| <a href="#">UPDATE_OBJECT_INFO Procedure</a>           | Updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database                                              |

### 185.3.1 ADD\_COLORED\_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the [REMOVE\\_COLORED\\_SQL Procedure](#).

#### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
 sql_id IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL);
```

#### Parameters

**Table 185-3 ADD\_COLORED\_SQL Procedure Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| sql_id    | 13-character external SQL ID          |
| dbid      | Optional DBID, defaults to Local DBID |

### 185.3.2 ASH\_GLOBAL\_REPORT\_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

#### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
 l_dbid IN NUMBER,
 l_inst_num IN VARCHAR2((1023)),
 l_btime IN DATE,
 l_etime IN DATE,
 l_options IN NUMBER DEFAULT 0,
 l_slot_width IN NUMBER DEFAULT 0,
 l_sid IN NUMBER DEFAULT NULL,
 l_sql_id IN VARCHAR2 DEFAULT NULL,
```

```

l_wait_class IN VARCHAR2 DEFAULT NULL,
l_service_hash IN NUMBER DEFAULT NULL,
l_module IN VARCHAR2 DEFAULT NULL,
l_action IN VARCHAR2 DEFAULT NULL,
l_client_id IN VARCHAR2 DEFAULT NULL,
l_plsql_entry IN VARCHAR2 DEFAULT NULL,
l_data_src IN NUMBER DEFAULT 0,
l_container IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

## Parameters

**Table 185-4** *ASH\_GLOBAL\_REPORT\_HTML Parameters*

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <code>l_module</code>       | Module name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>l_action</code>       | Action name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>l_plsql_entry</code>  | PL/SQL entry point (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>l_data_src</code>     | Ignored since the report works off of data on disk only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>l_container</code>    | Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> <li>• If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>• If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

### Return Values

The output will be one column of VARCHAR2(1500).

### Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL\_ID 'abcdefghijkl123 ' pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

**Table 185-5 ASH\_REPORT\_HTML: Wildcards Allowed (or Not) in Arguments**

| Argument Name               | Comment                                                                            | Wildcard Allowed |
|-----------------------------|------------------------------------------------------------------------------------|------------------|
| <code>l_sid</code>          | Session ID (for example, V\$SESSION.SID)                                           | No               |
| <code>l_sql_id</code>       | SQL ID (for example, V\$SQL.SQL_ID)                                                | Yes              |
| <code>l_wait_class</code>   | Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)                            | Yes              |
| <code>l_service_hash</code> | Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)                      | No               |
| <code>l_module</code>       | Module name (for example, V\$SESSION.MODULE)                                       | Yes              |
| <code>l_action</code>       | Action name (for example, V\$SESSION.ACTION)                                       | Yes              |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER)   | Yes              |
| <code>l_data_src</code>     | Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype | No               |

## 185.3.3 ASH\_GLOBAL\_REPORT\_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
 l_dbid IN VARCHAR2(1023),
 l_inst_num IN NUMBER,
 l_btime IN DATE,
 l_etime IN DATE,
 l_options IN NUMBER DEFAULT 0,
 l_slot_width IN NUMBER DEFAULT 0,
 l_sid IN NUMBER DEFAULT NULL,
 l_sql_id IN VARCHAR2 DEFAULT NULL,
 l_wait_class IN VARCHAR2 DEFAULT NULL,
 l_service_hash IN NUMBER DEFAULT NULL,
 l_module IN VARCHAR2 DEFAULT NULL,
 l_action IN VARCHAR2 DEFAULT NULL,
 l_client_id IN VARCHAR2 DEFAULT NULL,
 l_plsql_entry IN VARCHAR2 DEFAULT NULL,
 l_data_src IN NUMBER DEFAULT 0,
 l_container IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 185-6** *ASH\_GLOBAL\_REPORT\_TEXT* Parameters

| Parameter                   | Description                                                                                                                                                                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>         | Database identifier                                                                                                                                                                                                                                                                     |
| <code>l_inst_num</code>     | List of instances (such as '1,2,3'), or NULL to report on all instances in the database                                                                                                                                                                                                 |
| <code>l_btime</code>        | The 'begin time'                                                                                                                                                                                                                                                                        |
| <code>l_etime</code>        | The 'end time'                                                                                                                                                                                                                                                                          |
| <code>l_options</code>      | Report level (currently not used)                                                                                                                                                                                                                                                       |
| <code>l_slot_width</code>   | Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots. |
| <code>l_sid</code>          | Session ID (see Usage Notes)                                                                                                                                                                                                                                                            |
| <code>l_sql_id</code>       | SQL ID (see Usage Notes)                                                                                                                                                                                                                                                                |
| <code>l_wait_class</code>   | Wait class name (see Usage Notes)                                                                                                                                                                                                                                                       |
| <code>l_service_hash</code> | Service name hash (see Usage Notes)                                                                                                                                                                                                                                                     |
| <code>l_module</code>       | Module name (see Usage Notes)                                                                                                                                                                                                                                                           |
| <code>l_action</code>       | Action name (see Usage Notes)                                                                                                                                                                                                                                                           |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (see Usage Notes)                                                                                                                                                                                                                                  |
| <code>l_plsql_entry</code>  | PL/SQL entry point (see Usage Notes)                                                                                                                                                                                                                                                    |

**Table 185-6 (Cont.) ASH\_GLOBAL\_REPORT\_TEXT Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_data_src</code>  | Ignored since the report works off of data on disk only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>l_container</code> | <p>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V\$CONTAINERS. Behavior is as follows:</p> <ul style="list-style-type: none"> <li>• If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>• If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

### Return Values

The output will be one column of VARCHAR2(320).

### Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

**Table 185-7 ASH\_GLOBAL\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

| Argument Name               | Comment                                                       | Wildcard Allowed |
|-----------------------------|---------------------------------------------------------------|------------------|
| <code>l_sid</code>          | Session ID (for example, V\$SESSION.SID)                      | No               |
| <code>l_sql_id</code>       | SQL ID (for example, V\$SQL.SQL_ID)                           | Yes              |
| <code>l_wait_class</code>   | Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)       | Yes              |
| <code>l_service_hash</code> | Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH) | No               |
| <code>l_module</code>       | Module name (for example, V\$SESSION.MODULE)                  | Yes              |
| <code>l_action</code>       | Action name (for example, V\$SESSION.ACTION)                  | Yes              |

**Table 185-7 (Cont.) ASH\_GLOBAL\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

| Argument Name | Comment                                                                          | Wildcard Allowed |
|---------------|----------------------------------------------------------------------------------|------------------|
| l_client_id   | Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER) | Yes              |
| l_plsql_entry | PL/SQL entry point (for example, "SYS.DBMS_LOB.*")                               | Yes              |
| l_data_src    | Wildcards are not allowed for l_data_src as it is of numeric datatype            | No               |

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

## 185.3.4 ASH\_REPORT\_ANALYTICS Function

This function returns the ASH Analytics active report.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
 dbid IN NUMBER DEFAULT NULL,
 inst_id IN NUMBER DEFAULT NULL,
 begin_time IN DATE,
 end_time IN DATE,
 report_level IN VARCHAR2 DEFAULT NULL,
 filter_list IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 185-8 ASH\_REPORT\_ANALYTICS Parameters**

| Parameter    | Description                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbid         | Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.                                               |
| inst_id      | Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL. |
| begin_time   | The start time of the interval for which the ASH report is required.                                                                                                                    |
| end_time     | The end time of the interval for which the ASH report is required.                                                                                                                      |
| report_level | Describes the list of components to build.                                                                                                                                              |
| filter_list  | Describes the list of filters to apply. Its default value is NULL (no filters to apply).                                                                                                |

**Return Values**

Returns the ASH Analytics active report.

## 185.3.5 ASH\_REPORT\_HTML Function

This table function displays the ASH Spot report in HTML.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
 l_dbid IN NUMBER,
 l_inst_num IN NUMBER,
 l_btime IN DATE,
 l_etime IN DATE,
 l_options IN NUMBER DEFAULT 0,
 l_slot_width IN NUMBER DEFAULT 0,
 l_sid IN NUMBER DEFAULT NULL,
 l_sql_id IN VARCHAR2 DEFAULT NULL,
 l_wait_class IN VARCHAR2 DEFAULT NULL,
 l_service_hash IN NUMBER DEFAULT NULL,
 l_module IN VARCHAR2 DEFAULT NULL,
 l_action IN VARCHAR2 DEFAULT NULL,
 l_client_id IN VARCHAR2 DEFAULT NULL,
 l_plsql_entry IN VARCHAR2 DEFAULT NULL,
 l_data_src IN NUMBER DEFAULT 0,
 l_container IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

**Parameters****Table 185-9** *ASH\_REPORT\_HTML Parameters*

| Parameter                   | Description                                                                                                                                                                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>         | Database identifier                                                                                                                                                                                                                                                                     |
| <code>l_inst_num</code>     | Instance number                                                                                                                                                                                                                                                                         |
| <code>l_btime</code>        | The 'begin time'                                                                                                                                                                                                                                                                        |
| <code>l_etime</code>        | The 'end time'                                                                                                                                                                                                                                                                          |
| <code>l_options</code>      | Report level (currently not used)                                                                                                                                                                                                                                                       |
| <code>l_slot_width</code>   | Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots. |
| <code>l_sid</code>          | Session ID (see Usage Notes)                                                                                                                                                                                                                                                            |
| <code>l_sql_id</code>       | SQL ID (see Usage Notes)                                                                                                                                                                                                                                                                |
| <code>l_wait_class</code>   | Wait class name (see Usage Notes)                                                                                                                                                                                                                                                       |
| <code>l_service_hash</code> | Service name hash (see Usage Notes)                                                                                                                                                                                                                                                     |
| <code>l_module</code>       | Module name (see Usage Notes)                                                                                                                                                                                                                                                           |
| <code>l_action</code>       | Action name (see Usage Notes)                                                                                                                                                                                                                                                           |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (see Usage Notes)                                                                                                                                                                                                                                  |

**Table 185-9 (Cont.) ASH\_REPORT\_HTML Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_plsql_entry</code> | PL/SQL entry point (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>l_data_src</code>    | Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> <li>• 1 =&gt; memory (<code>V\$ACTIVE_SESSION_HISTORY</code>)</li> <li>• 2 =&gt; disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>)</li> <li>• 0 =&gt; both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                    |
| <code>l_container</code>   | Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> <li>• If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>• If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

**Return Values**

The output will be one column of `VARCHAR2(500)`.

**Usage Notes**

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report

targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

**Table 185-10 ASH\_REPORT\_HTML: Wildcards Allowed (or Not) in Arguments**

| Argument Name  | Comment                                                                          | Wildcard Allowed |
|----------------|----------------------------------------------------------------------------------|------------------|
| l_sid          | Session ID (for example, V\$SESSION.SID)                                         | No               |
| l_sql_id       | SQL ID (for example, V\$SQL.SQL_ID)                                              | Yes              |
| l_wait_class   | Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)                          | Yes              |
| l_service_hash | Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)                    | No               |
| l_module       | Module name (for example, V\$SESSION.MODULE)                                     | Yes              |
| l_action       | Action name (for example, V\$SESSION.ACTION)                                     | Yes              |
| l_client_id    | Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER) | Yes              |

### 185.3.6 ASH\_REPORT\_TEXT Function

This table function displays the ASH Spot report in text.

#### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(
 l_dbid IN NUMBER,
 l_inst_num IN NUMBER,
 l_btime IN DATE,
 l_etime IN DATE,
 l_options IN NUMBER DEFAULT 0,
 l_slot_width IN NUMBER DEFAULT 0,
 l_sid IN NUMBER DEFAULT NULL,
 l_sql_id IN VARCHAR2 DEFAULT NULL,
 l_wait_class IN VARCHAR2 DEFAULT NULL,
 l_service_hash IN NUMBER DEFAULT NULL,
 l_module IN VARCHAR2 DEFAULT NULL,
 l_action IN VARCHAR2 DEFAULT NULL,
 l_client_id IN VARCHAR2 DEFAULT NULL,
 l_plsql_entry IN VARCHAR2 DEFAULT NULL,
 l_data_src IN NUMBER DEFAULT 0,
 l_container IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

## Parameters

**Table 185-11** *ASH\_REPORT\_TEXT* Parameters

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <code>l_sql_id</code>       | SQL ID (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>l_wait_class</code>   | Wait class name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>l_service_hash</code> | Service name hash (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>l_module</code>       | Module name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>l_action</code>       | Action name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>l_plsql_entry</code>  | PL/SQL entry point (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>l_data_src</code>     | Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> <li>• 1 =&gt; memory (<code>V\$ACTIVE_SESSION_HISTORY</code>)</li> <li>• 2 =&gt; disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>)</li> <li>• 0 =&gt; both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                    |
| <code>l_container</code>    | Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> <li>• If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>• If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

## Return Values

The output will be one column of `VARCHAR2(80)`.

### Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

**Table 185-12 ASH\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

| Argument Name               | Comment                                                                                        | Wildcard Allowed |
|-----------------------------|------------------------------------------------------------------------------------------------|------------------|
| <code>l_sid</code>          | Session ID (for example, <code>V\$SESSION.SID</code> )                                         | No               |
| <code>l_sql_id</code>       | SQL ID (for example, <code>V\$SQL.SQL_ID</code> )                                              | Yes              |
| <code>l_wait_class</code>   | Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code> )                          | Yes              |
| <code>l_service_hash</code> | Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code> )                    | No               |
| <code>l_module</code>       | Module name (for example, <code>V\$SESSION.MODULE</code> )                                     | Yes              |
| <code>l_action</code>       | Action name (for example, <code>V\$SESSION.ACTION</code> )                                     | Yes              |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code> ) | Yes              |
| <code>l_plsql_entry</code>  | PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code> )                               | Yes              |
| <code>l_data_src</code>     | Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype             | No               |

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

## 185.3.7 AWR\_DIFF\_REPORT\_HTML Function

This table function displays the AWR Compare Periods report in HTML.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
 dbid1 IN NUMBER,
 inst_num1 IN NUMBER,
 bid1 IN NUMBER,
 eid1 IN NUMBER,
 dbid2 IN NUMBER,
 inst_num2 IN NUMBER,
 bid2 IN NUMBER,
 eid2 IN NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

### Parameters

**Table 185-13** *AWR\_DIFF\_REPORT\_HTML Parameters*

| Parameter | Description               |
|-----------|---------------------------|
| dbid1     | 1st database identifier   |
| inst_num1 | 1st instance number       |
| bid1      | 1st beginning snapshot ID |
| eid1      | 1st ending snapshot ID    |
| dbid2     | 2nd database identifier   |
| inst_num2 | 2nd instance number       |
| bid2      | 2nd beginning snapshot ID |
| eid2      | 2nd ending snapshot ID    |

### Return Values

The output will be one column of VARCHAR2(500).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrdrpt.sql` script which prompts users for the required information.

## 185.3.8 AWR\_DIFF\_REPORT\_TEXT Function

This table function displays the AWR Compare Periods report in text.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
 dbid1 IN NUMBER,
 inst_num1 IN NUMBER,
```

```

bid1 IN NUMBER,
eid1 IN NUMBER,
dbid2 IN NUMBER,
inst_num2 IN NUMBER,
bid2 IN NUMBER,
eid2 IN NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;

```

### Parameters

**Table 185-14** *AWR\_DIFF\_REPORT\_TEXT* Parameters

| Parameter | Description               |
|-----------|---------------------------|
| dbid1     | 1st database identifier   |
| inst_num1 | 1st instance number       |
| bid1      | 1st beginning snapshot ID |
| eid1      | 1st ending snapshot ID    |
| dbid2     | 2nd database identifier   |
| inst_num2 | 2nd instance number       |
| bid2      | 2nd beginning snapshot ID |
| eid2      | 2nd ending snapshot ID    |

### Return Values

The output will be one column of VARCHAR2(500).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrd rpt.sql` script which prompts users for the required information.

## 185.3.9 AWR\_GLOBAL\_DIFF\_REPORT\_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
 dbid1 IN NUMBER,
 inst_num1 IN AWRRPT_INSTANCE_LIST_TYPE,
 bid1 IN NUMBER,
 eid1 IN NUMBER,
 dbid2 IN NUMBER,
 inst_num2 IN AWRRPT_INSTANCE_LIST_TYPE,
 bid2 IN NUMBER,
 eid2 IN NUMBER)
RETURN awrrpt_html_type_table PIPELINED;

```

```

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
 dbid1 IN NUMBER,
 inst_num1 IN VARCHAR2,

```

```

bid1 IN NUMBER,
eid1 IN NUMBER,
dbid2 IN NUMBER,
inst_num2 IN VARCHAR2,
bid2 IN NUMBER,
eid2 IN NUMBER)
RETURN awrrpt_html_type_table PIPELINED;

```

### Parameters

**Table 185-15** *AWR\_GLOBAL\_DIFF\_REPORT\_HTML Function Parameters*

| Parameter | Description                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbid1     | 1st database identifier                                                                                                                                                                                                    |
| inst_num1 | 1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.                          |
| bid1      | 1st beginning snapshot ID                                                                                                                                                                                                  |
| eid1      | 1st ending snapshot ID                                                                                                                                                                                                     |
| dbid2     | 2nd database identifier                                                                                                                                                                                                    |
| inst_num2 | 2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid2      | 2nd beginning snapshot ID                                                                                                                                                                                                  |
| eid2      | 2nd ending snapshot ID                                                                                                                                                                                                     |

### Return Values

The output will be one column of VARCHAR2(1500).

## 185.3.10 AWR\_GLOBAL\_DIFF\_REPORT\_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
 dbid1 IN NUMBER,
 inst_num1 IN AWRRPT_INSTANCE_LIST_TYPE,
 bid1 IN NUMBER,
 eid1 IN NUMBER,
 dbid2 IN NUMBER,
 inst_num2 IN AWRRPT_INSTANCE_LIST_TYPE,
 bid2 IN NUMBER,
 eid2 IN NUMBER)
RETURN awdrpt_text_type_table PIPELINED;

```

```

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
 dbid1 IN NUMBER,
 inst_num1 IN VARCHAR2,

```

```

bid1 IN NUMBER,
eid1 IN NUMBER,
dbid2 IN NUMBER,
inst_num2 IN VARCHAR2,
bid2 IN NUMBER,
eid2 IN NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;

```

### Parameters

**Table 185-16** *AWR\_GLOBAL\_DIFF\_REPORT\_TEXT Functions Parameters*

| Parameter | Description                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbid1     | 1st database identifier                                                                                                                                                                                                    |
| inst_num1 | 1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.                          |
| bid1      | 1st beginning snapshot ID                                                                                                                                                                                                  |
| eid1      | 1st ending snapshot ID                                                                                                                                                                                                     |
| dbid2     | 2nd database identifier                                                                                                                                                                                                    |
| inst_num2 | 2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid2      | 2nd beginning snapshot ID                                                                                                                                                                                                  |
| eid2      | 2nd ending snapshot ID                                                                                                                                                                                                     |

### Return Values

The output will be one column of VARCHAR2(320).

## 185.3.11 AWR\_GLOBAL\_REPORT\_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
 l_dbid IN NUMBER,
 l_inst_num IN AWRRPT_INSTANCE_LIST_TYPE,
 l_bid IN NUMBER,
 l_eid IN NUMBER,
 l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;

```

```

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
 l_dbid IN NUMBER,
 l_inst_num IN VARCHAR2,
 l_bid IN NUMBER,
 l_eid IN NUMBER,
 l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;

```

## Parameters

**Table 185-17 AWR\_GLOBAL\_REPORT\_HTML Function Parameters**

| Parameter               | Description                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>     | Database identifier                                                                                                                                                                                                    |
| <code>l_inst_num</code> | List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| <code>l_bid</code>      | Beginning snapshot ID                                                                                                                                                                                                  |
| <code>l_eid</code>      | Ending snapshot ID                                                                                                                                                                                                     |
| <code>l_options</code>  | Report level (currently not used)                                                                                                                                                                                      |

## Return Values

The output will be one column of `VARCHAR2(1500)`.

## 185.3.12 AWR\_GLOBAL\_REPORT\_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
 l_dbid IN NUMBER,
 l_inst_num IN AWRRPT_INSTANCE_LIST_TYPE,
 l_bid IN NUMBER,
 l_eid IN NUMBER,
 l_options IN NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
 l_dbid IN NUMBER,
 l_inst_num IN VARCHAR2,
 l_bid IN NUMBER,
 l_eid IN NUMBER,
 l_options IN NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

## Parameters

| Parameter           | Description         |
|---------------------|---------------------|
| <code>l_dbid</code> | Database identifier |

**Table 185-18 (Cont.) AWR\_GLOBAL\_REPORT\_TEXT Function Parameters**

| Parameter               | Description                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_inst_num</code> | List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| <code>l_bid</code>      | Beginning snapshot ID                                                                                                                                                                                                  |
| <code>l_eid</code>      | Ending snapshot ID                                                                                                                                                                                                     |
| <code>l_options</code>  | A flag to specify to control the output of the report. Currently, not used.                                                                                                                                            |

**Return Values**

The output will be one column of `VARCHAR2(320)`.

### 185.3.13 AWR\_REPORT\_HTML Function

This table function displays the AWR report in HTML.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
 l_dbid IN NUMBER,
 l_inst_num IN NUMBER,
 l_bid IN NUMBER,
 l_eid IN NUMBER,
 l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

**Parameters****Table 185-19 AWR\_REPORT\_HTML Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>     | Database identifier                                                                                                                                                                                                                                                                                                     |
| <code>l_inst_num</code> | Instance number                                                                                                                                                                                                                                                                                                         |
| <code>l_bid</code>      | Beginning snapshot ID                                                                                                                                                                                                                                                                                                   |
| <code>l_eid</code>      | Ending snapshot ID                                                                                                                                                                                                                                                                                                      |
| <code>l_options</code>  | A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <li><code>l_options = 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</li> </ul> |

**Return Values**

The output will be one column of `VARCHAR2(1500)`.

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

## 185.3.14 AWR\_REPORT\_TEXT Function

This table function displays the AWR report in text.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
 l_dbid IN NUMBER,
 l_inst_num IN NUMBER,
 l_bid IN NUMBER,
 l_eid IN NUMBER,
 l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 185-20 AWR\_REPORT\_TEXT Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>     | Database identifier                                                                                                                                                                                                                                                                                                     |
| <code>l_inst_num</code> | Instance number                                                                                                                                                                                                                                                                                                         |
| <code>l_bid</code>      | Beginning snapshot ID                                                                                                                                                                                                                                                                                                   |
| <code>l_eid</code>      | Ending snapshot ID                                                                                                                                                                                                                                                                                                      |
| <code>l_options</code>  | A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <li><code>l_options - 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</li> </ul> |

### Return Values

The output will be one column of `VARCHAR2(80)`.

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

## 185.3.15 AWR\_SET\_REPORT\_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS(
 top_n_events IN NUMBER DEFAULT NULL,
 top_n_files IN NUMBER DEFAULT NULL,
```

```

top_n_segments IN NUMBER DEFAULT NULL,
top_n_services IN NUMBER DEFAULT NULL,
top_n_sql IN NUMBER DEFAULT NULL,
top_n_sql_max IN NUMBER DEFAULT NULL,
top_sql_pct IN NUMBER DEFAULT NULL,
shmem_threshold IN NUMBER DEFAULT NULL,
versions_threshold IN NUMBER DEFAULT NULL,
top_n_disks IN NUMBER DEFAULT NULL,
outlier_pct IN NUMBER DEFAULT NULL,
outlier_cpu_pct IN NUMBER DEFAULT NULL);

```

## Parameters

**Table 185-21** *AWR\_SET\_REPORT\_THRESHOLDS Procedure Parameters*

| Parameter          | Description                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------|
| top_n_events       | Number of most significant wait events to be included                                                   |
| top_n_files        | Number of most active files to be included                                                              |
| top_n_segments     | Number of most active segments to be included                                                           |
| top_n_services     | Number of most active services to be included                                                           |
| top_n_sql          | Number of most significant SQL statements to be included                                                |
| top_n_sql_max      | Number of SQL statements to be included if their activity is greater than that specified by top_sql_pct |
| top_sql_pct        | Significance threshold for SQL statements between top_n_sql and top_n_sql_max                           |
| shmem_threshold    | Shared memory low threshold                                                                             |
| versions_threshold | Plan version count low threshold                                                                        |
| top_n_disks        | Number of cell disks with most I/O                                                                      |
| outlier_pct        | Percentage of maximum capacity before displaying outliers for Exadata sections                          |
| outlier_cpu_pct    | Threshold for mean percentage CPU to display outliers                                                   |

## User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the `AWR_SET_REPORT_THRESHOLDS` procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

## 185.3.16 AWR\_SQL\_REPORT\_HTML Function

This table function displays the AWR SQL Report in HTML format.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
 l_dbid IN NUMBER,
 l_inst_num IN NUMBER,

```

```

l_bid IN NUMBER,
l_eid IN NUMBER,
l_sqlid IN VARCHAR2,
l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

### Parameters

**Table 185-22 AWR\_SQL\_REPORT\_HTML Parameters**

| Parameter  | Description                                                                 |
|------------|-----------------------------------------------------------------------------|
| l_dbid     | Database identifier                                                         |
| l_inst_num | Instance number                                                             |
| l_bid      | Beginning snapshot ID                                                       |
| l_eid      | Ending snapshot ID                                                          |
| l_sqlid    | SQL ID of statement to be analyzed                                          |
| l_options  | A flag to specify to control the output of the report. Currently, not used. |

### Return Values

The output will be one column of VARCHAR2(500).

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

## 185.3.17 AWR\_SQL\_REPORT\_TEXT Function

This table function displays the AWR SQL Report in text format.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
 l_dbid IN NUMBER,
 l_inst_num IN NUMBER,
 l_bid IN NUMBER,
 l_eid IN NUMBER,
 l_sqlid IN VARCHAR2,
 l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 185-23 AWR\_SQL\_REPORT\_TEXT Parameters**

| Parameter  | Description           |
|------------|-----------------------|
| l_dbid     | Database identifier   |
| l_inst_num | Instance number       |
| l_bid      | Beginning snapshot ID |

**Table 185-23 (Cont.) AWR\_SQL\_REPORT\_TEXT Parameters**

| Parameter              | Description                                                               |
|------------------------|---------------------------------------------------------------------------|
| <code>l_eid</code>     | Ending snapshot ID                                                        |
| <code>l_sqlid</code>   | SQL ID of statement to be analyzed                                        |
| <code>l_options</code> | Flag to specify to control the output of the report. Currently, not used. |

**Return Values**

The output will be one column of `VARCHAR2(120)`.

**Usage Notes**

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

### 185.3.18 CONTROL\_RESTRICTED\_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

 **Note:**

To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT(
 allow IN BOOLEAN);
```

**Parameters**

**Table 185-24 CONTROL\_RESTRICTED\_SNAPSHOT Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>allow</code> | This parameter can have one of the following values: <ul style="list-style-type: none"> <li><code>TRUE</code>: AWR snapshots can be created for the database in the <i>restricted session</i> mode.</li> <li><code>FALSE</code>: AWR snapshots cannot be created for the database in the <i>restricted session</i> mode.</li> </ul> |

## 185.3.19 CREATE\_BASELINE Functions and Procedures

This function and procedure creates a baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
 start_snap_id IN NUMBER,
 end_snap_id IN NUMBER,
 baseline_name IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL,
 expiration IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
 start_snap_id IN NUMBER,
 end_snap_id IN NUMBER,
 baseline_name IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL,
 expiration IN NUMBER DEFAULT NULL)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
 start_time IN DATE,
 end_time IN DATE,
 baseline_name IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL,
 expiration IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
 start_time IN DATE,
 end_time IN DATE,
 baseline_name IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL,
 expiration IN NUMBER DEFAULT NULL);
RETURN NUMBER;
```

### Parameters

**Table 185-25 CREATE\_BASELINE Function & Procedure Parameters**

| Parameter     | Description                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| start_snap_id | Start snapshot sequence number for the baseline.                                                                                          |
| end_snap_id   | End snapshot sequence number for the baseline.                                                                                            |
| start_time    | Start time for the baseline.                                                                                                              |
| end_time      | End time for the baseline.                                                                                                                |
| baseline_name | Name of baseline.                                                                                                                         |
| dbid          | Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.                   |
| expiration    | Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL. |

### Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

### Examples

This example creates a baseline (named 'oltp\_peakload\_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
 end_snap_id => 107,
 baseline_name =>
'oltp_peakload_bl');
```

If you query the DBA\_HIST\_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

## 185.3.20 CREATE\_BASELINE\_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

### Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
 start_time IN DATE,
 end_time IN DATE,
 baseline_name IN VARCHAR2,
 template_name IN VARCHAR2,
 expiration IN NUMBER,
 dbid IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
 day_of_week IN VARCHAR2,
 hour_in_day IN NUMBER,
 duration IN NUMBER,
 start_time IN DATE,
 end_time IN DATE,
 baseline_name_prefix IN VARCHAR2,
 template_name IN VARCHAR2,
 expiration IN NUMBER,
 dbid IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 185-26 CREATE\_BASELINE\_TEMPLATE Procedure Parameters**

| Parameter            | Description                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time           | Start Time for the baseline to be created'                                                                                                           |
| end_time             | End Time for the baseline to be created                                                                                                              |
| baseline_name        | Name of baseline to be created                                                                                                                       |
| template_name        | Name for the template                                                                                                                                |
| expiration           | Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL             |
| dbid                 | Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.   |
| day_of_week          | Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY. |
| hour_in_day          | Value of 0-23 to specify the Hour in the Day the baseline should start                                                                               |
| duration             | Duration (in number of hours) after hour in the day that the baseline should last                                                                    |
| baseline_name_prefix | Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.                |

## 185.3.21 CREATE\_REMOTE\_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
 node_id IN NUMBER,
 flush_level IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
 node_id IN NUMBER,
 flush_level IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
 node_name IN VARCHAR2,
 topology_name IN VARCHAR2 DEFAULT NULL,
 flush_level IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
 node_name IN VARCHAR2,
 topology_name IN VARCHAR2 DEFAULT NULL,
 flush_level IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

## Parameters

**Table 185-27 CREATE\_REMOTE\_SNAPSHOT Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_id       | RMF node identifier of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| node_name     | RMF node name of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| topology_name | RMF topology name of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| flush_level   | The flush level can be one of the following: <ul style="list-style-type: none"> <li>• <b>BESTFIT:</b><br/>Uses the default value depending on the type of snapshot being taken.</li> <li>• <b>LITE:</b><br/>Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container.</li> <li>• <b>TYPICAL:</b><br/>Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database.</li> <li>• <b>ALL:</b><br/>Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.</li> </ul> |

## Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the DBA\_HIST\_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

## 185.3.22 CREATE\_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
 flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
 dbid IN NUMBER DEFAULT NULL,
 source_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
```

```
flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
dbid IN NUMBER DEFAULT NULL,
source_name IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

### Parameters

**Table 185-28 CREATE\_SNAPSHOT Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flush_level | The flush level can be one of the following: <ul style="list-style-type: none"> <li><b>BESTFIT:</b><br/>Uses the default value depending on the type of snapshot being taken.</li> <li><b>LITE:</b><br/>Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container.</li> <li><b>TYPICAL:</b><br/>Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database.</li> <li><b>ALL:</b><br/>Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.</li> </ul> |
| dbid        | Database ID of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| source_name | Name of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Examples

This example creates a snapshot of the local database with the flush level of ALL:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the DBA\_HIST\_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

## 185.3.23 DROP\_BASELINE Procedure

This procedure drops a previously-defined baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
baseline_name IN VARCHAR2,
cascade IN BOOLEAN DEFAULT FALSE,
dbid IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 185-29 DROP\_BASELINE Parameters**

| Parameter     | Description                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------|
| baseline_name | Name of baseline to drop from the system                                                                                   |
| cascade       | If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed. |
| dbid          | Database ID for which the baseline needs to be dropped (defaults to local DBID).                                           |

## Examples

This example drops the baseline 'oltp\_peakload\_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
 baseline_name => 'oltp_peakload_bl');
```

If you query the DBA\_HIST\_BASELINE view after the DROP\_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA\_HIST\_SNAPSHOT view to find that the underlying snapshots are left intact.

## 185.3.24 DROP\_BASELINE\_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
 template_name IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 185-30 DROP\_BASELINE\_TEMPLATE Procedure Parameters**

| Parameter     | Description                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| template_name | Name of the template to remove                                                                                                                        |
| dbid          | Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL. |

## 185.3.25 DROP\_SNAPSHOT\_RANGE Procedure

This procedure drops a range of snapshots.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE (
 low_snap_id IN NUMBER,
```

```

high_snap_id IN NUMBER,
dbid IN NUMBER DEFAULT NULL);

```

### Parameters

**Table 185-31 DROP\_SNAPSHOT\_RANGE Procedure Parameters**

| Parameter    | Description                            |
|--------------|----------------------------------------|
| low_snap_id  | Low snapshot id of snapshots to drop.  |
| high_snap_id | High snapshot id of snapshots to drop. |
| dbid         | Database id (defaults to local DBID).  |

### Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

## 185.3.26 LOCAL\_AWR\_DBID Function

This function returns the database identifier for the local AWR database.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID()
RETURN NUMBER;

```

## 185.3.27 MODIFY\_BASELINE\_WINDOW\_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
 window_size IN NUMBER,
 dbid IN NUMBER DEFAULT NULL);

```

### Parameters

**Table 185-32 MODIFY\_BASELINE\_WINDOW\_SIZE Procedure Parameters**

| Parameter   | Description                                                                |
|-------------|----------------------------------------------------------------------------|
| window_size | New Window size for the default Moving Window Baseline, in number of days. |
| dbid        | Database ID (defaults to local DBID).                                      |

## Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the [MODIFY\\_SNAPSHOT\\_SETTINGS Procedures](#) can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

## 185.3.28 MODIFY\_SNAPSHOT\_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
 retention IN NUMBER DEFAULT NULL,
 interval IN NUMBER DEFAULT NULL,
 topnsql IN NUMBER DEFAULT NULL,
 dbid IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
 retention IN NUMBER DEFAULT NULL,
 interval IN NUMBER DEFAULT NULL,
 topnsql IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 185-33** MODIFY\_SNAPSHOT\_SETTINGS Procedure Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>retention</code> | <p>New retention time (in minutes). The specified value must be in the range of <code>MIN_RETENTION</code> (1 day) to <code>MAX_RETENTION</code> (100 years).</p> <p>If <code>ZERO</code> is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the old value for retention is preserved.</p> <p><b>NOTE:</b> The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the <a href="#">MODIFY_BASELINE_WINDOW_SIZE Procedure</a> can be used to adjust the window size.</p> |

**Table 185-33 (Cont.) MODIFY\_SNAPSHOT\_SETTINGS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval  | <p>New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year).</p> <p>If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</p> <p>If NULL is specified, the current value is preserved.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| topnsql   | <ul style="list-style-type: none"> <li>If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting.</li> <li>If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.</li> </ul> |
| dbid      | <p>Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
 interval => 60,
 retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

## 185.3.29 PURGE\_SQL\_DETAILS Procedure

This procedure purges SQL details, specifically rows from `WRH$_SQLTEXT`, `WRH$_SQL_PLAN`, and `WRH$_SQL_BIND_METADATA` that do not have corresponding rows (`DBID`, `SQL_ID`) in `WRH$_SQLSTAT`.

The subprogram calls for the `DBID` for which to run the purge. If the `DBID` is not specified, the database `DBID` is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS(
 numrows IN NUMBER DEFAULT NULL,
 dbid IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 185-34 PURGE\_SQL\_DETAILS Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| numrows   | Number of rows                      |
| dbid      | Database ID (default to local DBID) |

## 185.3.30 REGISTER\_REMOTE\_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
 node_id IN NUMBER);
```

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
 node_name IN VARCHAR2,
 topology_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 185-35 REGISTER\_REMOTE\_DATABASE Parameters**

| Parameter     | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| node_id       | RMF node identifier of the database that needs to be registered in the AWR. |
| node_name     | RMF node name of the database that needs to be registered in the AWR.       |
| topology_name | RMF topology name of the database that needs to be registered in the AWR.   |

### Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

## 185.3.31 REMOVE\_COLORED\_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
 sql_id IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 185-36 REMOVE\_COLORED\_SQL Procedure Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| sql_id    | 13-character external SQL ID          |
| dbid      | Optional dbid, defaults to Local DBID |

## 185.3.32 RENAME\_BASELINE Procedure

This procedure renames a baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
 old_baseline_name IN VARCHAR2,
 new_baseline_name IN VARCHAR2,
 dbid IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 185-37 RENAME\_BASELINE Procedure Parameters**

| Parameter         | Description                                                                      |
|-------------------|----------------------------------------------------------------------------------|
| old_baseline_name | Old baseline name.                                                               |
| new_baseline_name | New baseline name.                                                               |
| dbid              | Database ID for which the baseline needs to be renamed (defaults to local DBID). |

## 185.3.33 SELECT\_BASELINE\_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of [AWR\\_BASELINE\\_METRIC\\_TYPE Object Type](#).

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(
 l_baseline_id IN NUMBER,
 l_begin_snap IN NUMBER DEFAULT NULL,
 l_end_snap IN NUMBER DEFAULT NULL,
 l_dbid IN NUMBER DEFAULT NULL)
RETURN awrbl_details_type_table PIPELINED;
```

**Parameters****Table 185-38 SELECT\_BASELINE\_DETAILS Function Parameters**

| Parameter     | Description                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l_baseline_id | ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.            |
| l_begin_snap  | Start snapshot sequence number for the baseline.                                                                                                           |
| l_end_snap    | End snapshot sequence number for the baseline.                                                                                                             |
| l_dbid        | Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL. |

## 185.3.34 SELECT\_BASELINE\_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of [AWR\\_BASELINE\\_METRIC\\_TYPE Object Type](#).

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
 l_baseline_name IN VARCHAR2,
 l_dbid IN NUMBER DEFAULT NULL,
 l_instance_num IN NUMBER DEFAULT NULL)
RETURN awr_metric_type_table PIPELINED;
```

**Parameters****Table 185-39 SELECT\_BASELINE\_METRIC Function Parameters**

| Parameter       | Description                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| l_baseline_name | Name of the baseline for which the metrics need to be viewed.                                                                                    |
| l_dbid          | Database identifier for the baseline. If set to NULL, the database identifier for the local database is used. Default is NULL.                   |
| l_instance_num  | The instance number for which the metrics need to be viewed. If set to NULL, metrics for the local database instance are shown. Default is NULL. |

## 185.3.35 UNREGISTER\_REMOTE\_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
 node_id IN NUMBER,
 remote_check IN BOOLEAN DEFAULT TRUE);
```

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
 node_name IN VARCHAR2,
 topology_name IN VARCHAR2 DEFAULT NULL,
 remote_check IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 185-40 UNREGISTER\_REMOTE\_DATABASE Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_id       | Identifier of the remote database whose data needs to be removed from the AWR.                                                                                                                                                                                                                                                                                                                            |
| node_name     | Name of the remote database whose data needs to be removed from the AWR.                                                                                                                                                                                                                                                                                                                                  |
| topology_name | RMF topology name of the remote database.                                                                                                                                                                                                                                                                                                                                                                 |
| remote_check  | If set to TRUE, the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available.<br><br>If set to FALSE, the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage). |

### Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

## 185.3.36 UPDATE\_DATAFILE\_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

## 185.3.37 UPDATE\_OBJECT\_INFO Procedure

This procedure updates rows of WRH\$\_SEG\_STAT\_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
 maxrows IN NUMBER DEFAULT 0);
```

### Parameters

**Table 185-41 UPDATE\_OBJECT\_INFO Procedure Parameters**

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| maxrows   | Maximum number of rows to be updated. Default= 0, meaning there is no limit. |

# DBMS\_XA

The `DBMS_XA` package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL\*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_XA Subprograms](#)

 **See Also:**

*Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

## 186.1 DBMS\_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

## 186.2 DBMS\_XA Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`. Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` or `READ` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

## 186.3 DBMS\_XA Constants

The DBMS\_XA package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in [Table 186-1](#) for use in the flag field of the [XA\\_START Function](#) and the [XA\\_END Function](#).

**Table 186-1 DBMS\_XA Constants for Flag Field of XA\_START & XA\_END Functions**

| Name      | Type        | Value                                      | Description                                                       |
|-----------|-------------|--------------------------------------------|-------------------------------------------------------------------|
| TMNOFLAGS | PLS_INTEGER | 00000000                                   | Indicates no flag value is selected.                              |
| TMSUCCESS | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('04000000') | Dissociates caller from transaction branch                        |
| TMJOIN    | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('00200000') | Caller is joining existing transaction branch.                    |
| TMSUSPEND | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('02000000') | Caller is suspending, not ending, association                     |
| TMRESUME  | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('08000000') | Caller is resuming association with suspended transaction branch. |

The DBMS\_XA package uses the constants shown in [Table 186-2](#) for Possible Return Values

**Table 186-2 DBMS\_XA Constants for Possible Return Values**

| Name           | Type        | Value       | Description                                                         |
|----------------|-------------|-------------|---------------------------------------------------------------------|
| XA_RBBASE      | PLS_INTEGER | 100         | Inclusive lower bound of the rollback codes                         |
| XA_RBROLLBACK  | PLS_INTEGER | XA_RBBASE   | Rollback was caused by an unspecified reason                        |
| XA_RBCOMMFAIL  | PLS_INTEGER | XA_RBBASE+1 | Rollback was caused by a communication failure                      |
| XA_RBDEADLOCK  | PLS_INTEGER | XA_RBBASE+2 | Deadlock was detected                                               |
| XA_RBINTEGRITY | PLS_INTEGER | XA_RBBASE+3 | Condition that violates the integrity of the resources was detected |
| XA_RBOTHER     | PLS_INTEGER | XA_RBBASE+4 | Resource manager rolled back the transaction for an unlisted reason |

**Table 186-2 (Cont.) DBMS\_XA Constants for Possible Return Values**

| Name           | Type        | Value          | Description                                                                            |
|----------------|-------------|----------------|----------------------------------------------------------------------------------------|
| XA_RBPROTO     | PLS_INTEGER | XA_RBBASE+5    | Protocol error occurred in the resource manager                                        |
| XA_RBTIMEOUT   | PLS_INTEGER | XA_RBBASE+6    | transaction branch took long                                                           |
| XA_RBTRANSIENT | PLS_INTEGER | XA_RBBASE+7    | May retry the transaction branch                                                       |
| XA_RBEND       | PLS_INTEGER | XA_RBTRANSIENT | Inclusive upper bound of the rollback codes                                            |
| XA_NOMIGRATE   | PLS_INTEGER | 9              | Transaction branch may have been heuristically completed                               |
| XA_HEURHAZ     | PLS_INTEGER | 8              | Transaction branch may have been heuristically completed                               |
| XA_HEURCOM     | PLS_INTEGER | 7              | Transaction branch has been heuristically committed                                    |
| XA_HEURRB      | PLS_INTEGER | 6              | Transaction branch has been heuristically rolled back                                  |
| XA_HEURMIX     | PLS_INTEGER | 5              | Some of the transaction branches have been heuristically committed, others rolled back |
| XA_RETRY       | PLS_INTEGER | 4              | Routine returned with no effect and may be re-issued                                   |
| XA_RDONLY      | PLS_INTEGER | 3              | Transaction was read-only and has been committed                                       |
| XA_OK          | PLS_INTEGER | 0              | Normal execution                                                                       |
| XAER_ASYNC     | PLS_INTEGER | -2             | Asynchronous operation already outstanding                                             |
| XAER_RMERR     | PLS_INTEGER | -3             | Resource manager error occurred in the transaction branch                              |
| XAER_NOTA      | PLS_INTEGER | -4             | XID is not valid                                                                       |
| XAER_INVALID   | PLS_INTEGER | -5             | Invalid arguments were given                                                           |
| XAER_PROTO     | PLS_INTEGER | -6             | Routine invoked in an improper context                                                 |
| XAER_RMFAIL    | PLS_INTEGER | -7             | Resource manager unavailable                                                           |
| XAER_DUPID     | PLS_INTEGER | -8             | XID already exists                                                                     |
| XAER_OUTSIDE   | PLS_INTEGER | -9             | Resource manager doing work outside global transaction                                 |

## 186.4 DBMS\_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA\_PREPARE/COMMIT/ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA\_END has been

called so that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

## 186.5 DBMS\_XA Data Structures

The `DBMS_XA` package uses this `OBJECT` type and associated `TABLE` type.

### OBJECT Types

- [DBMS\\_XA\\_XID Object Type](#)

### TABLE Types

- [DBMS\\_XA\\_XID\\_ARRAY Table Type](#)

### 186.5.1 DBMS\_XA DBMS\_XA\_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

#### Note:

For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

### Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
 formatid NUMBER,
 gtrid RAW(64),
 bqual RAW(64),
 constructor function DBMS_XA_XID(
 gtrid IN NUMBER)
 RETURN SELF AS RESULT,
 constructor function DBMS_XA_XID (
 gtrid IN RAW,
 bqual IN RAW)
 RETURN SELF AS RESULT,
 constructor function DBMS_XA_XID(
 formatid IN NUMBER,
```

```

gtrid IN RAW,
bqual IN RAW DEFAULT HEXTORAW('00000000000000000000000000000001')
RETURN SELF AS RESULT)

```

### Attributes

**Table 186-3 DBMS\_XA\_XID Object Type**

| Attribute | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| formatid  | Format identifier, a number identifying different transaction managers (TM)                                    |
| gtrid     | Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes |
| bqual     | Branch qualifier, of which the maximum size is 64 bytes                                                        |

## 186.5.2 DBMS\_XA DBMS\_XA\_XID\_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

### Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

## 186.6 Summary of DBMS\_XA Subprograms

This table lists the DBMS\_XA subprograms and briefly describes them.

**Table 186-4 DBMS\_XA Package Subprograms**

| Subprogram                              | Description                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <a href="#">DIST_TXN_SYNC Procedure</a> | Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)                      |
| <a href="#">XA_COMMIT Function</a>      | Commits the global transaction specified by <code>xid</code>                                                          |
| <a href="#">XA_END Function</a>         | Disassociates the current session from the transaction branch specified by <code>xid</code>                           |
| <a href="#">XA_FORGET Function</a>      | Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.             |
| <a href="#">XA_GETLASTOER Function</a>  | Obtains the last Oracle error code, in case of failure of previous XA calls.                                          |
| <a href="#">XA_PREPARE Function</a>     | Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible |
| <a href="#">XA_RECOVER Function</a>     | Obtains a list of prepared or heuristically completed transaction branches from a resource manager                    |
| <a href="#">XA_ROLLBACK Function</a>    | Informs the resource manager to roll back work done on behalf of a transaction branch                                 |
| <a href="#">XA_SETTIMEOUT Function</a>  | Sets the transaction timeout in seconds for the current session                                                       |

**Table 186-4 (Cont.) DBMS\_XA Package Subprograms**

| Subprogram                        | Description                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------|
| <a href="#">XA_START Function</a> | Associates the current session with the transaction branch specified by <code>xid</code> |

## 186.6.1 DIST\_TXN\_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

### Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

## 186.6.2 XA\_COMMIT Function

This function commits the global transaction specified by `xid`.

### Syntax

```
DBMS_XA.XA_COMMIT (
 xid IN DBMS_XA_XID,
 onePhase IN BOOLEAN)
RETURN PLS_INTEGER;
```

### Parameters

**Table 186-5 XA\_COMMIT Function Parameters**

| Parameter             | Description                                 |
|-----------------------|---------------------------------------------|
| <code>xid</code>      | See <a href="#">DBMS_XA_XID Object Type</a> |
| <code>onePhase</code> | If TRUE, apply single phase commit          |

### Return Values

See [Table 186-2](#). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

### Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is TRUE, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.

- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

### 186.6.3 XA\_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

#### Syntax

```
DBMS_XA.XA_END (
 xid IN DBMS_XA_XID,
 flag IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

#### Parameters

**Table 186-6 XA\_END Function Parameters**

| Parameter         | Description                                 |
|-------------------|---------------------------------------------|
| <code>xid</code>  | See <a href="#">DBMS_XA_XID Object Type</a> |
| <code>flag</code> | See <a href="#">Table 186-1</a> .           |

#### Return Values

See [Table 186-2](#). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

#### Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT is not allowed in a subordinate session`.

- Executing a COMMIT or a ROLLBACK statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session. To commit the transaction ID or the [XA\\_ROLLBACK Function](#) to commit/rollback the transaction specified by the `xid`.

## 186.6.4 XA\_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

### Syntax

```
DBMS_XA.XA_FORGET (
 xid IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

### Parameters

**Table 186-7** XA\_FORGET Function Parameters

| Parameter        | Description                                 |
|------------------|---------------------------------------------|
| <code>xid</code> | See <a href="#">DBMS_XA_XID Object Type</a> |

### Return Values

See [Table 186-2](#). Possible return values are `XA_OK`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`.

## 186.6.5 XA\_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

### Syntax

```
DBMS_XA.XA_GETLASTOER
RETURN PLS_INTEGER;
```

### Return Values

The return value carries the last Oracle error code.

## 186.6.6 XA\_PREPARE Function

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

### Syntax

```
DBMS_XA.XA_PREPARE (
 xid IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

## Parameters

**Table 186-8** XA\_PREPARE Function Parameters

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| xid       | See <a href="#">DBMS_XA_XID Object Type</a> |

## Return Values

See [Table 186-2](#). Possible return codes include: XA\_OK, XA\_RDONLY, XA\_RB\*, XAER\_RMERR, XAER\_RMFAIL, XAER\_NOTA, XAER\_INVAL, or XAER\_PROTO.

## Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, FORCE ANY TRANSACTION must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and XA\_PREPARE has returned XA\_OK, the application may proceed to call XA\_COMMIT.

## 186.6.7 XA\_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

### Syntax

```
DBMS_XA.XA_RECOVER
RETURN DBMS_XA_XID_ARRAY;
```

### Return Values

See [DBMS\\_XA\\_XID\\_ARRAY Table Type](#)

### Usage Notes

- The flags TMSTARTSCAN, TMENDSCAN, TMNOFLAGS are not supported.
- The privilege SELECT ON DBA\_PENDING\_TRANSACTIONS must be granted to the user who needs to call XA\_RECOVER.

## 186.6.8 XA\_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

### Syntax

```
DBMS_XA.XA_ROLLBACK (
 xid IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

## Parameters

**Table 186-9** *XA\_ROLLBACK Function Parameters*

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| xid       | See <a href="#">DBMS_XA_XID Object Type</a> |

## Return Values

See [Table 186-2](#). Possible return values are: XA\_OK, XA\_RB\*, XA\_HEURHAZ, XA\_HEURCOM, XA\_HEURRB, or XA\_HEURMIX.

## Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege `FORCE ANY TRANSACTION` must be granted to the user.

## 186.6.9 XA\_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

### Syntax

```
DBMS_XA.XA_SETTIMEOUT (
 seconds IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

## Parameters

**Table 186-10** *XA\_SETTIMEOUT Function Parameters*

| Parameter | Description                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| seconds   | The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds. |

## Return Values

See [Table 186-2](#). Possible return values are XA\_OK, XAER\_RMERR, XAER\_RMFAIL, or XAER\_INVAL.

## Usage Notes

Only if return value is XA\_OK, is the timeout value successfully set.

## 186.6.10 XA\_START Function

This function associates the current session with a transaction branch specified by the `xid`.

### Syntax

```
DBMS_XA.XA_START (
 xid IN DBMS_XA_XID, flag IN PLS_INTEGER) RETURN PLS_INTEGER;
```

### Parameters

**Table 186-11** XA\_START Function Parameters

| Parameter         | Description                                 |
|-------------------|---------------------------------------------|
| <code>xid</code>  | See <a href="#">DBMS_XA_XID Object Type</a> |
| <code>flag</code> | See <a href="#">Table 186-1</a> .           |

### Return Values

See [Table 186-2](#)

### Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in `flag`, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in `flag`, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVAL`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, `XA_START` may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

# DBMS\_XDB

The `DBMS_XDB` package supports the following features:

The `DBMS_XDB` package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- [DBMS\\_XDB Overview](#)
- [DBMS\\_XDB Security Model](#)
- [DBMS\\_XDB Constants](#)
- [Summary of DBMS\\_XDB Subprograms](#)

## See Also:

- *Oracle XML DB Developer's Guide*
- *Oracle Database New Features Guide*

## 187.1 DBMS\_XDB Overview

`DBMS_XDB` provides a range of management functions.

The `DBMS_XDB` package supports the following features:

- The Resource Management functionality provides [LINK Procedures](#), [EXISTSRESOURCE Function](#), [LOCKRESOURCE Function](#), [GETLOCKTOKEN Procedure](#), [UNLOCKRESOURCE Function](#), [CREATERESOURCE Functions](#), [RENAMERESOURCE Procedure](#), [DELETERESOURCE Procedure](#), [GETRESOID Function](#), [CREATEOIDPATH Function](#), and [CREATEFOLDER Function](#) subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use [CHECKPRIVILEGES Function](#), [GETACLDOCUMENT Function](#), and [CHANGEPRIVILEGES Function](#) for Oracle Resources. [ACLCHECKPRIVILEGES Function](#) provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.

- The XDB username is created during XDB installation. This user owns a set of default tables and packages. [GETXDB\\_TABLESPACE Function](#) and the `DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE` Procedure enable movement of schemas to a specified tablespace, and support the default `SYSAUX` tablespace introduction

## 187.2 DBMS\_XDB Security Model

Owned by XDB, the `DBMS_XDB` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or `XDB`, or the current user has the `XDBADMIN` or `DBA` role.

## 187.3 DBMS\_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12c.

They are relocated to either the [DBMS\\_XDB\\_CONFIG](#) package or the [DBMS\\_XDB\\_REPOS](#) package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their `DBMS_XDB` context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

**Table 187-1 DBMS\_XDB Constants**

| Constant                                   | Type        | Value   | Description                                                                             | Relocated                   |
|--------------------------------------------|-------------|---------|-----------------------------------------------------------------------------------------|-----------------------------|
| <code>DELETE_RESOURCE</code>               | NUMBER      | 1       | Deletes a resource; fails if the resource has children.                                 | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RECURSIVE</code>              | NUMBER      | 2       | Deletes a resource and its children, if any.                                            | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_FORCE</code>                  | NUMBER      | 3       | Deletes the resource, even if the object it contains is invalid.                        | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RECURSIVE_FORCE</code>        | NUMBER      | 4       | Deletes a resource and its children, if any, even if the object it contains is invalid. | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RES_METADATA_CASCADE</code>   | NUMBER      | 1       | Deletes the corresponding row in the metadata table                                     | <code>DBMS_XDB_REPOS</code> |
| <code>DELETE_RES_METADATA_NOCASCADE</code> | NUMBER      | 2       | Does not delete the row in the metadata table                                           | <code>DBMS_XDB_REPOS</code> |
| <code>DEFAULT_LOCK_TIMEOUT CONSTANT</code> | PLS_INTEGER | (60*60) | Default time (in seconds) after which lock will expire                                  | <code>DBMS_XDB_REPOS</code> |
| <code>LINK_TYPE_HARD</code>                | NUMBER      | 1       | Type of link to be created (default)                                                    | <code>DBMS_XDB_REPOS</code> |
| <code>LINK_TYPE_WEAK</code>                | NUMBER      | 2       | Type of link to be created                                                              | <code>DBMS_XDB_REPOS</code> |
| <code>LINK_TYPE_SYMBOLIC</code>            | NUMBER      | 3       | Type of link to be created                                                              | <code>DBMS_XDB_REPOS</code> |

**Table 187-1 (Cont.) DBMS\_XDB Constants**

| Constant            | Type   | Value | Description                                              | Relocated       |
|---------------------|--------|-------|----------------------------------------------------------|-----------------|
| ON_DENY_NEXT_CUSTOM | NUMBER | 1     | If access denied, the next custom authorization is tried | DBMS_XDB_CONFIG |
| ON_DENY_BASIC       | NUMBER | 2     | If access denied, basic authentication is used           | DBMS_XDB_CONFIG |

## 187.4 Summary of DBMS\_XDB Subprograms

This table lists the DBMS\_XDB subprograms and briefly describes them.

**Table 187-2 DBMS\_XDB Package Subprograms**

| Subprogram                                           | Description                                                                                                                                     |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACLCHECKPRIVILEGES Function</a>          | Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter. |
| <a href="#">APPENDRESOURCEMETADATA Procedure</a>     | Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource                                     |
| <a href="#">CHANGEOWNER Procedure</a>                | Changes the owner of the resource/s to the specified owner.                                                                                     |
| <a href="#">CHANGEPRIVILEGES Function</a>            | Adds a specified ACE to a specified resource's ACL                                                                                              |
| <a href="#">CHECKPRIVILEGES Function</a>             | Checks access privileges granted to the current user on the specified resource                                                                  |
| <a href="#">CREATEFOLDER Function</a>                | Creates a new folder resource in the hierarchy                                                                                                  |
| <a href="#">CREATEOIDPATH Function</a>               | Creates a virtual path to the resource based on object ID                                                                                       |
| <a href="#">CREATERESOURCE Functions</a>             | Creates a new resource                                                                                                                          |
| <a href="#">DELETERESOURCE Procedure</a>             | Deletes a resource from the hierarchy                                                                                                           |
| <a href="#">DELETERESOURCEMETADATA Procedures</a>    | Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)                                                     |
| <a href="#">ENABLEDIGESTAUTHENTICATION Procedure</a> | Enables digest authentication                                                                                                                   |
| <a href="#">EXISTSRESOURCE Function</a>              | Determines if a resource is in the hierarchy, based on its absolute path                                                                        |
| <a href="#">GETACLDOCUMENT Function</a>              | Retrieves ACL document that protects resource given its path name                                                                               |
| <a href="#">GETCONTENTBLOB Function</a>              | Retrieves the contents of a resource returned as a BLOB                                                                                         |
| <a href="#">GETCONTENTCLOB Function</a>              | Retrieves the contents of a resource returned as a CLOB                                                                                         |
| <a href="#">GETCONTENTVARCHAR2 Function</a>          | Retrieves the contents of a resource returned as a string                                                                                       |
| <a href="#">GETCONTENTXMLREF Function</a>            | Retrieves the contents of a resource returned as a REF to an XMLTYPE                                                                            |

**Table 187-2 (Cont.) DBMS\_XDB Package Subprograms**

| Subprogram                                        | Description                                                                        |
|---------------------------------------------------|------------------------------------------------------------------------------------|
| <a href="#">GETCONTENTXMLTYPE Function</a>        | Retrieves the contents of a resource returned as an XMLTYPE                        |
| <a href="#">GETHTTPREQUESTHEADER Function</a>     | Gets the values of the passed header                                               |
| <a href="#">GETLOCKTOKEN Procedure</a>            | Returns that resource's lock token for the current user given a path to a resource |
| <a href="#">GETPRIVILEGES Function</a>            | Gets all privileges granted to the current user on a specified resource            |
| <a href="#">GETRESOID Function</a>                | Returns the object ID of the resource from its absolute path                       |
| <a href="#">GETXDB_TABLESPACE Function</a>        | Returns the current tablespace of the XDB (user)                                   |
| <a href="#">HASBLOBCONTENT Function</a>           | Returns TRUE if the resource has BLOB content                                      |
| <a href="#">HASCHARCONTENT Function</a>           | Returns TRUE if the resource has character content                                 |
| <a href="#">HASXMLCONTENT Function</a>            | Returns TRUE if the resource has XML content                                       |
| <a href="#">HASXMLREFERENCE Function</a>          | Returns TRUE if the resource has REF to XML content                                |
| <a href="#">ISFOLDER Function</a>                 | Returns TRUE if the resource is a folder or container                              |
| <a href="#">LINK Procedures</a>                   | Creates a link to an existing resource                                             |
| <a href="#">LOCKRESOURCE Function</a>             | Gets a WebDAV-style lock on that resource given a path to that resource            |
| <a href="#">PROCESSLINKS Procedure</a>            | Processes document links in the specified resource                                 |
| <a href="#">PURGERESOURCEMETADATA Procedure</a>   | Deletes all user metadata from a resource                                          |
| <a href="#">RENAMERESOURCE Procedure</a>          | Renames the XDB resource                                                           |

| <a href="#">SPLITPATH Procedure</a>               | Splits the path into a parentpath and childpath                                    |
| <a href="#">TOUCHRESOURCE Procedure</a>           | Changes the modification time of the resource to the current time                  |
| <a href="#">UNLOCKRESOURCE Function</a>           | Unlocks the resource given a lock token and resource path                          |
| <a href="#">UPDATERESOURCEMETADATA Procedures</a> | Updates metadata for a resource                                                    |

## 187.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [ACLCHECKPRIVILEGES Function](#).

### Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
 acl_path IN VARCHAR2,
 owner IN VARCHAR2,
 privs IN xmltype)
RETURN PLS_INTEGER;
```

### Parameters

**Table 187-3** *ACLCHECKPRIVILEGES Function Parameters*

| Parameter             | Description                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>acl_path</code> | Absolute path in the Hierarchy for ACL document                                                                                                                             |
| <code>owner</code>    | Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution                                                                   |
| <code>privs</code>    | An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges. See description for <a href="#">CHECKPRIVILEGES Function</a> . |

## 187.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [APPENDRESOURCEMETADATA Procedure](#).

### Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadata IN XMLTYPE);
```

```
DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadata IN REF SYS.XMLTYPE);
```

### Parameters

**Table 187-4 APPENDRESOURCEMETADATA Procedure**

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| abspath   | Absolute path of the resource                                                                      |
| metadata  | Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table. |

### Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

## 187.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12c.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CHANGEOWNER Procedure](#).

### Syntax

```
DBMS_XDB.CHANGEOWNER(
 abspath IN VARCHAR2,
 owner IN VARCHAR2,
 recurse IN BOOLEAN := FALSE);
```

### Parameters

**Table 187-5 CHANGEOWNER Procedure Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |
| owner     | New owner for the resource    |

**Table 187-5 (Cont.) CHANGEOWNER Procedure Parameters**

| Parameter            | Description                                                           |
|----------------------|-----------------------------------------------------------------------|
| <code>recurse</code> | If TRUE, recursively change owner of all resources in the folder tree |

## 187.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL. This procedure is deprecated in Release 12c.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CHANGEPRIVILEGES Function](#).

### Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
 res_path IN VARCHAR2,
 ace IN XMLType)
RETURN PLS_INTEGER;
```

### Parameters

**Table 187-6 CHANGEPRIVILEGES Function Parameters**

| Parameter             | Description                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>res_path</code> | Path name of the resource for which privileges need to be changed                                                          |
| <code>ace</code>      | An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges |

### Return Values

A positive integer if the ACL was successfully modified.

### Usage Notes

If no ACE with the same principal and the same operation (`grant/deny`) already exists in the ACL, the new ACE is added at the end of the ACL.

## 187.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CHECKPRIVILEGES Function](#).

### Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
 res_path IN VARCHAR2,
 privs IN xmltype)
RETURN PLS_INTEGER;
```

### Parameters

**Table 187-7** CHECKPRIVILEGES Function Parameters

| Parameter | Description                                                                                    |
|-----------|------------------------------------------------------------------------------------------------|
| res_path  | Absolute path in the Hierarchy for resource                                                    |
| privs     | An XMLType instance of the privilege element specifying the requested set of access privileges |

### Return Values

A positive integer if all requested privileges granted.

## 187.4.6 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CREATEFOLDER Function](#).

### Syntax

```
DBMS_XDB.CREATEFOLDER(
 path IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 187-8 CREATEFOLDER Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| path      | Path name for the new folder |

## Return Values

TRUE if operation successful; FALSE, otherwise.

## Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

## 187.4.7 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

### Note:

This function is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CREATEOIDPATH Function](#).

## Syntax

```
DBMS_XDB.CREATEOIDPATH(
 oid IN RAW)
RETURN VARCHAR2;
```

## Parameters

**Table 187-9 CREATEOIDPATH Function Parameters**

| Parameter | Description               |
|-----------|---------------------------|
| oid       | Object ID of the resource |

## 187.4.8 CREATERESOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CREATERESOURCE Functions](#).

### Syntax

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(
 abspath IN VARCHAR2,
 datarow IN REF SYS.XMLTYPE,
 createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB.CREATERESOURCE(
 abspath IN VARCHAR2,
 data IN BLOB,
 csid IN NUMBER :=0,
 createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN BFILE,
 csid IN NUMBER :=0,
 createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN CLOB,
 createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN VARCHAR2,
```

```

 schemaurl IN VARCHAR2 := NULL,
 elem IN VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Given an `XMLTYPE` and a schema URL, inserts a new resource into the hierarchy with the `XMLTYPE` as the contents:

```

DBMS_XDB.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN SYS.XMLTYPE,
 schemaurl IN VARCHAR2 := NULL,
 elem IN VARCHAR2 := NULL)
RETURN BOOLEAN;

```

## Parameters

**Table 187-10** CREATERESOURCE Function Parameters

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>abspath</code>       | Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>data</code>          | String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>datarow</code>       | REF to an <code>XMLType</code> row to be used as the contents                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>csid</code>          | Character set id of the document. Must be a valid Oracle ID; otherwise returns an error.<br><br>If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> <li>From the <code>abspath</code> extension, determine the resource's MIME type.</li> <li>If the MIME type is <code>*/xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</li> <li>Otherwise, it is defaulted to the database character set.</li> </ul> |
| <code>createfolders</code> | If <code>TRUE</code> , create the parent folders if they do not exist                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>schemaurl</code>     | For XML data, schema URL data conforms to (default <code>NULL</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>elem</code>          | Element name (default <code>NULL</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

## 187.4.9 DELETERESOURCE Procedure

This **deprecated procedure** deletes a resource from the hierarchy.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [DELETERESOURCE Procedure](#).

### Syntax

```
DBMS_XDB.DELETERESOURCE(
 path IN VARCHAR2,
 delete_option IN PLS_INTEGER);
```

### Parameters

**Table 187-11 DELETERESOURCE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path          | Path name of the resource to delete                                                                                                                                                                                                                    |
| delete_option | The option that controls how a resource is deleted; defined in <a href="#">Table 187-1</a> : <ul style="list-style-type: none"> <li>• DELETE_RESOURCE</li> <li>• DELETE_RECURSIVE</li> <li>• DELETE_FORCE</li> <li>• DELETE_RECURSIVE_FORCE</li> </ul> |

## 187.4.10 DELETERESOURCEMETADATA Procedures

This **deprecated procedure** takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [DELETERESOURCEMETADATA Procedures](#).

### Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadata IN REF SYS.XMLTYPE,
 delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadatans IN VARCHAR2,
 metadataname IN VARCHAR2,
 delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

## Parameters

**Table 187-12 DELETERESOURCEMETADATA Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| abspath       | Absolute path of the resource                                                                                                                                                                                                                                                                           |
| metadata      | REF to the piece of metadata (schema based) to be deleted                                                                                                                                                                                                                                               |
| metdatans     | Namespace of the metadata fragment to be removed                                                                                                                                                                                                                                                        |
| metdataname   | Local name of the metadata fragment to be removed                                                                                                                                                                                                                                                       |
| delete_option | Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> <li>DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</li> <li>DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</li> </ul> |

## 187.4.11 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_CONFIG](#) package - the [ENABLEDIGESTAUTHENTICATION Procedure](#).

### Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

## 187.4.12 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [EXISTSRESOURCE Function](#).

### Syntax

```
DBMS_XDB.EXISTSRESOURCE(
 abspath IN VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 187-13** EXISTSRESOURCE Function Parameters

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| abspath   | Path name of the resource whose ACL document is required |

### Return Values

TRUE if the resource is found.

## 187.4.13 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETACLDOCUMENT Function](#).

### Syntax

```
DBMS_XDB.GETACLDOCUMENT(
 abspath IN VARCHAR2)
RETURN sys.xmltype;
```

## Parameters

**Table 187-14** GETACLDOCUMENT Function Parameters

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| abspath   | Path name of the resource whose ACL document is required |

## Return Values

The XMLType for ACL document.

## 187.4.14 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a BLOB.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTBLOB Function](#).

## Syntax

```
DBMS_XDB.GETCONTENTBLOB(
 abspath IN VARCHAR2,
 csid OUT PLS_INTEGER,
 locksrc IN BOOLEAN := FALSE)
RETURN BLOB;
```

## Parameters

**Table 187-15** GETCONTENTBLOB Function Parameters

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| abspath   | Absolute path of the resource                                              |
| csid      | If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy. |
| locksrc   | Contents of the resource as a BLOB                                         |

## Return Values

The contents of the resource as a BLOB.

## 187.4.15 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a CLOB.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTCLOB Function](#).

### Syntax

```
DBMS_XDB.GETCONTENTCLOB(
 abspath IN VARCHAR2,
 RETURN CLOB;
```

### Parameters

**Table 187-16** GETCONTENTCLOB Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

### Return Values

The contents of the resource as a CLOB.

## 187.4.16 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTVARCHAR2 Function](#).

### Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
 abspath IN VARCHAR2,
 RETURN BLOB;
```

## Parameters

**Table 187-17** GETCONTENTVARCHAR2 Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## Return Values

The contents of the resource as a string.

## 187.4.17 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a REF to an XMLTYPE.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTXMLREF Function](#).

## Syntax

```
DBMS_XDB.GETCONTENTXMLREF(
 abspath IN VARCHAR2,
 RETURN SYS.XMLTYPE;
```

## Parameters

**Table 187-18** GETCONTENTXMLREF Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## Return Values

The contents of the resource as a REF to an XMLTYPE.

## 187.4.18 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an XMLTYPE.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTXMLTYPE](#) Function.

### Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
 abspath IN VARCHAR2,
 RETURN SYS.XMLTYPE;
```

### Parameters

**Table 187-19** GETCONTENTXMLTYPE Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

### Return Values

The contents of the resource as an XMLTYPE.

## 187.4.19 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

 **Note:**

This procedure is deprecated in Release 12c.

### Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(
 header_name IN VARCHAR2)
 RETURN VARCHAR2;
```

## Parameters

**Table 187-20** GETHTTPREQUESTHEADER Function Parameters

| Parameter   | Description   |
|-------------|---------------|
| header_name | Passed header |

## Return Values

Returns NULL in case the header is not present in the request, or for AUTHENTICATION, for security reasons.

## 187.4.20 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource's lock token for the current user.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETLOCKTOKEN Procedure](#).

## Syntax

```
DBMS_XDB.GETLOCKTOKEN(
 path IN VARCHAR2,
 locktoken OUT VARCHAR2);
```

## Parameters

**Table 187-21** GETLOCKTOKEN Procedure Parameters

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| path      | Path name to the resource                    |
| locktoken | Logged-in user's lock token for the resource |

## Usage Notes

The user must have READPROPERTIES privilege on the resource.

## 187.4.21 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETPRIVILEGES Function](#).

### Syntax

```
DBMS_XDB.GETPRIVILEGES(
 res_path IN VARCHAR2)
RETURN sys.xmltype;
```

### Parameters

**Table 187-22 GETPRIVILEGES Function Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| res_path  | Absolute path in the hierarchy of the resource |

### Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

## 187.4.22 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETRESOID Function](#).

### Syntax

```
DBMS_XDB.GETRESOID(
 abspath IN VARCHAR2)
RETURN RAW;
```

## Parameters

**Table 187-23 GETRESOID Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

## Return Values

NULL if the resource is not present.

## 187.4.23 GETXDB\_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETXDB\\_TABLESPACE Function](#).

## Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
RETURN VARCHAR2;
```

## 187.4.24 HASBLOBCONTENT Function

This deprecated function returns TRUE if the resource has BLOB content.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASBLOBCONTENT Function](#).

