<code>ccharset</code>	The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

### Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

## 222.3.11 PRINT\_CGI\_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

### Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

### Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

## 222.3.12 REDIRECT\_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

### Syntax

```
OWA_UTIL.REDIRECT_URL(
 curl IN VARCHAR2
 bclose_header IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 222-9 REDIRECT\_URL Procedure Parameters**

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

### Usage Notes

This procedure must come before any HTP procedure or HTF function call.

### Examples

This procedure generates

```
Location: <curl>\n\n
```

## 222.3.13 SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL\*Plus.

The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

### Syntax

```
OWA_UTIL.SHOWPAGE;
```

### Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the [DBMS\\_OUTPUT](#) package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

### Examples

The output of htp procedure is displayed in SQL\*Plus, SQL\*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

## 222.3.14 SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

### Syntax

```
OWA_UTIL.SHOWSOURCE (
 cname IN VARCHAR2);
```

### Parameters

**Table 222-10 SHOWSOURCE Procedure Parameters**

Parameter	Description
cname	The function or procedure whose source you want to show.

## 222.3.15 SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document.

If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the [SHOWSOURCE Procedure](#).

### Syntax

```
OWA_UTIL.SIGNATURE;
```

```
OWA_UTIL.SIGNATURE (
 cname IN VARCHAR2);
```

## Parameters

**Table 222-11 SIGNATURE Procedure Parameters**

Parameter	Description
cname	The function or procedure whose source you want to show.

## Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

## 222.3.16 STATUS\_LINE Procedure

This procedure sends a standard HTTP status code to the client.

This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

## Syntax

```
OWA_UTIL.STATUS_LINE(
 nstatus IN INTEGER,
 creason IN VARCHAR2 DEFAULT NULL,
 bclose_header IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 222-12 STATUS\_LINE Procedure Parameters**

Parameter	Description
nstatus	The status code.
creason	The string for the status code.
bclose_header	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

## Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

## 222.3.17 TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

### Syntax

```
OWA_UTIL.TABLEPRINT(
 ctable IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL,
 ntable_type IN INTEGER DEFAULT HTML_TABLE,
 ccolumns IN VARCHAR2 DEFAULT '*',
 cclauses IN VARCHAR2 DEFAULT NULL,
 ccol_aliases IN VARCHAR2 DEFAULT NULL,
 nrow_min IN NUMBER DEFAULT 0,
 nrow_max IN NUMBER DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 222-13 TABLEPRINT Function Parameters**

Parameter	Description
<code>ctable</code>	The database table.
<code>cattributes</code>	Other attributes to be included as-is in the tag.
<code>ntable_type</code>	How to generate the table. Specify <code>HTML_TABLE</code> to generate the table using <code>&lt;TABLE&gt;</code> tags or <code>PRE_TABLE</code> to generate the table using the <code>&lt;PRE&gt;</code> tags. These are constants: <ul style="list-style-type: none"> <li><code>HTML_TABLE CONSTANT INTEGER := 1;</code></li> <li><code>PRE_TABLE CONSTANT INTEGER := 2;</code></li> </ul>
<code>ccolumns</code>	A comma-delimited list of columns from <code>ctable</code> to include in the generated table.
<code>cclauses</code>	<code>WHERE</code> or <code>ORDER BY</code> clauses, which specify which rows to retrieve from the database table, and how to order them.
<code>ccol_aliases</code>	A comma-delimited list of headings for the generated table.
<code>nrow_min</code>	The first row, of those retrieved, to display.
<code>nrow_max</code>	The last row, of those retrieved, to display.

### Return Values

Returns `TRUE` if there are more rows beyond the `nrow_max` requested, `FALSE` otherwise.

### Usage Notes

- `RAW` columns are supported, but `LONG RAW` columns are not. References to `LONG RAW` columns will print the result 'Not Printable'.
- Note that in this function, `cattributes` is the second rather than the last parameter.

### Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

<http://myhost:7777/pls/hr/showemps>

returns to the following to the client:

<PRE>

```

| EMPNO | ENAME | JOB | MGR | HIREDATE | SAL | COMM | DEPTNO |

| 7369 | SMITH | CLERK | 7902 | 17-DEC-80 | 800 | | 20 |
| 7499 | ALLEN | SALESMAN | 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521 | WARD | SALESMAN | 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566 | JONES | MANAGER | 7839 | 02-APR-81 | 2975 | | 20 |
| 7654 | MARTIN | SALESMAN | 7698 | 28-SEP-81 | 1250 | 1400 | 30 |
| 7698 | BLAKE | MANAGER | 7839 | 01-MAY-81 | 2850 | | 30 |
| 7782 | CLARK | MANAGER | 7839 | 09-JUN-81 | 2450 | | 10 |
| 7788 | SCOTT | ANALYST | 7566 | 09-DEC-82 | 3000 | | 20 |
| 7839 | KING | PRESIDENT | | 17-NOV-81 | 5000 | | 10 |
| 7844 | TURNER | SALESMAN | 7698 | 08-SEP-81 | 1500 | 0 | 30 |
| 7876 | ADAMS | CLERK | 7788 | 12-JAN-83 | 1100 | | 20 |
| 7900 | JAMES | CLERK | 7698 | 03-DEC-81 | 950 | | 30 |
| 7902 | FORD | ANALYST | 7566 | 03-DEC-81 | 3000 | | 20 |
| 7934 | MILLER | CLERK | 7782 | 23-JAN-82 | 1300 | | 10 |

```

</PRE>

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
 ignore_more BOOLEAN;
begin
 ignore_more := OWA_UTIL.TABLEPRINT
 ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
 'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
 'Employee Number, Name, Salary');
END;
```

A request for a URL like

[http://myhost:7777/pls/hr/showemps\\_10](http://myhost:7777/pls/hr/showemps_10)

would return the following to the client:

<PRE>

```

| Employee Number | Name | Salary |

| 7782 | CLARK | 2450 |
| 7839 | KING | 5000 |
| 7934 | MILLER | 1300 |

```

</PRE>

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

---

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

---

## 222.3.18 TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

### Syntax

```
OWA_UTIL.TODATE(
 p_dateArray IN dateType)
RETURN DATE;
```

### Parameters

**Table 222-14** TODATE Function Parameters

Parameter	Description
p_dateArray	The value to convert.

### Related Topics

- [DATETYPE Datatype](#)  
The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE\_DATE Procedure enables the user to select the desired date.

## 222.3.19 WHO\_CALLED\_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

### Syntax

```
OWA_UTIL.WHO_CALLED_ME(
 owner OUT VARCHAR2,
 name OUT VARCHAR2,
 lineno OUT NUMBER,
 caller_t OUT VARCHAR2);
```

### Parameters

**Table 222-15** WHO\_CALLED\_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.

**Table 222-15 (Cont.) WHO\_CALLED\_ME Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

# 223

## SDO\_CS

The `SDO_CS` package contains functions and procedures for working with coordinate systems.

You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_CSW\_PROCESS

The `SDO_CSW_PROCESS` package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

# 225

## SDO\_GCDR

The `SDO_GCDR` package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GCDR` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_GEOM

The `SDO_GEOM` package contains the geometry functions.

These can be grouped into the following categories (with examples of each):

- **Relationship (True/False) between two objects:** `RELATE`, `WITHIN_DISTANCE`
- **Validation:** `VALIDATE_GEOMETRY_WITH_CONTEXT`, `VALIDATE_LAYER_WITH_CONTEXT`
- **Single-object operations:** `SDO_ARC_DENSIFY`, `SDO_AREA`, `SDO_BUFFER`, `SDO_CENTROID`, `SDO_CONVEXHULL`, `SDO_LENGTH`, `SDO_MBR`, `SDO_POINTONSURFACE`
- **Two-object operations:** `SDO_DISTANCE`, `SDO_DIFFERENCE`, `SDO_INTERSECTION`, `SDO_UNION`, `SDO_XOR`

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_GEOR

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_ADMIN

The `SDO_GEOR_ADMIN` package contains subprograms for administrative operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_AGGR

The `SDO_GEOR_AGGR` package provides an interface to the `SDO_GEOR_AGGR` package for performing aggregate operations on GeoRaster objects.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_AGGR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_RA

The `SDO_GEOR_RA` package provides an interface to the `SDO_GEOR_RA` package for performing raster algebra and analytic operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_RA` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

# 231

## SDO\_GEOR\_UTL

The `SDO_GEOR_UTL` package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

232

## SDO\_LRS

The `SDO_LRS` package contains functions that create, modify, query, and convert linear referencing elements.

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial and Graph Developer's Guide*.

# 233

## SDO\_MIGRATE

The `SDO_MIGRATE` package lets you upgrade geometry tables from previous releases of Oracle Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial and Graph Developer's Guide*.

234

## SDO\_NET

The `SDO_NET` package contains functions and procedures for working with data modeled as nodes and links in a network.

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

# 235

## SDO\_NFE

The `SDO_NFE` package contains functions and procedures for performing network feature editing.

For a complete description of this package within the context of Oracle Spatial and Graph, see [SDO\\_NFE](#) in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

# 236

## SDO\_OLS

The `SDO_OLS` package contains subprograms for Spatial OpenLS support.

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial and Graph Developer's Guide*.

237

## SDO\_PC\_PKG

The `SDO_PC_PKG` package contains subprograms to support the use of point clouds in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

238

## SDO\_SAM

The `SDO_SAM` package contains functions and procedures for spatial analysis and data mining.

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial and Graph Developer's Guide*.

239

## SDO\_TIN\_PKG

The `SDO_TIN_PKG` package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the

# 240

## SDO\_TOPO

The `SDO_TOPO` package contains subprograms for creating and managing Oracle Spatial topologies.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

# 241

## SDO\_TOPO\_MAP

The `SDO_TOPO_MAP` package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

# 242

## SDO\_TUNE

The `SDO_TUNE` package contains Spatial tuning functions and procedures.

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial and Graph Developer's Guide*.

# 243

## SDO\_UTIL

The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_WFS\_LOCK

The `SDO_WFS_LOCK` package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial and Graph Developer's Guide*.

245

## SDO\_WFS\_PROCESS

The `SDO_WFS_PROCESS` package contains subprograms for various processing operations related to support for Web Feature Services.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

# 246

## SEM\_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

247

## SEM\_OLS

The `SEM_OLS` package provides an interface to the `SEM_OLS` package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

For a complete description of this package, see `SEM_OLS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

## SEM\_PERF

The `SEM_PERF` package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

## SEM\_RDFCTX

The `SEM_RDFCTX` package contains subprograms for managing extractor policies and semantic indexes created for documents.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*

# 250

## SEM\_RDFSA

The `SEM_RDFSA` package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

# UTL\_CALL\_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms.

Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [UTL\\_CALL\\_STACK Operational Notes](#)
- [UTL\\_CALL\\_STACK Exceptions](#)
- [Data Structures](#)
- [Summary of UTL\\_CALL\\_STACK Subprograms](#)

## See Also:

- *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
- *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

## 251.1 UTL\_CALL\_STACK Overview

The `UTL_CALL_STACK` package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks.

Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

### Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.

- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

### Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

### Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
 BEGIN
 ... (1)
 raise zero_divide;
 EXCEPTION
 when others then
 raise no_data_found;
 END;
EXCEPTION
 WHEN others THEN
 ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

### Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

## 251.2 UTL\_CALL\_STACK Security Model

EXECUTE ON UTL\_CALL\_STACK is granted to PUBLIC.

The UTL\_CALL\_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls

UTL\_CALL\_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list only shows program unit C.

## 251.3 UTL\_CALL\_STACK Operational Notes

Certain operational notes apply to UTL\_CALL\_STACK.

- Compiler optimizations can change lexical, dynamic and backtrace depth.
- UTL\_CALL\_STACK is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using UTL\_CALL\_STACK.
- Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through UTL\_CALL\_STACK.

## 251.4 UTL\_CALL\_STACK Exceptions

This table lists the exceptions raised by UTL\_CALL\_STACK.

**Table 251-1 Exceptions Raised by UTL\_CALL\_STACK**

Exception	Error Code	Description
BAD_DEPTH_INDICATOR	64610	This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception.

## 251.5 UTL\_CALL\_STACK Data Structures

The UTL\_CALL\_STACK package defines a VARRAY type, UNIT\_QUALIFIED\_NAME.

### VARRAY Type

- [UNIT\\_QUALIFIED\\_NAME](#)

### 251.5.1 UNIT\_QUALIFIED\_NAME

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

#### Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
 FUNCTION localFunction(...) RETURNS VARCHAR2 IS
 FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
 BEGIN
 DECLARE
 localVar PLS_INTEGER;
 BEGIN
```

```

 ... (1)
 END;
END;
BEGIN
 ...
END;

```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be "\_\_anonymous\_block"

## 251.6 Summary of UTL\_CALL\_STACK Subprograms

This table lists the subprograms in the UTL\_CALL\_STACK package.

**Table 251-2 UTL\_CALL\_STACK Package Subprograms**

Subprogram	Description
<a href="#">BACKTRACE_DEPTH Function</a>	Returns the number of backtrace items in the backtrace
<a href="#">BACKTRACE_LINE Function</a>	Returns the line number of the unit at the specified backtrace depth
<a href="#">BACKTRACE_UNIT Function</a>	Returns the name of the unit at the specified backtrace depth
<a href="#">CURRENT_EDITION Function</a>	Returns the current edition name of the unit of the subprogram at the specified dynamic depth
<a href="#">CONCATENATE_SUBPROGRAM Function</a>	Returns a concatenated form of a unit-qualified name
<a href="#">DYNAMIC_DEPTH Function</a>	Returns the number of subprograms on the call stack
<a href="#">ERROR_DEPTH Function</a>	Returns the number of errors on the error stack
<a href="#">ERROR_MSG Function</a>	Returns the error message of the error at the specified error depth
<a href="#">ERROR_NUMBER Function</a>	Returns the error number of the error at the specified error depth
<a href="#">LEXICAL_DEPTH Function</a>	Returns the lexical nesting level of the subprogram at the specified dynamic depth
<a href="#">OWNER Function</a>	Returns the owner name of the unit of the subprogram at the specified dynamic depth
<a href="#">UNIT_LINE Function</a>	Returns the line number of the unit of the subprogram at the specified dynamic depth
<a href="#">SUBPROGRAM Function</a>	Returns the unit-qualified name of the subprogram at the specified dynamic depth

## 251.6.1 BACKTRACE\_DEPTH Function

This function returns the number of backtrace items in the backtrace.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
RETURN PLS_INTEGER;
```

### Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

## 251.6.2 BACKTRACE\_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (
 backtrace_depth IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 251-3** *BACKTRACE\_LINE Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

### Return Values

The line number of the unit at the specified backtrace depth

## 251.6.3 BACKTRACE\_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (
 backtrace_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 251-4** *BACKTRACE\_UNIT Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

### Return Values

The name of the unit at the specified backtrace depth

## 251.6.4 CURRENT\_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (
 dynamic_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 251-5** *CURRENT\_EDITION Function Parameters*

Parameter	Description
dynamic_depth	Depth in the error stack

### Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

## 251.6.5 CONCATENATE\_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

### Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (
 qualified_name IN UNIT_QUALIFIED_NAME)
RETURN VARCHAR2;
```

### Parameters

**Table 251-6** *CONCATENATE\_SUBPROGRAM Function Parameters*

Parameter	Description
qualified_name	A unit-qualified name

### Return Values

A string of the form UNIT.SUBPROGRAM.LOCAL\_SUBPROGRAM

## 251.6.6 DYNAMIC\_DEPTH Function

This function returns the number of subprograms on the call stack.

### Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH
RETURN PLS_INTEGER;
```

### Return Values

The number of subprograms on the call stack

## 251.6.7 ERROR\_DEPTH Function

This function returns the number of errors on the error stack.

### Syntax

```
UTL_CALL_STACK.ERROR_DEPTH
RETURN PLS_INTEGER;
```

### Return Values

The number of errors on the error stack

## 251.6.8 ERROR\_MSG Function

This function returns the error message of the error at the specified error depth.

### Syntax

```
UTL_CALL_STACK.ERROR_MSG (
 error_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 251-7** *ERROR\_MSG Function Parameters*

Parameter	Description
error_depth	Depth in the error stack

### Return Values

The error message of the error at the specified error depth.

## 251.6.9 ERROR\_NUMBER Function

This function returns the error number of the error at the specified error depth.

### Syntax

```
UTL_CALL_STACK.ERROR_NUMBER (
 error_depth IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 251-8** *ERROR\_NUMBER Function Parameters*

Parameter	Description
error_depth	Depth in the call stack

### Return Values

The error number of the error at the specified error depth

## 251.6.10 LEXICAL\_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (
 dynamic_depth IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 251-9** *LEXICAL\_DEPTH Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

### Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

## 251.6.11 OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.OWNER (
 dynamic_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

## Parameters

**Table 251-10** *OWNER Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

## Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

## 251.6.12 UNIT\_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.UNIT_LINE (
 dynamic_depth IN PLS_INTEGER)
 RETURN PLS_INTEGER;
```

## Parameters

**Table 251-11** *UNIT\_LINE Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

## Return Values

The line number of the unit of the subprogram at the specified dynamic depth

## 251.6.13 SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.SUBPROGRAM (
 dynamic_depth IN PLS_INTEGER)
 RETURN UNIT_QUALIFIED_NAME;
```

## Parameters

**Table 251-12** *SUBPROGRAM Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

### **Return Values**

Returns the unit-qualified name of the subprogram at the specified dynamic depth

# UTL\_COLL

The UTL\_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- [Summary of UTL\\_COLL Subprograms](#)

## 252.1 Summary of UTL\_COLL Subprograms

The UTL\_COLL package has one subprogram, the IS\_LOCATOR function.

**Table 252-1 UTL\_COLL Package Subprograms**

Subprogram	Description
<a href="#">IS_LOCATOR Function</a>	Determines whether a collection item is actually a locator or not

### 252.1.1 IS\_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

#### Syntax

```
UTL_COLL.IS_LOCATOR (
 coln IN STANDARD)
 RETURNS BOOLEAN;
```

#### Pragmas

Asserts WNDS, WNPS and RNPS pragmas

#### Parameters

**Table 252-2 IS\_LOCATOR Function Parameters**

Parameter	Description
coln	Nested table or varray item.

#### Return Values

**Table 252-3 IS\_LOCATOR Function Return Values**

Return Value	Description
1	Collection item is indeed a locator.
0	Collection item is not a locator.

## Examples

```
CREATE OR REPLACE TYPE list_t AS TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
 pno number,
 ph list_t);
/

CREATE TABLE phone_book OF phone_book_t
 NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
 NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
 plist list_t;
 plist1 list_t;
BEGIN
 SELECT ph INTO plist FROM phone_book WHERE pno=1;

 SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

 IF (UTL_COLL.IS_LOCATOR(plist)) THEN
 DBMS_OUTPUT.PUT_LINE('plist is a locator');
 ELSE
 DBMS_OUTPUT.PUT_LINE('plist is not a locator');
 END IF;

 IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
 DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
 ELSE
 DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
 END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

# UTL\_COMPRESS

The UTL\_COMPRESS package provides a set of data compression utilities.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of UTL\\_COMPRESS Subprograms](#)

## 253.1 UTL\_COMPRESS Constants

The maximum number of handles for piecewise operations can be defined by a constant.

```
UTLCOMP_MAX_HANDLE CONSTANT PLS_INTEGER := 5;
```

## 253.2 UTL\_COMPRESS Exceptions

This table describes exceptions raised by UTL\_COMPRESS subprograms.

**Table 253-1 UTL\_COMPRESS Exceptions**

Exception	Description
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

## 253.3 UTL\_COMPRESS Operational Notes

Certain operational notes apply to UTL\_COMPRESS.

- It is the caller's responsibility to free the temporary LOB returned by the LZ\* functions with DBMS\_LOB.FREETEMPORARY call.
- A BFILE passed into LZ\_COMPRESS\* or LZ\_UNCOMPRESS\* has to be opened by DBMS\_LOB.FILEOPEN.

- Under special circumstances (especially if the input has already been compressed) the output produced by one of the UTL\_COMPRESS subprograms may be the same size, or even slightly larger than, the input.
- The output of the UTL\_COMPRESS compressed data is compatible with `gzip(with -n option)/gunzip` on a single file.

## 253.4 Summary of UTL\_COMPRESS Subprograms

This table lists the UTL\_COMPRESS subprograms and briefly describes them.

**Table 253-2 UTL\_COMPRESS Package Subprograms**

Subprogram	Description
<a href="#">ISOPEN Function</a>	Checks to see if the handle to a piecewise (un)compress context is open or closed
<a href="#">LZ_COMPRESS Functions and Procedures</a>	Compresses data using Lempel-Ziv compression algorithm
<a href="#">LZ_COMPRESS_ADD Procedure</a>	Adds a piece of compressed data
<a href="#">LZ_COMPRESS_CLOSE</a>	Closes and finishes piecewise compress operation
<a href="#">LZ_COMPRESS_OPEN</a>	Initializes a piecewise context that maintains the compress state and data
<a href="#">LZ_UNCOMPRESS Functions and Procedures</a>	Accepts compressed input, verifies it to be a valid and uncompresses it
<a href="#">LZ_UNCOMPRESS_EXTRACT Procedure</a>	Extracts a piece of uncompressed data
<a href="#">LZ_UNCOMPRESS_OPEN Function</a>	Initializes a piecewise context that maintains the uncompress state and data
<a href="#">LZ_UNCOMPRESS_CLOSE Procedure</a>	Closes and finishes the piecewise uncompress

### 253.4.1 ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

#### Syntax

```
UTL_COMPRESS.ISOPEN(
 handle in binary_integer)
RETURN BOOLEAN;
```

#### Parameters

**Table 253-3 ISOPEN Function Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.

**Return Values**

TRUE if the given piecewise handle is opened, otherwise FALSE.

**Examples**

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
 UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
 UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

## 253.4.2 LZ\_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

**Syntax**

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN RAW,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BLOB,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BLOB,
 dst IN OUT NOCOPY BLOB,
 quality IN BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BFILE,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BFILE,
```

```
dst IN OUT NOCOPY BLOB,
quality IN BINARY_INTEGER DEFAULT 6);
```

### Parameters

**Table 253-4 LZ\_COMPRESS Function and Procedures Parameters**

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

### Usage Notes

- `quality` is an optional compression tuning value. It allows the UTL\_COMPRESS user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

## 253.4.3 LZ\_COMPRESS\_ADD Procedure

This procedure adds a piece of compressed data.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
 handle IN BINARY_INTEGER,
 dst IN OUT NOCOPY BLOB,
 src IN RAW);
```

### Parameters

**Table 253-5 LZ\_COMPRESS\_ADD Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.
src	The input data to be compressed.

### Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - NULL handle, src, dst, or invalid dst.

## 253.4.4 LZ\_COMPRESS\_CLOSE

This procedure closes and finishes piecewise compress operation.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
 handle IN BINARY_INTEGER,
 dst IN OUT NOCOPY BLOB);
```

### Parameters

**Table 253-6 LZ\_COMPRESS\_CLOSE Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.

### Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, dst, or invalid dst.

## 253.4.5 LZ\_COMPRESS\_OPEN

This function initializes a piecewise context that maintains the compress state and data.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
 dst IN OUT NOCOPY BLOB,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 253-7 LZ\_COMPRESS\_OPEN Function Parameters**

Parameter	Description
dst	User supplied LOB to store compressed data.
quality	Speed versus efficiency of resulting compressed output. <ul style="list-style-type: none"> <li>• Valid values are the range 1..9, with a default value of 6.</li> <li>• 1=fastest compression, 9=slowest compression and best compressed file size.</li> </ul>

### Return Values

A handle to an initialized piecewise compress context.

### Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL `dst` or invalid quality specified.

### Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
  - in the event of an exception in the middle of process
- because lack of doing so will cause these handles to leak.

## 253.4.6 LZ\_UNCOMPRESS Functions and Procedures

This procedure accepts as input a `RAW`, `BLOB` or `BFILE` compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed `RAW` or `BLOB` result.

### Syntax

This function returns uncompressed data as `RAW`:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary `BLOB`:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`, which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BLOB,
 dst IN OUT NOCOPY BLOB);
```

This function returns a temporary `BLOB` for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`. The original `dst` data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BFILE,
 dst IN OUT NOCOPY BLOB);
```

## Parameters

**Table 253-8 LZ\_UNCOMPRESS Function and Procedures Parameters**

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

## 253.4.7 LZ\_UNCOMPRESS\_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
 handle IN BINARY_INTEGER,
 dst OUT NOCOPY RAW);
```

## Parameters

**Table 253-9 LZ\_UNCOMPRESS\_EXTRACT Function Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.
dst	The uncompressed data.

### Exceptions

- no\_data\_found - finished uncompress.
- invalid\_handle - out of range invalid or uninitialized handle.
- invalid\_argument - NULL handle.

## 253.4.8 LZ\_UNCOMPRESS\_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
 src IN BLOB)
RETURN BINARY_INTEGER;
```

## Parameters

**Table 253-10 LZ\_UNCOMPRESS\_OPEN Function Parameters**

Parameter	Description
src	The input data to be uncompressed.

**Return Values**

A handle to an initialized piecewise compress context.

**Exceptions**

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

**Usage Notes**

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.

## 253.4.9 LZ\_UNCOMPRESS\_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

**Syntax**

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
 handle IN BINARY_INTEGER);
```

**Parameters**

**Table 253-11 LZ\_UNCOMPRESS\_CLOSE Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.

**Exceptions**

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

# UTL\_ENCODE

The `UTL_ENCODE` package provides functions that encode `RAW` data into a standard encoded format so that the data can be transported between hosts.

You can use `UTL_ENCODE` functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- [Summary of UTL\\_ENCODE Subprograms](#)

## 254.1 Summary of UTL\_ENCODE Subprograms

This table lists the `UTL_ENCODE` subprograms and briefly describes them.

**Table 254-1 UTL\_ENCODE Package Subprograms**

Subprogram	Description
<a href="#">BASE64_DECODE Function</a>	Reads the base 64-encoded <code>RAW</code> input string and decodes it to its original <code>RAW</code> value
<a href="#">BASE64_ENCODE Function</a>	Encodes the binary representation of the <code>RAW</code> value into base 64 elements and returns it in the form of a <code>RAW</code> string
<a href="#">MIMEHEADER_DECODE Function</a>	Decodes a string from mime header format
<a href="#">MIMEHEADER_ENCODE Function</a>	Encodes a string into mime header format
<a href="#">QUOTED_PRINTABLE_DECODE Function</a>	Reads the <code>varchar2</code> quoted printable format input string and decodes it to the corresponding <code>RAW</code> string
<a href="#">QUOTED_PRINTABLE_ENCODE Function</a>	Reads the <code>RAW</code> input string and encodes it to the corresponding quoted printable format string
<a href="#">TEXT_DECODE Function</a>	Decodes a character set sensitive text string
<a href="#">TEXT_ENCODE Function</a>	Encodes a character set sensitive text string
<a href="#">UUDECODE Function</a>	Reads the <code>RAW</code> uuencode format input string and decodes it to the corresponding <code>RAW</code> string
<a href="#">UUENCODE Function</a>	Reads the <code>RAW</code> input string and encodes it to the corresponding uuencode format string

## 254.1.1 BASE64\_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

### Syntax

```
UTL_ENCODE.BASE64_DECODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 254-2** BASE64\_DECODE Function Parameters

Parameter	Description
r	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

### Return Values

**Table 254-3** BASE64\_DECODE Function Return Values

Return	Description
RAW	Contains the decoded string

## 254.1.2 BASE64\_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

### Syntax

```
UTL_ENCODE.BASE64_ENCODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 254-4** BASE64\_ENCODE Function Parameters

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

## Return Values

**Table 254-5 BASE64\_ENCODE Function Return Values**

Return	Description
RAW	Contains the encoded base 64 elements

## 254.1.3 MIMEHEADER\_DECODE Function

This function accepts as input an "encoded word."

It uses the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER\_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

### Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
 buf IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 254-6 MIMEHEADER\_DECODE Function Parameters**

Parameter	Description
buf	The encoded text data with mime header format tags.

### Return Values

**Table 254-7 MIMEHEADER\_DECODE Function Return Values**

Return	Description
data	The encoded text data with mime header format tags

## Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?');
```

## 254.1.4 MIMEHEADER\_ENCODE Function

This function returns as an output an "encoded word".

The output is in the following form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=-
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The `ENCODING` input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

## Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
 buf IN VARCHAR2 CHARACTER SET ANY_CS,
 encode_charset IN VARCHAR2 DEFAULT NULL,
 encoding IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

## Parameters

**Table 254-8 MIMEHEADER\_ENCODE Function Parameters**

Parameter	Description
<code>buf</code>	The text data.
<code>encode_charset</code>	The target character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code>

## Return Values

**Table 254-9 MIMEHEADER\_ENCODE Function Return Values**

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

## 254.1.5 QUOTED\_PRINTABLE\_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

### Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 254-10 QUOTED\_PRINTABLE\_DECODE Function Parameters**

Parameters	Description
r	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

### Return Values

**Table 254-11 QUOTED\_PRINTABLE\_DECODE Function Return Values**

Return	Description
RAW	The decoded string

## 254.1.6 QUOTED\_PRINTABLE\_ENCODE Function

This function reads the `RAW` input string and encodes it to the corresponding quoted printable format string.

### Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 254-12 QUOTED\_PRINTABLE\_ENCODE Function Parameters**

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

## Return Values

**Table 254-13 QUOTED\_PRINTABLE\_ENCODE Function Return Values**

Return	Description
RAW	Contains the quoted printable string

## 254.1.7 TEXT\_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL.

The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If `encode_charset` is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

### Syntax

```
UTL_ENCODE.TEXT_DECODE(
 buf IN VARCHAR2 CHARACTER SET ANY_CS,
 encode_charset IN VARCHAR2 DEFAULT NULL,
 encoding IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

## Parameters

**Table 254-14 TEXT\_DECODE Function Parameters**

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL.

## Return Values

**Table 254-15** TEXT\_DECODE Function Return Values

Return	Description
string	A VARCHAR2 decoded text string.

## Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
 'Here is some text',
 WE8ISO8859P1,
 UTL_ENCODE.BASE64);
```

## 254.1.8 TEXT\_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`.

The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if `ENCODING` is `NULL`.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

## Syntax

```
UTL_ENCODE.TEXT_ENCODE (
 buf IN VARCHAR2 CHARACTER SET ANY_CS,
 encode_charset IN VARCHAR2 DEFAULT NULL,
 encoding IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

## Parameters

**Table 254-16** TEXT\_ENCODE Function Parameters

Parameter	Description
buf	The text data.
encode_charset	The target character set.
encoding	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code>

## Return Values

**Table 254-17** TEXT\_ENCODE Function Return Values

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

## Examples

```
v2:=utl_encode.text_encode(
 'Here is some text',
 'WE8ISO8859P1',
 UTL_ENCODE.BASE64);
```

## 254.1.9 UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string.

See "[UUENCODE Function](#)" for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

## Syntax

```
UTL_ENCODE.UUDECODE (
 r IN RAW)
RETURN RAW;
```

## Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 254-18** UUDECODE Function Parameters

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

## Return Values

**Table 254-19** UUDECODE Function Return Values

Return	Description
RAW	The decoded RAW string

## 254.1.10 UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string.

The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

### Syntax

```
UTL_ENCODE.UUENCODE (
 r IN RAW,
 type IN PLS_INTEGER DEFAULT 1,
 filename IN VARCHAR2 DEFAULT NULL,
 permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 254-20 UUENCODE Function Parameters**

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

### Return Values

**Table 254-21 UUENCODE Function Return Values**

Return	Description
RAW	Contains the uuencode format string

# UTL\_FILE

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of UTL\\_FILE Subprograms](#)

## 255.1 UTL\_FILE Security Model

The set of files and directories that are accessible to the user through `UTL_FILE` is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user.

The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both `READ` and `WRITE` access to the directory object `USER_DIR`, the user can open a file located in the operating system directory described by `USER_DIR`, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

`UTL_FILE` provides file access both on the client side and on the server side. When run on the server, `UTL_FILE` provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, `UTL_FILE` provides access to operating system files that are accessible from the client.