## Syntax

```
DBMS_XDB.HASBLOBCONTENT
abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 187-24 HASBLOBCONTENT Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

TRUE if the resource has BOB content.

## 187.4.25 HASCHARCONTENT Function

This deprecated function returns TRUE if the resource has character content.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASCHARCONTENT Function](#).

## Syntax

```
DBMS_XDB.HASCHARCONTENT
 (abspath IN VARCHAR2)
 RETURN BOOLEAN;
```

## Parameters

**Table 187-25 HASCHARCONTENT Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

TRUE if the resource has character content.

## 187.4.26 HASXMLCONTENT Function

This deprecated function returns TRUE if the resource has XML content.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASXMLCONTENT Function](#).

## Syntax

```
DBMS_XDB.HASXMLCONTENT
 abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 187-26 HASXMLCONTENT Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

TRUE if the resource has XML content.

## 187.4.27 HASXMLREFERENCE Function

This deprecated function returns TRUE if the resource has a REF to XML content.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASXMLREFERENCE Function](#).

## Syntax

```
DBMS_XDB.HASXMLREFERENCE
 abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 187-27 HASXMLREFERENCE Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

TRUE resource has a REF to XML content.

## 187.4.28 ISFOLDER Function

This deprecated function returns `TRUE` if the resource is a folder or container.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [ISFOLDER Function](#).

### Syntax

```
DBMS_XDB.ISFOLDER
 abspath IN VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 187-28 DBMS\_XDB.ISFOLDER Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

### Return Values

`TRUE` if the resource is a folder or container.

## 187.4.29 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [LINK Procedures](#).

### Syntax

```
DBMS_XDB.LINK(
 srcpath IN VARCHAR2,
 linkfolder IN VARCHAR2,
 linkname IN VARCHAR2);

DBMS_XDB.LINK(
 srcpath IN VARCHAR2,
 linkfolder IN VARCHAR2,
```

```

linkname IN VARCHAR2,
linktype IN PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);

```

## Parameters

**Table 187-29 LINK Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srcpath    | Path name of the resource to which a link is created                                                                                                                                        |
| linkfolder | Folder in which the new link is placed                                                                                                                                                      |
| linkname   | Name of the new link                                                                                                                                                                        |
| linktype   | Type of link to be created: <ul style="list-style-type: none"> <li>• DBMS_XDB.LINK_TYPE_HARD (default)</li> <li>• DBMS_XDB.LINK_TYPE_WEAK</li> <li>• DBMS_XDB.LINK_TYPE_SYMBOLIC</li> </ul> |

## 187.4.30 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [LOCKRESOURCE Function](#).

## Syntax

```

DBMS_XDB.LOCKRESOURCE(
 path IN VARCHAR2,
 depthzero IN BOOLEAN,
 shared IN boolean)
RETURN BOOLEAN;

```

## Parameters

**Table 187-30 LOCKRESOURCE Function Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| path      | Path name of the resource to lock.       |
| depthzero | Currently not supported                  |
| shared    | Passing TRUE obtains a shared write lock |

## Return Values

TRUE if successful.

## Usage Notes

The user must have `UPDATE` privileges on the resource.

## 187.4.31 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [PROCESSLINKS Procedure](#).

## Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath IN VARCHAR2,
 recurse IN BOOLEAN := FALSE);
```

## Parameters

**Table 187-31** PROCESSLINKS Procedure Parameters

| Parameter            | Description                                                                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>abspath</code> | Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.                                                                                                                                                        |
| <code>recurse</code> | Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only. |

## 187.4.32 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [PURGERESOURCEMETADATA Procedure](#).

## Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath IN VARCHAR2);
```

## Parameters

**Table 187-32 PURGERESOURCEMETADATA Procedure Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## 187.4.33 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [RENAMERESOURCE Procedure](#).

### Syntax

```
DBMS_XDB.RENAMERESOURCE(
 srcpath IN VARCHAR2,
 destfolder IN CARCHAR2,
 newname IN VARCHAR2);
```

### Parameters

**Table 187-33 RENAMERESOURCE Procedure Parameters**

| Parameter  | Description                                                               |
|------------|---------------------------------------------------------------------------|
| srcpath    | Absolute path in the Hierarchy for the source resource destination folder |
| destfolder | Absolute path in the Hierarchy for the destination folder                 |
| newname    | Name of the child in the destination folder                               |

## 187.4.34 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [SETACL Procedure](#).

### Syntax

```
DBMS_XDB.SETACL(
 res_path IN VARCHAR2,
 acl_path IN VARCHAR2);
```

### Parameters

**Table 187-34 SETACL Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| res_path  | Absolute path in the Hierarchy for resource |
| acl_path  | Absolute path in the Hierarchy for ACL      |

### Usage Notes

The user must have <write-acl> privileges on the resource.

## 187.4.35 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [SPLITPATH Procedure](#).

### Syntax

```
DBMS_XDB.SPLITPATH(
 abspath IN VARCHAR2,
 parentpath OUT VARCHAR2,
 childpath OUT VARCHAR2);
```

### Parameters

**Table 187-35 SPLITPATH Procedure Parameters**

| Parameter  | Description               |
|------------|---------------------------|
| abspath    | Absolute path to be split |
| parentpath | Parentpath                |
| childpath  | Childpath                 |

## 187.4.36 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [TOUCHRESOURCE Procedure](#).

### Syntax

```
DBMS_XDB.TOUCHRESOURCE
 abspath IN VARCHAR2);
```

### Parameters

**Table 187-36 DBMS\_XDB.TOUCHRESOURCE Procedure Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## 187.4.37 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [UNLOCKRESOURCE Function](#).

### Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
 path IN VARCHAR2,
 deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 187-37 UNLOCKRESOURCE Function Parameters**

| Parameter | Description               |
|-----------|---------------------------|
| path      | Path name to the resource |
| deltoken  | Lock token to be removed  |

## Return Values

TRUE if operation successful.

## Usage Notes

The user must have UPDATE privileges on the resource.

## 187.4.38 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [UPDATERESOURCEMETADATA Procedures](#).

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

## Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldmetadata IN REF SYS.XMLTYPE,
 newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldmetadata IN REF SYS.XMLTYPE,
 newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldns IN VARCHAR2,
 oldname IN VARCHAR,
 newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldns IN VARCHAR2,
 oldname IN VARCHAR,
 newmetadata IN REF SYS.XMLTYPE);
```

### Parameters

**Table 187-38 UPDATERESOURCEMETADATA Procedure Parameters**

| Parameter   | Description                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------|
| abspath     | Absolute path of the resource                                                                                  |
| oldmetadata | REF to the old of metadata                                                                                     |
| newmetadata | REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload) |
| oldns       | Namespace identifying old metadata                                                                             |
| oldname     | Local name identifying old metadata                                                                            |

### Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

# DBMS\_XDB\_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- [DBMS\\_XDB\\_ADMIN Security Model](#)
- [Summary of DBMS\\_XDB\\_ADMIN Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide* for information about Oracle XML DB Repository

## 188.1 DBMS\_XDB\_ADMIN Security Model

Owned by XDB, the `DBMS_XDB_ADMIN` package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.

## 188.2 Summary of DBMS\_XDB\_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

**Table 188-1 DBMS\_XDB\_ADMIN Package Subprograms**

| Subprogram                                         | Description                                                         |
|----------------------------------------------------|---------------------------------------------------------------------|
| <a href="#">CREATENONCEKEY Procedure</a>           | Generates a nonce value for use in digest authentication            |
| <a href="#">INSTALLDEFAULTWALLET Procedure</a>     | Installs the default XDB wallet in the default XDB wallet directory |
| <a href="#">MOVEXDB_TABLESPACE Procedure</a>       | Moves the XDB (user) to the specified tablespace                    |
| <a href="#">REBUILDHIERARCHICALINDEX Procedure</a> | Rebuilds the hierarchical index after import or export operations   |

### 188.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

#### Syntax

```
DBMS_XDB_ADMIN.CREATENONCEKEY;
```

## 188.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/db_name/xdb_wallet` where `db_name` is the unique database name.

### Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

### Usage Notes

Only `SYS` can install or replace the default wallet.

## 188.2.3 MOVEXDB\_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

### Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(
 new_tablespace IN VARCHAR2);
```

### Parameters

**Table 188-2 MOVEXDB\_TABLESPACE Procedure Parameters**

| Parameter                   | Description                                      |
|-----------------------------|--------------------------------------------------|
| <code>new_tablespace</code> | Name of the tablespace to where the XDB is moved |

### Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the `SYSAUX` tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to `READ ONLY` because this might affect various XML operations being executed.

## 188.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

### Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

# DBMS\_XDB\_CONFIG

The `DBMS_XDB_CONFIG` package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_XDB\\_CONFIG Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 189.1 DBMS\_XDB\_CONFIG Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package `DBMS_XDB_CONFIG` is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

## 189.2 DBMS\_XDB\_CONFIG Security Model

Owned by XDB, the `DBMS_XDB_CONFIG` package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 189.3 DBMS\_XDB\_CONFIG Constants

The `DBMS_XDB_CONFIG` package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

**Table 189-1 DBMS\_XDB\_CONFIG Constants**

| Constant                         | Type   | Value | Description                               |
|----------------------------------|--------|-------|-------------------------------------------|
| <code>XDB_ENDPOINT_HTTP</code>   | NUMBER | 1     | Defining listener for first HTTP port     |
| <code>XDB_ENDPOINT_HTTP2</code>  | NUMBER | 2     | Defining listener for second HTTP port    |
| <code>XDB_ENDPOINT_RHTTP</code>  | NUMBER | 3     | Defining listener for a remote HTTP port  |
| <code>XDB_ENDPOINT_RHTTPS</code> | NUMBER | 4     | Defining listener for a remote HTTPS port |
| <code>XDB_PROTOCOL_TCP</code>    | NUMBER | 1     | Defining listener for HTTP protocol       |
| <code>XDB_PROTOCOL_TCPS</code>   | NUMBER | 2     | Defining listener for HTTPS protocol      |

## 189.4 Summary of DBMS\_XDB\_CONFIG Subprograms

The `DBMS_XDB_CONFIG` package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

**Table 189-2 DBMS\_XDB\_CONFIG Package Subprograms**

| Subprogram                                     | Description                                                                                                                                                             |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADDHTTPEXPIREMAPPING Procedure</a> | Adds to <code>XDB\$CONFIG</code> a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.                |
| <a href="#">ADDMIMEMAPPING Procedure</a>       | Adds a mime mapping to XDB configuration                                                                                                                                |
| <a href="#">ADDSCHEMALOCMAPPING Procedure</a>  | Adds a schema location mapping to the XDB configuration                                                                                                                 |
| <a href="#">ADDSERVLET Procedure</a>           | Adds a servlet to XDB configuration                                                                                                                                     |
| <a href="#">ADDSERVLETMAPPING Procedure</a>    | Adds a servlet mapping to XDB configuration                                                                                                                             |
| <a href="#">ADDSERVLETSECROLE Procedure</a>    | Adds a security role <code>REF</code> to a specified servlet in XDB configuration                                                                                       |
| <a href="#">ADDXMLEXTENSION Procedure</a>      | Adds adds the following XML extension to the XDB configuration under <code>&lt;xml-extensions&gt;</code> :<br><code>&lt;extension&gt;extension&lt;/extension&gt;</code> |
| <a href="#">CFG_GET Function</a>               | Retrieves the session's configuration information as an <code>XMLType</code> instance                                                                                   |

**Table 189-2 (Cont.) DBMS\_XDB\_CONFIG Package Subprograms**

| Subprogram                                           | Description                                                                                          |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <a href="#">CFG_REFRESH Procedure</a>                | Refreshes the session's configuration information to the latest configuration                        |
| <a href="#">CFG_UPDATE Procedure</a>                 | Updates the configuration information and commits the change.                                        |
| <a href="#">DELETEHTTPEXPIREMAPPING Procedure</a>    | Deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date                       |
| <a href="#">DELETEMIMEMAPPING Procedure</a>          | Deletes the mime mapping for a specified extension from the XDB configuration                        |
| <a href="#">DELETESCHEMALOCMAPPING Procedure</a>     | Deletes the schema location mapping for a specified schema URL from the XDB configuration            |
| <a href="#">DELETESERVLET Procedure</a>              | Deletes a servlet from the XDB configuration                                                         |
| <a href="#">DELETESERVLETMAPPING Procedure</a>       | Deletes the servlet mapping for a specified servlet name from the XDB configuration                  |
| <a href="#">DELETESERVLETSECROLE Procedure</a>       | Deletes the specified role from a servlet in the XDB configuration                                   |
| <a href="#">DELETXMLEXTENSION Procedure</a>          | Deletes the specified XML extension from the XDB configuration                                       |
| <a href="#">ENABLEDIGESTAUTHENTICATION Procedure</a> | Enables enables digest authentication                                                                |
| <a href="#">GETFTPSPORT Function</a>                 | Gets the value of the current FTP port                                                               |
| <a href="#">GETHTTPSPORT Function</a>                | Gets the value of the current HTTP port                                                              |
| <a href="#">GETHTTPCONFIGREALM Function</a>          | Gets the realm name                                                                                  |
| <a href="#">GETHTTPSPORT Function</a>                | Gets the value of the current HTTPS port                                                             |
| <a href="#">GETLISTENERENDPOINT Procedure</a>        | Gets the parameters of a listener end point corresponding to the XML DB HTTP server                  |
| <a href="#">GETREMOTEHTTPSPORT Function</a>          | Gets the value of a remote HTTP port                                                                 |
| <a href="#">GETREMOTEHTTPSPORT Function</a>          | Gets the value of a remote HTTPS port                                                                |
| <a href="#">ISGLOBALPORTENABLED Function</a>         | Returns the value of the DBMS_XDB_CONFIG.SETGLOBALPORTENABLED procedure setting                      |
| <a href="#">SETGLOBALPORTENABLED Procedure</a>       | Enables the use of a global port for Oracle Enterprise Manager Database Express (EM Express) clients |
| <a href="#">SETFTPSPORT Procedure</a>                | Sets the FTP port to a new value                                                                     |
| <a href="#">SETHTTPSPORT Procedure</a>               | Sets the HTTP port to a new value                                                                    |
| <a href="#">SETHTTPCONFIGREALM Procedure</a>         | Sets the realm to a new value                                                                        |
| <a href="#">SETHTTPSPORT Procedure</a>               | Sets the HTTPS port to a new value                                                                   |
| <a href="#">SETLISTENERENDPOINT Procedure</a>        | Sets the parameters of a listener end point corresponding to the XML DB HTTP server                  |

**Table 189-2 (Cont.) DBMS\_XDB\_CONFIG Package Subprograms**

| Subprogram                                       | Description                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SETLISTENERLOCALACCESS Procedure</a> | Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when <code>l_access</code> is set to <code>TRUE</code> ) or to listen on both localhost and non-localhost interfaces (when <code>l_access</code> is set to <code>FALSE</code> ) |
| <a href="#">SETREMOTEHTTPPORT Procedure</a>      | Sets the remote HTTP port to a new value                                                                                                                                                                                                                                                      |
| <a href="#">SETREMOTEHTTPSPORT Procedure</a>     | Sets the remote HTTPS port to a new value                                                                                                                                                                                                                                                     |
| <a href="#">USEDPORT Procedure</a>               | Obtains the port numbers used by other pluggable databases in the same consolidation database                                                                                                                                                                                                 |

## 189.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

### Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
 pattern IN VARCHAR2,
 expire IN VARCHAR2);
```

### Parameters

**Table 189-3 ADDHTTPEXPIREMAPPING Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pattern</code> | URL pattern (only * accepted as wildcards)                                                                                                                                                                                                                                                                       |
| <code>expire</code>  | Expiration directive, follows the <code>ExpireDefault</code> in Apache's <code>mod_expires</code> :<br><br><code>base [plus] (num type)*</code><br><code>-- base: now   modification</code><br><code>-- type: year years month months week weeks day days </code><br><code>minute minutess second seconds</code> |

### Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
 '/public/test2/*', 'modification plus 1 day 30 seconds');
```

## 189.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING(
 extension IN VARCHAR2,
 mimetype IN VARCHAR2);
```

### Parameters

**Table 189-4** *ADDMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is being added
mimetype	Mime type

## 189.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
 <namespace>namespace</namespace>
 <element>element</element>
 <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING(
 namespace IN VARCHAR2,
 element IN VARCHAR2,
 schemaURL IN VARCHAR2);
```

### Parameters

**Table 189-5** *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

## 189.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
 <servlet-name>name</servlet-name> <servlet-language>language</servlet-
language>
 <display-name>dispname</display-name>
 <description>descript</description>
 <servlet-class>class</servlet-class>
```

```
<servlet-schema>schema</servlet-schema>
</servlet>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET(
 name IN VARCHAR2,
 language IN VARCHAR2,
 dispname IN VARCHAR2,
 icon IN VARCHAR2 := NULL,
 descript IN VARCHAR2 := NULL,
 class IN VARCHAR2 := NULL,
 jspfile IN VARCHAR2 := NULL,
 plsqli IN VARCHAR2 := NULL,
 schema IN VARCHAR2 := NULL);
```

### Parameters

**Table 189-6 ADDSERVLET Procedure Parameters**

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	This parameter is not supported. Always provide NULL value for this parameter. System throws an error if the value is not NULL.
plsqli	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema is used to specify <code>servlet-schema</code> xml element name in <code>xdbconfig.xml</code> . It indicates the Oracle schema in which the Java class is loaded.  If you do not specify any value, then the schema is searched using the default resolver specification.

## 189.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```
<servlet-mapping>
 <servlet-pattern>pattern</servlet-pattern>
 <servlet-name>name</servlet-name>
</servlet-mapping>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
 pattern IN VARCHAR2, name IN VARCHAR2);
```

### Parameters

**Table 189-7 ADDSERVLETMAPPING Procedure Parameters**

Parameter	Description
pattern	Servlet pattern
name	Servlet name

## 189.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role `REF` to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```
<security-role-ref>
 <role-name>rolename</role-name>
 <role-link>rolelink</role-link>
 <description>descript</description>
</security-role-ref>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
 servname IN VARCHAR2, rolename IN VARCHAR2, rolelink
IN VARCHAR2, descript IN VARCHAR2 := NULL);
```

### Parameters

**Table 189-8 ADDSERVLETSECROLE Procedure Parameters**

Parameter	Description
servname	Servlet name
rolename	Role name
rolelink	Role link
descript	Description

## 189.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under `<xml-extensions>`.

It adds the following XML extension to the XDB configuration, under `<xml-extensions>`:

```
<extension>extension</extension>
```

**Syntax**

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(
 extension IN VARCHAR2);
```

**Parameters****Table 189-9** *ADDXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be added

## 189.4.8 CFG\_GET Function

This function retrieves the session's configuration information as an XMLType instance.

**Syntax**

```
DBMS_XDB_CONFIG.CFG_GET
RETURN SYS.XMLType;
```

## 189.4.9 CFG\_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

**Syntax**

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

## 189.4.10 CFG\_UPDATE Procedure

This procedure updates the configuration information and commits the change.

**Syntax**

```
DBMS_XDB_CONFIG.CFG_UPDATE(
 xdbconfig IN SYS.XMLTYPE);
```

**Parameters****Table 189-10** *CFG\_UPDATE Procedure Parameters*

Parameter	Description
xdbconfig	The new configuration data

## 189.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date.

### Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
 pattern IN VARCHAR2);
```

### Parameters

**Table 189-11** DELETEHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)

## 189.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
 extension IN VARCHAR2);
```

### Parameters

**Table 189-12** DELETEMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is to be deleted

## 189.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
 schemaURL IN VARCHAR2);
```

### Parameters

**Table 189-13** DELETESCHEMALOCMAPPING Procedure Parameters

Parameter	Description
schemaURL	Schema URL

## 189.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(
 name IN VARCHAR2);
```

### Parameters

**Table 189-14** *DELETESERVLET Procedure Parameters*

Parameter	Description
name	Servlet name

## 189.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING(
 name IN VARCHAR2);
```

### Parameters

**Table 189-15** *DELETESERVLETMAPPING Procedure Parameters*

Parameter	Description
name	Servlet name

## 189.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE(
 servname IN VARCHAR2, rolename IN VARCHAR2);
```

### Parameters

**Table 189-16** *DELETESERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

## 189.4.17 DELETXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETXMLEXTENSION(
 extension IN VARCHAR2);
```

### Parameters

**Table 189-17** *DELETXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be deleted

## 189.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

### Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

## 189.4.19 GETFTPSPORT Function

This procedure gets the value of the current FTP port.

### Syntax

```
DBMS_XDB_CONFIG.GETFTPSPORT
 RETURN NUMBER;
```

## 189.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

### Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM
 RETURN VARCHAR2;
```

## 189.4.21 GETHTTPSPORT Function

This function gets the value of the current HTTP port.

### Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT
 RETURN NUMBER;
```

## 189.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

### Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT
RETURN NUMBER;
```

### Usage Notes

Returns NULL if no port has been configured

## 189.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

### Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (
 endpoint IN NUMBER,
 host OUT VARCHAR2, port OUT NUMBER,
 protocol OUT NUMBER);
```

### Parameters

**Table 189-18** GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point listens
port	Port on which the listener end point listens
protocol	Transport protocol accepted by the listener end point

## 189.4.24 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTP port.

### Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
RETURN NUMBER;
```

## 189.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

### Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
RETURN NUMBER;
```

## 189.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the GlobalPortEnabled setting.

### Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

### Usage Notes

- This procedure returns TRUE if GlobalPortEnabled has been set to TRUE; otherwise it returns FALSE.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

## 189.4.27 SETFTPSPORT Procedure

This procedure sets the FTP port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETFTPSPORT(
 new_port IN NUMBER);
```

### Parameters

**Table 189-19** SETFTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the FTP port is set

## 189.4.28 SETGLOBALPORTENABLED Procedure

This procedure enables Oracle Enterprise Manager Database Express (EM Express) clients to use a single port (called a global port), for the session rather than using a port dedicated to the PDB.

### Syntax

```
DBMS_XDB_CONFIG.SETGLOBALPORTENABLED (
 isenabled IN BOOLEAN);
```

## Parameters

**Table 189-20 SETGLOBALPORTENABLED Procedure Parameters**

Parameter	Description
isenabled	<p>TRUE enables the EM Express client to use a global port for the session rather than using the PDB that allocated the port.</p> <p>FALSE enables the port ID to determine the PDB to use.</p> <p>The default is TRUE for PDBs but FALSE for the CDB root.</p>

## Usage Notes

- Use the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure if you use EM Express to manage database ports in a multitenant environment.
- To use a global port, you must enable it in both the CDB and the PDB. PDBs have it enabled by default. For CDBs, you must run the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure in the CDB root.
- After you set `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to TRUE, then you must specify a PDB to use for the global port. You can do so by specifying the PDB name in the **Container Name** field of the EM Express login page. For example, if you enter `hr_pdb`, then the EM Express URL becomes `http://server_name:5500/hr_pdb/em`. This example uses the port 5500 in the CDB root, which in turn routes messages to the EM Express in the PDB `hr_pdb`. The port can be an HTTP or HTTPS port.
- The PDB that you specify in the EM Express login page must be open in read/write mode before you can run `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED`. You can check the read/write mode status of a PDB by connecting to the PDB and then querying the `OPEN_MODE` column of the `V$PDBS` dynamic view.
- The `DBMS_XDB_CONFIG.ISGLOBALPORTENABLED` function returns the value of the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` setting.
- You can use the `XDB_PROTOCOLS` lockdown profile to control the security for the global port.

### See Also:

- *Oracle Database 2 Day DBA* for information about using `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to start EM Express for a PDB
- *Oracle Database Security Guide* for information about lockdown profiles

## 189.4.29 SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(
 new_port IN NUMBER);
```

### Parameters

**Table 189-21** SETHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port is set

## 189.4.30 SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

### Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
 realm IN VARCHAR2);
```

### Parameters

**Table 189-22** SETHTTPCONFIGREALM Procedure Parameters

Parameter	Description
realm	Realm as defined in IETF's RFC2617

## 189.4.31 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(
 new_port IN NUMBER);
```

### Parameters

**Table 189-23** SETHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTPS port is set

## 189.4.32 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

### Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
 endpoint IN NUMBER,
 host IN VARCHAR2, port IN NUMBER,
 protocol IN NUMBER);
```

### Parameters

**Table 189-24 SETLISTENERENDPOINT Procedure Parameters**

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

## 189.4.33 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

### Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
 l_access BOOLEAN);
```

### Parameters

**Table 189-25 SETLISTENERLOCALACCESS Procedure Parameters**

Parameter	Description
<code>l_access.</code>	<code>TRUE</code> or <code>FALSE</code> .

## 189.4.34 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT(
 new_port IN NUMBER);
```

### Parameters

**Table 189-26** SETREMOTEHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTP port is set

## 189.4.35 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT (
 new_port IN NUMBER);
```

### Parameters

**Table 189-27** SETREMOTEHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the remote HTTPS port is set

## 189.4.36 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

### Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```

# DBMS\_XDB\_CONSTANTS

The `DBMS_XDB_CONSTANTS` package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_XDB\\_CONSTANTS Subprograms](#)

## 190.1 DBMS\_XDB\_CONSTANTS Security Model

Owned by XDB, the `DBMS_XDB_CONSTANTS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 190.2 Summary of DBMS\_XDB\_CONSTANTS Subprograms

This table lists the `DBMS_XDB_CONSTANTS` subprograms and briefly describes them.

**Table 190-1 DBMS\_XDB\_CONSTANTS Package Subprograms**

Subprograms	Description
<a href="#">ENCODING_DEFAULT Function</a>	Returns 'AL32UTF8'
<a href="#">ENCODING_ISOLATIN1 Function</a>	Returns 'WE8ISO8859P1'
<a href="#">ENCODING_UTF8 Function</a>	Returns 'AL32UTF8'
<a href="#">ENCODING_WIN1252 Function</a>	Returns 'WE8MSWIN1252'
<a href="#">NAMESPACE_ACL Function</a>	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
<a href="#">NAMESPACE_METADATA Function</a>	Returns 'http://xmlns.oracle.com/xdbuserMetaData'
<a href="#">NAMESPACE_ORACLE Function</a>	Returns 'http://xmlns.oracle.com'
<a href="#">NAMESPACE_ORACLE_XDB Function</a>	Returns 'http://xmlns.oracle.com/xdb'
<a href="#">NAMESPACE_RESOURCE Function</a>	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
<a href="#">NAMESPACE_RESOURCE_EVENT Function</a>	Returns 'http://xmlns.oracle.com/resourceEvent'
<a href="#">NAMESPACE_RESOURCE_CONFIG Function</a>	Returns 'http://xmlns.oracle.com/XDBResConfig.xsd'
<a href="#">NAMESPACE_XDBSCHEMA Function</a>	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

**Table 190-1 (Cont.) DBMS\_XDB\_CONSTANTS Package Subprograms**

Subprograms	Description
<a href="#">NAMESPACE_XMLDIFF Function</a>	Returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'
<a href="#">NAMESPACE_XMLINSTANCE Function</a>	Returns 'http://www.w3.org/2001/XMLSchema-instance'
<a href="#">NAMESPACE_XMLSCHEMA Function</a>	Returns 'http://www.w3.org/2001/XMLSchema'
<a href="#">NSPREFIX_ACL_ACL Function</a>	Returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'
<a href="#">NSPREFIX_RESCONFIG_RC Function</a>	Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'
<a href="#">NSPREFIX_RESOURCE_R Function</a>	Returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'
<a href="#">NSPREFIX_XDB_XDB Function</a>	Returns 'http://xmlns.oracle.com/xdb'
<a href="#">NSPREFIX_XMLINSTANCE_XSI Function</a>	Returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'
<a href="#">NSPREFIX_XMLDIFF_XD Function</a>	Returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'
<a href="#">NSPREFIX_XMLSCHEMA_XSD Function</a>	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'
<a href="#">SCHEMAURL_ACL Function</a>	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
<a href="#">SCHEMAELEM_RES_ACL Function</a>	Returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'
<a href="#">SCHEMAELEM_RESCONTENT_BINARY Function</a>	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'
<a href="#">SCHEMAELEM_RESCONTENT_TEXT Function</a>	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'
<a href="#">SCHEMAURL_RESOURCE Function</a>	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
<a href="#">SCHEMAURL_XDBSCHEMA Function</a>	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
<a href="#">XDBSCHEMA_PREFIXES Function</a>	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'
<a href="#">XSD_ATTRIBUTE Function</a>	Returns 'attribute'
<a href="#">XSD_COMPLEX_TYPE Function</a>	Returns 'complexType'
<a href="#">XSD_ELEMENT Function</a>	Returns 'element'
<a href="#">XSD_GROUP Function</a>	Returns 'group'

## 190.2.1 ENCODING\_DEFAULT Function

This function returns 'AL32UTF8'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'AL32UTF8'

## 190.2.2 ENCODING\_ISOLATIN1 Function

This function returns 'WE8ISO8859P1'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'WE8ISO8859P1'

## 190.2.3 ENCODING\_UTF8 Function

This function returns 'AL32UTF8'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'AL32UTF8'

## 190.2.4 ENCODING\_WIN1252 Function

This function returns 'WE8MSWIN1252'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'WE8MSWIN1252'

## 190.2.5 NAMESPACE\_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

## 190.2.6 NAMESPACE\_METADATA Function

This function returns 'http://xmlns.oracle.com/xdbuserMetaData'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdbuserMetaData'

## 190.2.7 NAMESPACE\_ORACLE Function

This function returns 'http://xmlns.oracle.com'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com'

## 190.2.8 NAMESPACE\_ORACLE\_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb'

## 190.2.9 NAMESPACE\_RESOURCE Function

This function returns '/XDBResource.xsd'

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

## 190.2.10 NAMESPACE\_RESOURCE\_EVENT Function

This function returns 'http://xmlns.oracle.com/resourceEvent'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/resourceEvent'

## 190.2.11 NAMESPACE\_RESOURCE\_CONFIG Function

This function returns 'http://xmlns.oracle.com/XDBResConfig.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/XDBResConfig.xsd'

## 190.2.12 NAMESPACE\_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

## 190.2.13 NAMESPACE\_XMLDIFF Function

This function returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/xdiff.xsd'

## 190.2.14 NAMESPACE\_XMLINSTANCE Function

This function returns 'http://www.w3.org/2001/XMLSchema-instance'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://www.w3.org/2001/XMLSchema-instance'

## 190.2.15 NAMESPACE\_XMLSCHEMA Function

This function returns 'http://www.w3.org/2001/XMLSchema'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLSCHEMA
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://www.w3.org/2001/XMLSchema'

## 190.2.16 NSPREFIX\_ACL\_ACL Function

This function returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'

## 190.2.17 NSPREFIX\_RESCONFIG\_RC Function

This function returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd" '.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd" '.

## 190.2.18 NSPREFIX\_RESOURCE\_R Function

This function returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'

## 190.2.19 NSPREFIX\_XDB\_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb'

## 190.2.20 NSPREFIX\_XMLINSTANCE\_XSI Function

This function returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" '.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" '.

## 190.2.21 NSPREFIX\_XMLDIFF\_XD Function

This function returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd" '.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd" '

## 190.2.22 NSPREFIX\_XMLSCHEMA\_XSD Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '

## 190.2.23 SCHEMAURL\_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

## 190.2.24 SCHEMAELEM\_RES\_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/acl.xsd#acl'

## 190.2.25 SCHEMAELEM\_RESCONTENT\_BINARY Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'

## 190.2.26 SCHEMAELEM\_RESCONTENT\_TEXT Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'

## 190.2.27 SCHEMAURL\_RESOURCE Function

This function returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

## 190.2.28 SCHEMAURL\_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

## 190.2.29 XDBSCHEMA\_PREFIXES Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb"'.  
xmlns:xdb="http://xmlns.oracle.com/xdb".

### Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb"'

## 190.2.30 XSD\_ATTRIBUTE Function

This function returns 'attribute'.

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'attribute'

## 190.2.31 XSD\_COMPLEX\_TYPE Function

This function returns 'complexType'.

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'complexType'

## 190.2.32 XSD\_ELEMENT Function

This function returns 'element'.

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_ELEMENT
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'element'

## 190.2.33 XSD\_GROUP Function

This function returns 'group'

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'group'

# DBMS\_XDB\_REPOS

The `DBMS_XDB_REPOS` package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_XDB\\_REPOS Subprograms](#)

## See Also:

Oracle XML DB Developer's Guide for more information regarding:

- Using and managing repository resources
- ACL-based security management (controlling access to repository resources)
- Managing XLink and XInclude links
- Loading documents into the repository
- Creating, deleting, and managing resource metadata

## 191.1 DBMS\_XDB\_REPOS Overview

The `DBMS_XDB_REPOS` package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - `DBMS_XDB_REPOS`, [DBMS\\_XDBZ](#), and [DBMS\\_XDB\\_VERSION](#) - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

## 191.2 DBMS\_XDB\_REPOS Security Model

Owned by XDB, the `DBMS_XDB_REPOS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or `XDB`, or the current user has the `XDBADMIN` or `DBA` role.

## 191.3 DBMS\_XDB\_REPOS Constants

The `DBMS_XDB_REPOS` package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

**Table 191-1 DBMS\_XDB\_REPOS Constants**

Constant	Type	Value	Description
<code>DELETE_RESOURCE</code>	NUMBER	1	Deletes a resource; fails if the resource has children.
<code>DELETE_RECURSIVE</code>	NUMBER	2	Deletes a resource and its children, if any.
<code>DELETE_FORCE</code>	NUMBER	3	Deletes the resource, even if the object it contains is invalid
<code>DELETE_RECURSIVE_FORCE</code>	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid
<code>DELETE_RES_METADATA_CASCADE</code>	NUMBER	1	Deletes the row in the metadata
<code>DELETE_RES_METADATA_NOCASCADE</code>	NUMBER	2	Does not delete the row
<code>DEFAULT_LOCK_TIMEOUT</code>	PLS_INTEGER	(60*60)	Timeout value (in seconds) of the webdav lock
<code>LINK_TYPE_HARD</code>	NUMBER	1	Hard link of a folder to a resource
<code>LINK_TYPE_WEAK</code>	NUMBER	2	Weak link of a folder to a resource
<code>LINK_TYPE_SYMBOLIC</code>	NUMBER	3	Symbolic link of a folder to a resource

## 191.4 Summary of DBMS\_XDB\_REPOS Subprograms

This table lists the `DBMS_XDB_REPOS` subprograms and briefly describes them.

**Table 191-2 DBMS\_XDB\_REPOS Package Subprograms**

Subprogram	Description
<a href="#">ACLCHECKPRIVILEGES Function</a>	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
<a href="#">APPENDRESOURCEMETADATA Procedure</a>	Takes in user-defined metadata either as a <code>REF</code> to <code>XMLTYPE</code> or an <code>XMLTYPE</code> and adds it to the desired resource
<a href="#">CHANGEOWNER Procedure</a>	Changes the owner of the resource/s to the specified owner.
<a href="#">CHANGEPRIVILEGES Function</a>	Adds a specified ACE to a specified resource's ACL
<a href="#">CHECKPRIVILEGES Function</a>	Checks access privileges granted to the current user on the specified resource
<a href="#">CREATEFOLDER Function</a>	Creates a new folder resource in the hierarchy

Table 191-2 (Cont.) DBMS\_XDB\_REPOS Package Subprograms

Subprogram	Description
<a href="#">CREATEOIDPATH Function</a>	Creates a virtual path to the resource based on object ID
<a href="#">CREATERESOURCE Functions</a>	Creates a new resource
<a href="#">DELETERESOURCE Procedure</a>	Deletes a resource from the hierarchy
<a href="#">DELETERESOURCEMETADATA Procedures</a>	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
<a href="#">EXISTSRESOURCE Function</a>	Determines if a resource is in the hierarchy, based on its absolute path
<a href="#">GETACLDOCUMENT Function</a>	Retrieves ACL document that protects resource given its path name
<a href="#">GETCONTENTBLOB Function</a>	Retrieves the contents of a resource returned as a BLOB
<a href="#">GETCONTENTCLOB Function</a>	Retrieves the contents of a resource returned as a CLOB
<a href="#">GETCONTENTVARCHAR2 Function</a>	Retrieves the contents of a resource returned as a string
<a href="#">GETCONTENTXMLREF Function</a>	Retrieves the contents of a resource returned as a REF to an XMLTYPE
<a href="#">GETCONTENTXMLTYPE Function</a>	Retrieves the contents of a resource returned as an XMLTYPE
<a href="#">GETLOCKTOKEN Procedure</a>	Returns that resource's lock token for the current user given a path to a resource
<a href="#">GETPRIVILEGES Function</a>	Gets all privileges granted to the current user on a specified resource
<a href="#">GETRESOID Function</a>	Returns the object ID of the resource from its absolute path
<a href="#">GETXDB_TABLESPACE Function</a>	Returns the current tablespace of the XDB (user)
<a href="#">HASBLOBCONTENT Function</a>	Returns TRUE if the resource has BLOB content
<a href="#">HASCHARCONTENT Function</a>	Returns TRUE if the resource has character content
<a href="#">HASXMLCONTENT Function</a>	Returns TRUE if the resource has XML content
<a href="#">HASXMLREFERENCE Function</a>	Returns TRUE if the resource has REF to XML content
<a href="#">ISFOLDER Function</a>	Returns TRUE if the resource is a folder or container
<a href="#">LINK Procedures</a>	Creates a link to an existing resource
<a href="#">LOCKRESOURCE Function</a>	Gets a WebDAV-style lock on that resource given a path to that resource
<a href="#">PROCESSLINKS Procedure</a>	Processes document links in the specified resource
<a href="#">PURGERESOURCEMETADATA Procedure</a>	Deletes all user metadata from a resource
<a href="#">RENAMERESOURCE Procedure</a>	Renames the XDB resource
<a href="#">SETACL Procedure</a>	Sets the ACL on a specified resource
<a href="#">SPLITPATH Procedure</a>	Splits the path into a parentpath and childpath

**Table 191-2 (Cont.) DBMS\_XDB\_REPOS Package Subprograms**

Subprogram	Description
<a href="#">TOUCHRESOURCE Procedure</a>	Changes the modification time of the resource to the current time
<a href="#">UNLOCKRESOURCE Function</a>	Unlocks the resource given a lock token and resource path
<a href="#">UPDATERESOURCEMETADATA Procedures</a>	Updates metadata for a resource

## 191.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

### Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES(
 acl_path IN VARCHAR2,
 owner IN VARCHAR2,
 privs IN xmltype)
RETURN PLS_INTEGER;
```

### Parameters

**Table 191-3 ACLCHECKPRIVILEGES Function Parameters**

Parameter	Description
<code>acl_path</code>	Absolute path in the Hierarchy for ACL document
<code>owner</code>	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
<code>privs</code>	An XMLType instance of the privilege element specifying the requested set of access privileges. See description for <a href="#">CHECKPRIVILEGES Function</a> .

## 191.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

### Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadata IN XMLTYPE);

DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadata IN REF SYS.XMLTYPE);
```

## Parameters

**Table 191-4 APPENDRESOURCEMETADATA Procedure**

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

## Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

## 191.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

### Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER(
 abspath IN VARCHAR2,
 owner IN VARCHAR2,
 recurse IN BOOLEAN := FALSE);
```

## Parameters

**Table 191-5 CHANGEOWNER Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

## 191.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

### Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES(
 res_path IN VARCHAR2,
 ace IN xmltype)
RETURN PLS_INTEGER;
```

## Parameters

**Table 191-6 CHANGEPRIVILEGES Function Parameters**

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

## Return Values

A positive integer if the ACL was successfully modified.

## Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

## 191.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

### Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES(
 res_path IN VARCHAR2,
 privs IN xmltype)
RETURN PLS_INTEGER;
```

## Parameters

**Table 191-7 CHECKPRIVILEGES Function Parameters**

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

## Return Values

A positive integer if all requested privileges granted.

## 191.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

### Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER(
 path IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 191-8 CREATEFOLDER Function Parameters**

Parameter	Description
path	Path name for the new folder

## Return Values

TRUE if operation successful; FALSE, otherwise.

## Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

## 191.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

### Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH(
 oid IN RAW)
RETURN VARCHAR2;
```

## Parameters

**Table 191-9 CREATEOIDPATH Function Parameters**

Parameter	Description
oid	Object ID of the resource

## 191.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

### Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
 abspath IN VARCHAR2,
 data IN VARCHAR2)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
 abspath IN VARCHAR2,
 data IN SYS.XMLTYPE)
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE(
 abspath IN VARCHAR2,
 datarow IN REF SYS.XMLTYPE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE(
 abspath IN VARCHAR2,
 data IN BLOB,
 csid IN NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN BFILE,
 csid IN NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN CLOB)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN VARCHAR2,
 schemaurl IN VARCHAR2 := NULL,
 elem IN VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
 abspath IN VARCHAR2,
 data IN SYS.XMLTYPE,
 schemaurl IN VARCHAR2 := NULL,
 elem IN VARCHAR2 := NULL)
RETURN BOOLEAN;
```

## Parameters

**Table 191-10** CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an <code>XMLType</code> row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error.  If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> <li>From the <code>abspath</code> extension, determine the resource's MIME type.</li> <li>If the MIME type is <code>*/xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</li> <li>Otherwise, it is defaulted to the database character set.</li> </ul>
schemaur1	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

## Return Values

TRUE if operation successful; FALSE, otherwise.

## 191.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

### Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE(
 path IN VARCHAR2,
 delete_option IN PLS_INTEGER);
```

### Parameters

**Table 191-11** DELETERESOURCE Procedure Parameters

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a resource is deleted: <ul style="list-style-type: none"> <li>DELETE_RESOURCE</li> <li>DELETE_RECURSIVE</li> <li>DELETE_FORCE</li> <li>DELETE_RECURSIVE_FORCE</li> </ul>

## 191.4.10 DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

### Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadata IN REF SYS.XMLTYPE,
 delete_option IN pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
 abspath IN VARCHAR2,
 metadatans IN VARCHAR2,
 metadataname IN VARCHAR2,
 delete_option IN pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

### Parameters

**Table 191-12 DELETERESOURCEMETADATA Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted
mettadatans	Namespace of the metadata fragment to be removed
mettadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> <li>DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</li> <li>DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</li> </ul>

## 191.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

### Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(
 abspath IN VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 191-13** EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

### Return Values

TRUE if the resource is found.

## 191.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

### Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(
 abspath IN VARCHAR2)
RETURN sys.xmltype;
```

### Parameters

**Table 191-14** GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

### Return Values

The XMLType for ACL document.

## 191.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

### Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(
 abspath IN VARCHAR2,
 csid OUT PLS_INTEGER,
```

```

 locksrc IN BOOLEAN := FALSE)
RETURN BLOB;

```

### Parameters

**Table 191-15** GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

### Return Values

The contents of the resource as a BLOB.

## 191.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

### Syntax

```

DBMS_XDB_REPOS.GETCONTENTCLOB(
 abspath IN VARCHAR2,
RETURN CLOB;

```

### Parameters

**Table 191-16** GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

### Return Values

The contents of the resource as a CLOB.

## 191.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

### Syntax

```

DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
 abspath IN VARCHAR2,
RETURN BLOB;

```

**Parameters****Table 191-17 GETCONTENTVARCHAR2 Function Parameters**

Parameter	Description
abspath	Absolute path of the resource

**Return Values**

The contents of the resource as a string.

## 191.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

**Syntax**

```
DBMS_XDB_REPOS.GETCONTENTXMLREF (
 abspath IN VARCHAR2,
 RETURN SYS.XMLTYPE;
```

**Parameters****Table 191-18 GETCONTENTXMLREF Function Parameters**

Parameter	Description
abspath	Absolute path of the resource

**Return Values**

The contents of the resource as a REF to an XMLTYPE.

## 191.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

**Syntax**

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE (
 abspath IN VARCHAR2,
 RETURN SYS.XMLTYPE;
```

**Parameters****Table 191-19 GETCONTENTXMLTYPE Function Parameters**

Parameter	Description
abspath	Absolute path of the resource

### Return Values

The contents of the resource as an XMLTYPE.

## 191.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

### Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN(
 path IN VARCHAR2,
 locktoken OUT VARCHAR2);
```

### Parameters

**Table 191-20 GETLOCKTOKEN Procedure Parameters**

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

### Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

## 191.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

### Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES(
 res_path IN VARCHAR2)
RETURN sys.xmltype;
```

### Parameters

**Table 191-21 GETPRIVILEGES Function Parameters**

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

### Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

## 191.4.20 GETRESOID Function

The GETRESOID function returns the object ID of the resource from its absolute path.

### Syntax

```
DBMS_XDB_REPOS.GETRESOID(
 abspath IN VARCHAR2)
RETURN RAW;
```

### Parameters

**Table 191-22** GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

NULL if the resource is not present.

## 191.4.21 GETXDB\_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

### Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE
RETURN VARCHAR2;
```

## 191.4.22 HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

### Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT
 abspath IN VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 191-23** HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

### Return Values

TRUE if the resource has BOB content.

## 191.4.23 HASCHARCONTENT Function

This function returns `TRUE` if the resource has character content.

### Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT
 (abspath IN VARCHAR2)
 RETURN BOOLEAN;
```

### Parameters

**Table 191-24 HASCHARCONTENT Function Parameters**

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

### Return Values

`TRUE` if the resource has character content.

## 191.4.24 HASXMLCONTENT Function

This function returns `TRUE` if the resource has XML content.

### Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT
 (abspath IN VARCHAR2)
 RETURN BOOLEAN;
```

### Parameters

**Table 191-25 HASXMLCONTENT Function Parameters**

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

### Return Values

`TRUE` if the resource has XML content.

## 191.4.25 HASXMLREFERENCE Function

This function returns `TRUE` if the resource has a `REF` to XML content.

### Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE
 (abspath IN VARCHAR2)
 RETURN BOOLEAN;
```

## Parameters

**Table 191-26 HASXMLREFERENCE Function Parameters**

Parameter	Description
abspath_path	Absolute path of the resource

## Return Values

TRUE resource has a REF to XML content.

## 191.4.26 ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

### Syntax

```
DBMS_XDB_REPOS.ISFOLDER
 abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 191-27 ISFOLDER Function Parameters**

Parameter	Description
abspath_path	Absolute path of the resource

## Return Values

TRUE if the resource is a folder or container.

## 191.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

### Syntax

```
DBMS_XDB_REPOS.LINK(
 srcpath IN VARCHAR2,
 linkfolder IN VARCHAR2,
 linkname IN VARCHAR2);

DBMS_XDB_REPOS.LINK(
 srcpath IN VARCHAR2,
 linkfolder IN VARCHAR2,
 linkname IN VARCHAR2,
 linktype IN PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

## Parameters

**Table 191-28 LINK Procedure Parameters**

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: <ul style="list-style-type: none"> <li>• DBMS_XDB.LINK_TYPE_HARD (default)</li> <li>• DBMS_XDB.LINK_TYPE_WEAK</li> <li>• DBMS_XDB.LINK_TYPE_SYMBOLIC</li> </ul>

## 191.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

### Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE(
 path IN VARCHAR2,
 depthzero IN BOOLEAN,
 shared IN boolean)
RETURN BOOLEAN;
```

### Parameters

**Table 191-29 LOCKRESOURCE Function Parameters**

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

### Return Values

TRUE if successful.

### Usage Notes

The user must have UPDATE privileges on the resource.

## 191.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

### Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath IN VARCHAR2,
 recurse IN BOOLEAN := FALSE);
```

## Parameters

**Table 191-30 PROCESSLINKS Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the recurse flag.
recurse	Used only if abspath specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.

## 191.4.30 PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

### Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
 abspath IN VARCHAR2);
```

## Parameters

**Table 191-31 PURGERESOURCEMETADATA Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource

## 191.4.31 RENAMERESOURCE Procedure

This procedure renames the XDB resource.

### Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE(
 srcpath IN VARCHAR2,
 destfolder IN CARCHAR2,
 newname IN VARCHAR2);
```

## Parameters

**Table 191-32 RENAMERESOURCE Procedure Parameters**

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

## 191.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

### Syntax

```
DBMS_XDB_REPOS.SETACL(
 res_path IN VARCHAR2,
 acl_path IN VARCHAR2);
```

### Parameters

**Table 191-33 SETACL Procedure Parameters**

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

### Usage Notes

The user must have <write-acl> privileges on the resource.

## 191.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

### Syntax

```
DBMS_XDB_REPOS.SPLITPATH(
 abspath IN VARCHAR2,
 parentpath OUT VARCHAR2,
 childpath OUT VARCHAR2);
```

### Parameters

**Table 191-34 SPLITPATH Procedure Parameters**

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

## 191.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

### Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE(
 abspath IN VARCHAR2);
```

## Parameters

**Table 191-35 TOUCHRESOURCE Procedure Parameters**

Parameter	Description
abspath_path	Absolute path of the resource

## 191.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

### Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE(
 path IN VARCHAR2,
 deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 191-36 UNLOCKRESOURCE Function Parameters**

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

### Return Values

TRUE if operation successful.

### Usage Notes

The user must have UPDATE privileges on the resource.

## 191.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

### Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldmetadata IN REF SYS.XMLTYPE,
 newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldmetadata IN REF SYS.XMLTYPE,
 newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldns IN VARCHAR2,
 oldname IN VARCHAR,
 newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
 abspath IN VARCHAR2,
 oldns IN VARCHAR2,
 oldname IN VARCHAR,
 newmetadata IN REF SYS.XMLTYPE);
```

## Parameters

**Table 191-37 UPDATERESOURCEMETADATA Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

## Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

# DBMS\_XDB\_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- [Security Model](#)
- [Summary of DBMS\\_XDB\\_VERSION Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 192.1 DBMS\_XDB\_VERSION Security Model

Owned by XDB, the `DBMS_XDB_VERSION` package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 192.2 Summary of DBMS\_XDB\_VERSION Subprograms

This table lists the `DBMS_XDB_VERSION` subprograms and briefly describes them.

**Table 192-1** *DBMS\_XDB\_VERSION Package Subprograms*

Method	Description
<a href="#">CHECKIN Function</a>	Checks in a checked-out VCR and returns the resource id of the newly-created version
<a href="#">CHECKOUT Procedure</a>	Checks out a VCR before updating or deleting it
<a href="#">GETCONTENTSBLobbyRESID Function</a>	Obtain contents as a BLOB
<a href="#">GETCONTENTSCLobbyRESID Function</a>	Obtain contents as a CLOB
<a href="#">GETCONTENTSXMLBYRESID Function</a>	Obtain contents as an XMLType
<a href="#">GETPREDECESSORS Function</a>	Retrieves the list of predecessors by path name
<a href="#">GETPREDSBYRESID Function</a>	Retrieves the list of predecessors by resource id
<a href="#">GETRESOURCEBYRESID Function</a>	Obtains the resource as an XMLType, given the resource object ID

**Table 192-1 (Cont.) DBMS\_XDB\_VERSION Package Subprograms**

Method	Description
<a href="#">GETSUCCESSORS Function</a>	Retrieves the list of successors by path name
<a href="#">GETSUCCSBYRESID Function</a>	Retrieves the list of successors by resource id
<a href="#">MAKEVERSIONED Function</a>	Turns a regular resource whose path name is given into a version-controlled resource
<a href="#">UNCHECKOUT Function</a>	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

## 192.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

### Syntax

```
DBMS_XDB_VERSION.CHECKIN(
 pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 192-2 CHECKIN Function Parameters**

Parameter	Description
pathname	The path name of the checked-out resource.

### Usage Notes

This is not an auto-commit SQL operation. [CHECKIN Function](#) doesn't have to take the same path name that was passed to [CHECKOUT Procedure](#) operation. However, the [CHECKIN Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [CHECKIN Function](#) because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to [CHECKIN Function](#) the resource.

## 192.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

### Syntax

```
DBMS_XDB_VERSION.Checkout(
 pathname VARCHAR2);
```

## Parameters

**Table 192-3 CHECKOUT Procedure Parameters**

Parameter	Description
pathname	The path name of the VCR to be checked out.

## Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot [CHECKOUT Procedure](#) the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the [CHECKOUT Procedure](#) operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

## 192.2.3 GETCONTENTSBLobbyRESID Function

This function obtain contents as a BLOB.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLobbyRESID(
 resid DBMS_XDB.resid_type)
RETURN BLOB;
```

## Parameters

**Table 192-4 GETCONTENTSBLobbyRESID Function Parameters**

Parameter	Description
resid	The resource id.

## 192.2.4 GETCONTENTSCLobbyRESID Function

This function obtains contents as a CLOB.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLobbyRESID(
 resid DBMS_XDB.resid_type)
RETURN CLOB;
```

## Parameters

**Table 192-5 GETCONTENTSCLobbyRESID Function Parameters**

Parameter	Description
resid	The resource id.

## 192.2.5 GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
 resid DBMS_XDB.resid_type)
RETURN XMLType;
```

### Parameters

**Table 192-6** GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
resid	The resource id.

### Return Values

If the contents are not valid XML, returns NULL.

## 192.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

### Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
 pathname VARCHAR2)
RETURN resid_list_type;
```

### Parameters

**Table 192-7** GETPREDECESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

### Return Values

An exception is raised if pathname is illegal.

## 192.2.7 GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

### Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(
 resid resid_type)
RETURN resid_list_type;
```

## Parameters

**Table 192-8 GETPREDSBYRESID Function Parameters**

Parameter	Description
resid	The resource id.

## Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

## Exceptions

An exception is raised if the RESID is illegal.

## 192.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an XMLType, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

### Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
 resid resid_type)
RETURN XMLType;
```

## Parameters

**Table 192-9 GETRESOURCEBYRESID Function Parameters**

Parameter	Description
resid	The resource id.

## 192.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

### Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(
 pathname VARCHAR2)
RETURN resid_list_type;
```

## Parameters

**Table 192-10 GETSUCCESSORS Function Parameters**

Parameter	Description
pathname	The path name of the resource.

**Usage Notes**

Getting successors by RESID is more efficient than by pathname.

**Exceptions**

An exception is raised if the pathname is illegal.

## 192.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

**Syntax**

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(
 resid resid_type)
RETURN resid_list_type;
```

**Parameters****Table 192-11** GETSUCCSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

**Usage Notes**

Getting successors by RESID is more efficient than by pathname.

**Exceptions**

An exception is raised if the pathname is illegal.

## 192.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

**Syntax**

```
DBMS_XDB_VERSION.MAKEVERSIONED(
 pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

**Parameters****Table 192-12** MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

### Return Values

This function returns the resource ID of the first version, or root, of the VCR.

### Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

## 192.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

### Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
 pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 192-13 UNCHECKOUT Function Parameters**

Parameter	Description
pathname	The path name of the checked-out resource.

### Usage Notes

This is not an auto-commit SQL operation. The [UNCHECKOUT Function](#) does not have to take the same path name that was passed to the operation by the [CHECKOUT Procedure](#). However, the [UNCHECKOUT Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [UNCHECKOUT Function](#), because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to [UNCHECKOUT Function](#) the resource.

### Exceptions

An exception is raised if the path name doesn't exist.

# DBMS\_XDBRESOURCE

The `DBMS_XDBRESOURCE` package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XDBRESOURCE Subprograms](#)

## See Also:

Oracle XML DB Developer's Guide for examples of "Using `DBMS_XDBRESOURCE`"

## 193.1 DBMS\_XDBRESOURCE Overview

The `DBMS_XDBRESOURCE` package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in `DBMS_XMLDOM` package, an `XDBResource` instance could be converted to a `DOMDocument` type by using `DBMS_XDBRESOURCE.MAKEDOCUMENT` routine.

## 193.2 DBMS\_XDBRESOURCE Security Model

Owned by `XDB`, the `DBMS_XDBRESOURCE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 193.3 Summary of DBMS\_XDBRESOURCE Subprograms

This table lists the `DBMS_XDBRESOURCE` subprograms and briefly describes them.

**Table 193-1** *DBMS\_XDBRESOURCE Package Subprograms*

Subprogram	Description
<a href="#">FREERESOURCE Procedure</a>	Frees any memory associated with an <code>XDBResource</code>
<a href="#">GETACL Function</a>	Given an <code>XDBResource</code> , returns its ACL as string
<a href="#">GETACLDOCFROMRES Function</a>	Returns the ACL Document for the given resource as <code>XMLType</code>

**Table 193-1 (Cont.) DBMS\_XDBRESOURCE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
GETAUTHOR Function	Given an XDBResource, returns its author
GETCHARACTERSET Function	Given an XDBResource, returns its character set
GETCOMMENT Function	Given an XDBResource, returns its comment
GETCONTENTBLOB Function	Returns the contents of the resource as a BLOB
GETCONTENTCLOB Function	Returns the contents of the resource as a CLOB
GETCONTENTREF Function	Returns the contents of the resource as an XMLTypeRef
GETCONTENTTYPE Function	Given an XDBResource, returns its content-type
GETCONTENTXML Function	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function	Returns the contents of the resource as a string
GETCREATIONDATE Function	Given an XDBResource, returns its creation date
GETCREATOR Function	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function	Given an XDBResource, returns its display name
GETLANGUAGE Function	Given an XDBResource, returns its language
GETLASTMODIFIER Function	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function	Given an XDBResource, returns its modification date
GETOWNER Function	Given an XDBResource, returns its owner.
GETREFCOUNT Function	Given an XDBResource, returns its reference count
GETVERSIONID Function	Given an XDBResource, returns its version ID.
HASACLCHANGED Function	Returns TRUE if the ACL of the given resource has changed, FALSE otherwise
HASAUTHORCHANGED Function	Returns TRUE if the ACL of the given resource has changed FALSE otherwise
HASCHANGED Function	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function	Returns TRUE if the contents of the given resource has changed, FALSE otherwise
HASCONTENTTYPECHANGED Function	Returns TRUE if the content-type of the given resource has changed, FALSE otherwise

Table 193-1 (Cont.) *DBMS\_XDBRESOURCE Package Subprograms*

Subprogram	Description
<a href="#">HASCREATIONDATECHANGED Function</a>	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
<a href="#">HASCREATORCHANGED Function</a>	Returns TRUE if the creator of the given resource has changed, FALSE otherwise
<a href="#">HASCUSTOMMETADATACHANGED Function</a>	Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise
<a href="#">HASDISPLAYNAMECHANGED Function</a>	Returns TRUE if the display name of the given resource has changed, FALSE otherwise
<a href="#">HASLANGUAGECHANGED Function</a>	Returns TRUE if the language of the given resource has changed, FALSE otherwise
<a href="#">HASLASTMODIFIERCHANGED Function</a>	Returns TRUE if the last modifier of the given resource has changed, FALSE otherwise
<a href="#">HASMODIFICATIONDATECHANGED Function</a>	Returns TRUE if the modification date of the given resource has changed, FALSE otherwise
<a href="#">HASOWNERCHANGED Function</a>	Returns TRUE if the owner of the given resource has changed, FALSE otherwise
<a href="#">HASREFCOUNTCHANGED Function</a>	Returns TRUE if the reference count of the given resource has changed, FALSE otherwise
<a href="#">HASVERSIONIDCHANGED Function</a>	Returns TRUE if the version ID of the given resource has changed, FALSE otherwise
<a href="#">ISFOLDER Function</a>	Returns TRUE if the given resource is a folder, FALSE otherwise
<a href="#">ISNULL Function</a>	Returns TRUE if input resource is NULL, FALSE otherwise
<a href="#">MAKEDOCUMENT Function</a>	Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface
<a href="#">SAVE Procedure</a>	Updates the resource with any modifications
<a href="#">SETACL Procedure</a>	Sets the ACL of the given XDBResource to the path specified
<a href="#">SETAUTHOR Procedure</a>	Sets the author of the given XDBResource to the specified string
<a href="#">SETCHARACTERSET Procedure</a>	Sets the character set of the given XDBResource to a specified character set
<a href="#">SETCOMMENT Procedure</a>	Sets a comment associated with the given XDBResource
<a href="#">SETCONTENT Procedures</a>	Replaces the contents of the given resource with the given CLOB
<a href="#">SETCONTENTTYPE Procedure</a>	Sets the content-type of the given XDBResource
<a href="#">SETCUSTOMMETADATA Procedure</a>	Sets the custom metadata specified by the XPath and namespace to new data
<a href="#">SETDISPLAYNAME Procedure</a>	Sets the display name of the given XDBResource

**Table 193-1 (Cont.) DBMS\_XDBRESOURCE Package Subprograms**

Subprogram	Description
<a href="#">SETLANGUAGE Procedure</a>	Sets the language of the given XDBResource
<a href="#">SETOWNER Procedure</a>	Sets the owner of the given XDBResource

### 193.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

#### Syntax

```
DBMS_XDBRESOURCE.FREERESOURCE (
 res IN XDBResource)
RETURN VARCHAR2;
```

#### Parameters

**Table 193-2 FREERESOURCE Procedure Parameters**

Parameter	Description
res	XDBResource to free

### 193.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

#### Syntax

```
DBMS_XDBRESOURCE.GETACL (
 res IN XDBResource)
RETURN VARCHAR2;
```

#### Parameters

**Table 193-3 GETACL Function Parameters**

Parameter	Description
res	XDBResource

### 193.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

#### Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (
 res IN XDBResource)
RETURN SYS.XMLTYPE;
```

**Parameters****Table 193-4 GETACLDOCFROMRES Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

**Syntax**

```
DBMS_XDBRESOURCE.GETAUTHOR (
 res IN XDBResource)
RETURN VARCHAR2;
```

**Parameters****Table 193-5 GETAUTHOR Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

**Syntax**

```
DBMS_XDBRESOURCE.GETCHARACTERSET (
 res IN XDBResource)
RETURN VARCHAR2;
```

**Parameters****Table 193-6 GETCHARACTERSET Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

**Syntax**

```
DBMS_XDBRESOURCE.GETCOMMENT (
 res IN XDBResource)
RETURN VARCHAR2;
```

## Parameters

**Table 193-7 GETCOMMENT Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (
 res IN XDBResource,
 csid OUT PLS_INTEGER)
RETURN BLOB;
```

## Parameters

**Table 193-8 GETCONTENTBLOB Function Parameters**

Parameter	Description
res	XDBResource
csid	Character set ID of the BLOB returned

## 193.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (
 res IN XDBResource)
RETURN CLOB;
```

## Parameters

**Table 193-9 GETCONTENTCLOB Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (
 res IN XDBResource)
RETURN VARCHAR2;
```

### Parameters

**Table 193-10** GETCONTENTREF Function Parameters

Parameter	Description
res	XDBResource

## 193.3.10 GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (
 res IN XDBResource)
RETURN VARCHAR2;
```

### Parameters

**Table 193-11** GETCONTENTTYPE Function Parameters

Parameter	Description
res	XDBResource

## 193.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (
 res IN XDBResource)
RETURN XMLType;
```

### Parameters

**Table 193-12** GETCONTENTXML Function Parameters

Parameter	Description
res	XDBResource

## 193.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (
 res IN XDBResource)
RETURN VARCHAR2;
```

### Parameters

**Table 193-13** GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
res	XDBResource

## 193.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

### Syntax

```
DBMS_XDBRESOURCE.GETCREATIONDATE (
 res IN XDBResource)
RETURN TIMESTAMP;
```

### Parameters

**Table 193-14** GETCREATIONDATE Function Parameters

Parameter	Description
res	XDBResource

## 193.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

### Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (
 res IN XDBResource)
RETURN VARCHAR2;
```

### Parameters

**Table 193-15** GETCREATOR Function Parameters

Parameter	Description
res	XDBResource

## 193.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

### Syntax

```
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (
 res IN XDBResource,
 xpath IN VARCHAR2, namespace IN VARCHAR2)
RETURN XMLType;
```

### Parameters

**Table 193-16** GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

### Usage Notes

The first component of the XPath expression must be "Resource".

## 193.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

### Syntax

```
DBMS_XDBRESOURCE.GETDISPLAYNAME (
 res IN XDBResource)
RETURN VARCHAR2;
```

### Parameters

**Table 193-17** GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

## 193.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

### Syntax

```
DBMS_XDBRESOURCE.GETLANGUAGE (
 res IN XDBResource)
RETURN VARCHAR2;
```

**Parameters****Table 193-18 GETLANGUAGE Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

**Syntax**

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (
 res IN XDBResource)
RETURN VARCHAR2;
```

**Parameters****Table 193-19 GETLASTMODIFIER Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

**Syntax**

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (
 res IN XDBResource)
RETURN TIMESTAMP;
```

**Parameters****Table 193-20 GETMODIFICATIONDATE Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

**Syntax**

```
DBMS_XDBRESOURCE.GETOWNER (
 res IN XDBResource)
RETURN VARCHAR2;
```

**Parameters****Table 193-21 GETOWNER Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

**Syntax**

```
DBMS_XDBRESOURCE.GETREFCOUNT (
 res IN XDBResource)
RETURN PLS_INTEGER;
```

**Parameters****Table 193-22 GETREFCOUNT Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

**Syntax**

```
DBMS_XDBRESOURCE.GETVERSIONID (
 res IN XDBResource)
RETURN PLS_INTEGER;
```

**Parameters****Table 193-23 GETVERSIONID Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.23 HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

**Syntax**

```
DBMS_XDBRESOURCE.HASACLCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-24 HASACLCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.24 HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-25 HASAUTHORCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

### Syntax

```
DBMS_XDBRESOURCE.HASCHANGED (
 res IN XDBResource,
 xpath IN VARCHAR2,
 namespace IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 193-26 HASCHANGED Function Parameters**

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

## 193.3.26 HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 193-27 HASCHARACTERSETCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.27 HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 193-28 HASCOMMENTCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.28 HASCONTENTCHANGED Function

This function returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASCONTENTCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-29 HASCONTENTCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.29 HASCONTENTTYPECHANGED Function

This function returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-30 HASCONTENTTYPECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.30 HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-31 HASCREATIONDATECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.31 HASCREATORCHANGED Function

This function returns `TRUE` if the creator of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 193-32 HASCREATORCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

### Syntax

```
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 193-33 HASCUSTOMMETADATACHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-34 HASDISPLAYNAMECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.34 HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-35 HASLANGUAGECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.35 HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-36 HASLASTMODIFIERCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.36 HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 193-37 HASMODIFICATIONDATECHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.37 HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASOWNERCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 193-38 HASOWNERCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.38 HASREFCOUNTCHANGED Function

This function returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-39 HASREFCOUNTCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.39 HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-40 HASVERSIONIDCHANGED Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.40 ISFOLDER Function

This function returns `TRUE` if the given resource is a folder, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.ISFOLDER (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-41 ISFOLDER Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.41 ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

### Syntax

```
DBMS_XDBRESOURCE.ISNULL (
 res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 193-42 ISNULL Function Parameters**

Parameter	Description
res	Input resource

## 193.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

### See Also:

The [DBMS\\_XMLDOM](#) package

## Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (
 res IN XDBResource)
RETURN DBMS_XMLDOM.DOMDocument;
```

## Parameters

**Table 193-43 MAKEDOCUMENT Function Parameters**

Parameter	Description
res	XDBResource

## 193.3.43 SAVE Procedure

This procedure updates the resource with any modifications.

## Syntax

```
DBMS_XDBRESOURCE.SAVE (
 res IN XDBResource);
```

## Parameters

**Table 193-44 SAVE Procedure Parameters**

Parameter	Description
res	XDBResource

## 193.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

### Syntax

```
DBMS_XDBRESOURCE.SETACL (
 res IN OUT XDBResource,
 ACLPath IN VARCHAR2);
```

### Parameters

**Table 193-45 SETACL Procedure Parameters**

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

## 193.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

### Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (
 res IN OUT XDBResource,
 author IN VARCHAR2);
```

### Parameters

**Table 193-46 SETAUTHOR Procedure Parameters**

Parameter	Description
res	XDBResource
author	Author

## 193.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

### Syntax

```
DBMS_XDBRESOURCE.SETCHARACTERSET (
 res IN OUT XDBResource,
 charSet IN VARCHAR2);
```

## Parameters

**Table 193-47 SETCHARACTERSET Procedure Parameters**

Parameter	Description
res	XDBResource
charset	New character set

## 193.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (
 res IN OUT XDBResource,
 comment IN VARCHAR2);
```

## Parameters

**Table 193-48 SETCOMMENT Procedure Parameters**

Parameter	Description
res	XDBResource
comment	New comment

## 193.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

### Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (
 res IN OUT XDBResource,
 data IN BFILE,
 csid IN NUMBER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
 res IN OUT XDBResource,
 data IN BLOB,
 csid IN PLS_INTEGER);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
 res IN OUT XDBResource,
 data IN CLOB);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
 res IN OUT XDBResource,
 data IN REF SYS.XMLType,
 sticky IN BOOLEAN := TRUE);
```

```
DBMS_XDBRESOURCE.SETCONTENT (
 res IN OUT XDBResource,
```

```

data IN VARCHAR2);
DBMS_XDBRESOURCE.SETCONTENT (
 res IN OUT XDBResource,
 data IN SYS.XMLType);

```

### Parameters

**Table 193-49 SETCONTENT Procedure Parameters**

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

## 193.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

### Syntax

```

DBMS_XDBRESOURCE.SETCONTENTTYPE (
 res IN OUT XDBResource,
 conttype IN VARCHAR2);

```

### Parameters

**Table 193-50 SETCONTENTTYPE Procedure Parameters**

Parameter	Description
res	XDBResource
conttype	New content-type

## 193.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

### Syntax

```

DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
 res IN OUT XDBResource,
 xpath IN VARCHAR2,
 namespace IN VARCHAR2,
 newMetadata IN XMLType);

```

## Parameters

**Table 193-51 SETCUSTOMMETADATA Procedure Parameters**

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

## Usage Notes

The first component of the XPath expression must be "Resource".