Directory objects offer more flexibility and granular control to the `UTL_FILE` application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. `CREATE ANY DIRECTORY` privilege is granted only to `SYS` and `SYSTEM` by default.

 **Note:**

Use the `CREATE DIRECTORY` feature for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the `FOPEN` function is the owner of the shadow process running the instance. Normally, this owner is `ORACLE`. Files created using `FOPEN` are always writable and readable using the `UTL_FILE` subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

 **WARNING:**

The privileges needed to access files in a directory object are operating system specific. `UTL_FILE` directory object privileges give you read and write access to all files within the specified directory.

## 255.2 UTL\_FILE Operational Notes

Keep these notes in mind when using `UTL_FILE`.

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN_NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.

## 255.3 UTL\_FILE Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL\_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET\_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

### Note:

The UTL\_FILE package is similar to the client-side TEXT\_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL\_FILE and TEXT\_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

## 255.4 UTL\_FILE Exceptions

This table describes exceptions raised by UTL\_FILE subprograms.

**Table 255-1 UTL\_FILE Package Exceptions**

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The MAX_LINESIZE value for FOPEN( ) is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.

**Table 255-1 (Cont.) UTL\_FILE Package Exceptions**

Exception Name	Description
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: <ul style="list-style-type: none"> <li>ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or</li> <li>ABSOLUTE_OFFSET &lt; 0, or</li> <li>Either offset caused a seek past the end of the file</li> </ul>
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL\_FILE can also raise predefined PL/SQL exceptions such as NO\_DATA\_FOUND or VALUE\_ERROR.

## 255.5 UTL\_FILE Examples

These two examples show use of the procedure.

### Example 1

#### Note:

The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;
```

```
SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible

File Location	Filename	Invalid Because
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

### Example 2

```

DECLARE
 V1 VARCHAR2(32767);
 F1 UTL_FILE.FILE_TYPE;
BEGIN
 -- In this example MAX_LINESIZE is less than GET_LINE's length request
 -- so the number of bytes returned will be 256 or less if a line terminator is
 -- seen.
 F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R', 256);
 UTL_FILE.GET_LINE(F1, V1, 32767);
 UTL_FILE.FCLOSE(F1);

 -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
 -- so the number of bytes returned will be 1024 or less if a line terminator
 -- is seen.
 F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
 UTL_FILE.GET_LINE(F1, V1, 32767);
 UTL_FILE.FCLOSE(F1);

 -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults
 -- to
 -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
 -- defaults to 1024.
 -- So the number of bytes returned will be 1024 or less if a line terminator
 -- is seen.
 F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
 UTL_FILE.GET_LINE(F1, V1);
 UTL_FILE.FCLOSE(F1);
END;

```

## 255.6 UTL\_FILE Data Structures

The UTL\_FILE package defines a RECORD type.

### Record Types

- [FILETYPE Record Type](#)

## 255.6.1 FILETYPE Record Type

The contents of `FILE_TYPE` are private to the `UTL_FILE` package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
 id BINARY_INTEGER,
 datatype BINARY_INTEGER,
 byte_mode BOOLEAN);
```

### Fields

**Table 255-2 FILE\_TYPE Fields**

Field	Description
<code>id</code>	A numeric value indicating the internal file handle number
<code>datatype</code>	Indicates whether the file is a CHAR file, Nchar file or other (binary)
<code>byte_mode</code>	Indicates whether the file was open as a binary file, or as a text file

#### **Caution:**

Oracle does not guarantee the persistence of `FILE_TYPE` values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.

## 255.7 Summary of UTL\_FILE Subprograms

This table lists the `UTL_FILE` subprograms and briefly describes them.

**Table 255-3 UTL\_FILE Subprograms**

Subprogram	Description
<a href="#">FCLOSE Procedure</a>	Closes a file
<a href="#">FCLOSE_ALL Procedure</a>	Closes all open file handles
<a href="#">FCOPY Procedure</a>	Copies a contiguous portion of a file to a newly created file
<a href="#">FFLUSH Procedure</a>	Physically writes all pending output to a file
<a href="#">FGETATTR Procedure</a>	Reads and returns the attributes of a disk file
<a href="#">FGETPOS Function</a>	Returns the current relative offset position within a file, in bytes
<a href="#">FOPEN Function</a>	Opens a file for input or output
<a href="#">FOPEN_NCHAR Function</a>	Opens a file in Unicode for input or output
<a href="#">FREMOVE Procedure</a>	Deletes a disk file, assuming that you have sufficient privileges
<a href="#">FRENAME Procedure</a>	Renames an existing file to a new name, similar to the UNIX <code>mv</code> function

**Table 255-3 (Cont.) UTL\_FILE Subprograms**

Subprogram	Description
<a href="#">FSEEK Procedure</a>	Adjusts the file pointer forward or backward within the file by the number of bytes specified
<a href="#">GET_LINE Procedure</a>	Reads text from an open file
<a href="#">GET_LINE_NCHAR Procedure</a>	Reads text in Unicode from an open file
<a href="#">GET_RAW Procedure</a>	Reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read
<a href="#">IS_OPEN Function</a>	Determines if a file handle refers to an open file
<a href="#">NEW_LINE Procedure</a>	Writes one or more operating system-specific line terminators to a file
<a href="#">PUT Procedure</a>	Writes a string to a file
<a href="#">PUT_LINE Procedure</a>	Writes a line to a file, and so appends an operating system-specific line terminator
<a href="#">PUT_LINE_NCHAR Procedure</a>	Writes a Unicode line to a file
<a href="#">PUT_NCHAR Procedure</a>	Writes a Unicode string to a file
<a href="#">PUTF Procedure</a>	A PUT procedure with formatting
<a href="#">PUTF_NCHAR Procedure</a>	A PUT_NCHAR procedure with formatting, and writes a Unicode string to a file, with formatting
<a href="#">PUT_RAW Procedure</a>	Accepts as input a RAW data value and writes the value to the output buffer

## 255.7.1 FCLOSE Procedure

This procedure closes an open file identified by a file handle.

### Syntax

```
UTL_FILE.FCLOSE (
 file IN OUT FILE_TYPE);
```

### Parameters

**Table 255-4 FCLOSE Procedure Parameters**

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

### Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE\_ERROR exception when closing a file.

## Exceptions

WRITE\_ERROR  
INVALID\_FILEHANDLE

## 255.7.2 FCLOSE\_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

### Syntax

```
UTL_FILE.FCLOSE_ALL;
```

### Usage Notes

 **Note:**

FCLOSE\_ALL does not alter the state of the open file handles held by the user. This means that an IS\_OPEN test on a file handle after an FCLOSE\_ALL call still returns TRUE, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE\_ALL.

## Exceptions

WRITE\_ERROR

## 255.7.3 FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file.

By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

### Syntax

```
UTL_FILE.FCOPY (
 src_location IN VARCHAR2,
 src_filename IN VARCHAR2,
 dest_location IN VARCHAR2,
 dest_filename IN VARCHAR2,
 start_line IN BINARY_INTEGER DEFAULT 1,
 end_line IN BINARY_INTEGER DEFAULT NULL);
```

## Parameters

**Table 255-5 FCOPY Procedure Parameters**

Parameters	Description
src_location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
src_filename	Source file to be copied
dest_location	Destination directory where the destination file is created
dest_filename	Destination file created from the source file
start_line	Line number at which to begin copying. The default is 1 for the first line
end_line	Line number at which to stop copying. The default is NULL, signifying end of file

## Exceptions

INVALID\_FILENAME  
 INVALID\_PATH  
 INVALID\_OPERATION  
 INVALID\_OFFSET  
 READ\_ERROR  
 WRITE\_ERROR

## 255.7.4 FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

## Syntax

```
UTL_FILE.FFLUSH (
 file IN FILE_TYPE);
```

## Parameters

**Table 255-6 FFLUSH Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

### Exceptions

INVALID\_FILENAME  
INVALID\_MAXLINESIZE  
INVALID\_OPERATION  
WRITE\_ERROR

## 255.7.5 FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

### Syntax

```
UTL_FILE.FGETATTR(
 location IN VARCHAR2,
 filename IN VARCHAR2,
 fexists OUT BOOLEAN,
 file_length OUT NUMBER,
 block_size OUT BINARY_INTEGER);
```

### Parameters

**Table 255-7 FGETATTR Procedure Parameters**

Parameters	Description
location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
filename	Name of the file to be examined
fexists	A BOOLEAN for whether or not the file exists
file_length	Length of the file in bytes. NULL if file does not exist.
block_size	File system block size in bytes. NULL if the file does not exist.

### Exceptions

INVALID\_PATH  
INVALID\_FILENAME  
INVALID\_OPERATION  
READ\_ERROR  
ACCESS\_DENIED

## 255.7.6 FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

### Syntax

```
UTL_FILE.FGETPOS (
 file IN FILE_TYPE)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 255-8 FGETPOS Parameters**

Parameters	Description
file	Directory location of the source file

### Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

READ\_ERROR

### Usage Notes

If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## 255.7.7 FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously.

See also [FOPEN\\_NCHAR Function](#).

### Syntax

```
UTL_FILE.FOPEN (
 location IN VARCHAR2,
 filename IN VARCHAR2,
 open_mode IN VARCHAR2,
 max_linesize IN BINARY_INTEGER DEFAULT 1024)
 RETURN FILE_TYPE;
```

## Parameters

**Table 255-9 FOPEN Function Parameters**

Parameter	Description
location	Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: <ul style="list-style-type: none"> <li>• r -- read text</li> <li>• w -- write text</li> <li>• a -- append text</li> <li>• rb -- read byte mode</li> <li>• wb -- write byte mode</li> <li>• ab -- append byte mode</li> </ul> If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of bytes for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

## Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL\_FILE package, and individual components should not be referenced or changed by the UTL\_FILE user.

**Table 255-10 FOPEN Function Return Values**

Return	Description
FILE_TYPE	Handle to open file

## Exceptions

INVALID\_MAXILINESIZE

INVALID\_MODE

INVALID\_OPERATION

INVALID\_PATH

INVALID\_FILENAME

## Usage Notes

The file location and file name parameters must be supplied to the `FOPEN` function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects.

## 255.7.8 FOPEN\_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. With this function, you can read or write a text file in Unicode instead of in the database character set.

You can have a maximum of 50 files open simultaneously.

Even though the contents of an `NVARCHAR2` buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. `UTL_FILE` converts between UTF8 and AL16UTF16 as necessary.

See also [FOPEN Function](#).

### Syntax

```
UTL_FILE.FOPEN_NCHAR (
 location IN VARCHAR2,
 filename IN VARCHAR2,
 open_mode IN VARCHAR2,
 max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

### Parameters

**Table 255-11 FOPEN\_NCHAR Function Parameters**

Parameter	Description
<code>location</code>	Directory location of file
<code>filename</code>	File name (including extension)
<code>open_mode</code>	Open mode ( <code>r,w,a,rb,wb,ab</code> )
<code>max_linesize</code>	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)

### Return Values

`FOPEN_NCHAR` returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the `UTL_FILE` package, and individual components should not be referenced or changed by the `UTL_FILE` user.

**Table 255-12 FOPEN\_NCHAR Function Return Values**

Return	Description
<code>FILE_TYPE</code>	Handle to open file

**Exceptions**

INVALID\_MAXLINESIZE

INVALID\_MODE

INVALID\_OPERATION

INVALID\_PATH

## 255.7.9 REMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

**Syntax**

```
UTL_FILE.REMOVE (
 location IN VARCHAR2,
 filename IN VARCHAR2);
```

**Parameters****Table 255-13 REMOVE Procedure Parameters**

Parameters	Description
location	Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	Name of the file to be deleted

**Exceptions**

ACCESS\_DENIED

DELETE\_FAILED

INVALID\_FILENAME

INVALID\_OPERATION

INVALID\_PATH

**Usage Notes**

The REMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

## 255.7.10 RENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX mv function.

**Syntax**

```
UTL_FILE.RENAME (
 src_location IN VARCHAR2,
 src_filename IN VARCHAR2,
```

```

dest_location IN VARCHAR2,
dest_filename IN VARCHAR2,
overwrite IN BOOLEAN DEFAULT FALSE);

```

### Parameters

**Table 255-14 FRENAME Procedure Parameters**

Parameters	Description
src_location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
src_filename	Source file to be renamed
dest_location	Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)
dest_filename	New name of the file
overwrite	Default is FALSE. Permission on both the source and destination directories must be granted. You can use the <code>overwrite</code> parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite.

### Exceptions

```

ACCESS_DENIED
INVALID_FILENAME
INVALID_PATH
RENAME_FAILED

```

## 255.7.11 FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

### Syntax

```

UTL_FILE.FSEEK (
 file IN OUT UTL_FILE.FILE_TYPE,
 absolute_offset IN PL_INTEGER DEFAULT NULL,
 relative_offset IN PLS_INTEGER DEFAULT NULL);

```

### Parameters

**Table 255-15 FSEEK Procedure Parameters**

Parameters	Description
file	File handle
absolute_offset	Absolute location to which to seek; default = NULL
relative_offset	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OFFSET

INVALID\_OPERATION

READ\_ERROR

## Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset > 0`, or backward, if `relative_offset < 0`, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## 255.7.12 GET\_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

### Syntax

```
UTL_FILE.GET_LINE (
 file IN FILE_TYPE,
 buffer OUT VARCHAR2,
 len IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 255-16** GET\_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an <code>FOPEN</code> call. The file must be open for reading (mode <code>r</code> ); otherwise an <code>INVALID_OPERATION</code> exception is raised.
buffer	Data buffer to receive the line read from the file
len	The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

NO\_DATA\_FOUND

READ\_ERROR

## Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. See also "[GET\\_LINE\\_NCHAR Procedure](#)".

## 255.7.13 GET\_LINE\_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype, such as `NCHAR`, `NCLOB`, or `VARCHAR2` is specified, PL/SQL will perform standard implicit conversion from `NVARCHAR2` after the text is read.

See also [GET\\_LINE Procedure](#)

## Syntax

```
UTL_FILE.GET_LINE_NCHAR (
 file IN FILE_TYPE,
 buffer OUT NVARCHAR2,
 len IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 255-17 GET\_LINE\_NCHAR Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code> ). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>buffer</code>	Data buffer to receive the line read from the file
<code>len</code>	The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .

**Exceptions**

INVALID\_FILEHANDLE

INVALID\_OPERATION

NO\_DATA\_FOUND

READ\_ERROR

## 255.7.14 GET\_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL\_FILE.GET\_RAW ignores line terminators.

**Syntax**

```
UTL_FILE.GET_RAW (
 file IN UTL_FILE.FILE_TYPE,
 buffer OUT NOCOPY RAW,
 len IN PLS_INTEGER DEFAULT NULL);
```

**Parameters****Table 255-18 GET\_RAW Procedure Parameters**

Parameters	Description
file	File handle
buffer	RAW data
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

**Exceptions**

INVALID\_FILEHANDLE

INVALID\_OPERATION

LENGTH\_MISMATCH

NO\_DATA\_FOUND

READ\_ERROR

**Usage Notes**

The subprogram will raise No\_Data\_Found when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
 h UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
 Buf RAW(32767);
 Amnt CONSTANT PLS_INTEGER := 32767;
BEGIN
 LOOP
```

```
BEGIN
 Utl_File.Get_Raw(h, Buf, Amnt);
 -- Do something with this chunk
EXCEPTION WHEN No_Data_Found THEN EXIT; END;
END LOOP;
UTL_FILE.FCLOSE (h);
END;
```

## 255.7.15 IS\_OPEN Function

This function tests a file handle to see if it identifies an open file.

IS\_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

### Syntax

```
UTL_FILE.IS_OPEN (
 file IN FILE_TYPE)
RETURN BOOLEAN;
```

### Parameters

**Table 255-19 IS\_OPEN Function Parameters**

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

### Return Values

TRUE OR FALSE

### Exceptions

INVALID\_FILEHANDLE

## 255.7.16 NEW\_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle.

This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

### Syntax

```
UTL_FILE.NEW_LINE (
 file IN FILE_TYPE,
 lines IN BINARY_INTEGER := 1);
```

## Parameters

**Table 255-20 NEW\_LINE Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call
lines	Number of line terminators to be written to the file

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## 255.7.17 PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle.

The file must be open for write operations. No line terminator is appended by PUT; use NEW\_LINE to terminate the line or use PUT\_LINE to write a complete line with a line terminator. See also "[PUT\\_NCHAR Procedure](#)".

## Syntax

```
UTL_FILE.PUT (
 file IN FILE_TYPE,
 buffer IN VARCHAR2);
```

## Parameters

**Table 255-21 PUT Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

## Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## 255.7.18 PUT\_LINE Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

The file must be open for write operations. `PUT_LINE` terminates the line with the platform-specific line terminator character or characters.

See also "[PUT\\_LINE\\_NCHAR Procedure](#)".

### Syntax

```
UTL_FILE.PUT_LINE (
 file IN FILE_TYPE,
 buffer IN VARCHAR2,
 autoflush IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 255-22** PUT\_LINE Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call
<code>buffer</code>	Text buffer that contains the lines to be written to the file
<code>autoflush</code>	Flushes the buffer to disk after the <code>WRITE</code>

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

### Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## 255.7.19 PUT\_LINE\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set.

This procedure is equivalent to the [PUT\\_NCHAR Procedure](#), except that the line separator is appended to the written text. See also [PUT\\_LINE Procedure](#).

## Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
 file IN FILE_TYPE,
 buffer IN NVARCHAR2);
```

## Parameters

**Table 255-23** PUT\_LINE\_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Text buffer that contains the lines to be written to the file

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## 255.7.20 PUT\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before writing the text.

## Syntax

```
UTL_FILE.PUT_NCHAR (
 file IN FILE_TYPE,
 buffer IN NVARCHAR2);
```

## Parameters

**Table 255-24 PUT\_NCHAR Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

## Related Topics

- [PUT Procedure](#)  
`PUT` writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

## 255.7.21 PUTF Procedure

This procedure is a formatted `PUT` procedure.

It works like a limited `printf()`.

## Syntax

```
UTL_FILE.PUTF (
 file IN FILE_TYPE,
 format IN VARCHAR2,
 [arg1 IN VARCHAR2 DEFAULT NULL,
 . . .
 arg5 IN VARCHAR2 DEFAULT NULL]);
```

## Parameters

**Table 255-25 PUTF Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN call

**Table 255-25 (Cont.) PUTF Procedure Parameters**

Parameters	Description
format	Format string that can contain text as well as the formatting characters \n and %s
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

**Usage Notes**

- If file is opened for byte mode operations, then the INVALID\_OPERATION exception is raised.
- The format string can contain any text, but the character sequences %s and \n have special meaning.

Character Sequence	Meaning
%s	Substitute this sequence with the string value of the next argument in the argument list.
\n	Substitute with the appropriate platform-specific line terminator.

**Exceptions**

INVALID\_FILEHANDLE  
INVALID\_OPERATION  
WRITE\_ERROR

**Examples**

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.

my_world varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
 my_world,
 'greetings for all earthlings');
```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

**Related Topics**

- [PUTF\\_NCHAR Procedure](#)  
This procedure is a formatted version of a PUT\_NCHAR Procedure.

## 255.7.22 PUTF\_NCHAR Procedure

This procedure is a formatted version of a PUT\_NCHAR Procedure.

Using `PUTF_NCHAR`, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements `\n` and `%s`, and up to five arguments to be substituted for consecutive instances of `%s` in the format string. The expected datatype of the format string and the arguments is `NVARCHAR2`.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

### Syntax

```
UTL_FILE.PUTF_NCHAR (
 file IN FILE_TYPE,
 format IN NVARCHAR2,
 [arg1 IN NVARCHAR2 DEFAULT NULL,
 . . .
 arg5 IN NVARCHAR2 DEFAULT NULL]);
```

### Parameters

**Table 255-26** PUTF\_NCHAR Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code> ). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>format</code>	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code>
<code>arg1..arg5</code>	From one to five operational argument strings. Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument.

### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

### Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

#### Related Topics

- [PUT\\_NCHAR Procedure](#)  
This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

## 255.7.23 PUT\_RAW Procedure

This procedure accepts as input a `RAW` data value and writes the value to the output buffer.

#### Syntax

```
UTL_FILE.PUT_RAW (
 file IN UTL_FILE.FILE_TYPE,
 buffer IN RAW,
 autoflush IN BOOLEAN DEFAULT FALSE);
```

#### Parameters

**Table 255-27** PUT\_RAW Procedure Parameters

Parameters	Description
<code>file</code>	File handle
<code>buffer</code>	The <code>RAW</code> data written to the buffer
<code>autoflush</code>	If <code>TRUE</code> , then performs a flush after writing the value to the output buffer; default is <code>FALSE</code> .

#### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

#### Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

# 256

## UTL\_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Examples](#)
- [Data Structures](#)
- [Operations](#)
- [Subprogram Groups](#)
- [Summary of UTL\\_HTTP Subprograms](#)

### See Also:

- [UTL\\_URL](#)
- [UTL\\_SMTP](#)
- *Oracle Database Enterprise User Security Administrator's Guide* for more information on Wallet Manager

## 256.1 UTL\_HTTP Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. `UTL_HTTP` also contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

## 256.2 UTL\_HTTP Security Model

This package is an invoker's rights package. The invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

### Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*

## 256.3 UTL\_HTTP Constants

The `UTL_HTTP` package defines several constants to use when specifying parameter values.

These are shown in following tables.

- [Table 256-1](#)
- [Table 256-2](#)
- [Table 256-3](#)

**Table 256-1 UTL\_HTTP Constants - HTTP Versions**

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP/1.0'	Denotes HTTP version 1.0 that can be used in the function <code>BEGIN_REQUEST</code> .
HTTP_VERSION_1_1	VARCHAR2(10)	'HTTP/1.1'	Denotes HTTP version 1.1 that can be used in the function <code>BEGIN_REQUEST</code> .

**Table 256-2 UTL\_HTTP Constants - Default Ports**

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

**Table 256-3 UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.
HTTP_NON_AUTHORITATIVE_INFORMATION	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.

**Table 256-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_MOVED_PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND_CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARILY_REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIMEOUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.

**Table 256-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined Content-Length.
HTTP_PRECONDITION_FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ENTITY_TOO_LARGE	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.

**Table 256-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_GATEWAY_ TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_ NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

## 256.4 UTL\_HTTP Exceptions

Exceptions indicate that the UTL\_HTTP package encountered issues.

The following table lists these exceptions. By default, UTL\_HTTP raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

**Table 256-4 UTL\_HTTP Exceptions**

Exception	Error Code	Reason	Where Raised
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when <code>detailed_exception</code> is enabled
BAD_URL	29262	The requested URL is badly formed	<code>BEGIN_REQUEST</code> , when <code>detailed_exception</code> is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	<code>READ_RAW</code> , <code>READ_TEXT</code> , and <code>READ_LINE</code> , when <code>detailed_exception</code> is enabled
HEADER_NOT_FOUND	29265	The header is not found	<code>GET_HEADER</code> , <code>GET_HEADER_BY_NAME</code> , when <code>detailed_exception</code> is enabled
HTTP_CLIENT_ERROR	29268	From <code>GET_RESPONSE</code> , the response status code indicates that a client error has occurred (status code in 4xx range). Or from <code>begin_request</code> , the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	<code>GET_RESPONSE</code> , <code>BEGIN_REQUEST</code> when <code>detailed_exception</code> is enabled

Table 256-4 (Cont.) UTL\_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
HTTP_SERVER_ERROR	29269	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
NETWORK_ACCESS_DENIED	24247	Access to the remote network host or credentials in an Oracle wallet is denied	BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when detailed_exception is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when detailed_exception is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when detailed_exception is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
REQUEST_FAILED	29273	The request fails to execute	Any HTTP request or response interface when detailed_exception is disabled
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when detailed_exception is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled

 **Note:**

The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

## 256.5 UTL\_HTTP Examples

These five examples demonstrate how to use UTL\_HTTP.

- [General Usage](#)
- [Retrieving HTTP Response Headers](#)
- [Handling HTTP Authentication](#)
- [Retrieving and Restoring Cookies](#)
- [Making HTTP Request with Private Wallet and Cookie Table](#)

### 256.5.1 UTL\_HTTP General Usage

This is an general example of UTL\_HTTP usage.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 value VARCHAR2(1024);
BEGIN
 UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
 req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
 UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
 resp := UTL_HTTP.GET_RESPONSE(req);
 LOOP
 UTL_HTTP.READ_LINE(resp, value, TRUE);
 DBMS_OUTPUT.PUT_LINE(value);
 END LOOP;
 UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
 WHEN UTL_HTTP.END_OF_BODY THEN
 UTL_HTTP.END_RESPONSE(resp);
END;
```

### 256.5.2 UTL\_HTTP Retrieving HTTP Response Headers

This example shows how UTL\_HTTP retrieves HTTP response headers.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 name VARCHAR2(256);
 value VARCHAR2(1024);
BEGIN
 UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
 req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
 UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
 resp := UTL_HTTP.GET_RESPONSE(req);
 DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
 DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
 FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
 UTL_HTTP.GET_HEADER(resp, i, name, value);
```

```

 DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
 END LOOP;
 UTL_HTTP.END_RESPONSE(resp);
END;
```

## 256.5.3 UTL\_HTTP Handling HTTP Authentication

This code sample indicates how UTL\_HTTP handles HTTP authentication.

```

SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url IN VARCHAR2,
 username IN VARCHAR2 DEFAULT NULL,
 password IN VARCHAR2 DEFAULT NULL,
 realm IN VARCHAR2 DEFAULT NULL) AS

 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 my_scheme VARCHAR2(256);
 my_realm VARCHAR2(256);
 name VARCHAR2(256);
 value VARCHAR2(256);
BEGIN
 -- Turn off checking of status code. We will check it by ourselves.
 UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
 req := UTL_HTTP.BEGIN_REQUEST(url);
 IF (username IS NOT NULL) THEN
 UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
Authen. Scheme
 END IF;
 resp := UTL_HTTP.GET_RESPONSE(req);
 IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
 UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
 DBMS_OUTPUT.PUT_LINE('Web proxy server is protected. ');
 DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || '
for the proxy server. ');
 UTL_HTTP.END_RESPONSE(resp);
 RETURN;
 ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
 UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
 DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected. ');
 DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || '
for the Web page. ');
 UTL_HTTP.END_RESPONSE(resp);
 RETURN;
 END IF;
 FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
 UTL_HTTP.GET_HEADER(resp, i, name, value);
 DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
 END LOOP;
 UTL_HTTP.END_RESPONSE(resp);
END;
```

## 256.5.4 UTL\_HTTP Retrieving and Restoring Cookies

This example show how UTL\_HTTP can be used to retrieve and restore cookies.

```

CREATE TABLE my_cookies (
 session_id INTEGER,
```

```
name VARCHAR2(256),
value VARCHAR2(1024),
domain VARCHAR2(256),
expire DATE,
path VARCHAR2(1024),
secure VARCHAR2(1),
version INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
 cookies UTL_HTTP.COOKIE_TABLE;
 my_session_id PLS_INTEGER;
 secure VARCHAR2(1);
BEGIN
 /* assume that some cookies have been set in previous HTTP requests. */
 UTL_HTTP.GET_COOKIES(cookies);
 SELECT session_id.nextval INTO my_session_id FROM DUAL;
 FOR i in 1..cookies.count LOOP
 IF (cookies(i).secure) THEN
 secure := 'Y';
 ELSE
 secure := 'N';
 END IF;
 INSERT INTO my_cookies
 VALUES (my_session_id, cookies(i).name, cookies(i).value,
 cookies(i).domain,
 cookies(i).expire, cookies(i).path, secure, cookies(i).version);
 END LOOP;
 RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
 cookies UTL_HTTP.COOKIE_TABLE;
 cookie UTL_HTTP.COOKIE;
 i PLS_INTEGER := 0;
 CURSOR c (c_session_id PLS_INTEGER) IS
 SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
 FOR r IN c(this_session_id) LOOP
 i := i + 1;
 cookie.name := r.name;
 cookie.value := r.value;
 cookie.domain := r.domain;
 cookie.expire := r.expire;
 cookie.path := r.path;
 IF (r.secure = 'Y') THEN
 cookie.secure := TRUE;
 ELSE
 cookie.secure := FALSE;
 END IF;
 cookie.version := r.version;
 cookies(i) := cookie;
 END LOOP;
 UTL_HTTP.CLEAR_COOKIES;
 UTL_HTTP.ADD_COOKIES(cookies);
```

```
END;
/
```

## 256.5.5 UTL\_HTTP Making HTTP Request with Private Wallet and Cookie Table

This example shows how UTL\_HTTP creates a request context with a wallet and cookie table, then makes an HTTP Request using that wallet and cookie table.

```
SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
 request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 data VARCHAR2(1024);

BEGIN

 -- Create a request context with its wallet and cookie table
 request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
 wallet_path => 'file:/oracle/wallets/test/
wallet',
 wallet_password => '*****',
 enable_cookies => TRUE,
 max_cookies => 300,
 max_cookies_per_site => 20);

 -- Make a HTTP request using the private wallet and cookie
 -- table in the request context
 req := UTL_HTTP.BEGIN_REQUEST(
 url => url,
 request_context => request_context);
 resp := UTL_HTTP.GET_RESPONSE(req);

 BEGIN
 LOOP
 UTL_HTTP.READ_TEXT(resp, data);
 DBMS_OUTPUT.PUT(data);
 END LOOP;
 EXCEPTION
 WHEN UTL_HTTP.END_OF_BODY THEN
 UTL_HTTP.END_RESPONSE(resp);
 END;

 -- Destroy the request context
 UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
 DISPLAY_PAGE('https://www.example.com/');
END;
/
```

## 256.6 UTL\_HTTP Data Structures

Data structures are used to represent requests, responses, cookies, connections, and request context.

- [REQ Type](#)
- [RESP Type](#)
- [COOKIE and COOKIE\\_TABLE Types](#)
- [CONNECTION Type](#)
- [REQUEST\\_CONTEXT\\_KEY Type](#)

### 256.6.1 REQ Type

Use this PL/SQL record type to represent an HTTP request.

#### Syntax

```
TYPE req IS RECORD (
 url VARCHAR2(32767),
 method VARCHAR2(64),
 http_version VARCHAR2(64));
```

#### Parameters

**Table 256-5 REQ Type Parameters**

Parameter	Description
url	The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code> .
method	The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code> .
http_version	The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code> .

#### Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

### 256.6.2 REQUEST\_CONTEXT\_KEY Type

This type is used to represent the key to a request context.

A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

### Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

### Usage Notes

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

## 256.6.3 RESP Type

This PL/SQL record type is used to represent an HTTP response.

### Syntax

```
TYPE resp IS RECORD (
 status_code PLS_INTEGER,
 reason_phrase VARCHAR2(256),
 http_version VARCHAR2(64));
```

### Parameters

**Table 256-6 RESP Type Parameters**

Parameter	Description
<code>status_code</code>	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by <code>GET_RESPONSE</code> .
<code>reason_phrase</code>	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by <code>GET_RESPONSE</code> .
<code>http_version</code>	The HTTP protocol version used in the HTTP response. It is set after the response is processed by <code>GET_RESPONSE</code> .

### Usage Notes

The information returned in `RESP` from the interface `GET_RESPONSE` is read-only. There are other fields in the `RESP` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

## 256.6.4 COOKIE and COOKIE\_TABLE Types

The `COOKIE` type is the PL/SQL record type that represents an HTTP cookie. The `COOKIE_TABLE` type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

### Syntax

```
TYPE cookie IS RECORD (
 name VARCHAR2(256),
 value VARCHAR2(1024),
 domain VARCHAR2(256),
 expire TIMESTAMP WITH TIME ZONE,
 path VARCHAR2(1024),
 secure BOOLEAN,
 version PLS_INTEGER,
 comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

### Fields of COOKIE Record Type

[Table 256-7](#) shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

**Table 256-7 Fields of COOKIE and COOKIE\_TABLE Type**

Field	Description
name	The name of the HTTP cookie
value	The value of the cookie
domain	The domain for which the cookie is valid
expire	The time by which the cookie will expire
path	The subset of URLs to which the cookie applies
secure	Should the cookie be returned to the Web server using secured means only.
version	The version of the HTTP cookie specification the cookie conforms. This field is <code>NULL</code> for Netscape cookies.
comment	The comment that describes the intended use of the cookie. This field is <code>NULL</code> for Netscape cookies.

### Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the `UTL_HTTP` package. The cookies are maintained by the package transparently. They are maintained inside the `UTL_HTTP` package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using `GET_COOKIES`, store them persistently in a database table, and re-store the cookies back in the package using `ADD_COOKIES` in the next database session. All the fields in the `cookie` record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See ["Retrieving and Restoring Cookies"](#).

## 256.6.5 CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. `connection_table` is a PL/SQL table of `connection`.

For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The `host` and `port` fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `ssl` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the `host` and `port` fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

### Syntax

```
TYPE connection IS RECORD (
 host VARCHAR2(256),
 port PLS_INTEGER,
 proxy_host VARCHAR2(256),
 proxy_port PLS_INTEGER,
 ssl BOOLEAN);

TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

## 256.7 UTL\_HTTP Operations

These topics provide information about how `UTL_HTTP` makes HTTP requests from SQL and PL/SQL.

- [Operational Flow](#)
- [Simple HTTP Fetches](#)
- [HTTP Requests](#)
- [HTTP Responses](#)
- [HTTP Persistent Connections](#)
- [Error Conditions](#)
- [Session Settings](#)
- [Request Context](#)

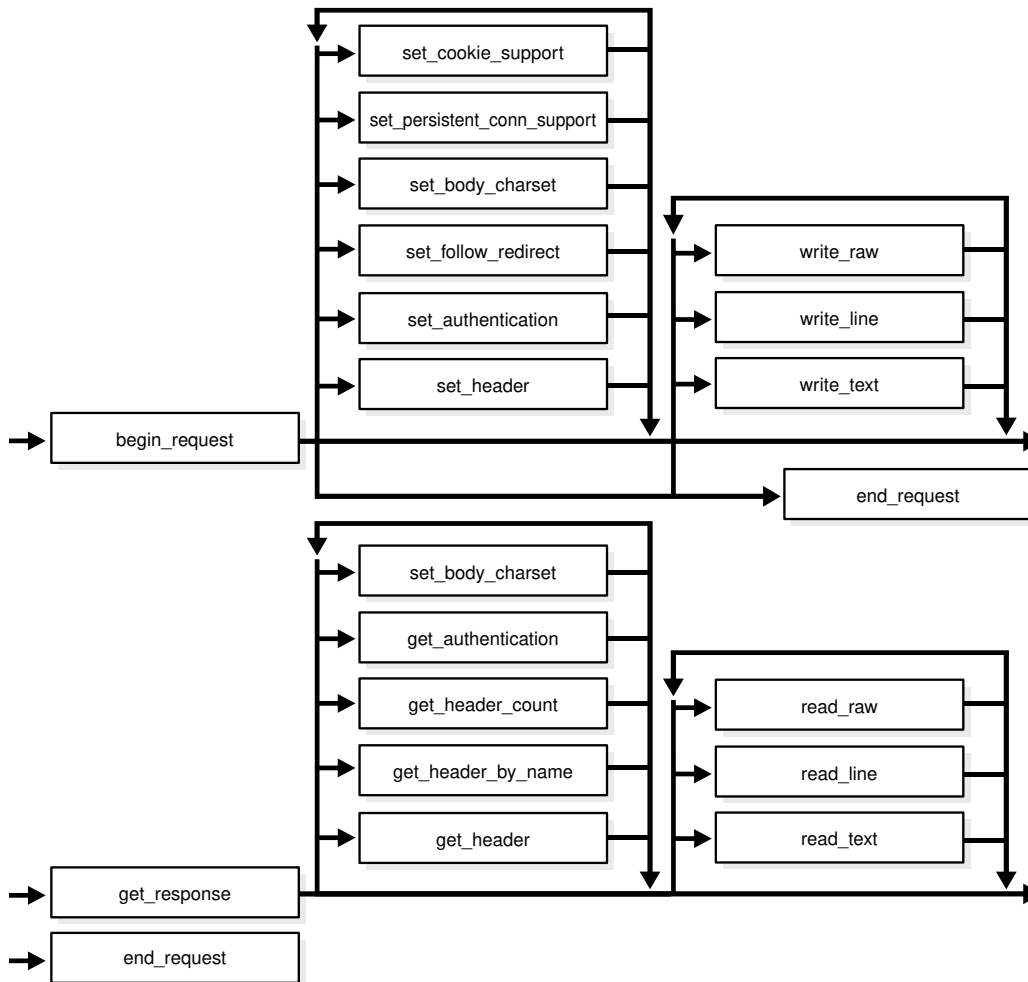

- [External Password Store](#)

## 256.7.1 UTL\_HTTP Operational Flow

The `UTL_HTTP` package provides access to the HTTP protocol.

The interfaces must be called in the order shown in the following illustration, or an exception will be raised.

Figure 256-1 Flow of the Core UTL\_HTTP Package

**illustration:** arpls006  
**release:** 9  
**caption:** The flow of the core UTL\_HTTP Package API  
**date:** 9/5/01  
**platform:** pc

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - GET\_COOKIE\_COUNT
  - GET\_COOKIES
  - ADD\_COOKIES
  - CLEAR\_COOKIES
- Persistent connections
  - GET\_PERSISTENT\_CONN\_COUNT
  - GET\_PERSISTENT\_CONNS
  - CLOSE\_PERSISTENT\_CONN
  - CLOSE\_PERSISTENT\_CONNS
- Interfaces that manipulate attributes and configurations of the UTL\_HTTP package in the current session
  - SET\_PROXY
  - GET\_PROXY
  - SET\_COOKIE\_SUPPORT
  - GET\_COOKIE\_SUPPORT
  - SET\_FOLLOW\_REDIRECT
  - GET\_FOLLOW\_REDIRECT
  - SET\_BODY\_CHARSET
  - GET\_BODY\_CHARSET
  - SET\_PERSISTENT\_CONN\_SUPPORT
  - GET\_PERSISTENT\_CONN\_SUPPORT
  - SET\_DETAILED\_EXCP\_SUPPORT
  - GET\_DETAILED\_EXCP\_SUPPORT
  - SET\_WALLET
  - SET\_TRANSFER\_TIMEOUT
  - GET\_TRANSFER\_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL\_HTTP package in the current session
  - GET\_DETAILED\_SQLCODE
  - GET\_DETAILED\_SQLERRM

 **Note:**

Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

## 256.7.2 UTL\_HTTP Simple HTTP Fetches

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.

### Note:

UTL\_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL\_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

### See Also:

[Simple HTTP Fetches in a Single Call Subprograms](#)

## 256.7.3 UTL\_HTTP HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

### See Also:

[HTTP Requests Subprograms](#)

## 256.7.4 UTL\_HTTP HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET\_RESPONSE and receive response information from the Web server.

When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

### See Also:

[HTTP Responses Subprograms](#)

## 256.7.5 UTL\_HTTP HTTP Cookies

The UTL\_HTTP package provides subprograms to manipulate HTTP cookies.

### See Also:

[HTTP Cookies Subprograms](#)

## 256.7.6 UTL\_HTTP HTTP Persistent Connections

The UTL\_HTTP package provides subprograms to manipulate persistent connections.

### See Also:

[HTTP Persistent Connections Subprograms](#)

## 256.7.7 UTL\_HTTP Error Conditions

The UTL\_HTTP package provides subprograms to retrieve error information.

### See Also:

[Error Conditions Subprograms](#)

## 256.7.8 UTL\_HTTP Session Settings

Session settings manipulate the configuration and default behavior of `UTL_HTTP` when HTTP requests are executed within a database user session.

When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

### See Also:

[Session Settings Subprograms](#)

## 256.7.9 UTL\_HTTP Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

### See Also:

[HTTP Requests Subprograms](#)

## 256.7.10 UTL\_HTTP External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

### See Also:

[SET\\_AUTHENTICATION\\_FROM\\_WALLET Procedure](#)

## 256.8 UTL\_HTTP Subprogram Groups

This section describes the `UTL_HTTP` subprograms. They are grouped by function.

- [Simple HTTP Fetches in a Single Call Subprograms](#)
- [Session Settings Subprograms](#)
- [HTTP Requests Subprograms](#)
- [HTTP Request Contexts Subprograms](#)
- [HTTP Responses Subprograms](#)
- [HTTP Cookies Subprograms](#)
- [HTTP Persistent Connections Subprograms](#)
- [Error Conditions Subprograms](#)

### 256.8.1 UTL\_HTTP Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

**Table 256-8 UTL\_HTTP Subprograms—Simple HTTP Fetches in a Single Call**

Subprogram	Description
<a href="#">REQUEST Function</a>	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
<a href="#">REQUEST_PIECES Function</a>	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

### 256.8.2 UTL\_HTTP Session Settings Subprograms

This table lists and briefly describes the `UTL_HTTP` Session Settings Subprograms.

**Table 256-9 UTL\_HTTP Subprograms—Session Settings**

Subprogram	Description
<a href="#">GET_BODY_CHARSET Procedure</a>	Retrieves the default character set of the body of all future HTTP requests
<a href="#">GET_COOKIE_SUPPORT Procedure</a>	Retrieves the current cookie support settings
<a href="#">GET_DETAILED_EXCP_SUPPORT Procedure</a>	Checks if the <code>UTL_HTTP</code> package will raise a detailed exception or not
<a href="#">GET_FOLLOW_REDIRECT Procedure</a>	Retrieves the follow-redirect setting in the current session
<a href="#">GET_PERSISTENT_CONN_SUPPORT Procedure</a>	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
<a href="#">GET_PROXY Procedure</a>	Retrieves the current proxy settings

**Table 256-9 (Cont.) UTL\_HTTP Subprograms—Session Settings**

Subprogram	Description
<a href="#">GET_RESPONSE_ERROR_CHECK Procedure</a>	Checks if the response error check is set or not
<a href="#">GET_TRANSFER_TIMEOUT Procedure</a>	Retrieves the current network transfer timeout value
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a>	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header
<a href="#">SET_COOKIE_SUPPORT Procedures</a>	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
<a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a>	Sets the UTL_HTTP package to raise a detailed exception
<a href="#">SET_FOLLOW_REDIRECT Procedures</a>	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a>	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
<a href="#">SET_PROXY Procedure</a>	Sets the proxy to be used for requests of HTTP or other protocols
<a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a>	Sets whether or not <code>GET_RESPONSE</code> raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a>	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server
<a href="#">SET_WALLET Procedure</a>	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

### 256.8.3 UTL\_HTTP HTTP Requests Subprograms

This table lists and briefly describes the UTL\_HTTP HTTP Requests.

**Table 256-10 UTL\_HTTP Subprograms—HTTP Requests**

Subprogram	Description
<a href="#">BEGIN_REQUEST Function</a>	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
<a href="#">SET_HEADER Procedure</a>	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
<a href="#">SET_AUTHENTICATION Procedure</a>	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
<a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a>	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

**Table 256-10 (Cont.) UTL\_HTTP Subprograms—HTTP Requests**

Subprogram	Description
<a href="#">SET_BODY_CHARSET Procedures</a>	Sets the character set of the request body when the media type is text but the character set is not specified in the Content-Type header
<a href="#">SET_COOKIE_SUPPORT Procedures</a>	Enables or disables support for the HTTP cookies in the request
<a href="#">SET_FOLLOW_REDIRECT Procedures</a>	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the <a href="#">GET_RESPONSE Function</a>
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a>	Enables or disables support for the HTTP 1.1 persistent-connection in the request
<a href="#">SET_PROXY Procedure</a>	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP)
<a href="#">WRITE_RAW Procedure</a>	Writes some binary data in the HTTP request body
<a href="#">WRITE_TEXT Procedure</a>	Writes some text data in the HTTP request body

## 256.8.4 UTL\_HTTP HTTP Request Contexts Subprograms

UTL\_HTTP HTTP Request Contexts subprograms create or destroy a request context.

The following table lists and briefly describes the UTL\_HTTP HTTP Request Contexts.

**Table 256-11 UTL\_HTTP Subprograms—HTTP Request Contexts**

Subprogram	Description
<a href="#">CREATE_REQUEST_CONTEXT Function</a>	Creates a request context in UTL_HTTP for a wallet and a cookie table
<a href="#">DESTROY_REQUEST_CONTEXT Procedure</a>	Destroys a request context in UTL_HTTP

## 256.8.5 UTL\_HTTP HTTP Responses Subprograms

This table lists and briefly describes the HTTP Responses Subprograms of UTL\_HTTP.

**Table 256-12 UTL\_HTTP Subprograms—HTTP Responses**

Subprogram	Description
<a href="#">END_RESPONSE Procedure</a>	Ends the HTTP response. It completes the HTTP request and response.
<a href="#">GET_AUTHENTICATION Procedure</a>	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
<a href="#">GET_HEADER Procedure</a>	Returns the n <sup>th</sup> HTTP response header name and value returned in the response
<a href="#">GET_HEADER_BY_NAME Procedure</a>	Returns the HTTP response header value returned in the response given the name of the header

**Table 256-12 (Cont.) UTL\_HTTP Subprograms—HTTP Responses**

Subprogram	Description
<a href="#">GET_HEADER_COUNT Function</a>	Returns the number of HTTP response headers returned in the response
<a href="#">GET_RESPONSE Function</a>	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
<a href="#">READ_LINE Procedure</a>	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
<a href="#">READ_RAW Procedure</a>	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
<a href="#">READ_TEXT Procedure</a>	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
<a href="#">SET_BODY_CHARSET Procedures</a>	Sets the character set of the response body when the media type is "text" but the character set is not specified in the Content-Type header

## 256.8.6 UTL\_HTTP HTTP Cookies Subprograms

The HTTP cookies subprograms manages cookies in the `UTL_HTTP` package.

The following table lists and briefly describes the HTTP cookies subprograms of `UTL_HTTP`.

**Table 256-13 UTL\_HTTP Subprograms—HTTP Cookies**

Subprogram	Description
<a href="#">ADD_COOKIES Procedure</a>	Add the cookies either to a request context or to the <code>UTL_HTTP</code> package's session state
<a href="#">CLEAR_COOKIES Procedure</a>	Clears all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state
<a href="#">GET_COOKIE_COUNT Function</a>	Returns the number of cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session states
<a href="#">GET_COOKIES Function</a>	Returns all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state.

## 256.8.7 UTL\_HTTP HTTP Persistent Connections Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Persistent Connections subprograms.

**Table 256-14 UTL\_HTTP Subprograms—HTTP Persistent Connections**

Subprogram	Description
<a href="#">CLOSE_PERSISTENT_CONN Procedure</a>	Closes an HTTP persistent connection maintained by the <code>UTL_HTTP</code> package in the current database session
<a href="#">CLOSE_PERSISTENT_CONNS Procedure</a>	Closes a group of HTTP persistent connections maintained by the <code>UTL_HTTP</code> package in the current database session

**Table 256-14 (Cont.) UTL\_HTTP Subprograms—HTTP Persistent Connections**

Subprogram	Description
<a href="#">GET_PERSISTENT_CONN_COUNT Function</a>	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers
<a href="#">GET_PERSISTENT_CONNS Procedure</a>	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers

## 256.8.8 UTL\_HTTP Error Conditions Subprograms

This table lists and briefly describes error conditions subprograms of UTL\_HTTP .

**Table 256-15 UTL\_HTTP Subprograms—Error Conditions**

Subprogram	Description
<a href="#">GET_DETAILED_SQLCODE Function</a>	Retrieves the detailed SQLCODE of the last exception raised
<a href="#">GET_DETAILED_SQLERRM Function</a>	Retrieves the detailed SQLERRM of the last exception raised

## 256.9 Summary of UTL\_HTTP Subprograms

This table lists the UTL\_HTTP subprograms and briefly describes them.

**Table 256-16 UTL\_HTTP Package Subprograms**

Subprogram	Description	Group
<a href="#">ADD_COOKIES Procedure</a>	Add the cookies either to a request context or to the UTL_HTTP package's session state	<a href="#">HTTP Cookies Subprograms</a>
<a href="#">BEGIN_REQUEST Function</a>	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	<a href="#">HTTP Requests Subprograms</a>
<a href="#">CLEAR_COOKIES Procedure</a>	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state	<a href="#">HTTP Cookies Subprograms</a>
<a href="#">CLOSE_PERSISTENT_CONN Procedure</a>	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	<a href="#">HTTP Persistent Connections Subprograms</a>
<a href="#">CLOSE_PERSISTENT_CONNECTIONS Procedure</a>	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	<a href="#">HTTP Persistent Connections Subprograms</a>

Table 256-16 (Cont.) UTL\_HTTP Package Subprograms

Subprogram	Description	Group
<a href="#">CREATE_REQUEST_CONTEXT Function</a>	Creates a request context in UTL_HTTP for a wallet and a cookie table	<a href="#">HTTP Requests Subprograms</a>
<a href="#">DESTROY_REQUEST_CONTEXT Procedure</a>	Destroys a request context in UTL_HTTP for a wallet and a cookie table	<a href="#">HTTP Requests Subprograms</a>
<a href="#">END_REQUEST Procedure</a>	Ends the HTTP request	<a href="#">HTTP Requests Subprograms</a>
<a href="#">END_RESPONSE Procedure</a>	Ends the HTTP response. It completes the HTTP request and response	<a href="#">HTTP Responses Subprograms</a>
<a href="#">GET_AUTHENTICATION Procedure</a>	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	<a href="#">HTTP Responses Subprograms</a>
<a href="#">GET_BODY_CHARSET Procedure</a>	Retrieves the default character set of the body of all future HTTP requests	<a href="#">Session Settings Subprograms</a>
<a href="#">GET_COOKIE_COUNT Function</a>	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	<a href="#">HTTP Cookies Subprograms</a>
<a href="#">GET_COOKIE_SUPPORT Procedure</a>	Retrieves the current cookie support settings	<a href="#">Session Settings Subprograms</a>
<a href="#">GET_COOKIES Function</a>	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	<a href="#">HTTP Cookies Subprograms</a>
<a href="#">GET_DETAILED_EXCP_SUPPORT Procedure</a>	Checks if the UTL_HTTP package will raise a detailed exception or not	<a href="#">Session Settings Subprograms</a>
<a href="#">GET_DETAILED_SQLCODE Function</a>	Retrieves the detailed <code>SQLCODE</code> of the last exception raised	<a href="#">Error Conditions Subprograms</a>
<a href="#">GET_DETAILED_SQLERRM Function</a>	Retrieves the detailed <code>SQLERRM</code> of the last exception raised	<a href="#">Error Conditions Subprograms</a>
<a href="#">GET_FOLLOW_REDIRECT Procedure</a>	Retrieves the follow-redirect setting in the current session	<a href="#">Session Settings Subprograms</a>
<a href="#">GET_HEADER Procedure</a>	Returns the $n^{\text{th}}$ HTTP response header name and value returned in the response	<a href="#">HTTP Responses Subprograms</a>
<a href="#">GET_HEADER_BY_NAME Procedure</a>	Returns the HTTP response header value returned in the response given the name of the header	<a href="#">HTTP Responses Subprograms</a>
<a href="#">GET_HEADER_COUNT Function</a>	Returns the number of HTTP response headers returned in the response	<a href="#">HTTP Responses and HTTP Responses Subprograms</a>

Table 256-16 (Cont.) UTL\_HTTP Package Subprograms

Subprogram	Description	Group
<a href="#">GET_PERSISTENT_CONN_COUNT Function</a>	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers	<a href="#">HTTP Persistent Connections Subprograms</a>
<a href="#">GET_HEADER_COUNT Function</a>	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	<a href="#">Session Settings Subprograms</a>
<a href="#">GET_PERSISTENT_CONNECTION_SUPPORT Procedure</a>	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see <a href="#">Session Settings Subprograms</a> )	<a href="#">HTTP Persistent Connections Subprograms</a>
<a href="#">GET_PERSISTENT_CONNS Procedure</a>	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers	<a href="#">HTTP Persistent Connections Subprograms</a>
<a href="#">GET_PROXY Procedure</a>	Retrieves the current proxy settings	<a href="#">Session Settings Subprograms</a>
<a href="#">GET_RESPONSE Function</a>	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	<a href="#">HTTP Responses Subprograms</a>
<a href="#">GET_RESPONSE_ERROR_CHECK Procedure</a>	Checks if the response error check is set or no	<a href="#">Session Settings Subprograms</a>
<a href="#">GET_TRANSFER_TIMEOUT Procedure</a>	Retrieves the current network transfer timeout value	<a href="#">Session Settings Subprograms</a>
<a href="#">READ_LINE Procedure</a>	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	<a href="#">HTTP Responses Subprograms</a>
<a href="#">READ_RAW Procedure</a>	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	<a href="#">HTTP Responses Subprograms</a>
<a href="#">READ_TEXT Procedure</a>	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	<a href="#">HTTP Responses Subprograms</a>
<a href="#">REQUEST Function</a>	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	<a href="#">Simple HTTP Fetches in a Single Call Subprograms</a>

Table 256-16 (Cont.) UTL\_HTTP Package Subprograms

Subprogram	Description	Group
<a href="#">REQUEST_PIECES Function</a>	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	<a href="#">Simple HTTP Fetches in a Single Call Subprograms</a>
<a href="#">SET_AUTHENTICATION Procedure</a>	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	<a href="#">HTTP Requests Subprograms</a>
<a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a>	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	<a href="#">HTTP Requests Subprograms</a>
<a href="#">SET_BODY_CHARSET Procedures</a>	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header	<a href="#">Session Settings Subprograms</a>
<a href="#">SET_BODY_CHARSET Procedures</a>	Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header	<a href="#">HTTP Requests Subprograms</a>
<a href="#">SET_BODY_CHARSET Procedures</a>	Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header	<a href="#">HTTP Responses Subprograms</a> and <a href="#">Session Settings Subprograms</a>
<a href="#">SET_COOKIE_SUPPORT Procedures</a>	Enables or disables support for the HTTP cookies in the request	<a href="#">HTTP Requests Subprograms</a>
<a href="#">SET_DETAILED_EXCEPTION_SUPPORT Procedure</a>	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	<a href="#">Session Settings Subprograms</a>
<a href="#">SET_DETAILED_EXCEPTION_SUPPORT Procedure</a>	Sets the UTL_HTTP package to raise a detailed exception	<a href="#">Session Settings Subprograms</a>
<a href="#">SET_FOLLOW_REDIRECT Procedures</a>	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the <code>GET_RESPONSE</code> function	<a href="#">HTTP Requests Subprograms</a>

Table 256-16 (Cont.) UTL\_HTTP Package Subprograms

Subprogram	Description	Group
<a href="#">SET_HEADER Procedure</a>	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function	<a href="#">Session Settings Subprograms</a>
<a href="#">SET_HEADER Procedure</a>	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	<a href="#">HTTP Requests Subprograms</a>
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a>	Enables or disables support for the HTTP 1.1 persistent-connection in the request	<a href="#">HTTP Requests Subprograms</a>
<a href="#">SET_PROXY Procedure</a>	Sets the proxy to be used for requests of HTTP or other protocols	<a href="#">Session Settings and Session Settings Subprograms</a>
<a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a>	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	<a href="#">Session Settings Subprograms</a>
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a>	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	<a href="#">Session Settings and Session Settings Subprograms</a>
<a href="#">SET_WALLET Procedure</a>	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	<a href="#">Session Settings Subprograms</a>
<a href="#">WRITE_LINE Procedure</a>	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	<a href="#">HTTP Requests Subprograms</a>
<a href="#">WRITE_RAW Procedure</a>	Writes some binary data in the HTTP request body	<a href="#">HTTP Requests Subprograms</a>
<a href="#">WRITE_TEXT Procedure</a>	Writes some text data in the HTTP request body	<a href="#">HTTP Requests Subprograms</a>

## 256.9.1 ADD\_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL\_HTTP package's session state.

### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

## Syntax