## 193.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (
 res IN OUT XDBResource,
 name IN VARCHAR2);
```

## Parameters

**Table 193-52 SETDISPLAYNAME Procedure Parameters**

Parameter	Description
res	XDBResource
name	New display name

## 193.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (
 res IN OUT XDBResource,
 ACLPath IN VARCHAR2);
```

## Parameters

**Table 193-53 SETLANGUAGE Procedure Parameters**

Parameter	Description
res	XDBResource
ACLPath	New path

## 193.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETOWNER (
 res IN OUT XDBResource,
 owner IN VARCHAR2);
```

### Parameters

**Table 193-54 SETOWNER Procedure Parameters**

Parameter	Description
res	XDBResource
owner	New owner

### Usage Notes

The user must have the XDBADMIN privilege to call this subprogram.

# DBMS\_XDBT

The `DBMS_XDBT` package provides a convenient mechanism for administrators to set up a `CONTEXT` index on the Oracle XML DB hierarchy.

The package contains procedures to create default preferences, create the index and set up automatic synchronization of the `CONTEXT` index

The `DBMS_XDBT` package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_XDBT Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 194.1 DBMS\_XDBT Overview

The `DBMS_XDBT` package contains a set of package variables that describe the configuration settings for the index.

The `DBMS_XDBT` package can be used in the following ways:

- Customize the package to set up the appropriate configuration.
- Use the [DROPPREFERENCES Procedure](#) to drop any existing index preferences
- Create new index preferences using the [CREATEPREFERENCES Procedure](#) procedure
- Create the `CONTEXT` index using the [CREATEINDEX Procedure](#) procedure
- Set up automatic synchronization of the index using the [CONFIGUREAUTOSYNC Procedure](#)

## 194.2 DBMS\_XDBT Security Model

Owned by `XDB`, the `DBMS_XDBT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB`. Subprograms in this package are executed using the privileges of the current user.

## 194.3 DBMS\_XDBT Operational Notes

Configuration settings, or package variables, are available to customize the DBMS\_XDBT package.

The DBMS\_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER\_JOBS catalog views.

**Table 194-1 General Indexing Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
IndexName	XDB\$CI	Name of the CONTEXT index.
IndexTablespace	XDB\$RESINFO	Tablespace used by tables and indexes comprising the CONTEXT index.
IndexMemory	128M	Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).
LogFile	'XdbCtxLog'	The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.

**Table 194-2 Filtering Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
SkipFilter_Types	image/%, audio/%, video/%, model/%	List of mime types that should not be indexed.
NullFilter_Types	text/plain, text/html, text/xml	List of mime types that do not need to use the INSO filter. Use this for text-based documents.
FilterPref	XDB\$CI_FILTER	Name of the filter preference.

**Table 194-3 Stoplist Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
StoplistPref	XDB\$CI_STOPLIST	Name of the stoplist.
StopWords	0..9; 'a'..'z'; 'A'..'Z'	List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.

**Table 194-4 Sectioning and Section Group Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
SectionGroup	HTML_SECTION_GROUP	Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.

**Table 194-4 (Cont.) Sectioning and Section Group Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
SectiongroupPref	XDB\$CI_SECTIONGROUP	Name of the section group.

**Table 194-5 Other Index Preference Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
DatastorePref	XDB\$CI_DATASTORE	Name of the datastore preference
StoragePref	XDB\$CI_STORAGE	Name of the storage preference.
WordlistPref	XDB\$CI_WORDLIST	Name of the wordlist preference.
DefaultLexerPref	XDB\$CI_DEFAULT_LEXER	Name of the default lexer preference.

**Table 194-6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS\_XDBT**

Parameter	Default Value	Description
AutoSyncPolicy	SYNC_BY_PENDING_COUNT	Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.
MaxPendingCount	2	Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
CheckPendingCountInterval	10 minutes	How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
SyncInterval	60 minutes	Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.

## 194.4 Summary of DBMS\_XDBT Subprograms

This table lists the DBMS\_XDBT subprograms in alphabetical order and briefly describes them.

**Table 194-7 DBMS\_XDBT Package Subprograms**

Subprogram	Description
<a href="#">CONFIGUREAUTOSYNC Procedure</a>	Configures the CONTEXT index for automatic maintenance, SYNC
<a href="#">CREATEDATASTOREPREF Procedure</a>	Creates a USER datastore preference for the CONTEXT index
<a href="#">CREATEFILTERPREF Procedure</a>	Creates a filter preference for the CONTEXT index
<a href="#">CREATEINDEX Procedure</a>	Creates the CONTEXT index on the XML DB hierarchy

**Table 194-7 (Cont.) DBMS\_XDBT Package Subprograms**

Subprogram	Description
<a href="#">CREATELEXERPREF Procedure</a>	Creates a lexer preference for the <code>CONTEXT</code> index
<a href="#">CREATEPREFERENCES Procedure</a>	Creates preferences required for the <code>CONTEXT</code> index on the XML DB hierarchy
<a href="#">CREATESECTIONGROUPPREF Procedure</a>	Creates a storage preference for the <code>CONTEXT</code> index
<a href="#">CREATESTOPLISTPREF Procedure</a>	Creates a section group for the <code>CONTEXT</code> index
<a href="#">CREATESTORAGEPREF Procedure</a>	Creates a wordlist preference for the <code>CONTEXT</code> index
<a href="#">CREATEWORLDDLISTPREF Procedure</a>	Creates a stoplist for the <code>CONTEXT</code> index
<a href="#">DROPPREFERENCES Procedure</a>	Drops any existing preferences

## 194.4.1 CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the `CONTEXT` index.

### Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

### Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the `USER_JOBS` catalog views
- The configuration parameter `AutoSyncPolicy` can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

Sync Basis	Description
<code>SYNC_BY_PENDING_COUNT</code>	The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the <a href="#">MaxPendingCount</a> configuration setting). The pending queue is polled at regular intervals (See the <a href="#">CheckPendingCountInterval</a> configuration parameter) to determine if the number of documents exceeds the threshold.
<code>SYNC_BY_TIME</code>	The SYNC is triggered at regular intervals. (See the <a href="#">SyncInterval</a> configuration parameter).
<code>SYNC_BY_PENDING_COUNT_AND_TIME</code>	A combination of both of the preceding options.

## 194.4.2 CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

### Usage Notes

- The name of the datastore preference can be modified; see the `DatastorePref` configuration setting.
- The default `USER` datastore procedure also filters the incoming document. The `DBMS_XDBT` package provides a set of configuration settings that control the filtering process.
- The `SkipFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
  - The `NullFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
  - All other documents use the `INSO` filter through the `IFILTER` API.

## 194.4.3 CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

### Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see [CREATEDATASTOREPREF Procedure](#) for more details.

## 194.4.4 CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEINDEX;
```

### Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.

- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later `SYNCs`, will use.

## 194.4.5 CREATELEXERPREF Procedure

This procedure creates a `BASIC` `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

### Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

## 194.4.6 CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

### Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

## 194.4.7 CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

### Usage Notes

- The name of the section group can be changed; see the `SectiongroupPref` configuration setting.
- The `HTML` sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the `AUTO_SECTION_GROUP` or the `PATH_SECTION_GROUP`; see the `SectionGroup` configuration setting.

## 194.4.8 CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

### Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

## 194.4.9 CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

### Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.
- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

## 194.4.10 CREATEWORDLISTPREF Procedure

This procedure creates a word list preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEWORDLISTPREF;
```

### Usage Notes

- The name of the word list preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

## 194.4.11 DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

### **Syntax**

```
DBMS_XDBT.DROPPREFERENCES;
```

# DBMS\_XDBZ

The DBMS\_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_XDBZ Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 195.1 DBMS\_XDBZ Security Model

Owned by XDB, the DBMS\_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 195.2 DBMS\_XDBZ Constants

The DBMS\_XDBZ package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

**Table 195-1 DBMS\_XDBZ Constants - Name Format**

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

**Table 195-2 DBMS\_XDBZ Constants - Enable Option**

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the <a href="#">ENABLE_HIERARCHY Procedure</a>

**Table 195-2 (Cont.) DBMS\_XDBZ Constants - Enable Option**

Constant	Type	Value	Description
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

**Table 195-3 DBMS\_XDBZ Constants - Enable Option Exercised**

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code>
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code>

## 195.3 Summary of DBMS\_XDBZ Subprograms

This table lists the DBMS\_XDBZ subprograms and briefly describes them.

**Table 195-4 DBMS\_XDBZ Package Subprograms**

Method	Description
<a href="#">DISABLE_HIERARCHY Procedure</a>	Disables repository support for the specified XMLTYPE table or view
<a href="#">ENABLE_HIERARCHY Procedure</a>	Enables repository support for the specified XMLType table or view
<a href="#">GET_ACLOID Function</a>	Retrieves the ACL Object ID for the specified resource
<a href="#">GET_USERID Function</a>	Retrieves the user ID for the specified user
<a href="#">IS_HIERARCHY_ENABLED Function</a>	Determines if repository support for the specified XMLType table or view is enabled
<a href="#">PURGELDAPCACHE Function</a>	Purges the LDAP nickname cache

### 195.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

#### Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

## 195.3.2 DISABLE\_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

### Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(
 object_schema IN VARCHAR2,
 object_name IN VARCHAR2);
```

### Parameters

**Table 195-5** DISABLE\_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view

## 195.3.3 ENABLE\_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

### See Also:

*Oracle XML DB Developer's Guide* for more information about

### Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
 object_schema IN VARCHAR2,
 object_name IN VARCHAR2,
 hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

### Parameters

**Table 195-6** ENABLE\_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view

**Table 195-6 (Cont.) ENABLE\_HIERARCHY Procedure Parameters**

Parameter	Description
hierarchy_type	<p>How to enable the hierarchy.</p> <ul style="list-style-type: none"> <li>ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository</li> <li>ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</li> </ul> <p>If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.</p>

## 195.3.4 GET\_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

### Syntax

```
DBMS_XDBZ.GET_ACLOID(
 aclpath IN VARCHAR2,
 acloid OUT RAW)
RETURN BOOLEAN;
```

### Parameters

**Table 195-7 GET\_ACLOID Function Parameters**

Parameter	Description
aclpath	ACL resource path for the repository
acloid	Returned Object ID

### Return Values

Returns TRUE if successful.

## 195.3.5 GET\_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

### Syntax

```
DBMS_XDBZ.GET_USERID(
 username IN VARCHAR2,
 userid OUT RAW,
 format IN BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

## Parameters

**Table 195-8 GET\_USERID Function Parameters**

Parameter	Description
username	Name of the database or LDAP user.
userid	Return parameter for the matching user id.
format	Format of the specified user name; valid options are: <ul style="list-style-type: none"> <li>DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname</li> <li>DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name.</li> </ul>

## Return Values

Returns TRUE if successful.

## 195.3.6 IS\_HIERARCHY\_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

## Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
 object_schema IN VARCHAR2,
 object_name IN VARCHAR2,
 hierarchy_type IN PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

## Parameters

**Table 195-9 IS\_HIERARCHY\_ENABLED Function Parameters**

Parameter	Description
object_schema	Schema name of the XMLType table or view
object_name	Name of the XMLType table or view
hierarchy_type	Type of hierarchy to check for: <ul style="list-style-type: none"> <li>IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with hierarchy_type as ENABLE_CONTENTS</li> <li>IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with hierarchy_type as ENABLE_RESMETADATA</li> </ul>

## Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

## 195.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.

It returns `TRUE` if successful.

### **Syntax**

```
DBMS_XDBZ.PURGELDAPCACHE
RETURN BOOLEAN;
```

# DBMS\_XEVENT

The `DBMS_XEVENT` package provides event-related types and supporting subprograms.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Subprogram Groups](#)
- [Summary of DBMS\\_XEVENT Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

## 196.1 DBMS\_XEVENT Security Model

Owned by `XDB`, the `DBMS_XEVENT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 196.2 DBMS\_XEVENT Constants

The `DBMS_XEVENT` package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

**Table 196-1 DBMS\_XEVENT Constants**

Name	Type	Value	Description
<code>RENDER_EVENT</code>	<code>PLS_INTEGER</code>	1	
<code>PRE_CREATE_EVENT</code>	<code>PLS_INTEGER</code>	2	
<code>POST_CREATE_EVENT</code>	<code>PLS_INTEGER</code>	3	
<code>PRE_DELETE_EVENT</code>	<code>PLS_INTEGER</code>	4	
<code>POST_DELETE_EVENT</code>	<code>PLS_INTEGER</code>	5	
<code>PRE_UPDATE_EVENT</code>	<code>PLS_INTEGER</code>	6	
<code>POST_UPDATE_EVENT</code>	<code>PLS_INTEGER</code>	7	
<code>PRE_LOCK_EVENT</code>	<code>PLS_INTEGER</code>	8	

**Table 196-1 (Cont.) DBMS\_XEVENT Constants**

Name	Type	Value	Description
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

## 196.3 Subprogram Groups

The subprograms in the DBMS\_XEVENT package can be divided in groups.

- [XDBEvent Type Subprograms](#)
- [XDBRepositoryEvent Type Subprograms](#)
- [XDBHandlerList Type Subprograms](#)
- [XDBHandler Type Subprograms](#)
- [XDBPath Type Subprograms](#)
- [XDBLink Type Subprograms](#)

## 196.3.1 DBMS\_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

**Table 196-2 XDBEvent Subprograms**

Subprogram	Description
<a href="#">GETCURRENTUSER Function</a>	Returns the name of the user executing the operation that triggers the event
<a href="#">GETEVENT Function</a>	Returns a value identifying the triggering event
<a href="#">ISNULL Functions</a>	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## 196.3.2 DBMS\_XEVENT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

**Table 196-3 XDBRepositoryEvent Subprograms**

Subprogram	Description
<a href="#">GETAPPLICATIONDATA Function</a>	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler
<a href="#">GETHANDLERLIST Function</a>	Returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler
<a href="#">GETINTERFACE Function</a>	Returns the top-level interface used to initiate the operation that triggered the event
<a href="#">GETLINK Function</a>	Returns an XDBLink object for the target resource
<a href="#">GETLOCK Function</a>	Returns the lock object corresponding to the current operation
<a href="#">GETOLDRESOURCE Function</a>	Returns the original XDBResource object before the operation was executed
<a href="#">GETOPENACCESSMODE Function</a>	Returns the access mode for the open operation
<a href="#">GETOPENDENYMODE Function</a>	Returns the deny mode for the open operation
<a href="#">GETOUTPUTSTREAM Function</a>	Returns the output BLOB in which the handler can write the rendered data
<a href="#">GETPARAMETER Function</a>	Returns the value of a request or session-specific parameter
<a href="#">GETPARENT Function</a>	Returns the resource object corresponding to a parent folder of the target resource
<a href="#">GETPATH Function</a>	Returns the XDBPath object representing the path of the resource for which the event was fired

**Table 196-3 (Cont.) XDBRepositoryEvent Subprograms**

Subprogram	Description
<a href="#">GETRESOURCE Function</a>	Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource
<a href="#">GETUPDATEBYTECOUNT Function</a>	If the current operation is a byte-range write, returns the byte count
<a href="#">GETUPDATEBYTEOFFSET Function</a>	If the current operation is a byte-range write, function returns the byte offset at which the range begins
<a href="#">GETXDBEVENT Function</a>	Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type
<a href="#">ISNULL Functions</a>	Returns <code>TRUE</code> if input argument is <code>NULL</code>
<a href="#">SETRENDERPATH Procedure</a>	Specifies the path of the resource that contains the rendered contents
<a href="#">SETRENDERSTREAM Procedure</a>	sets the <code>BLOB</code> from which the rendered contents can be read

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

### 196.3.3 DBMS\_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandlerList` type.

**Table 196-4 XDBHandlerList Subprograms**

Subprogram	Description
<a href="#">CLEAR Procedure</a>	Clears the handler list
<a href="#">GETFIRST Function</a>	Returns the first handler in the list
<a href="#">GETNAME Function</a>	Returns the next handler in the list
<a href="#">ISNULL Functions</a>	Returns <code>TRUE</code> if input argument is <code>NULL</code>
<a href="#">REMOVE Procedure</a>	Removes the specified handler from the handler list

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

### 196.3.4 DBMS\_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandler` type.

**Table 196-5 XDBHandler Type Subprograms**

Subprogram	Description
<a href="#">GETLANGUAGE Function</a>	Returns the implementation language of the handler

**Table 196-5 (Cont.) XDBHandler Type Subprograms**

Subprogram	Description
<a href="#">GETSCHEMA Function</a>	Returns the schema of the handler's source
<a href="#">GETSOURCE Function</a>	Returns the name of the Java class, PL/SQL package or object type implementing the handler
<a href="#">ISNULL Functions</a>	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

### 196.3.5 DBMS\_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

**Table 196-6 XDBPath Type Subprograms**

Subprogram	Description
<a href="#">GETNAME Function</a>	Returns the string representation of the path
<a href="#">GETPARENTPATH Function</a>	Returns the parent's path
<a href="#">ISNULL Functions</a>	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

### 196.3.6 DBMS\_XEVENT XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

**Table 196-7 XDBLink Type Subprograms**

Subprogram	Description
<a href="#">GETCHILDROID Function</a>	Returns the OID of the resource to which the link is pointing
<a href="#">GETPARENTNAME Function</a>	Returns the link's parent folder's name
<a href="#">GETPARENTOID Function</a>	Returns the link's parent folder's OID
<a href="#">ISNULL Functions</a>	Returns TRUE if input argument is NULL

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## 196.4 Summary of DBMS\_XEVENT Subprograms

This table lists the DBMS\_XEVENT subprograms and briefly describes them.

**Table 196-8 DBMS\_XEVENT Package Subprograms**

Subprogram	Description	Group
<a href="#">CLEAR Procedure</a>	Clears the handler list	<a href="#">XDBHandlerList Type Subprograms</a>
<a href="#">GETAPPLICATIONDATA Function</a>	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETCHILDROID Function</a>	Returns the OID of the resource to which the link is pointing	<a href="#">XDBLink Type Subprograms</a>
<a href="#">GETCURRENTUSER Function</a>	Returns the name of the user executing the operation that triggers the event	<a href="#">XDBEvent Type Subprograms</a>
<a href="#">GETEVENT Function</a>	Returns a value identifying the triggering event	<a href="#">XDBEvent Type Subprograms</a>
<a href="#">GETFIRST Function</a>	Returns the first handler in the list	<a href="#">XDBHandlerList Type Subprograms</a>
<a href="#">GETHANDLERLIST Function</a>	Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETINTERFACE Function</a>	Returns the top-level interface used to initiate the operation that triggered the event	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETLANGUAGE Function</a>	Returns the implementation language of the handler	<a href="#">XDBHandler Type Subprograms</a>
<a href="#">GETLINK Function</a>	Returns an <code>XDBLink</code> object for the target resource	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETLOCK Function</a>	Returns the lock object corresponding to the current operation	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETNAME Function</a>	Returns the string representation of the path	<a href="#">XDBPath Type Subprograms</a>
<a href="#">GETNAME Function</a>	Returns the next handler in the list	<a href="#">XDBHandlerList Type Subprograms</a>
<a href="#">GETOLDRESOURCE Function</a>	Returns the original <code>XDBResource</code> object before the operation was executed	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETOPENACCESSMODE Function</a>	Returns the access mode for the open operation	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETOPENDENYMODE Function</a>	Returns the deny mode for the open operation	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETOUTPUTSTREAM Function</a>	Returns the output BLOB in which the handler can write the rendered data	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETPARAMETER Function</a>	Returns the value of a request or session-specific parameter	<a href="#">XDBRepositoryEvent Type Subprograms</a>
<a href="#">GETPARENT Function</a>	Returns the resource object corresponding to a parent folder of the target resource	<a href="#">XDBRepositoryEvent Type Subprograms</a>

Table 196-8 (Cont.) DBMS\_XEVENT Package Subprograms

Subprogram	Description	Group
GETPARENTNAME Function	Returns the link's parent folder's name	XDBLink Type Subprograms
GETPARENTOID Function	Returns the link's parent folder's OID	XDBLink Type Subprograms
GETPARENTNAME Function	Returns the parent's path	XDBPath Type Subprograms
GETPATH Function	Returns the XDBPath object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms
GETRESOURCE Function	Returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms
GETSCHEMA Function	Returns the schema of the handler's source	XDBHandler Type Subprograms
GETSOURCE Function	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms
GETUPDATEBYTECOUNT Function	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms
GETUPDATEBYTEOFFSET Function	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms
GETXDBEVENT Function	Converts an XDBRepositoryEvent object to an XDBEvent type	XDBRepositoryEvent Type Subprograms
ISNULL Functions	Returns TRUE if input argument is NULL	XDBEvent Type Subprograms XDBRepositoryEvent Type Subprograms XDBHandlerList Type Subprograms XDBHandler Type Subprograms XDBPath Type Subprograms
REMOVE Procedure	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms
SETRENDERPATH Procedure	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms
SETRENDERSTREAM Procedure	sets the BLOB from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms

## 196.4.1 CLEAR Procedure

This procedure clears the handler list.

### See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.CLEAR (
 hl IN OUT XDBHandlerList);
```

### Parameters

**Table 196-9** CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

## 196.4.2 GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
 ev IN XDBRepositoryEvent)
RETURN XMLType;
```

### Parameters

**Table 196-10** GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.3 GETCHILDROID Function

This function returns the OID of the resource to which the link is pointing.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETCHILDROID (
 link IN XDBLink)
RETURN RAW;
```

### Parameters

**Table 196-11** GETCHILDROID Function Parameters

Parameter	Description
link	Link

## 196.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

### See Also:

[XDBEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETCURRENTUSER (
 ev IN XDBEvent)
RETURN VARCHAR2;
```

### Parameters

**Table 196-12** GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

## 196.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

### See Also:

[XDBEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETEVENT (
 ev IN XDBEvent)
RETURN XDBEventID;
```

### Parameters

**Table 196-13** GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

## 196.4.6 GETFIRST Function

This function returns the first handler in the list.

### See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETFIRST (
 hl IN XDBHandlerList)
RETURN XDBHandler;
```

### Parameters

**Table 196-14** GETFIRST Function Parameters

Parameter	Description
hl	Handler list

## 196.4.7 GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETHANDLERLIST (
 ev IN XDBRepositoryEvent)
RETURN XDBHandlerList;
```

### Parameters

**Table 196-15** GETHANDLERLIST Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETINTERFACE (
 ev IN XDBRepositoryEvent)
RETURN VARCHAR2;
```

## Parameters

**Table 196-16** GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

**See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLANGUAGE (
 handler IN XDBHandler)
RETURN VARCHAR2;
```

## Parameters

**Table 196-17** GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

## 196.4.10 GETLINK Function

This function returns an XDBLink object for the target resource.

For a link\* or unlink\* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, ParentName, ParentOID, ChildOID and LinkName.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLINK (
 ev IN XDBRepositoryEvent)
RETURN XDBLink;
```

## Parameters

**Table 196-18 GETLINK Function Parameters**

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.11 GETLINKNAME Function

This function returns the name of the link.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETLINKNAME (
 link IN XDBLink)
RETURN VARCHAR2;
```

## Parameters

**Table 196-19 GETLINKNAME Function Parameters**

Parameter	Description
link	Link

## 196.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETLOCK (
 ev IN XDBRepositoryEvent)
RETURN XDBLock;
```

## Parameters

**Table 196-20 GETLOCK Function Parameters**

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

### See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETLANGUAGE (
 handler IN XDBHandler)
RETURN VARCHAR2;
```

## Parameters

**Table 196-21 GETLANGUAGE Function Parameters**

Parameter	Description
handler	Handler

## 196.4.14 GETNAME Function

This function returns the string representation of the path.

### See Also:

[XDBPath Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETNAME (
 path IN XDBPath)
RETURN VARCHAR2;
```

## Parameters

**Table 196-22** GETNAME Function Parameters

Parameter	Description
path	Path

## 196.4.15 GETNEXT Function

This function returns the next handler in the list.

**See Also:**

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETNEXT (
 hl IN XDBHandlerList)
RETURN XDBHandler;
```

### Parameters

**Table 196-23** GETNEXT Function Parameters

Parameter	Description
hl	Handler list

## 196.4.16 GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
 ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

## Parameters

**Table 196-24** GETOLDRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
 ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

## Parameters

**Table 196-25** GETOPENACCESSMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

### Return Values

- XDBRepositoryEvent.OPEN\_ACCESS\_READ (value 1)
- XDBRepositoryEvent.OPEN\_ACCESS\_WRITE (value 2)
- XDBRepositoryEvent.OPEN\_ACCESS\_READ\_WRITE (value 3)

## 196.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (
 ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

### Parameters

**Table 196-26** GETOPENDENYMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

### Return Values

- XDBRepositoryEvent.OPEN\_DENY\_NONE (value 0)
- XDBRepositoryEvent.OPEN\_DENY\_READ (value 1)
- XDBRepositoryEvent.OPEN\_DENY\_READ\_WRITE (value 2)

## 196.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
 ev IN XDBRepositoryEvent)
RETURN BLOB;
```

### Parameters

**Table 196-27** GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARAMETER (
 ev IN XDBRepositoryEvent,
 key IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 196-28** GETPARAMETER Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type
key	Supported parameters: <ul style="list-style-type: none"><li>• ACCEPT</li><li>• ACCEPT-LANGUAGE</li><li>• ACCEPT-CHARSET</li><li>• ACCEPT_ENCODING</li></ul>

## 196.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a `link*` or `unlink*` event, this method returns the link's parent folder.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENT (
 ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

## Parameters

**Table 196-29** GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETPARENTNAME (
 link IN XDBLink)
 RETURN VARCHAR2;
```

## Parameters

**Table 196-30** GETPARENTNAME Function Parameters

Parameter	Description
link	Link

## 196.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETPARENTOID (
 link IN XDBLink)
 RETURN RAW;
```

## Parameters

**Table 196-31** GETPARENTOID Function Parameters

Parameter	Description
link	Link

## 196.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

**See Also:**

[XDBPath Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENTPATH (
 path IN XDBPath,
 level IN INTEGER)
RETURN XDBPath;
```

## Parameters

**Table 196-32** GETPARENTPATH Function Parameters

Parameter	Description
path	Path
level	Number of levels up the hierarchy

## 196.4.25 GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETPATH (
 ev IN XDBRepositoryEvent)
RETURN XDBPath;
```

**Parameters****Table 196-33** GETPATH Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.26 GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a `link*` or `unlink*` event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

 **See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETRESOURCE (
 ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

**Parameters****Table 196-34** GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

 **See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETSCHEMA (
 handler IN XDBHandler)
 RETURN VARCHAR2;
```

**Parameters****Table 196-35 GETSCHEMA Function Parameters**

Parameter	Description
handler	Handler

## 196.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

**See Also:**

[XDBHandler Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETSOURCE (
 handler IN XDBHandler)
 RETURN VARCHAR2;
```

**Parameters****Table 196-36 GETSOURCE Function Parameters**

Parameter	Description
handler	Handler

## 196.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the `GETUPDATEBYTECOUNT` function returns the byte count. It is only valid for the inconsistent-update event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
 ev IN XDBRepositoryEvent)
RETURN NUMBER;
```

**Parameters****Table 196-37** GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the GETUPDATEBYTEOFFSET function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
 ev IN XDBRepositoryEvent)
RETURN NUMBER;
```

**Parameters****Table 196-38** GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.31 GETXDBEVENT Function

This function converts an XDBRepositoryEvent object to an XDBEvent type.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.GETXDBEVENT (
 ev IN XDBRepositoryEvent)
RETURN XDBEvent;
```

**Parameters****Table 196-39 GETXDBEVENT Function Parameters**

Parameter	Description
ev	Event of XDBRepositoryEvent type

## 196.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

 **See Also:**

- [XDBEvent Type Subprograms](#) for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group
- [XDBHandlerList Type Subprograms](#) for other subprograms in this group
- [XDBHandler Type Subprograms](#) for other subprograms in this group
- [XDBPath Type Subprograms](#) for other subprograms in this group
- [XDBLink Type Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_XEVENT.ISNULL (
 ev IN XDBEvent)
RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
 ev IN XDBRepositoryEvent)
RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
 hl IN XDBHandlerList)
RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
 handler IN XDBHandler)
RETURN BOOLEAN;
RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
 path IN XDBPath)
RETURN BOOLEAN;
```

```
DBMS_XEVENT.ISNULL (
 link IN XDBLink)
RETURN BOOLEAN;
```

### Parameters

**Table 196-40 ISNULL Function Parameters**

Parameter	Description
ev	Event of specified type
hl	Handler list
handler	Handler
path	Path

## 196.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

### See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.REMOVE (
 hl IN OUT XDBHandlerList,
 handler IN XDBHandler);
```

### Parameters

**Table 196-41 REMOVE Procedure Parameters**

Parameter	Description
hl	Handler list
handler	Handler

## 196.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by [GETOUTPUTSTREAM Function](#) is written to or after the [SETRENDERSTREAM Procedure](#) is called; doing so will result in an error. This is only valid for the render event.

### Syntax

```
DBMS_XEVENT.SETRENDERPATH (
 ev IN XDBRepositoryEvent,
 path IN VARCHAR2);
```

## Parameters

**Table 196-42 SETRENDERPATH Procedure Parameters**

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

## 196.4.35 SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read.

This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

### Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
 ev IN XDBRepositoryEvent,
 istr IN BLOB);
```

## Parameters

**Table 196-43 SETRENDERSTREAM Procedure Parameters**

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

# DBMS\_XMLDOM

The `DBMS_XMLDOM` package is used to access `XMLType` objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Exceptions](#)
- [Subprogram Groups](#)
- [Subprogram Groups](#)
- [Summary of DBMS\\_XMLDOM Subprograms](#)

## See Also:

*Oracle XML Developer's Kit Programmer's Guide*

## 197.1 DBMS\_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

## Note:

Read-from and write-to files must be on the server file system.

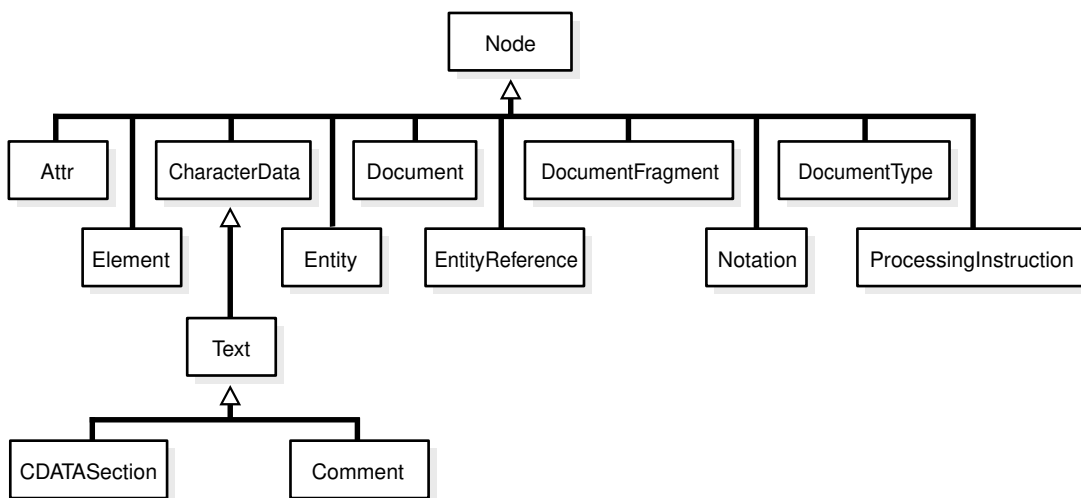

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform [APPENDCHILD Function](#) on a `DOMNode` `n`, the [APPENDCHILD Function](#) PL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement` `elem`, use [SETATTRIBUTE Procedures](#), use PL/SQL procedure .

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see [Figure 197-1](#)). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

**Figure 197-1 Inheritance Diagram for DOM Types**

The implementation of this interface follows the REC-DOM-Level-1-19981001.

## 197.2 DBMS\_XMLDOM Security Model

Owned by XDB, the DBMS\_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

## 197.3 DBMS\_XMLDOM Constants

The DBMS\_XMLDOM package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

**Table 197-1 Defined Constants for DBMS\_XMLDOM**

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDATASection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

## 197.4 DBMS\_XMLDOM Types

This table lists and briefly describes the types for the DBMS\_XMLDOM.DOMTYPE package.

**Table 197-2 XDB\_XMLDOM Types**

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDATASection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.

**Table 197-2 (Cont.) XDB\_XMLDOM Types**

Type	Description
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

## 197.5 DBMS\_XMLDOM Exceptions

DBMS\_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for DBMS\_XMLDOM:

**Table 197-3 Exceptions for DBMS\_XMLDOM**

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.

**Table 197-3 (Cont.) Exceptions for DBMS\_XMLDOM**

Exception	Description
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

## 197.6 DBMS\_XMLDOM Subprogram Groups

DBMS\_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- [DOMNode Subprograms](#)
- [DOMAttr Subprograms](#)
- [DOMCDataSection Subprograms](#)
- [DOMCharacterData Subprograms](#)
- [DOMComment Subprograms](#)
- [DOMDocument Subprograms](#)
- [DOMDocumentFragment Subprograms](#)
- [DOMDocumentType Subprograms](#)
- [DOMElement Subprograms](#)
- [DOMEntity Subprograms](#)
- [DOMEntityReference Subprograms](#)
- [DOMImplementation Subprograms](#)
- [DOMNamedNodeMap Subprograms](#)
- [DOMNodeList Subprograms](#)
- [DOMNotation Subprograms](#)
- [DOMProcessingInstruction Subprograms](#)
- [DOMText Subprograms](#)

### 197.6.1 DBMS\_XMLDOM DOMNode Subprograms

This table lists and briefly describes the `DOMNode` subprograms of `DBMS_XMLDOM`.

**Table 197-4 Summary of DOMNode Subprograms; DBMS\_XMLDOM**

Subprogram	Description
<a href="#">ADOPTNODE Function</a>	Adopts a node from another document
<a href="#">APPENDCHILD Function</a>	Appends a new child to the node
<a href="#">CLONENODE Function</a>	Clones the node
<a href="#">FREENODE Procedure</a>	Frees all resources associated with the node
<a href="#">GETATTRIBUTES Function</a>	Retrieves the attributes of the node
<a href="#">GETCHILDNODES Function</a>	Retrieves the children of the node

**Table 197-4 (Cont.) Summary of DOMNode Subprograms; DBMS\_XMLDOM**

Subprogram	Description
<a href="#">GETEXPANDEDNAME Procedure and Functions</a>	Retrieves the expanded name of the node
<a href="#">GETFIRSTCHILD Function</a>	Retrieves the first child of the node
<a href="#">GETLASTCHILD Function</a>	Retrieves the last child of the node
<a href="#">GETLOCALNAME Procedure and Functions</a>	Retrieves the local part of the qualified name
<a href="#">GETNAMESPACE Procedure and Functions</a>	Retrieves the node's namespace URI
<a href="#">GETNEXTSIBLING Function</a>	Retrieves the next sibling of the node
<a href="#">GETNODENAME Function</a>	Retrieves the Name of the Node
<a href="#">GETNODETYPE Function</a>	Retrieves the Type of the node
<a href="#">GETNODEVALUE Function</a>	Retrieves the Value of the Node
<a href="#">GETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a>	Retrieves Node Value as binary stream
<a href="#">GETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a>	Retrieves Node Value as character stream
<a href="#">GETOWNERDOCUMENT Function</a>	Retrieves the owner document of the node
<a href="#">GETPARENTNODE Function</a>	Retrieves the parent of this node
<a href="#">GETPREFIX Function</a>	Retrieves the namespace prefix
<a href="#">GETPREVIOUSIBLING Function</a>	Retrieves the previous sibling of the node
<a href="#">GETSCHEMANODE Function</a>	Retrieves the associated schema URI
<a href="#">HASATTRIBUTES Function</a>	Tests if the node has attributes
<a href="#">HASCILDNODES Function</a>	Tests if the node has child nodes
<a href="#">IMPORTNODE Function</a>	Imports a node from another document
<a href="#">INSERTBEFORE Function</a>	Inserts a child before the reference child
<a href="#">ISNULL Functions</a>	Tests if the node is <code>NULL</code>
<a href="#">MAKEATTR Function</a>	Casts the node to an Attribute
<a href="#">MAKECDATASECTION Function</a>	Casts the node to a CData Section
<a href="#">MAKECHARACTERDATA Function</a>	Casts the node to Character Data
<a href="#">MAKECOMMENT Function</a>	Casts the node to a Comment
<a href="#">MAKEDOCUMENT Function</a>	Casts the node to a DOM Document
<a href="#">MAKEDOCUMENTFRAGMENT Function</a>	Casts the node to a DOM Document Fragment
<a href="#">MAKEDOCUMENTTYPE Function</a>	Casts the node to a DOM Document Type
<a href="#">MAKEELEMENT Function</a>	Casts the node to a DOM Element
<a href="#">MAKEENTITY Function</a>	Casts the node to a DOM Entity
<a href="#">MAKEENTITYREFERENCE Function</a>	Casts the node to a DOM Entity Reference
<a href="#">MAKENOTATION Function</a>	Casts the node to a DOM Notation
<a href="#">MAKEPROCESSINGINSTRUCTION Function</a>	Casts the node to a DOM Processing Instruction
<a href="#">MAKETEXT Function</a>	Casts the node to a DOM Text
<a href="#">REMOVECHILD Function</a>	Removes a specified child from a node

**Table 197-4 (Cont.) Summary of DOMNode Subprograms; DBMS\_XMLDOM**

Subprogram	Description
<a href="#">REPLACECHILD Function</a>	Replaces the old child with a new child
<a href="#">SETNODEVALUE Procedure</a>	Sets the Value of the node
<a href="#">SETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a>	Sets the Node Value as binary stream
<a href="#">SETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a>	Sets the Node Value as a character stream
<a href="#">SETPREFIX Procedure</a>	Sets the namespace prefix
<a href="#">USEBINARYSTREAM Function</a>	Establishes that the stream is valid
<a href="#">WRITETOBUFFER Procedures</a>	Writes the contents of the node to a buffer
<a href="#">WRITETOCLOB Procedures</a>	Writes the contents of the node to a CLOB
<a href="#">WRITETOFILE Procedures</a>	Writes the contents of the node to a file

## 197.6.2 DBMS\_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 197-5 Summary of DOMAttr Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">GETEXPANDEDNAME Procedure and Functions</a>	Retrieves the expanded name of the attribute
<a href="#">GETLOCALNAME Procedure and Functions</a>	Retrieves the local name of the attribute
<a href="#">GETNAME Functions</a>	Retrieves the name of the attribute
<a href="#">GETNAMESPACE Procedure and Functions</a>	Retrieves the NS URI of the attribute
<a href="#">GETOWNERELEMENT Function</a>	Retrieves the Element node, parent of the attribute
<a href="#">GETQUALIFIEDNAME Functions</a>	Retrieves the Qualified Name of the attribute
<a href="#">GETSPECIFIED Function</a>	Tests if attribute was specified in the element
<a href="#">GETVALUE Function</a>	Retrieves the value of the attribute
<a href="#">ISNULL Functions</a>	Tests if the Attribute node is NULL
<a href="#">MAKENODE Functions</a>	Casts the Attribute to a node
<a href="#">SETVALUE Procedure</a>	Sets the value of the attribute

## 197.6.3 DBMS\_XMLDOM DOMCDataSection Subprograms

This table lists the DOMCdata subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 197-6 Summary of DOMCdata Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">ISNULL Functions</a>	Tests if the <code>CDataSection</code> is <code>NULL</code>
<a href="#">MAKENODE Functions</a>	Casts the <code>CDataSection</code> to a node

## 197.6.4 DBMS\_XMLDOM DOMCharacterData Subprograms

This table lists the `DOMCharacterData` subprograms of `DBMS_XMLDOM` in alphabetical order and briefly describes them.

**Table 197-7 Summary of DOMCharacterData Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">APPENDDATA Procedure</a>	Appends the specified data to the node data
<a href="#">DELETEDATA Procedure</a>	Deletes the data from the specified <code>offSets</code>
<a href="#">GETDATA Functions</a>	Retrieves the data of the node
<a href="#">GETLENGTH Functions</a>	Retrieves the length of the data
<a href="#">INSERTDATA Procedure</a>	Inserts the data in the node at the specified <code>offSets</code>
<a href="#">ISNULL Functions</a>	Tests if the <code>CharacterData</code> is <code>NULL</code>
<a href="#">MAKENODE Functions</a>	Casts the <code>CharacterData</code> to a node
<a href="#">REPLACEDATA Procedure</a>	Changes a range of characters in the node
<a href="#">SETDATA Procedures</a>	Sets the data to the node
<a href="#">SUBSTRINGDATA Function</a>	Retrieves the substring of the data

## 197.6.5 DBMS\_XMLDOM DOMComment Subprograms

The table lists the `DOMComment` subprograms of `DBMS_XMLDOM` in alphabetical order and briefly describes them.

**Table 197-8 Summary of DOMComment Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">ISNULL Functions</a>	Tests if the comment is <code>NULL</code>
<a href="#">MAKENODE Functions</a>	Casts the <code>Comment</code> to a node

## 197.6.6 DBMS\_XMLDOM DOMDocument Subprograms

This table lists the `DOMDocument` subprograms of `DBMS_XMLDOM` in alphabetical order and briefly describes them.

**Table 197-9 Summary of DOMDocument Subprograms; DBMS\_XMLDOM**

Method	Description
CREATEATTRIBUTE Functions	Creates an Attribute
CREATEDATASECTION Function	Creates a CDataSection node
CREATECOMMENT Function	Creates a Comment node
CREATEDOCUMENT Function	Creates a new Document
CREATEDOCUMENTFRAGMENT Function	Creates a new Document Fragment
CREATEELEMENT Functions	Creates a new Element
CREATEENTITYREFERENCE Function	Creates an Entity reference
CREATEPROCESSINGINSTRUCTION Function	Creates a Processing Instruction
CREATETEXTNODE Function	Creates a Text node
FREEDOCFRAG Procedure	Frees the document fragment
FREEDOCUMENT Procedure	Frees the document
GETCHARSET Function	Retrieves the character set of the DOM document
GETDOCTYPE Function	Retrieves the DTD of the document
GETDOCUMENTELEMENT Function	Retrieves the root element of the document
GETELEMENTSBYTAGNAME Functions	Retrieves <ul style="list-style-type: none"> <li>• the elements in the DOMNODELIST by tag name</li> <li>• elements in the subtree of a DOMNODELIST by tagname</li> </ul>
GETIMPLEMENTATION Function	Retrieves the DOM implementation
GETSTANDALONE Function	Retrieves the standalone property of the document
GETVERSION Function	Retrieves the version of the document
GETXMLTYPE Function	Retrieves the XMLType associated with the DOM Document
ISNULL Functions	Tests if the document is NULL
MAKENODE Functions	Casts the document to a node
NEWDOMDOCUMENT Functions	Creates a new document
SETCHARSET Procedure	Sets the character set of the DOM document
SETDOCTYPE Procedure	Sets the DTD of the document
SETSTANDALONE Procedure	Sets the standalone property of the document
SETVERSION Procedure	Sets the version of the document
WRITETOBUFFER Procedures	Writes the document to a buffer
WRITETOCLOB Procedures	Writes the document to a CLOB
WRITETOFILE Procedures	Writes the document to a file

## 197.6.7 DBMS\_XMLDOM DOMDocumentFragment Subprograms

This table lists the DOMDocumentFragment subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 197-10 Summary of DOMDocumentFragment Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">FREEDOCFRAG Procedure</a>	Frees the specified document fragment
<a href="#">ISNULL Functions</a>	Tests if the DocumentFragment is <code>NULL</code>
<a href="#">MAKENODE Functions</a>	Casts the Document Fragment to a node
<a href="#">WRITETOBUFFER Procedures</a>	Writes the contents of a document fragment into a buffer

## 197.6.8 DBMS\_XMLDOM DOMDocumentType Subprograms

This table lists the DOMDocumentType subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 197-11 Summary of DOMDocumentType Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">FINDENTITY Function</a>	Finds the specified entity in the document type
<a href="#">FINDNOTATION Function</a>	Finds the specified notation in the document type
<a href="#">GETENTITIES Function</a>	Retrieves the nodemap of entities in the Document type
<a href="#">GETNAME Functions</a>	Retrieves the name of the Document type
<a href="#">GETNOTATIONS Function</a>	Retrieves the nodemap of the notations in the Document type
<a href="#">GETPUBLICID Functions</a>	Retrieves the public ID of the document type
<a href="#">GETSYSTEMID Functions</a>	Retrieves the system ID of the document type
<a href="#">ISNULL Functions</a>	Tests if the Document Type is <code>NULL</code>
<a href="#">MAKENODE Functions</a>	Casts the document type to a node

## 197.6.9 DBMS\_XMLDOM DOMEElement Subprograms

This table lists the DOMEElement subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 197-12 Summary of DOMEElement Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">FREEELEMENT Procedure</a>	Frees memory allocated to a DOMEElement handle

**Table 197-12 (Cont.) Summary of DOMELEMENT Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">GETATTRIBUTE Functions</a>	Retrieves the attribute node by name
<a href="#">GETATTRIBUTENODE Functions</a>	Retrieves the attribute node by name
<a href="#">GETCHILDRENBYTAGNAME Functions</a>	Retrieves children of the element by tag name
<a href="#">GETELEMENTSBYTAGNAME Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the elements in the DOMNODELIST by tag name</li> <li>elements in the subtree of a DOMNODELIST by tagname</li> </ul>
<a href="#">GETEXPANDEDNAME Procedure and Functions</a>	Retrieves the expanded name of the element
<a href="#">GETLOCALNAME Procedure and Functions</a>	Retrieves the local name of the element
<a href="#">GETNAMESPACE Procedure and Functions</a>	Retrieves the NS URI of the element
<a href="#">GETQUALIFIEDNAME Functions</a>	Retrieves the qualified name of the element
<a href="#">GETTAGNAME Function</a>	Retrieves the Tag name of the element
<a href="#">HASATTRIBUTE Functions</a>	Tests if an attribute exists
<a href="#">ISNULL Functions</a>	Tests if the Element is NULL
<a href="#">MAKENODE Functions</a>	Casts the Element to a node
<a href="#">NORMALIZE Procedure</a>	Normalizes the text children of the element
<a href="#">REMOVEATTRIBUTE Procedures</a>	Removes the attribute specified by the name
<a href="#">REMOVEATTRIBUTENODE Function</a>	Removes the attribute node in the element
<a href="#">RESOLVENAMESPACEPREFIX Function</a>	Resolve the prefix to a namespace URI
<a href="#">SETATTRIBUTE Procedures</a>	Sets the attribute specified by the name
<a href="#">SETATTRIBUTENODE Functions</a>	Sets the attribute node in the element

## 197.6.10 DBMS\_XMLDOM DOMEntity Subprograms

This table lists and briefly describes the `DOMEntity` subprograms of `DBMS_XMLDOM`.

**Table 197-13 Summary of DOMEntity Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">GETNOTATIONNAME Function</a>	Retrieves the notation name of the entity
<a href="#">GETPUBLICID Functions</a>	Retrieves the public Id of the entity
<a href="#">GETSYSTEMID Functions</a>	Retrieves the system Id of the entity
<a href="#">ISNULL Functions</a>	Tests if the Entity is NULL
<a href="#">MAKENODE Functions</a>	Casts the Entity to a node

## 197.6.11 DBMS\_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the `DOMEntityReference` subprograms of `DBMS_XMLDOM`.

**Table 197-14 Summary of DOMEntityReference Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">ISNULL Functions</a>	Tests if the <code>DOMEntityReference</code> is NULL
<a href="#">MAKENODE Functions</a>	Casts the <code>DOMEntityReference</code> to NULL

## 197.6.12 DBMS\_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the `DOMImplementation` subprograms of `DBMS_XMLDOM`.

**Table 197-15 Summary of DOMImplementation Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">ISNULL Functions</a>	Tests if the <code>DOMImplementation</code> node is NULL
<a href="#">HASFEATURE Function</a>	Tests if the <code>DOMImplementation</code> implements a feature

## 197.6.13 DBMS\_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the `DOMNamedNodeMap` subprograms of `DBMS_XMLDOM`.

**Table 197-16 Summary of DOMNamedNodeMap Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">GETLENGTH Functions</a>	Retrieves the number of items in the map
<a href="#">GETNAMEDITEM Function</a>	Retrieves the item specified by the name
<a href="#">ISNULL Functions</a>	Tests if the <code>NamedNodeMap</code> is NULL
<a href="#">ITEM Functions</a>	Retrieves the item given the index in the map
<a href="#">REMOVENAMEDITEM Function</a>	Removes the item specified by name
<a href="#">SETNAMEDITEM Function</a>	Sets the item in the map specified by the name

## 197.6.14 DBMS\_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the `DOMNodeList` subprograms of `DBMS_XMLDOM`.

**Table 197-17 Summary of DOMNodeList Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">FREENODELIST Procedure</a>	Frees all resources associated with a nodelist
<a href="#">GETLENGTH Functions</a>	Retrieves the number of items in the list
<a href="#">ISNULL Functions</a>	Tests if the <code>NodeList</code> is NULL
<a href="#">ITEM Functions</a>	Retrieves the item given the index in the list

## 197.6.15 DBMS\_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the `DOMNotation` subprograms of `DBMS_XMLDOM`.

**Table 197-18 Summary of DOMNotation Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">GETPUBLICID Functions</a>	Retrieves the public Id of the notation
<a href="#">GETSYSTEMID Functions</a>	Retrieves the system Id of the notation
<a href="#">ISNULL Functions</a>	Tests if the Notation is NULL
<a href="#">MAKENODE Functions</a>	Casts the notation to a node

## 197.6.16 DBMS\_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the `DOMProcessingInstruction` subprograms of `DBMS_XMLDOM`.

**Table 197-19 Summary of DOMProcessingInstruction Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">GETDATA Functions</a>	Retrieves the data of the processing instruction
<a href="#">GETTARGET Function</a>	Retrieves the target of the processing instruction
<a href="#">ISNULL Functions</a>	Tests if the Processing Instruction is NULL
<a href="#">MAKENODE Functions</a>	Casts the Processing Instruction to a node
<a href="#">SETDATA Procedures</a>	Sets the data of the processing instruction

## 197.6.17 DBMS\_XMLDOM DOMText Subprograms

This table lists and briefly describes the `DOMText` subprograms of `DBMS_XMLDOM`.

**Table 197-20 Summary of DOMText Subprograms; DBMS\_XMLDOM**

Method	Description
<a href="#">ISNULL Functions</a>	Tests if the text is NULL
<a href="#">MAKENODE Functions</a>	Casts the text to a node
<a href="#">SPLITTEXT Function</a>	Splits the contents of the text node into 2 text nodes

## 197.7 Summary of DBMS\_XMLDOM Subprograms

This table lists the `DBMS_XMLDOM` subprograms and briefly describes them.

**Table 197-21 Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">ADOPTNODE Function</a>	Adopts a node from another document	<a href="#">DOMNode Subprograms</a>
<a href="#">APPENDCHILD Function</a>	Appends a new child to the node	<a href="#">DOMNode Subprograms</a>
<a href="#">APPENDDATA Procedure</a>	Appends the specified data to the node data	<a href="#">DOMCharacterData Subprograms</a>
<a href="#">CLONENODE Function</a>	Clones the node	<a href="#">DOMNode Subprograms</a>
<a href="#">CREATEATTRIBUTE Functions</a>	Creates an Attribute	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATECDATASECTION Function</a>	Creates a <code>CDataSection</code> node	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATECOMMENT Function</a>	Creates a Comment node	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATEDOCUMENT Function</a>	Creates a new Document	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATEDOCUMENTFRAGMENT Function</a>	Creates a new Document Fragment	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATEELEMENT Functions</a>	Creates a new Element	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATEENTITYREFERENCE Function</a>	Creates an Entity reference	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATEPROCESSINGINSTRUCTION Function</a>	Creates a Processing Instruction	<a href="#">DOMDocument Subprograms</a>
<a href="#">CREATETEXTNODE Function</a>	Creates a Text node	<a href="#">DOMDocument Subprograms</a>
<a href="#">DELETEDATA Procedure</a>	Deletes the data from the specified <code>offsets</code>	<a href="#">DOMCharacterData Subprograms</a>
<a href="#">FINDENTITY Function</a>	Finds the specified entity in the document type	<a href="#">DOMDocumentType Subprograms</a>
<a href="#">FINDNOTATION Function</a>	Finds the specified notation in the document type	<a href="#">DOMDocumentType Subprograms</a>
<a href="#">FREEDOCFRAG Procedure</a>	Frees the document fragment	<a href="#">DOMDocument Subprograms</a> and <a href="#">DOMDocumentFragment Subprograms</a>
<a href="#">FREEDOCUMENT Procedure</a>	Frees the document	<a href="#">DOMDocument Subprograms</a>
<a href="#">FREEELEMENT Procedure</a>	Frees memory allocated to a <code>DOMElement</code> handle	<a href="#">DOMElement Subprograms</a>
<a href="#">FREENODE Procedure</a>	Frees all resources associated with the node	<a href="#">DOMNode Subprograms</a>
<a href="#">FREENODELIST Procedure</a>	Frees all resources associated with a <code>nodelist</code>	<a href="#">DOMNodeList Subprograms</a>
<a href="#">GETATTRIBUTE Functions</a>	Retrieves the attribute node by name	<a href="#">DOMElement Subprograms</a>
<a href="#">GETATTRIBUTENODE Functions</a>	Retrieves the attribute node by name	<a href="#">DOMElement Subprograms</a>

**Table 197-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">GETATTRIBUTES Function</a>	Retrieves the attributes of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETCHARSET Function</a>	Retrieves the charset of the DOM document	<a href="#">DOMDocument Subprograms</a>
<a href="#">GETCHILDNODES Function</a>	Retrieves the children of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETCHILDRENBYPAGENAME Functions</a>	Retrieves children of the element by tag name	<a href="#">DOMCharacterData Subprograms</a>
<a href="#">GETDATA Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the data of the node</li> <li>the data of the processing instruction</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMCharacterData Subprograms</a></li> <li><a href="#">DOMProcessingInstruction Subprograms</a></li> </ul>
<a href="#">GETDOCTYPE Function</a>	Retrieves the DTD of the document	<a href="#">DOMDocument Subprograms</a>
<a href="#">GETDOCUMENTELEMENT Function</a>	Retrieves the root element of the document	<a href="#">DOMDocument Subprograms</a>
<a href="#">GETELEMENTSBYPAGENAME Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the elements in the DOMNODELIST by tag name</li> <li>elements in the subtree of a DOMNODELIST by tagname</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMDocument Subprograms</a></li> <li><a href="#">DOMElement Subprograms</a></li> </ul>
<a href="#">GETENTITIES Function</a>	Retrieves the nodemap of entities in the Document type	<a href="#">DOMDocumentType Subprograms</a>
<a href="#">GETEXPANDEDNAME Procedure and Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the expanded name of the node</li> <li>the expanded name of the attribute</li> <li>the expanded name of the element</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMAttr Subprograms</a></li> <li><a href="#">DOMElement Subprograms</a></li> </ul>
<a href="#">GETFIRSTCHILD Function</a>	Retrieves the first child of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETIMPLEMENTATION Function</a>	Retrieves the DOM implementation	<a href="#">DOMDocument Subprograms</a>
<a href="#">GETLASTCHILD Function</a>	Retrieves the last child of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETLENGTH Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the length of the data</li> <li>the number of items in the map</li> <li>the number of items in the list</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMCharacterData Subprograms</a></li> <li><a href="#">DOMNamedNodeMap Subprograms</a></li> <li><a href="#">DOMNodeList Subprograms</a></li> </ul>

**Table 197-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">GETLOCALNAME Procedure and Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the local part of the qualified name</li> <li>the local name of the attribute</li> <li>the local name of the element</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMAttr Subprograms</a></li> <li><a href="#">DOMElement Subprograms</a></li> </ul>
<a href="#">GETNAME Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the name of the attribute</li> <li>the name of the Document type</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMAttr Subprograms</a></li> <li><a href="#">DOMDocumentType Subprograms</a></li> </ul>
<a href="#">GETNAMEDITEM Function</a>	Retrieves <ul style="list-style-type: none"> <li>an item specified by name and namespace URI )</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNamedNodeMap Subprograms</a></li> <li><a href="#">DOMNamedNodeMap Subprograms</a></li> </ul>
<a href="#">GETNAMESPACE Procedure and Functions</a>	Retrieves <ul style="list-style-type: none"> <li>the node's namespace URI</li> <li>the NS URI of the attribute</li> <li>the NS URI of the element</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMAttr Subprograms</a></li> <li><a href="#">DOMElement Subprograms</a></li> </ul>
<a href="#">GETNEXTSIBLING Function</a>	Retrieves the next sibling of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETNODENAME Function</a>	Retrieves the Name of the Node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETNODETYPE Function</a>	Retrieves the Type of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETNODEVALUE Function</a>	Retrieves the Value of the Node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a>	Retrieves the Node Value as binary stream	<a href="#">DOMNode Subprograms</a>
<a href="#">GETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a>	Retrieves the Node Value as character stream	<a href="#">DOMNode Subprograms</a>
<a href="#">GETNOTATIONNAME Function</a>	Retrieves the notation name of the entity	<a href="#">DOMEntity Subprograms</a>
<a href="#">GETNOTATIONS Function</a>	Retrieves the nodemap of the notations in the Document type	<a href="#">DOMDocumentType Subprograms</a>
<a href="#">GETTARGET Function</a>	Retrieves the target of the processing instruction	<a href="#">DOMProcessingInstruction Subprograms</a>
<a href="#">GETOWNERDOCUMENT Function</a>	Retrieves the owner document of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETOWNERELEMENT Function</a>	Retrieves the Element node, parent of the attribute	<a href="#">DOMAttr Subprograms</a>
<a href="#">GETPARENTNODE Function</a>	Retrieves the parent of this node	<a href="#">DOMNode Subprograms</a>
<a href="#">GETPREFIX Function</a>	Retrieves the namespace prefix )	<a href="#">DOMNode Subprograms</a>
<a href="#">GETPREVIOUSIBLING Function</a>	Retrieves the previous sibling of the node	<a href="#">DOMNode Subprograms</a>

**Table 197-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
GETPUBLICID Functions	Retrieves <ul style="list-style-type: none"> <li>the public ID of the document type</li> <li>the public Id of the entity</li> <li>the public Id of the notation</li> </ul>	<ul style="list-style-type: none"> <li>DOMDocumentType Subprograms</li> <li>DOMEntity Subprograms</li> <li>DOMNotation Subprograms</li> </ul>
GETQUALIFIEDNAME Functions	Retrieves <ul style="list-style-type: none"> <li>the Qualified Name of the attribute</li> <li>the qualified name of the element</li> </ul>	<ul style="list-style-type: none"> <li>DOMAttr Subprograms</li> <li>DOMElement Subprograms</li> </ul>
GETSCHEMANODE Function	Retrieves the associated schema URI	DOMNode Subprograms
GETSPECIFIED Function	Tests if attribute was specified in the element.	DOMAttr Subprograms
GETSTANDALONE Function	Retrieves the standalone property of the document	DOMDocument Subprograms
GETSYSTEMID Functions	Retrieves <ul style="list-style-type: none"> <li>the system ID of the document type</li> <li>the system Id of the entity</li> <li>the system Id of the notation</li> </ul>	<ul style="list-style-type: none"> <li>DOMDocumentType Subprograms</li> <li>DOMEntity Subprograms</li> <li>DOMNotation Subprograms</li> </ul>
GETTAGNAME Function	Retrieves the Tag name of the element	DOMElement Subprograms
GETVALUE Function	Retrieves the value of the attribute	DOMAttr Subprograms
GETVERSION Function	Retrieves the version of the document	DOMDocument Subprograms)
GETXMLTYPE Function	Retrieves the XMLType associated with the DOM Document	DOMDocument Subprograms
HASATTRIBUTES Function	Tests if the node has attributes	DOMNode Subprograms
HASATTRIBUTE Functions	Tests if an attribute exists	DOMElement Subprograms
HASCHILDNODES Function	Tests if the node has child nodes	DOMNode Subprograms
HASFEATURE Function	Tests if the DOMImplementation implements a feature	DOMImplementation Subprograms
IMPORTNODE Function	Imports a node from another document	DOMNode Subprograms
INSERTBEFORE Function	Inserts a child before the reference child	DOMNode Subprograms
INSERTDATA Procedure	Inserts the data in the node at the specified offSets	DOMCharacterData Subprograms

**Table 197-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
ISNULL Functions	Tests <ul style="list-style-type: none"> <li>• if the node is NULL</li> <li>• if the Attribute node is NULL</li> <li>• if the CDataSection is NULL</li> <li>• if the CharacterData is NULL</li> <li>• if the comment is NULL</li> <li>• if the document is NULL</li> <li>• if the DocumentFragment is NULL</li> <li>• if the Document Type is NULL</li> <li>• if the Element is NULL</li> <li>• if the Entity is NULL</li> <li>• if the DOMEntityReference is NULL</li> <li>• if the DOMImplementation node is NULL</li> <li>• if the NamedNodeMap is NULL</li> <li>• if the NodeList is NULL</li> <li>• if the Notation is NULL</li> <li>• if the Processing Instruction is NULL</li> <li>• if the text is NULL</li> </ul>	<ul style="list-style-type: none"> <li>• DOMNode Subprograms</li> <li>• DOMAttr Subprograms</li> <li>• DOMCDataSection Subprograms</li> <li>• DOMCharacterData Subprograms</li> <li>• DOMComment Subprograms</li> <li>• DOMDocument Subprograms</li> <li>• DOMDocumentFragment Subprograms</li> <li>• DOMDocumentType Subprograms</li> <li>• DOMELEMENT Subprograms</li> <li>• DOMEntity Subprograms</li> <li>• DOMEntityReference Subprograms</li> <li>• DOMImplementation Subprograms</li> <li>• DOMNamedNodeMap Subprograms</li> <li>• DOMNodeList Subprograms</li> <li>• DOMNotation Subprograms</li> <li>• DOMProcessingInstruction Subprograms</li> <li>• DOMText Subprograms</li> </ul>
ITEM Functions	Retrieves <ul style="list-style-type: none"> <li>• the item given the index in the map</li> <li>• the item given the index in the NodeList</li> </ul>	<ul style="list-style-type: none"> <li>• DOMNamedNodeMap Subprograms</li> <li>• DOMNodeList Subprograms</li> </ul>
MAKEATTR Function	Casts the node to an Attribute	DOMNode Subprograms
MAKECDATASECTION Function	Casts the node to a CData Section	DOMNode Subprograms
MAKECHARACTERDATA Function	Casts the node to Character Data	DOMNode Subprograms
MAKECOMMENT Function	Casts the node to a Comment	DOMNode Subprograms
MAKEDOCUMENT Function	Casts the node to a DOM Document	DOMNode Subprograms
MAKEDOCUMENTFRAGMENT Function	Casts the node to a DOM Document Fragment	DOMNode Subprograms)

**Table 197-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">MAKEDOCUMENTTYPE Function</a>	Casts the node to a DOM Document Type	<a href="#">DOMNode Subprograms</a>
<a href="#">MAKEELEMENT Function</a>	Casts the node to a DOM Element	<a href="#">DOMNode Subprograms</a>
<a href="#">MAKEENTITY Function</a>	Casts the node to a DOM Entity	<a href="#">DOMNode Subprograms</a>
<a href="#">MAKEENTITYREFERENCE Function</a>	Casts the node to a DOM Entity Reference	<a href="#">DOMNode Subprograms</a>
<a href="#">MAKENODE Functions</a>	Casts <ul style="list-style-type: none"> <li>• the Attribute to a node</li> <li>• the CDatasection to a node</li> <li>• the CharacterData to a node</li> <li>• the Comment to a node</li> <li>• the document to a node</li> <li>• the Document Fragment to a node</li> <li>• the document type to a node</li> <li>• the Element to a node</li> <li>• the Entity to a node</li> <li>• the DOMEntityReference to NULL</li> <li>• the notation to a node</li> <li>• the Processing Instruction to a node</li> <li>• the text to a node</li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">DOMAttr Subprograms</a></li> <li>• <a href="#">DOMCDataSection Subprograms</a></li> <li>• <a href="#">DOMCharacterData Subprograms</a></li> <li>• <a href="#">DOMComment Subprograms</a></li> <li>• <a href="#">DOMDocument Subprograms</a></li> <li>• <a href="#">DOMDocumentFragment Subprograms</a></li> <li>• <a href="#">DOMDocumentType Subprograms</a></li> <li>• <a href="#">DOMElement Subprograms</a></li> <li>• <a href="#">DOMEntity Subprograms</a></li> <li>• <a href="#">DOMEntityReference Subprograms</a></li> <li>• <a href="#">DOMNotation Subprograms</a></li> <li>• <a href="#">DOMProcessingInstruction Subprograms</a></li> <li>• <a href="#">DOMText Subprograms</a></li> </ul>
<a href="#">MAKENOTATION Function</a>	Casts the node to a DOM Notation	<a href="#">DOMNode Subprograms</a>
<a href="#">MAKEPROCESSINGINSTRUCTION Function</a>	Casts the node to a DOM Processing Instruction	<a href="#">DOMNode Subprograms</a>
<a href="#">MAKETEXT Function</a>	Casts the node to a DOM Text	<a href="#">DOMNode Subprograms</a>
<a href="#">NEWDOMDOCUMENT Functions</a>	Creates a new document	<a href="#">DOMDocument Subprograms</a>
<a href="#">NORMALIZE Procedure</a>	Normalizes the text children of the element	<a href="#">DOMElement Subprograms</a>
<a href="#">REMOVEATTRIBUTE Procedures</a>	Removes the attribute specified by the name	<a href="#">DOMElement Subprograms</a>
<a href="#">REMOVEATTRIBUTENODE Function</a>	Removes the attribute node in the element	<a href="#">DOMElement Subprograms</a>
<a href="#">REMOVECHILD Function</a>	Removes a specified child from a node	<a href="#">DOMNode Subprograms</a>

**Table 197-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">REMOVENAMEITEM Function</a>	Removes the item specified by name	<a href="#">DOMNamedNodeMap Subprograms</a>
<a href="#">REPLACECHILD Function</a>	Replaces the old child with a new child	<a href="#">DOMNode Subprograms</a>
<a href="#">REPLACEDATA Procedure</a>	Changes a range of characters in the node	<a href="#">DOMCharacterData Subprograms</a>
<a href="#">RESOLVENAMESPACEPREFIX Function</a>	Resolve the prefix to a namespace URI	<a href="#">DOMElement Subprograms</a>
<a href="#">SETATTRIBUTE Procedures</a>	Sets the attribute specified by the name	<a href="#">DOMElement Subprograms</a>
<a href="#">SETATTRIBUTENODE Functions</a>	Sets the attribute node in the element	<a href="#">DOMElement Subprograms</a>
<a href="#">SETCHARSET Procedure</a>	Sets the charset of the DOM document	<a href="#">DOMDocument Subprograms</a>
<a href="#">SETDATA Procedures</a>	Sets <ul style="list-style-type: none"> <li>the data to the node</li> <li>the data of the processing instruction</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMCharacterData Subprograms</a></li> <li><a href="#">DOMProcessingInstruction Subprograms</a></li> </ul>
<a href="#">SETDOCTYPE Procedure</a>	Sets the DTD of the document.	<a href="#">DOMDocument Subprograms</a>
<a href="#">SETNAMEITEM Function</a>	Sets the item in the map specified by the name	<a href="#">DOMNamedNodeMap Subprograms</a>
<a href="#">SETNODEVALUE Procedure</a>	Sets the Value of the node	<a href="#">DOMNode Subprograms</a>
<a href="#">SETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a>	Sets the Node Value as a binary stream	<a href="#">DOMNode Subprograms</a>
<a href="#">SETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a>	Sets the Node Value as a character stream	<a href="#">DOMNode Subprograms</a>
<a href="#">SETPREFIX Procedure</a>	Sets the namespace prefix	<a href="#">DOMNode Subprograms</a>
<a href="#">SETSTANDALONE Procedure</a>	Sets the standalone property of the document	<a href="#">DOMDocument Subprograms</a>
<a href="#">SETVALUE Procedure</a>	Sets the value of the attribute	<a href="#">DOMAttr Subprograms</a>
<a href="#">SETVERSION Procedure</a>	Sets the version of the document	<a href="#">DOMDocument Subprograms</a>
<a href="#">SPLITTEXT Function</a>	Splits the contents of the text node into 2 text nodes	<a href="#">DOMText Subprograms</a>
<a href="#">SUBSTRINGDATA Function</a>	Retrieves the substring of the data	<a href="#">DOMCharacterData Subprograms</a>
<a href="#">USEBINARYSTREAM Function</a>	Strabismus that the stream is valid for use	<a href="#">DOMNode Subprograms</a>

**Table 197-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

Subprogram	Description	Group
<a href="#">WRITETOBUFFER Procedures</a>	Writes <ul style="list-style-type: none"> <li>the contents of the node to a buffer</li> <li>the document to a buffer</li> <li>the contents of a document fragment into a buffer</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMDocument Subprograms</a></li> <li><a href="#">DOMDocumentFragment Subprograms</a></li> </ul>
<a href="#">WRITETOCLOB Procedures</a>	Writes <ul style="list-style-type: none"> <li>the contents of the node to a CLOB</li> <li>the document to a CLOB</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMDocument Subprograms</a></li> </ul>
<a href="#">WRITETOFILE Procedures</a>	Writes <ul style="list-style-type: none"> <li>the contents of the node to a file</li> <li>the document to a file</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMDocument Subprograms</a></li> </ul>

## 197.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

### See Also:

[DOMNode Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XMLDOM.ADOPTNODE (
 doc IN DOMDocument ,
 importedNode IN DOMNode)
RETURN DOMNODE;
```

### Parameters

**Table 197-22 ADOPTNODE Function Parameters**

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

### Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

## 197.7.2 APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.APPENDCHILD(
 n IN DOMNode,
 newchild IN DOMNode)
RETURN DOMNODE;
```

### Parameters

**Table 197-23 APPENDCHILD Function Parameters**

Parameter	Description
<code>n</code>	DOMNode
<code>newchild</code>	The child to be appended to the list of children of node <code>n</code>

## 197.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

**See Also:**

[DOMCharacterData Subprograms](#)

### Syntax

```
DBMS_XMLDOM.APPENDDATA(
 cd IN DOMCHARACTERDATA,
 arg IN VARCHAR2);
```

### Parameters

**Table 197-24 APPENDDATA Procedure Parameters**

Parameter	Description
<code>cd</code>	DOMCHARACTERDATA

**Table 197-24 (Cont.) APPENDDATA Procedure Parameters**

Parameter	Description
arg	The data to append to the existing data

## 197.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is `NULL`.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CLONENODE (
 n IN DOMNODE,
 deep IN BOOLEAN)
RETURN DOMNODE;
```

### Parameters

**Table 197-25 CLONENODE Function Parameters**

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

### Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is `TRUE`).
- Cloning any other type of node simply returns a copy of this node.