```
UTL_HTTP.ADD_COOKIES (
 cookies IN cookie_table,
 request_context IN request_context_key DEFAULT NULL);
```

## Parameters

**Table 256-17 ADD\_COOKIES Procedure Parameters**

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

## Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

## 256.9.2 BEGIN\_REQUEST Function

This function begins a new HTTP request. UTL\_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@]host[:port]/[...]
```

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

## Syntax

```
UTL_HTTP.BEGIN_REQUEST (
 url IN VARCHAR2,
 method IN VARCHAR2 DEFAULT 'GET',
 http_version IN VARCHAR2 DEFAULT NULL,
 request_context IN request_context_key DEFAULT NULL,
 https_host IN VARCHAR2 DEFAULT NULL)
RETURN req;
```

## Parameters

**Table 256-18 BEGIN\_REQUEST Function Parameters**

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.
request_context	Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.
https_host	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

## Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the `UTL_URL` package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See [UTL\\_URL](#) for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- `BEGIN_REQUEST` can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the [GET\\_RESPONSE Function](#) will raise the `PROTOCOL_ERROR` exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r => req,
 name => 'Content-Type',
 value => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r => req,
 name => 'Content-Length',
```

```

 value => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r => req,
 data => 'pl = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
 (r => req);
...

```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the [SET\\_WALLET Procedure](#) procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

### 256.9.3 CLEAR\_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

#### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

#### Syntax

```

UTL_HTTP.CLEAR_COOKIES (
 request_context IN request_context_key DEFAULT NULL);

```

#### Parameters

**Table 256-19** CLEAR\_COOKIES Procedure Parameters

Parameter	Description
<code>request_context</code>	Request context to clear the cookies. If <code>NULL</code> , the cookies maintained in the <code>UTL_HTTP</code> package's session state will be cleared instead.

## 256.9.4 CLOSE\_PERSISTENT\_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

### See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

### Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
 conn IN connection);
```

### Parameters

**Table 256-20** CLOSE\_PERSISTENT\_CONN Procedure Parameters

Parameter	Description
<code>conn</code>	The HTTP persistent connection to close

## 256.9.5 CLOSE\_PERSISTENT\_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters `NULL`. If a particular parameter is set to `NULL` when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to `foobar`:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the `foobar` at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
 proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

**See Also:**

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

**Syntax**

```

UTL_HTTP.CLOSE_PERSISTENT_CONNS (
 host IN VARCHAR2 DEFAULT NULL,
 port IN PLS_INTEGER DEFAULT NULL,
 proxy_host IN VARCHAR2 DEFAULT NULL,
 proxy_port IN PLS_INTEGER DEFAULT NULL,
 ssl IN BOOLEAN DEFAULT NULL);

```

**Parameters****Table 256-21** CLOSE\_PERSISTENT\_CONNS Procedure Parameters

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

**Usage Notes**

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the CLOSE\_PERSISTENT\_CONN procedure that closes a specific persistent connection.

## 256.9.6 CREATE\_REQUEST\_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the

HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

### See Also:

[Request Context and HTTP Request Contexts Subprograms](#)

## Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 enable_cookies IN BOOLEAN DEFAULT TRUE,
 max_cookies IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

## Parameters

**Table 256-22 CREATE\_REQUEST\_CONTEXT Function Parameters**

Parameter	Description
wallet_path	Directory path that contains the Oracle wallet. The format is <i>file:directory-path</i>
wallet_password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the <i>Oracle Database Enterprise User Security Administrator's Guide</i> for detailed information about wallets.
enable_cookies	Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it.
max_cookies	Sets the maximum total number of cookies that will be maintained in this request context
max_cookies_per_site	Sets the maximum number of cookies per each Web site that will be maintained in this request context

## Return Values

The request context created.

## Examples

```
DECLARE
 request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
 req utl_http.req;
BEGIN
 request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
 wallet_path => 'file:/oracle/wallets/test_wallets',
 wallet_password => NULL,
 enable_cookies => TRUE,
 max_cookies => 300,
 max_cookies_per_site => 20);
 req := UTL_HTTP.BEGIN_REQUEST(
```

```

 url => 'http://www.example.com/',
 request_context => request_context);
END;
```

## 256.9.7 DESTROY\_REQUEST\_CONTEXT Procedure

This procedure destroys a request context in UTL\_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

### See Also:

[Request Context](#) and [HTTP Request Contexts Subprograms](#)

### Syntax

```

UTL_HTTP.DESTROY_REQUEST_CONTEXT (
 request_context request_context_key);
```

### Parameters

**Table 256-23 DESTROY\_REQUEST\_CONTEXT Procedure Parameters**

Parameter	Description
request_context	Request context to destroy

### Examples

```

DECLARE
 request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
 request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);
 ...
 UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

## 256.9.8 END\_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

**Syntax**

```
UTL_HTTP.END_REQUEST (
 r IN OUT NOCOPY req);
```

**Parameters****Table 256-24 END\_REQUEST Procedure Parameters**

Parameter	Description
r	The HTTP request

## 256.9.9 END\_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

**Syntax**

```
UTL_HTTP.END_RESPONSE (
 r IN OUT NOCOPY resp);
```

**Parameters****Table 256-25 END\_RESPONSE Procedure Parameters**

Parameter	Description
r	The HTTP response

## 256.9.10 GET\_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

**Syntax**

```
UTL_HTTP.GET_AUTHENTICATION(
 r IN OUT NOCOPY resp,
```

```
scheme OUT VARCHAR2,
realm OUT VARCHAR2,
for_proxy IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 256-26** GET\_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP response
scheme	The scheme for the required HTTP authentication
realm	The realm for the required HTTP authentication
for_proxy	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE

### Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET\_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET\_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

## 256.9.11 GET\_BODY\_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

#### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
 charset OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 256-27** GET\_BODY\_CHARSET Procedure Parameters

Parameter	Description
charset	The default character set of the body of all future HTTP requests

## 256.9.12 GET\_COOKIE\_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL\_HTTP package's session state.

### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

### Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (
 request_context IN request_context_key DEFAULT NULL)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 256-28 GET\_COOKIE\_COUNT Function Parameters**

Parameter	Description
request_context	Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.

## 256.9.13 GET\_COOKIE\_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
 enable OUT BOOLEAN,
 max_cookies OUT PLS_INTEGER,
 max_cookies_per_site OUT PLS_INTEGER);
```

### Parameters

**Table 256-29 GET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
enable	Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)

**Table 256-29 (Cont.) GET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
max_cookies	Indicates the maximum total number of cookies maintained in the current session
max_cookies_per_site	Indicates the maximum number of cookies maintained in the current session for each Web site

## 256.9.14 GET\_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL\_HTTP package's session state.

### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

### Syntax

```
UTL_HTTP.GET_COOKIES (
 cookies IN OUT NOCOPY cookie_table,
 request_context IN request_context_key DEFAULT NULL);
```

### Parameters

**Table 256-30 GET\_COOKIES Function Parameters**

Parameter	Description
cookies	The cookies returned
request_context	Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.

## 256.9.15 GET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure checks if the UTL\_HTTP package will raise a detailed exception or not.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
 enable OUT BOOLEAN);
```

## Parameters

**Table 256-31 GET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters**

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

## 256.9.16 GET\_DETAILED\_SQLCODE Function

This function retrieves the detailed `SQLCODE` of the last exception raised.

 **See Also:**  
[Error Conditions](#) and [Error Conditions Subprograms](#)

### Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```

## 256.9.17 GET\_DETAILED\_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

 **See Also:**  
[Error Conditions](#) and [Error Conditions Subprograms](#)

### Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```

## 256.9.18 GET\_FOLLOW\_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

 **See Also:**  
[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (
 max_redirects OUT PLS_INTEGER);
```

## Parameters

**Table 256-32 GET\_FOLLOW\_REDIRECT Procedure Parameters**

Parameter	Description
max_redirects	The maximum number of redirections for all future HTTP requests

## 256.9.19 GET\_HEADER Procedure

This procedure returns the  $n^{\text{th}}$  HTTP response header name and value returned in the response.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

## Syntax

```
UTL_HTTP.GET_HEADER (
 r IN OUT NOCOPY resp,
 n IN PLS_INTEGER,
 name OUT NOCOPY VARCHAR2,
 value OUT NOCOPY VARCHAR2);
```

## Parameters

**Table 256-33 GET\_HEADER Procedure Parameters**

Parameter	Description
r	The HTTP response
n	The $n^{\text{th}}$ header to return
name	The name of the HTTP response header
value	The value of the HTTP response header

## Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 256.9.20 GET\_HEADER\_BY\_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
 r IN OUT NOCOPY resp,
 name IN VARCHAR2,
 value OUT NOCOPY VARCHAR2,
 n IN PLS_INTEGER DEFAULT 1);
```

### Parameters

**Table 256-34** GET\_HEADER\_BY\_NAME Procedure Parameters

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The $n^{\text{th}}$ occurrence of an HTTP response header by the specified name to return. The default is 1.