## 197.7.5 CREATEATTRIBUTE Functions

This function creates a `DOMATTR` node.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

Creates a `DOMATTR` with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
 doc IN DOMDOCUMENT,
 name IN VARCHAR2)
RETURN DOMATTR;
```

Creates a `DOMATTR` with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
 doc IN DOMDOCUMENT,
 qname IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMATTR;
```

### Parameters

**Table 197-26 CREATEATTRIBUTE Function Parameters**

Parameter	Description
<code>doc</code>	<code>DOMDOCUMENT</code>
<code>qname</code>	New attribute qualified name
<code>ns</code>	Namespace

## 197.7.6 CREATECDATASECTION Function

This function creates a `DOMCDATASECTION` node.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(
 doc IN DOMDOCUMENT,
 data IN VARCHAR2)
RETURN DOMCDATASECTION;
```

## Parameters

**Table 197-27 CREATECDATASECTION Function Parameters**

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

## 197.7.7 CREATECOMMENT Function

This function creates a DOMCOMMENT node.

### See Also:

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
 doc IN DOMDOCUMENT,
 data IN VARCHAR2)
RETURN DOMCOMMENT;
```

## Parameters

**Table 197-28 CREATECOMMENT Function Parameters**

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

## 197.7.8 CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

### See Also:

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
 namespaceURI IN VARCHAR2,
 qualifiedName IN VARCHAR2,
```

```
doctype IN DOMTYPE := NULL)
RETURN DOMDOCUMENT;
```

### Parameters

**Table 197-29** CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

## 197.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

 **See Also:**  
[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT (
 doc IN DOMDOCUMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

### Parameters

**Table 197-30** CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

## 197.7.10 CREATEELEMENT Functions

This function creates a DOMELEMENT.

 **See Also:**  
[DOMDocument Subprograms](#)

### Syntax

Creates a DOMELEMENT with specified name:

```
DBMS_XMLDOM.CREATEELEMENT (
 doc IN DOMDOCUMENT,
```

```

 tagName IN VARCHAR2)
RETURN DOMELEMENT;
```

Creates a DOMELEMENT with specified name and namespace URI:

```

DBMS_XMLDOM.CREATEELEMENT(
 doc IN DOMDOCUMENT,
 tagName IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMELEMENT;
```

### Parameters

**Table 197-31 CREATEELEMENT Function Parameters**

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

## 197.7.11 CREATEENTITYREFERENCE Function

This function creates a DUMENTITYREFERENCE node.

 **See Also:**  
[DOMDocument Subprograms](#)

### Syntax

```

DBMS_XMLDOM.CREATEENTITYREFERENCE(
 doc IN DOMDOCUMENT,
 name IN VARCHAR2)
RETURN DUMENTITYREFERENCE;
```

### Parameters

**Table 197-32 CREATEENTITYREFERENCE Function Parameters**

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

## 197.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a `DOMPROCESSINGINSTRUCTION` node.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
 doc IN DOMDocument,
 target IN VARCHAR2,
 data IN VARCHAR2)
RETURN DOMPROCESSINGINSTRUCTION;
```

### Parameters

**Table 197-33** CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
<code>doc</code>	DOMDOCUMENT
<code>target</code>	Target of the new processing instruction
<code>data</code>	Content data of the new processing instruction

## 197.7.13 CREATETEXTNODE Function

This function creates a `DOMTEXT` node.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
 doc IN DOMDocument,
 data IN VARCHAR2)
RETURN DOMTEXT;
```

### Parameters

**Table 197-34** CREATETEXTNODE Function Parameters

Parameter	Description
<code>doc</code>	DOMDOCUMENT

**Table 197-34 (Cont.) CREATETEXTNODE Function Parameters**

Parameter	Description
data	Content of the DOMText node

## 197.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

### See Also:

[DOMCharacterData Subprograms](#)

### Syntax

```
DBMS_XMLDOM.DELETEDATA(
 cd IN DOMCHARACTERDATA,
 offset IN NUMBER,
 cnt IN NUMBER);
```

### Parameters

**Table 197-35 DELETEDATA PROCEDURE Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

## 197.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

### See Also:

[DOMDocumentType Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FINDENTITY(
 dt IN DOMDOCUMENTTYPE,
 name IN VARCHAR2,
 par IN BOOLEAN)
RETURN DUMENTITY;
```

## Parameters

**Table 197-36** FINDENTITY Function Parameters

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

## 197.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

**See Also:**

[DOMDocumentType Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FINDNOTATION(
 dt IN DOMDocumentType,
 name IN VARCHAR2)
RETURN DOMNOTATION;
```

### Parameters

**Table 197-37** FINDNOTATION Function Parameters

Parameter	Description
dt	The DTD
name	The notation to find

## 197.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

**See Also:**

[DOMDocument Subprograms](#) and [DOMDocumentFragment Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(
 df IN DOMDOCUMENTFRAGMENT);
```

## Parameters

**Table 197-38 FREEDOCFRAG Procedure Parameters**

Parameter	Description
df	DOM document fragment

## 197.7.18 FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

 **See Also:**  
[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(
 doc IN DOMDOCUMENT);
```

### Parameters

**Table 197-39 FREEDOCUMENT Procedure Parameters**

Parameter	Description
doc	DOMDOCUMENT

## 197.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a DOMELEMENT handle.

 **See Also:**  
[DBMS\\_XMLDOM DOMELEMENT Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FREEELEMENT(
 elem IN DOMELEMENT);
```

## Parameters

**Table 197-40 FREEELEMENT Procedure Parameters**

Parameter	Description
elem	Of type DOMELEMENT

## 197.7.20 FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FREENODE(
 n IN DOMNODE);
```

### Parameters

**Table 197-41 FREENODE Procedure Parameters**

Parameter	Description
n	DOMNODE

## 197.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

 **See Also:**  
[DBMS\\_XMLDOM DOMNodeList Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FREENODELIST(
 nl IN DOMNodeList);
```

## Parameters

**Table 197-42 FREENODELIST Procedure Parameters**

Parameter	Description
nl	Of type DOMNODELIST

## 197.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of an `DOMELEMENT` by name.

 **See Also:**  
[DOMElement Subprograms](#)

### Syntax

Returns the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN VARCHAR2;
```

Returns the value of a `DOMELEMENT`'s attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 197-43 GETATTRIBUTE Function Parameters**

Parameter	Description
elem	The <code>DOMELEMENT</code>
name	Attribute name
ns	Namespace

## 197.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the `DOMELEMENT` by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### See Also:

[DOMElement Subprograms](#)

### Syntax

Returns an attribute node from the `DOMELEMENT` by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the `DOMELEMENT` by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMATTR;
```

### Parameters

**Table 197-44** GETATTRIBUTENODE Function Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name; * matches any attribute
<code>ns</code>	Namespace

## 197.7.24 GETATTRIBUTES Function

This function retrieves a `NAMEDNODEMAP` containing the attributes of this node (if it is an Element) or `NULL` otherwise.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETATTRIBUTES (
 n IN DOMNode)
RETURN DOMNAMEDNODEMAP;
```

### Parameters

**Table 197-45** GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNode

## 197.7.25 GETCHARSET Function

This function retrieves the charset of the DOM document.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETCHARSET (
 doc IN DOMDocument)
RETURN VARCHAR2;
```

### Parameters

**Table 197-46** GETCHARSET Function Parameters

Parameter	Description
doc	DOM document

### Usage Notes

For a newly parsed document, we return the database charset. Once the SETCHARSET Procedure is called with a non-NULL value for charset, that charset is returned.

## 197.7.26 GETCHILDNODES Function

This function retrieves a `DOMNODELIST` that contains all children of this node. If there are no children, this is a `DOMNODELIST` containing no nodes.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETCHILDNODES (
 n IN DOMNode)
RETURN DOMNodeList;
```

### Parameters

**Table 197-47 GETCHILDNODES Function Parameters**

Parameter	Description
n	DOMNODE

## 197.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

### See Also:

[DOMElement Subprograms](#)

### Syntax

Returns children of the `DOMELEMENT` given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMElement,
 name IN VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
 elem IN DOMElement,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODELIST;
```

## Parameters

**Table 197-48** GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	DOMELEMENT
name	Tag name
ns	Namespace

## 197.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Gets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETDATA(
 cd IN DOMCHARACTERDATA)
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.GETDATA(
 pi IN DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

### Parameters

**Table 197-49** GETDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
pi	The DOMPROCESSINGINSTRUCTION

## 197.7.29 GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETDOCTYPE (
 doc IN DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

### Parameters

**Table 197-50** GETDOCTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

## 197.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT (
 doc IN DOMDOCUMENT)
RETURN DOMELEMENT;
```

### Parameters

**Table 197-51** GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

## 197.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
 doc IN DOMDOCUMENT,
 tagname IN VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name and namespace (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODELIST;
```

### Parameters

**Table 197-52** GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

## 197.7.32 GETENTITIES Function

This function retrieves a `DOMNAMEDNODEMAP` containing the general entities, both external and internal, declared in the DTD.

**See Also:**

[DOMDocumentType Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETENTITIES(
 dt IN DOMDocumentType)
RETURN DOMNAMEDNODEMAP;
```

### Parameters

**Table 197-53** GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

## 197.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Retrieves the expanded name of the `Node` if it is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: [DOMNode Subprograms](#))

```
DBMS_XMLDOM.GETEXPANDEDNAME(
 n IN DOMNODE
 data OUT VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
 a IN DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 197-54** GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned expanded name of the Node
a	DOMATTR
elem	DOMELEMENT

## 197.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns `NULL`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(
 n IN DOMNODE)
RETURN DOMNODE;
```

## Parameters

**Table 197-55 GETFIRSTCHILD Function Parameters**

Parameter	Description
n	DOMNODE

## 197.7.35 GETIMPLEMENTATION Function

This function returns the `DOMIMPLEMENTATION` object that handles this `DOMDOCUMENT`.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(
 doc IN DOMDOCUMENT)
RETURN DOMIMPLEMENTATION;
```

## Parameters

**Table 197-56 GETIMPLEMENTATION Function Parameters**

Parameter	Description
doc	DOMDOCUMENT

## 197.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns `NULL`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
 n IN DOMNODE)
RETURN DOMNODE;
```

## Parameters

**Table 197-57 GETLASTCHILD Function Parameters**

Parameter	Description
n	DOMNODE

## 197.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH(
 cd IN DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH(
 nnm IN DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH(
 nl IN DOMNODELIST)
RETURN NUMBER;
```

## Parameters

**Table 197-58 GETLENGTH Function Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
nnm	DOMNAMEDNODEMAP
nl	DOMNODELIST

## 197.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

### Syntax

Retrieves the local part of the node's qualified name (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME(
 n IN DOMNODE,
 data OUT VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME(
 a IN DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 197-59 GETLOCALNAME Procedure and Function Parameters**

Parameter	Description
n	DOMNode
data	Returned local name.
a	DOMAttr.
elem	DOMElement.

## 197.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

### Syntax

Returns the name of this attribute (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAME(
 a IN DOMATTR)
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETNAME(
 dt IN DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

## Parameters

**Table 197-60 GETNAME Function Parameters**

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

## 197.7.40 GETNAMEDITEM Function

GETNAMEDITEM retrieves a node specified by name.

### See Also:

[DOMNamedNodeMap Subprograms](#)

## Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2)
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNODE;
```

## Parameters

**Table 197-61 GETNAMEDITEM Function Parameters**

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

## 197.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

### Syntax

Retrieves the namespace URI associated with the node (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(
 n IN DOMNODE,
 data OUT VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(
 a IN DOMATTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 197-62 GETNAMESPACE Procedure and Function Parameters**

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

## 197.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(
 n IN DOMNODE)
RETURN DOMNode;
```

**Parameters**

**Table 197-63 GETNEXTSIBLING Function Parameters**

Parameter	Description
n	DOMNODE

### 197.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

 **See Also:**  
[DOMNode Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.GETNODETYPE (
 n IN DOMNODE)
RETURN NUMBER;
```

**Parameters**

**Table 197-64 GETNODETYPE Function Parameters**

Parameter	Description
n	DOMNODE

### 197.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

 **See Also:**  
[DOMNode Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.GETNODENAME (
 n IN DOMNODE)
RETURN VARCHAR2;
```

## Parameters

**Table 197-65** GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

## 197.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNODEVALUE (
 n IN DOMNODE)
RETURN VARCHAR2; *
```

### Parameters

**Table 197-66** GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

## 197.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
 n IN DOMNODE)
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of SYS.UTL\_BINARYOUTPUTSTREAM into which XDB writes the contents of the node. The datatype of the node must be RAW or CLOB – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
 n in DOMNODE,
 value in SYS.UTL_BINARYOUTPUTSTREAM);
```

### Parameters

**Table 197-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters**

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

## 197.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

This function returns an instance of the PL/SQL XMLCharacterInputStream. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
 n IN DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the SYS.UTL\_CHARACTEROUTPUTSTREAM.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
 n IN DOMNODE,
 value IN SYS.UTL_CHARACTEROUTPUTSTREAM);
```

### Parameters

**Table 197-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters**

Parameter	Description
n	DOMNODE

**Table 197-68 (Cont.) GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters**

Parameter	Description
value	CHARACTEROUTPUTSTREAM

## 197.7.48 GETNOTATIONNAME Function

This function returns the notation name of the `DOMENTITY`.

 **See Also:**  
[DOMEntity Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME (
 ent IN DOMENTITY)
RETURN VARCHAR2;
```

### Parameters

**Table 197-69 GETNOTATIONNAME Function Parameters**

Parameter	Description
ent	DOMENTITY

## 197.7.49 GETNOTATIONS Function

This function retrieves a `DOMNAMEDNODEMAP` containing the notations declared in the DTD.

 **See Also:**  
[DOMDocumentType Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNOTATIONS (
 dt IN DOMDOCUMENTTYPE)
RETURN DOMNAMEDNODEMAP;
```

## Parameters

**Table 197-70 GETNOTATIONS Function Parameters**

Parameter	Description
dt	DOMDOCUMENTTYPE

## 197.7.50 GETTARGET Function

This function returns the target of the `DOMPROCESSINGINSTRUCTION`.

**See Also:**

[DOMProcessingInstruction Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETTARGET(
 pi IN DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

## Parameters

**Table 197-71 GETTARGET Function Parameters**

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

## 197.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is `NULL`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
 n IN DOMNODE)
RETURN DOMDOCUMENT;
```

## Parameters

**Table 197-72** GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

## 197.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

 **See Also:**  
[DOMAttr Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(
 a IN DOMATTR)
RETURN DOMELEMENT;
```

### Parameters

**Table 197-73** GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

## 197.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETPARENTNODE(
 n IN DOMNODE)
RETURN DOMNODE;
```

## Parameters

**Table 197-74** GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

## 197.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETPREFIX(
 n IN DOMNODE)
RETURN VARCHAR2;
```

## Parameters

**Table 197-75** GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

## 197.7.55 GETPREVIOUSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETPREVIOUSIBLING(
 n IN DOMNODE)
RETURN DOMNODE;
```

## Parameters

**Table 197-76** GETPREVIOUSIBLING Function Parameters

Parameter	Description
n	DOMNODE

## 197.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the public identifier of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID(
 dt IN DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID(
 ent IN DOMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID(
 n IN DOMNOTATION)
RETURN VARCHAR2;
```

### Parameters

**Table 197-77** GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

## 197.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the qualified name of the `DOMATTR` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (
 a IN DOMATTR)
RETURN VARCHAR2;
```

Returns the qualified name of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 197-78** GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

## 197.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETSCHEMANODE (
 n IN DOMNODE)
RETURN DOMNODE;
```

### Parameters

**Table 197-79** GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

## 197.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

### See Also:

[DOMAttr Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.GETSPECIFIED(
 a IN DOMATTR)
RETURN BOOLEAN;
```

**Parameters****Table 197-80** GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

## 197.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the `DOMDOCUMENT`.

**See Also:**

[DOMDocument Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.GETSTANDALONE(
 doc IN DOMDOCUMENT)
RETURN VARCHAR2;
```

**Parameters****Table 197-81** GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

## 197.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Returns the system id of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID(
 dt IN DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID(
 ent IN DONENTITY)
RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID(
 n IN DOMNOTATION)
RETURN VARCHAR2;
```

### Parameters

**Table 197-82** GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

## 197.7.62 GETTAGNAME Function

This function returns the name of the DOMELEMENT.

### See Also:

[DOMELEMENT Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETTAGNAME(
 elem IN DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 197-83** GETTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT

## 197.7.63 GETVALUE Function

This function retrieves the value of the attribute.

 **See Also:**  
[DOMAttr Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETVALUE (
 a IN DOMATTR)
RETURN VARCHAR2;
```

### Parameters

**Table 197-84** GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

## 197.7.64 GETVERSION Function

This function returns the version of the DOMDOCUMENT.

 **See Also:**  
[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETVERSION(
 doc IN DOMDOCUMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 197-85** GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

## 197.7.65 GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

### See Also:

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETXMLTYPE(
 doc IN DOMDOCUMENT)
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 197-86** GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

## 197.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

### See Also:

[DOMElement Subprograms](#)

### Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 197-87 HASATTRIBUTE Function Parameters**

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

## 197.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.HASATTRIBUTES (
 n IN DOMNODE)
RETURN BOOLEAN;
```

### Parameters

**Table 197-88 HASATTRIBUTES Function Parameters**

Parameter	Description
n	DOMNODE

## 197.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.HASCHILDNODES (
 n IN DOMNODE)
RETURN BOOLEAN;
```

## Parameters

**Table 197-89 HASCHILDNODES Function Parameters**

Parameter	Description
n	DOMNODE

## 197.7.69 HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

 **See Also:**  
[DOMImplementation Subprograms](#)

### Syntax

```
DBMS_XMLDOM.HASFEATURE(
 di IN DOMIMPLEMENTATION,
 feature IN VARCHAR2,
 version IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 197-90 HASFEATURE Function Parameters**

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

## 197.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.IMPORTNODE(
 doc IN DOMDOCUMENT,
 importedNode IN DOMNODE,
```

```

 deep IN BOOLEAN)
RETURN DOMNODE;
```

## Parameters

**Table 197-91** IMPORTNODE Function Parameters

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. <ul style="list-style-type: none"> <li>If this value is <code>TRUE</code>, the entire subtree of the node will be imported with the node.</li> <li>If this value is <code>FALSE</code>, only the node itself will be imported.</li> </ul>

## Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

## 197.7.71 INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

**See Also:**

[DOMNode Subprograms](#)

## Syntax

```

DBMS_XMLDOM.INSERTBEFORE(
 n IN DOMNODE,
 newchild IN DOMNODE,
 refchild IN DOMNODE)
RETURN DOMNode;
```

## Parameters

**Table 197-92** INSERTBEFORE Function Parameters

Parameter	Description
n	DOMNode
newChild	The child to be inserted in the DOMNODE
refChild	The reference node before which the newchild is to be inserted

## 197.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

**See Also:**

[DOMCharacterData Subprograms](#)

### Syntax

```
DBMS_XMLDOM.INSERTDATA(
 cd IN DOMCHARACTERDATA,
 offset IN NUMBER,
 arg IN VARCHAR2);
```

### Parameters

**Table 197-93 INSERTDATA Procedure Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

## 197.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 n IN DOMNODE)
RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 a IN DOMATTR)
RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCDATASection Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 cds IN DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 cd IN DOMCHARACTERDATA)
RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMComment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 com IN DOMCOMMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 doc IN DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 df IN DOMDOCUMENTFRAGMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 dt IN DOMDOCUMENTTYPE)
RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 elem IN DOMELEMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 ent IN DOMENTITY)
RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 EREF IN DOMENTITYREFERENCE)
RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: [DOMImplementation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 di IN DOMIMPLEMENTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 nnm IN DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 nl IN DOMNODELIST)
RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 n IN DOMNOTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 pi IN DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.ISNULL(
 t IN DOMTEXT)
RETURN BOOLEAN;
```

## Parameters

**Table 197-94 ISNULL Function Parameters**

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check

**Table 197-94 (Cont.) ISNULL Function Parameters**

Parameter	Description
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

## 197.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ITEM(
 nnm IN DOMNAMEDNODEMAP,
 index IN NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ITEM(
 nl IN DOMNODELIST,
 index IN NUMBER)
RETURN DOMNODE;
```

### Parameters

**Table 197-95 ITEM Function Parameters**

Parameter	Description
nnm	DOMNAMEDNODEMAP
index	The index in the node map at which the item is to be retrieved
nl	DOMNODELIST
index	The index in the <code>NodeList</code> used to retrieve the item

## 197.7.75 MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEATTR (
 n IN DOMNODE)
RETURN DOMATTR;
```

### Parameters

**Table 197-96 MAKEATTR Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.76 MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKECDATASECTION(
 n IN DOMNODE)
RETURN DOMCDATASECTION;
```

### Parameters

**Table 197-97 MAKECDATASECTION Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.77 MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA(
 n IN DOMNode)
RETURN DOMCharacterData;
```

### Parameters

**Table 197-98 MAKECHARACTERDATA Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.78 MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKECOMMENT(
 n IN DOMNODE)
RETURN DOMCOMMENT;
```

### Parameters

**Table 197-99 MAKECOMMENT Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.79 MAKEDOCUMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENT`, and returns the `DOMDOCUMENT`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT(
 n IN DOMNODE)
RETURN DOMDocument;
```

### Parameters

**Table 197-100 MAKEDOCUMENT Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTFRAGMENT`, and returns the `DOMDOCUMENTFRAGMENT`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
 n IN DOMNODE)
RETURN DOMDOCUMENTFRAGMENT;
```

### Parameters

**Table 197-101 MAKEDOCUMENTFRAGMENT Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE (
 n IN DOMNODE)
RETURN DOMDOCUMENTTYPE;
```

### Parameters

**Table 197-102 MAKEDOCUMENTTYPE Function Parameters**

Parameter	Description
n	DOMNODE to cast.

## 197.7.82 MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEELEMENT (
 n IN DOMNODE)
RETURN DOMELEMENT;
```

### Parameters

**Table 197-103 MAKEELEMENT Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.83 MAKEENTITY Function

This function casts a specified DOMNODE to a DUMENTITY, and returns the DUMENTITY.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEENTITY(
 n IN DOMNODE)
RETURN DUMENTITY;
```

### Parameters

**Table 197-104 MAKEENTITY Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.84 MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DUMENTITYREFERENCE, and returns the DUMENTITYREFERENCE.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(
 n IN DOMNODE)
RETURN DUMENTITYREFERENCE;
```

### Parameters

**Table 197-105 MAKEENTITYREFERENCE Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.85 MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 a IN DOMATTR)
RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: [DOMCDATASection Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 cds IN DOMCDATASECTION)
RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 cd IN DOMCHARACTERDATA)
RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMComment Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 com IN DOMCOMMENT)
RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 doc IN DOMDOCUMENT)
RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 df IN DOMDOCUMENTFRAGMENT)
RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 dt IN DOMDOCUMENTTYPE)
RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 elem IN DOMELEMENT)
RETURN DOMNODE;
```

Casts specified `DOMENTITY` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 ent IN DOMENTITY)
RETURN DOMNODE;
```

Casts the `DOMENTITYREFERENCE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 eref IN DOMENTITYREFERENCE)
RETURN DOMNODE;
```

Casts the `DOMNOTATION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 n IN DOMNOTATION)
RETURN DOMNODE;
```

Casts the `DOMPROCESSINGINSTRUCTION` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 pi IN DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;
```

Casts the `DOMTEXT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
 t IN DOMTEXT)
RETURN DOMNODE;
```

## Parameters

**Table 197-106** MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast

**Table 197-106 (Cont.) MAKENODE Function Parameters**

Parameter	Description
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast
t	DOMTEXT to cast

## 197.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKENOTATION(
 n IN DOMNODE)
RETURN DOMNOTATION;
```

### Parameters

**Table 197-107 MAKENOTATION Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
 n IN DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;
```

## Parameters

**Table 197-108 MAKEPROCESSINGINSTRUCTION Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.88 MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKETEXT(
 n IN DOMNODE)
RETURN DOMTEXT;
```

### Parameters

**Table 197-109 MAKETEXT Function Parameters**

Parameter	Description
n	DOMNODE to cast

## 197.7.89 NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
 xmlDoc IN SYS.XMLTYPE)
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
 c1 IN CLOB)
 RETURN DOMDOCUMENT;
```

### Parameters

**Table 197-110 NEWDOMDOCUMENT Function Parameters**

Parameter	Description
xmlDoc	XMLType source for the DOMDOCUMENT
c1	CLOB source for the DOMDOCUMENT

## 197.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

**See Also:**

[DOMELEMENT Subprograms](#)

### Syntax

```
DBMS_XMLDOM.NORMALIZE(
 elem IN DOMELEMENT);
```

### Parameters

**Table 197-111 NORMALIZE Procedure Parameters**

Parameter	Description
elem	The DOMELEMENT

## 197.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

**See Also:**

[DOMELEMENT Subprograms](#)

## Syntax

Removes the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2);
```

Removes the value of a `DOMELEMENT`'s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 ns IN VARCHAR2);
```

## Parameters

**Table 197-112 REMOVEATTRIBUTE Procedure Parameters**

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name
<code>ns</code>	Namespace

## 197.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the `DOMELEMENT`. The method returns the removed node.

**See Also:**

[DOMElement Subprograms](#)

## Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
 elem IN DOMELEMENT,
 oldAttr IN DOMATTR)
RETURN DOMAttr;
```

## Parameters

**Table 197-113 REMOVEATTRIBUTENODE Function Parameters**

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code> .
<code>oldAttr</code>	The old <code>DOMATTR</code> .

## 197.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.REMOVECHILD(
 n IN DOMNode,
 oldchild IN DOMNode)
RETURN DOMNODE;
```

### Parameters

**Table 197-114 REMOVECHILD Function Parameters**

Parameter	Description
<code>n</code>	DOMNODE
<code>oldChild</code>	The child of the node <code>n</code> to be removed

## 197.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

**See Also:**

[DOMNamedNodeMap Subprograms](#)

### Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
 nnm IN DOMNamedNodeMap,
 name IN VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
 nnm IN DOMNamedNodeMap,
 name IN VARCHAR2,
 ns IN VARCHAR2)
RETURN DOMNode;
```

### Parameters

**Table 197-115** REMOVENAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

## 197.7.95 REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.REPLACECHILD(
 n IN DOMNode,
 newchild IN DOMNode,
 oldchild IN DOMNode)
RETURN DOMNode;
```

### Parameters

**Table 197-116** REPLACECHILD Function Parameters

Parameter	Description
n	DOMNode
newchild	The new child which is to replace the old child
oldchild	The child of the node n which is to be replaced

## 197.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

 **See Also:**

[DOMCharacterData Subprograms](#)

### Syntax

```
DBMS_XMLDOM.REPLACEDATA(
 cd IN DOMCHARACTERDATA,
 offset IN NUMBER,
 cnt IN NUMBER,
 arg IN VARCHAR2);
```

### Parameters

**Table 197-117** REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

## 197.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

 **See Also:**

[DOMElement Subprograms](#)

### Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
 elem IN DOMELEMENT,
 prefix IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 197-118 RESOLVENAMESPACEPREFIX Function Parameters**

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

## 197.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT's attribute by name.

### See Also:

[DOMELEMENT Subprograms](#)

### Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 newvalue IN VARCHAR2);
```

Sets the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
 elem IN DOMELEMENT,
 name IN VARCHAR2,
 newvalue IN VARCHAR2,
 ns IN VARCHAR2);
```

### Parameters

**Table 197-119 SETATTRIBUTE Procedure Parameters**

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

## 197.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the `DOMELEMENT`.

**See Also:**

[DOMElement Subprograms](#)

### Syntax

Adds a new attribute node to the `DOMELEMENT`:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
 elem IN DOMELEMENT,
 newAttr IN DOMATTR)
RETURN DOMATTR;
```

Adds a new attribute node to the `DOMElement`; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
 elem IN DOMELEMENT,
 newAttr IN DOMATTR,
 ns IN VARCHAR2)
RETURN DOMATTR;
```

### Parameters

**Table 197-120 SETATTRIBUTENODE Function Parameters**

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>newAttr</code>	The new <code>DOMATTR</code>
<code>ns</code>	The namespace

## 197.7.100 SETCHARSET Procedure

This function sets the character set of the DOM document.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.SETCHARSET(
 doc IN DOMDocument,
 charset IN VARCHAR2);
```

## Parameters

**Table 197-121 SETCHARSET Procedure Parameters**

Parameter	Description
doc	DOM document
charset	Character set

## Usage Notes

This is used for [WRITETOFILE Procedures](#) if not explicitly specified at that time.

## 197.7.101 SETDATA Procedures

This overloaded procedure sets character data or DOMPROCESSINGINSTRUCTION content data. The specific functionality is described in the syntax declarations.

### Syntax

Sets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.SETDATA(
 cd IN DOMCHARACTERDATA,
 data IN VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.SETDATA(
 pi IN DOMPROCESSINGINSTRUCTION,
 data IN VARCHAR2);
```

## Parameters

**Table 197-122 SETDATA Procedure Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

## 197.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the [GETDOCTYPE Function](#).

## Syntax

```
DBMS_XMLDOM.SETDOCTYPE(
 doc IN DOMDocument,
 name IN VARCHAR2,
 sysid IN VARCHAR2,
 pubid IN VARCHAR2);
```

## Parameters

**Table 197-123 SETDOCTYPE Procedure Parameters**

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

## 197.7.103 SETNAMEDITEM Function

This function adds a node using its `nodeName` attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `nodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

### See Also:

[DOMNamedNodeMap Subprograms](#)

## Syntax

Adds a node using its `nodeName` attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 arg IN DOMNODE)
RETURN DOMNode;
```

Adds a node using its `nodeName` attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(
 nnm IN DOMNAMEDNODEMAP,
 arg IN DOMNODE,
 ns IN VARCHAR2)
RETURN DOMNode;
```

## Parameters

**Table 197-124 SETNAMEDITEM Function Parameters**

Parameter	Description
nm	DOMNAMEDNODEMAP
arg	The Node to be added using its nodeName attribute
ns	Namespace

## 197.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.SETNODEVALUE (
 n IN DOMNODE,
 nodeValue IN VARCHAR2);
```

### Parameters

**Table 197-125 SETNODEVALUE Procedure Parameters**

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

## 197.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

**See Also:**

[DOMNode Subprograms](#)

## Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
 n IN DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
 n in DOMNODE,
 value in SYS.UTL_BINARYINPUTSTREAM);
```

## Parameters

**Table 197-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters**

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

## 197.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

 **See Also:**  
[DOMNode Subprograms](#)

## Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
 n IN DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The

datatype of the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
 n IN DOMNODE,
 value IN SYS.UTL_CHARACTERINPUTSTREAM);
```

### Parameters

**Table 197-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters**

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

## 197.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.SETPREFIX(
 n IN DOMNODE,
 prefix IN VARCHAR2);
```

### Parameters

**Table 197-128 SETPREFIX Procedure Parameters**

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

## 197.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

### See Also:

[DOMDocument Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.SETSTANDALONE (
 doc IN DOMDOCUMENT,
 newvalue IN VARCHAR2);
```

**Parameters****Table 197-129 SETSTANDALONE Procedure Parameters**

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

## 197.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

 **See Also:**  
[DOMAttr Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.SETVALUE (
 a IN DOMATTR,
 value IN VARCHAR2);
```

**Parameters****Table 197-130 SETVALUE Procedure Parameters**

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

## 197.7.110 SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

 **See Also:**  
[DOMDocument Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.SETVERSION(
 doc IN DOMDOCUMENT,
 version IN VARCHAR2);
```

**Parameters****Table 197-131 SETVERSION Procedure Parameters**

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

## 197.7.111 SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

**See Also:**

[DBMS\\_XMLDOM DOMText Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.SPLITTEXT(
 t IN DOMTEXT,
 offset IN NUMBER)
RETURN DOMText;
```

**Parameters****Table 197-132 SPLITTEXT Function Parameters**

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

## 197.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

**See Also:**

[DOMCharacterData Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.SUBSTRINGDATA (
 cd IN DOMCHARACTERDATA,
 offset IN NUMBER,
 cnt IN NUMBER)
RETURN VARCHAR2;
```

**Parameters****Table 197-133 SUBSTRINGDATA Function Parameters**

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

## 197.7.113 USEBINARYSTREAM Function

This function returns `TRUE` if the datatype of the node is `RAW` or `BLOB`, so that the node value may be read or written using an `UTL_BINARYINPUTSTREAM` or `UTL_BINARYOUTPUTSTREAM`.

If a value of `FALSE` is returned, the node value may only be accessed through an `UTL_CHARACTERINPUTSTREAM` or `UTL_CHARACTEROUTPUTSTREAM`.

**See Also:**[DOMNode Subprograms](#)**Syntax**

```
DBMS_XMLDOM.USEBINARYSTREAM (
 n IN DOMNODE)
RETURN BOOLEAN;
```

**Parameters****Table 197-134 USEBINARYSTREAM Function Parameters**

Parameter	Description
n	DOMNODE

## 197.7.114 WRITETOBUFFER Procedures

WRITETOBUFFER is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified buffer using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
 n IN DOMNODE,
 buffer IN OUT VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
 doc IN DOMDOCUMENT,
 buffer IN OUT VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER (
 df IN DOMDOCUMENTFRAGMENT,
 buffer IN OUT VARCHAR2);
```

### Parameters

**Table 197-135 WRITETOBUFFER Procedure Parameters**

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

## 197.7.115 WRITETOCLOB Procedures

WRITETOCLOB is an overloaded procedure that writes an XML node or document to a specified CLOB.

The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified CLOB using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB(
 n IN DOMNODE,
 cl IN OUT CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB(
 doc IN DOMDOCUMENT,
 cl IN OUT CLOB);
```

### Parameters

**Table 197-136 WRITETOCLOB Procedure Parameters**

Parameter	Description
n	DOMNODE
cl	CLOB to which to write
doc	DOMDOCUMENT

## 197.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node.

The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified file using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE(
 n IN DOMNODE,
 fileName IN VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE(
 n IN DOMNODE,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE(
 doc IN DOMDOCUMENT,
 filename IN VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE(
 doc IN DOMDOCUMENT,
 fileName IN VARCHAR2,
 charset IN VARCHAR2);
```

## Parameters

**Table 197-137** WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE
fileName	File to which to write. The filename should be in the format of database_directory_object_name/filename, for example mydir/filename (on windows, use \ instead of /).
charset	specified character set
doc	DOMDOCUMENT
charset	Character set

# DBMS\_XMLGEN

The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- [Security Model](#)
- [Summary of DBMS\\_XMLGEN Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using `DBMS_XMLGEN`

## 198.1 DBMS\_XMLGEN Security Model

Owned by `XDB`, the `DBMS_XMLGEN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 198.2 Summary of DBMS\_XMLGEN Subprograms

This table lists the `DBMS_XMLGEN` subprograms and briefly describes them.

**Table 198-1 Summary of DBMS\_XMLGEN Package Subprograms**

Subprogram	Description
<a href="#">CLOSECONTEXT Procedure</a>	Closes the context and releases all resources
<a href="#">CONVERT Functions</a>	Converts the XML into the escaped or unescaped XML equivalent
<a href="#">GETNUMROWSPROCESSED Function</a>	Gets the number of SQL rows that were processed in the last call to <a href="#">GETXML Functions</a>
<a href="#">GETXML Functions</a>	Gets the XML document
<a href="#">GETXMLTYPE Functions</a>	Gets the XML document and returns it as <code>XMLType</code>
<a href="#">NEWCONTEXT Functions</a>	Creates a new context handle

**Table 198-1 (Cont.) Summary of DBMS\_XMLGEN Package Subprograms**

Subprogram	Description
<a href="#">NEWCONTEXTFROMHIERARCHY Function</a>	Obtains a handle to use in the <a href="#">GETXML Functions</a> and other functions to get a hierarchical XML with recursive elements from the result
<a href="#">RESTARTQUERY Procedure</a>	Restarts the query to start fetching from the beginning
<a href="#">SETCONVERTSPECIALCHARS Procedure</a>	Sets whether special characters such as \$, which are non-XML characters, should be converted or not to their escaped representation
<a href="#">SETMAXROWS Procedure</a>	Sets the maximum number of rows to be fetched each time
<a href="#">SETNULLHANDLING Procedure</a>	Sets NULL handling options
<a href="#">SETROWSETTAG Procedure</a>	Sets the name of the element enclosing the entire result
<a href="#">SETROWTAG Procedure</a>	Sets the name of the element enclosing each row of the result
<a href="#">SETSKIPROWS Procedure</a>	Sets the number of rows to skip every time before generating the XML.
<a href="#">USEITEMTAGSFORCOLL Procedure</a>	Forces the use of the collection column name appended with the tag <code>_ITEM</code> for collection elements
<a href="#">USENULLATTRIBUTEINDICATOR Procedure</a>	Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document.

## 198.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

### Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
 ctx IN ctxHandle);
```

### Parameters

**Table 198-2 CLOSECONTEXT Procedure Parameters**

Parameter	Description
<code>ctx</code>	The context handle to close.

## 198.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

### Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
 xmlData IN VARCHAR2,
 flag IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
 xmlData IN CLOB,
 flag IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

### Parameters

**Table 198-3 CONVERT Function Parameters**

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

### Usage Notes

This function escapes the XML data if the ENTITY\_ENCODE is specified. For example, the escaped form of the character < is &lt;. Unescaping is the reverse transformation.

## 198.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

### Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
 ctx IN ctxHandle)
RETURN NUMBER;
```

## Parameters

**Table 198-4 GETNUMROWSPROCESSED Function Parameters**

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.

## Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

## Related Topics

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

## 198.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

### Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of [GETXML Functions](#) to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this [GETXML Functions](#) call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
 ctx IN ctxHandle,
 tmpclob IN OUT NCOPY CLOB,
 dtdOrSchema IN number := NONE)
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS\_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
 ctx IN ctxHandle,
 dtdOrSchema IN number := NONE)
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS\_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
 sqlQuery IN VARCHAR2,
 dtdOrSchema IN number := NONE)
RETURN CLOB;
```

## Parameters

**Table 198-5 GETXML Function Parameters**

Parameter	Description
ctx	The context handle obtained from the <code>newContext</code> call.
tmpClob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only <code>NONE</code> is supported.

## Usage Notes

When the rows indicated by the [SETSKIPROWS Procedure](#) call are skipped, the maximum number of rows as specified by the [SETMAXROWS Procedure](#) call (or the entire result if not specified) is fetched and converted to XML. Use the [GETNUMROWSPROCESSED Function](#) to check if any rows were retrieved.

## 198.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results. This function is overloaded.

### Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
 ctx IN ctxhandle,
 dtdOrSchema IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
 sqlQuery IN VARCHAR2,
 dtdOrSchema IN number := NONE)
RETURN sys.XMLType
```

## Parameters

**Table 198-6 GETXMLTYPE Function Parameters**

Parameter	Description
ctx	The context handle obtained from the <code>newContext</code> call.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only <code>NONE</code> is supported.

## 198.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in [GETXML Functions](#) and other functions to get XML back from the result. There are several version of the function.

### Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
 query IN VARCHAR2)
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
 queryString IN SYS_REFCURSOR)
RETURN ctxHandle;
```

### Parameters

**Table 198-7 NEWCONTEXT Function Parameters**

Parameter	Description
query	The query, in the form of a VARCHAR, the result of which must be converted to XML.
queryString	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

## 198.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

### Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (
 queryString IN VARCHAR2)
RETURN ctxHandle;
```

## Parameters

**Table 198-8 NEWCONTEXTFROMHIERARCHY Function Parameters**

Parameter	Description
queryString	The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a CONNECT BY clause, and the result must have the same property as the result set generated by a CONNECT BY query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.

## Related Topics

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

## 198.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

### Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
 ctx IN ctxHandle);
```

## Parameters

**Table 198-9 RESTARTQUERY Procedure Parameters**

Parameter	Description
ctx	The context handle corresponding to the current query.

## 198.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to &lt;.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, ", ', which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

### Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
 ctx IN ctxHandle,
 conv IN BOOLEAN);
```

### Parameters

**Table 198-10 SETCONVERTSPECIALCHARS Procedure Parameters**

Parameter	Description
ctx	The context handle obtained from one of the <a href="#">NEWCONTEXT Functions</a> call.
conv	TRUE indicates that conversion is needed.

## 198.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

### Syntax

```
DBMS_XMLGEN.SETMAXROWS (
 ctx IN ctxHandle,
 maxRows IN NUMBER);
```

### Parameters

**Table 198-11 SETMAXROWS Procedure Parameters**

Parameter	Description
ctx	The context handle corresponding to the query executed.
maxRows	The maximum number of rows to get for each call to <a href="#">GETXML Functions</a>

### Related Topics

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

## 198.2.11 SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the `flag` parameter setting.

### Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
 ctx IN ctx,
 flag IN NUMBER);
```

### Parameters

**Table 198-12 SETNULLHANDLING Procedure Parameters**

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>flag</code>	The NULL handling option set. <ul style="list-style-type: none"> <li><code>DROP_NULLS CONSTANT NUMBER := 0</code>; (Default) Leaves out the tag for NULL elements.</li> <li><code>NULL_ATTR CONSTANT NUMBER := 1</code>; Sets <code>xsi:nil="true"</code>.</li> <li><code>EMPTY_TAG CONSTANT NUMBER := 2</code>; Sets, for example, <code>&lt;foo/&gt;</code>.</li> </ul>

## 198.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

### Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
 ctx IN ctxHandle,
 rowSetTagName IN VARCHAR2);
```

### Parameters

**Table 198-13 SETROWSETTAG Procedure Parameters**

Parameter	Description
<code>ctx</code>	The context handle obtained from the <a href="#">NEWCONTEXT Functions</a> call.
<code>rowSetTagName</code>	The name of the document element. Passing <code>NULL</code> indicates that you do not want the <code>ROWSET</code> element present.

### Usage Notes

The user can set the `rowSetTag` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is

more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

## 198.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

### Syntax

```
DBMS_XMLGEN.SETROWTAG (
 ctx IN ctxHandle,
 rowTagName IN VARCHAR2);
```

### Parameters

**Table 198-14 SETROWTAG Procedure Parameters**

Parameter	Description
ctx	The context handle obtained from the <a href="#">NEWCONTEXT Functions</a> call.
rowTagName	The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.

### Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

## 198.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See [GETNUMROWSPROCESSED Function](#).

### Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
 ctx IN ctxHandle,
 skipRows IN NUMBER);
```

### Parameters

**Table 198-15 SETSKIPROWS Procedure Parameters**

Parameter	Description
ctx	The context handle corresponding to the query executed.

**Table 198-15 (Cont.) SETSKIPROWS Procedure Parameters**

Parameter	Description
skipRows	The number of rows to skip for each call to <code>getXML</code> .

**Related Topics**

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

## 198.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

**Syntax**

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
 ctx IN ctxHandle);
```

**Parameters****Table 198-16 USEITEMTAGSFORCOLL Procedure Parameters**

Parameter	Description
ctx	The context handle.

**Usage Notes**

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

## 198.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate `NULL`, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the [SETNULLHANDLING Procedure](#).

**Syntax**

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
 ctx IN ctxType,
 attrind IN BOOLEAN := TRUE);
```

**Parameters****Table 198-17 USENULLATTRIBUTEINDICATOR Procedure Parameters**

Parameter	Description
ctx	Context handle.

**Table 198-17 (Cont.) USENULLATTRIBUTEINDICATOR Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
attrind	Use attribute to indicate NULL?

# DBMS\_XMLINDEX

The `DBMS_XMLINDEX` package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XMLINDEX Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide* for more information about "XMLIndex"

## 199.1 DBMS\_XMLINDEX Overview

`DBMS_XMLINDEX` provides a mechanism for asynchronous index maintenance.

### Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. `DBMS_XMLINDEX` provides this mechanism.

## 199.2 DBMS\_XMLINDEX Security Model

Owned by XDB, the `DBMS_XMLINDEX` package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

## 199.3 Summary of DBMS\_XMLINDEX Subprograms

This table lists the `DBMS_XMLINDEX` subprograms and briefly describes them.

**Table 199-1 DBMS\_XMLINDEX Package Subprograms**

Subprogram	Description
<a href="#">CREATEDATEINDEX Procedure</a>	Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex

**Table 199-1 (Cont.) DBMS\_XMLINDEX Package Subprograms**

Subprogram	Description
<a href="#">CREATENUMBERINDEX Procedure</a>	Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
<a href="#">DROPPARAMETER Procedure</a>	Drops the XMLIndex parameter string that is associated with a given parameter identifier.
<a href="#">MODIFYPARAMETER Procedure</a>	Modifies the XMLIndex parameter string that is associated with a given parameter name
<a href="#">PROCESS_PENDING Procedure</a>	Processes pending rows for a NONBLOCKING ALTER INDEX OPERATION on an XMLIndex
<a href="#">REGISTERPARAMETER Procedure</a>	Registers a parameter string and XMLIndex parameter string pair in XDB
<a href="#">SYNCINDEX Procedure</a>	Synchronizes the index manually

## 199.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date\_index\_clause to be set to an empty string.

### Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX (
 xml_index_schema IN VARCHAR2,
 xml_index_name IN VARCHAR2,
 date_index_name IN VARCHAR2,
 xmltypename IN VARCHAR2,
 date_index_clause IN VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX (
 xml_index_schema IN VARCHAR2,
 xml_index_name IN VARCHAR2,
 date_index_name IN VARCHAR2,
 xmltypename IN VARCHAR2);
```

### Parameters

**Table 199-2 CREATEDATEINDEX Procedure Parameters**

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema

**Table 199-2 (Cont.) CREATEDATEINDEX Procedure Parameters**

Parameter	Description
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

## 199.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

### Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
 xml_index_schema IN VARCHAR2,
 xml_index_name IN VARCHAR2,
 num_index_name IN VARCHAR2,
 num_index_clause IN VARCHAR2,
 xmltypename IN VARCHAR2);
```

### Parameters

**Table 199-3 CREATENUMBERINDEX Procedure Parameters**

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
num_index_name	Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
num_index_clause	Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.

## 199.3.3 DROPPARAMETER Procedure

This procedure drops the XMLIndex parameter string that is associated with a given parameter identifier.

### Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
 name IN VARCHAR2);
```

### Parameters

**Table 199-4 DROPPARAMETER Procedure Parameters**

Parameter	Description
name	Identifier for parameter string

### Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
 'myIndexParam');
```

## 199.3.4 MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

### Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
 name IN VARCHAR2,
 parameter IN CLOB);
```

### Parameters

**Table 199-5 MODIFYPARAMETER Procedure Parameters**

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

### Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
 'myIndexParam',
 'PATH TABLE po_ptab
 PATH ID INDEX po_pidx
 ORDER KEY INDEX po_oidx
 VALUE INDEX po_vidx');
```

## 199.3.5 PROCESS\_PENDING Procedure

This procedure processes executes DMLs required to complete a NONBLOCKING ALTER INDEX ADD\_GROUP/ADD\_COLUMN operation on an XMLIndex.

### Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (
 xml_index_schema IN VARCHAR2,
 xml_index_name IN VARCHAR2,
 pending_row_count OUT BINARY_INTEGER,
 error_row_count OUT BINARY_INTEGER);
```

### Parameters

**Table 199-6** PROCESS\_PENDING Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex to be altered using NONBLOCKING ALTER INDEX OPERATION
pending_row_count	Number of pending rows to be processed
error_row_count	Number of rows for which indexing may have failed because of an error

### Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the NONBLOCKING ALTER INDEX OPERATION.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in SYS\_AIXSXI\_#####\_PENDINGTAB and errors in SYS\_AIXSXI\_#####\_ERRORTAB.. Keeping track of rows and the errors is useful in triaging issues.

### Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
 'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

## 199.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

### Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
 name IN VARCHAR2,
 parameter IN CLOB);
```

## Parameters

**Table 199-7 REGISTERPARAMETER Procedure Parameters**

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

## Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
 'myIndexParam',
 'PATH TABLE po_ptab
 PATH ID INDEX po_pidx
 ORDER KEY INDEX po_oidx
 VALUE INDEX po_vidx
 PATHS(NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
 GROUP MASTERGROUP XMLTABLE PO_TAB
 ('/p:PurchaseOrder'
 COLUMNS
 REFERENCE VARCHAR2(30) PATH 'p:Reference',
 REQUESTOR VARCHAR2(30) PATH 'p:Requestor')
 GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
 ('/p:PurchaseOrder/p:LineItems/p:LineItem'
 COLUMNS
 LINENUMBER NUMBER(38) PATH '@:ItemNumber',
 QUANTITY NUMBER(38) PATH '@:Quantity',
 DESCRIPTION VARCHAR2(256) PATH 'p:Description'));
```

## 199.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

### Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
 xml_index_schema IN VARCHAR2,
 xml_index_name IN VARCHAR2,
 partition_name IN VARCHAR2 DEFAULT NULL,
 reindex IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 199-8 SYNCINDEX Procedure Parameters**

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_schema_name	Name of the XMLIndex
partition_name	[Currently not supported]

**Table 199-8 (Cont.) SYNCINDEX Procedure Parameters**

Parameter	Description
reindex	Default is <code>FALSE</code> . If set to <code>TRUE</code> , this drops the secondary indexes and recreates them later so that they can be bulk-loaded.

**Examples**

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

# DBMS\_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_XMLPARSER Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 200.1 DBMS\_XMLPARSER Security Model

Owned by `XDB`, the `DBMS_XMLPARSER` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

## 200.2 Summary of DBMS\_XMLPARSER Subprograms

This table lists the `DBMS_XMLPARSER` subprograms and briefly describes them.

**Table 200-1 DBMS\_XMLPARSER Package Subprograms**

Method	Description
<a href="#">FREEPARSER</a>	Frees a parser object.
<a href="#">GETDOCTYPE</a>	Gets parsed DTD.
<a href="#">GETDOCUMENT</a>	Gets DOM document.
<a href="#">GETRELEASEVERSION</a>	Returns the release version of Oracle XML Parser for PL/SQL.
<a href="#">GETVALIDATIONMODE</a>	Returns validation mode.
<a href="#">NEWPARSER</a>	Returns a new parser instance
<a href="#">PARSE</a>	Parses XML stored in the given url/file.
<a href="#">PARSEBUFFER</a>	Parses XML stored in the given buffer
<a href="#">PARSECLOB</a>	Parses XML stored in the given clob
<a href="#">PARSEDTD</a>	Parses DTD stored in the given url/file
<a href="#">PARSEDTDBUFFER</a>	Parses DTD stored in the given buffer
<a href="#">PARSEDTDCLOB</a>	Parses DTD stored in the given clob
<a href="#">SETBASEDIR</a>	Sets base directory used to resolve relative URLs.
<a href="#">SETDOCTYPE</a>	Sets DTD.
<a href="#">SETERRORLOG</a>	Sets errors to be sent to the specified file
<a href="#">SETPRESERVEWHITESPACE</a>	Sets white space preserve mode
<a href="#">SETVALIDATIONMODE</a>	Sets validation mode.
<a href="#">SHOWWARNINGS</a>	Turns warnings on or off.

## 200.2.1 FREEPARSER

This procedure frees a parser object.

### Syntax

```
PROCEDURE freeParser(
 p Parser);
```

### Parameters

**Table 200-2 FREEPARSER Procedure Parameters**

Parameter	IN / OUT	Description
p	( IN )	Parser instance.

## 200.2.2 GETDOCTYPE

The `GETDOCTYPE` function returns the parsed DTD. This function must be called only after a DTD is parsed.

### Syntax

```
FUNCTION getDoctype(
 p Parser)
RETURN DOMDocumentType;
```

### Parameters

**Table 200-3** GETDOCTYPE Function Parameters

Parameter	IN / OUT	Description
p	( IN )	Parser instance.

## 200.2.3 GETDOCUMENT

`GETDOCUMENT` returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

### Syntax

```
FUNCTION GETDOCUMENT(
 p Parser)
RETURN DOMDocument;
```

### Parameters

**Table 200-4** GETDOCUMENT Function Parameters

Parameter	IN / OUT	Description
p	( IN )	Parser instance.

## 200.2.4 GETRELEASEVERSION

`GETRELEASEVERSION` returns the release version of the Oracle XML parser for PL/SQL.

### Syntax

```
FUNCTION getReleaseVersion
RETURN VARCHAR2;
```

## 200.2.5 GETVALIDATIONMODE

The GETVALIDATIONMODE function retrieves the validation mode: TRUE for validating, FALSE otherwise.

### Syntax

```
FUNCTION GETVALIDATIONMODE(
 p Parser)
RETURN BOOLEAN;
```

### Parameters

**Table 200-5 GETVALIDATIONMODE Function Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

## 200.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

### Syntax

```
FUNCTION newParser
RETURN Parser;
```

## 200.2.7 PARSE

PARSE parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

### Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```
FUNCTION parse(url VARCHAR2)
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```
PROCEDURE parse(
 p Parser,
 url VARCHAR2);
```

### Parameters

**Table 200-6 PARSE Subprogram Parameters**

Parameter	IN / OUT	Description
url	(IN)	Complete path of the url/file to be parsed.
p	(IN)	Parser instance.

## 200.2.8 PARSEBUFFER

PARSEBUFFER parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEBUFFER(
 p Parser,
 doc VARCHAR2);
```

### Parameters

**Table 200-7 PARSEBUFFER Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

## 200.2.9 PARSECLOB

PARSECLOB parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSECLOB(
 p Parser,
 doc CLOB);
```

## Parameters

**Table 200-8 PARSECLOB Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

## 200.2.10 PARSEDTD

PARSEDTD parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTD(
 p Parser,
 url VARCHAR2,
 root VARCHAR2);
```

## Parameters

**Table 200-9 PARSEDTD Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

## 200.2.11 PARSEDTDBUFFER

PARSEDTDBUFFER parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTDBUFFER(
 p Parser,
 dtd VARCHAR2,
 root VARCHAR2);
```

## Parameters

**Table 200-10 PARSEDTDBUFFER Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

## 200.2.12 PARSEDTDCLOB

PARSEDTDCLOB parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTDCLOB(
 p Parser,
 dtd CLOB,
 root VARCHAR2);
```

## Parameters

**Table 200-11 PARSEDTDCLOB Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

## 200.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE setBaseDir(
 p Parser,
 dir VARCHAR2);
```

## Parameters

**Table 200-12 SETBASEDIR Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

## 200.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

### Syntax

```
PROCEDURE setDoctype(
 p Parser,
 dtd DOMDocumentType);
```

## Parameters

**Table 200-13 SETDOCTYPE Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

## 200.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

### Syntax

```
PROCEDURE setErrorLog(
 p Parser,
 fileName VARCHAR2);
```

## Parameters

**Table 200-14 SETERRORLOG Procedure Parameters**

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

## 200.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

### Syntax

```
PROCEDURE setPreserveWhitespace(
 p Parser,
 yes BOOLEAN);
```

### Parameters

**Table 200-15** SETPRESERVEWHITESPACE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

## 200.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

### Syntax

```
PROCEDURE setValidationMode(
 p Parser,
 yes BOOLEAN);
```

### Parameters

**Table 200-16** SETVALIDATIONMODE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

## 200.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

### Syntax

```
PROCEDURE showWarnings(
 p Parser,
 yes BOOLEAN);
```

## Parameters

**Table 200-17 SHOWWARNINGS Procedure Parameters**

Parameter	IN / OUT	Description
p	( IN )	Parser instance.
yes	( IN )	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

# 201

## DBMS\_XMLQUERY

DBMS\_XMLQUERY provides database-to-XMLType functionality.

### Note:

With Oracle Database 18.1 Release, the DBMS\_XMLQUERY package is deprecated. Use DBMS\_XMLGEN instead.

The DBMS\_XMLQUERY package has been replaced with improved technology. While Oracle recommends you not to begin development using DBMS\_XMLQUERY, Oracle continues to support DBMS\_XMLQUERY for reasons of backward compatibility. Your existing applications using DBMS\_XMLQUERY will continue to work.

### See Also:

For more information, see [DBMS\\_XMLGEN](#).

This chapter contains the following topics:

- [DBMS\\_XMLQUERY Security Model](#)
- [DBMS\\_XMLQUERY Constants](#)
- [Types](#)
- [Summary of DBMS\\_XMLQUERY Subprograms](#)

## 201.1 DBMS\_XMLQUERY Security Model

Owned by XDB, the DBMS\_XMLQUERY package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

## 201.2 DBMS\_XMLQUERY Constants

The DBMS\_XMLQUERY package includes several constants to use when specifying parameter values.

These constants are defined in the following table.

**Table 201-1 Constants of DBMS\_XMLQUERY**

Constant	Description
DB_ENCODING	Used to signal that the DB character encoding is to be used.
DEFAULT_ROWSETTAG	The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.
DEFAULT_ERRORTAG	The default tag to enclose raised errors -- ERROR.
DEFAULT_ROWIDATTR	The default name for the cardinality attribute of XML elements corresponding to <code>db.records</code> -- NUM
DEFAULT_ROWTAG	The default tag name for the element corresponding to <code>db.records</code> -- ROW
DEFAULT_DATE_FORMAT	Default date mask -- 'MM/dd/yyyy HH:mm:ss'
ALL_ROWS	Indicates that all rows are needed in the output.
NONE	Used to specifies that the output should not contain any XML metadata (for example, no DTD).
DTD	Used to specify that the generation of the DTD is desired.
SCHEMA	Used to specify that the generation of the XML Schema is desired.
LOWER_CASE	Use lower case tag names.
UPPER_CASE	Use upper case tag names.

## 201.3 Types

The DBMS\_XMLQUERY subprograms use the `ctxType` type.

**Table 201-2 Types of DBMS\_XMLQUERY**

Type	Description
<code>ctxType</code>	The type of the query context handle. This is the return type of <a href="#">NEWCONTEXT</a>

## 201.4 Summary of DBMS\_XMLQUERY Subprograms

This table lists the DBMS\_XMLQUERY subprograms and briefly describes them.

**Table 201-3 DBMS\_XMLQUERY Package Subprograms**

Method	Description
<a href="#">CLOSECONTEXT</a>	Closes or deallocates a particular query context.
<a href="#">GETDTD</a>	Generates the DTD.
<a href="#">GETEXCEPTIONCONTENT</a>	Returns the thrown exception's error code and error message.
<a href="#">GETNUMROWSPROCESSED</a>	Returns the number of rows processed for the query.
<a href="#">GETVERSION</a>	Prints the version of the XSU in use.

Table 201-3 (Cont.) DBMS\_XMLQUERY Package Subprograms

Method	Description
GETXML	Generates the XML document.
NEWCONTEXT	Creates a query context and it returns the context handle.
PROPAGATEORIGINALEXCEPTION	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> .
REMOVEXSLTPARAM	Removes a particular top-level stylesheet parameter.
SETBINDVALUE	Sets a value for a particular bind name.
SETCOLLIDATTRNAME	Sets the name of the id attribute of the collection element's separator tag.
SETDATAHEADER	Sets the XML data header.
SETDATEFORMAT	Sets the format of the generated dates in the XML document.
SETENCODINGTAG	Sets the encoding processing instruction in the XML document.
SETERRORTAG	Sets the tag to be used to enclose the XML error documents.
SETMAXROWS	Sets the maximum number of rows to be converted to XML.
SETMETAHEADER	Sets the XML meta header.
SETRAISEEXCEPTION	Tells the XSU to throw the raised exceptions.
SETRAISENOROWSEXCEPTION	Tells the XSU to throw or not to throw an <code>OracleXMLNoRowsException</code> in the case when for one reason or another, the XML document generated is empty.
SETROWIDATTRNAME	Sets the name of the id attribute of the row enclosing tag.
SETROWIDATTRVALUE	Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.
SETROWSETTAG	Sets the tag to be used to enclose the XML dataset.
SETROWTAG	Sets the tag to be used to enclose the XML element.
SETSKIPROWS	Sets the number of rows to skip.
SETSQLTOXMLNAMEESCAPING	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETSTYLESHEETHEADER	Sets the stylesheet header.
SETTAGCASE	Specified the case of the generated XML tags.
SETXSLT	Registers a stylesheet to be applied to generated XML.
SETXSLTPARAM	Sets the value of a top-level stylesheet parameter.
USENULLATTRIBUTEINDICATOR	Specifies weather to use an XML attribute to indicate NULLness.

**Table 201-3 (Cont.) DBMS\_XMLQUERY Package Subprograms**

Method	Description
<a href="#">USETYPEFORCOLLELEMTAG</a>	Tells the XSU to use the collection element's type name as the collection element tag name.

## 201.4.1 CLOSECONTEXT

This procedure closes or deallocates a particular query context

### Syntax

```
PROCEDURE CLOSECONTEXT(
 ctxHdl IN ctxType);
```

**Table 201-4 CLOSECONTEXT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 201.4.2 GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

### Syntax

Function that generates the DTD based on the SQL query that is used to initialize the context.

```
FUNCTION GETDTD(
 ctxHdl IN ctxType,
 withVer IN BOOLEAN := false)
RETURN CLOB;
```

Procedure that generates the DTD based on the SQL query that is used to initialize the context. Specifies the output CLOB for XML document result.

```
PROCEDURE GETDTD(
 ctxHdl IN ctxType,
 xDoc IN CLOB,
 withVer IN BOOLEAN := false);
```

## Parameters

**Table 201-5 GETDTD Subprogram Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
withVer	(IN)	Generate the version information? TRUE for yes.
xDoc	(IN)	CLOB into which to write the generated XML document.

## 201.4.3 GETEXCEPTIONCONTENT

GETEXCEPTIONCONTENT returns the thrown exception's SQL error code and error message through the procedure's OUT parameters.

This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

### Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(
 ctxHdl IN ctxType,
 errNo OUT NUMBER,
 errMsg OUT VARCHAR2);
```

## Parameters

**Table 201-6 GETEXCEPTIONCONTENT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(OUT)	Error number.
errMsg	(OUT)	Error message.

## 201.4.4 GETNUMROWSPROCESSED

Return the number of rows processed for the query.

### Syntax

```
FUNCTION GETNUMROWSPROCESSED(
 ctxHdl IN ctxType)
RETURN NUMBER;
```

**Table 201-7 GETNUMROWSPROCESSED Function Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 201.4.5 GETVERSION

The `GETVERSION` procedure prints the version of the XSU in use.

### Syntax

```
PROCEDURE GETVERSION();
```

## 201.4.6 GETXML

`GETXML` creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context does not need to be explicitly opened or closed.

### Syntax

This function uses a SQL query in string form.

```
FUNCTION GETXML(
 sqlQuery IN VARCHAR2,
 metaType IN NUMBER := NONE)
RETURN CLOB;
```

This function uses a SQL query in `CLOB` form.

```
FUNCTION GETXML(
 sqlQuery IN CLOB,
 metaType IN NUMBER := NONE)
RETURN CLOB;
```

This function generates the XML document based on a SQL query used to initialize the context.

```
FUNCTION GETXML(
 ctxHdl IN ctxType,
 metaType IN NUMBER := NONE)
RETURN CLOB;
```

This procedure generates the XML document based on the SQL query used to initialize the context.

```
PROCEDURE GETXML(
 ctxHdl IN ctxType,
 xDoc IN CLOB,
 metaType IN NUMBER := NONE);
```

## Parameters

**Table 201-8 GETXML Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
metaType	(IN)	XML metadatatype (NONE, DTD, or SCHEMA).
sqlQuery	(IN)	SQL query.
xDoc	(IN)	CLOB into which to write the generated XML document.

## 201.4.7 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

### Syntax

```
FUNCTION NEWCONTEXT(
 sqlQuery IN VARCHAR2)
RETURN ctxType;
```

```
FUNCTION NEWCONTEXT(
 sqlQuery IN CLOB)
RETURN ctxType;
```

### Parameters

**Table 201-9 NEWCONTEXT Function Parameters**

Parameter	IN / OUT	Description
sqlQuery	(IN)	SQL query, the results of which to convert to XML.

## 201.4.8 PROPAGATEORIGINALEXCEPTION

The PROPAGATEORIGINALEXCEPTION procedure specifies whether to throw every original exception raised or to wrap it in an OracleXMLSQLException.

### Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(
 ctxHdl IN ctxType,
 flag IN BOOLEAN);
```

**Parameters****Table 201-10 PROPAGATEORIGINALEXCEPTION Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	TRUE if want to propagate original exception, FALSE to wrap in OracleXMLException.

## 201.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

**Syntax**

```
PROCEDURE REMOVEXSLTPARAM(
 ctxHdl IN ctxType,
 name IN VARCHAR2);
```

**Table 201-11 REMOVEXSLTPARAM Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.

## 201.4.10 SETBINDVALUE

This procedure sets a value for a particular bind name.

**Syntax**

```
PROCEDURE SETBINDVALUE(
 ctxHdl IN ctxType,
 bindName IN VARCHAR2,
 bindValue IN VARCHAR2);
```

**Table 201-12 SETBINDVALUE Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
bindName	(IN)	Bind name.
bindValue	(IN)	Bind value.

## 201.4.11 SETCOLLIDATTRNAME

This procedure sets the name of the id attribute of the collection element's separator tag.

Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

### Syntax

```
PROCEDURE SETCOLLIDATTRNAME(
 ctxHdl IN ctxType,
 attrName IN VARCHAR2);
```

**Table 201-13 SETCOLLIDATTRNAME Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

## 201.4.12 SETDATAHEADER

This procedure sets the XML data header.

The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the `rowset`. The two entities are enclosed by the `docTag` argument. The last data header specified is used. Passing in `NULL` for the header parameter unsets the data header.

### Syntax

```
PROCEDURE SETDATAHEADER(
 ctxHdl IN ctxType,
 header IN CLOB := null,
 tag IN VARCHAR2 := null);
```

**Table 201-14 SETDATAHEADER Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
header	(IN)	Header.
tag	(IN)	Tag used to enclose the data header and the rowset.

## 201.4.13 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask -- `DEFAULT_DATE_FORMAT`.

**Syntax**

```
PROCEDURE SETDATEFORMAT(
 ctxHdl IN ctxType,
 mask IN VARCHAR2);
```

**Table 201-15 SETDATEFORMAT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
mask	(IN)	The date mask.

## 201.4.14 SETENCODINGTAG Procedure

This procedure sets the encoding processing instruction in the XML document.

**Syntax**

```
PROCEDURE SETENCODINGTAG(
 ctxHdl IN ctxType,
 enc IN VARCHAR2 := DB_ENCODING);
```

**Table 201-16 SETENCODINGTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
enc	(IN)	The encoding to use.

## 201.4.15 SETERRORTAG Procedure

This procedure sets the tag to be used to enclose the XML error documents.

**Syntax**

```
PROCEDURE SETERRORTAG(
 ctxHdl IN ctxType,
 tag IN VARCHAR2);
```

**Table 201-17 SETERRORTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## 201.4.16 SETMAXROWS Procedure

This procedure sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

### Syntax

```
PROCEDURE SETMAXROWS (
 ctxHdl IN ctxType,
 rows IN NUMBER);
```

**Table 201-18 SETMAXROWS Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to generate.

## 201.4.17 SETMETAHEADER Procedure

This procedure sets the XML meta header.

When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

### Syntax

```
PROCEDURE SETMETAHEADER(
 ctxHdl IN ctxType,
 header IN CLOB := null);
```

**Table 201-19 SETMETAHEADER Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
Header	(IN)	Header.

## 201.4.18 SETRAISEEXCEPTION

This procedure specifies whether to throw raised exceptions.

If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

### Syntax

```
PROCEDURE SETRAISEEXCEPTION(
 ctxHdl IN ctxType,
 flag IN BOOLEAN:=true);
```

**Table 201-20 SETRAISEEXCEPTION Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Throw raised exceptions? TRUE for yes, otherwise FALSE.

## 201.4.19 SETRAISENOROWSEXCEPTION

This procedure specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

### Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(
 ctxHdl IN ctxType,
 flag IN BOOLEAN:=false);
```

**Table 201-21 SETRAISENOROWSEXCEPTION Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Throws an <code>OracleXMLNoRowsException</code> if set to TRUE.

## 201.4.20 SETROWIDATTRNAME

This procedure sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

### Syntax

```
PROCEDURE SETROWIDATTRNAME(
 ctxHdl IN ctxType,
 attrName IN VARCHAR2);
```

**Table 201-22 SETROWIDATTRNAME Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

## 201.4.21 SETROWIDATTRVALUE

This procedure specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.

Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

**Syntax**

```
PROCEDURE SETROWIDATTRVALUE(
 ctxHdl IN ctxType,
 colName IN VARCHAR2);
```

**Table 201-23 SETROWIDATTRVALUE Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column whose value is to be assigned to the row id attribute.

## 201.4.22 SETROWSETTAG

This procedure sets the tag to be used to enclose the XML dataset.

**Syntax**

```
PROCEDURE SETROWSETTAG(
 ctxHdl IN ctxType,
 tag IN VARCHAR2);
```

**Table 201-24 SETROWSETTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## 201.4.23 SETROWTAG

This procedure sets the tag to be used to enclose the XML element corresponding to a db.record.

**Syntax**

```
PROCEDURE SETROWTAG(
 ctxHdl IN ctxType,
 tag IN VARCHAR2);
```

**Table 201-25 SETROWTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## 201.4.24 SETSKIPROWS

SETSKIPROWS sets the number of rows to skip. By default, 0 rows are skipped.

### Syntax

```
PROCEDURE SETSKIPROWS(
 ctxHdl IN ctxType,
 rows IN NUMBER);
```

**Table 201-26 SETSKIPROWS Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to skip.

## 201.4.25 SETSQLTOXMLNAMEESCAPING

This procedure turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

### Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING(
 ctxHdl IN ctxType,
 flag IN BOOLEAN := true);
```

**Table 201-27 SETSQLTOXMLNAMEESCAPING Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping? TRUE for yes, otherwise FALSE.

## 201.4.26 SETSTYLE SHEETHEADER

SETSTYLE SHEETHEADER sets the stylesheet header (the stylesheet processing instructions) in the generated XML document.

Passing NULL for the uri argument will unset the stylesheet header and the stylesheet type.

### Syntax

```
PROCEDURE SETSTYLE SHEETHEADER(
 ctxHdl IN ctxType,
 uri IN VARCHAR2,
 type IN VARCHAR2 := 'text/xsl');
```

**Table 201-28 SETSTYLESHEETHEADER Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	Stylesheet URI.
type	(IN)	Stylesheet type; defaults to "text/xsl".

## 201.4.27 SETTAGCASE

SETTAGCASE specifies the case of the generated XML tags.

### Syntax

```
PROCEDURE SETTAGCASE(
 ctxHdl IN ctxType,
 tCase IN NUMBER);
```

**Table 201-29 SETTAGCASE Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tCase	(IN)	The tag's case: <ul style="list-style-type: none"> <li>• 0 for as are</li> <li>• 1 for lower case</li> <li>• 2 for upper case</li> </ul>

## 201.4.28 SETXSLT

SETXSLT registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. Passing `NULL` for the `uri` argument, or `NULL` or an empty string for the `stylesheet` argument, *unsets* the stylesheet header and type.

### Syntax

To unregister the stylesheet, pass in `NULL` for the URI.

```
PROCEDURE SETXSLT(
 ctxHdl IN ctxType,
 uri IN VARCHAR2,
 ref IN VARCHAR2 := null);
```

To unregister the stylesheet pass in `NULL` or an empty string for the stylesheet.

```
PROCEDURE SETXSLT(
 ctxHdl IN ctxType,
 stylesheet CLOB,
 ref IN VARCHAR2 := null);
```

## Parameters

**Table 201-30 SETXSLT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	Stylesheet URI.
stylesheet	(IN)	Stylesheet.
ref	(IN)	URL to include, imported and external entities.

## 201.4.29 SETXSLTPARAM

SETXSLTPARAM sets the value of a top-level stylesheet parameter.

The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

### Syntax

```
PROCEDURE SETXSLTPARAM(
 ctxHdl IN ctxType,
 name IN VARCHAR2,
 value IN VARCHAR2);
```

**Table 201-31 SETXSLTPARAM Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.
value	(IN)	Value to be assigned to the stylesheet parameter.

## 201.4.30 USENULLATTRIBUTEINDICATOR

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

### Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(
 ctxHdl IN ctxType,
 flag IN BOOLEAN);
```

**Table 201-32 USENULLATTRIBUTEINDICATOR Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Sets attribute to NULL if TRUE, omits from XML document if FALSE.

## 201.4.31 USETYPEFORCOLLELEMTAG

This procedure specifies whether to use the collection element's type name as its element tag name.

By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

### Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(
 ctxHdl IN ctxType,
 flag IN BOOLEAN := true);
```

**Table 201-33 USETYPEFORCOLLELEMTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on use of the type name?

# DBMS\_XMLSAVE

DBMS\_XMLSAVE provides XML to database-type functionality.

## Note:

With Oracle Database 18.1 Release, the DBMS\_XMLSAVE package is deprecated. Use DBMS\_XMLSTORE instead.

The DBMS\_XMLSAVE package has been replaced with improved technology. While Oracle recommends you not to begin development using DBMS\_XMLSAVE, Oracle continues to support this package for reasons of backward compatibility. Your existing applications using DBMS\_XMLSAVE will continue to work.

This chapter contains the following topics:

- [DBMS\\_XMLSAVE Security Model](#)
- [DBMS\\_XMLSAVE Constants](#)
- [Types](#)
- [Summary of DBMS\\_XMLSAVE Subprograms](#)

## See Also:

- For more information on DBMS\_XMLSTORE, see [DBMS\\_XMLSTORE](#)
- *Oracle XML DB Developer's Guide*

## 202.1 DBMS\_XMLSAVE Security Model

Owned by XDB, the DBMS\_XMLSAVE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC

Subprograms in this package are executed using the privileges of the current user.

## 202.2 DBMS\_XMLSAVE Constants

The DBMS\_XMLSAVE includes constants to use when specifying parameter values.

These constants are defined in the following table.

**Table 202-1 Constants of DBMS\_XMLSAVE**

Constant	Description
DEFAULT_ROWTAG	The default tag name for the element corresponding to database records -- ROW
DEFAULT_DATE_FORMAT	Default date mask: 'MM/dd/yyyy HH:mm:ss'
MATCH_CASE	Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.
IGNORE_CASE	Used to specify that when mapping XML elements to database entities the XSU should be case insensitive.

## 202.3 Types

The DBMS\_XMLSAVE subprograms use the `ctxType` Type.

**Table 202-2 Types of DBMS\_XMLSAVE**

Type	Description
<code>ctxType</code>	The type of the query context handle. The type of the query context handle. This the return type of <a href="#">NEWCONTEXT</a> .

## 202.4 Summary of DBMS\_XMLSAVE Subprograms

This table lists the DBMS\_XMLSAVE subprograms and briefly describes them.

**Table 202-3 DBMS\_XMLSAVE Package Subprograms**

Method	Description
<a href="#">CLEARKEYCOLUMNLIST</a>	Clears the key column list.
<a href="#">CLEARUPDATECOLUMNLIST</a>	Clears the update column list.
<a href="#">CLOSECONTEXT</a>	It closes/deallocates a particular save context.
<a href="#">DELETXML</a>	Deletes records specified by data from the XML document, from the table specified at the context creation time.
<a href="#">GETEXCEPTIONCONTENT</a>	Returns the thrown exception's error code and error message.
<a href="#">INSERTXML</a>	Inserts the XML document into the table specified at the context creation time.
<a href="#">NEWCONTEXT</a>	Creates a save context, and returns the context handle.
<a href="#">PROPAGATEORIGINALEXCEPTION</a>	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> .
<a href="#">REMOVEXSLTPARAM</a>	Removes the value of a top-level stylesheet parameter
<a href="#">SETBATCHSIZE</a>	Changes the batch size used during DML operations.

**Table 202-3 (Cont.) DBMS\_XMLSAVE Package Subprograms**

Method	Description
<a href="#">SETCOMMITBATCH</a>	Sets the commit batch size.
<a href="#">SETDATEFORMAT</a>	Sets the format of the generated dates in the XML document.
<a href="#">SETIGNORECASE</a>	The XSU does mapping of XML elements to database.
<a href="#">SETKEYCOLUMN</a>	This methods adds a column to the key column list.
<a href="#">SETPRESERVEWHITESPACE</a>	Tells the XSU whether to preserve whitespace or not.
<a href="#">SETROWTAG</a>	Names the tag used in the XML document to enclose the XML elements corresponding to database.
<a href="#">SETSQLTOXMLNAMEESCAPING</a>	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
<a href="#">SETUPDATECOLUMN</a>	Adds a column to the update column list.
<a href="#">SETXSLT</a>	Registers a XSL transform to be applied to the XML to be saved.
<a href="#">SETXSLTPARAM</a>	Sets the value of a top-level stylesheet parameter.
<a href="#">UPDATEXML</a>	Updates the table given the XML document.

## 202.4.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

### Syntax

```
PROCEDURE clearKeyColumnList(
 ctxHdl IN ctxType);
```

### Parameters

**Table 202-4 CLEARKEYCOLUMNLIST Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 202.4.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

### Syntax

```
PROCEDURE clearUpdateColumnList(
 ctxHdl IN ctxType);
```

**Parameters****Table 202-5 CLEARUPDATECOLUMNLIST Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 202.4.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

**Syntax**

```
PROCEDURE closeContext(
 ctxHdl IN ctxType);
```

**Parameters****Table 202-6 CLOSECONTEXT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 202.4.4 DELETEXML

The `DELETEXML` function deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

The options are described in the following table.

**Syntax**

```
FUNCTION deleteXML(
 ctxHdl IN ctxPType,
 xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION deleteXML(
 ctxHdl IN ctxType,
 xDoc IN CLOB)
RETURN NUMBER;
```

## Parameters

**Table 202-7 DELETXML Function Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

## 202.4.5 GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code.

This is to get around the fact that the JVM throws an exception on top of whatever exception was raised, rendering PL/SQL unable to access the original exception.

### Syntax

```
PROCEDURE getExceptionContent(
 ctxHdl IN ctxType,
 errNo OUT NUMBER,
 errMsg OUT VARCHAR2);
```

## Parameters

**Table 202-8 GETEXCEPTIONCONTENT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(IN)	Error number.
errMsg	(IN)	Error message.

## 202.4.6 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

### Syntax

**Table 202-9 INSERTXML Function Syntax**

Syntax	Description
<pre>FUNCTION insertXML(   ctxHdl IN ctxType,   xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION insertXML(   ctxHdl IN ctxType,   xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.

### Parameters

**Table 202-10 INSERTXML Function Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

## 202.4.7 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

### Syntax

```
FUNCTION newContext(
 targetTable IN VARCHAR2)
RETURN ctxType;
```

### Parameters

**Table 202-11 NEWCONTEXT Function Parameters**

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

## 202.4.8 PROPAGATEORIGINALEXCEPTION

The `PROPAGATEORIGINALEXCEPTION` procedure tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an `OracleXMLSQLException`.

### Syntax

```
PROCEDURE propagateOriginalException(
 ctxHdl IN ctxType,
 flag IN BOOLEAN);
```

### Parameters

**Table 202-12** PROPAGATEORIGINALEXCEPTION Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Propagate the original exception? 0=FALSE, 1=TRUE.

## 202.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter.

### Syntax

```
PROCEDURE removeXSLTParam(
 ctxHdl IN ctxType,
 name IN VARCHAR2);
```

### Parameters

**Table 202-13** REMOVEXSLTPARAM Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.

## 202.4.10 SETBATCHSIZE

This procedure changes the batch size used during DML operations.

When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the

performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

### Syntax

```
PROCEDURE setBatchSize(
 ctxHdl IN ctxType,
 batchSize IN NUMBER);
```

### Parameters

**Table 202-14 SETBATCHSIZE Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Batch size.

## 202.4.11 SETCOMMITBATCH

This procedure sets the commit batch size.

The commit batch size refers to the number of records inserted after which a commit should follow. If `batchSize` is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is 0.

### Syntax

```
PROCEDURE setCommitBatch(
 ctxHdl IN ctxType,
 batchSize IN NUMBER);
```

### Parameters

**Table 202-15 SETCOMMITBATCH Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Commit batch size.

## 202.4.12 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

**Syntax**

```
PROCEDURE setDateFormat(
 ctxHdl IN ctxType,
 mask IN VARCHAR2);
```

**Parameters****Table 202-16 SETDATEFORMAT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
mask	(IN)	Syntax of the date format pattern.

## 202.4.13 SETIGNORECASE

This function tells the XSU whether to ignore case when the XSU maps XML elements to database columns/attributes. This matching is based on the element names (XML tags).

**Syntax**

```
PROCEDURE setIgnoreCase(
 ctxHdl IN ctxType,
 flag IN NUMBER);
```

**Parameters****Table 202-17 SETIGNORECASE Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.

## 202.4.14 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

**Syntax**

```
PROCEDURE setKeyColumn(
 ctxHdl IN ctxType,
 colName IN VARCHAR2);
```

**Parameters****Table 202-18 SETKEYCOLUMN Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

## 202.4.15 SETPRESERVEWHITESPACE

This procedure tells the XSU whether or not to preserve whitespace.

**Syntax**

```
PROCEDURE setPreserveWhitespace(
 ctxHdl IN ctxType,
 flag IN BOOLEAN := true);
```

**Parameters****Table 202-19 SETPRESERVEWHITESPACE Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Should XSU preserve whitespace?

## 202.4.16 SETROWTAG

This procedure names the tag used in the XML document to enclose the XML elements corresponding to db. records.

**Syntax**

```
PROCEDURE setRowTag(
 ctxHdl IN ctxType,
 tag IN VARCHAR2);
```

**Parameters****Table 202-20 SETROWTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## 202.4.17 SETSQLTOXMLNAMEESCAPING

SETSQLTOXMLNAMEESCAPING turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

### Syntax

```
PROCEDURE setSQLToXMLNameEscaping(
 ctxHdl IN ctxType,
 flag IN BOOLEAN := true);
```

### Parameters

**Table 202-21 SETSQLTOXMLNAMEESCAPING Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping?

## 202.4.18 SETUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

### Syntax

```
PROCEDURE setUpDateColumn(
 ctxHdl IN ctxType,
 colName IN VARCHAR2);
```

### Parameters

**Table 202-22 SETUPDATECOLUMN Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

## 202.4.19 SETXSLT

SETXSLT registers an XSL transform to be applied to the XML to be saved.

If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

## Syntax

**Table 202-23 SETXSLT Procedure Syntax**

Syntax	Description
<pre>PROCEDURE setXSLT(   ctxHdl IN ctxType,   uri IN VARCHAR2,   ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a URI.
<pre>PROCEDURE setXSLT(   ctxHdl IN ctxType,   stylesheet IN CLOB,   ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a CLOB.

## Parameters

**Table 202-24 SETXSLT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	URI to the stylesheet to register.
ref	(IN)	URL for include, import, and external entities.
stylesheet	(IN)	CLOB containing the stylesheet to register.

## 202.4.20 SETXSLTPARAM

SETXSLTPARAM sets the value of a top-level stylesheet parameter.

The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

## Syntax

```
PROCEDURE setXSLTParam(
 ctxHdl IN ctxType,
 name IN VARCHAR2,
 value IN VARCHAR2);
```

## Parameters

**Table 202-25 SETXSLTPARAM Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.
value	(IN)	Parameter value as an XPath expression

## 202.4.21 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

### Syntax

```
FUNCTION updateXML(
 ctxHdl IN ctxType,
 xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION updateXML(
 ctxHdl IN ctxType,
 xDoc IN CLOB)
RETURN NUMBER;
```

## Parameters

**Table 202-26 UPDATEXML Function Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

# DBMS\_XMLSCHEMA

DBMS\_XMLSCHEMA package provides procedures to manage XML schemas.

It is created by script `dbmsxsch.sql` during Oracle database installation.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS\\_XMLSCHEMA Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 203.1 DBMS\_XMLSCHEMA Overview

The DBMS\_XMLSCHEMA package uses subprograms to manage XML schemas.

These subprograms provide the following XML schema management::

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

## 203.2 DBMS\_XMLSCHEMA Security Model

Owned by XDB, the DBMS\_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 203.3 DBMS\_XMLSCHEMA Constants

The `DBMS_XMLSCHEMA` package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- [Table 203-1](#)
- [Table 203-2](#)
- [Table 203-3](#)

**Table 203-1** *DBMS\_XMLSCHEMA Constants - Delete Option*

Constant	Type	Value	Description
<code>DELETE_RESTRICT</code>	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
<code>DELETE_INVALIDATE</code>	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
<code>DELETE_CASCADE</code>	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
<code>DELETE_CASCADE_FORCE</code>	NUMBER	4	This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

**Table 203-2** *DBMS\_XMLSCHEMA Constants - Enable Hierarchy*

Constant	Type	Value	Description
<code>ENABLE_HIERARCHY_NONE</code>	PLS_INTEGER	1	The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will not be called on any tables created while registering that schema

Table 203-2 (Cont.) DBMS\_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS
ENABLE_HIERARCHY_RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 203-3 DBMS\_XMLSCHEMA Constants - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

## 203.4 Views

This table lists the views used by the `DBMS_XMLSCHEMA` package

The columns of these views are described in detail in the *Oracle Database Reference*

**Table 203-4 Summary of Views used by DBMS\_XMLSCHEMA**

Schema	Description
<code>USER_XML_SCHEMAS</code>	All registered XML Schemas owned by the user
<code>ALL_XML_SCHEMAS</code>	All registered XML Schemas usable by the current user
<code>DBA_XML_SCHEMAS</code>	All registered XML Schemas in the database
<code>DBA_XML_TABLES</code>	All XMLType tables in the system
<code>USER_XML_TABLES</code>	All XMLType tables owned by the current user
<code>ALL_XML_TABLES</code>	All XMLType tables usable by the current user
<code>DBA_XML_TAB_COLS</code>	All XMLType table columns in the system
<code>USER_XML_TAB_COLS</code>	All XMLType table columns in tables owned by the current user
<code>ALL_XML_TAB_COLS</code>	All XMLType table columns in tables usable by the current user
<code>DBA_XML_VIEWS</code>	All XMLType views in the system
<code>USER_XML_VIEWS</code>	All XMLType views owned by the current user
<code>ALL_XML_VIEWS</code>	All XMLType views usable by the current user
<code>DBA_XML_VIEW_COLS</code>	All XMLType view columns in the system
<code>USER_XML_VIEW_COLS</code>	All XMLType view columns in views owned by the current user
<code>ALL_XML_VIEW_COLS</code>	All XMLType view columns in views usable by the current user

## 203.5 DBMS\_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

## 203.6 Summary of DBMS\_XMLSCHEMA Subprograms

This table lists the DBMS\_XMLSCHEMA subprograms and briefly describes them.

**Table 203-5 DBMS\_XMLSCHEMA Package Subprograms**

Method	Description
<a href="#">COMPILESCHEMA Procedure</a>	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
<a href="#">COPYEVOLVE Procedure</a>	Evolves registered schemas so that existing XML instances remain valid
<a href="#">DELETESCHEMA Procedure</a>	Removes the schema from the database
<a href="#">INPLACEEVOLVE Procedure</a>	Evolves registered schemas by propagating schema changes to object types and tables
<a href="#">PURGESCHEMA Procedure</a>	Removes the XML schema
<a href="#">REGISTERSCHEMA Procedures</a>	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
<a href="#">REGISTERURI Procedure</a>	Registers an XML schema specified by a URI name

### 203.6.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

#### Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(
 schemaur1 IN VARCHAR2);
```

#### Parameters

**Table 203-6 COMPILESCHEMA Procedure Parameters**

Parameter	Description
<code>schemaur1</code>	URL identifying the schema

### 203.6.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables

- deletes old schemas
- registers new schemas
- creates new XMLType tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

 **See Also:**

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

### Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE (
 schemaurls IN XDB$STRUBG_LIST_T,
 newschemas IN XMLSequenceType,
 transforms IN XMLSequenceType :=NULL,
 preserveolddocs IN BOOLEAN :=FALSE,
 maptablename IN VARCHAR2 :=NULL,
 generatetables IN BOOLEAN :=TRUE,
 force IN BOOLEAN :=FALSE,
 schemaowners IN XDB$STRING_LIST_T :=NULL,
 parallelDegree IN PLS_INTEGER := 0,
 options IN PLS_INTEGER := 0);
```

### Parameters

**Table 203-7 COPYEVOLVE Procedure Parameters**

Parameter	Description
schemaurls	VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.
newschemas	VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.
transforms	VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.

Table 203-7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
maptabname	<p>Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are:</p> <ul style="list-style-type: none"> <li>• SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms</li> <li>• SCHEMA_OWNER - VARCHAR2(30) - Owner of the schema</li> <li>• ELEMENT_NAME - VARCHAR2(256) - Element to which this table conforms</li> <li>• TAB_NAME - VARCHAR2(65) - Qualified table name: <code>&lt;owner_name&gt;.&lt;table_name&gt;</code></li> <li>• COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables)</li> <li>• TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.</li> </ul>
generatetables	<p>Default is TRUE, and new tables will be generated.</p> <p>If FALSE:</p> <ul style="list-style-type: none"> <li>• new tables will not be generated after registration of new schemas</li> <li>• preserveolddocs must be TRUE</li> <li>• maptablename must be non-NULL</li> </ul>
force	<p>Default is FALSE.</p> <p>If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.</p>
schemaowners	<p>VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.</p>
paralleldegree	<p>Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.</p>
options	<p>Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.</p>

### Usage Notes

You should back up all schemas and documents prior to invocation because [COPYEVOLVE Procedure](#) deletes all conforming documents prior to implementing the schema evolution.

## 203.6.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

### Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(
 schemaur1 IN VARCHAR2,
 delete_option IN PLS_INTEGER := DELETE_RESTRICT);
```

### See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

### Parameters

**Table 203-8 DELETESCHEMA Procedure Parameters**

Parameter	Description
schemaur1	URL identifying the schema to be deleted
delete_option	Delete options: <ul style="list-style-type: none"> <li>DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema</li> <li>DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects.</li> <li>DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema.</li> <li>DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.</li> </ul>

### Exceptions

**Table 203-9 DELETESCHEMA Procedure Exceptions**

Exception	Description
ORA-31001	Invalid resource handle or path name

## 203.6.4 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

### Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
 schemaURL IN VARCHAR2,
 diffXML IN XMLType,
 flags IN NUMBER);
```

### Parameters

**Table 203-10 INPLACEEVOLVE Procedure Parameters**

Parameter	Description
schemaur1	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
flags	<p>The following bits may be set in this parameter to control the behavior of this procedure:</p> <ul style="list-style-type: none"> <li>• INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new.</li> <li>• INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file.</li> </ul> <p>That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</p> <ul style="list-style-type: none"> <li>• Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new.</li> <li>• Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)</li> </ul>

### Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.

- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.
- Any errors resulting from CREATE TYPE, ALTER TYPE and like commands will generate error messages.

### Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the [REGISTERSCHEMA Procedures](#) and the [REGISTERURI Procedure](#) at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

## 203.6.5 PURGESCHEMA Procedure

This procedure removes the XML schema.

### See Also:

"XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

### Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(
 schemaid IN RAW);
```

### Parameters

**Table 203-11 PURGESCHEMA Procedure Parameters**

Parameter	Description
schemaid	ID of the schema to be purged

### Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the HIDE mode.
- Once a schema has been deleted in HIDE mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.

- The Schema ID can be obtained from the catalog views.

## 203.6.6 REGISTERSHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

### Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

### See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

### Syntax

Registers a schema specified as a `VARCHAR2`:

```
DBMS_XMLSCHEMA.REGISTERSHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN VARCHAR2,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := FALSE,
 gentables IN BOOLEAN := TRUE,
 force IN BOOLEAN := FALSE,
 owner IN VARCHAR2 := NULL,
 enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
 options IN PLS_INTEGER := 0);
```

Registers the schema specified as a `BFILE`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN BFILE,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := FALSE,
 force IN BOOLEAN := FALSE,
 owner IN VARCHAR2 := NULL,
 enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
 options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN BFILE,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := TRUE,
 gentables IN BOOLEAN := TRUE,
 force IN BOOLEAN := TRUE,
 owner IN VARCHAR2 := '',
 csid IN NUMBER,
 enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
 options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN BLOB,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := FALSE,
 force IN BOOLEAN := FALSE,
 owner IN VARCHAR2 := NULL,
 enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
 options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN BLOB,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := TRUE,
 gentables IN BOOLEAN := TRUE,
 force IN BOOLEAN := TRUE,
 owner IN VARCHAR2 := '',
 csid IN NUMBER,
 enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
 options IN PLS_INTEGER := 0);
```

Registers the schema specified as a CLOB

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN CLOB,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := FALSE,
 force IN BOOLEAN := FALSE,
 owner IN VARCHAR2 := NULL,
 options IN PLS_INTEGER := 0);
```

Registers the schema specified as an XMLTYPE.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN SYS.XMLTYPE,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := FALSE,
 force IN BOOLEAN := FALSE,
 owner IN VARCHAR2 := NULL,
 enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
 options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
 schemaurl IN VARCHAR2,
 schemadoc IN SYS.URITYPE,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := FALSE,
 force IN BOOLEAN := FALSE,
 owner IN VARCHAR2 := NULL,
 enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
 options IN PLS_INTEGER := 0);
```

## Parameters

**Table 203-12 REGSITERSHEMA Procedure Parameters**

Parameter	Description
schemaurl	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? <ul style="list-style-type: none"> <li>By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code></li> <li>If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code></li> </ul> You need write privileges on the directory to be able to register a schema as global.
gentypes	Determines whether the schema compiler generates object types. By default, <code>TRUE</code> . If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code> .
genbean	Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code> . Oracle recommends that this parameter always be set to <code>FALSE</code> .
gentables	Determines whether the schema compiler generates default tables. By default, <code>TRUE</code>

**Table 203-12 (Cont.) REGSITERSchema Procedure Parameters**

Parameter	Description
force	If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
enablehierarchy	<ul style="list-style-type: none"> <li>ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema</li> <li>ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default.</li> <li>ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.</li> </ul>
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:</p> <ul style="list-style-type: none"> <li>REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)</li> <li>REGISTER_BINARYXML - Register the schema for Binary XML</li> <li>REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables</li> </ul>

## 203.6.7 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

### Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

### Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
 schemaurl IN VARCHAR2,
 schemadocuri IN VARCHAR2,
 local IN BOOLEAN := TRUE,
 gentypes IN BOOLEAN := TRUE,
 genbean IN BOOLEAN := FALSE,
 gentables IN BOOLEAN := TRUE,
 force IN BOOLEAN := FALSE,
 owner IN VARCHAR2 := NULL,
 options IN PLS_INTEGER := 0);
```

### Parameters

**Table 203-13 REGISTERURI Procedure Parameters**

Parameter	Description
<code>schemaurl</code>	Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element.
<code>schemadocuri</code>	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code> , and invokes the <a href="#">REGISTERSHEMA Procedures</a> .
<code>local</code>	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code> If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> The user needs write privileges on the directory to register a global schema.
<code>gentypes</code>	Determines whether the compiler generate object types. By default, <code>TRUE</code> .
<code>genbean</code>	Determines whether the compiler generate Java beans. By default, <code>FALSE</code> .
<code>gentables</code>	Determines whether the compiler generate default tables. <code>TRUE</code> by default.
<code>force</code>	<code>TRUE</code> : schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .

**Table 203-13 (Cont.) REGISTERURI Procedure Parameters**

Parameter	Description
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:</p> <ul style="list-style-type: none"> <li>REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)</li> </ul>

# DBMS\_XMLSCHEMA\_ANNOTATE

The `DBMS_XMLSCHEMA_ANNOTATE` package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XMLSCHEMA\\_ANNOTATE Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 204.1 DBMS\_XMLSCHEMA\_ANNOTATE Overview

The `DBMS_XMLSCHEMA_ANNOTATE` package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

## 204.2 DBMS\_XMLSCHEMA\_ANNOTATE Security Model

Owned by XDB, the `DBMS_XMLSCHEMA_ANNOTATE` package must be created by SYS or XDB. The `EXECUTE` privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 204.3 Summary of DBMS\_XMLSCHEMA\_ANNOTATE Subprograms

This table lists and describes the `DBMS_XMLSCHEMA_ANNOTATE` package subprograms.

**Table 204-1 DBMS\_XMLSCHEMA\_ANNOTATE Package Subprograms**

Subprogram	Description
<a href="#">ADDXDBNAMESPACE Procedure</a>	Adds the XDB namespace required for XDB annotation
<a href="#">DISABLEDEFAULTTABLECREATION Procedure</a>	Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element
<a href="#">DISABLEMAINTAINDOM Procedure</a>	Sets the DOM fidelity attribute to <code>FALSE</code>
<a href="#">ENABLEDEFAULTTABLECREATION Procedure</a>	Enables the creation of <code>ALL</code> top level tables by removing the empty default table name annotation
<a href="#">ENABLEMAINTAINDOM Procedure</a>	Sets the DOM fidelity attribute to <code>TRUE</code>
<a href="#">GETSCHEMAANNOTATIONS Function</a>	Creates a document containing the differences between the annotated XML schema and the original XML schema
<a href="#">GETSIDXDEFFROMVIEW Function</a>	Takes a <code>XMLTABLE</code> view definition on a <code>xmltype</code> column or table and it returns a <code>CLOB</code> which can be used as parameter to create a structured <code>xmlindex</code> that backs up the <code>XMLTABLE</code> view as relational table
<a href="#">PRINTWARNINGS Procedure</a>	Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema
<a href="#">REMOVEANYSTORAGE Procedure</a>	Removes the setting of the SQL type from the <code>ANY</code> child of the complex type with the given name
<a href="#">REMOVEDEFAULTTABLE Procedure</a>	Removes any default table attribute given for the element. After calling this procedure, the system generates table names
<a href="#">REMOVEMAINTAINDOM Procedure</a>	Removes all annotations used to maintain DOM from the given schema
<a href="#">REMOVEOUTOFFLINE Procedure</a>	Removes any existing <code>SQLInline</code> attributes to prevent out-of-line storage
<a href="#">REMOVESQLCOLLTYPE Procedure</a>	Removes a SQL collection type.
<a href="#">REMOVESQLNAME Procedure</a>	Removes a <code>SQLNAME</code> from a global element
<a href="#">REMOVESQLTYPE Procedure</a>	Removes a SQL type
<a href="#">REMOVESQLTYPE MAPPING Procedure</a>	Removes the SQL type mapping for the given schema type.
<a href="#">REMOVETABLEPROPS Procedure</a>	Removes the table storage properties from the <code>CREATE TABLE</code> statement
<a href="#">REMOVETIMESTAMPWITHTIMEZONE Procedure</a>	Removes the setting of the <code>TimeStampWithTimeZone</code> datatype from all <code>dateTime</code> typed elements in the XML schema
<a href="#">SETANYSTORAGE Procedure</a>	Assigns a SQL datatype to the <code>ANY</code> child of the complex type with the given name
<a href="#">SETDEFAULTTABLE Procedure</a>	Sets the name of the table for the specified global element
<a href="#">SETOUTOFFLINE Procedure</a>	Sets the <code>SQLInline</code> attribute to <code>FALSE</code>

**Table 204-1 (Cont.) DBMS\_XMLSCHEMA\_ANNOTATE Package Subprograms**

Subprogram	Description
<a href="#">SETSHEMAANNOTATIONS Procedure</a>	Takes the annotated differences resulting from a call to DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema
<a href="#">SETSQLCOLLTYPE Procedure</a>	Assigns a SQL type name for a collection
<a href="#">SETSQLNAME Procedure</a>	Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema
<a href="#">SETSQLTYPE Procedure</a>	Assigns a SQL type to a global object
<a href="#">SETSQLTYPE MAPPING Procedure</a>	Defines a mapping of schema type and SQL type
<a href="#">SETTABLEPROPS Procedure</a>	Specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement
<a href="#">SETTIMESTAMPWITH TIMEZONE Procedure</a>	Sets the TIMESTAMPWITH TIMEZONE datatype to all dateTime typed elements in the XML schema

## 204.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
 xmlschema IN OUT XMLTYPE);
```

### Parameters

**Table 204-2 ADDXDBNAMESPACE Procedure Parameters**

Parameter	Description
xmlschema	Gets an XML Schema as XMLTYPE, performs the annotation and returns it

### Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

## 204.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements.

The procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
 xmlschema IN OUT XMLType,
 globalelementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
 xmlschema IN OUT XMLType);
```

### Parameters

**Table 204-3** DISABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalelementName	Name of the global element in the schema

### Example

The `purchaseOrder` element will have an annotation similar to `xdb:defaultTable=""`.

```
DECLARE
 xml_schema XMLTYPE;
BEGIN
 SELECT out INTO xml_schema FROM annotation_tab;
 DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
 'purchaseOrder');
 UPDATE annotation_tab SET out = xml_schema;
END;
/
```

## 204.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to `FALSE`.

There are two overloads. The first sets DOM fidelity attribute to `FALSE` for all complex types, and the second sets it to `FALSE` for the named complex type. This is equivalent to adding `xdb:maintainDOM="false"` on all or specified complex types respectively.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
 xmlschema IN OUT XMLType,
 overwrite IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
 xmlschema IN OUT XMLType,
 complexTypeName IN VARCHAR2,
 overwrite IN BOOLEAN default TRUE);
```

## Parameters

**Table 204-4** DISABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

## 204.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
 xmlschema IN OUT XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
 xmlschema IN OUT XMLTYPE,
 globalElementName IN VARCHAR2);;
```

## Parameters

**Table 204-5** ENABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
globalElementName	Name of the global element in the schema

### Usage Notes

This procedure does not affect elements that have a default table name.

## 204.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to TRUE.

There are two overloads. The first sets DOM fidelity attribute to TRUE for all complex types, and the second sets it to TRUE for the named complex type.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
 xmlschema IN OUT XMLType,
 overwrite IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
 xmlschema IN OUT XMLType,
```

```

complexTypeName IN VARCHAR2,
overwrite IN BOOLEAN default TRUE);

```

### Parameters

**Table 204-6** ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

## 204.3.6 GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
 xmlschema IN xmlType)
RETURN xmlType;

```

### Parameters

**Table 204-7** GETSCHEMAANNOTATIONS Function Parameters

Parameter	Description
xmlschema	The original XML schema

### Return Values

This function returns the document `annotations.xml` as an `xmlType`.

### Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`.

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

#### See Also:

[SETSCHEMAANNOTATIONS Procedure](#)

### Example

For an example of DBMS\_XMLSCHEMA\_ANNOTATE.GETSCHEMAANNOTATIONS, see the example in [SETSCHEMAANNOTATIONS Procedure](#).

## 204.3.7 GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (
 viewName IN xmlType)
RETURN CLOB;
```

### Parameters

**Table 204-8** GETSIDXDEFFROMVIEW Function Parameters

Parameter	Description
viewName	The original XML schema

### Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

## 204.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (
 value IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 204-9** PRINTWARNINGS Procedure Parameters

Parameter	Description
val	For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE.

### Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed,

and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

## 204.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the ANY child of the complex type with the given name.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
 xmlschema IN OUT XMLType,
 complexTypeName IN VARCHAR2);
```

### Parameters

**Table 204-10 REMOVEANYSTORAGE Procedure Parameters**

Parameter	Description
xmlschema	The XML schema to be annotated.
complexTypeName	The name of the complex type.

### Usage Notes

This procedure reverses the [SETANYSTORAGE Procedure](#).

## 204.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
 xmlschema IN OUT XMLTYPE,
 globalElementName IN VARCHAR2);
```

### Parameters

**Table 204-11 REMOVEDEFAULTTABLE Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

### Example

Annotations can be verified anytime using "select out from annotation\_tab".

```
--The purchaseOrder element will have no annotation for defaultTable.
```

```

DECLARE
 xml_schema XMLTYPE;
BEGIN
 SELECT out INTO xml_schema FROM annotation_tab;
 DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
 'purchaseOrder');
 UPDATE annotation_tab SET out = xml_schema;
END;
/

```

## 204.3.11 REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
 xmlschema IN OUT XMLType);

```

### Parameters

**Table 204-12** REMOVEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated

## 204.3.12 REMOVEOUTOFLINE Procedure

This procedure removes any existing `SQLInline` attributes to prevent out-of-line storage.

There are three overloads.

### Syntax

Removes the `SQLInline` attribute for the named element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
 xmlschema IN OUT XMLType,
 elementName IN VARCHAR2,
 elementType IN VARCHAR2,
 overwrite IN BOOLEAN default TRUE);

```

Removes the `SQLInline` attribute for the object specified by its global object and local element names.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
 xmlschema IN OUT XMLType,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localElementName IN VARCHAR2);

```

Removes the `SQLInline` attribute for the referenced global element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
 xmlschema IN OUT XMLType,
 reference IN VARCHAR2);
```

### Parameters

**Table 204-13 REMOVEOUTOFLINE Procedure Parameters**

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
elementType	The element type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
reference	A reference to a global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

### Usage Notes

This procedure reverses [SETOUTOFLINE Procedure](#).

## 204.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
 xmlschema IN OUT XMLType,
 elementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
 xmlschema IN OUT XMLType,
 globalObject IN VARCHAR2,
 globalName IN VARCHAR2,
 localElementName IN VARCHAR2);
```

### Parameters

**Table 204-14 REMOVESQLCOLLTYPE Procedure Parameters**

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name

**Table 204-14 (Cont.) REMOVESQLCOLLTYPE Procedure Parameters**

Parameter	Description
globalObject	The global object (global complex type or global element)
globalName	The name of the global object
localElementName	The name of a local element that descends from the global element

### Usage Notes

This procedure reverses the [SETSQLCOLLTYPE Procedure](#).

## 204.3.14 REMOVESQLNAME Procedure

This procedure removes a `SQLNAME` from a global element.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
 xmlschema IN OUT XMLType,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localObject IN VARCHAR2,
 localObjectName IN VARCHAR2,
 sqlName IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 204-15 REMOVESQLNAME Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

### Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
 xml_schema XMLTYPE;
BEGIN
 SELECT out INTO xml_schema FROM annotation_tab;
```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
 'element', 'purchaseOrder',
 'element', 'shipTo',
 'SHIPTO_SQLNAME');
UPDATE annotation_tab SET out = xml_schema;
END;
/

```

## 204.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
 xmlschema in out XMLType,
 globalElementName IN VARCHAR2);

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
 xmlschema IN OUT XMLTYPE,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localObject IN VARCHAR2,
 localObjectName IN VARCHAR2);

```

### Parameters

**Table 204-16 REMOVESQLTYPE Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated.
globalObject	Global object (global complex type or global element)
globalElementName	Name of the global element.
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object

### Usage Notes

This procedure reverses the [SETSQLTYPE Procedure](#).

## 204.3.16 REMOVESQLTYPE MAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE MAPPING (
 xmlschema IN OUT XMLTYPE,
 schemaTypeName IN VARCHAR2);

```

## Parameters

**Table 204-17 REMOVESQLTYPE MAPPING Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Name of the schema type

## Usage Notes

This procedure reverses the [SETSQLTYPE MAPPING Procedure](#).

## 204.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the `CREATE TABLE` statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

## Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
 xmlschema IN OUT XMLTYPE,
 globalElementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
 xmlschema IN OUT XMLTYPE,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localElementName IN VARCHAR2);
```

## Parameters

**Table 204-18 REMOVETABLEPROPS Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element

## Usage Notes

This procedure reverses the [SETTABLEPROPS Procedure](#).

## 204.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
 xmlschema IN OUT XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
 xmlschema IN OUT XMLTYPE,
 schemaTypeName IN VARCHAR2);
```

### Parameters

**Table 204-19** REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>schemaTypeName</code>	Name of the schema type

### Usage Notes

This procedure reverses the [SETTIMESTAMPWITHTIMEZONE Procedure](#).

## 204.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the `ANY` child of the complex type with the given name.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE (
 xmlschema IN OUT XMLType,
 complexTypeName IN VARCHAR2,
 sqlTypeName IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 204-20** SETANYSTORAGE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>complexTypeName</code>	Name of the complex type
<code>sqlTypeName</code>	Name of the SQL type
<code>overwrite</code>	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

### Example

The `xsd:any` child of complex type `Items` is assigned an annotation similar to `xdb:SQLType="VARCHAR"`.

```
DECLARE xml_schema XMLTYPE;BEGIN SELECT out INTO
xml_schema FROM annotation_tab; DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage
(xml_schema,
'Items',
'VARCHAR'); UPDATE
annotation_tab SET out = xml_schema;END;
/
```

## 204.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
xmlschema IN OUT XMLTYPE,
globalElementName IN VARCHAR2,
tableName IN VARCHAR2,
overwrite IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 204-21 SETDEFAULTTABLE Procedure Parameters**

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>globalElementName</code>	Name of the global element in the schema
<code>tableName</code>	Name being assigned to the table
<code>overwrite</code>	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

## 204.3.21 SETOUTOFFLINE Procedure

This procedure sets the `SQLInline` attribute to `FALSE`, that is, it sets `xdb:SQLInline=FALSE`.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate `XMLType` table. XDB stores references to each row of the `XMLType` table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '1000 column limit' errors during XML schema registration, when some elements have complex types with many elements.

**Also See:**

*Oracle XML DB Developer's Guide*

There are three overloads.

**Syntax**

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
 xmlschema IN OUT XMLType,
 elementName IN VARCHAR2,
 elementType IN VARCHAR2,
 defaultTableName IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
 xmlschema IN OUT XMLType,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localElementName IN VARCHAR2,
 defaultTableName IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE` to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
 xmlschema IN OUT XMLType,
 reference IN VARCHAR2,
 defaultTableName IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

**Table 204-22 SETOUTOFLINE Procedure Parameters**

Parameter	Description
<code>xmlschema</code>	The XML schema to be annotated.
<code>elementName</code>	The element name
<code>elementType</code>	The element type
<code>defaultTableName</code>	The name of the default table.
<code>globalObject</code>	The global object (global complex type or global element)
<code>globalObjectName</code>	The name of the global object
<code>localElementName</code>	The name of a local element that descends from the global element.
<code>reference</code>	A reference to a global element

**Table 204-22 (Cont.) SETOUTOFLINE Procedure Parameters**

Parameter	Description
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

### Usage Notes

After XML schema registration and before loading XML instance data, use `DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES()` to make these references scope to the out-of-line table only. This ensures better query performance later on.

### Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to `xdb:defaultTable="CMMNT_DEFAULT_TABLE"`

```
DECLARE
 xml_schema xmltype;
BEGIN
 SELECT OUT INTO xml_schema FROM annotation_tab;

 DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
 'ipo:comment',
 'CMMNT_DEFAULT_TABLE');

 UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

## 204.3.22 SETSCHEMAANNOTATIONS Procedure

This procedure takes the annotated differences resulting from a call to `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` and patches them into the provided XML schema.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
 xmlschema IN OUT xmlType,
 annotations IN VARCHAR2);
```

### Parameters

**Table 204-23 SETSCHEMAANNOTATIONS Procedure Parameters**

Parameter	Description
xmlschema	An XML schema to be patched.
annotations	The differences document produced by calling <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> on the original XML schema and an annotated XML schema.

## Usage Notes

DBMS\_XMLSCHEMA\_ANNOTATE.SETSCHEMAANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

### See Also:

[GETSCHEMAANNOTATIONS Function](#)

## Example

The following example illustrates DBMS\_XMLSCHEMA\_ANNOTATE.SETSCHEMAANNOTATIONS shown here and [GETSCHEMAANNOTATIONS Function](#).

```

-- test getannotations and apply them
declare
 xml_schema xmltype;
 xml_schema2 xmltype;
 annotations xmltype;
begin
 select out into xml_schema from annotation_tab;

 -- get the annotations from the schema
 annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

 -- apply the annotations to the schema
 select inp into xml_schema2 from annotation_tab;

 DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

 update annotation_tab t set t.out = xml_schema2;
end;
/

```

## 204.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`.

Using this procedure, XDB creates SQLTypes with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
 xmlschema IN OUT XMLTYPE,
 elementName IN VARCHAR2,
 sqlCollType IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
 xmlschema IN OUT XMLType,
 globalObject IN VARCHAR2,

```

```

globalObjectName IN VARCHAR2,
localElementName IN VARCHAR2,
sqlCollType IN VARCHAR2,
overwrite IN BOOLEAN default TRUE);

```

### Parameters

**Table 204-24 SETSQLCOLLTYPE Procedure Parameters**

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
sqlCollType	The SQL collection type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

### Example

The `item` element will have an annotation similar to `xdb:SQLCollType="ITEM_SQL_COL_TYPE"`.

```

declare
 xml_schema xmltype;
begin
 SELECT out INTO xml_schema FROM annotation_tab;
 DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
 'item',
 'ITEM_SQL_COL_TYPE',TRUE);
 UPDATE annotation_tab SET out = xml_schema;
end;

```

## 204.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
 xmlschema IN OUT XMLType,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localObject IN VARCHAR2,
 localObjectName IN VARCHAR2,
 sqlName IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 204-25 SETSQLNAME Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

### Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```

DECLARE
 xml_schema XMLTYPE;
BEGIN
 SELECT out INTO xml_schema FROM annotation_tab;
 DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
 'element', 'purchaseOrder',
 'element', 'shipTo',
 'SHIPTO_SQLNAME');
 UPDATE annotation_tab SET out = xml_schema;
END;
/

```

## 204.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
 xmlschema IN OUT XMLTYPE,
 globalElementName IN VARCHAR2,
 sqlType IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
 xmlschema IN OUT XMLTYPE,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localObject IN VARCHAR2,
 localObjectName IN VARCHAR2,

```

```

sqlType IN VARCHAR2,
overwrite IN BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 204-26 SETSQLTYPE Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
globalElementName	Name of the global element
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlType	SQL type assigned to the named global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

## Example

The purchaseOrder element will have an annotation similar to `xdb:SQLType="PO_SQLTYPE"` and the shipTo element has one similar to `xdb:SQLType="VARCHAR"`.

```

DECLARE
 xml_schema xmltype;
BEGIN
 SELECT out INTO xml_schema FROM annotation_tab;
 DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
 'purchaseOrder',
 'PO_SQLTYPE');
 UPDATE annotation_tab SET out = xml_schema;
END;
/

DECLARE xml_schema xmltype;BEGIN SELECT out INTO
xml_schema FROM annotation_tab; DBMS_XMLSCHEMA_ANNOTATE.setSQLType
(xml_schema,
'element','purchaseOrder',
'element','shipTo',
'VARCHAR'); UPDATE
annotation_tab SET out = xml_schema;END;
/

```

## 204.3.26 SETSQLTYPE MAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the SETSQLTYPE procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

**Syntax**

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE_MAPPING (
 xmlschema IN OUT XMLType,
 schemaTypeName IN VARCHAR2,
 sqlTypeName IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

**Parameters****Table 204-27 SETSQLTYPE\_MAPPING Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Schema type
sqlTypeName	Name of the SQL type
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

**Example**

The attribute `orderDate` will have an annotation similar to `xdb:SQLType="DATE"`.

```
declare xml_schema xmltype;beginSELECT out INTO
xml_schema FROM annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping
(xml_schema,
'date',
'DATE');UPDATE annotation_tab
SET out = xml_schema;end;
/
```

## 204.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement.

There are two overloads with different parameter requirements, as indicated:

**Syntax**

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
 xmlschema IN OUT XMLType,
 globalElementName IN VARCHAR2,
 tableProps IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
 xmlschema IN OUT XMLType,
 globalObject IN VARCHAR2,
 globalObjectName IN VARCHAR2,
 localElementName IN VARCHAR2,
 tableProps IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 204-28 SETTABLEPROPS Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
tableProps	Table properties
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

### Example

The `purchaseOrder` element will have an annotation similar to `xdb:tableProps="CACHE"`.

```
DECLARE xml_schema XMLTYPE;BEGIN SELECT out INTO xml_schema FROM
annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
'purchaseOrder' , 'CACHE'); UPDATE annotation_tab SET out =
xml_schema;END;
/
```

## 204.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema.

This is equivalent to adding `xdb:SQLType="TIMESTAMP WITH TIME ZONE"` to all `dateTime` objects.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
xmlschema IN OUT XMLTYPE,
overwrite IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 204-29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

# DBMS\_XMLSTORAGE\_MANAGE

The `DBMS_XMLSTORAGE_MANAGE` package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XMLSTORAGE\\_MANAGE Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 205.1 DBMS\_XMLSTORAGE\_MANAGE Overview

`DBMS_XMLSTORAGE_MANAGE` contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

## 205.2 DBMS\_XMLSTORAGE\_MANAGE Security Model

Owned by XDB, the `DBMS_XMLSTORAGE_MANAGE` package must be created by SYS or XDB. The `EXECUTE` privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

## 205.3 Summary of DBMS\_XMLSTORAGE\_MANAGE Subprograms

This table lists and describes the `DBMS_XML_STORAGE` package subprograms.

**Table 205-1 DBMS\_XMLSTORAGE\_MANAGE Package Subprograms**

Subprogram	Description
<a href="#">DISABLEINDEXESANDCONSTRAINTS Procedure</a>	Disables the indexes and constraints for XMLType tables and XMLType columns

**Table 205-1 (Cont.) DBMS\_XMLSTORAGE\_MANAGE Package Subprograms**

Subprogram	Description
<a href="#">ENABLEINDEXESANDCONSTRAINTS Procedure</a>	Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables
<a href="#">EXCHANGEPOSTPROC Procedure</a>	Enable constraints after exchange partition
<a href="#">EXCHANGEPREPROC Procedure</a>	Disable constraints before exchange partition
<a href="#">INDEXXMLREFERENCES Procedure</a>	Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table
<a href="#">REFPARTITIONEXCHANGEIN Procedure</a>	This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an xmltype column with a local xmlindex.
<a href="#">REFPARTITIONEXCHANGEOUT Procedure</a>	Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.
<a href="#">RENAMECOLLECTIONTABLE Procedure</a>	Renames a collection table to the given table name
<a href="#">SCOPEXMLREFERENCES Procedure</a>	Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types
<a href="#">XPATHT2TABCOLMAPPING Function</a>	Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name

## 205.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
 owner_name IN VARCHAR2 DEFAULT USER,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2 DEFAULT NULL,
 clear IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 205-2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters**

Parameter	Description
owner_name	Owner's name
table_name	Name of the XMLType table that the procedure is being performed on
column_name	XMLType column name

**Table 205-2 (Cont.) DISABLEINDEXESANDCONSTRAINTS Procedure Parameters**

Parameter	Description
clear	Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them.

### Usage Notes

#### Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

#### Using clear to Enable and Disable Indexes and Constraints

 **Note:**

If the DISABLEINDEXESANDCONSTRAINTS procedure is called with clear set to TRUE, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the DISABLEINDEXESANDCONSTRAINTS procedure with clear set to TRUE.

Ideally, it is recommended that you set clear set to TRUE for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) clear should be set to FALSE, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with clear set to TRUE for the next bulk load operation.

### Example

The following example illustrates the use of clear in the DISABLEINDEXESANDCONSTRAINTS procedure and the [ENABLEINDEXESANDCONSTRAINTS Procedure](#).

First, add a not-NULL constraint on comment element of the PURCHASEORDER\_TAB table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check
("XMLDATA"."comment" IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the clear as TRUE, by calling the DISABLEINDEXESANDCONSTRAINTS procedure:

```
BEGIN
 XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
 (USER, 'PURCHASEORDER_TAB', NULL, TRUE);
END;
```

/

Next, perform a bulk load operation (such as datapump import) which violates constraint `c1` in the `ALTER` table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
 tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

**NOTE:** To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
 WHERE owner = user;
```

Finally, try to enable the constraint using the `ENABLEINDEXESANDCONSTRAINTS` procedure. It raises an error because `c1`, the not null constraint, is violated by the bulk load operation:

```
BEGIN
 xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
 (USER, 'PURCHASEORDER_TAB');
END;
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear= FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully). Note: `clear = FALSE` by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
 xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
 (USER, 'PURCHASEORDER_TAB');
END;
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
 WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```
BEGIN
 xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
 (USER, 'PURCHASEORDER_TAB');
END;
```

## 205.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an `XMLType` table including its child tables and out-of-line tables.

When `column_name` is passed, it does the same for this `XMLType` column.

**Syntax**

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (
 owner_name IN VARCHAR2 DEFAULT USER,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 205-3** ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from
column_name	Column name

**Usage Notes**

This procedure reverses [DISABLEINDEXESANDCONSTRAINTS Procedure](#).

**Example**

See [DISABLEINDEXESANDCONSTRAINTS Procedure](#)

## 205.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

**Syntax**

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (
 owner_name IN VARCHAR2 DEFAULT USER,
 table_name IN VARCHAR2);
```

**Parameters****Table 205-4** EXCHANGEPOSTPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

## 205.3.4 EXCHANGEPROC Procedure

This procedure disable constraints before exchange partition.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPROC (
 owner_name IN VARCHAR2 DEFAULT USER,
 table_name IN VARCHAR2);
```

### Parameters

**Table 205-5 EXCHANGEPROC Procedure Parameters**

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

## 205.3.5 INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends \_1, \_2, and so on to their names.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
 owner_name IN VARCHAR2 DEFAULT USER,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 205-6 INDEXXMLREFERENCES Procedure Parameters**

Parameter	Description
owner_name	The owner's name
table_name	The table being indexed
column_name	A column name. Not needed for XML type tables.
index_name	The name of the newly created index

### Usage Notes

This procedure is only used if the REFS are scoped. See [SCOPEXMLREFERENCES Procedure](#).

Indexed REFS lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFS.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFS recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML\_OUT\_OF\_LINE\_TABLES or XML\_NESTED\_TABLES view. This creates the index names from the current value of a column in the view.

 **Note:**

This procedure is limited to the structured storage model.

## 205.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (
 owner_name IN VARCHAR2,
 parent_table_name IN VARCHAR2,
 child_table_name IN VARCHAR2,
 parent_exchange_table_name IN VARCHAR2,
 child_exchange_table_name IN VARCHAR2,
 parent_exchange_stmt IN CLOB,
 child_exchange_stmt IN CLOB);
```

### Parameters

**Table 205-7 REFPARTITIONEXCHANGEIN Parameters**

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name

**Table 205-7 (Cont.) REFPARTITIONEXCHANGEIN Parameters**

Parameter	Description
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

## 205.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT (
 owner_name IN VARCHAR2,
 parent_table_name IN VARCHAR2,
 child_table_name IN VARCHAR2,
 parent_exchange_table_name IN VARCHAR2,
 child_exchange_table_name IN VARCHAR2,
 parent_exchange_stmt IN CLOB,
 child_exchange_stmt IN CLOB);
```

### Parameters

**Table 205-8 REFPARTITIONEXCHANGEOUT Parameters**

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named parent_table_name
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named child_table_name
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named parent_table_name and the table named parent_exchange_table_name

**Table 205-8 (Cont.) REFPARTITIONEXCHANGEOUT Parameters**

Parameter	Description
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named child_table_name and the table named child_exchange_table_name

## 205.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the XMLType base table or an XMLType column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
 owner_name IN VARCHAR2 DEFAULT USER,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2 DEFAULT NULL,
 xpath IN VARCHAR2,
 collection_table_name IN VARCHAR2
 namespaces IN VARCHAR2 default NULL); // For release 11.2 only
```

### Parameters

**Table 205-9 RENAMECOLLECTIONTABLE Procedure Parameters**

Parameter	Description
owner_name	The name of the owner
table_name	The name of a base table that can be used as the starting point for specifying the collection table
column_name	An XMLType column that can be the starting point for specifying the collection table
xpath	The XPath expression that specifies the collection table
collection_table_name	The name of the collection table
namespaces	For Oracle Database 11g Release 2 (11.2) and higher. The namespaces used in XPath.

### Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

**Note:**

This procedure is limited to the structured storage model.

For Oracle Database 11g Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

**Example**

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
 USER,
 'EMP_TAB',
 NULL,
 '"XMLDATA"."EMPLOYEE"."NAME"',
 'EMP_TAB_NAMELIST');
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
 USER,
 'EMP_TAB',
 NULL,
 '/e:Employee/Name',
 'EMP_TAB_NAMELIST',
 ''http://www.oracle.com/emp.xsd'' as "e");
```

## 205.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types.

**Syntax**

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

**Usage Notes**

- If you have used [SETOUTOFFLINE Procedure](#) in the `DBMS_XMLSTORAGE_MANAGE` package to avoid raising '1000 column limit' errors during XML schema registration, you should also use [SCOPEXMLREFERENCES Procedure](#).
- Using `SCOPEXMLREFERENCES` after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

 **Note:**

This procedure is limited to the structured storage model.

## 205.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
 owner_name IN VARCHAR2 DEFAULT USER,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2 DEFAULT NULL,
 xpath IN VARCHAR2,
 namespaces IN VARCHAR2 DEFAULT NULL)
RETURN XMLTYPE;
```

### Parameters

**Table 205-10 XPATH2TABCOLMAPPING Procedure Parameters**

Parameter	Description
owner_user	Owner's name
table_name	Name of the base table
column_name	Optional name of the XML type column if table_name is not an XMLType table. If table_name refers to XMLType table then column_name should be NULL.
xpath	Path expression in DOT notation or XPath notation (see examples below)
namespaces	Optional namespace definitions for path expression

### Examples

XPath2TabColMapping evaluated on XMLType table with XPath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
 USER, 'XML_TAB', '', '//n1:item/n1:location','xdbXmark' as "n1")
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table SYS\_NT12345 and column location.

XPath2TabColMapping evaluated on table not of XMLType but with XMLType column  
by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
 USER, 'PurchaseOrderTab', 'XMLCOL', 'xmldata.LineItems.LineItem', '')
FROM DUAL;
```

# DBMS\_XMLSTORE

DBMS\_XMLSTORE provides the ability to store XML data in relational tables.

This chapter contains the following sections:

- [Security Model](#)
- [Types](#)
- [Summary of DBMS\\_XMLSTORE Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 206.1 DBMS\_XMLSTORE Security Model

Owned by XDB, the DBMS\_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 206.2 Types

The DBMS\_XMLSTORE subprograms use the ctxType Type.

**Table 206-1** *Types of DBMS\_XMLSTORE*

Type	Description
ctxType	The type of the query context handle. This is the return type of <a href="#">NEWCONTEXT</a> .

## 206.3 Summary of DBMS\_XMLSTORE Subprograms

This table lists the DBMS\_XMLSTORE subprograms and briefly describes them.

**Table 206-2** *DBMS\_XMLSTORE Package Subprograms*

Method	Description
<a href="#">CLEARKEYCOLUMNLIST</a>	Clears the key column list.
<a href="#">CLEARUPDATECOLUMNLIST</a>	Clears the update column list.
<a href="#">CLOSECONTEXT</a>	It closes/deallocates a particular save context.

**Table 206-2 (Cont.) DBMS\_XMLSTORE Package Subprograms**

Method	Description
<a href="#">DELETEXML</a>	Deletes records specified by data from the XML document, from the table specified at the context creation time.
<a href="#">INSERTXML</a>	Inserts the XML document into the table specified at the context creation time.
<a href="#">NEWCONTEXT</a>	Creates a save context, and returns the context handle.
<a href="#">SETKEYCOLUMN</a>	This method adds a column to the key column list.
<a href="#">SETROWTAG</a>	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
<a href="#">SETUPDATECOLUMN</a>	Adds a column to the "update column list".
<a href="#">UPDATEXML</a>	Updates the table given the XML document.

## 206.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

### Syntax

```
PROCEDURE clearKeyColumnList(
 ctxHdl IN ctxType);
```

**Table 206-3 CLEARKEYCOLUMNLIST Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 206.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

### Syntax

```
PROCEDURE clearUpdateColumnList(
 ctxHdl IN ctxType);
```

**Table 206-4 CLEARUPDATECOLUMNLIST Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 206.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

### Syntax

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```

**Table 206-5 CLOSECONTEXT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

## 206.3.4 DELETEXML

DELETEXML deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

### Syntax

The following syntax uses a VARCHAR2 type for the xDoc parameter.

```
FUNCTION deleteXML(
 ctxHdl IN ctxPType,
 xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax uses a CLOB type for the xDoc parameter.

```
FUNCTION deleteXML(
 ctxHdl IN ctxType,
 xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax uses an XMLType type for the xDoc parameter.

```
FUNCTION deleteXML(
 ctxHdl IN ctxType,
 xDoc IN XMLType)
RETURN NUMBER;
```

### Parameters

**Table 206-6 DELETEXML Function Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

## 206.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into those columns unless `SETUPDATECOLUMN` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

### Syntax

```
FUNCTION insertXML(
 ctxHdl IN ctxType,
 xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION insertXML(
 ctxHdl IN ctxType,
 xDoc IN CLOB)
RETURN NUMBER;
```

```
FUNCTION insertXML(
 ctxHdl IN ctxType,
 xDoc IN XMLType)
RETURN NUMBER;
```

### Parameters

**Table 206-7** INSERTXML Function Parameters

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>xDoc</code>	(IN)	String containing the XML document.

## 206.3.6 NEWCONTEXT

`NEWCONTEXT` creates a save context and returns the context handle.

### Syntax

```
FUNCTION newContext(
 targetTable IN VARCHAR2)
RETURN ctxType;
```

**Table 206-8 NEWCONTEXT Function Parameters**

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

## 206.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

### Syntax

```
PROCEDURE setKeyColumn(
 ctxHdl IN ctxType,
 colName IN VARCHAR2);
```

**Table 206-9 SETKEYCOLUMN Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be <code>NULL</code> .

## 206.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

### Syntax

```
PROCEDURE setRowTag(
 ctxHdl IN ctxType,
 tag IN VARCHAR2);
```

**Table 206-10 SETROWTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

## 206.3.9 SETUPDATECOLUMN

`SETUPDATECOLUMN` adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for `INSERTXML` to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `setUpdateColumn` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

### Syntax

```
PROCEDURE setUpdateColumn(
 ctxHdl IN ctxType,
 colName IN VARCHAR2);
```

**Table 206-11** SETUPDATECOLUMN Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

## 206.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

### Syntax

The following syntax passes the `xDoc` parameter as a `VARCHAR2`.

```
FUNCTION updateXML(
 ctxHdl IN ctxType,
 xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `CLOB`.

```
FUNCTION updateXML(
 ctxHdl IN ctxType,
 xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `XMLType`.

```
FUNCTION updateXML(
 ctxHdl IN ctxType,
 xDoc IN XMLType)
RETURN NUMBER;
```

## Parameters

**Table 206-12 UPDATEXML Function Parameters**

Parameter	IN / OUT	Description
ctxHdl	( IN )	Context handle.
xDoc	( IN )	String containing the XML document.

# DBMS\_XPLAN

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats.

You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

## See Also:

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
- For more information on the `V$SQL_PLAN` fixed view, see *Oracle Database Reference*
- For more information on the `V$SQL_PLAN_STATISTICS` fixed view, see *Oracle Database Reference*

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Examples](#)
- [Summary of DBMS\\_XPLAN Subprograms](#)

## 207.1 DBMS\_XPLAN Overview

The `DBMS_XPLAN` package supplies five table functions.

These functions are listed below:

- `DISPLAY` - to format and display the contents of a plan table.
- `DISPLAY_AWR` - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- `DISPLAY_CURSOR` - to format and display the contents of the execution plan of any loaded cursor.
- `DISPLAY_SQL_PLAN_BASELINE` - to display one or more execution plans for the SQL statement identified by SQL handle

- `DISPLAY_SQLSET` - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

## 207.2 DBMS\_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (`SYS`). The table function `DISPLAY_CURSOR` requires `SELECT` or `READ` privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`.

`DISPLAY_AWR Function` requires the user to have `SELECT` or `READ` privileges on `DBA_HIST_SQL_PLAN`, `DBA_HIST_SQLTEXT`, and `V$DATABASE`.

`DISPLAY_SQLSET Function` requires the user to have the `SELECT` or `READ` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

`DISPLAY_SQL_PLAN_BASELINE Function` requires the user to have the `SELECT` or `READ` privilege on `DBA_SQL_PLAN_BASELINES` as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

The preceding privileges are granted automatically as part of `SELECT_CATALOG_ROLE`.

## 207.3 DBMS\_XPLAN Data Structures

The `DBMS_XPLAN` package defines a `TABLE` type.

### Table Types

- `DBMS_XPLAN PLAN_OBJECT_LIST Table Type`

### 207.3.1 DBMS\_XPLAN PLAN\_OBJECT\_LIST Table Type

This type allows for a list of generic objects as input to the `COMPARE_PLANS` function.

#### Syntax

```
TYPE plan_object_list IS TABLE OF generic_plan_object;
```

The generic object abstracts the common attributes of plans from all plan sources. Every plan source is a subclass of the `plan_object_list` superclass. The following table summarizes the different plan sources. Note that when an optional parameter is null, it can correspond to multiple objects. For example, if you do not specify a child number for `cursor_cache_object`, then it matches all cursor cache statements with the specified SQL ID.

**Table 207-1 Plan Sources for PLAN\_OBJECT\_LIST**

Plan Source	Specification	Description
Plan table	<code>plan_table_object(owner, plan_table_name, statement_id, plan_id)</code>	The parameters are as follows: <ul style="list-style-type: none"> <li>• <code>owner</code>—The owner of the plan table</li> <li>• <code>plan_table_name</code>—The name of the plan table</li> <li>• <code>statement_id</code>—The ID of the statement (optional)</li> <li>• <code>plan_id</code>—The ID of the plan (optional)</li> </ul>
Cursor cache	<code>cursor_cache_object(sql_id, child_number)</code>	The parameters are as follows: <ul style="list-style-type: none"> <li>• <code>sql_id</code>—The SQL ID of the plan</li> <li>• <code>child_number</code>—The child number of the plan in the cursor cache (optional)</li> </ul>
AWR	<code>awr_object(sql_id, dbid, con_dbid, plan_hash_value)</code>	The parameters are as follows: <ul style="list-style-type: none"> <li>• <code>sql_id</code>—The SQL ID of the plan</li> <li>• <code>dbid</code>—The database ID (optional)</li> <li>• <code>con_dbid</code>—The CDB ID (optional)</li> <li>• <code>plan_hash_value</code>—The hash value of the plan (optional)</li> </ul>
SQL tuning set	<code>sqlset_object (sqlset_owner, sqlset_name, sql_id, plan_hash_value)</code>	The parameters are as follows: <ul style="list-style-type: none"> <li>• <code>sqlset_owner</code>—The owner of the SQL tuning set</li> <li>• <code>sqlset_name</code>—The name of the SQL tuning set</li> <li>• <code>sql_id</code>—The SQL ID of the plan</li> <li>• <code>plan_hash_value</code>—The hash value of the plan (optional)</li> </ul>
SQL plan management	<code>spm_object (sql_handle, plan_name)</code>	The parameters are as follows: <ul style="list-style-type: none"> <li>• <code>sql_handle</code>—The SQL handle of plans protected by SQL plan management</li> <li>• <code>plan_name</code>—The name of the SQL plan baseline (optional)</li> </ul>
SQL profile	<code>sql_profile_object (profile_name)</code>	The <code>profile_name</code> parameter specifies the name of the SQL profile.
Advisor	<code>advisor_object (task_name, execution_name, sql_id, plan_id)</code>	The parameters are as follows: <ul style="list-style-type: none"> <li>• <code>task_name</code>—The name of the advisor task</li> <li>• <code>execution_name</code>—The name of the task execution</li> <li>• <code>sql_id</code>—The SQL ID of the plan</li> <li>• <code>plan_id</code>—The advisor plan ID (optional)</li> </ul>

## 207.4 Examples

These examples show sample uses of DBMS\_XPLAN.

### Displaying a Plan Table Using DBMS\_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
 WHERE e.deptno = d.deptno
 AND e.ename='benoit';
```

Display the plan using the DBMS\_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

Plan hash value: 3693697075

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT		1	57	6 (34)	00:00:01
* 1	HASH JOIN		1	57	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	37	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	80	3 (34)	00:00:01

Predicate Information (identified by operation id):

```
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

### Displaying a Cursor Execution Plan Using DBMS\_XPLAN.DISPLAY\_CURSOR

By default, the table function DISPLAY\_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
 WHERE e.deptno = d.deptno
 AND e.empno=7369;
```

```
ENAME

SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR();
```

This query produces the following output:

Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

```
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT					
* 1	HASH JOIN		1	16	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	13	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	12	3 (34)	00:00:01

Predicate Information (identified by operation id):

```
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."EMPNO"=7369)
```

21 rows selected.

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

SQL_ID	CHILD_NUMBER
gwp663cqh5qbf	0

Display the execution plan for the cursor:

```
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0);
```

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT				7 (100)	
1	SORT GROUP BY		4	64	7 (43)	00:00:01
* 2	HASH JOIN		14	224	6 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	44	3 (34)	00:00:01
4	TABLE ACCESS FULL	EMP	14	70	3 (34)	00:00:01

Predicate Information (identified by operation id):

```
2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to get the `sql_id` and `child_number` pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number) t WHERE
sql_text LIKE '%TOTO%';
```

### Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the `display` and `display_cursor` table functions. In [Displaying a Plan Table Using DBMS\\_XPLAN.DISPLAY](#), the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY();
Plan hash value: 3693697345
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time	TQ	INOUT	PQ Distrib
0	SELECT STATEMENT		1	117	6 (50)	00:00:01			
1	PX COORDINATOR								
2	PX SEND QC (ORDER)	::TQ10003	1	117	6 (50)	00:00:01	Q1,03	P->S	QC (ORDER)
3	SORT ORDER BY		1	117	6 (50)	00:00:01	Q1,03	PCWP	
4	PX RECEIVE		1	117	5 (40)	00:00:01	Q1,03	PCWP	
5	PX SEND RANGE	::TQ10002	1	117	5 (40)	00:00:01	Q1,02	P->P	RANGE
* 6	HASH JOIN		1	117	5 (40)	00:00:01	Q1,02	PCWP	
7	PX RECEIVE		1	87	2 (50)	00:00:01	Q1,02	PCWP	
8	PX SEND HASH	::TQ10001	1	87	2 (50)	00:00:01	Q1,01	P->P	HASH
9	PX BLOCK ITERATOR		1	87	2 (50)	00:00:01	Q1,01	PCWC	
* 10	TABLE ACCESS FULL	EMP	1	87	2 (50)	00:00:01	Q1,01	PCWP	
11	BUFFER SORT						Q1,02	PCWC	
12	PX RECEIVE		4	120	3 (34)	00:00:01	Q1,02	PCWP	
13	PX SEND HASH	::TQ10000	4	120	3 (34)	00:00:01		S->P	HASH
14	TABLE ACCESS FULL	DEPT	4	120	3 (34)	00:00:01			

Predicate Information (identified by operation id):

```
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
```

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the `statement_id` parameter passed to the `display` table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no

need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

### Using a View to Display Last Explain Plan

```
define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

display the output of the last explain plan command
SELECT * FROM PLAN;
```

## 207.5 Summary of DBMS\_XPLAN Subprograms

This table lists the DBMS\_XPLAN subprograms and briefly describes them.

**Table 207-2** *DBMS\_XPLAN Package Subprograms*

Subprogram	Description
<a href="#">COMPARE_PLANS Function</a>	Compares each plan in a list with a reference plan and returns the report
<a href="#">DIFF_PLAN Function</a>	Compares plans
<a href="#">DISPLAY Function</a>	Displays the contents of the plan table
<a href="#">DISPLAY_AWR Function</a>	Displays the contents of an execution plan stored in the AWR
<a href="#">DISPLAY_CURSOR Function</a>	Displays the execution plan of any cursor in the cursor cache
<a href="#">DISPLAY_PLAN Function</a>	Displays the contents of the plan table in a variety of formats with CLOB output type
<a href="#">DISPLAY_SQL_PLAN_BASELINE Function</a>	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
<a href="#">DISPLAY_SQLSET Function</a>	Displays the execution plan of a given statement stored in a SQL tuning set

### 207.5.1 COMPARE\_PLANS Function

This function compares each plan in a list with a reference plan and returns the report.

#### Syntax

```
DBMS_XPLAN.COMPARE_PLANS(
 reference_plan IN generic_plan_object,
 compare_plan_list IN plan_object_list,
 type IN VARCHAR2 := 'TEXT',
 level IN VARCHAR2 := 'TYPICAL',
 section IN VARCHAR2 := 'ALL')
RETURN CLOB;
```

## Parameters

**Table 207-3 COMPARE\_PLANS Function Parameters**

Parameter	Description
<code>reference_plan</code>	The reference plan. This plan should always evaluate to a single plan.
<code>compare_plan_list</code>	List of plans to compare with reference plan. The <code>compare_plan_list</code> is a list of <code>generic_object</code> and each <code>generic_object</code> could correspond to one or more plans.
<code>type</code>	Type of the report. Possible values are: <ul style="list-style-type: none"> <li>• TEXT</li> <li>• HTML</li> <li>• XML</li> </ul>
<code>level</code>	Format of the report. Possible values are: <ul style="list-style-type: none"> <li>• BASIC</li> <li>• TYPICAL</li> <li>• ALL</li> </ul>
<code>section</code>	A particular section in the report. Possible values are: <ul style="list-style-type: none"> <li>• SUMMARY</li> <li>• FINDINGS</li> <li>• PLANS</li> <li>• INFORMATION</li> <li>• ERRORS</li> </ul>

### Example 207-1 Examples

The following examples illustrate the usage of COMPARE\_PLANS Function.

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
- plan_object_list (cursor_cache_object('8mkxm7ur07za0', 4)));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the child cursor number 4 for the same SQL ID. Returns the report in the text format (default).

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0',
2),
plan_object_list(spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_sdfjkd')));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the plan baseline captured by SPM for query whose SQL handle is 'SQL\_024d0f7d21351f5d' and plan name is 'SQL\_PLAN\_sdfjkd'. Returns the report in the text format (default).

```

var report clob;
exec :report = dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
 plan_object_list(cursor_cache_object('8mkxm7ur07za0'),
sqlset_object('SH', 'SQLT_WORKLOAD', '6vfqvav0rgyad'),
awr_object('6vfqvav0rgyad', 5), spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_ sdfjkd'), plan_table_object('SH', 'plan_table',
NULL, 38), sql_profile_object('pe3r3ejsfd'), a
dvisor_object('TASK_1228', 'EXEC_1928', '8mkxm7ur07za0')), type => 'XML',
 level => 'ALL', section => 'SUMMARY');

```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with each of the plans in the following list:

- cursor\_cache\_object('8mkxm7ur07za0'): All the plans in the cursor cache that are generated for the SQL ID '8mkxm7ur07za0'.
- sqlset\_object('SH', 'SQLT\_WORKLOAD', '6vfqvav0rgyad'): All the plans generated in the SQL tuning set SH. SQLT\_WORKLOAD for the SQL ID '6vfqvav0rgyad'.
- awr\_object('6vfqvav0rgyad', 5): All the plans in AWR that are captured for database ID 5 and SQL ID '6vfqvav0rgyad'.
- spm\_object('SQL\_024d0f7d21351f5d', 'SQL\_PLAN\_ sdfjkd'): The plan baseline for the query with SQL handle 'SQL\_024d0f7d21351f5d' with name 'SQL\_PLAN\_ sdfjkd'.
- plan\_table\_object('SH', 'plan\_table', NULL, 38): Plan stored in SH.plan\_table identified by plan\_id=38.
- sql\_profile\_object('pe3r3ejsfd'): Plan identified by the SQL profile name 'pe3r3ejsfd'.
- advisor\_object('TASK\_1228', 'EXEC\_1928', '8mkxm7ur07za0'): All the plans stored in SQL advisor identified by task name 'TASK\_1228', execution name 'EXEC\_1928' and SQL ID '8mkxm7ur07za0'.