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 256.9.21 GET\_HEADER\_COUNT Function

This function returns the number of HTTP response headers returned in the response.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.GET_HEADER_COUNT (
 r IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

### Parameters

**Table 256-35 GET\_HEADER\_COUNT Function Parameters**

Parameter	Description
r	The HTTP response

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 256.9.22 GET\_PERSISTENT\_CONN\_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

### See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

### Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## 256.9.23 GET\_PERSISTENT\_CONN\_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
 enable OUT BOOLEAN,
 max_conns OUT PLS_INTEGER);
```

### Parameters

**Table 256-36 GET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters**

Parameter	Description
enable	TRUE if persistent connection support is enabled; otherwise FALSE
max_conns	the maximum number of persistent connections maintained in the current session

## 256.9.24 GET\_PERSISTENT\_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

### See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

### Syntax

```
UTL_HTTP.get_persistent_conns (
 connections IN OUT NOCOPY connection_table);
```

### Parameters

**Table 256-37 GET\_PERSISTENT\_CONNS Procedure Parameters**

Parameter	Description
connections	The network connections kept persistent

## Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## 256.9.25 GET\_PROXY Procedure

This procedure retrieves the current proxy settings.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

```
UTL_HTTP.GET_PROXY (
 proxy OUT NOCOPY VARCHAR2,
 no_proxy_domains OUT NOCOPY VARCHAR2);
```

## Parameters

**Table 256-38 GET\_PROXY Procedure Parameters**

Parameter	Description
proxy	The proxy (host and an optional port number) currently used by the UTL_HTTP package
no_proxy_domains	The list of hosts and domains for which no proxy is used for all requests

## 256.9.26 GET\_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

## Syntax

```
UTL_HTTP.GET_RESPONSE (
 r IN OUT NOCOPY req,
```

```

 return_info_response IN BOOLEAN DEFAULT FALSE)
RETURN resp;

```

## Parameters

**Table 256-39 GET\_RESPONSE Function Parameters**

Parameter	Description
r	The HTTP response
return_info_response	Return 100 informational response or not. <ul style="list-style-type: none"> <li>TRUE means <code>get_response</code> should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned.</li> <li>FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.</li> </ul>

## Exceptions

- When detailed-exception is disabled:
  - ORA-29273 `REQUEST_FAILED` - the request fails to execute. Use the [GET\\_DETAILED\\_EXCP\\_SUPPORT Procedure](#) and the [GET\\_DETAILED\\_SQLERRM Function](#) to get the detailed error message.
- When detailed-exception is enabled:
  - ORA-29261 `BAD_ARGUMENT` - some arguments passed are not valid
- When response error check is enabled:
  - ORA-29268 `HTTP_CLIENT_ERROR` - the response code is in 400 range
  - ORA-29269 `HTTP_SERVER_ERROR` - the response code is in 500 range

## Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the [END\\_REQUEST Procedure](#).
- If URL redirection occurs, the URL and method fields in the `req` record will be updated to the last redirected URL and the method used to access the URL.

## Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to `GET_RESPONSE` to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to `GET_RESPONSE` to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional `EXPECT: 100-CONTINUE` request header, and check for 100 CONTINUE response from

the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```

DECLARE
 data VARCHAR2(1024) := '...';
 req utl_http.req;
 resp utl_http.resp;
BEGIN

 req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
 utl_http.set_header(req, 'Content-Length', length(data));
 -- Ask HTTP server to return "100 Continue" response
 utl_http.set_header(req, 'Expect', '100-continue');
 resp := utl_http.get_response(req, TRUE);

 -- Check for and dispose "100 Continue" response
 IF (resp.status_code <> 100) THEN
 utl_http.end_response(resp);
 raise_application_error(20000, 'Request rejected');
 END IF;
 utl_http.end_response(resp);

 -- Now, send the request body
 utl_http.write_text(req, data);

 -- Get the regular response
 resp := utl_http.get_response(req);
 utl_http.read_text(resp, data);

 utl_http.end_response(resp);

END;
```

## 256.9.27 GET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure checks if the response error check is set or not.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```

UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
 enable OUT BOOLEAN);
```

### Parameters

**Table 256-40** GET\_RESPONSE\_ERROR\_CHECK Procedure Parameters

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

## 256.9.28 GET\_TRANSFER\_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
 timeout OUT PLS_INTEGER);
```

### Parameters

**Table 256-41 GET\_TRANSFER\_TIMEOUT Procedure Parameters**

Parameter	Description
timeout	The network transfer timeout value in seconds

## 256.9.29 READ\_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of `UTL_TCP`. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.READ_LINE(
 r IN OUT NOCOPY resp,
 data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
 remove_crlf IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 256-42 READ\_LINE Procedure Parameters**

Parameter	Description
r	The HTTP response

**Table 256-42 (Cont.) READ\_LINE Procedure Parameters**

Parameter	Description
data	The HTTP response body in text form
remove_crlf	Removes the newline characters if set to TRUE

**Usage Notes**

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## 256.9.30 READ\_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached.

**See Also:**

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

**Syntax**

```
UTL_HTTP.READ_RAW(
 r IN OUT NOCOPY resp,
```

```
data OUT NOCOPY RAW,
len IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 256-43 READ\_RAW Procedure Parameters**

Parameter	Description
r	The HTTP response
data	The HTTP response body in binary form
len	The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL

## Usage Notes

The UTL\_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read\_raw waits for each data packet to be ready to read until timeout occurs. If it occurs, read\_raw stops reading and returns all the data read successfully. If no data is read successfully, the transfer\_timeout exception is raised. The exception can be handled and the read operation can be retried later.

## 256.9.31 READ\_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The end\_of\_body exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

## Syntax

```
UTL_HTTP.READ_TEXT(
r IN OUT NOCOPY resp,
data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
len IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 256-44 READ\_TEXT Procedure Parameters**

Parameter	Description
<code>r</code>	The HTTP response
<code>data</code>	The HTTP response body in text form
<code>len</code>	The maximum number of characters of data to read. If <code>len</code> is NULL, this procedure will read as much input as possible to fill the buffer allocated in <code>data</code> . The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL.

## Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## 256.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

**See Also:**

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

**Syntax**

```
UTL_HTTP.REQUEST (
 url IN VARCHAR2,
 proxy IN VARCHAR2 DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 https_host IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Pragmas**

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

**Parameters**

**Table 256-45 REQUEST Function Parameters**

Parameter	Description
url	Uniform resource locator
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet
https_host	A string representing the host name. If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI). If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request. If NULL, the host name in the given URL will be used for SNI.

## Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

## Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

## Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL\_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function SET\_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document: http://home.nothing.comm.
<P>
Reason: Can't locate remote host: home.nothing.comm.
<P>
<P><HR>
<ADDRESS>
CERN-HTTPD3.0A</ADDRESS>
</BODY>
</HTML>
```

## Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com')
FROM DUAL;
```

## 256.9.33 REQUEST\_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

### See Also:

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

### Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
 url IN VARCHAR2,
 max_pieces IN NATURAL DEFAULT 32767,
 proxy IN VARCHAR2 DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 https_host IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 256-46 REQUEST\_PIECES Function Parameters**

Parameter	Description
url	Uniform resource locator
max_pieces	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.

**Table 256-46 (Cont.) REQUEST\_PIECES Function Parameters**

Parameter	Description
wallet_path	<p>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request.</p> <p>The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</p> <p>See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</p>
wallet_password	(Optional) Specifies the password required to open the wallet
https_host	<p>A string representing the host name.</p> <p>If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI).</p> <p>If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request.</p> <p>If NULL, the host name in the given URL will be used for SNI.</p>

### Return Values

REQUEST\_PIECES returns a PL/SQL table of type UTL\_HTTP.HTML\_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST\_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

### Exceptions

INIT\_FAILED  
REQUEST\_FAILED

### Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL\_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET\_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```

<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document: http://home.nothing.comm.
<P>
Reason: Can't locate remote host: home.nothing.comm.
<P>
<P><HR>
<ADDRESS>
CERN-HTTPD3.0A</ADDRESS>
</BODY>
</HTML>

```

## Examples

```

SET SERVEROUTPUT ON

DECLARE
 x UTL_HTTP.HTML_PIECES;
 len PLS_INTEGER;
BEGIN
 x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
 DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
 DBMS_OUTPUT.PUT_LINE('with total length ');
 IF x.count < 1 THEN
 DBMS_OUTPUT.PUT_LINE('0 ');
 ELSE
 len := 0;
 FOR i in 1..x.count LOOP
 len := len + length(x(i));
 END LOOP;
 DBMS_OUTPUT.PUT_LINE(len);
 END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687

```

## 256.9.34 SET\_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```

UTL_HTTP.SET_AUTHENTICATION(
 r IN OUT NOCOPY req,

```

```

username IN VARCHAR2,
password IN VARCHAR2,
scheme IN VARCHAR2 DEFAULT 'Basic',
for_proxy IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 256-47 SET\_AUTHENTICATION Procedure Parameters**

Parameter	Description
r	HTTP request
username	Username for the HTTP authentication
password	Password for the HTTP authentication
scheme	HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> .
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .

## Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

## 256.9.35 SET\_AUTHENTICATION\_FROM\_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

### See Also:

[External Password Store](#) on [Oracle Database](#), and [HTTP Requests Subprograms](#)

## Syntax

```

UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
 r IN OUT NOCOPY req,
 alias IN VARCHAR2,
 scheme IN VARCHAR2 DEFAULT 'Basic',
 for_proxy IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 256-48 SET\_AUTHENTICATION\_FROM\_WALLET Procedure Parameters**

Parameter	Description
r	The HTTP request

**Table 256-48 (Cont.) SET\_AUTHENTICATION\_FROM\_WALLET Procedure Parameters**

Parameter	Description
alias	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
scheme	HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.

**Usage Notes**

- To use the password credentials in a wallet, the UTL\_HTTP user must have the use-passwords privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

**Examples****Creating a wallet and entering username and password in the wallet**

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: *****
Enter password again: *****
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: *****
```

**Granting the use-passwords privilege on the wallet to a user by the database administrator**

```
BEGIN
 DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
 acl => 'wallet-acl.xml',
 description => 'Wallet ACL',
 principal => 'SCOTT',
 is_grant => TRUE,
 privilege => 'use-passwords');
 DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
 acl => 'wallet-acl.xml',
 wallet_path => 'file: /oracle/wallets/test_wallet');
END;
```

**Using username and password from the wallet**

```
DECLARE
 req UTL_HTTP.req;
BEGIN
 UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
 req := UTL_HTTP.BEGIN_REQUEST(...);
 UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
```

```
...
END;
```

## 256.9.36 SET\_BODY\_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

### See Also:

- [HTTP Responses](#) and [HTTP Responses Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to ISO-8859-1. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
 charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
 r IN OUT NOCOPY req,
 charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
 r IN OUT NOCOPY resp,
 charset IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 256-49 SET\_BODY\_CHARSET Procedure Parameters**

Parameter	Description
r	The HTTP response.
charset	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If charset is NULL, the database character set is assumed.

## 256.9.37 SET\_COOKIE\_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

### See Also:

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
 r IN OUT NOCOPY REQ,
 enable IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
 enable IN BOOLEAN,
 max_cookies IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

## Parameters

**Table 256-50 SET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
r	The HTTP request
enable	Set enable to TRUE to enable HTTP cookie support; FALSE to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session

**Table 256-50 (Cont.) SET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
<code>max_cookies_per_site</code>	Sets the maximum number of cookies maintained in the current session for each Web site

### Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "[Examples](#)" for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

## 256.9.38 SET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLERRM` for more detailed information about the error.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
 enable IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 256-51 SET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters**

Parameter	Description
enable	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

## 256.9.39 SET\_FOLLOW\_REDIRECT Procedures

This procedure sets the maximum number of times UTL\_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET\_RESPONSE function.

### See Also:

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
 max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
 r IN OUT NOCOPY req,
 max_redirects IN PLS_INTEGER DEFAULT 3);
```

### Parameters

**Table 256-52 SET\_FOLLOW\_REDIRECT Procedure Parameters**

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

## Usage Notes

If `max_redirects` is set to a positive number, the [GET\\_RESPONSE Function](#) will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the `REQ` record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The `SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.

## 256.9.40 SET\_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

## Syntax

```
UTL_HTTP.SET_HEADER (
 r IN OUT NOCOPY req,
 name IN VARCHAR2,
 value IN VARCHAR2);
```

## Parameters

**Table 256-53 SET\_HEADER Procedure Parameters**

Parameter	Description
<code>r</code>	The HTTP request
<code>name</code>	The name of the HTTP request header
<code>value</code>	The value of the HTTP request header

## Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL\_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL\_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET\_BODY\_CHARSET procedure.

When you set the Transfer-Encoding header with the value chunked, UTL\_HTTP automatically encodes the request body written by the WRITE\_TEXT, WRITE\_LINE and WRITE\_RAW procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

## 256.9.41 SET\_PERSISTENT\_CONN\_SUPPORT Procedure

This overloaded procedure provides persistent connection support. Descriptions of the different functionality are given in the syntax declarations.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

## Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
 enable IN BOOLEAN DEFAULT FALSE,
 max_conns IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
 r IN OUT NOCOPY req,
 enable IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 256-54 SET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters**

Parameter	Description
enable	TRUE to keep the network connection persistent. FALSE otherwise.

**Table 256-54 (Cont.) SET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters**

Parameter	Description
maximum_conns	Maximum number of connections
r	The HTTP request

### Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL\_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "[Examples](#)".

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the maximum\_conns parameter prior to calling the [BEGIN\\_REQUEST Function](#), otherwise persistent connections will not be enabled for the current request even if the other form of SET\_PERSISTENT\_CONN\_SUPPORT is called.

### Examples

Using SET\_PERSISTENT\_CONN\_SUPPORT in http requests at the session level, showing the active persistent connection after each request

```

DECLARE
 pieces utl_http.html_pieces;
 conns utl_http.connection_table;
BEGIN

 -- Turns on persistent connection support for the request_pieces call.
 utl_http.set_persistent_conn_support(true, 1);

 FOR i IN 1..10 LOOP

 pieces := utl_http.request_pieces('http://www.example.com/');

 -- Shows the active persistent connection
 utl_http.get_persistent_conns(conns);
 FOR j IN 1..conns.count LOOP
 dbms_output.put_line('Persistent connection '||j||': '||
conns(j).host||':'||conns(j).port);
 END LOOP;

 END LOOP;

 -- Turns off persistent connection support. Set active max persistent
connection to 0 to close all active connections.
 utl_http.set_persistent_conn_support(false, 0);

END;
/

```

Using SET\_PERSISTENT\_CONN\_SUPPORT in HTTP requests showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

```

DECLARE
-- Table to store the URLs
TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
paths VC2_TABLE;

PROCEDURE fetch_pages(paths IN vc2_table) AS
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 data VARCHAR2(1024);

BEGIN

 -- Set the proxy server
 UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

 FOR i IN 1..paths.count LOOP

 req := UTL_HTTP.BEGIN_REQUEST(paths(i));

 -- Use persistent connections except for the last request
 IF (i < paths.count) THEN
 -- Use a persistent connection for the current request
 UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
 END IF;

 resp := UTL_HTTP.GET_RESPONSE(req);

 -- Display the results of the response

```

```

DBMS_OUTPUT.PUT_LINE('-');
DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code: ' || resp.status_code);
DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
DBMS_OUTPUT.PUT_LINE('HTTP Response Version: ' || resp.http_version);

BEGIN
 LOOP
 UTL_HTTP.READ_TEXT(resp, data);
 -- do something with the data
 END LOOP;
EXCEPTION
 WHEN UTL_HTTP.END_OF_BODY THEN
 NULL;
END;
UTL_HTTP.END_RESPONSE(resp);
END LOOP;
END;

BEGIN
-- Set a maximum of 1 persistent connection, but start with persistent
connections
-- off
 UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

 -- Create a list of URLs
 paths(1) := 'http://www.example.com/technetwork/index.html';
 paths(2) := 'http://www.example.com/us/products/index.html';

 fetch_pages(paths);
END;
/

```

## 256.9.42 SET\_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`.

`no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```

UTL_HTTP.SET_PROXY (
 proxy IN VARCHAR2,
 no_proxy_domains IN VARCHAR2);

```

## Parameters

**Table 256-55 SET\_PROXY Procedure Parameters**

Parameter	Description
proxy	The proxy (host and an optional port number) to be used by the UTL_HTTP package
no_proxy_domains	The list of hosts and domains for which no proxy should be used for all requests

## Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com, eng.my-company.com:80`. When `no_proxy_domains` is NULL and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL\_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

## 256.9.43 SET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.

For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
 enable IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 256-56 SET\_RESPONSE\_ERROR\_CHECK Procedure Parameters**

Parameter	Description
enable	TRUE to check for response errors; otherwise FALSE

## Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`.