## 207.5.2 DIFF\_PLAN Function

This function compares two sql plans, the reference plan and the target plan. This function returns a task\_id that can be used to retrieve the report of findings.

### Syntax

```

DBMS_XPLAN.DIFF_PLAN(
 sql_text IN CLOB,
 outline IN CLOB,
 user_name IN VARCHAR2 := 'NULL')
RETURN VARCHAR2;

```

### Parameters

**Table 207-4** DIFF\_PLAN Function Parameters

Parameter	Description
sql_text	The text of the SQL statement.
outline	Used to generate the target plan.
user_name	The parsing schema name default to current user.

## 207.5.3 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

### Syntax

```
DBMS_XPLAN.DISPLAY(
 table_name IN VARCHAR2 DEFAULT 'PLAN_TABLE',
 statement_id IN VARCHAR2 DEFAULT NULL,
 format IN VARCHAR2 DEFAULT 'TYPICAL',
 filter_preds IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 207-5** DISPLAY Function Parameters

Parameter	Description
<code>table_name</code>	Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .
<code>statement_id</code>	Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.

Table 207-5 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS, and REMOTE SQL information (see below).</li> <li>• <b>SERIAL</b>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL</b>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the <a href="#">DISPLAY Function</a>. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS, and LAST (see the <a href="#">DISPLAY_CURSOR Function</a> or the <a href="#">DISPLAY_SQLSET Function</a> for a full description of these four keywords).</p>

**Table 207-5 (Cont.) DISPLAY Function Parameters**

Parameter	Description
<code>filter_preds</code>	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=&gt;'plan_id = 10'</code> Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes)

**Usage Notes**

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

**⚠ WARNING:**

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

**Examples**

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM TABLE (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my\_plan\_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as  
statement\_id='sales\_query':

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'sales_query'));
```

## 207.5.4 DISPLAY\_AWR Function

This table function displays the contents of an execution plan stored in AWR.

### Note:

This function is deprecated. Use `DISPLAY_WORKLOAD_REPOSITORY` instead. `DISPLAY_AWR` only works with snapshots for the local DBID, whereas `DISPLAY_WORKLOAD_REPOSITORY` supports all snapshots inside AWR, including remote and imported snapshots.

### Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER DEFAULT NULL,
 db_id IN NUMBER DEFAULT NULL,
 format IN VARCHAR2 DEFAULT TYPICAL);
```

### Parameters

**Table 207-6 DISPLAY\_AWR Table Function Parameters**

Parameter	Description
sql_id	Specifies the <code>SQL_ID</code> of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column <code>SQL_ID</code> in <code>DBA_HIST_SQLTEXT</code> .
plan_hash_value	Specifies the <code>PLAN_HASH_VALUE</code> of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given <code>SQL_ID</code> .
db_id	Specifies the <code>database_id</code> for which the plan of the SQL statement, identified by <code>SQL_ID</code> should be displayed. If not supplied, the <code>database_id</code> of the local database is used, as shown in <code>V\$DATABASE</code> .

**Table 207-6 (Cont.) DISPLAY\_AWR Table Function Parameters**

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>• <b>SERIAL</b>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL</b>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>

### Usage Notes

- To use the DISPLAY\_AWR functionality, the calling user must have SELECT or READ privilege on DBA\_HIST\_SQL\_PLAN, DBA\_HIST\_SQLTEXT, and V\$DATABASE, otherwise it shows an appropriate error message.
- The following examples show different ways of using the format parameter:
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.

- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates and the predicate section.

### Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.*
FROM DBA_HIST_SQLTEXT ht,
table(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null, 'ALL')) tf
WHERE ht.sql_text like '%TOTO%';
```

## 207.5.5 DISPLAY\_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as. I/O, memory and timing) can be reported (based on the V\$SQL\_PLAN\_STATISTICS\_ALL VIEWS).

### Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
 sql_id IN VARCHAR2 DEFAULT NULL,
 cursor_child_no IN NUMBER DEFAULT 0,
 format IN VARCHAR2 DEFAULT 'TYPICAL');
```

### Parameters

**Table 207-7 DISPLAY\_CURSOR Function Parameters**

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V\$SQL or V\$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V\$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.
cursor_child_no	Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.

**Table 207-7 (Cont.) DISPLAY\_CURSOR Function Parameters**

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>• <b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> <li>• <b>ADAPTIVE:</b> <ul style="list-style-type: none"> <li>– Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join.</li> <li>– Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans.</li> <li>– Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this.</li> <li>– Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer.</li> </ul> </li> </ul> <p>For finer control on the display output, you can add the following keywords to the preceding format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).</p> <p>Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> <li>• <b>IOSTATS</b> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the</li> </ul>

**Table 207-7 (Cont.) DISPLAY\_CURSOR Function Parameters**

Parameter	Description
	<p>gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.</p> <ul style="list-style-type: none"> <li>MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</li> <li>ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'</li> <li>LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.</li> </ul> <p>The following formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> <li>RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.</li> <li>RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</li> </ul> <p>You can prefix format keywords with the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>

### Usage Notes

- To use the DISPLAY\_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V\$SQL\_PLAN\_STATISTICS\_ALL, V\$SQL and V\$SQL\_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST'));
```

## 207.5.6 DISPLAY\_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

### Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
 table_name IN VARCHAR2 DEFAULT 'PLAN_TABLE',
 statement_id IN VARCHAR2 DEFAULT NULL,
 format IN VARCHAR2 DEFAULT 'TYPICAL',
 filter_preds IN VARCHAR2 DEFAULT NULL,
 type IN VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;
```

### Parameters

**Table 207-8 DISPLAY\_PLAN Function Parameters**

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .
statement_id	Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=&gt;'plan_id = 10'</code>  Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes)

Table 207-8 (Cont.) DISPLAY\_PLAN Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>• <b>SERIAL</b>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL</b>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> <li>• <b>ADAPTIVE</b>: Displays the default plan, and for each dynamic subplan (if stipulated): <ul style="list-style-type: none"> <li>- A list of the rowsources from the original which may be replaced, and the rowsources to replace them</li> <li>- If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed</li> </ul> </li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the <a href="#">DISPLAY Function</a>. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the</p>

**Table 207-8 (Cont.) DISPLAY\_PLAN Function Parameters**

Parameter	Description
	<a href="#">DISPLAY_CURSOR Function</a> or the <a href="#">DISPLAY_SQLSET Function</a> for a full description of these four keywords).
type	Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE).

### Return Values

Returns the requested report as CLOB

### Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

#### WARNING:

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

## 207.5.7 DISPLAY\_SQL\_PLAN\_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

### Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
 sql_handle IN VARCHAR2 := NULL,
 plan_name IN VARCHAR2 := NULL,
 format IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

### Parameters

**Table 207-9 DISPLAY\_SQL\_PLAN\_BASELINE Function Parameters**

Parameter	Description
sql_handle	SQL statement handle. It identifies a SQL statement whose plans are to be displayed.

**Table 207-9 (Cont.) DISPLAY\_SQL\_PLAN\_BASELINE Function Parameters**

Parameter	Description
<code>plan_name</code>	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
<code>format</code>	Format string determines what information stored in the plan displayed. The following format values are possible, each representing a common use case: BASIC, TYPICAL, and ALL.

**Return Values**

A PL/SQL type table

**Usage Notes**

This function uses plan information stored in the plan baseline to explain and display the plans. The `plan_id` stored in the SQL management base may not match the `plan_id` of the generated plan. A mismatch between the stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

**Examples**

Display all plans of a SQL statement identified by the SQL handle  
`SYS_SQL_b1d49f6074ab95af` using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af'))
t;
```

Display all plans of one or more SQL statements containing the string HR2 using BASIC format:

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines WHERE
sql_text LIKE '%HR2%') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
'BASIC')) t;
```

## 207.5.8 DISPLAY\_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

### Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
 sqlset_name IN VARCHAR2,
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 format IN VARCHAR2 := 'TYPICAL',
 sqlset_owner IN VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

### Parameters

**Table 207-10** DISPLAY\_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the SQL Tuning Set
sql_id	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function DBMS_SQLTUNE.SELECT_SQLSET
plan_hash_value	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.

**Table 207-10 (Cont.) DISPLAY\_SQLSET Function Parameters**

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>• <b>SERIAL</b>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL</b>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> <li>• <b>IOSTATS</b> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter STATISTICS_LEVEL to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.</li> <li>• <b>MEMSTATS</b> - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</li> <li>• <b>ALLSTATS</b> - A shortcut for ' IOSTATS MEMSTATS '</li> <li>• <b>LAST</b> - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.</li> </ul>

**Table 207-10 (Cont.) DISPLAY\_SQLSET Function Parameters**

Parameter	Description
	<p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> <li>RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.</li> <li>RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>
sqlset_owner	The owner of the SQL tuning set. The default is the current user.

### Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP\_optimization\_0405':

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405', 'gwp663cqh5qbf',
3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405', 'gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_SQLSET(
 'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

## 207.5.9 DISPLAY\_WORKLOAD\_REPOSITORY Function

This table function displays the contents of an execution plan stored in AWR.

 **Note:**

This function replaces `DISPLAY_AWR`, which is deprecated.

### Syntax

```
DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY(
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER DEFAULT NULL,
 format IN VARCHAR2 DEFAULT 'TYPICAL'
 dbid IN NUMBER DEFAULT NULL,
 con_dbid IN NUMBER DEFAULT NULL,
 awr_location IN VARCHAR2 DEFAULT 'AWR_ROOT'
);
```

### Parameters

**Table 207-11** DISPLAY\_WORKLOAD\_REPOSITORY Table Function Parameters

Parameter	Description
sql_id	Specifies the <code>SQL_ID</code> of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column <code>SQL_ID</code> in <code>DBA_HIST_SQLTEXT</code> .
plan_hash_value	Specifies the <code>PLAN_HASH_VALUE</code> of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given <code>SQL_ID</code> .

**Table 207-11 (Cont.) DISPLAY\_WORKLOAD\_REPOSITORY Table Function Parameters**

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>ROWS - if relevant, shows the number of rows estimated by the optimizer</li> <li>BYTES - if relevant, shows the number of bytes estimated by the optimizer</li> <li>COST - if relevant, shows optimizer cost information</li> <li>PARTITION - if relevant, shows partition pruning information</li> <li>PARALLEL - if relevant, shows PX information (distribution method and table queue information)</li> <li>PREDICATE - if relevant, shows the predicate section</li> <li>PROJECTION -if relevant, shows the projection section</li> <li>ALIAS - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>NOTE - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>
dbid	<p>Identifies the plans for a specific database.</p> <p>If this parameter is omitted, then the value defaults to the DBID of the AWR repository pointed to by the initialization parameter AWR_LOCATION. In a CDB, if AWR_LOCATION is set to AWR_ROOT, then the value is set to the DBID of the CDB root. If it is set to AWR_PDB, then the value is set to the DBID of the container.</p>
con_dbid	<p>Identifies the plans for a specific container.</p> <p>If this parameter is omitted, then the value defaults to SYS_CONTEXT('userenv', 'con_id').</p>

**Table 207-11 (Cont.) DISPLAY\_WORKLOAD\_REPOSITORY Table Function Parameters**

Parameter	Description
awr_location	Specifies the location of the AWR repository. Supported values are: <ul style="list-style-type: none"> <li>AWR_ROOT when the AWR to be accessed is in the root container. This is the default.</li> <li>'AWR_PDB', if the AWR to be accessed is in the local container.</li> </ul>

**Example 207-2 Querying an AWR Plan**

Assume that you log in as an administrator and issue the following query:

```
select count(*) from sh.sAleS
```

You create an AWR snapshot as follows:

```
EXEC DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT;
```

You query joint DBA\_HIST\_SQLTEXT to the function output as follows:

```
SET LINESIZE 150
SET PAGESIZE 5000
```

```
SELECT t.*
FROM DBA_HIST_SQLTEXT ht,
 TABLE(DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY
 (ht.sql_id, null, '-PREDICATE +ALIAS',null,null,'AWR_ROOT')) t
WHERE ht.SQL_TEXT LIKE '%sAleS%';
```

```
SQL_ID 2f4cx9qjnqd70

select count(*) from sh.sAleS
```

Plan hash value: 1123225294

```

| Id | Operation | Name | Rows | Cost
(%CPU)| Time | Pstart | Pstop |

| 0 | SELECT STATEMENT | | |
27 (100)| | | |
| 1 | SORT AGGREGATE | | 1 |
| | | | |
| 2 | PARTITION RANGE ALL | | 918K |
27 (0)| 00:00:01 | 1 | 28 |
| 3 | BITMAP CONVERSION COUNT | | 918K |
27 (0)| 00:00:01 | | |
| 4 | BITMAP INDEX FAST FULL SCAN | SALES_PROMO_BIX | |
| | | | 1 | 28 |

```

# DBMS\_XSLPROCESSOR

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- [DBMS\\_XSLPROCESSOR Overview](#)
- [DBMS\\_XSLPROCESSOR Deprecated Subprograms](#)
- [DBMS\\_XSLPROCESSOR Security Model](#)
- [Summary of DBMS\\_XSLPROCESSOR Subprograms](#)

## See Also:

- *Oracle XML DB Developer's Guide*

## 208.1 DBMS\_XSLPROCESSOR Overview

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

### Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

### Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

### Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

## 208.2 DBMS\_XSLPROCESSOR Deprecated Subprograms

These subprograms are deprecated from the `DBMS_XSLPROCESSOR` package in Oracle Database 12c release 12.2.

### Note:

Oracle recommends that do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Starting in this release, these subprograms are available in the `DBMS_LOB` package.

- [CLOB2FILE Procedure](#)
- [READ2CLOB Function](#)

### See Also:

[Summary of DBMS\\_LOB Subprograms](#)

## 208.3 DBMS\_XSLPROCESSOR Security Model

Owned by `XDB`, the `DBMS_XSLPROCESSOR` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 208.4 Summary of DBMS\_XSLPROCESSOR Subprograms

This table lists the `DBMS_XSLPROCESSOR` subprograms and briefly describes them.

**Table 208-1** *DBMS\_XSLPROCESSOR Package Subprograms*

Method	Description
<a href="#">CLOB2FILE Procedure</a>	Writes content of a CLOB into a file This procedure has been deprecated starting in Oracle Database 12c release 12.2.
<a href="#">FREEPROCESSOR Procedure</a>	Frees a processor object
<a href="#">FREESTYLESHEET Procedure</a>	Frees a stylesheet object
<a href="#">NEWPROCESSOR Function</a>	Returns a new processor instance
<a href="#">NEWSTYLESHEET Functions</a>	Creates a new stylesheet from input and reference URLs
<a href="#">PROCESSXSL Functions and Procedures</a>	Transforms an input XML document

**Table 208-1 (Cont.) DBMS\_XSLPROCESSOR Package Subprograms**

Method	Description
<a href="#">READ2CLOB Function</a>	Reads content of the file into a CLOB This procedure has been deprecated starting in Oracle Database 12c release 12.2.
<a href="#">REMOVEPARAM Procedure</a>	Removes a top-level stylesheet parameter
<a href="#">RESETPARAMS Procedure</a>	Resets the top-level stylesheet parameters
<a href="#">SELECTNODES Function</a>	Selects nodes from a DOM tree that match a pattern
<a href="#">SELECTSINGLENODE Function</a>	Selects the first node from the tree that matches a pattern
<a href="#">SETERRORLOG Procedure</a>	Sets errors to be sent to the specified file
<a href="#">SETPARAM Procedure</a>	Sets a top-level parameter in the stylesheet
<a href="#">SHOWWARNINGS Procedure</a>	Turns warnings on or off
<a href="#">TRANSFORMNODE Function</a>	Transforms a node in a DOM tree using a stylesheet
<a href="#">VALUEOF Function and Procedure</a>	Gets the value of the first node that matches a pattern

## 208.4.1 CLOB2FILE Procedure

This procedure writes content of a CLOB into a file. This procedure has moved to the DBMS\_LOB package, starting in Oracle Database 12c release 12.2.

### Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE(
 c1 IN CLOB,
 flocation IN VARCHAR2,
 fname IN VARCHAR2,
 csid IN NUMBER := 0);
```

### Parameters

**Table 208-2 CLOB2FILE Procedure Parameters**

Parameter	Description
c1	CLOB
flocation	File directory
fname	File name
csid	Character set id of the file <ul style="list-style-type: none"> <li>• Must be a valid Oracle id; otherwise returns an error</li> <li>• If 0, content of the output file will be in the database character set</li> </ul>

## 208.4.2 FREEPROCESSOR Procedure

This procedure frees a `Processor` object.

### Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
 p IN Processor);
```

### Parameters

**Table 208-3** FREEPROCESSOR Procedure Parameters

Parameter	Description
p	Processor

## 208.4.3 FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

### Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
 ss IN Stylesheet);
```

### Parameters

**Table 208-4** FREESTYLESHEET Procedure Parameters

Parameter	Description
ss	Stylesheet

## 208.4.4 NEWPROCESSOR Function

This function returns a new `Processor` instance.

The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

### Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
 RETURN Processor;
```

## 208.4.5 NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance.

The options are described in the following table.

## Syntax

Creates and returns a new stylesheet instance using the given DOMDOCUMENT and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
 xmldoc IN DOMDOCUMENT,
 ref IN VARCHAR2)
RETURN Stylesheet;
```

Creates and returns a new Stylesheet instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
 inp IN VARCHAR2,
 ref IN VARCHAR2)
RETURN Stylesheet;
```

## Parameters

**Table 208-5 NEWSTYLESHEET Function Parameters**

Parameter	Description
xmlDoc	DOMDocument to use for construction
inp	Input URL to use for construction
ref	Reference URL

## 208.4.6 PROCESSXSL Functions and Procedures

This function transforms input XMLDocument.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

### Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmlDoc IN DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 url IN VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 clb IN CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
 p IN Processor,
 ss IN Stylesheet,
 xmldoc IN DOMDOCUMENT,
 dir IN VARCHAR2,
 fileName IN VARCHAR2);
```

Transforms input XMLDocument using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 url IN VARCHAR2,
 dir IN VARCHAR2,
 fileName IN VARCHAR2);
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldoc IN DOMDOCUMENT,
 cl IN OUT CLOB);
```

Transforms input XMLDocument using given DOMDOCUMENTFRAGMENT and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldf IN DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldf IN DOMDOCUMENTFRAGMENT,
 dir IN VARCHAR2,
 filename IN VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
```

```
xmldef IN DOMDOCUMENTFRAGMENT,
buf IN OUT VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldef IN DOMDOCUMENTFRAGMENT,
 cl IN OUT CLOB);
```

### Parameters

**Table 208-6** PROCESSXSL Function and Procedure Parameters

Parameter	Description
p	Processor instance
ss	Stylesheet instance
xmldef	XML document being transformed
url	URL for the information being transformed
clb	CLOB containing information to be transformed
dir	Directory where processing output file is saved
filename	Processing output file
cl	CLOB to which the processing output is saved
xmldef	XMLDocumentFragment being transformed

## 208.4.7 READ2CLOB Function

This function reads content of a file into a CLOB.

### Note:

This procedure has moved to the DBMS\_LOB package, starting in Oracle Database 12c release 12.2.

### Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(
 flocaction IN VARCHAR2,
 fname IN VARCHAR2,
 csid IN NUMBER:=0)
RETURN CLOB;
```

## Parameters

**Table 208-7 READ2CLOB Function Parameters**

Parameter	Description
flocation	File directory
fname	File name
csid	Character set id of the file <ul style="list-style-type: none"> <li>• Must be a valid Oracle id; otherwise returns an error</li> <li>• If 0, input file is assumed to be in the database character set</li> </ul>

## 208.4.8 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

### Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
 ss IN Stylesheet,
 name IN VARCHAR2);
```

### Parameters

**Table 208-8 REMOVEPARAM Procedure Parameters**

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter

## 208.4.9 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

### Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
 ss IN Stylesheet);
```

### Parameters

**Table 208-9 RESETPARAMS Procedure Parameters**

Parameter	Description
ss	Stylesheet instance

## 208.4.10 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
 n IN DBMS_XMLDOM.DOMNODE,
 pattern IN VARCHAR2,
 namespace IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODELIST;
```

### Parameters

**Table 208-10** SELECTNODES Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

## 208.4.11 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
 n IN DBMS_XMLDOM.DOMNODE,
 pattern IN VARCHAR2,
 namespace IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODE;
```

### Parameters

**Table 208-11** SELECTSINGLENODE Function Parameters

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

## 208.4.12 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

### Note:

This subprogram has been deprecated, and is included only for reasons of backward compatibility.

### Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
 p IN Processor,
 fileName IN VARCHAR2);
```

### Parameters

**Table 208-12 SETERRORLOG Procedure Parameters**

Parameter	Description
p	Processor instance
fileName	Complete path of the file to use as the error log

## 208.4.13 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid XPath expression. Literal string values must be quoted.

### Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
 ss IN Stylesheet,
 name IN VARCHAR2,
 value IN VARCHAR2);
```

### Parameters

**Table 208-13 SETPARAM Procedure Parameters**

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter
value	Value of the parameter

## 208.4.14 SHOWWARNINGS Procedure

This procedure turns warnings on (`TRUE`) or off (`FALSE`).

### Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
 p IN Processor,
 yes IN BOOLEAN);
```

### Parameters

**Table 208-14** SHOWWARNINGS Procedure Parameters

Parameter	Description
p	Processor instance
yes	Mode to set: <code>TRUE</code> to show warnings, <code>FALSE</code> otherwise

## 208.4.15 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

### Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(
 n IN DOMNODE,
 ss IN Stylesheet)
RETURN DOMDocumentFragment;
```

### Parameters

**Table 208-15** TRANSFORMNODE Function Parameters

Parameter	Description
n	DOMNode to transform
ss	Stylesheet to use

## 208.4.16 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

### Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
 n IN DBMS_XMLDOM.DOMNODE,
 pattern IN VARCHAR2,
 namespace IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF (
 n IN DBMS_XMLDOM.DOMNODE ,
 pattern IN VARCHAR2 ,
 val OUT VARCHAR2 ,
 namespace IN VARCHAR2 := NULL);
```

### Parameters

**Table 208-16 VALUEOF Function and Procedure Parameters**

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

# DBMS\_XSTREAM\_ADM

This `DBMS_XSTREAM_ADM` package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_XSTREAM\\_ADM Subprograms](#)

## See Also:

- *Oracle Database XStream Guide*
- *Oracle Call Interface Programmer's Guide*
- *Oracle Database XStream Java API Reference*

## 209.1 DBMS\_XSTREAM\_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

 **See Also:**

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

## 209.2 DBMS\_XSTREAM\_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

 **See Also:**

- [GRANT\\_ADMIN\\_PRIVILEGE Procedure](#)
- *Oracle Database XStream Guide, Chapter 4, "XStream Out and Security"* for more information about XStream and security.

## 209.3 DBMS\_XSTREAM\_ADM Operational Notes

Some subprograms in the `DBMS_APPLY_ADM` package can manage XStream outbound servers, and some subprograms in the `DBMS_APPLY_ADM` package can manage XStream inbound servers.

### See Also:

[DBMS\\_APPLY\\_ADM](#) for details about which subprograms can manage outbound servers and inbound servers

## 209.4 Summary of DBMS\_XSTREAM\_ADM Subprograms

This table lists the `DBMS_XSTREAM_ADM` subprograms and briefly describes them.

**Table 209-1 DBMS\_XSTREAM\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_COLUMN Procedure</a>	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
<a href="#">ADD_GLOBAL_PROPAGATION_RULES Procedure</a>	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_GLOBAL_RULES Procedure</a>	Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist
<a href="#">ADD_OUTBOUND Procedure</a>	Creates an XStream outbound server that dequeues LCRs from the specified queue
<a href="#">ADD_SCHEMA_PROPAGATION_RULES Procedure</a>	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_SCHEMA_RULES Procedure</a>	Adds rules to a rule set of XStream clients.
<a href="#">ADD_SUBSET_OUTBOUND_RULES Procedure</a>	Adds subset rules to an outbound server configuration
<a href="#">ADD_SUBSET_PROPAGATION_RULES Procedure</a>	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_SUBSET_RULES Procedure</a>	Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist

Table 209-1 (Cont.) DBMS\_XSTREAM\_ADM Package Subprograms

Subprogram	Description
<a href="#">ADD_TABLE_PROPAGATION_RULES Procedure</a>	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
<a href="#">ADD_TABLE_RULES Procedure</a>	This procedure adds rules to a rule set of an XStream client.
<a href="#">ALTER_INBOUND Procedure</a>	Modifies an XStream inbound server
<a href="#">ALTER_OUTBOUND Procedure</a>	Modifies an XStream outbound server
<a href="#">CREATE_INBOUND Procedure</a>	Creates an XStream inbound server and its queue
<a href="#">CREATE_OUTBOUND Procedure</a>	Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs
<a href="#">DELETE_COLUMN Procedure</a>	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
<a href="#">DROP_INBOUND Procedure</a>	Removes an inbound server configuration
<a href="#">DROP_OUTBOUND Procedure</a>	Removes an outbound server configuration
<a href="#">ENABLE_GG_XSTREAM_FOR_STREAMS Procedure</a>	Enables XStream performance optimizations for Oracle Replication components
<a href="#">GET_MESSAGE_TRACKING Function</a>	Returns the tracking label for the current session
<a href="#">GET_TAG Function</a>	Gets the binary tag for all redo entries generated by the current session
<a href="#">IS_GG_XSTREAM_FOR_STREAMS Function</a>	Returns TRUE if XStream performance optimizations are enabled for Oracle Replication components, or returns FALSE if XStream performance optimizations are disabled for Oracle Replication components
<a href="#">KEEP_COLUMNS Procedure</a>	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
<a href="#">MERGE_STREAMS Procedure</a>	Merges a stream flowing from one capture process with a stream flowing from another capture process
<a href="#">MERGE_STREAMS_JOB Procedure</a>	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the MERGE_STREAMS procedure to merge the two streams
<a href="#">PURGE_SOURCE_CATALOG Procedure</a>	Removes all Oracle Replication data dictionary information at the local database for the specified object
<a href="#">RECOVER_OPERATION Procedure</a>	Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
<a href="#">REMOVE_QUEUE Procedure</a>	Removes the specified ANYDATA queue

Table 209-1 (Cont.) DBMS\_XSTREAM\_ADM Package Subprograms

Subprogram	Description
<a href="#">REMOVE_RULE Procedure</a>	Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.
<a href="#">REMOVE_SUBSET_OUTBOUND_RULES Procedure</a>	Removes subset rules from an outbound server configuration
<a href="#">REMOVE_XSTREAM_CONFIGURATION Procedure</a>	Removes the XStream configuration at the local database
<a href="#">RENAME_COLUMN Procedure</a>	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
<a href="#">RENAME_SCHEMA Procedure</a>	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
<a href="#">RENAME_TABLE Procedure</a>	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
<a href="#">SET_MESSAGE_TRACKING Procedure</a>	Sets the tracking label for logical change records (LCRs) produced by the current session
<a href="#">SET_PARAMETER Procedure</a>	Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process
<a href="#">SET_TAG Procedure</a>	Sets the binary tag for all redo entries subsequently generated by the current session
<a href="#">SET_UP_QUEUE Procedure</a>	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream
<a href="#">SPLIT_STREAMS Procedure</a>	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process
<a href="#">START_OUTBOUND Procedure</a>	Starts an XStream outbound server
<a href="#">STOP_OUTBOUND Procedure</a>	Stops an XStream outbound server

 **Note:**

All subprograms commit unless specified otherwise.

## 209.4.1 ADD\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

 **Note:**

- `ADD_COLUMN` transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

### Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 column_value IN ANYDATA,
 value_type IN VARCHAR2 DEFAULT 'NEW',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.ADD_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 column_function IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT 'NEW',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 209-2 ADD\_COLUMN Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error.  For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.

**Table 209-2 (Cont.) ADD\_COLUMN Procedure Parameters**

Parameter	Description
table_name	The name of the table to which the column is added in the row LCR, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function.  This parameter cannot be specified if the <code>column_function</code> parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function.  The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter.  The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE.  The function executes when the rule evaluates to TRUE.  This parameter cannot be specified if the <code>column_value</code> parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR.  Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule.  Specify 'REMOVE' to remove the transformation from the rule.

### Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD\_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all add column transformations with the specified <code>step_number</code> for the specified rule.

table_name	column_name	step_number	Result
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

## 209.4.2 ADD\_GLOBAL\_PROPAGATION\_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
```

```

and_condition IN VARCHAR2 DEFAULT NULL,
queue_to_queue IN BOOLEAN DEFAULT NULL);

```

## Parameters

**Table 209-3 ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>

**Table 209-3 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
include_tagged_lcr	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p>
source_database	<p>The global name of the source database. The source database is where the changes originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

**Table 209-3 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p>
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>The procedure cannot change the queue to queue property of an existing propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul>

**Usage Notes**

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

### Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.3 ADD\_GLOBAL\_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Note:

If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
```

```

source_database IN VARCHAR2 DEFAULT NULL,
dml_rule_name OUT VARCHAR2,
ddl_rule_name OUT VARCHAR2,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

```

```

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
streams_type IN VARCHAR2,
streams_name IN VARCHAR2 DEFAULT NULL,
queue_name IN VARCHAR2 DEFAULT 'streams_queue',
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 209-4 ADD\_GLOBAL\_RULES Procedure Parameters**

Parameter	Description
streams_type	<p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify apply for an apply process.</li> </ul>
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</li> <li>If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>

**Table 209-4 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

Parameter	Description
queue_name	<p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p>

**Table 209-4 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

**Table 209-4 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p>
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>

### Usage Notes

This procedure creates DML and DDL rules automatically based on include\_dml and include\_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

 **See Also:**

- ["Operational Notes"](#)
- ["Security Model"](#)

**Examples**

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.4 ADD\_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the [CREATE\\_OUTBOUND Procedure](#).

To create the capture process individually, use one of the following packages:

- DBMS\_XSTREAM\_ADM
- DBMS\_CAPTURE\_ADM

To create a queue individually, use the `SET_UP_QUEUE` procedure in the `DBMS_XSTREAM_ADM` package.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- This procedure enables the outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

## Syntax

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
 server_name IN VARCHAR2,
 queue_name IN VARCHAR2 DEFAULT NULL,
 source_database IN VARCHAR2 DEFAULT NULL,
 table_names IN DBMS_UTILITY.UNCL_ARRAY,
 schema_names IN DBMS_UTILITY.UNCL_ARRAY,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 capture_name IN VARCHAR2 DEFAULT NULL,
 start_scn IN NUMBER DEFAULT NULL,
 start_time IN TIMESTAMP DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL,
 lcrld_version IN NUMBER DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
 server_name IN VARCHAR2,
 queue_name IN VARCHAR2 DEFAULT NULL,
 source_database IN VARCHAR2 DEFAULT NULL,
 table_names IN VARCHAR2 DEFAULT NULL,
 schema_names IN VARCHAR2 DEFAULT NULL,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 capture_name IN VARCHAR2 DEFAULT NULL,
 start_scn IN NUMBER DEFAULT NULL,
 start_time IN TIMESTAMP DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL,
 lcrld_version IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 209-5 ADD\_OUTBOUND Procedure Parameters**

Parameter	Description
server_name	<p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>
queue_name	<p>The name of the local queue from which the outbound server dequeues LCRs, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If NULL, the procedure raises an error.</p>

**Table 209-5 (Cont.) ADD\_OUTBOUND Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
table_names	<p>The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as [<i>schema_name</i>.]<i>table_name</i>. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>
schema_names	<p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the <i>schema_names</i> parameter with the <i>table_names</i> parameter. To specify tables, enter fully qualified table names in the <i>table_names</i> parameter (<i>schema_name.table_name</i>).</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>
connect_user	<p>The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.</p> <p>If NULL, then the current user is the default.</p>
comment	<p>An optional comment associated with the outbound server.</p>

**Table 209-5 (Cont.) ADD\_OUTBOUND Procedure Parameters**

Parameter	Description
capture_name	<p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If the specified name matches the name of an existing capture process for an apply process, then an error is raised.</p> <p>If the specified name does not match the name of an existing capture process, then an error is raised.</p> <p>If NULL, then the outbound server is created without a capture process.</p>
start_scn	<p>A valid system change number (SCN) for the database from which the capture process starts capturing changes.</p> <p>If the capture_name parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p>
start_time	<p>A valid time from which the capture process starts capturing changes.</p> <p>If the capture_name parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the capture_name parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>

**Table 209-5 (Cont.) ADD\_OUTBOUND Procedure Parameters**

Parameter	Description
<code>lcrld_version</code>	<p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If <code>NULL</code>, the default, and the database compatibility level is 12.2.0 or higher, then the <code>lcrld_version</code> is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the <code>lcrld_version</code> is set to 1 internally.</p>

### Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are `NULL` or empty, then the outbound server streams all DML and DDL changes to the client application.  
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one `NULL` entry.

## 209.4.5 ADD\_SCHEMA\_PROPAGATION\_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
 schema_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
 schema_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

### Parameters

**Table 209-6 ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
schema_name	The name of the schema. For example, hr.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

**Table 209-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
source_queue_name	<p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>

**Table 209-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
include_tagged_lcr	<p>If <b>TRUE</b>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <b>TRUE</b> regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to <b>TRUE</b> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <b>FALSE</b>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <b>TRUE</b> only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to <b>FALSE</b> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify <b>TRUE</b> for this parameter if the <code>inclusion_rule</code> parameter is set to <b>FALSE</b>.</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If <b>NULL</b>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <b>TRUE</b>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <b>FALSE</b>, then this parameter contains a <b>NULL</b>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <b>TRUE</b>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <b>FALSE</b>, then this parameter contains a <b>NULL</b>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <b>TRUE</b>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <b>FALSE</b>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

**Table 209-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p>
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul>

**Usage Notes**

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

### Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.6 ADD\_SCHEMA\_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema. This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Note:

If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
 schema_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
```

```

include_ddl IN BOOLEAN DEFAULT FALSE,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
dml_rule_name OUT VARCHAR2,
ddl_rule_name OUT VARCHAR2,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

```

```

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
 schema_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 209-7 ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Replication does not validate the existence of the schema.
streams_type	The type of XStream client: <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify apply for an apply process.</li> </ul>

**Table 209-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</li> <li>• If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>
queue_name	<p>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>

**Table 209-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.</p>
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
dml_rule_name	<p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p>

**Table 209-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

Parameter	Description
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of <code>'02'</code>, specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p>
source_root_name	<p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>

## Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

### See Also:

- ["Operational Notes"](#)
- ["Security Model"](#)

## Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.7 ADD\_SUBSET\_OUTBOUND\_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One `column_list` parameter is type `VARCHAR2` and the other `column_list` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

### Note:

This procedure does not add rules to the outbound server's capture process.

## Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
 server_name IN VARCHAR2,
 table_name IN VARCHAR2,
 condition IN VARCHAR2 DEFAULT NULL,
 column_list IN DBMS_UTILITY.LNAME_ARRAY,
 keep IN BOOLEAN DEFAULT TRUE,
 source_database IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
 server_name IN VARCHAR2,
 table_name IN VARCHAR2,
 condition IN VARCHAR2 DEFAULT NULL,
 column_list IN VARCHAR2 DEFAULT NULL,
```

```
keep IN BOOLEAN DEFAULT TRUE,
source_database IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 209-8 ADD\_SUBSET\_OUTBOUND\_RULES Procedure Parameters**

Parameter	Description
server_name	The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.
table_name	The name of the table specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, you can specify <code>hr.employees</code> . If the schema is not specified, then the current user is the default.  If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database.  The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.
condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.  For example, to specify rows in the <code>hr.employees</code> table where the <code>salary</code> is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code> , enter the following as the condition:  <code>' salary &gt; 4000 and job_id = 'SA_MAN' '</code>  If NULL, then the procedure raises an error.  <b>Note:</b> The quotation marks in the preceding example are all single quotation marks.
column_list	The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the <code>keep</code> parameter.  The columns can be specified in the following ways: <ul style="list-style-type: none"> <li>• Comma-delimited list of type VARCHAR2.</li> <li>• A PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code>, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL.</li> </ul> To include or exclude all of the columns in a table, specify each column in the table in the list or array.  If NULL, then the procedure raises an error.
keep	If TRUE, then the columns specified in the <code>column_list</code> parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the <code>condition</code> parameter are streamed to the outbound server's client application.  If FALSE, then the columns specified in the <code>column_list</code> parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application.  <b>See Also:</b> "Usage Notes"

**Table 209-8 (Cont.) ADD\_SUBSET\_OUTBOUND\_RULES Procedure Parameters**

Parameter	Description
source_datab ase	<p>The global name of the container where the specified <code>table_names</code> and <code>schema_names</code> are located.</p> <p>If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p>

### Usage Notes

When the `keep` parameter is set to `TRUE`, this procedure creates a keep columns declarative rule-based transformation for the columns listed in `column_list`.

When the `keep` parameter is set to `FALSE`, this procedure creates a delete column declarative rule-based transformation for each column listed in `column_list`.

#### See Also:

*Oracle Database XStream Guide* for information about declarative rule-based transformations

## 209.4.8 ADD\_SUBSET\_PROPAGATION\_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
 table_name IN VARCHAR2,
 dml_condition IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 insert_rule_name OUT VARCHAR2,
 update_rule_name OUT VARCHAR2,
```

```

delete_rule_name OUT VARCHAR2,
queue_to_queue IN BOOLEAN DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
table_name IN VARCHAR2,
dml_condition IN VARCHAR2,
streams_name IN VARCHAR2 DEFAULT NULL,
source_queue_name IN VARCHAR2,
destination_queue_name IN VARCHAR2,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
queue_to_queue IN BOOLEAN DEFAULT NULL);

```

## Parameters

**Table 209-9 ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
table_name	<p>The name of the table specified as [<i>schema_name</i>. <i>object_name</i>]. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</p>
dml_condition	<p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary &gt; 4000 and job_id = 'SA_MAN' '</pre> <p><b>Note:</b> The quotation marks in the preceding example are all single quotation marks.</p>
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>. <i>queue_name</i>]. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>

**Table 209-9 (Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
destination_queue_name	<p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>
include_tagged_lcr	<p>If <code>TRUE</code>, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.</p> <p>If <code>FALSE</code>, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
insert_rule_name	Contains the system-generated <code>INSERT</code> rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes and updates that must be converted into deletes

**Table 209-9 (Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
queue_to_queue	<p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul>

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the `dml_condition` parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified `dml_condition`, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified `dml_condition`, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD\_SUBSET\_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

#### Note:

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

### Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `db1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DB1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

## 209.4.9 ADD\_SUBSET\_RULES Procedure

This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.  
This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
 table_name IN VARCHAR2,
 dml_condition IN VARCHAR2,
 streams_type IN VARCHAR2 DEFAULT 'apply',
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 insert_rule_name OUT VARCHAR2,
 update_rule_name OUT VARCHAR2,
 delete_rule_name OUT VARCHAR2,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
 table_name IN VARCHAR2,
 dml_condition IN VARCHAR2,
 streams_type IN VARCHAR2 DEFAULT 'apply',
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-10 ADD\_SUBSET\_RULES Procedure Parameters**

Parameter	Description
table_name	The name of the table specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.  The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.  For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition:  ' salary > 4000 and job_id = 'SA_MAN' '
streams_type	The type of XStream client: <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify apply for an apply process.</li> </ul>

Table 209-10 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters

Parameter	Description
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</li> <li>• If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>
queue_name	<p>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>

**Table 209-10 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

Parameter	Description
include_tagged_lcr	<p>If <b>TRUE</b>, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.</li> <li>• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag.</li> </ul> <p>If <b>FALSE</b>, then an XStream client performs its action only when the tag is <b>NULL</b>:</p> <ul style="list-style-type: none"> <li>• A redo entry is considered for capture by a capture process only when the redo entry contains a <b>NULL</b> tag.</li> <li>• An LCR is considered for apply by an apply process only if the LCR contains a <b>NULL</b> tag.</li> </ul> <p>A setting of <b>FALSE</b> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p>
source_database	<p>The global name of the source database. If <b>NULL</b>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <b>NULL</b> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
insert_rule_name	Contains the system-generated <b>INSERT</b> rule name. This rule handles inserts and updates that must be converted into inserts.
update_rule_name	Contains the system-generated <b>UPDATE</b> rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated <b>DELETE</b> rule name. This rule handles deletes and updates that must be converted into deletes

**Table 209-10 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

Parameter	Description
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>

### Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the `dml_condition` parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified `dml_condition`, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified `dml_condition`, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified `dml_condition`, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified `dml_condition`, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS\_XSTREAM\_ADM package or the DBMS\_RULE\_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table

name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

 **Note:**

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

### Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

## 209.4.10 ADD\_TABLE\_PROPAGATION\_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
 table_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
 table_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
```

```

include_ddl IN BOOLEAN DEFAULT FALSE,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
queue_to_queue IN BOOLEAN DEFAULT NULL);

```

## Parameters

**Table 209-11 ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
table_name	The name of the table specified as <code>[schema_name.]table_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If <code>NULL</code> and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If <code>NULL</code> and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as <code>[schema_name.]queue_name</code> . The current database must contain the source queue, and the queue must be <code>ANYDATA</code> type. For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code> , if the destination queue is in a remote database. The queue must be <code>ANYDATA</code> type. For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code> , enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. <b>Note:</b> Connection qualifiers are not allowed.
include_dml	If <code>TRUE</code> , then the procedure creates a rule for DML changes. If <code>FALSE</code> , then the procedure does not create a DML rule. <code>NULL</code> is not permitted.

**Table 209-11 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
include_ddl	<p>If <b>TRUE</b>, then the procedure creates a rule for DDL changes. If <b>FALSE</b>, then the procedure does not create a DDL rule. <b>NULL</b> is not permitted.</p> <p>The generated rule evaluates to <b>TRUE</b> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <b>FALSE</b> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <b>FALSE</b> for changes that create synonyms or views based on the table. The rule also evaluates to <b>FALSE</b> for a change to a PL/SQL subprogram that refers to the table.</p>
include_tagged_lcr	<p>If <b>TRUE</b>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <b>TRUE</b> regardless of whether a logical change record (LCR) has a non-<b>NULL</b> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<b>NULL</b> tag. If the rules are added to a positive rule set, then setting this parameter to <b>TRUE</b> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <b>FALSE</b>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <b>TRUE</b> only if an LCR has a <b>NULL</b> Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <b>NULL</b> tag. If the rules are added to a positive rule set, then setting this parameter to <b>FALSE</b> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <b>NULL</b> tag.</p> <p>Usually, specify <b>TRUE</b> for this parameter if the <code>inclusion_rule</code> parameter is set to <b>FALSE</b>.</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If <b>NULL</b>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <b>TRUE</b>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <b>FALSE</b>, then this parameter contains a <b>NULL</b>.</p>

**Table 209-11 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p>

**Table 209-11 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

Parameter	Description
queue_to_queue	<p>If <b>TRUE</b> or <b>NULL</b>, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <b>FALSE</b>, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If <b>TRUE</b> and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If <b>FALSE</b> and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If <b>NULL</b>, then the procedure does not change the queue to queue property of the propagation.</li> </ul>

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

### Examples

The following is an example of a table rule condition created for filtering DML statements:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.11 ADD\_TABLE\_RULES Procedure

This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
 table_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
 table_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-12** ADD\_TABLE\_RULES Procedure Parameters

Parameter	Description
<code>table_name</code>	The name of the table specified as <code>[schema_name].object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Replication does not validate the existence of the table.

**Table 209-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

Parameter	Description
streams_type	<p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify apply for an apply process.</li> </ul>
streams_name	<p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</li> <li>If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p>
queue_name	<p>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>
include_dml	<p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>

Table 209-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters

Parameter	Description
include_ddl	<p>If <b>TRUE</b>, then the procedure creates a DDL rule for DDL changes. If <b>FALSE</b>, then the procedure does not create a DDL rule. <b>NULL</b> is not permitted.</p> <p>The generated rule evaluates to <b>TRUE</b> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <b>FALSE</b> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <b>FALSE</b> for changes that create synonyms or views based on the table. The rule also evaluates to <b>FALSE</b> for a change to a PL/SQL subprogram that refers to the table.</p>
include_tagged_lcr	<p>If <b>TRUE</b>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <b>TRUE</b> regardless of whether a redo entry, session, or LCR has a non-<b>NULL</b> tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-<b>NULL</b> tag.</li> <li>• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-<b>NULL</b> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <b>TRUE</b> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag.</p> <p>If <b>FALSE</b>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <b>TRUE</b> only if a redo entry, session, or LCR has a <b>NULL</b> Oracle Replication tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is <b>NULL</b>:</p> <ul style="list-style-type: none"> <li>• A redo entry is considered for capture by a capture process only when the redo entry contains a <b>NULL</b> tag.</li> <li>• An LCR is considered for apply by an apply process only if the LCR contains a <b>NULL</b> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <b>FALSE</b> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a <b>NULL</b> tag.</p> <p>A setting of <b>FALSE</b> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>Usually, specify <b>TRUE</b> for this parameter if the <code>inclusion_rule</code> parameter is set to <b>FALSE</b>.</p>

**Table 209-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
dml_rule_name	<p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p>
ddl_rule_name	<p>If include_ddl is TRUE, then this parameter contains the DDL rule name.</p> <p>If include_ddl is FALSE, then this parameter contains a NULL.</p>
inclusion_rule	<p>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 209-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p>
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>

### Usage Notes

This procedure creates DML and DDL rules automatically based on include\_dml and include\_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

 **See Also:**

- ["Operational Notes"](#)
- ["Security Model"](#)

**Examples**

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.12 ALTER\_INBOUND Procedure

This procedure modifies an XStream inbound server.

**Syntax**

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(
 server_name IN VARCHAR2,
 apply_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 209-13 ALTER\_INBOUND Procedure Parameters**

Parameter	Description
server_name	The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.
apply_user	The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules. The client application must attach to the inbound server as the apply user. Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS. If NULL, then the apply user is not changed. See <a href="#">"CREATE_INBOUND Procedure"</a> for information about the required privileges for an apply user.
comment	An optional comment associated with the inbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.

## 209.4.13 ALTER\_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the `CREATE_OUTBOUND` procedure in this package.
- The queue used by the capture process was created by the `CREATE_OUTBOUND` procedure.

To check whether this procedure can alter the outbound server's capture process, query the `CAPTURE_NAME` column in the `ALL_XSTREAM_OUTBOUND` view. When the name of the capture process appears in the `CAPTURE_NAME` column of this view, the `ALTER_OUTBOUND` procedure can manage the capture process's rules or change the capture user for the capture process. When the `CAPTURE_NAME` column of this view is `NULL`, the `ALTER_OUTBOUND` procedure cannot manage the capture process.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

### Note:

Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_scn` and `start_time` parameters are included in this procedure.

### Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
 server_name IN VARCHAR2,
 table_names IN DBMS_UTILITY.UNCL_ARRAY,
 schema_names IN DBMS_UTILITY.UNCL_ARRAY,
 add IN BOOLEAN DEFAULT TRUE,
 capture_user IN VARCHAR2 DEFAULT NULL,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 start_scn IN NUMBER DEFAULT NULL,
 start_time IN TIMESTAMP DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
 server_name IN VARCHAR2,
 table_names IN VARCHAR2 DEFAULT NULL,
 schema_names IN VARCHAR2 DEFAULT NULL,
 add IN BOOLEAN DEFAULT TRUE,
```

```

capture_user IN VARCHAR2 DEFAULT NULL,
connect_user IN VARCHAR2 DEFAULT NULL,
comment IN VARCHAR2 DEFAULT NULL,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
start_scn IN NUMBER DEFAULT NULL,
start_time IN TIMESTAMP DEFAULT NULL,
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 209-14 ALTER\_OUTBOUND Procedure Parameters**

Parameter	Description
server_name	The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.
table_names	<p>The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the add parameter.</p> <p>The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as [<i>schema_name</i>.]<i>table_name</i>. For example, hr.employees. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>
schema_names	<p>The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the add parameter.</p> <p>The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (<i>schema_name.table_name</i>).</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>
add	<p>If TRUE, then the procedure adds to the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.</p> <p>If FALSE, then the procedure removes from the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.</p>

Table 209-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters

Parameter	Description
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules.</p> <p>Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.</p> <p>If NULL, then the capture user is not changed.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>Ensure that the capture user is granted the other required privileges. See "<a href="#">CREATE_OUTBOUND Procedure</a>" for information about the privileges required by a capture user.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p><b>Note:</b> If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.</p>
connect_user	<p>The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user.</p> <p>Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS.</p> <p>If NULL, then the connect user is not changed.</p> <p>If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>Ensure that the connect user is granted the other required privileges. See "<a href="#">CREATE_OUTBOUND Procedure</a>" for information about the privileges required by a connect user.</p>
comment	<p>An optional comment associated with the outbound server.</p> <p>If non-NULL, then the specified comment replaces the existing comment.</p> <p>If NULL, then the existing comment is not changed.</p>

**Table 209-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters**

Parameter	Description
inclusion_rule	<p>If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application.</p> <p>If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the positive rule sets in the XStream Out configuration.</p> <p>If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application.</p> <p>If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the negative rule sets in the XStream Out configuration.</p>
start_scn	<p>A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process.</p> <p>If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>If NULL and the <code>start_time</code> parameter is NULL, then the start SCN is not changed.</p> <p>If NULL and the <code>start_time</code> parameter is non-NULL, then the start SCN is changed to match the specified start time.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p> <p><b>Note:</b> If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the <code>start_scn</code> parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the <code>start_scn</code> parameter is non-NULL.</p>

**Table 209-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters**

Parameter	Description
start_time	<p>A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process.</p> <p>If a valid time is specified, then the capture process captures changes from the specified time when it is restarted.</p> <p>An error is returned if an invalid time is specified.</p> <p>If NULL and the start_scn parameter is NULL, then the start time is not changed.</p> <p>If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p><b>Note:</b> If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.</p>
include_dml	<p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
source_database	<p>The global name of the container where the specified table_names and schema_names are located.</p> <p>If source_database is non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>

### Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table\_names and schema\_names parameters:

- If both the table\_names and schema\_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.
 

This procedure is overloaded. The table\_names and schema\_names parameters are defaulted to NULL. Do not specify NULL for both table\_names and schema\_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table\_names and schema\_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for schemas are not changed for the XStream Out configuration.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

**Note:**

An empty array includes one `NULL` entry.

## 209.4.14 CREATE\_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

**Note:**

A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

### Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(
 server_name IN VARCHAR2,
 queue_name IN VARCHAR2,
 apply_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL);
```

## Parameters

Table 209-15 CREATE\_INBOUND Procedure Parameters

Parameter	Description
server_name	<p>The name of the inbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.</p>
queue_name	<p>The name of the local queue used by the inbound server, specified as <code>[schema_name.]queue_name</code>.</p> <p>If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> An inbound server's queue is used only to store error transactions.</p>
apply_user	<p>The apply user. If NULL, then the current user is the default.</p> <p>The client application must attach to the inbound server as the apply user.</p> <p>The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> <li>• The necessary privileges to perform DML and DDL changes on the apply objects</li> <li>• EXECUTE privilege on the rule sets used by the inbound server</li> <li>• EXECUTE privilege on all rule-based transformation functions used in the rule set</li> <li>• EXECUTE privilege on all apply handler procedures</li> </ul> <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p><b>Note:</b> If the apply user for an inbound server is dropped using <code>DROP USER . . . CASCADE</code>, then the inbound server is also dropped automatically.</p>
comment	An optional comment associated with the inbound server.

## Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However,

to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the `DBMS_XSTREAM_ADM` and `DBMS_RULE_ADM` packages.

In a CDB, you can execute the `CREATE_INBOUND` procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

 **See Also:**

*Oracle Database XStream Guide*

## 209.4.15 CREATE\_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

### Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
 server_name IN VARCHAR2,
 source_database IN VARCHAR2 DEFAULT NULL,
 table_names IN DBMS_UTILITY.UNCL_ARRAY,
 schema_names IN DBMS_UTILITY.UNCL_ARRAY,
```

```

capture_user IN VARCHAR2 DEFAULT NULL,
connect_user IN VARCHAR2 DEFAULT NULL,
comment IN VARCHAR2 DEFAULT NULL,
capture_name IN VARCHAR2 DEFAULT NULL,
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL,
lcrld_version IN NUMBER DEFAULT NULL);

```

```

DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
server_name IN VARCHAR2,
source_database IN VARCHAR2 DEFAULT NULL,
table_names IN VARCHAR2 DEFAULT NULL,
schema_names IN VARCHAR2 DEFAULT NULL,
capture_user IN VARCHAR2 DEFAULT NULL,
connect_user IN VARCHAR2 DEFAULT NULL,
comment IN VARCHAR2 DEFAULT NULL,
capture_name IN VARCHAR2 DEFAULT NULL,
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL,
lcrld_version IN NUMBER DEFAULT NULL);

```

## Parameters

**Table 209-16 CREATE\_OUTBOUND Procedure Parameters**

Parameter	Description
server_name	<p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>

**Table 209-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters**

Parameter	Description
source_database	<p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the CREATE_OUTBOUND procedure. See <i>Oracle Database XStream Guide</i> for instructions.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p>
table_names	<p>The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>• Comma-delimited list of type VARCHAR2.</li> <li>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>
schema_names	<p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>• Comma-delimited list of type VARCHAR2.</li> <li>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name).</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>

Table 209-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters

Parameter	Description
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the current user is the default.</p> <p>This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> <li>EXECUTE privilege on the rule sets used by the capture process</li> <li>EXECUTE privilege on all rule-based transformation functions used in the positive rule set</li> </ul> <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS.</p> <p>A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.</p>
connect_user	<p>The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user.</p> <p>If NULL, then the current user is the default.</p> <p>The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, grant the following privileges to the connect user:</p> <ul style="list-style-type: none"> <li>EXECUTE privilege on the rule sets used by the outbound server</li> <li>EXECUTE privilege on all rule-based transformation functions used in the rule set</li> </ul> <p>You can grant these privileges directly to the connect user, or you can grant them through roles.</p> <p>In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p>

**Table 209-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters**

Parameter	Description
comment	An optional comment associated with the outbound server.
capture_name	<p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised.</p> <p>If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name.</p> <p>If NULL, then the system creates a new capture process with a system-generated name.</p> <p><b>Note:</b> The capture process name cannot be altered after the capture process is created.</p>
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
source_root_name	<p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>
source_container_name	<p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>
lcrld_version	<p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrld_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrld_version is set to 1 internally.</p>

## Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are `NULL` or empty, then the outbound server streams all DML and DDL changes to the client application.  
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one `NULL` entry.

## 209.4.16 DELETE\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
- [KEEP\\_COLUMNS Procedure](#)

**Syntax**

```
DBMS_XSTREAM_ADM.DELETE_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

**Parameters****Table 209-17 DELETE\_COLUMN Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error.  For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>table_name</code>	The name of the table from which the column is deleted in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>column_name</code>	The name of the column deleted from each row LCR that satisfies the rule.

**Table 209-17 (Cont.) DELETE\_COLUMN Procedure Parameters**

Parameter	Description
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. <b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

**Usage Notes**

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table\_name, column\_name, and step\_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE\_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

## 209.4.17 DROP\_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the `CREATE_INBOUND` procedure created the queue.
- The inbound server is the only subscriber to the queue.

**See Also:**

"[CREATE\\_INBOUND Procedure](#)"

### Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
 server_name IN VARCHAR2);
```

### Parameters

**Table 209-18 DROP\_INBOUND Procedure Parameters**

Parameter	Description
<code>server_name</code>	The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner.

## 209.4.18 DROP\_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the `CREATE_OUTBOUND` procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the `DROP_OUTBOUND` procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the `CREATE_OUTBOUND` procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

 **See Also:**

- "ADD\_OUTBOUND Procedure"
- "CREATE\_OUTBOUND Procedure"

**Syntax**

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND(
 server_name IN VARCHAR2);
```

**Parameters****Table 209-19 DROP\_OUTBOUND Procedure Parameters**

Parameter	Description
server_name	The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner.

## 209.4.19 ENABLE\_GG\_XSTREAM\_FOR\_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Replication components.

This procedure is intended for users of Oracle Replication who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Replication components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply
- Dependency computation and scheduling
- Capture process parallelism

**Syntax**

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS(
 enable IN BOOLEAN TRUE);
```

## Parameters

**Table 209-20 ENABLE\_GG\_XSTREAM\_FOR\_STREAMS Procedure Parameters**

Parameter	Description
enable	If TRUE, then enable XStream performance optimizations for Oracle Replication components. If FALSE, then disable XStream performance optimizations for Oracle Replication components.

## Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the `PURPOSE` column in the following views displays XStream Streams:
  - ALL\_APPLY
  - DBA\_APPLY
  - ALL\_CAPTURE
  - DBA\_CAPTURE
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Replication components.

### See Also:

- [IS\\_GG\\_XSTREAM\\_FOR\\_STREAMS Function](#)
- *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream*

## 209.4.20 GET\_MESSAGE\_TRACKING Function

The `GET_MESSAGE_TRACKING` Function returns the tracking label for the current session.

### See Also:

[SET\\_MESSAGE\\_TRACKING Procedure](#)

## Syntax

```
DBMS_XSTREAM_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

## 209.4.21 GET\_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

 **See Also:**  
["SET\\_TAG Procedure"](#)

### Syntax

```
DBMS_XSTREAM_ADM.GET_TAG
RETURN RAW;
```

### Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
 raw_tag RAW(2000);
BEGIN
 raw_tag := DBMS_XSTREAM_ADM.GET_TAG();
 DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_XSTREAM_ADM.GET_TAG FROM DUAL;
```

## 209.4.22 IS\_GG\_XSTREAM\_FOR\_STREAMS Function

This function returns `TRUE` if XStream performance optimizations are enabled for Oracle Replication components, or this function returns `FALSE` if XStream performance optimizations are disabled for Oracle Replication components.

 **See Also:**  
["ENABLE\\_GG\\_XSTREAM\\_FOR\\_STREAMS Procedure"](#)

### Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```

## 209.4.23 KEEP\_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

### Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Replication capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes
- [DELETE\\_COLUMN Procedure](#)

### Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_list IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_table IN DBMS_UTILITY.LNAME_ARRAY,
 value_type IN VARCHAR2 DEFAULT '*',
```

```

step_number IN NUMBER DEFAULT 0,
operation IN VARCHAR2 DEFAULT 'ADD');

```

## Parameters

**Table 209-21 KEEP\_COLUMNS Procedure Parameters**

Parameter	Description
rule_name	<p>The name of the rule, specified as [<i>schema_name</i>.]<i>rule_name</i>. If NULL, then the procedure raises an error.</p> <p>For example, to specify a rule in the <i>hr</i> schema named <i>employees12</i>, enter <i>hr.employees12</i>. If the schema is not specified, then the current user is the default.</p>
table_name	<p>The name of the table for which the columns are kept in the row LCR, specified as [<i>schema_name</i>.]<i>object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p>
column_list	<p>The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR.</p> <p>If this parameter is set to NULL, and the <i>column_table</i> parameter is also set to NULL, then the procedure raises an error.</p>
column_table	<p>The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL.</p> <p>The transformation removes columns that are not in the table from the row LCR.</p> <p>If this parameter is set to NULL, and the <i>column_list</i> parameter is also set to NULL, then the procedure raises an error.</p>
value_type	<p>Specify 'NEW' to keep the columns in the new values in the row LCR.</p> <p>Specify 'OLD' to keep the columns in the old values in the row LCR.</p> <p>Specify '*' to keep the columns in both the old and new values in the row LCR.</p>
step_number	<p>The order of execution of the transformation.</p> <p><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering</p>
operation	<p>Specify 'ADD' to add the transformation to the rule.</p> <p>Specify 'REMOVE' to remove the transformation from the rule.</p>

## Usage Notes

When 'REMOVE' is specified for the *operation* parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified *table\_name*, *column\_list*, *column\_table*, and *step\_number* parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP\_COLUMNS procedure when one or more of these parameters is NULL:

<b>table_name</b>	<b>column_list/ column_table</b>	<b>step_number</b>	<b>Result</b>
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.
NULL	NULL	non-NULL	Remove all keep columns transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified <code>column_list/column_table</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations with the specified <code>column_list/column_table</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations with the specified <code>table_name</code> and <code>column_list/column_table</code> for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations with the specified <code>table_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified <code>table_name</code> , <code>column_list/column_table</code> , and <code>step_number</code> for the specified rule.

## 209.4.24 MERGE\_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the `MERGE_STREAMS_JOB` procedure. The `MERGE_STREAMS_JOB` procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the `MERGE_STREAMS_JOB` procedure does nothing.

Typically, it is best to run the `MERGE_STREAMS_JOB` procedure instead of running the `MERGE_STREAMS` procedure directly.

However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$XSTREAM_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
  - The acknowledged SCN of the cloned propagation.
  - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

#### See Also:

[SPLIT\\_STREAMS Procedure](#)

#### Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS (
 cloned_propagation_name IN VARCHAR2,
 propagation_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT NULL,
 perform_actions IN BOOLEAN DEFAULT TRUE,
```

```

script_name IN VARCHAR2 DEFAULT NULL,
script_directory_object IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 209-22 MERGE\_STREAMS Procedure Parameters**

Parameter	Description
cloned_propagation_name	<p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p>
propagation_name	<p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> <li>The queue specified in the <code>queue_name</code> parameter does not exist.</li> <li>The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.</li> </ul>
queue_name	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If <code>NULL</code>, then the existing, original queue is the source queue for the propagation that is merged back. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p>
perform_actions	<p>If <code>TRUE</code>, then the procedure performs the necessary actions to merge the streams directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to merge the streams directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li><code>script_name</code></li> <li><code>script_directory_object</code></li> </ul>

**Table 209-22 (Cont.) MERGE\_STREAMS Procedure Parameters**

Parameter	Description
<code>script_name</code>	<p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>

**Usage Notes**

You can use the `MERGE_STREAMS` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

## 209.4.25 MERGE\_STREAMS\_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the `MERGE_STREAMS` procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the

MERGE\_STREAMS\_JOB procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name` parameter when the MERGE\_STREAMS\_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT\_STREAMS procedure.

If the `auto_merge_threshold` parameter was set to NULL or 0 (zero) in the SPLIT\_STREAMS procedure that split the streams, then you can run the MERGE\_STREAMS\_JOB procedure manually. In this case, it is not run automatically.

### See Also:

- [MERGE\\_STREAMS Procedure](#)
- [SPLIT\\_STREAMS Procedure](#)

## Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB(
 cloned_propagation_name IN VARCHAR2,
 propagation_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT NULL,
 merge_threshold IN NUMBER,
 schedule_name IN VARCHAR2 DEFAULT NULL,
 merge_job_name IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 209-23 MERGE\_STREAMS\_JOB Procedure Parameters**

Parameter	Description
<code>cloned_propagation_name</code>	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
<code>propagation_name</code>	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions: <ul style="list-style-type: none"> <li>• The queue specified in the <code>queue_name</code> parameter does not exist.</li> <li>• The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.</li> </ul>

**Table 209-23 (Cont.) MERGE\_STREAMS\_JOB Procedure Parameters**

Parameter	Description
queue_name	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure.</p> <p>Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p>
merge_threshold	<p>The merge threshold in seconds.</p> <p>The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV\$XSTREAM_CAPTURE dynamic performance view determines whether the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.</p>
schedule_name	<p>The name of the schedule for the merge job.</p> <p>If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>
merge_job_name	<p>The name of the job that merges the streams.</p> <p>If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>

### Usage Notes

You can use the MERGE\_STREAMS\_JOB procedure to merge two streams that were not split using the SPLIT\_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE\_STREAMS\_JOB procedure completes, you can query the DBA\_CAPTURE and DBA\_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule\_name and merge\_job\_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

## 209.4.26 PURGE\_SOURCE\_CATALOG Procedure

This procedure removes all Oracle Replication data dictionary information at the local database for the specified object.

You can use this procedure to remove Oracle Replication metadata that is not needed currently and will not be needed in the future.

### Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG(
 source_database IN VARCHAR2,
 source_object_name IN VARCHAR2,
 source_object_type IN VARCHAR2,
 source_root_name IN VARCHAR2);
```

### Parameters

**Table 209-24 PURGE\_SOURCE\_CATALOG Procedure Parameters**

Parameter	Description
source_database	In a non-CDB, specify the global name of the source database containing the database object. In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, TABLE is the only possible object type.
source_root_name	The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If the source_root_name parameter is NULL, then the global name of the local root is the default. <b>Note:</b> This parameter only applies to a CDB.

### Usage Notes

The global name of the source database containing the object must be specified for the source\_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination

database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

 **Note:**

These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

## 209.4.27 RECOVER\_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If

you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

 **Note:**

To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

 **See Also:**

- ["SPLIT\\_STREAMS Procedure"](#)
- ["MERGE\\_STREAMS Procedure"](#)
- ["MERGE\\_STREAMS\\_JOB Procedure"](#)

### Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(
 script_id IN RAW,
 operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```

### Parameters

**Table 209-25 RECOVER\_OPERATION Procedure Parameters**

Parameter	Description
<code>script_id</code>	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.
<code>operation_mode</code>	<p>If <code>FORWARD</code>, then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation.</p> <p>If <code>ROLLBACK</code>, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view. The other views retain information about the operation for 30 days.</p> <p>If <code>PURGE</code>, then the procedure moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view without rolling the operation back. The other views retain information about the operation for 30 days.</p>

## 209.4.28 REMOVE\_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the `drop_unused_queue_table` parameter is set to `TRUE`, then drops the queue table if it is empty and no other queues are using it.
5. If the `cascade` parameter is set to `TRUE`, then drops all of the XStream clients that are using the queue.

### Note:

The specified queue must be a ANYDATA queue.

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE(
 queue_name IN VARCHAR2,
 cascade IN BOOLEAN DEFAULT FALSE,
 drop_unused_queue_table IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 209-26 REMOVE\_QUEUE Procedure Parameters**

Parameter	Description
<code>queue_name</code>	The name of the queue to remove, specified as [ <i>schema_name</i> .] <i>queue_name</i> . For example, <code>strmadmin.streams_queue</code> . If the schema is not specified, then the current user is the default.
<code>cascade</code>	If <code>TRUE</code> , then the procedure drops any XStream clients that use the queue.  If <code>FALSE</code> , then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the <code>cascade</code> parameter set to <code>FALSE</code> , make sure no XStream clients are using the queue currently.
<code>drop_unused_queue_table</code>	If <code>TRUE</code> and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue.  If <code>FALSE</code> , then the procedure does not drop the queue table.

## 209.4.29 REMOVE\_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

### Note:

If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE(
 rule_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2,
 drop_unused_rule IN BOOLEAN DEFAULT TRUE,
 inclusion_rule IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 209-27 REMOVE\_RULE Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule to remove, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure removes all rules from the specified capture process, apply process, or propagation rule set.  For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code> , enter <code>hr.prop_rule1</code> . If the schema is not specified, then the current user is the default.
<code>streams_type</code>	The type of XStream client: <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>propagation</code> for a propagation.</li> <li>Specify <code>apply</code> for an apply process.</li> </ul>
<code>streams_name</code>	The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner.  If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata.  If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.

**Table 209-27 (Cont.) REMOVE\_RULE Procedure Parameters**

Parameter	Description
drop_unused_rule	<p>If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database.</p> <p>If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database.</p> <p>If FALSE, then the procedure does not drop the rule from the database.</p>
inclusion_rule	<p>If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the XStream client.</p> <p>If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the XStream client.</p>

### 209.4.30 REMOVE\_SUBSET\_OUTBOUND\_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the ADD\_SUBSET\_OUTBOUND\_RULES procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
 FROM ALL_XSTREAM_RULES
 WHERE SUBSETTING_OPERATION IS NOT NULL;
```

#### Note:

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

#### See Also:

["ADD\\_SUBSET\\_OUTBOUND\\_RULES Procedure"](#)

#### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
 server_name IN VARCHAR2,
 insert_rule_name IN VARCHAR2,
 update_rule_name IN VARCHAR2,
 delete_rule_name IN VARCHAR2);
```

## 209.4.31 REMOVE\_XSTREAM\_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
 container IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-28 REMOVE\_XSTREAM\_CONFIGURATION Procedure Parameters**

Parameter	Description
container	<p>If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB.</p> <p>If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>

### Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the ABORT\_TABLE\_INSTANTIATION procedure in the DBMS\_CAPTURE\_ADM package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the ABORT\_SCHEMA\_INSTANTIATION procedure in the DBMS\_CAPTURE\_ADM package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the ABORT\_GLOBAL\_INSTANTIATION procedure in the DBMS\_CAPTURE\_ADM package
- Drops propagations that were created using either the DBMS\_XSTREAM\_ADM package or the DBMS\_PROPAGATION\_ADM package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the DBMS\_AQADM package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers

- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_XSTREAM_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_XSTREAM_ADM` package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

 **Note:**

Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Replication configuration exists at the database, then this procedure also removes the entire Oracle Replication configuration.

 **Note:**

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

## 209.4.32 RENAME\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

### Note:

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

*Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes

### Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 from_column_name IN VARCHAR2,
 to_column_name IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 209-29** RENAME\_COLUMN Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure raises an error.  For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.

**Table 209-29 (Cont.) RENAME\_COLUMN Procedure Parameters**

Parameter	Description
table_name	The name of the table in which the column is renamed in the row LCR, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
from_column_name	The name of the column to be renamed in each row LCR that satisfies the rule.
to_column_name	The new name of the column in each row LCR that satisfies the rule.
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. <b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

### Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_COLUMN` procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified <code>step_number</code> for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>to_column_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.

<b>table_name</b>	<b>from_column_name</b>	<b>to_column_name</b>	<b>step_number</b>	<b>Result</b>
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>column_name</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> for the specified rule.
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

### 209.4.33 RENAME\_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

**Syntax**

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA (
 rule_name IN VARCHAR2,
 from_schema_name IN VARCHAR2,
 to_schema_name IN VARCHAR2,
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

**Parameters****Table 209-30 RENAME\_SCHEMA Procedure Parameters**

Parameter	Description
rule_name	The name of the rule, specified as [ <i>schema_name</i> .] <i>rule_name</i> . If NULL, then the procedure raises an error.  For example, to specify a rule in the <i>hr</i> schema named <i>employees12</i> , enter <i>hr.employees12</i> . If the schema is not specified, then the current user is the default.
from_schema_name	The name of the schema to be renamed in each row LCR that satisfies the rule.
to_schema_name	The new name of the schema in each row LCR that satisfies the rule.
step_number	The order of execution of the transformation. <b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule.  Specify 'REMOVE' to remove the transformation from the rule.

**Usage Notes**

When 'REMOVE' is specified for the *operation* parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified *from\_schema\_name*, *to\_schema\_name*, and *step\_number* parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the *RENAME\_SCHEMA* procedure when one or more of these parameters is NULL:

<b>from_schema_name</b>	<b>to_schema_name</b>	<b>step_number</b>	<b>Result</b>
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified <code>to_schema_name</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified <code>to_schema_name</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>to_schema_name</code> for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified <code>from_schema_name</code> , <code>to_schema_name</code> , and <code>step_number</code> for the specified rule.

## 209.4.34 RENAME\_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

**Syntax**

```
DBMS_XSTREAM_ADM.RENAME_TABLE(
 rule_name IN VARCHAR2,
 from_table_name IN VARCHAR2,
 to_table_name IN VARCHAR2,
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

**Parameters****Table 209-31 RENAME\_TABLE Procedure Parameters**

Parameter	Description
rule_name	The name of the rule, specified as [ <i>schema_name</i> .] <i>rule_name</i> . If NULL, then the procedure raises an error.  For example, to specify a rule in the <i>hr</i> schema named <i>employees12</i> , enter <i>hr.employees12</i> . If the schema is not specified, then the current user is the default.
from_table_name	The name of the table to be renamed in each row LCR that satisfies the rule, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.
to_table_name	The new name of the table in each row LCR that satisfies the rule, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <i>humres.staff</i> .  The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
step_number	The order of execution of the transformation.  <b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule.  Specify 'REMOVE' to remove the transformation from the rule.

### Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_TABLE` procedure when one or more of these parameters is `NULL`:

<code>from_table_name</code>	<code>to_table_name</code>	<code>step_number</code>	Result
<code>NULL</code>	<code>NULL</code>	<code>NULL</code>	Remove all rename table transformations for the specified rule.
<code>NULL</code>	<code>NULL</code>	non- <code>NULL</code>	Remove all rename table transformations with the specified <code>step_number</code> for the specified rule.
<code>NULL</code>	non- <code>NULL</code>	non- <code>NULL</code>	Remove all rename table transformations with the specified <code>to_table_name</code> and <code>step_number</code> for the specified rule.
non- <code>NULL</code>	<code>NULL</code>	non- <code>NULL</code>	Remove all rename table transformations with the specified <code>from_table_name</code> and <code>step_number</code> for the specified rule.
<code>NULL</code>	non- <code>NULL</code>	<code>NULL</code>	Remove all rename table transformations with the specified <code>to_table_name</code> for the specified rule.
non- <code>NULL</code>	non- <code>NULL</code>	<code>NULL</code>	Remove all rename table transformations with the specified <code>from_table_name</code> and <code>to_table_name</code> for the specified rule.
non- <code>NULL</code>	<code>NULL</code>	<code>NULL</code>	Remove all rename table transformations with the specified <code>from_table_name</code> for the specified rule.
non- <code>NULL</code>	non- <code>NULL</code>	non- <code>NULL</code>	Remove all rename table transformations with the specified <code>from_table_name</code> , <code>to_table_name</code> , and <code>step_number</code> for the specified rule.

## 209.4.35 SET\_MESSAGE\_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

 **Note:**

The tracking label set by this procedure does not track non-LCR messages.

 **See Also:**

KAWGET\_MESSAGE\_TRACKING

**Syntax**

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
 tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
 actions IN NUMBER DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

**Parameters****Table 209-32 SET\_MESSAGE\_TRACKING Procedure Parameters**

Parameter	Description
tracking_label	The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
actions	When DBMS_XSTREAM_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory. Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.

## 209.4.36 SET\_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

**Syntax**

```
DBMS_XSTREAM_ADM.SET_PARAMETER(
 streams_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 parameter IN VARCHAR2,
 value IN VARCHAR2 DEFAULT NULL,
 no_wait IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 209-33 SET\_PARAMETER Procedure Parameters**

Parameter	Description
streams_type	The type of XStream client: <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>apply</code> for an outbound server or inbound server.</li> </ul>
streams_name	The name of the capture process, outbound server, or inbound server. Do not specify an owner.
parameter	The name of the parameter you are setting. See " <a href="#">Capture Process Parameters</a> " for information about capture process parameters. See " <a href="#">Apply Component Parameters</a> " for information about outbound server and inbound server parameters.
value	The value to which the parameter is set. If <code>NULL</code> , then the parameter is set to its default value.
no_wait	If <code>TRUE</code> , then the parameter is set immediately. If <code>FALSE</code> , then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server. When you modify multiple parameters for the same process consecutively, setting this parameter to <code>TRUE</code> speeds up each call. However, if the process is currently running, you must set this parameter to <code>FALSE</code> in the last to the procedure to ensure that the process uses the modified parameter values. If the <code>no_wait</code> parameter is set to <code>TRUE</code> for the last call to the procedure, the running process might not detect the parameter changes.
source_database	If <code>CURRENT</code> , then the parameter is set only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB. If <code>ALL</code> , then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify <code>ALL</code> , the procedure must be invoked in the root. If a container name, then the parameter is set in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root. <b>Note:</b> This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters: <ul style="list-style-type: none"> <li><code>include_objects</code> capture parameter</li> <li><code>excludetag</code> capture or apply parameter</li> <li><code>excludetrans</code> capture or apply parameter</li> <li><code>excludeuser</code> capture or apply parameter</li> <li><code>excludeuserid</code> capture or apply parameter</li> <li><code>getreplicates</code> capture or apply parameter</li> <li><code>getapplops</code> capture or apply parameter</li> </ul>

## 209.4.37 SET\_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

### Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
 tag IN RAW DEFAULT NULL);
```

### Parameters

**Table 209-34 SET\_TAG Procedure Parameters**

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits.  By default, the tag for a session is NULL.  The size limit for a tag value is 2000 bytes.

### Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET\_TAG procedure:

- This procedure is not transactional. That is, the effects of SET\_TAG cannot be rolled back.
- If the SET\_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET\_TAG procedure in a session. A data dictionary build happens when the DBMS\_CAPTURE\_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

#### See Also:

[BUILD Procedure](#)

## 209.4.38 SET\_UP\_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

### Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE(
 queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
 storage_clause IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 queue_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-35 SET\_UP\_QUEUE Procedure Parameters**

Parameter	Description
queue_table	<p>The name of the queue table specified as <code>[schema_name.]queue_table_name</code>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner.</p> <p>Queue table names can be a maximum of 24 bytes.</p>
storage_clause	<p>The storage clause for queue table</p> <p>The storage parameter is included in the <code>CREATE TABLE</code> statement when the queue table is created. You can specify any valid table storage clause.</p> <p>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</p> <p>If <code>NULL</code>, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</p> <p><b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for more information about storage clauses</p>
queue_name	<p>The name of the queue that will function as the ANYDATA queue, specified as <code>[schema_name.]queue_name</code>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If the schema is not specified for this parameter, and the queue table owner is not specified in <code>queue_table</code>, then the current user is the default.</p> <p>Queue names can be a maximum of 24 bytes.</p>

**Table 209-35 (Cont.) SET\_UP\_QUEUE Procedure Parameters**

Parameter	Description
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.  If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

### Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE\_QUEUE\_TABLE procedure in the DBMS\_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the sort\_list setting in CREATE\_QUEUE\_TABLE is set to commit\_time. If the database is a release before Oracle Database 10g release 2, the sort\_list setting in CREATE\_QUEUE\_TABLE is set to enq\_time.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the CREATE\_QUEUE procedure in the DBMS\_AQADM package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. SET\_UP\_QUEUE then runs the ENABLE\_DB\_ACCESS procedure in the DBMS\_AQADM package, specifying the agent and the user.

 **Note:**

If the agent that SET\_UP\_QUEUE tries to create exists and is associated with a user other than the user specified by queue\_user, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET\_UP\_QUEUE.

## 209.4.39 SPLIT\_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Replication environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the queried acknowledged SCN. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

 **Note:**

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

 **See Also:**

- ["MERGE\\_STREAMS Procedure"](#)
- ["MERGE\\_STREAMS\\_JOB Procedure"](#)

**Syntax**

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS(
 propagation_name IN VARCHAR2,
 cloned_propagation_name IN VARCHAR2 DEFAULT NULL,
 cloned_queue_name IN VARCHAR2 DEFAULT NULL,
 cloned_capture_name IN VARCHAR2 DEFAULT NULL,
 perform_actions IN BOOLEAN DEFAULT TRUE,
 script_name IN VARCHAR2 DEFAULT NULL,
 script_directory_object IN VARCHAR2 DEFAULT NULL,
 auto_merge_threshold IN NUMBER DEFAULT NULL,
 schedule_name IN OUT VARCHAR2,
 merge_job_name IN OUT VARCHAR2);
```

**Parameters****Table 209-36 SPLIT\_STREAMS Procedure Parameters**

Parameter	Description
propagation_name	The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
cloned_propagation_name	The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.
cloned_queue_name	The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.
cloned_capture_name	The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.

**Table 209-36 (Cont.) SPLIT\_STREAMS Procedure Parameters**

Parameter	Description
<code>perform_actions</code>	<p>If <code>TRUE</code>, then the procedure performs the necessary actions to split the stream directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to split the stream directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>• <code>script_name</code></li> <li>• <code>script_directory_object</code></li> </ul>
<code>script_name</code>	<p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure performs the actions to split the stream directly and does not generate a script.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is <code>NULL</code>, then the procedure ignores this parameter and does not generate a script.</p> <p>If <code>NULL</code> and the <code>script_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>

Table 209-36 (Cont.) SPLIT\_STREAMS Procedure Parameters

Parameter	Description
auto_merge_threshold	<p>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV\$XSTREAM_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.</p> <p>If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process.</p> <p>The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.</p>
schedule_name	<p>The Oracle Scheduler schedule name, specified as [<i>schema_name</i>.]<i>schedule_name</i>. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default.</p> <p>If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.</p> <p>If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name.</p> <p>If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</p> <p>If an existing schedule name is specified, an error is raised.</p>

**Table 209-36 (Cont.) SPLIT\_STREAMS Procedure Parameters**

Parameter	Description
merge_job_name	<p>The Oracle Scheduler job name, specified as [<i>schema_name</i>.]<i>merge_job_name</i>. For example, <i>strmadmin.merge_job</i>. If the schema is not specified, then the current user is the default.</p> <p>If <i>auto_merge_threshold</i> is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL and <i>auto_merge_threshold</i> is a non-NULL positive number, then the system generates a job name.</p> <p>If <i>auto_merge_threshold</i> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If an existing job name is specified, an error is raised.</p>

**See Also:**

*Oracle Database Administrator's Guide* for information about Oracle Scheduler

## 209.4.40 START\_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

### Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
 server_name IN VARCHAR2);
```

### Parameters

**Table 209-37 START\_OUTBOUND Procedure Parameters**

Parameter	Description
server_name	The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner.

## 209.4.41 STOP\_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

### Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND(
 server_name IN VARCHAR2,
 force IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 209-38 STOP\_OUTBOUND Procedure Parameters**

Parameter	Description
server_name	The name of the outbound server being stopped. A NULL specification is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the outbound server and its capture process as soon as possible. If FALSE, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter.

# 210

## DBMS\_XSTREAM\_AUTH

The `DBMS_XSTREAM_AUTH` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XSTREAM\\_AUTH Subprograms](#)

**See Also:**

[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#)

### 210.1 DBMS\_XSTREAM\_AUTH Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

### 210.2 DBMS\_XSTREAM\_AUTH Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `DBMS_XSTREAM_AUTH` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

### 210.3 Summary of DBMS\_XSTREAM\_AUTH Subprograms

This table lists the `DBMS_XSTREAM_AUTH` subprograms and briefly describes them.

**Table 210-1 DBMS\_XSTREAM\_AUTH Package Subprograms**

Subprogram	Description
<a href="#">GRANT_ADMIN_PRIVILEGE Procedure</a>	Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges
<a href="#">GRANT_REMOTE_ADMIN_ACCESS Procedure</a>	Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link
<a href="#">REVOKE_ADMIN_PRIVILEGE Procedure</a>	Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges
<a href="#">REVOKE_REMOTE_ADMIN_ACCESS Procedure</a>	Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link

**Note:**

All subprograms commit unless specified otherwise.

## 210.3.1 GRANT\_ADMIN\_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

**See Also:**

"[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#)"

### Syntax

```
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE (
 grantee IN VARCHAR2,
 privilege_type IN VARCHAR2 DEFAULT '*',
 grant_select_privileges IN BOOLEAN DEFAULT FALSE,
 do_grants IN BOOLEAN DEFAULT TRUE,
 file_name IN VARCHAR2 DEFAULT NULL,
 directory_name IN VARCHAR2 DEFAULT NULL,
 grant_optional_privileges IN VARCHAR2 DEFAULT NULL,
 container IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameters

Table 210-2 GRANT\_ADMIN\_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
privilege_type	Specify one of the following values: <ul style="list-style-type: none"> <li>• CAPTURE Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes.</li> <li>• APPLY Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes.</li> <li>• * Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.</li> </ul>
grant_select_privileges	If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not grant the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model. Set this parameter to FALSE for the XStream untrusted user model.
do_grants	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.

**Table 210-2 (Cont.) GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>
grant_optional_privileges	<p>A comma-separated list of optional privileges to grant to the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges</p>
container	<p>If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p>

### Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege
- EXECUTE on the following packages:
  - DBMS\_APPLY\_ADM
  - DBMS\_AQ
  - DBMS\_AQADM
  - DBMS\_AQIN
  - DBMS\_AQELM
  - DBMS\_CAPTURE\_ADM
  - DBMS\_FLASHBACK
  - DBMS\_LOCK
  - DBMS\_PROPAGATION\_ADM
  - DBMS\_RULE\_ADM
  - DBMS\_TRANSFORM

- DBMS\_XSTREAM\_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT\_CATALOG\_ROLE
- SELECT or READ privilege on data dictionary views related to XStream and Oracle Replication
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the GRANT\_REMOTE\_ADMIN\_ACCESS procedure in this package.

#### Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

#### See Also:

- ["GRANT\\_REMOTE\\_ADMIN\\_ACCESS Procedure"](#)
- *Oracle Database SQL Language Reference* for information about the CREATE DIRECTORY SQL statement

## 210.3.2 GRANT\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

### Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
 grantee IN VARCHAR2);
```

## Parameters

**Table 210-3 GRANT\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

## Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

### Note:

The GRANT\_ADMIN\_PRIVILEGE procedure in this package runs this procedure.

### See Also:

"GRANT\_ADMIN\_PRIVILEGE Procedure"

## 210.3.3 REVOKE\_ADMIN\_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

### Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE(
 grantee IN VARCHAR2,
 privilege_type IN VARCHAR2 DEFAULT '*',
 revoke_select_privileges IN BOOLEAN DEFAULT FALSE,
 do_revokes IN BOOLEAN DEFAULT TRUE,
 file_name IN VARCHAR2 DEFAULT NULL,
 directory_name IN VARCHAR2 DEFAULT NULL,
 revoke_optional_privileges IN VARCHAR2 DEFAULT NULL,
 container IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameters

Table 210-4 *REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters*

Parameter	Description
grantee	The user from whom privileges are revoked
privilege_type	Specify one of the following values: <ul style="list-style-type: none"> <li>• CAPTURE Specifying CAPTURE revokes the minimum privileges required by the user to administer capture processes.</li> <li>• APPLY Specifying APPLY revokes the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes.</li> <li>• * Specifying * revokes the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.</li> </ul>
revoke_select_privileges	If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user. If FALSE, then the procedure does not revoke the set of privileges to the user. SELECT_CATALOG_ROLE enables the user to select from the data dictionary.
do_revokes	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.

**Table 210-4 (Cont.) REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>
revoke_optional_privileges	<p>A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges</p>
container	<p>If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p>

### Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT\_ADMIN\_PRIVILEGE procedure in this package.

#### Note:

To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

#### See Also:

- ["GRANT\\_ADMIN\\_PRIVILEGE Procedure"](#)
- *Oracle Database SQL Language Reference* for information about the CREATE DIRECTORY SQL statement

## 210.3.4 REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

### Note:

The `REVOKE_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

### See Also:

"[REVOKE\\_ADMIN\\_PRIVILEGE Procedure](#)"

### Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS (
 grantee IN VARCHAR2);
```

### Parameters

**Table 210-5 REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

Parameter	Description
grantee	<p>The user for whom access from a remote XStream administrator is disabled.</p> <p>If a row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure updates the <code>ACCESS_FROM_REMOTE</code> column for the grantee to <code>NO</code>. If, after this update, both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column are <code>NO</code> for the grantee, then the procedure removes the grantee from the view.</p> <p>If no row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure does not update the view and does not raise an error.</p>

# 211

## DEBUG\_EXTPROC

The `DEBUG_EXTPROC` package enables you to start up the `extproc` agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of `DEBUG\_EXTPROC` Subprograms](#)

### 211.1 `DEBUG_EXTPROC` Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

### 211.2 `DEBUG_EXTPROC` Operational Notes

These operational notes apply to `DEBUG_EXTPROC`.

To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle `USER` where you want to debug the 'extproc' process.
- Ensure that you have `execute` privileges on package `DEBUG_EXTPROC`

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have `EXECUTE` privileges on the package.

#### Note:

These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through `SQL*Plus` or `OCI` program by connecting to `ORACLE`.

- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

## 211.3 Rules and Limits

`DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

## 211.4 Summary of `DEBUG_EXTPROC` Subprograms

The `STARTUP_EXTPROC_AGENT` procedure is the only `DEBUG_EXTPROC` subprogram.

**Table 211-1** `DEBUG_EXTPROC` Package Subprograms

Subprogram	Description
<code>STARTUP_EXTPROC_AGENT Procedure</code>	Starts up the extproc agent process in the session

### 211.4.1 `STARTUP_EXTPROC_AGENT` Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

#### Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

# 212

## HTF

The `HTF` (hypertext functions) and `HTP` (hypertext procedures) packages generate HTML tags. For example, the `HTF.ANCHOR` function generates the HTML anchor tag, `<A>`.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTF Subprograms](#)

## 212.1 HTF Deprecated Subprograms

The `ESCAPE_URL` function is deprecated with Oracle Database 10g.

### Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

### Related Topics

- [ESCAPE\\_URL Function](#)  
This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

## 212.2 HTF Operational Notes

These operational notes apply to the HTF package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE\\_SC Function](#) or the [ESCAPE\\_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE\\_URL Function](#).
- The [FORMAT\\_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT\\_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.PRINT function. It then prints its parameters to the generated Web page.

## 212.3 Rules and Limits

If you use values of the LONG datatype in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA\_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the function.

## 212.4 HTF Examples

The commands in this example generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
 HTP.P (HTF.HTMLOPEN); -- generates <HTML>
 HTP.P (HTF.HEADOPEN); -- generates <HEAD>
 HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
 HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
 HTP.P (HTF.BODYOPEN); -- generates <BODY>
 HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
 HTP.P (HTF.BODYCLOSE); -- generates </BODY>
 HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

## 212.5 Summary of Tags

This list summarizes the HTML tags generated by the HTF package.

### HTML, HEAD, and BODY Tags

[HTMLOPEN Function](#), [HTMLCLOSE Function](#) - generate <HTML> and </HTML>

[HEADOPEN Function](#), [HEADCLOSE Function](#) - generate <HEAD> and </HEAD>

[BODYOPEN Function](#), [BODYCLOSE Function](#) - generate <BODY> and </BODY>

### Comment Tag

[COMMENT Function](#) - generates <!-- and -->

[http://www.w3.org.BASE Function](#) - generates <BASE>

[LINKREL Function](#) - generates <LINK> with the REL attribute

[LINKREV Function](#) - generates <LINK> with the REV attribute

[TITLE Function](#) - generates <TITLE>

[META Function](#) - generates <META>

[SCRIPT Function](#) - generates <SCRIPT>

[STYLE Function](#) - generates <STYLE>

[ISINDEX Function](#) - generates <ISINDEX>

### Applet Tags

[APPLETOPEN Function](#), [APPLETCLOSE Function](#) - generate <APPLET> and </APPLET>

[PARAM Function](#) - generates <PARAM>

### List Tags

[OLISTOPEN Function](#), [OLISTCLOSE Function](#) - generate <OL> and </OL>

[ULISTOPEN Function](#), [ULISTCLOSE Function](#) - generate <UL> and </UL>

[DLISTOPEN Function](#), [DLISTCLOSE Function](#) - generate <DL> and </DL>

[DLISTTERM Function](#) - generates <DT>

[DLISTDEF Function](#) - generates <DD>

[DIRLISTOPEN Function](#), [DIRLISTCLOSE Function](#) - generate <DIR> and </DIR>

[LISTHEADER Function](#) - generates <LH>

[LISTINGOPEN Function](#), [LISTINGCLOSE Function](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Function](#) - generate <MENU> and </MENU>

[LISTITEM Function](#) - generates <LI>

### Form Tags

[FORMOPEN Function](#), [FORMCLOSE Function](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Function](#) - generates <INPUT TYPE="CHECKBOX">

[FORMHIDDEN Function](#) - generates <INPUT TYPE="HIDDEN">

[FORMIMAGE Function](#) - generates <INPUT TYPE="IMAGE">

[FORMPASSWORD Function](#) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Function](#) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Function](#), [FORMSELECTCLOSE Function](#) - generate `<SELECT>`  
and `</SELECT>`

[FORMSELECTOPTION Function](#) - generates `<OPTION>`

[FORMTEXT Function](#) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Function](#) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Function](#), [FORMTEXTAREACLOSE Function](#) - generate  
`<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Function](#) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Function](#) - generates `<INPUT TYPE="SUBMIT">`

### Table Tags

[TABLEOPEN Function](#), [TABLECLOSE Function](#) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Function](#) - generates `<CAPTION>`

[TABLEROWOPEN Function](#), [TABLEROWCLOSE Function](#) - generate `<TR>` and `</TR>`

[TABLEHEADER Function](#) - generates `<TH>`

[TABLEDATA Function](#) - generates `<TD>`

### IMG, HR, and A Tags

[HR Function](#), [LINE Function](#) - generate `<HR>`

[IMG Function](#), [IMG2 Function](#) - generate `<IMG>`

[ANCHOR Function](#), [ANCHOR2 Function](#) - generate `<A>`

[MAPOPEN Function](#), [MAPCLOSE Function](#) - generate `<MAP>` and `</MAP>`

### Paragraph Formatting Tags

[HEADER Function](#) - generates heading tags (`<H1>` to `<H6>`)

[PARA Function](#), [PARAGRAPH Function](#) - generate `<P>`

[PRN Functions](#), [PRINT Functions](#) - generate any text that is passed in

[PRN Functions](#), [S Function](#) - generate any text that is passed in; special characters in  
HTML are escaped

[PREOPEN Function](#), [PRECLOSE Function](#) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Function](#), [BLOCKQUOTECLOSE Function](#) - generate  
`<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Function](#) - generates `<DIV>`

[NL Function](#), [BR Function](#) - generate `<BR>`

[NOBR Function](#) - generates `<NOBR>`

[WBR Function](#) - generates <WBR>

[PLAINTEXT Function](#) - generates <PLAINTEXT>

[ADDRESS Function](#) - generates <ADDRESS>

[MAILTO Function](#) - generates <A> with the MAILTO attribute

[AREA Function](#) - generates <AREA>

[BGSOUND Function](#) - generates <BGSOUND>

### **Character Formatting Tags**

[BASEFONT Function](#) - generates <BASEFONT>

[BIG Function](#) - generates <BIG>

[BOLD Function](#) - generates <B>

[CENTER Function](#) - generates <CENTER> and </CENTER>

[CENTEROPEN Function](#), [CENTERCLOSE Function](#) - generate <CENTER> and </CENTER>

[CITE Function](#) - generates <CITE>

[CODE Function](#) - generates <CODE>

[DFN Function](#) - generates <DFN>

[EM Function](#), [EMPHASIS Function](#) - generate <EM>

[FONTOPEN Function](#), [FONTCLOSE Function](#) - generate <FONT> and </FONT>

[ITALIC Function](#) - generates <I>

[KBD Function](#), [KEYBOARD Function](#) - generate <KBD> and </KBD>

[S Function](#) - generates <S>

[SAMPLE Function](#) - generates <SAMP>

[SMALL Function](#) - generates <SMALL>

[STRIKE Function](#) - generates <STRIKE>

[STRONG Function](#) - generates <STRONG>

[SUB Function](#) - generates <SUB>

[SUP Function](#) - generates <SUP>

[TELETYPE Function](#) - generates <TT>

[UNDERLINE Function](#) - generates <U>

[VARIABLE Function](#) - generates <VAR>

### **Frame Tags**

[FRAME Function](#) - generates <FRAME>

[FRAMESETOPEN Function](#), [FRAMESETCLOSE Function](#) - generate <FRAMESET> and </FRAMESET>

[NOFRAMESOPEN Function](#), [NOFRAMESCLOSE Function](#) - generate <NOFRAMES> and </NOFRAMES>

## 212.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

**Table 212-1 HTF Package Subprograms**

Subprogram	Description
<a href="#">ADDRESS Function</a>	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
<a href="#">ANCHOR Function</a>	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">ANCHOR2 Function</a>	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">APPLETCLOSE Function</a>	Closes the applet invocation with the </APPLET> tag
<a href="#">APPLETOPEN Function</a>	Generates the <APPLET> tag which begins the invocation of a Java applet
<a href="#">AREA Function</a>	Generates the <AREA> tag, which defines a client-side image map
<a href="#">BASE Function</a>	Generates the <BASE> tag which records the URL of the document
<a href="#">BASEFONT Function</a>	Generates the <BASEFONT> tag which specifies the base font size for a Web page
<a href="#">BGSOUND Function</a>	Generates the <BGSOUND> tag which includes audio for a Web page
<a href="#">BIG Function</a>	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
<a href="#">BLOCKQUOTECLOSE Function</a>	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
<a href="#">BLOCKQUOTEOPEN Function</a>	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
<a href="#">BODYCLOSE Function</a>	Generates the </BODY> tag which marks the end of a body section of an HTML document
<a href="#">BODYOPEN Function</a>	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
<a href="#">BOLD Function</a>	Generates the <B> and </B> tags which direct the browser to display the text in boldface
<a href="#">BR Function</a>	Generates the   tag which begins a new line of text
<a href="#">CENTER Function</a>	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
<a href="#">CENTERCLOSE Function</a>	Generates the </CENTER> tag which marks the end of a section of text to center

Table 212-1 (Cont.) HTF Package Subprograms

Subprogram	Description
<a href="#">CENTEROPEN Function</a>	Generates the <CENTER> tag which mark the beginning of a section of text to center
<a href="#">CITE Function</a>	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
<a href="#">CODE Function</a>	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
<a href="#">COMMENT Function</a>	Generates the comment tags <!-- ctext -->
<a href="#">DFN Function</a>	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
<a href="#">DIRLISTCLOSE Function</a>	Generates the </DIR> tag which ends a directory list section
<a href="#">DIRLISTOPEN Function</a>	Generates the <DIR> which starts a directory list section
<a href="#">DIV Function</a>	Generates the <DIV> tag which creates document divisions
<a href="#">DLISTCLOSE Function</a>	Generates the </DL> tag which ends a definition list
<a href="#">DLISTDEF Function</a>	Generates the <DD> tag, which inserts definitions of terms
<a href="#">DLISTOPEN Function</a>	Generates the <DL> tag which starts a definition list
<a href="#">DLISTTERM Function</a>	Generates the <DT> tag which defines a term in a definition list <DL>
<a href="#">EM Function</a>	Generates the <EM> and </EM> tags, which define text to be emphasized
<a href="#">EMPHASIS Function</a>	Generates the <EM> and </EM> tags, which define text to be emphasized
<a href="#">ESCAPE_SC Function</a>	Replaces characters that have special meaning in HTML with their escape sequences
<a href="#">ESCAPE_URL Function</a>	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
<a href="#">FONTCLOSE Function</a>	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
<a href="#">FONTOPEN Function</a>	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
<a href="#">FORMAT_CELL Function</a>	formats column values inside an HTML table using the <a href="#">TABLEDATA Function</a>
<a href="#">FORMCHECKBOX Function</a>	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
<a href="#">FORMCLOSE Function</a>	Generates the </FORM> tag which marks the end of a form section in an HTML document
<a href="#">FORMFILE Function</a>	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
<a href="#">FORMHIDDEN Function</a>	Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element

Table 212-1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMIMAGE Function	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMPASSWORD Function	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELETOPTION Function	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Function	Generates the <HEAD> tag which marks the beginning of the HTML document head section

Table 212-1 (Cont.) HTF Package Subprograms

Subprogram	Description
HR Function	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Function	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Function	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Function	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
ITALIC Function	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Function	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function	Generates the <LI> tag, which indicates a list item
MAILTO Function	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Function	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Function	Generates the <MENU> tag which begins a list that presents one line for each item

Table 212-1 (Cont.) HTF Package Subprograms

Subprogram	Description
<a href="#">META Function</a>	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
<a href="#">NL Function</a>	Generates the   tag which begins a new line of text
<a href="#">NOBR Function</a>	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
<a href="#">NOFRAMESCLOSE Function</a>	Generates the </NOFRAMES> tag which marks the end of a no-frames section
<a href="#">NOFRAMESOPEN Function</a>	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
<a href="#">OLISTCLOSE Function</a>	Generates the </OL> tag which defines the end of an ordered list
<a href="#">OLISTOPEN Function</a>	Generates the <OL> tag which marks the beginning of an ordered list
<a href="#">PARA Function</a>	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
<a href="#">PARAGRAPH Function</a>	Adds attributes to the <P> tag
<a href="#">PARAM Function</a>	Generates the <PARAM> tag which specifies parameter values for Java applets
<a href="#">PLAINTEXT Function</a>	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
<a href="#">PRECLOSE Function</a>	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
<a href="#">PREOPEN Function</a>	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
<a href="#">PRINT Functions</a>	Generates the specified parameter as a string terminated with the \n newline character
<a href="#">PRN Functions</a>	Generates the specified parameter as a string
<a href="#">S Function</a>	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
<a href="#">SAMPLE Function</a>	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
<a href="#">SCRIPT Function</a>	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBScript
<a href="#">SMALL Function</a>	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
<a href="#">STRIKE Function</a>	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
<a href="#">STRONG Function</a>	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically

Table 212-1 (Cont.) HTF Package Subprograms

Subprogram	Description
<a href="#">STYLE Function</a>	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
<a href="#">SUB Function</a>	Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript
<a href="#">SUP Function</a>	Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript
<a href="#">TABLECAPTION Function</a>	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
<a href="#">TABLECLOSE Function</a>	Generates the </TABLE> tag which marks the end of an HTML table
<a href="#">TABLEDATA Function</a>	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
<a href="#">TABLEHEADER Function</a>	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
<a href="#">TABLEOPEN Function</a>	Generates the <TABLE> tag which marks the beginning of an HTML table
<a href="#">TABLEROWCLOSE Function</a>	Generates the </TR> tag which marks the end of a new row in an HTML table
<a href="#">TABLEROWOPEN Function</a>	Generates the <TR> tag which marks the beginning of a new row in an HTML table
<a href="#">TELETYPE Function</a>	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
<a href="#">TITLE Function</a>	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
<a href="#">ULISTCLOSE Function</a>	Generates the </UL> tag which marks the end of an unordered list
<a href="#">ULISTOPEN Function</a>	Generates the <UL> tag which marks the beginning of an unordered list
<a href="#">UNDERLINE Function</a>	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
<a href="#">VARIABLE Function</a>	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
<a href="#">WBR Function</a>	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

## 212.6.1 ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

### Syntax

```
HTF.ADDRESS (
 cvalue IN VARCHAR2
```

```

cnowrap IN VARCHAR2 DEFAULT NULL
cclear IN VARCHAR2 DEFAULT NULL
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-2 ADDRESS Function Parameters**

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

### Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## 212.6.2 ANCHOR Function

Like the ANCHOR2 function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Function](#) provides a target and therefore can be used for a frame.

### Syntax

```

HTF.ANCHOR (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-3 ANCHOR Function Parameters**

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
ctext
```

### Usage Notes

This tag accepts several attributes, but either `HREF` or `NAME` is required. `HREF` specifies to where to link. `NAME` allows this tag to be a target of a hypertext link.

## 212.6.3 ANCHOR2 Function

Like the `ANCHOR` function, this function generates the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link.

The difference between this and the `ANCHOR` function is that this function provides a target and therefore can be used for a frame.

### Syntax

```
HTF.ANCHOR2 (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 ctarget IN varchar2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-4 ANCHOR2 Function Parameters**

Parameter	Description
<code>curl</code>	The value for the <code>HREF</code> attribute.
<code>ctext</code>	The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.
<code>cname</code>	The value for the <code>NAME</code> attribute
<code>ctarget</code>	The value for the <code>TARGET</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag

### Examples

This function generates

```
ctext
```

## 212.6.4 APPLETCLOSE Function

This function closes the applet invocation with the `</APPLET>` tag.

You must first invoke the a Java applet using [APPLETOPEN Function](#)

### Syntax

```
HTF.APPLETCLOSE
RETURN VARCHAR2;
```

## 212.6.5 APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Function](#) which generates the </APPLET> tag.

### Syntax

```
HTF.APPLETOPEN (
 ccode IN VARCHAR2,
 cheight IN NUMBER,
 cwidth IN NUMBER,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-5 APPLETOPEN Function Parameters**

Parameter	Description
ccode	The value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

### Usage Notes

- Specify parameters to the Java applet using the [PARAM Function](#) function.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

## 212.6.6 AREA Function

This function generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

### Syntax

```
HTF.AREA (
 ccoords IN VARCHAR2
 cshape IN VARCHAR2 DEFAULT NULL,
 chref IN VARCHAR2 DEFAULT NULL,
 cnohref IN VARCHAR2 DEFAULT NULL,
 ctargt IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-6 AREA Function Parameters**

Parameter	Description
ccords	The value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctargt	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctargt"
cattributes>
```

## 212.6.7 BASE Function

This function generates the <BASE> tag which records the URL of the document.

### Syntax

```
HTF.BASE (
 ctargt IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-7 BASE Function Parameters**

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

## 212.6.8 BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

### Syntax

```
HTF.BASEFONT (
 nsize IN INTEGER)
RETURN VARCHAR2;
```

## Parameters

**Table 212-8 BASEFONT Function Parameters**

Parameter	Description
nsize	The value for the SIZE attribute.

## Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

## 212.6.9 BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

### Syntax

```
HTF.BGSOUND (
 csrc IN VARCHAR2,
 cloop IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-9 BGSOUND Function Parameters**

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

## 212.6.10 BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTF.BIG (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-10 BIG Function Parameters**

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

## 212.6.11 BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Function](#).

### Syntax

```
HTF.BLOCKQUOTECLOSE
RETURN VARCHAR2;
```

## Examples

This function generates

```
</BLOCKQUOTE>
```

## 212.6.12 BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Function](#).

### Syntax

```
HTF.BLOCKQUOTEOPEN (
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-11** BLOCKQUOTEOPEN Function Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## 212.6.13 BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Function](#).

### Syntax

```
HTF.BODYCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</BODY>
```

## 212.6.14 BODYOPEN Function

This function generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Function](#).

### Syntax

```
HTF.BODYOPEN (
 cbackground IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-12 BODYOPEN Function Parameters**

Parameter	Description
<code>cbackground</code>	The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

## 212.6.15 BOLD Function

This function generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

### Syntax

```
HTF.BOLD (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-13 BOLD Function Parameters**

Parameter	Description
c <code>text</code>	The text that goes between the tags.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<B cattributes>ctext
```

## 212.6.16 BR Function

This function generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [NL Function](#).

## Syntax

```
HTF.BR(
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-14 BR Function Parameters**

Parameter	Description
c <code>clear</code>	The value for the <code>CLEAR</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## 212.6.17 CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

## Syntax

```
HTF.CENTER (
 ctext IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 212-15** CENTER Parameters

Parameter	Description
c <b>text</b>	The text that goes between the tags.

## Examples

This function generates

```
<CENTER>ctext</CENTER>
```

## 212.6.18 CENTERCLOSE Function

This function generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Function](#).

### Syntax

```
HTF.CENTERCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</CENTER>
```

## 212.6.19 CENTEROPEN Function

This function generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the [CENTERCLOSE Function](#).

### Syntax

```
HTF.CENTEROPEN
RETURN VARCHAR2;
```

### Examples

This function generates

```
<CENTER>
```

## 212.6.20 CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

### Syntax

```
HTF.CITE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-16 CITE Function Parameters**

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

## 212.6.21 CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

### Syntax

```
HTF.CODE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-17 CODE Function Parameters**

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

### Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

## 212.6.22 COMMENT Function

This function generates the comment tags.

### Syntax

```
HTF.COMMENT (
 ctext IN VARCHAR2)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-18** COMMENT Function Parameters

Parameter	Description
ctext	The comment.

### Examples

This function generates

```
<!-- ctext -->
```

## 212.6.23 DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

### Syntax

```
HTF.DFN (
 ctext IN VARCHAR2)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-19** DFN Function Parameters

Parameter	Description
ctext	The text to render in italics.

### Examples

This function generates

```
<DFN>ctext</DFN>
```

## 212.6.24 DIRLISTCLOSE Function

This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

### Syntax

```
HTF.DIRLISTCLOSE
 RETURN VARCHAR2;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Function](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This function generates

```
</DIR>
```

### Related Topics

- [DIRLISTOPEN Function](#)  
This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

## 212.6.25 DIRLISTOPEN Function

This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

### Syntax

```
HTF.DIRLISTOPEN
 RETURN VARCHAR2;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Function](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This function generates

```
<DIR>
```

### Related Topics

- [DIRLISTCLOSE Function](#)  
This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

## 212.6.26 DIV Function

This function generates the <DIV> tag which creates document divisions.

### Syntax

```
HTF.DIV (
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-20** DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

## 212.6.27 DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

### Syntax

```
HTF.DLISTCLOSE
RETURN VARCHAR2;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

### Examples

This function generates

```
</DL>
```

### Related Topics

- [DLISTOPEN Function](#)  
This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

## 212.6.28 DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

### Syntax

```
HTF.DLISTDEF (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-21 DLISTDEF Function Parameters**

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## 212.6.29 DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

### Syntax

```
HTF.DLISTOPEN (
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-22 DLISTOPEN Function Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

## Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

## Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

## Related Topics

- [DLISTCLOSE Function](#)  
This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Function](#).

## 212.6.30 DLISTTERM Function

This function generates the `<DT>` tag which defines a term in a definition list `<DL>`.

### Syntax

```
HTF.DLISTTERM (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-23 DLISTTERM Function Parameters**

Parameter	Description
ctext	The term.
cclear	The value for the <code>CLEAR</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## 212.6.31 EM Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Function](#).

### Syntax

```
HTF.EM(
 ctext IN VARCHAR2,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-24** EM Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<EM cattributes>ctext
```

## 212.6.32 EMPHASIS Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EM Function](#).

### Syntax

```

HTF.EMPHASIS(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-25** EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<EM cattributes>ctext
```

## 212.6.33 ESCAPE\_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&amp;`
- `"` to `&quot;`

- < to &lt;
- > to &gt;

This function performs the same operation as HTP. [PRINTS Procedure](#) and HTP. [PS Procedure](#).

### Syntax

```
HTF.ESCAPE_SC(
 ctext IN VARCHAR2);
```

### Parameters

**Table 212-26 ESCAPE\_SC Function Parameters**

Parameter	Description
c_text	The text string to convert.

## 212.6.34 ESCAPE\_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

### Note:

This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the [ESCAPE Function](#) in the [UTL\\_URL](#) package.

The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;
- % to &25

### Syntax

```
HTF.ESCAPE_URL(
 p_url IN VARCHAR2);
```

**Parameters****Table 212-27 ESCAPE\_URL Function Parameters**

Parameter	Description
p_url	The string to convert.

## 212.6.35 FONTCLOSE Function

This function generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Function](#).

**Syntax**

```
HTF.FONTCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```

```

## 212.6.36 FONTOPEN Function

This function generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Function](#).

**Syntax**

```
HTF.FONTOPEN(
 ccolor IN VARCHAR2 DEFAULT NULL,
 cface IN VARCHAR2 DEFAULT NULL,
 csize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-28 FONTOPEN Function Parameters**

Parameter	Description
ccolor	The value for the <code>COLOR</code> attribute.
cface	The value for the <code>FACE</code> attribute
csize	The value for the <code>SIZE</code> attribute
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```

```

## 212.6.37 FORMAT\_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

### Syntax

```
HTF.FORMAT_CELL(
 columnValue IN VARCHAR2
 format_numbers IN VARCHAR2 DEFAULT NULL
 RETURN VARCHAR2;
```

### Parameters

**Table 212-29** FORMAT\_CELL Function Parameters

Parameter	Description
columnValue	The value that needs to be formatted in an HTML table.
format_numbers	The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.

### Examples

This function generates

```
<TD >columnValue</TD>
```

### Related Topics

- [TABLEDATA Function](#)  
This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

## 212.6.38 FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

### Syntax

```
HTF.FORMCHECKBOX(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT 'ON',
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

## Parameters

**Table 212-30 FORMCHECKBOX Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 212.6.39 FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Function](#).

### Syntax

```
HTF.FORMCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</FORM>
```

## 212.6.40 FORMFILE Function

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

### Syntax

```
HTF.FORMFILE(
 cname IN VARCHAR2,
 caccept IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

## Parameters

**Table 212-31 FORMFILE Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## 212.6.41 FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

## Syntax

```
HTF.FORMHIDDEN(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-32 FORMHIDDEN Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## 212.6.42 FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted

under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

### Syntax

```
HTF.FORMIMAGE(
 cname IN VARCHAR2,
 csrc IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-33 FORMIMAGE Function Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute that specifies the image file.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## 212.6.43 FORMOPEN Function

This function generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Function](#).

### Syntax

```
HTF.FORMOPEN(
 curl IN VARCHAR2,
 cmethod IN VARCHAR2 DEFAULT 'POST',
 ctarget IN VARCHAR2 DEFAULT NULL,
 cenctype IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-34 FORMOPEN Function Parameters**

Parameter	Description
<code>curl</code>	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
<code>cmethod</code>	The value for the <code>METHOD</code> attribute. The value can be "GET" or "POST".

**Table 212-34 (Cont.) FORMOPEN Function Parameters**

Parameter	Description
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

## 212.6.44 FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

**Syntax**

```
HTF.FORMPASSWORD(
 cname IN VARCHAR2,
 csize IN VARCHAR2,
 cmaxlength IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-35 FORMPASSWORD Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```

## 212.6.45 FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```
HTF.FORMRADIO(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2,
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-36 FORMRADIO Function Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 212.6.46 FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

### Syntax

```
HTF.FORMRESET(
 cvalue IN VARCHAR2 DEFAULT 'Reset',
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-37 FORMRESET Function Parameters**

Parameter	Description
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## 212.6.47 FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Function](#). The values are inserted using [FORMSELETOPTION Function](#).

### Syntax

```
HTF.FORMSELECTCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</SELECT>
```

as shown under [Examples](#) of the [FORMSELECTOPEN Function](#).

## 212.6.48 FORMSELECTOPEN Function

This function generates the `<SELECT>` tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Function](#). The values are inserted using [FORMSELETOPTION Function](#).

### Syntax

```
HTF.FORMSELECTOPEN(
 cname IN VARCHAR2,
 cprompt IN VARCHAR2 DEFAULT NULL,
 nsize IN INTEGER DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-38** FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
 'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

## 212.6.49 FORMSELECTOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

### Syntax

```
HTF.FORMSELECTOPTION(
 cvalue IN VARCHAR2,
 cselected IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-39** FORMSELECTOPTION Function Parameters

Parameter	Description
cvalue	The text for the option
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates <OPTION SELECTED cattributes>cvalue as shown under the Examples section of the [FORMSELECTOPEN Function](#).

## 212.6.50 FORMSUBMIT Function

This function generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

### Syntax

```
HTF.FORMSUBMIT(
 cname IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT 'Submit',
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-40 FORMSUBMIT Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## 212.6.51 FORMTEXT Function

This function generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

### Syntax

```
HTF.FORMTEXT(
 cname IN VARCHAR2,
 csize IN VARCHAR2 DEFAULT NULL,
 cmaxlength IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-41 FORMTEXT Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmmaxlength	The value for the MAXLENGTH attribute.

**Table 212-41 (Cont.) FORMTEXT Function Parameters**

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

## 212.6.52 FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

**Syntax**

```
HTF.FORMTEXTAREA(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-42 FORMTEXTAREA Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></
TEXTAREA>
```

## 212.6.53 FORMTEXTAREA2 Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Function](#) except that in that case you cannot specify a wrap style.

### Syntax

```
HTF.FORMTEXTAREA2(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-43 FORMTEXTAREA2 Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## 212.6.54 FORMTEXTAREACLOSE Function

This function generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Function](#) or [FORMTEXTAREAOPEN2 Function](#).

### Syntax

```
HTF.FORMTEXTAREACLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

&lt;/TEXTAREA&gt;

## 212.6.55 FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

### Syntax

```
HTF.FORMTEXTAREAOPEN(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-44 FORMTEXTAREAOPEN Function Parameters**

Parameter	Description
<code>cname</code>	The value for the NAME attribute.
<code>nrows</code>	The value for the ROWS attribute. This is an integer.
<code>ncolumns</code>	The value for the COLS attribute. This is an integer.
<code>calign</code>	The value for the ALIGN attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## 212.6.56 FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Function](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

### Syntax

```
HTF.FORMTEXTAREAOPEN2(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-45 FORMTEXTAREAOPEN2 Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```

<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP =
" cwrap" cattributes>

```

## 212.6.57 FRAME Function

This function generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

### Syntax

```

HTF.FRAME(
 csrc IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cmarginwidth IN VARCHAR2 DEFAULT NULL,
 cmarginheight IN VARCHAR2 DEFAULT NULL,
 cscrolling IN VARCHAR2 DEFAULT NULL,
 cnoresize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-46 FRAME Function Parameters**

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

## 212.6.58 FRAMESETCLOSE Function

This function generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Function](#).

## Syntax

```
HTF.FRAMESETCLOSE
RETURN VARCHAR2;
```

## Examples

This function generates

```
</FRAMESET>
```

## 212.6.59 FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Function](#).

## Syntax

```
HTF.FRAMESETOPEN(
 crows IN VARCHAR2 DEFAULT NULL,
 ccols IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-47** FRAMESETOPEN Function Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

## 212.6.60 HEADCLOSE Function

This function generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Function](#).

### Syntax

```
HTF.HEADCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</HEAD>
```

## 212.6.61 HEADER Function

This function generates opening heading tags (`<H1>` to `<H6>`) and their corresponding closing tags (`</H1>` to `</H6>`).

### Syntax

```
HTF.HEADER(
 nsize IN INTEGER,
 cheader IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-48** HEADER Function Parameters

Parameter	Description
<code>nsize</code>	The heading level. This is an integer between 1 and 6.
<code>cheader</code>	The text to display in the heading.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	The value for the <code>NOWRAP</code> attribute.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

```
HTF.header (1,'Overview')
 RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

## 212.6.62 HEADOPEN Function

This function generates the `<HEAD>` tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Function](#).

### Syntax

```
HTF.HEADOPEN
 RETURN VARCHAR2;
```

### Examples

This function generates

```
<HEAD>
```

## 212.6.63 HR Function

This function generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Function](#).

### Syntax

```
HTF.HR(
 cclear IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-49** HR Function Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 212.6.64 HTMLCLOSE Function

This function generates the `</HTML>` tag which marks the end of an HTML document.

You use the [HTMLOPEN Function](#) to mark the beginning of an HTML document.

**Syntax**

```
HTF.HTMLCLOSE
 RETURN VARCHAR2;
```

**Examples**

This function generates

```
</HTML>
```

## 212.6.65 HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Function](#) to mark the end of the an HTML document.

**Syntax**

```
HTF.HTMLOPEN
 RETURN VARCHAR2;
```

**Examples**

This function generates

```
<HTML>
```

## 212.6.66 IMG Function

This function generates the <IMG> tag which directs the browser to load an image onto the HTML page.

The [IMG2 Function](#) performs the same operation but additionally uses the `cusemap` parameter.

**Syntax**

```
HTF.IMG(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

**Parameters****Table 212-50 IMG Function Parameters**

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.

**Table 212-50 (Cont.) IMG Function Parameters**

Parameter	Description
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```

```

## 212.6.67 IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The [IMG Function](#) performs the same operation but does not use the `cusemap` parameter.

**Syntax**

```
HTF.IMG2(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cusemap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-51 IMG2 Function Parameters**

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cusemap	The value for the USEMAP attribute which specifies a client-side image map.
ccattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```

```

## 212.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

### Syntax

```
HTF.ISINDEX(
 cprompt IN VARCHAR2 DEFAULT NULL,
 curl IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-52 ISINDEX Function Parameters**

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

### Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## 212.6.69 ITALIC Function

This function generates the <I> and </I> tags which direct the browser to render the text in italics.

### Syntax

```
HTF.ITALIC(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-53 ITALIC Function Parameters**

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<I cattributes>ctext</I>
```

## 212.6.70 KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Function](#).

### Syntax

```
HTF.KBD(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-54 KBD Function Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## 212.6.71 KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Function](#).

### Syntax

```
HTF.KEYBOARD(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-55 KEYBOARD Function Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## 212.6.72 LINE Function

This function generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Function](#).

### Syntax

```
HTF.LINE(
 cclear IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-56** LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 212.6.73 LINKREL Function

This function generates the `<LINK>` tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of [LINKREV Function](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Function](#).

### Syntax

```
HTF.LINKREL(
 crel IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-57 LINKREL Function Parameters**

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

## Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## 212.6.74 LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Function](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Function](#).

## Syntax

```
HTF.LINKREV(
 crev IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-58 LINKREV Function Parameters**

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

## Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## 212.6.75 LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

### Syntax

```
HTF.LISTHEADER(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-59** LISTHEADER Function Parameters

Parameter	Description
<code>ctext</code>	The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> .
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<LH cattributes>ctext</LH>
```

## 212.6.76 LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Function](#).

### Syntax

```
HTF.LISTINGCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</LISTING>
```

## 212.6.77 LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Function](#).

**Syntax**

```
HTF.LISTINGOPEN
 RETURN VARCHAR2;
```

**Examples**

This function generates

```
<LISTING>
```

## 212.6.78 LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

**Syntax**

```
HTF.LISTITEM(
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cdingbat IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

**Parameters****Table 212-60 LISTITEM Function Parameters**

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## 212.6.79 MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

**Syntax**

```
HTF.MAILTO(
 address IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

## Parameters

**Table 212-61 MAILTO Function Parameters**

Parameter	Description
address	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the <code>NAME</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
ctext
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
Send Email to the President
```

## 212.6.80 MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map

. To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Function](#).

### Syntax

```

HTF.MAPCLOSE
RETURN VARCHAR2;

```

### Examples

This function generates

```
</MAP>
```

## 212.6.81 MAPOPEN Function

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Function](#).

**Syntax**

```
HTF.MAPOPEN(
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-62 MAPOPEN Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<MAP NAME="cname" cattributes>
```

## 212.6.82 MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

**Syntax**

```
HTF.MENULISTCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```
</MENU>
```

## 212.6.83 MENULISTOPEN Function

This function generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

**Syntax**

```
HTF.MENULISTOPEN
RETURN VARCHAR2;
```

## Examples

This function generates

```
<MENU>
```

## 212.6.84 META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

### Syntax

```
HTF.META(
 chttp_equiv IN VARCHAR2,
 cname IN VARCHAR2,
 ccontent IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 212-63 META Function Parameters**

Parameter	Description
<code>chttp_equiv</code>	The value for the <code>CHTTP_EQUIV</code> attribute.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>ccontent</code>	The value for the <code>CONTENT</code> attribute.

### Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## 212.6.85 NL Function

This function generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [BR Function](#).

### Syntax

```
HTF.NL(
 cclear IN VARCHAR2 DEFAULT NULL,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-64 NL Function Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## 212.6.86 NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

### Syntax

```

HTF.NOBR(
c text IN VARCHAR2)
RETURN VARCHAR2;

```

### Parameters

**Table 212-65 NOBR Function Parameters**

Parameter	Description
c text	The text that is to be rendered on one line.

### Examples

This function generates

```
<NOBR>c text</NOBR>
```

## 212.6.87 NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

### Syntax

```

HTF.NOFRAMESCLOSE
RETURN VARCHAR2;

```

### Examples

This function generates

```
</NOFRAMES>
```

## 212.6.88 NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

### Syntax

```
HTF.NOFRAMESOPEN
 RETURN VARCHAR2;
```

### Examples

This function generates

```
<NOFRAMES>
```

## 212.6.89 OLISTCLOSE Function

This function generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Function](#). Numbered items are added using [LISTITEM Function](#).

### Syntax

```
HTF.OLISTCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```

```

## 212.6.90 OLISTOPEN Function

This function generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Function](#). Numbered items are added using [LISTITEM Function](#).

### Syntax

```
HTF.OLISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-66** OLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## 212.6.91 PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Function](#).

### Syntax

```

HTF.PARA
RETURN VARCHAR2;

```

### Examples

This function generates

```
<P>
```

## 212.6.92 PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

### Syntax

```

HTF.PARAGRAPH(
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

## Parameters

**Table 212-67** PARAGRAPH Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

## Related Topics

- [PARA Function](#)  
This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

## 212.6.93 PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Function](#) to begin the invocation. Use one [PARAM Function](#) for each desired name-value pair, and use [APPLETCLOSE Function](#) to end the applet invocation.

## Syntax

```
HTF.PARAM(
 cname IN VARCHAR2
 cvalue IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 212-68** PARAM Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

## Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## 212.6.94 PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

### Syntax

```
HTF.PLAINTEXT(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-69** PLAINTEXT Function Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## 212.6.95 PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Function](#).

### Syntax

```
HTF.PRECLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</PRE>
```

## 212.6.96 PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Function](#).

## Syntax

```
HTF.PREOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwidth IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-70** PREOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## 212.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character.

The [PRN Functions](#) performs the same operation but does not terminate with a newline character.

## Syntax

```
HTF.PRINT (
 cbuf IN VARCHAR2)
RETURN VARCHAR2;
```

```
HTF.PRINT (
 dbuf IN DATE)
RETURN VARCHAR2;
```

```
HTF.PRINT (
 nbuf IN NUMBER)
RETURN VARCHAR2;
```

## Parameters

**Table 212-71** PRINT Function Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

**Usage Notes**

- The `\n` character is not the same as `<BR>`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `<BR>` to control how the browser renders the HTML source.
- These functions do not have function equivalents.

## 212.6.98 PRN Functions

These functions generate the specified parameter as a string.

Unlike the [PRINT Functions](#) the string is not terminated with the `\n` newline character.

**Syntax**

```
HTF.PRN (
 cbuf IN VARCHAR2)
RETURN VARCHAR2;
```

```
HTF.PRN (
 dbuf IN DATE)
RETURN VARCHAR2;
```

```
HTF.PRN (
 nbuf IN NUMBER)
RETURN VARCHAR2;
```

**Parameters****Table 212-72 PRN Function Parameters**

Parameter	Description
<code>cbuf</code>	The string to generate (not terminated by a newline).
<code>dbuf</code>	The string to generate (not terminated by a newline).
<code>nbuf</code>	The string to generate (not terminated by a newline).

**Usage Notes**

These functions do not have function equivalents.

## 212.6.99 S Function

This function generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Function](#).

**Syntax**

```
HTF.S (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-73 S Function Parameters**

Parameter	Description
c <code>text</code>	The text to be rendered in strikethrough type.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<S cattributes>ctext</S>
```

## 212.6.100 SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

## Syntax

```
HTF.SAMPLE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-74 SAMPLE Function Parameters**

Parameter	Description
c <code>text</code>	The text to be rendered in monospace font.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

## 212.6.101 SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

## Syntax

```
HTF.SCRIPT (
 cscript IN VARCHAR2,
 clanguage IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-75** SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

## Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## 212.6.102 SMALL Function

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

### Syntax

```
HTF.SMALL (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-76** SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

## 212.6.103 STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Function](#).

### Syntax

```
STRIKE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-77 STRIKE Function Parameters**

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## 212.6.104 STRONG Function

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

### Syntax

```
HTF.STRONG(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-78 STRONG Function Parameters**

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<STRONG cattributes>ctext
```

## 212.6.105 STYLE Function

This function generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

### Syntax

```
HTF.STYLE(
 cstyle IN VARCHAR2)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-79** STYLE Function Parameters

Parameter	Description
cstyle	The style information to include.

### Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

## 212.6.106 SUB Function

This function generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript.

### Syntax

```
HTF.SUB(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-80** SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
_{ctext}
```

## 212.6.107 SUP Function

This function generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

### Syntax

```
HTF.SUP(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-81 SUP Function Parameters**

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
^{ctext}
```

## 212.6.108 TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

### Syntax

```
HTF.TABLECAPTION(
 ccaption IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-82 TABLECAPTION Function Parameters**

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

## 212.6.109 TABLECLOSE Function

This function generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Function](#).

### Syntax

```
HTF.TABLECLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</TABLE>
```

## 212.6.110 TABLEDATA Function

This function generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

### Syntax

```
HTF.TABLEDATA(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-83** TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

## 212.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

### Syntax

```
HTF.TABLEHEADER(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-84** TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

## 212.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Function](#).

### Syntax

```
HTF.TABLEOPEN(
 cborder IN VARCHAR2 DEFAULT NULL
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-85 TABLEOPEN Function Parameters**

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

## 212.6.113 TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Function](#).

### Syntax

```
HTF.TABLEROWCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</TABLE>
```

## 212.6.114 TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Function](#).

### Syntax

```
HTF.TABLEROWOPEN(
 calign IN VARCHAR2 DEFAULT NULL,
 cvalign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-86** TABLEROWOPEN Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## 212.6.115 TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

### Syntax

```
HTF.TELETYPE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-87** TELETYPE Function Parameters

Parameter	Description
c <code>text</code>	The text to render in a fixed width typewriter font.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<TT cattributes>ctext</TT>
```

## 212.6.116 TITLE Function

This function generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

### Syntax

```
HTF.TITLE(
 ctitle IN VARCHAR2)
 RETURN VARCHAR2;
```

## Parameters

**Table 212-88** TITLE Function Parameters

Parameter	Description
c <code>title</code>	The text to display in the titlebar of the browser window.

## Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

## 212.6.117 ULISTCLOSE Function

This function generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Function](#). Add list items with [LISTITEM Function](#).

### Syntax

```
HTF.ULISTCLOSE
 RETURN VARCHAR2;
```

## Examples

This function generates

&lt;/UL&gt;

## 212.6.118 ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Function](#). Add list items with [LISTITEM Function](#).

### Syntax

```
HTF.ULISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cdingbat IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-89** ULISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## 212.6.119 UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

### Syntax

```
HTF.UNDERLINE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-90 UNDERLINE Function Parameters**

Parameter	Description
c <code>text</code>	The text to render with an underline.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<U cattributes>ctext</U>
```

## 212.6.120 VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

## Syntax

```
HTF.VARIABLE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

## Parameters

**Table 212-91 VARIABLE Function Parameters**

Parameter	Description
c <code>text</code>	The text to render in italics.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

## 212.6.121 WBR Function

This function generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

## Syntax

```
HTF.WBR
 RETURN VARCHAR2;
```

## Examples

This function generates

<WBR>

# 213

## HTP

The `HTP` (hypertext procedures) and `HTF` (hypertext functions) packages generate HTML tags. For example, the `HTP.ANCHOR` procedure generates the HTML anchor tag, `<A>`.

This chapter contains the following topics:

- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTP Subprograms](#)

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for `mod_plsql`*

## 213.1 HTP Operational Notes

Certain operational notes apply to the `HTP` package.

For every `HTP` procedure that generates one or more HTML tags, there is a corresponding `HTF` function with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have `HTF` function equivalents. Use the [ESCAPE\\_SC Function](#) or the [ESCAPE\\_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE\\_URL Function](#).
- The [FORMAT\\_CELL Function](#) does not have an `HTP` equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an `HTP` equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT\\_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of `HTF` functions, call the functions from within the `HTP.PRINT` procedure. It then prints its parameters to the generated Web page.

## 213.2 HTP Rules and Limits

If you use values of the LONG datatype in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA\_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.

## 213.3 HTP Examples

These commands generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
 HTP.HTMLOPEN; -- generates <HTML>
 HTP.HEADOPEN; -- generates <HEAD>
 HTP.TITLE('Hello'); -- generates <TITLE>Hello</TITLE>
 HTP.HEADCLOSE; -- generates </HEAD>
 HTP.BODYOPEN; -- generates <BODY>
 HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
 HTP.BODYCLOSE; -- generates </BODY>
 HTP.HTMLCLOSE; -- generates </HTML>
END;
```

## 213.4 HTP Summary of Tags

HTP tags can be grouped by type, to make understanding them easier.

### HTML, HEAD, and BODY Tags

[HTMLOPEN Procedure](#), [HTMLCLOSE Procedure](#) - generate <HTML> and </HTML>

[HEADOPEN Procedure](#), [HEADCLOSE Procedure](#) - generate <HEAD> and </HEAD>

[BODYOPEN Procedure](#), [BODYCLOSE Procedure](#) - generate <BODY> and </BODY>

### Comment Tag

[COMMENT Procedure](#) - generates <!-- and -->

### Tags in the <HEAD> Area

[BASE Procedure](#) - generates <BASE>

[LINKREL Procedure](#) - generates <LINK> with the REL attribute

[LINKREV Procedure](#) - generates <LINK> with the REV attribute

[TITLE Procedure](#) - generates <TITLE>

[META Procedure](#) - generates <META>

[SCRIPT Procedure](#) - generates <SCRIPT>

[STYLE Procedure](#) - generates <STYLE>

[ISINDEX Procedure](#) - generates <ISINDEX>

### Applet Tags

[APPLETOPEN Procedure](#), [APPLETCLOSE Procedure](#) - generate `<APPLET>` and `</APPLET>`

[PARAM Procedure](#) - generates `<PARAM>`

### List Tags

[OLISTOPEN Procedure](#), [OLISTCLOSE Procedure](#) - generate `<OL>` and `</OL>`

[ULISTOPEN Procedure](#), [ULISTCLOSE Procedure](#) - generate `<UL>` and `</UL>`

[DLISTOPEN Procedure](#), [DLISTCLOSE Procedure](#) - generate `<DL>` and `</DL>`

[DLISTTERM Procedure](#) - generates `<DT>`

[DLISTDEF Procedure](#) - generates `<DD>`

[DIRLISTOPEN Procedure](#), [DIRLISTCLOSE Procedure](#) - generate `<DIR>` and `</DIR>`

[LISTHEADER Procedure](#) - generates `<LH>`

[LISTINGOPEN Procedure](#), [LISTINGCLOSE Procedure](#) - generate `<LISTING>` and `</LISTING>`

[MENULISTOPEN Procedure](#) - generate `<MENU>` and `</MENU>`

[LISTITEM Procedure](#) - generates `<LI>`

### Form Tags

[FORMOPEN Procedure](#), [FORMCLOSE Procedure](#) - generate `<FORM>` and `</FORM>`

[FORMCHECKBOX Procedure](#) - generates `<INPUT TYPE="CHECKBOX">`

[FORMHIDDEN Procedure](#) - generates `<INPUT TYPE="HIDDEN">`

[FORMIMAGE Procedure](#) - generates `<INPUT TYPE="IMAGE">`

[FORMPASSWORD Procedure](#) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Procedure](#) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Procedure](#), [FORMSELECTCLOSE Procedure](#) - generate `<SELECT>` and `</SELECT>`

[FORMSELETOPTION Procedure](#) - generates `<OPTION>`

[FORMTEXT Procedure](#) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Procedure](#) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Procedure](#), [FORMTEXTAREACLOSE Procedure](#) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Procedure](#) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Procedure](#) - generates `<INPUT TYPE="SUBMIT">`

### Table Tags

[TABLEOPEN Procedure](#), [TABLECLOSE Procedure](#) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Procedure](#) - generates `<CAPTION>`

[TABLEROWOPEN Procedure](#), [TABLEROWCLOSE Procedure](#) - generate `<TR>` and `</TR>`

[TABLEHEADER Procedure](#) - generates `<TH>`

[TABLEDATA Procedure](#) - generates `<TD>`

### IMG, HR, and A Tags

[HR Procedure](#), [LINE Procedure](#) - generate `<HR>`

[IMG Procedure](#), [IMG2 Procedure](#) - generate `<IMG>`

[ANCHOR Procedure](#), [ANCHOR2 Procedure](#) - generate `<A>`

[MAPOPEN Procedure](#), [MAPCLOSE Procedure](#) - generate `<MAP>` and `</MAP>`

### Paragraph Formatting Tags

[HEADER Procedure](#) - generates heading tags (`<H1>` to `<H6>`)

[PARA Procedure](#), [PARAGRAPH Procedure](#) - generate `<P>`

[PRN Procedures](#), [PRINT Procedures](#) - generate any text that is passed in

[PRINTS Procedure](#), [PS Procedure](#) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Procedure](#), [PRECLOSE Procedure](#) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Procedure](#), [BLOCKQUOTECLOSE Procedure](#) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Procedure](#) - generates `<DIV>`

[NL Procedure](#), [BR Procedure](#) - generate `<BR>`

[NOBR Procedure](#) - generates `<NOBR>`

[WBR Procedure](#) - generates `<WBR>`

[PLAINTEXT Procedure](#) - generates `<PLAINTEXT>`

[ADDRESS Procedure](#) - generates `<ADDRESS>`

[MAILTO Procedure](#) - generates `<A>` with the `MAILTO` attribute

[AREA Procedure](#) - generates `<AREA>`

[BGSOUND Procedure](#) - generates `<BGSOUND>`

### Character Formatting Tags

[BASEFONT Procedure](#) - generates `<BASEFONT>`

[BIG Procedure](#) - generates `<BIG>`

**BOLD Procedure** - generates <B>

**CENTER Procedure** - generates <CENTER> and </CENTER>

**CENTEROPEN Procedure, CENTERCLOSE Procedure** - generate <CENTER> and </CENTER>

**CITE Procedure** - generates <CITE>

**CODE Procedure** - generates <CODE>

**DFN Procedure** - generates <DFN>

**EM Procedure, EMPHASIS Procedure** - generate <EM>

**FONTOPEN Procedure, FONTCLOSE Procedure** - generate <FONT> and </FONT>

**ITALIC Procedure** - generates <I>

**KBD Procedure, KEYBOARD Procedure** - generate <KBD> and </KBD>

**S Procedure** - generates <S>

**SAMPLE Procedure** - generates <SAMP>

**SMALL Procedure** - generates <SMALL>

**STRIKE Procedure** - generates <STRIKE>

**STRONG Procedure** - generates <STRONG>

**SUB Procedure** - generates <SUB>

**SUP Procedure** - generates <SUP>

**TELETYPE Procedure** - generates <TT>

**UNDERLINE Procedure** - generates <U>

**VARIABLE Procedure** - generates <VAR>

### Frame Tags

**FRAME Procedure** - generates <FRAME>

**FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure** - generate <FRAMESET> and </FRAMESET>

**NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure** - generate <NOFRAMES> and </NOFRAMES>

## 213.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

**Table 213-1 HTP Package Subprograms**

Subprogram	Description
<b>ADDRESS Procedure</b>	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document

Table 213-1 (Cont.) HTP Package Subprograms

Subprogram	Description
<a href="#">ANCHOR Procedure</a>	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">ANCHOR2 Procedure</a>	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">APPLETCLOSE Procedure</a>	Closes the applet invocation with the </APPLET> tag
<a href="#">APPLETOPEN Procedure</a>	Generates the <APPLET> tag which begins the invocation of a Java applet
<a href="#">AREA Procedure</a>	Generates the <AREA> tag, which defines a client-side image map
<a href="#">BASE Procedure</a>	Generates the <BASE> tag which records the URL of the document
<a href="#">BASEFONT Procedure</a>	Generates the <BASEFONT> tag which specifies the base font size for a Web page
<a href="#">BGSOUND Procedure</a>	Generates the <BGSOUND> tag which includes audio for a Web page
<a href="#">BIG Procedure</a>	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
<a href="#">BLOCKQUOTECLOSE Procedure</a>	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
<a href="#">BLOCKQUOTEOPEN Procedure</a>	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
<a href="#">BODYCLOSE Procedure</a>	Generates the </BODY> tag which marks the end of a body section of an HTML document
<a href="#">BODYOPEN Procedure</a>	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
<a href="#">BOLD Procedure</a>	Generates the <B> and </B> tags which direct the browser to display the text in boldface
<a href="#">BR Procedure</a>	Generates the   tag which begins a new line of text
<a href="#">CENTER Procedure</a>	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
<a href="#">CENTERCLOSE Procedure</a>	Generates the </CENTER> tag which marks the end of a section of text to center
<a href="#">CENTEROPEN Procedure</a>	Generates the <CENTER> tag which mark the beginning of a section of text to center
<a href="#">CITE Procedure</a>	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
<a href="#">CODE Procedure</a>	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
<a href="#">COMMENT Procedure</a>	Generates procedure generates the comment tags <!-- ctext -->
<a href="#">DFN Procedure</a>	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically

Table 213-1 (Cont.) HTP Package Subprograms

Subprogram	Description
<a href="#">DIRLISTCLOSE Procedure</a>	Generates the <code>&lt;/DIR&gt;</code> tag which ends a directory list section
<a href="#">DIRLISTOPEN Procedure</a>	Generates the <code>&lt;DIR&gt;</code> which starts a directory list section
<a href="#">DIV Procedure</a>	Generates the <code>&lt;DIV&gt;</code> tag which creates document divisions
<a href="#">DLISTCLOSE Procedure</a>	Generates the <code>&lt;/DL&gt;</code> tag which ends a definition list
<a href="#">DLISTDEF Procedure</a>	Generates the <code>&lt;DD&gt;</code> tag, which inserts definitions of terms
<a href="#">DLISTOPEN Procedure</a>	Generates the <code>&lt;DL&gt;</code> tag which starts a definition list
<a href="#">DLISTTERM Procedure</a>	Generates the <code>&lt;DT&gt;</code> tag which defines a term in a definition list <code>&lt;DL&gt;</code>
<a href="#">EM Procedure</a>	Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized
<a href="#">EMPHASIS Procedure</a>	Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized
<a href="#">ESCAPE_SC Procedure</a>	Replaces characters that have special meaning in HTML with their escape sequences
<a href="#">FONTCLOSE Procedure</a>	Generates the <code>&lt;/FONT&gt;</code> tag which marks the end of a section of text with the specified font characteristics
<a href="#">FONTOPEN Procedure</a>	Generates the <code>&lt;FONT&gt;</code> which marks the beginning of section of text with the specified font characteristics
<a href="#">FORMCHECKBOX Procedure</a>	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="checkbox"</code> which inserts a checkbox element in a form
<a href="#">FORMCLOSE Procedure</a>	Generates the <code>&lt;/FORM&gt;</code> tag which marks the end of a form section in an HTML document
<a href="#">FORMOPEN Procedure</a>	Generates the <code>&lt;FORM&gt;</code> tag which marks the beginning of a form section in an HTML document
<a href="#">FORMFILE Procedure</a>	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="file"</code> which inserts a file form element, and is used for file uploading for a given page
<a href="#">FORMHIDDEN Procedure</a>	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="hidden"</code> which inserts a hidden form element
<a href="#">FORMIMAGE Procedure</a>	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="image"</code> which creates an image field that the user clicks to submit the form immediately
<a href="#">FORMPASSWORD Procedure</a>	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="password"</code> which creates a single-line text entry field
<a href="#">FORMRADIO Procedure</a>	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="radio"</code> , which creates a radio button on the HTML form
<a href="#">FORMRESET Procedure</a>	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="reset"</code> which creates a button that, when selected, resets the form fields to their initial values
<a href="#">FORMSELECTCLOSE Procedure</a>	Generates the <code>&lt;/SELECT&gt;</code> tag which marks the end of a Select form element
<a href="#">FORMSELECTOPEN Procedure</a>	Generates the <code>&lt;/SELECT&gt;</code> tag which marks the beginning of a Select form element

Table 213-1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMSELETOPTION Procedure	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Procedure	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Procedure	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Procedure	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Procedure	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Procedure	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure	Generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Procedure	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Procedure	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Procedure	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Procedure	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Procedure	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Procedure	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Procedure	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Procedure	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Procedure	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Procedure	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
ITALIC Procedure	Generates the <I> and </I> tags which direct the browser to render the text in italics

Table 213-1 (Cont.) HTP Package Subprograms

Subprogram	Description
<a href="#">KBD Procedure</a>	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
<a href="#">KEYBOARD Procedure</a>	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
<a href="#">LINE Procedure</a>	Generates the <HR> tag, which generates a line in the HTML document
<a href="#">LINKREL Procedure</a>	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
<a href="#">LINKREV Procedure</a>	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
<a href="#">LISTHEADER Procedure</a>	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
<a href="#">LISTINGCLOSE Procedure</a>	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
<a href="#">LISTINGOPEN Procedure</a>	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
<a href="#">LISTITEM Procedure</a>	Generates the <LI> tag, which indicates a list item
<a href="#">MAILTO Procedure</a>	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
<a href="#">MAPCLOSE Procedure</a>	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
<a href="#">MAPOPEN Procedure</a>	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
<a href="#">MENULISTCLOSE Procedure</a>	Generates the </MENU> tag which ends a list that presents one line for each item
<a href="#">MENULISTOPEN Procedure</a>	Generates the <MENU> tag which begins a list that presents one line for each item
<a href="#">META Procedure</a>	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
<a href="#">NL Procedure</a>	Generates the   tag which begins a new line of text
<a href="#">NOBR Procedure</a>	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
<a href="#">NOFRAMESCLOSE Procedure</a>	Generates the </NOFRAMES> tag which marks the end of a no-frames section
<a href="#">NOFRAMESOPEN Procedure</a>	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
<a href="#">OLISTCLOSE Procedure</a>	Generates the </OL> tag which defines the end of an ordered list
<a href="#">OLISTOPEN Procedure</a>	Generates the <OL> tag which marks the beginning of an ordered list

Table 213-1 (Cont.) HTP Package Subprograms

Subprogram	Description
PARA Procedure	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure	Adds attributes to the <P> tag
PARAM Procedure	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Procedure	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Procedures	Generates the specified parameter as a string terminated with the \n newline character
PRINTS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures	Generates the specified parameter as a string
PS Procedure	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Procedure	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Procedure	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Procedure	Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript
SUP Procedure	Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript
TABLECAPTION Procedure	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure	Generates the </TABLE> tag which marks the end of an HTML table

**Table 213-1 (Cont.) HTP Package Subprograms**

Subprogram	Description
<a href="#">TABLEDATA Procedure</a>	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
<a href="#">TABLEHEADER Procedure</a>	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
<a href="#">TABLEOPEN Procedure</a>	Generates the <TABLE> tag which marks the beginning of an HTML table
<a href="#">TABLEROWCLOSE Procedure</a>	Generates the </TR> tag which marks the end of a new row in an HTML table
<a href="#">TABLEROWOPEN Procedure</a>	Generates the <TR> tag which marks the beginning of a new row in an HTML table
<a href="#">TELETYPE Procedure</a>	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
<a href="#">TITLE Procedure</a>	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
<a href="#">ULISTCLOSE Procedure</a>	Generates the </UL> tag which marks the end of an unordered list
<a href="#">ULISTOPEN Procedure</a>	Generates the <UL> tag which marks the beginning of an unordered list
<a href="#">UNDERLINE Procedure</a>	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
<a href="#">VARIABLE Procedure</a>	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
<a href="#">WBR Procedure</a>	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

## 213.5.1 ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

### Syntax

```
HTP.ADDRESS (
 cvalue IN VARCHAR2
 cnowrap IN VARCHAR2 DEFAULT NULL
 cclear IN VARCHAR2 DEFAULT NULL
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-2 ADDRESS Procedure Parameters**

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.

**Table 213-2 (Cont.) ADDRESS Procedure Parameters**

Parameter	Description
<code>cnowrap</code>	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag

**Examples**

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## 213.5.2 ANCHOR Procedure

Like the ANCHOR2 procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Procedure](#) provides a target and therefore can be used for a frame.

**Syntax**

```
HTP.ANCHOR (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-3 ANCHOR Procedure Parameters**

Parameter	Description
<code>curl</code>	The value for the HREF attribute.
<code>ctext</code>	The string that goes between the <A> and </A> tags.
<code>cname</code>	The value for the NAME attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
ctext
```

**Usage Notes**

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

## 213.5.3 ANCHOR2 Procedure

Like the ANCHOR procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the ANCHOR procedure is that this procedure provides a target and therefore can be used for a frame.

### Syntax

```
HTP.ANCHOR2 (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 ctarget in varchar2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-4 ANCHOR2 Procedure Parameters**

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

### Examples

This procedure generates

```
ctext
```

## 213.5.4 APPLETCLOSE Procedure

This procedure closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using [APPLETOPEN Procedure](#).

### Syntax

```
HTP.APPLETCLOSE;
```

## 213.5.5 APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Procedure](#) which generates the </APPLET> tag.

**Syntax**

```
HTP.APPLETOPEN (
 ccode IN VARCHAR2,
 cheight IN NUMBER,
 cwidth IN NUMBER,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-5 APPLETOPEN Procedure Parameters**

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

**Usage Notes**

- Specify parameters to the Java applet using the [PARAM Procedure](#).
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

## 213.5.6 AREA Procedure

This procedure generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

**Syntax**

```
HTP.AREA (
 ccoords IN VARCHAR2
 cshape IN VARCHAR2 DEFAULT NULL,
 chref IN VARCHAR2 DEFAULT NULL,
 cnohref IN VARCHAR2 DEFAULT NULL,
 ctargref IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-6 AREA Procedure Parameters**

Parameter	Description
<code>ccords</code>	The the value for the <code>COORDS</code> attribute.
<code>cshape</code>	The value for the <code>SHAPE</code> attribute.
<code>chref</code>	The value for the <code>HREF</code> attribute.
<code>cnohref</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOHREF</code> attribute is added to the tag.
<code>ctarget</code>	The value for the <code>TARGET</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
attributes>
```

## 213.5.7 BASE Procedure

This procedure generates the `<BASE>` tag which records the URL of the document.

### Syntax

```
HTP.BASE (
 ctarget IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-7 BASE Procedure Parameters**

Parameter	Description
<code>ctarget</code>	The value for the <code>TARGET</code> attribute which establishes a window name to which all links in this document are targeted.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" attributes>
```

## 213.5.8 BASEFONT Procedure

This procedure generates the <BASEFONT> tag which specifies the base font size for a Web page.

### Syntax

```
HTP.BASEFONT (
 nsize IN INTEGER);
```

### Parameters

**Table 213-8** BASEFONT Procedure Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

### Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

## 213.5.9 BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

### Syntax

```
HTP.BGSOUND (
 csrc IN VARCHAR2,
 cloop IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-9** BGSOUND Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

## 213.5.10 BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTP.BIG (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-10** BIG Procedure Parameters

Parameter	Description
<code>ctext</code>	The the text that goes between the tags.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

## 213.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Procedure](#).

### Syntax

```
HTP.BLOCKQUOTECLOSE;
```

### Examples

This procedure generates

```
</BLOCKQUOTE>
```

## 213.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Procedure](#).

### Syntax

```
HTP.BLOCKQUOTEOPEN (
 cnowrap IN VARCHAR2 DEFAULT NULL,
```

```

cclear IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-11 BLOCKQUOTEOPEN Procedure Parameters**

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## 213.5.13 BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Procedure](#).

### Syntax

```
HTP.BODYCLOSE;
```

### Examples

This procedure generates

```
</BODY>
```

## 213.5.14 BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Procedure](#).

### Syntax

```
HTP.BODYOPEN (
 cbackground IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-12 BODYOPEN Procedure Parameters**

Parameter	Description
<code>cbackground</code>	The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

## 213.5.15 BOLD Procedure

This procedure generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

### Syntax

```
HTP.BOLD (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-13 BOLD Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text that goes between the tags.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<B cattributes>ctext
```

## 213.5.16 BR Procedure

This procedure generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [NL Procedure](#).

**Syntax**

```
HTP.BR(
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-14 BR Procedure Parameters**

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## 213.5.17 CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

**Syntax**

```
HTP.CENTER (
 ctext IN VARCHAR2);
```

**Parameters****Table 213-15 CENTER Parameters**

Parameter	Description
<code>ctext</code>	The text that goes between the tags.

**Examples**

This procedure generates

```
<CENTER>ctext</CENTER>
```

## 213.5.18 CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Procedure](#).

**Syntax**

```
HTP.CENTERCLOSE;
```

**Examples**

This procedure generates

```
</CENTER>
```

## 213.5.19 CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Procedure](#).

**Syntax**

```
HTP.CENTEROPEN;
```

**Examples**

This procedure generates

```
<CENTER>
```

## 213.5.20 CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

**Syntax**

```
HTP.CITE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-16 CITE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to render as citation.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

## 213.5.21 CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

### Syntax

```
HTP.CODE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-17** CODE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render as code.
<code>cattributes</code>	The other attributes to be included as-is in the tag

### Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

## 213.5.22 COMMENT Procedure

This procedure generates the comment tags.

### Syntax

```
HTP.COMMENT (
 ctext IN VARCHAR2);
```

### Parameters

**Table 213-18** COMMENT Procedure Parameters

Parameter	Description
<code>ctext</code>	The comment.

### Examples

This procedure generates

```
<!-- ctext -->
```

## 213.5.23 DFN Procedure

This procedure generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

### Syntax

```
HTP.DFN (
 ctext IN VARCHAR2);
```

### Parameters

**Table 213-19 DFN Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to render in italics.

### Examples

This procedure generates

```
<DFN>ctext</DFN>
```

## 213.5.24 DIRLISTCLOSE Procedure

This procedure generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the `DIRLISTOPEN` Procedure.

### Syntax

```
HTP.DIRLISTCLOSE;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Procedure](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This procedure generates

```
</DIR>
```

### Related Topics

- [DIRLISTOPEN Procedure](#)  
This procedure generates the `<DIR>` which starts a directory list section. You end a directory list section with the `DIRLISTCLOSE` Procedure.

## 213.5.25 DIRLISTOPEN Procedure

This procedure generates the `<DIR>` which starts a directory list section. You end a directory list section with the `DIRLISTCLOSE` Procedure.

### Syntax

```
HTP.DIRLISTOPEN;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Procedure](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This procedure generates

```
<DIR>
```

### Related Topics

- [DIRLISTCLOSE Procedure](#)  
This procedure generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the `DIRLISTOPEN` Procedure.

## 213.5.26 DIV Procedure

This procedure generates the `<DIV>` tag which creates document divisions.

### Syntax

```
HTP.DIV (
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-20** DIV Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

## 213.5.27 DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Procedure.

### Syntax

```
HTP.DLISTCLOSE;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

### Examples

This procedure generates

```
</DL>
```

### Related Topics

- [DLISTOPEN Procedure](#)  
This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Procedure.

## 213.5.28 DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

### Syntax

```
HTP.DLISTDEF (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-21 DLISTDEF Procedure Parameters**

Parameter	Description
<code>ctext</code>	The definition of the term.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## 213.5.29 DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

### Syntax

```
HTP.DLISTOPEN (
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-22 DLISTOPEN Procedure Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

### Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

### Related Topics

- [DLISTCLOSE Procedure](#)  
This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

## 213.5.30 DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

### Syntax

```
HTP.DLISTTERM (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-23 DLISTTERM Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The term.
<code>c<sub>clear</sub></code>	The value for the <code>CLEAR</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## 213.5.31 EM Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Procedure](#).

## Syntax

```
HTP.EM(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-24 EM Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The text to emphasize.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<EM cattributes>ctext
```

## 213.5.32 EMPHASIS Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EM Procedure](#).

**Syntax**

```
HTP.EMPHASIS(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-25 EMPHASIS Procedure Parameters**

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<EM cattributes>ctext
```

## 213.5.33 ESCAPE\_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This procedure performs the same operation as [PRINTS Procedures](#) and [PS Procedure](#).

**Syntax**

```
HTP.ESCAPE_SC(
 ctext IN VARCHAR2);
```

**Parameters****Table 213-26 ESCAPE\_SC Procedure Parameters**

Parameter	Description
ctext	The text string to convert.

## 213.5.34 FONTCLOSE Procedure

This procedure generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Procedure](#).

### Syntax

```
HTP.FONTCLOSE;
```

### Examples

This procedure generates

```

```

## 213.5.35 FONTOPEN Procedure

This procedure generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Procedure](#).

### Syntax

```
HTP.FONTOPEN(
 ccolor IN VARCHAR2 DEFAULT NULL,
 cface IN VARCHAR2 DEFAULT NULL,
 csize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-27** FONTOPEN Procedure Parameters

Parameter	Description
<code>ccolor</code>	The value for the <code>COLOR</code> attribute.
<code>cface</code>	The value for the <code>FACE</code> attribute
<code>csize</code>	The value for the <code>SIZE</code> attribute
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```

```

## 213.5.36 FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

**Syntax**

```
HTP.FORMCHECKBOX(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT 'ON',
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-28 FORMCHECKBOX Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 213.5.37 FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Procedure](#).

**Syntax**

```
HTP.FORMCLOSE;
```

**Examples**

This procedure generates

```
</FORM>
```

## 213.5.38 FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Procedure](#).

**Syntax**

```
HTP.FORMOPEN(
 curl IN VARCHAR2,
 cmethod IN VARCHAR2 DEFAULT 'POST',
 ctargt IN VARCHAR2 DEFAULT NULL,
```

```

cenctype IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-29 FORMOPEN Procedure Parameters**

Parameter	Description
<code>curl</code>	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
<code>cmethod</code>	The value for the METHOD attribute. The value can be "GET" or "POST".
<code>ctarget</code>	The value for the TARGET attribute.
<code>cenctype</code>	The value for the ENCTYPE attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

## 213.5.39 FORMFILE Procedure

This procedure generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

### Syntax

```

HTP.FORMFILE(
 cname IN VARCHAR2,
 caccept IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-30 FORMFILE Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the NAME attribute.
<code>caccept</code>	A comma-delimited list of MIME types for upload.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## 213.5.40 FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

### Syntax

```
HTP.FORMHIDDEN(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-31 FORMHIDDEN Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## 213.5.41 FORMIMAGE Procedure

This procedure generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

### Syntax

```
HTP.FORMIMAGE(
 cname IN VARCHAR2,
 csrc IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-32 FORMIMAGE Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.

**Table 213-32 (Cont.) FORMIMAGE Procedure Parameters**

Parameter	Description
<code>csrc</code>	The value for the SRC attribute that specifies the image file.
<code>calign</code>	The value for the ALIGN attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## 213.5.42 FORMPASSWORD Procedure

This procedure generates the `<INPUT>` tag with `TYPE="password"` which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

**Syntax**

```
HTP.FORMPASSWORD(
 cname IN VARCHAR2,
 csize IN VARCHAR2,
 cmaxlength IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-33 FORMPASSWORD Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the NAME attribute.
<code>csize</code>	The value for the SIZE attribute.
<code>cmaxlength</code>	The value for the MAXLENGTH attribute.
<code>cvalue</code>	The value for the VALUE attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```

## 213.5.43 FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one.

Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```
HTP.FORMRADIO(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2,
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-34 FORMRADIO Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 213.5.44 FORMRESET Procedure

This procedure generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

### Syntax

```
HTP.FORMRESET(
 cvalue IN VARCHAR2 DEFAULT 'Reset',
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-35 FORMRESET Procedure Parameters**

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## 213.5.45 FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

### Syntax

```
HTP.FORMSELECTCLOSE;
```

### Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

## 213.5.46 FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

### Syntax

```
FORMSELECTOPEN(
 cname IN VARCHAR2,
 cprompt IN VARCHAR2 DEFAULT NULL,
 nsize IN INTEGER DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-36 FORMSELECTOPEN Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cprompt</code>	The string preceding the list box.
<code>nsize</code>	The value for the <code>SIZE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```

HTP.FORMSELECTOPEN('greatest_player';
 'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');
HTP.FORMSELECTCLOSE;

```

### generates

```

Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>

```

## 213.5.47 FORMSELECTOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

### Syntax

```

HTP.FORMSELECTOPTION(
 cvalue IN VARCHAR2,
 cselected IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-37 FORMSELECTOPTION Procedure Parameters**

Parameter	Description
<code>cvalue</code>	The text for the option.
<code>cvalue</code>	If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

## 213.5.48 FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

### Syntax

```

HTP.FORMSUBMIT(
 cname IN VARCHAR2 DEFAULT NULL,

```

```
cvalue IN VARCHAR2 DEFAULT 'Submit',
cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-38 FORMSUBMIT Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## 213.5.49 FORMTEXT Procedure

This procedure generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

### Syntax

```
HTP.FORMTEXT(
 cname IN VARCHAR2,
 csize IN VARCHAR2 DEFAULT NULL,
 cmaxlength IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-39 FORMTEXT Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```

## 213.5.50 FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

### Syntax

```
HTP.FORMTEXTAREA(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign , IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-40 FORMTEXTAREA Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the NAME attribute.
<code>nrows</code>	The value for the ROWS attribute. This is an integer.
<code>ncolumns</code>	The value for the COLS attribute. This is an integer.
<code>calign</code>	The value for the ALIGN attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></TEXTAREA>
```

## 213.5.51 FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Procedure](#) except that in that case you cannot specify a wrap style.

### Syntax

```
HTP.FORMTEXTAREA2(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-41 FORMTEXTAREA2 Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## 213.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Procedure](#) or [FORMTEXTAREAOPEN2 Procedure](#).

## Syntax

```
HTP.FORMTEXTAREACLOSE;
```

## Examples

This procedure generates

```
</TEXTAREA>
```

## 213.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

## Syntax

```
HTP.FORMTEXTAREAOPEN(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-42 FORMTEXTAREAOPEN Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## 213.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Procedure](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

## Syntax

```
HTP.FORMTEXTAREAOPEN2 (
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-43 FORMTEXTAREAOPEN2 Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP =
"cwrap" cattributes>
```

## 213.5.55 FRAME Procedure

This procedure generates the `<FRAME>` tag which begins the characteristics of a frame created by a `<FRAMESET>` tag.

### Syntax

```
HTP.FRAME(
 csrc IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cmarginwidth IN VARCHAR2 DEFAULT NULL,
 cmarginheight IN VARCHAR2 DEFAULT NULL,
 cscrolling IN VARCHAR2 DEFAULT NULL,
 cnoresize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-44** FRAME Procedure Parameters

Parameter	Description
<code>csrc</code>	The URL to display in the frame.
<code>cname</code>	The value for the NAME attribute.
<code>cmarginwidth</code>	The value for the MARGINWIDTH attribute.
<code>cscrolling</code>	The value for the SCROLLING attribute.
<code>cnoresize</code>	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

## 213.5.56 FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Procedure](#).

### Syntax

```
HTP.FRAMESETCLOSE;
```

**Examples**

This procedure generates

```
</FRAMESET>
```

## 213.5.57 FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Procedure](#).

**Syntax**

```
HTP.FRAMESETOPEN(
 rows IN VARCHAR2 DEFAULT NULL,
 ccols IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-45** FRAMESETOPEN Procedure Parameters

Parameter	Description
rows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<FRAMESET ROWS="rows" COLS="ccols" cattributes>
```

## 213.5.58 HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Procedure](#).

**Syntax**

```
HTP.HEADCLOSE;
```

**Examples**

This procedure generates

```
</HEAD>
```

## 213.5.59 HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

### Syntax

```
HTP.HEADER(
 nsize IN INTEGER,
 cheader IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-46** HEADER Procedure Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

```
HTP.header (1, 'Overview');
```

produces:

```
<H1>Overview</H1>
```

## 213.5.60 HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Procedure](#).

### Syntax

```
HTP.HEADOPEN;
```

### Examples

This procedure generates

```
<HEAD>
```

## 213.5.61 HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Procedure](#).

### Syntax

```
HTP.HR(
 cclear IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-47 HR Procedure Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 213.5.62 HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document.

You use the [HTMLOPEN Procedure](#) to mark the beginning of an HTML document.

### Syntax

```
HTP.HTMLCLOSE;
```

### Examples

This procedure generates

```
</HTML>
```

## 213.5.63 HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Procedure](#) to mark the end of the an HTML document.

**Syntax**

```
HTP.HTMLOPEN;
```

**Examples**

This procedure generates

```
<HTML>
```

## 213.5.64 IMG Procedure

This procedure generates the <IMG> tag which directs the browser to load an image onto the HTML page.

The [IMG2 Procedure](#) performs the same operation but additionally uses the `cusemap` parameter.

**Syntax**

```
HTP.IMG(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-48 IMG Procedure Parameters**

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```

```

## 213.5.65 IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The [IMG Procedure](#) performs the same operation but does not use the `cusemap` parameter.

**Syntax**

```
HTP.IMG2(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cusemap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-49 IMG2 Procedure Parameters**

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cusemap	The value for the USEMAP attribute which specifies a client-side image map.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```

```

## 213.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

**Syntax**

```
HTP.ISINDEX(
 cprompt IN VARCHAR2 DEFAULT NULL,
 curl IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-50 ISINDEX Procedure Parameters**

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

**Examples**

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## 213.5.67 ITALIC Procedure

This procedure generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

### Syntax

```
HTP.ITALIC(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-51** ITALIC Procedure Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<I cattributes>ctext</I>
```

## 213.5.68 KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Procedure](#).

### Syntax

```
HTP.KBD(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-52** KBD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## 213.5.69 KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Procedure](#).

### Syntax

```
HTP.KEYBOARD(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-53 KEYBOARD Procedure Parameters**

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## 213.5.70 LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Procedure](#).

### Syntax

```
HTP.LINE(
 cclear IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-54 LINE Procedure Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<HR CLEAR="clear" SRC="src" attributes>
```

## 213.5.71 LINKREL Procedure

This procedure generates the `<LINK>` tag with the `REL` attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the `HREF` attribute is present.

This is the opposite of [LINKREV Procedure](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Procedure](#).

### Syntax

```
HTP.LINKREL(
 crel IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-55 LINKREL Procedure Parameters**

Parameter	Description
<code>crel</code>	The value for the <code>REL</code> attribute.
<code>curl</code>	The value for the <code>URL</code> attribute.
<code>ctitle</code>	The value for the <code>TITLE</code> attribute.

### Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## 213.5.72 LINKREV Procedure

This procedure generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Procedure](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Procedure](#).

### Syntax

```
HTP.LINKREV(
 crev IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-56 LINKREV Procedure Parameters**

Parameter	Description
<code>crel</code>	The value for the REV attribute.
<code>curl</code>	The value for the URL attribute.
<code>ctitle</code>	The value for the TITLE attribute.

## Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## 213.5.73 LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

### Syntax

```
HTP.LISTHEADER(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-57 LISTHEADER Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> .
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

## 213.5.74 LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Procedure](#).

### Syntax

```
HTP.LISTINGCLOSE;
```

### Examples

This procedure generates

```
</LISTING>
```

## 213.5.75 LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Procedure](#).

### Syntax

```
HTP.LISTINGOPEN;
```

### Examples

This procedure generates

```
<LISTING>
```

## 213.5.76 LISTITEM Procedure

This procedure generates the `<LI>` tag, which indicates a list item.

### Syntax

```
HTP.LISTITEM(
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cdingbat IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-58 LISTITEM Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text for the list item.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cdingbat</code>	The value for the <code>DINGBAT</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## 213.5.77 MAILTO Procedure

This procedure generates the `<A>` tag with the `HREF` set to 'mailto' prepended to the mail address argument.

### Syntax

```
HTP.MAILTO(
 address IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-59 MAILTO Procedure Parameters**

Parameter	Description
<code>caddress</code>	The email address of the recipient.
<code>ctext</code>	The clickable portion of the link.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
ctext
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
Send Email to the President
```

## 213.5.78 MAPCLOSE Procedure

This procedure generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the [MAOPEN Procedure](#).

### Syntax

```
HTP.MAPCLOSE;
```

### Examples

This procedure generates

```
</MAP>
```

## 213.5.79 MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Procedure](#).

### Syntax

```
HTP.MAPOPEN(
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-60** MAPOPEN Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

## 213.5.80 MENULISTCLOSE Procedure

This procedure generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

### Syntax

```
HTP.MENULISTCLOSE;
```

### Examples

This procedure generates

```
</MENU>
```

## 213.5.81 MENULISTOPEN Procedure

This procedure generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

**Syntax**

```
HTP.MENULISTOPEN;
```

**Examples**

This procedure generates

```
<MENU>
```

## 213.5.82 META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

**Syntax**

```
HTP.META(
 chttp_equiv IN VARCHAR2,
 cname IN VARCHAR2,
 ccontent IN VARCHAR2);
```

**Parameters****Table 213-61 META Procedure Parameters**

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

**Examples**

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## 213.5.83 NL Procedure

This procedure generates the <BR> tag which begins a new line of text.

It performs the same operation as the [BR Procedure](#).

**Syntax**

```
HTP.NL(
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-62 NL Procedure Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## 213.5.84 NOBR Procedure

This procedure generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

**Syntax**

```
HTP.NOBR(
 ctext IN VARCHAR2);
```

**Parameters****Table 213-63 NOBR Procedure Parameters**

Parameter	Description
ctext	The text that is to be rendered on one line.

**Examples**

This procedure generates

```
<NOBR>ctext</NOBR>
```

## 213.5.85 NOFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

### Syntax

```
HTP.NOFRAMESCLOSE;
```

### Examples

This procedure generates

```
</NOFRAMES>
```

## 213.5.86 NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

### Syntax

```
HTP.NOFRAMESOPEN;
```

### Examples

This procedure generates

```
<NOFRAMES>
```

## 213.5.87 OLISTCLOSE Procedure

This procedure generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

### Syntax

```
HTP.OLISTCLOSE;
```

### Examples

This procedure generates

```

```

## 213.5.88 OLISTOPEN Procedure

This procedure generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

**Syntax**

```
HTP.OLISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-64** OLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## 213.5.89 PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Procedure](#).

**Syntax**

```
HTP.PARA;
```

**Examples**

This procedure generates

```
<P>
```

## 213.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the PARA Procedure.

**Syntax**

```
HTP.PARAGRAPH(
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-65** PARAGRAPH Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

## Related Topics

- [PARA Procedure](#)  
This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

## 213.5.91 PARAM Procedure

This procedure generates the `<PARAM>` tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Procedure](#) to begin the invocation. Use one [PARAM Procedure](#) for each desired name-value pair, and use [APPLETCLOSE Procedure](#) to end the applet invocation.

## Syntax

```
HTP.PARAM(
 cname IN VARCHAR2
 cvalue IN VARCHAR2);
```

## Parameters

**Table 213-66** PARAM Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.

## Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## 213.5.92 PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

### Syntax

```
HTP.PLAINTEXT(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-67** PLAINTEXT Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in fixed-width font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## 213.5.93 PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Procedure](#).

### Syntax

```
HTP.PRECLOSE;
```

### Examples

This procedure generates

```
</PRE>
```

## 213.5.94 PREOPEN Procedure

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Procedure](#).

### Syntax

```
HTP.PREOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
```

```

cwidth IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-68** PREOPEN Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cwidth</code>	The value for the WIDTH attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## 213.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Procedures](#) performs the same operation but does not terminate with a newline character.

### Syntax

```
HTP.PRINT (
 cbuf IN VARCHAR2);
```

```
HTP.PRINT (
 dbuf IN DATE);
```

```
HTP.PRINT (
 nbuf IN NUMBER);
```

### Parameters

**Table 213-69** PRINT Procedure Parameters

Parameter	Description
<code>cbuf</code>	The string to generate terminated by a newline.
<code>dbuf</code>	The string to generate terminated by a newline.
<code>nbuf</code>	The string to generate terminated by a newline.

### Usage Notes

- The `\n` character is not the same as `<BR>`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `<BR>` to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

## 213.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

### Syntax

```
HTP.PRINTS (
 ctext IN VARCHAR2);
```

### Parameters

**Table 213-70 PRINTS Procedure Parameters**

Parameter	Description
ctext	The string where to perform character substitution.

### Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) for the HTF implementation).

## 213.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the [PRINT Procedures](#) the string is not terminated with the \n newline character.

### Syntax

```
HTP.PRN (
 cbuf IN VARCHAR2);
```

```
HTP.PRN (
 dbuf IN DATE);
```

```
HTP.PRN (
 nbuf IN NUMBER);
```

## Parameters

**Table 213-71 PRN Procedure Parameters**

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

## Usage Notes

These procedures do not have function equivalents.

## 213.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PRINTS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

## Syntax

```
HTP.PS (
 ctext IN VARCHAR2);
```

## Parameters

**Table 213-72 PS Procedure Parameters**

Parameter	Description
ctext	The string where to perform character substitution.

## Usage Notes

This procedure does not have an HTP function equivalent (see [Operational Notes](#) for the HTP implementation).

## 213.5.99 S Procedure

This procedure generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Procedure](#).

### Syntax

```
HTP.S (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-73 S Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<S cattributes>ctext</S>
```

## 213.5.100 SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

### Syntax

```
HTP.SAMPLE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-74 SAMPLE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

## 213.5.101 SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBScript.

### Syntax

```
HTP.SCRIPT (
 cscript IN VARCHAR2,
 clanguage IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-75** SCRIPT Procedure Parameters

Parameter	Description
<code>cscript</code>	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
<code>clanguage</code>	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

### Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## 213.5.102 SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

### Syntax

```
HTP.SMALL (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-76** SMALL Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in small font.

**Table 213-76 (Cont.) SMALL Procedure Parameters**

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

## 213.5.103 STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Procedure](#).

**Syntax**

```
HTP.STRIKE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-77 STRIKE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## 213.5.104 STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

**Syntax**

```
HTP.STRONG(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-78 STRONG Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The text to be emphasized.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<STRONG cattributes>ctext
```

## 213.5.105 STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

## Syntax

```
HTP.STYLE(
 cstyle IN VARCHAR2);
```

## Parameters

**Table 213-79 STYLE Procedure Parameters**

Parameter	Description
<code>c<sub>style</sub></code>	The the style information to include.

## Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

## 213.5.106 SUB Procedure

This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

## Syntax

```
HTP.SUB(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-80 SUB Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The text to render in subscript.
<code>c<sub>align</sub></code>	The value for the <code>ALIGN</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
_{ctext}
```

## 213.5.107 SUP Procedure

This procedure generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

## Syntax

```
HTP.SUP(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-81 SUP Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The text to render in superscript.
<code>c<sub>align</sub></code>	The value for the <code>ALIGN</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
^{ctext}
```

## 213.5.108 TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

## Syntax

```
HTP.TABLECAPTION(
 ccaption IN VARCHAR2,
```

```

calign in VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-82 TABLECAPTION Procedure Parameters**

Parameter	Description
c <code>text</code>	The text for the caption.
c <code>align</code>	The value for the <code>ALIGN</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

## 213.5.109 TABLECLOSE Procedure

This procedure generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Procedure](#).

### Syntax

```
HTP.TABLECLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## 213.5.110 TABLEDATA Procedure

This procedure generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

### Syntax

```

HTP.TABLEDATA(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 213-83 TABLEDATA Procedure Parameters**

Parameter	Description
<code>cvalue</code>	The data for the cell in the table.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>ccolspan</code>	The value for the <code>COLSPAN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

## 213.5.111 TABLEHEADER Procedure

This procedure generates the `<TH>` and `</TH>` tags which insert a header cell in an HTML table.

The `<TH>` tag is similar to the `<TD>` tag except that the text in this case the rows are usually rendered in bold type.

## Syntax

```
HTP.TABLEHEADER(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-84 TABLEHEADER Procedure Parameters**

Parameter	Description
<code>cvalue</code>	The data for the cell in the table.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>crispen</code>	The value for the <code>ROWSPAN</code> attribute.

**Table 213-84 (Cont.) TABLEHEADER Procedure Parameters**

Parameter	Description
<code>ccolspan</code>	The value for the COLSPAN attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

## 213.5.112 TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Procedure](#).

**Syntax**

```
HTP.TABLEOPEN(
 cborder IN VARCHAR2 DEFAULT NULL
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-85 TABLEOPEN Procedure Parameters**

Parameter	Description
<code>border</code>	The value for the BORDER attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>cnowrap</code>	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

## 213.5.113 TABLEROWCLOSE Procedure

This procedure generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Procedure](#).

### Syntax

```
HTP.TABLEROWCLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## 213.5.114 TABLEROWOPEN Procedure

This procedure generates the `<TR>` tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Procedure](#).

### Syntax

```
HTP.TABLEROWOPEN(
 calign IN VARCHAR2 DEFAULT NULL,
 cvalign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-86** TABLEROWOPEN Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cvalign</code>	The value for the <code>VALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## 213.5.115 TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

### Syntax

```
HTP.TELETYPE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-87 TELETYPE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to render in a fixed width typewriter font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

## 213.5.116 TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

### Syntax

```
HTP.TITLE(
 ctitle IN VARCHAR2);
```

### Parameters

**Table 213-88 TITLE Procedure Parameters**

Parameter	Description
<code>ctitle</code>	The text to display in the titlebar of the browser window.

### Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

## 213.5.117 ULISTCLOSE Procedure

This procedure generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Procedure](#). Add list items with [LISTITEM Procedure](#).

### Syntax

```
HTP.ULISTCLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## 213.5.118 ULISTOPEN Procedure

This procedure generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Procedure](#). Add list items with [LISTITEM Procedure](#).

### Syntax

```
HTP.ULISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cdingbat IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-89** ULISTOPEN Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cdingbat</code>	The value for the <code>DINGBAT</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## 213.5.119 UNDERLINE Procedure

This procedure generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

### Syntax

```
HTP.UNDERLINE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-90** UNDERLINE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render with an underline.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<U cattributes>ctext</U>
```

## 213.5.120 VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

### Syntax

```
HTP.VARIABLE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-91** VARIABLE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render in italics.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

## 213.5.121 WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

### Syntax

```
HTP.WBR;
```

### Examples

This procedure generates

```
<WBR>
```

# OWA\_CACHE

The `OWA_CACHE` package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#)
- [Summary of OWA\\_CACHE Subprograms](#)

## 214.1 OWA\_CACHE Constants

`OWA_CACHE` defines several constants to use when specifying parameter values.

- `system_level` CONSTANT VARCHAR(6) := 'SYSTEM';
- `user_level` CONSTANT VARCHAR(4) := 'USER';

## 214.2 Summary of OWA\_CACHE Subprograms

This table lists the `OWA_CACHE` subprograms and briefly describes them.

**Table 214-1 OWA\_CACHE Package Subprograms**

Subprogram	Description
<a href="#">DISABLE</a> Procedure	Disables the cache for this particular request
<a href="#">GET_ETAG</a> Function	Returns the tag associated with the cached content (used in the Validation technique model only)
<a href="#">GET_LEVEL</a> Function	Returns the caching level (used in the Validation technique model only)
<a href="#">SET_CACHE</a> Procedure	Sets up the cache headers for validation model cache type
<a href="#">SET_EXPIRES</a> Procedure	Sets up the cache headers for expires model cache type
<a href="#">SET_NOT_MODIFIED</a> Procedure	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
<a href="#">SET_SURROGATE_CONTROL</a> Procedure	Sets up the headers for a surrogate-control header for Web cache

## 214.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

### Syntax

```
OWA_CACHE.DISABLE;
```

## 214.2.2 GET\_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

### Syntax

```
OWA_CACHE.GET_ETAG
RETURN VARCHAR2;
```

### Return Values

The tag for cache hit, otherwise NULL.

## 214.2.3 GET\_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

### Syntax

```
OWA_CACHE.GET_LEVEL
RETURN VARCHAR2;
```

### Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

## 214.2.4 SET\_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

### Syntax

```
OWA_CACHE.SET_CACHE(
 p_etag IN VARCHAR2,
 p_level IN VARCHAR2);
```

### Parameters

**Table 214-2** *SET\_CACHE Procedure Parameters*

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

**Exceptions**

VALUE\_ERROR is thrown if

- p\_etag is greater than 55
- p\_level is not 'USER' or 'SYSTEM'

## 214.2.5 SET\_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

**Syntax**

```
OWA_CACHE.SET_EXPIRES(
 p_expires IN NUMBER,
 p_level IN VARCHAR2);
```

**Parameters****Table 214-3 SET\_EXPIRES Procedure Parameters**

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

**Exceptions**

VALUE\_ERROR is thrown if

- p\_expires is negative or zero
- p\_level is not 'USER' or 'SYSTEM'
- p\_expires is > 525600 (1 year)

## 214.2.6 SET\_NOT\_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

**Syntax**

```
OWA_CACHE.SET_NOT_MODIFIED;
```

**Exceptions**

VALUE\_ERROR is thrown if If the etag was not passed in

## 214.2.7 SET\_SURROGATE\_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

### Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
 p_value IN VARCHAR2);
```

### Parameters

**Table 214-4 SET\_SURROGATE\_CONTROL Procedure Parameters**

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header.

### Exceptions

VALUE\_ERROR is thrown if p\_value is greater than 55 in length.

# 215

## OWA\_COOKIE

The OWA\_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Rules and Limits](#)
- [Summary of OWA\\_COOKIE Subprograms](#)

### 215.1 OWA\_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA\_CUSTOM package.

### 215.2 OWA\_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.
```

```
TYPE COOKIE IS RECORD (
 name VARCHAR2(4000),
 vals vc_arr,
 num_vals INTEGER);
```

### 215.3 OWA\_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

## 215.4 Summary of OWA\_COOKIE Subprograms

This table lists the OWA\_COOKIE subprograms and briefly describes them.

**Table 215-1 OWA\_COOKIE Package Subprograms**

Subprogram	Description
<a href="#">GET Function</a>	Gets the value of the specified cookie
<a href="#">GET_ALL Procedure</a>	Gets all cookie name-value pairs
<a href="#">REMOVE Procedure</a>	Removes the specified cookie
<a href="#">SEND procedure</a>	Generates a "Set-Cookie" line in the HTTP header

### 215.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA\_COOKIE.COOKIE DATA TYPE .

#### Syntax

```
OWA_COOKIE.GET(
 name IN VARCHAR2)
RETURN COOKIE;
```

#### Parameters

**Table 215-2 GET Function Parameters**

Parameter	Description
name	The name of the cookie.

#### Return Values

OWA\_COOKIE.COOKIE DATA TYPE.

### 215.4.2 GET\_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

#### Syntax

```
OWA_COOKIE.GET_ALL(
 names OUT vc_arr ,
 vals OUT vc_arr ,
 num_vals OUT INTEGER);
```

## Parameters

**Table 215-3 GET\_ALL Procedure Parameters**

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

## 215.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

### Syntax

```
OWA_COOKIE.REMOVE(
 name IN VARCHAR2,
 val IN VARCHAR2,
 path IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 215-4 REMOVE Procedure Parameters**

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

## 215.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

### Syntax

```
OWA_COOKIE.SEND(
 name in varchar2,
 value in varchar2,
 expires in date DEFAULT NULL,
 path in varchar2 DEFAULT NULL,
 domain in varchar2 DEFAULT NULL,
 secure in varchar2 DEFAULT NULL);
```

## Parameters

**Table 215-5 SEND Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
name	The name of the cookie.
value	The value of the cookie.
expires	The date at which the cookie will expire
path	The value for the path field.
domain	The value for the domain field.
secure	If the value of this parameter is not NULL, the "secure" field is added to the line.

# 216

## OWA\_CUSTOM

The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#)
- [Summary of OWA\\_CUSTOM Subprograms](#)

## 216.1 OWA\_CUSTOM Constants

`OWA_CUSTOM` defines several constants to use when specifying parameter values.

- `dbms_server_timezone` CONSTANT VARCHAR2(3) := 'PST';
- `dbms_server_gmtdiff` CONSTANT NUMBER := NULL;

## 216.2 Summary of OWA\_CUSTOM Subprograms

The `AUTHORIZE` function is the only subprogram in the `OWA_CUSTOM` package.

**Table 216-1** *OWA\_CUSTOM Package Subprograms*

Subprogram	Description
<a href="#">AUTHORIZE</a> Function	Provides a Global PLSQL Agent Authorization callback function

## 216.2.1 AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA\_CUSTOM package.

### Syntax

```
OWA_CUSTOM.AUTHORIZE
RETURN BOOLEAN;
```

# 217

## OWA\_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Variables](#)
- [Examples](#)
- [Summary of OWA\\_IMAGE Subprograms](#)

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## 217.1 OWA\_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

## 217.2 OWA\_IMAGE Types

This datatype (`point`) contain the `x` and `y` values of a coordinate, and so provides the coordinates of a user's click on an imagemap.

It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

## 217.3 OWA\_IMAGE Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the `X` and the `Y` fields of this variable are `NULL`.

## 217.4 OWA\_IMAGE Examples

This example shows use of OWA\_IMAGE.

```
CREATE OR REPLACE PROCEDURE process_image
 (my_img in OWA_IMAGE.POINT)
AS
 x integer := OWA_IMAGE.GET_X(my_img);
 y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
 /* process the coordinate */
END
```

## 217.5 Summary of OWA\_IMAGE Subprograms

This table lists the OWA\_IMAGE subprograms and briefly describes them.

**Table 217-1 OWA\_IMAGE Package Subprograms**

Subprogram	Description
<a href="#">GET_X Function</a>	Gets the X value of a point type
<a href="#">GET_Y Function</a>	Gets the Y value of a point type

### 217.5.1 GET\_X Function

This function returns the x coordinate of the point where the user clicked on an image map.

#### Syntax

```
OWA_IMAGE.GET_X(
 p IN point)
RETURN INTEGER;
```

#### Parameters

**Table 217-2 GET\_X Function Parameters**

Parameter	Description
p	The point where the user clicked.

#### Return Values

The X coordinate as an integer.

## 217.5.2 GET\_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

### Syntax

```
OWA_IMAGE.GET_Y(
 p IN point)
RETURN INTEGER;
```

### Parameters

**Table 217-3** GET\_Y Function Parameters

Parameter	Description
p	The point where the user clicked.

### Return Values

The Y coordinate as an integer.

# OWA\_OPT\_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA\\_OPT\\_LOCK Subprograms](#)

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## 218.1 OWA\_OPT\_LOCK Overview

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

## 218.2 OWA\_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR` DATA TYPE.

## 218.3 Summary of OWA\_OPT\_LOCK Subprograms

This table lists the `OWA_OPT_LOCK` subprograms and briefly describes them.

**Table 218-1 OWA\_OPT\_LOCK Package Subprograms**

Subprogram	Description
<a href="#">CHECKSUM Functions</a>	Returns the checksum value
<a href="#">GET_ROWID Function</a>	Returns the ROWID value
<a href="#">STORE_VALUES Procedure</a>	Stores unmodified values in hidden fields for later verification
<a href="#">VERIFY_VALUES Function</a>	Verifies the stored values against modified values

### 218.3.1 CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit `checksum` based on the Internet 1 protocol.

#### Syntax

```
OWA_OPT_LOCK.CHECKSUM(
 p_buff IN VARCHAR2)
RETURN NUMBER;
```

```
OWA_OPT_LOCK.CHECKSUM(
 p_owner IN VARCHAR2,
 p_tname IN VARCHAR2,
 p_rowid IN ROWID)
RETURN NUMBER;
```

#### Parameters

**Table 218-2 CHECKSUM Function Parameters**

Parameter	Description
<code>p_buff</code>	The nstring where you want to calculate the <code>checksum</code> .
<code>p_owner</code>	The owner of the table.
<code>p_tname</code>	The table name.
<code>p_rowid</code>	The row in <code>p_tname</code> where you want to calculate the <code>checksum</code> value. Use the <a href="#">GET_ROWID Function</a> to convert <code>VCARRAY</code> values to proper rowids.

## 218.3.2 GET\_ROWID Function

This function returns the ROWID datatype from the specified OWA\_OPT\_LOCK.VCARRAY DATA TYPE.

### Syntax

```
OWA_OPT_LOCK.GET_ROWID(
 p_old_values IN vccarray)
RETURN ROWID;
```

### Parameters

**Table 218-3 GET\_ROWID Function Parameters**

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

## 218.3.3 STORE\_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

### Syntax

```
OWA_OPT_LOCK.STORE_VALUES(
 p_owner IN VARCHAR2,
 p_tname IN VARCHAR2,
 p_rowid IN ROWID);
```

### Parameters

**Table 218-4 STORE\_VALUES Procedure Parameters**

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

### Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the owner name.

- One hidden form element is created for the table name. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the column value.

See also the [VERIFY\\_VALUES Function](#).

## 218.3.4 VERIFY\_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the [STORE\\_VALUES Procedure](#).

### Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
 p_old_values IN varray)
RETURN BOOLEAN;
```

### Parameters

**Table 218-5 VERIFY\_VALUES Function Parameters**

Parameter	Description
p_old_values	<p>A PL/SQL table containing the following information:</p> <ul style="list-style-type: none"> <li>• p_old_values(1) specifies the owner of the table.</li> <li>• p_old_values(2) specifies the table.</li> <li>• p_old_values(3) specifies the rowid of the row to verify.</li> </ul> <p>The remaining indexes contain values for the columns in the table.</p> <p>Typically, this parameter is passed in from the HTML form, where you have previously called the <a href="#">STORE_VALUES Procedure</a> to store the row values on hidden form elements.</p>

### Return Values

TRUE if no other update has been performed, otherwise FALSE.

# OWA\_PATTERN

The OWA\_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

## See Also:

For more information about implementation of this package, see the following:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Types](#)
- [Operational Notes](#)
- [Summary of OWA\\_PATTERN Subprograms](#)

## 219.1 OWA\_PATTERN Types

You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to OWA\_PATTERN function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

## 219.2 OWA\_PATTERN Operational Notes

The OWA\_PATTERN subprograms are overloaded. Specifically, there are six versions of `MATCH`, and four each of `AMATCH` and `CHANGE`.

The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a `owa_text.multi_line` datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the `owa_pattern.change` function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- [Wildcards](#)
- [Quantifiers](#)
- [Flags](#)

## 219.2.1 OWA\_PATTERN Wildcards

Wildcard tokens match something other than themselves.

**Table 219-1** *Wildcard tokens recognized by OWA\_PATTERN package*

Token	Description
<code>^</code>	Matches newline or the beginning of the target
<code>\$</code>	Matches newline or the end of the target
<code>\n</code>	Matches newline
<code>.</code>	Matches any character except newline
<code>\t</code>	Matches tab
<code>\d</code>	Matches digits [0-9]
<code>\D</code>	Matches non-digits [not 0-9]
<code>\w</code>	Matches word characters (0-9, a-z, A-Z, or <code>_</code> )
<code>\W</code>	Matches non-word characters (not 0-9, a-z, A-Z, or <code>_</code> )
<code>\s</code>	Matches whitespace characters (blank, tab, or newline).
<code>\S</code>	Matches non-whitespace characters (not blank, tab, or newline)
<code>\b</code>	Matches "word" boundaries (between <code>\w</code> and <code>\W</code> )
<code>\x&lt;HEX&gt;</code>	Matches the value in the current character set of the two hexadecimal digits
<code>\&lt;OCT&gt;</code>	Matches the value in the current character set of the two or three octal digits
<code>\</code>	Followed by any character not covered by another case matches that character
<code>&amp;</code>	Applies only to <code>CHANGE</code> . This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under <a href="#">CHANGE Functions and Procedures</a> .

## 219.2.2 OWA\_PATTERN Quantifiers

Any tokens except `&` can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals.

**Table 219-2** *Quantifiers*

Quantifier	Description
<code>?</code>	0 or 1 occurrence(s)
<code>*</code>	0 or more occurrences
<code>+</code>	1 or more occurrence(s)
<code>{n}</code>	Exactly <i>n</i> occurrences
<code>{n,}</code>	At least <i>n</i> occurrences

**Table 219-2 (Cont.) Quantifiers**

Quantifier	Description
{ <i>n</i> , <i>m</i> }	At least <i>n</i> , but not more than <i>m</i> , occurrences

## 219.2.3 OWA\_PATTERN Flags

In addition to targets and regular expressions, the OWA\_PATTERN functions and procedures use flags to affect how they are interpreted.

**Table 219-3 Flags**

Flag	Description
i	This indicates a case-insensitive search.
g	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

## 219.3 Summary of OWA\_PATTERN Subprograms

This table lists the OWA\_PATTERN subprograms and briefly describes them.

**Table 219-4 OWA\_PATTERN Package Subprograms**

Subprogram	Description
<a href="#">AMATCH Function</a>	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
<a href="#">CHANGE Functions and Procedures</a>	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
<a href="#">GETPAT Procedure</a>	Generates a pattern datatype from a VARCHAR2 type
<a href="#">MATCH Function</a>	Determines if a string contains the specified pattern

### 219.3.1 AMATCH Function

This function specifies if a pattern occurs in a particular location in a string.

There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.

 **Note:**

If multiple overlapping strings match the regular expression, this function takes the longest match.

**Syntax**

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2,
 from_loc IN INTEGER,
 pat IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2,
 from_loc IN INTEGER,
 pat IN OUT PATTERN,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2
 from_loc IN INTEGER
 pat in varchar2
 backrefs OUT owa_text.vc_arr
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2
 from_loc IN INTEGER
 pat IN OUT PATTERN
 backrefs OUT owa_text.vc_arr
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

**Parameters**

**Table 219-5 AMATCH Function Parameters**

Parameter	Description
line	The text to search in.
from_loc	The location (in number of characters) in line where the search is to begin.
pat	The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

## Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns 0.

## 219.3.2 CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

### Syntax

```
OWA_PATTERN.CHANGE(
 line IN OUT VARCHAR2,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE(
 line IN OUT VARCHAR2,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL);
```

```
owa_pattern.change(
 mline IN OUT owa_text.multi_line,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE(
 mline IN OUT owa_text.multi_line,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 219-6** CHANGE Procedure Parameters

Parameter	Description
<code>line</code>	The text to search in. The output value of this parameter is the altered string.
<code>mline</code>	The text to search in. This is a <code>owa_text.multi_line</code> datatype. The output value of this parameter is the altered string.
<code>from_str</code>	The regular expression to replace.
<code>to_str</code>	The substitution pattern.

**Table 219-6 (Cont.) CHANGE Procedure Parameters**

Parameter	Description
flags	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "i" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

**Return Values**

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

**Examples**

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

**Example 2:**

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found INTEGER;
BEGIN
 theline := 'what is the goal?';
 num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
 HTP.PRINT(num_found); -- num_found is 1
 HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```

## 219.3.3 GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA\_PATTERN.PATTERN DATA TYPE.

**Syntax**

```
OWA_PATTERN.GETPAT(
 arg IN VARCHAR2,
 pat IN OUT pattern);
```

## Parameters

**Table 219-7 GETPAT Procedure Parameters**

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

## 219.3.4 MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

### Syntax

```
owa_pattern.match(
 line IN VARCHAR2,
 pat IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
 line IN VARCHAR2,
 pat IN OUT PATTERN,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
 line IN VARCHAR2,
 pat IN VARCHAR2,
 backrefs OUT owa_text.vc_arr,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
 line IN VARCHAR2,
 pat IN OUT PATTERN,
 backrefs OUT owa_text.vc_arr,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
 mline IN owa_text.multi_line,
 pat IN VARCHAR2,
 rlist OUT owa_text.row_list,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
 mline IN owa_text.multi_line,
 pat IN OUT pattern,
 rlist OUT owa_text.row_list,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

## Parameters

**Table 219-8 MATCH Function Parameters**

Parameter	Description
line	The line to search in.
mline	The text to search in. This is a <code>owa_text.multi_line</code> datatype..
pat	The pattern to match. This is either a <code>VARCHAR2</code> or a <code>OWA_PATTERN.PATTERN DATA TYPE</code> . It is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the <code>OWA_TEXT.VC_ARR DATA TYPE</code> PL/SQL table. This parameter is a <code>row_list</code> that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

## Return Values

TRUE if a match was found, FALSE otherwise.

## Examples

KAZOO is the target where it is searching for the `zoo.*` regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of `zoo`, followed by any set of characters neither ending in nor including a newline (which does not match the period). The `i` flag indicates to ignore case in the search. In this case, the function returns `TRUE`, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in `sometext`. If found,

```
sometext VARCHAR2(256);
pat VARCHAR2(256);

sometext := 'what is the goal?'
pat := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
 HTP.PRINT('Match found');
ELSE
 HTP.PRINT('Match not found');
END IF;
```

### Operational Notes

- The regular expression in this function can be either a `VARCHAR2` or an `OWA_PATTERN.PATTERN DATA TYPE`. Create an `OWA_PATTERN.PATTERN DATA TYPE` from a string using the `OWA_PATTERN.GETPAT` procedure.
- Create a `MULTI_LINE DATA TYPE` from a long string using the `OWA_TEXT.STREAM2MULTI` procedure. If a `multi_line` is used, the `rlist` parameter specifies a list of chunks where matches were found.
- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

# 220

## OWA\_SEC

The OWA\_SEC package provides an interface for custom authentication.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Operational Notes](#)
- [Summary of OWA\\_SEC Subprograms](#)

## 220.1 OWA\_SEC Operational Notes

Parameters that have default values are optional.

## 220.2 Summary of OWA\_SEC Subprograms

This table lists the OWA\_SEC subprograms in alphabetical order and briefly describes them.

**Table 220-1 OWA\_SEC Package Subprograms**

Subprogram	Description
<a href="#">GET_CLIENT_HOSTNAME Function</a>	Returns the client's hostname
<a href="#">GET_CLIENT_IP Function</a>	Returns the client's IP address
<a href="#">GET_PASSWORD Function</a>	Returns the password that the user entered
<a href="#">GET_USER_ID Function</a>	Returns the username that the user entered
<a href="#">SET_AUTHORIZATION Procedure</a>	Enables the PL/SQL application to use custom authentication
<a href="#">SET_PROTECTION_REALM Procedure</a>	Defines the realm that the page is in

## 220.2.1 GET\_CLIENT\_HOSTNAME Function

This function returns the hostname of the client.

### Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
RETURN VARCHAR2;
```

### Return Values

The hostname.

## 220.2.2 GET\_CLIENT\_IP Function

This function returns the IP address of the client.

### Syntax

```
OWA_SEC.GET_CLIENT_IP
RETURN OWA_UTIL.IP_ADDRESS;
```

### Return Values

The IP address. The `owa_util.ip_address` datatype is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` datatype, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```

## 220.2.3 GET\_PASSWORD Function

This function returns the password that the user used to log in.

### Syntax

```
OWA_SEC.GET_PASSWORD
RETURN VARCHAR2;
```

### Return Values

The password.

### Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

## 220.2.4 GET\_USER\_ID Function

This function returns the username that the user used to log in.

### Syntax

```
OWA_SEC.GET_USER_ID
 RETURN VARCHAR2;
```

### Return Values

The username.

## 220.2.5 SET\_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA\_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway.

This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

### Syntax

```
OWA_SEC.SET_AUTHORIZATION(
 scheme IN INTEGER);
```

## Parameters

**Table 220-2 SET\_AUTHORIZATION Procedure Parameters**

Parameter	Description
scheme	<p>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</p> <ul style="list-style-type: none"> <li>OWA_SEC.NO_CHECK - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.</li> <li>OWA_SEC.GLOBAL - Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the "sys" schema.</li> <li>OWA_SEC.PER_PACKAGE - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.AUTHORIZE function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user's schema is called.</li> <li>OWA_SEC.CUSTOM - Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.</li> </ul> <p>The custom authorize function has the following signature:</p> <pre>FUNCTION AUTHORIZE RETURN BOOLEAN;</pre> <p>If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.</p>

### Related Topics

- [OWA\\_CUSTOM](#)  
The OWA\_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

## 220.2.6 SET\_PROTECTION\_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

### Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
 realm IN VARCHAR2);
```

## Parameters

**Table 220-3 SET\_PROTECTION\_REALM Procedure Parameters**

Parameter	Description
realm	The realm where the page belongs. This string is displayed to the user.

# 221

## OWA\_TEXT

The OWA\_TEXT package contains subprograms used by OWA\_PATTERN for manipulating strings. They are externalized so you can use them directly.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Types](#)
- [Summary of OWA\\_TEXT Subprograms](#)

## 221.1 OWA\_OPT\_LOCK Types

There are three OWA\_OPT\_LOCK lock types.

- [MULTI\\_LINE DATA TYPE](#)
- [ROW\\_LIST DATA TYPE](#)
- [VC\\_ARR DATA TYPE](#)

### 221.1.1 MULTI\_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA\_TEXT.VC\_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (
 rows vc_arr,
 num_rows INTEGER,
 partial_row BOOLEAN);
```

### 221.1.2 ROW\_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
 rows int_arr,
 num_rows INTEGER);
```

```
int_arr IS DEFINED AS:
```

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

## 221.1.3 VC\_ARR DATA TYPE

This is a component of the MULTI\_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

### Related Topics

- [MULTI\\_LINE DATA TYPE](#)  
This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA\_TEXT.VC\_ARR DATA TYPE, contains the text data in the record.

## 221.2 Summary of OWA\_TEXT Subprograms

This table lists the OWA\_TEXT subprograms and briefly describes them.

**Table 221-1 OWA\_TEXT Package Subprograms**

Subprogram	Description
<a href="#">ADD2MULTI Procedure</a>	Adds text to an existing multi_line type
<a href="#">NEW_ROW_LIST Function and Procedure</a>	Creates a new row_list
<a href="#">PRINT_MULTI Procedure</a>	Prints out the contents of a multi_list
<a href="#">PRINT_ROW_LIST Procedure</a>	Prints out the contents of a row_list
<a href="#">STREAM2MULTI Procedure</a>	Converts a varchar2 to a multi_line type

### 221.2.1 ADD2MULTI Procedure

This procedure adds content to an existing Multi\_Line Data Type

#### Syntax

```
OWA_TEXT.ADD2MULTI(
 stream IN VARCHAR2,
 mline IN OUT multi_line,

 continue IN BOOLEAN DEFAULT TRUE);
```

#### Parameters

**Table 221-2 ADD2MULTI Procedure Parameters**

Parameter	Description
stream	The text to add.
mline	The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <i>stream</i> .
continue	If TRUE, the procedure appends <i>stream</i> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <i>stream</i> in a new row.

## 221.2.2 NEW\_ROW\_LIST Function and Procedure

This function or procedure creates a new `OWA_TEX.ROW_LIST` DATA TYPE.

The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` datatype as an output parameter.

### Syntax

```
OWA_TEXT.NEW_ROW_LIST
 RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
 rlist OUT row_list);
```

### Parameters

**Table 221-3** *NEW\_ROW\_LIST Procedure Parameters*

Parameter	Description
<code>rlist</code>	This is an output parameter containing the new <code>row_list</code> datatype

### Return Values

The function version returns the new `row_list` datatype.

## 221.2.3 PRINT\_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.MULTI_LINE` DATA TYPE.

### Syntax

```
OWA_TEXT.PRINT_MULTI(
 mline IN multi_line);
```

### Parameters

**Table 221-4** *PRINT\_MULTI Procedure Parameters*

Parameter	Description
<code>mline</code>	The <code>multi_line</code> datatype to print.

### Return Values

The contents of the `multi_line`.

### Related Topics

- [PRINT Procedures](#)  
These procedures generate the specified parameter as a string terminated with the `\n` newline character.

- [PRN Procedures](#)  
These procedures generate the specified parameter as a string.

## 221.2.4 PRINT\_ROW\_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA\_TEXT.ROW\_LIST DATA TYPE.

### Syntax

```
OWA_TEXT.PRINT_ROW_LIST(
 rlist IN multi_line);
```

### Parameters

**Table 221-5 PRINT\_ROW\_LIST Procedure Parameters**

Parameter	Description
rlist	The row_list datatype to print.

### Return Values

The contents of the row\_list.

### Related Topics

- [PRINT Procedures](#)  
These procedures generate the specified parameter as a string terminated with the \n newline character.
- [PRN Procedures](#)  
These procedures generate the specified parameter as a string.

## 221.2.5 STREAM2MULTI Procedure

This procedure converts a string to a multi\_line datatype.

### Syntax

```
OWA_TEXT.STREAM2MULTI(
 stream IN VARCHAR2
 mline OUT multi_line);
```

### Parameters

**Table 221-6 STREAM2MULTI Procedure Parameters**

Parameter	Description
stream	The string to convert.
mline	The stream in OWA_TEXT.MULTI_LINE DATA TYPE format

# 222

## OWA\_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA\\_UTIL Subprograms](#)

## 222.1 OWA\_UTIL Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

## 222.2 OWA\_UTIL Types

`OWA_UTIL` uses Types to specify creating information.

- [DATATYPE Datatype](#)
- [IDENT\\_ARR Datatype](#)
- [IP\\_ADDRESS Datatype](#)

## 222.2.1 DATETYPE Datatype

The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE\_DATE Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

### Related Topics

- [TODATE Function](#)  
This function converts the DATETYPE Datatype to the standard Oracle DATE type.
- [CHOOSE\\_DATE Procedure](#)  
This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

## 222.2.2 IDENT\_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

## 222.2.3 IP\_ADDRESS Datatype

This datatype is used by the GET\_CLIENT\_IP Function in the OWA\_SEC package.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

### Related Topics

- [GET\\_CLIENT\\_IP Function](#)  
This function returns the IP address of the client.
- [OWA\\_SEC](#)  
The OWA\_SEC package provides an interface for custom authentication.

## 222.3 Summary of OWA\_UTIL Subprograms

This table lists the OWA\_UTIL subprograms and briefly describes them.

**Table 222-1 OWA\_UTIL Package Subprograms**

Subprogram	Description
<a href="#">BIND_VARIABLES Function</a>	Prepares a SQL query and binds variables to it
<a href="#">CALENDARPRINT Procedures</a>	Prints a calendar
<a href="#">CELLSPRINT Procedures</a>	Prints the contents of a query in an HTML table
<a href="#">CHOOSE_DATE Procedure</a>	Generates HTML form elements that allow the user to select a date
<a href="#">GET_CGI_ENV Function</a>	Returns the value of the specified CGI environment variable
<a href="#">GET_OWA_SERVICE_PATH Function</a>	Returns the full virtual path for the PL/SQL Gateway

Table 222-1 (Cont.) OWA\_UTIL Package Subprograms

Subprogram	Description
<a href="#">GET_PROCEDURE Function</a>	Returns the name of the procedure that is invoked by the PL/SQL Gateway
<a href="#">HTTP_HEADER_CLOSE Procedure</a>	Closes the HTTP header
<a href="#">LISTPRINT Procedure</a>	Generates a HTML form element that contains data from a query
<a href="#">MIME_HEADER Procedure</a>	Generates the Content-type line in the HTTP header
<a href="#">PRINT_CGI_ENV Procedure</a>	Generates a list of all CGI environment variables and their values
<a href="#">REDIRECT_URL Procedure</a>	Generates the Location line in the HTTP header
<a href="#">SHOWPAGE Procedure</a>	Prints a page generated by the HTP and HTF packages in SQL*Plus
<a href="#">SHOWSOURCE Procedure</a>	Prints the source for the specified subprogram
<a href="#">SIGNATURE procedure</a>	Prints a line that says that the page is generated by the PL/SQL Agent
<a href="#">STATUS_LINE Procedure</a>	Generates the Status line in the HTTP header
<a href="#">TABLEPRINT Function</a>	Prints the data from a table in the database as an HTML table
<a href="#">TODATE Function</a>	Converts dateType data to the standard PL/SQL date type
<a href="#">WHO_CALLED_ME Procedure</a>	Returns information on the caller of the procedure.

### 222.3.1 BIND\_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

#### Syntax

```
OWA_UTIL.BIND_VARIABLES(
 theQuery IN VARCHAR2 DEFAULT NULL,
 bv1Name IN VARCHAR2 DEFAULT NULL,
 bv1Value IN VARCHAR2 DEFAULT NULL,
 bv2Name IN VARCHAR2 DEFAULT NULL,
 bv2Value IN VARCHAR2 DEFAULT NULL,
 bv3Name IN VARCHAR2 DEFAULT NULL,
 bv3Value IN VARCHAR2 DEFAULT NULL,
 ...
 bv25Name IN VARCHAR2 DEFAULT NULL,
 bv25Value IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

## Parameters

**Table 222-2 BIND\_VARIABLES Function Parameters**

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

## Return Values

An integer identifying the opened cursor.

## 222.3.2 CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#).

## Syntax

```
OWA_UTIL.CALENDARPRINT(
 p_query IN VARCHAR2,
 p_mf_only IN VARCHAR2 DEFAULT 'N');
```

```
OWA_UTIL.CALENDARPRINT(
 p_cursor IN INTEGER,
 p_mf_only IN VARCHAR2 DEFAULT 'N');
```

## Parameters

**Table 222-3 CALENDARPRINT Procedure Parameters**

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

## Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.

- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

### 222.3.3 CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table.

There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the [FORMAT\\_CELL Function](#) in the "HTF" package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

#### Syntax

```
OWA_UTIL.CELLSPRINT(
 p_colCnt IN INTEGER,
 p_resultTbl IN vc_arr,

 p_format_numbers IN VARCHAR2 DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
 p_theCursor IN INTEGER,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_skip_rec IN NUMBER DEFAULT 0,
 p_more_data OUT BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT(
 p_theCursor IN INTEGER,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_skip_rec IN NUMBER DEFAULT 0,
 p_more_data OUT BOOLEAN);
```

```

OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_reccnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
 p_theCursor IN INTEGER,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_reccnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_skip_rec IN NUMBER DEFAULT 0,
 p_more_data OUT BOOLEAN,
 p_reccnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
 p_theCursor IN INTEGER,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_skip_rec IN NUMBER DEFAULT 0,
 p_more_data OUT BOOLEAN,
 p_reccnt OUT NUMBER);

```

## Parameters

**Table 222-4 CELLSPRINT Procedure Parameters**

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> .
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

## Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

## 222.3.4 CHOOSE\_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

### Syntax

```
OWA_UTIL.CHOOSE_DATE(
 p_name IN VARCHAR2,
 p_date IN DATE DEFAULT SYSDATE);
```

### Parameters

**Table 222-5 CHOOSE\_DATE Procedure Parameters**

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

### Usage Notes

- The parameter in the procedure that receives the data from these elements must be a [GET\\_CGI\\_ENV Function](#).
- Use the [TODATE Function](#) to convert the [GET\\_CGI\\_ENV Function](#) value to the standard Oracle DATE datatype.

### Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
 ...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
 ...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
 ...
<OPTION value="2002">2002
</SELECT>
```

## 222.3.5 GET\_CGI\_ENV Function

This function returns the value of the specified CGI environment variable.

### Syntax

```
OWA_UTIL.GET_CGI_ENV(
 param_name IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 222-6 GET\_CGI\_ENV Function Parameters**

Parameter	Description
<code>param_name</code>	The name of the CGI environment variable. It is case-insensitive.

## Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns `NULL`.

## 222.3.6 GET\_OWA\_SERVICE\_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

### Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
RETURN VARCHAR2;
```

### Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

## 222.3.7 GET\_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

### Syntax

```
OWA_UTIL.GET_PROCEDURE
RETURN VARCHAR2;
```

### Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

## 222.3.8 HTTP\_HEADER\_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

### Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

### Return Values

A newline character, which closes the HTTP header.

### Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as [MIME\\_HEADER Procedure](#), [REDIRECT\\_URL Procedure](#), or [STATUS\\_LINE Procedure](#)
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

## 222.3.9 LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query.

There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#).

### Syntax

```
OWA_UTIL.LISTPRINT(
 p_theQuery IN VARCHAR2,
 p_cname IN VARCHAR2,
 p_nsize IN NUMBER,
 p_multiple IN BOOLEAN DEFAULT FALSE);
```

```
OWA_UTIL.LISTPRINT(
 p_theCursor IN INTEGER,
 p_cname IN VARCHAR2,
 p_nsize IN NUMBER,
 p_multiple IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 222-7 LISTPRINT Procedure Parameters**

Parameter	Description
<code>p_theQuery</code>	The SQL query.
<code>p_theCursor</code>	The cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> .
<code>p_cname</code>	The name of the HTML form element.
<code>p_nsize</code>	The size of the form element (this controls how many items the user can see without scrolling).
<code>p_multiple</code>	Whether multiple selection is permitted.

### Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the `VALUE` attribute of the `OPTION` tag.
- The second column specifies the values that the user sees.

- The third column specifies whether or not the row is marked as `SELECTED` in the `OPTION` tag. If the value is not `NULL`, the row is selected.

### Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
...
</SELECT>
```

## 222.3.10 MIME\_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any `HTP.PRINT` or `HTP.PRN` calls to direct the script not to use the default MIME header.

### Syntax

```
OWA_UTIL.MIME_HEADER(
 ccontent_type IN VARCHAR2 DEFAULT 'text/html',
 bclose_header IN BOOLEAN DEFAULT TRUE,
 ccharset IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 222-8** MIME\_HEADER Procedure Parameters

Parameter	Description
<code>ccontent_type</code>	The MIME type to generate
<code>bclose_header</code>	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