## 256.9.44 SET\_TRANSFER\_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the `UTL_HTTP` package should attempt while reading the HTTP response from the Web server or proxy server.

This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (
 timeout IN PLS_INTEGER DEFAULT 60);
```

## Parameters

**Table 256-57 SET\_TRANSFER\_TIMEOUT Procedure Parameters**

Parameter	Description
timeout	The network transfer timeout value in seconds.

## Usage Notes

The default value of the time out is 60 seconds.

## 256.9.45 SET\_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS.

When the `UTL_HTTP` package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the `UTL_HTTP` package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the `UTL_HTTP` package. An Oracle wallet is required to make an HTTPS request.

### See Also:

- [Session Settings](#) and [Session Settings Subprograms](#)
- *Oracle Database Security Guide* managing fine-grained access

### Syntax

```
UTL_HTTP.SET_WALLET (
 path IN VARCHAR2,
 password IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 256-58 SET\_WALLET Procedure Parameters**

Parameter	Description
<code>path</code>	The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code> .  The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code> , and in Unix is, for example, <code>file:/home/username/wallets</code> . When the <code>UTL_HTTP</code> package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.
<code>password</code>	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to <code>NULL</code> . See <i>Oracle Database Advanced Security Guide</i> for information about using Oracle Wallet Manager and the <code>ORAPKI</code> utility to create an auto-login wallet.

### Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root

certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

 **See Also:**

*Oracle Database Advanced Security Guide* for more information on Wallet Manager

## 256.9.46 WRITE\_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`).

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

 **See Also:**

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```
UTL_HTTP.WRITE_LINE(
 r IN OUT NOCOPY req,
 data IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 256-59** WRITE\_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

## 256.9.47 WRITE\_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```
UTL_HTTP.WRITE_RAW(
 r IN OUT NOCOPY REQ,
 data IN RAW);
```

### Parameters

**Table 256-60** WRITE\_RAW Procedure Parameters

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

## 256.9.48 WRITE\_TEXT Procedure

This procedure writes some text data in the HTTP request body.

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```
UTL_HTTP.WRITE_TEXT(
 r IN OUT NOCOPY REQ,
 data IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 256-61** WRITE\_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

# UTL\_I18N

UTL\_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

## See Also:

*Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of UTL\\_I18N Subprograms](#)

## 257.1 UTL\_I18N Overview

UTL\_I18N services provide additional globalization functionality for applications written in PL/SQL.

The UTL\_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.

- A function that returns a listing of the most commonly used time zones.

## 257.2 UTL\_I18N Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default

## 257.3 UTL\_I18N Constants

`UTL_I18N` defines constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 257-1 UTL\_I18N Constants**

Constant	Type	Value	Description
<code>GENERIC_CONTEXT</code>	<code>PLS_INTEGER</code>	0	Returns the default character set for general cases.
<code>MAIL_GENERIC</code>	<code>PLS_INTEGER</code>	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
<code>ORACLE_TO_IANA</code>	<code>PLS_INTEGER</code>	0	Map from an Oracle character set name to an IANA character set name.
<code>SHIFT_IN</code>	<code>PLS_INTEGER</code>	0	Used with <code>shift_status</code> . Must be set the first time it is called in piecewise conversion.
<code>IANA_TO_ORACLE</code>	<code>PLS_INTEGER</code>	1	Map from an IANA character set name to an Oracle character set name.
<code>MAIL_CONTEXT</code>	<code>PLS_INTEGER</code>	1	The mapping is between an Oracle character set name and an email safe character set name.
<code>MAIL_WINDOWS</code>	<code>PLS_INTEGER</code>	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
<code>SHIFT_OUT</code>	<code>PLS_INTEGER</code>	1	
<code>FWKATAKANA_HIRAGANA</code>	<code>VARCHAR2(30)</code>	<code>'fwkatakana_hiragana'</code>	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
<code>FWKATAKANA_HWKATAKANA</code>	<code>VARCHAR2(30)</code>	<code>'fwkatakana_hwkatakana'</code>	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
<code>HIRAGANA_FWKATAKANA</code>	<code>VARCHAR2(30)</code>	<code>'hiragana_fwkatakana'</code>	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.

**Table 257-1 (Cont.) UTL\_I18N Constants**

Constant	Type	Value	Description
HIRAGANA_HWKATA KANA	VARCHAR2(30)	'hiragana_hwka takana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKA TAKANA	VARCHAR2(30)	'hwkatakana_fw katakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRA GANA	VARCHAR2(30)	'hwkatakana_hi ragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2(30)	'kana_fwkatata na'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2(30)	'kana_hiragana '	Converts any type of Kana character to a fullwidth Hiragana character.
KANA_HWKATAKANA	VARCHAR2(30)	'kana_hwkatata na'	Converts any type of Kana character to a halfwidth Katakana character.

## 257.4 Summary of UTL\_I18N Subprograms

This table lists the UTL\_I18N subprograms and briefly describes them.

**Table 257-2 UTL\_I18N Package Subprograms**

Procedure	Description
<a href="#">ESCAPE_REFERENCE</a> Function	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
<a href="#">GET_COMMON_TIME_ZONES</a> Function	Returns the list of common time zone IDs that are independent of the locales.
<a href="#">GET_DEFAULT_CHARSET</a> Function	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
<a href="#">GET_DEFAULT_ISO_CURRENCY</a> Function	Returns the default ISO 4217 currency code for the specified territory.
<a href="#">GET_DEFAULT_LINGUISTIC_SORT</a> Function	Returns the default linguistic sort name for the specified language.
<a href="#">GET_LOCAL_LANGUAGES</a> Function	Returns the local language names for the specified territory.
<a href="#">GET_LOCAL_LINGUISTIC_SORTS</a> Function	Returns the local linguistic sort names for the specified language.
<a href="#">GET_LOCAL_TERRITORIES</a> Function	Returns the local territory names for the specified language.
<a href="#">GET_LOCAL_TIME_ZONES</a> Function	Returns the local time zone IDs for the specified territory.

Table 257-2 (Cont.) UTL\_I18N Package Subprograms

Procedure	Description
<a href="#">GET_MAX_CHARACTER_SIZE Function</a>	Returns the maximum character size of a given character set.
<a href="#">GET_TRANSLATION Function</a>	Returns the translation of the language and territory name in the specified translation language.
<a href="#">MAP_CHARSET Function</a>	<ul style="list-style-type: none"> <li>Maps an Oracle character set name to an IANA character set name.</li> <li>Maps an IANA character set name to an Oracle character set name.</li> <li>Maps an Oracle character set name to an e-mail safe character set name.</li> </ul>
<a href="#">MAP_FROM_SHORT_LANGUAGE Function</a>	Maps an Oracle short language name to an Oracle language name.
<a href="#">MAP_LANGUAGE_FROM_ISO Function</a>	Returns an Oracle language name from an ISO locale name.
<a href="#">MAP_LOCALE_TO_ISO Function</a>	Returns an ISO locale name from the Oracle language and territory name.
<a href="#">MAP_TERRITORY_FROM_ISO Function</a>	Returns an Oracle territory name from an ISO locale name.
<a href="#">MAP_TO_SHORT_LANGUAGE Function</a>	Maps an Oracle language name to an Oracle short language name.
<a href="#">RAW_TO_CHAR Functions</a>	Converts RAW data that is not encoded in the database character set into a VARCHAR2 string
<a href="#">RAW_TO_NCHAR Functions</a>	Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string
<a href="#">STRING_TO_RAW Function</a>	Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.
<a href="#">TRANSLITERATE Function</a>	Transliterates between Japanese hiragana and katakana.
<a href="#">UNESCAPE_REFERENCE Function</a>	Converts an input string that contains character references to a text string.
<a href="#">VALIDATE_CHARACTER_ENCODING Function</a>	Validates the character encoding of VARCHAR2, NVARCHAR2, CLOB, and NCLOB data.

## 257.4.1 ESCAPE\_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document.

Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `&#xe5;` is the numeric character reference for the small letter "a" with a ring above, whereas `&aring;` is the character entity reference for the same character. Character entity references are also used to escape special characters, as

an example, `&lt;` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

### Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
 str IN VARCHAR2 CHARACTER SET ANY_CS,
 page_cs_name IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 257-3 ESCAPE\_REFERENCE Function Parameters**

Parameter	Description
<code>str</code>	Specifies the input string
<code>page_cs_name</code>	Specifies the character set of the document. If <code>page_cs_name</code> is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

### Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

### Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < ' || chr(229), 'us7ascii')
```

This returns 'hello &lt; &#xe5;'.

## 257.4.2 GET\_COMMON\_TIME\_ZONES Function

This function returns a listing of the most coemmonly used time zones. This list contains a subset of the time zones that are supported in the database.

### Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES
RETURN STRING_ARRAY;
```

### Examples

Returns the list of the most commonly used time zones.

```
DECLARE
 retval UTL_I18N.STRING_ARRAY;
BEGIN
 retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
```

## 257.4.3 GET\_DEFAULT\_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

### See Also:

"[MAP\\_CHARSET Function](#)" for an explanation of an e-mail safe character set

### Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
 language IN VARCHAR2,
 context IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
 iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 257-4 GET\_DEFAULT\_CHARSET Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language
context	GENERIC_CONTEXT   MAIL_CONTEXT GENERIC_CONTEXT: Returns the default character set for general cases MAIL_CONTEXT: Returns the default e-mail safe character set name
iswindows	If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE. iswindows has no effect if context is set as GENERIC_CONTEXT.

### Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

### Examples

GENERIC\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL\_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

## 257.4.4 GET\_DEFAULT\_ISO\_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

### Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
 territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 257-5 GET\_DEFAULT\_ISO\_CURRENCY Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

### Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

### Examples

Displays the default ISO currency code for China.

```
DECLARE
 retval VARCHAR2(50);
BEGIN
 retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
 DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

## 257.4.5 GET\_DEFAULT\_LINGUISTIC\_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

### Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 257-6 GET\_DEFAULT\_LINGUISTIC\_SORT Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

## Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

## Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```

DECLARE
 retval VARCHAR2(50);
BEGIN
 SELECT value INTO retval FROM nls_database_parameters
 WHERE parameter = 'NLS_LANGUAGE';
 retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
 DBMS_OUTPUT.PUT_LINE(retval);
END;
/

```

## 257.4.6 GET\_LOCAL\_LANGUAGES Function

This function returns the local language names for the specified territory.

### Syntax

```

UTL_I18N.GET_LOCAL_LANGUAGES (
 territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;

```

### Parameters

**Table 257-7 GET\_LOCAL\_LANGUAGES Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

### Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

### Examples

Returns the list of local languages used in Belgium.

```

DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
 DBMS_OUTPUT.PUT('Count = ');
 DBMS_OUTPUT.PUT_LINE(retval.LAST);
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;

```

```

/
...
Count = 2
DUTCH
FRENCH

```

## 257.4.7 GET\_LOCAL\_LINGUISTIC\_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A BINARY sort is included for all languages.

### Syntax

```

UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;

```

### Parameters

**Table 257-8 GET\_LOCAL\_LINGUISTIC\_SORTS Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Displays the local linguistic sort names for JAPANESE.

```

DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
 DBMS_OUTPUT.PUT('Count = ');
 DBMS_OUTPUT.PUT_LINE(retval.COUNT);
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY

```

## 257.4.8 GET\_LOCAL\_TERRITORIES Function

This function returns the local territory names for the specified language.

### Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

### Parameters

**Table 257-9 GET\_LOCAL\_TERRITORIES Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 retval := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');
 DBMS_OUTPUT.PUT('Count = ');
 DBMS_OUTPUT.PUT_LINE(retval.LAST);
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

## 257.4.9 GET\_LOCAL\_TIME\_ZONES Function

This function returns the local time zone IDs for the specified territory.

### Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
 territory IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

## Parameters

**Table 257-10 GET\_LOCAL\_TIME\_ZONES Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

## Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

## Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
 retval utl_i18n.string_array;
 retval2 utl_i18n.string_array;
 stpos INTEGER;
BEGIN
 retval := utl_i18n.get_local_time_zones(
 territory);
 retval2 := utl_i18n.get_common_time_zones;
 stpos := retval.LAST + 1;
 retval(stpos) := '-----'; -- a separator
 FOR i IN retval2.FIRST..retval2.LAST LOOP
 stpos := stpos + 1;
 retval(stpos) := retval2(i);
 END LOOP;
 RETURN retval;
END;
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 DBMS_OUTPUT.ENABLE(100000);
 retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;
```

Asia/Baku  
-----

```
Pacific/Pago_Pago
Pacific/Honolulu
America/Anchorage
America/Vancouver
America/Los_Angeles
America/Tijuana
America/Edmonton
America/Denver
America/Phoenix
America/Mazatlan
America/Winnipeg
America/Regina
America/Chicago
America/Mexico_City
America/Guatemala
America/El_Salvador
America/Managua
America/Costa_Rica
America/Montreal
...
```

## 257.4.10 GET\_MAX\_CHARACTER\_SIZE Function

This function returns the maximum character size of a given character set.

### Syntax

```
UTL_I18N.GET_MAX_CHARACTER_SIZE(
 charset_name IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

### Parameters

**Table 257-11 GET\_MAX\_CHARACTER\_SIZE Function Parameters**

Parameter	Description
charset_name	Specifies a valid character set name. It is case-insensitive.

### Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

### Examples

```
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');
```

This returns 4.

## 257.4.11 GET\_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

### Syntax

```
UTL_I18N.GET_TRANSLATION (
 parameter IN VARCHAR2 CHARACTER SET ANY_CS,
 trans_language IN VARCHAR2 'AMERICAN',
 flag IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

### Parameters

**Table 257-12 GET\_TRANSLATION Function Parameters**

Parameter	Description
parameter	Specifies a valid language name, territory name, or a combined string in the form of <i>language_territory</i> . It is case-insensitive.
trans_language	Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.
flag	Specifies the translation type: <ul style="list-style-type: none"> <li>LANGUAGE_TRANS: The function returns the language translation.</li> <li>TERRITORY_TRANS: The function returns the territory translation.</li> <li>LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation.</li> </ul> The default translation type is LANGUAGE_TRANS.

### Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

### Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
 CURSOR c1 IS
 SELECT value FROM V$NLS_VALID_VALUES
 WHERE parameter = 'LANGUAGE'
 ORDER BY value;
 retval NVARCHAR2(100);
BEGIN
 FOR item IN c1 LOOP
 retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
```

```

 END LOOP;
 END;

```

## 257.4.12 MAP\_CHARSET Function

This function maps a character set to another character set.

It maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

### Syntax

```

UTL_I18N.MAP_CHARSET(
 charset IN VARCHAR2,
 context IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
 flag IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;

```

### Parameters

**Table 257-13 MAP\_CHARSET Function Parameters**

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	<p>GENERIC_CONTEXT   MAIL_CONTEXT</p> <p>GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value.</p> <p>MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.</p>
flag	<ul style="list-style-type: none"> <li>• ORACLE_TO_IANA   IANA_TO_ORACLE if GENERIC_CONTEXT is set <p>ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default.</p> <p>IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name.</p> </li> <li>• MAIL_GENERIC   MAIL_WINDOWS if MAIL_CONTEXT is set <p>MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform.</p> <p>MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.</p> </li> </ul>

### Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the `MAP_CHARSET` function with the `ORACLE_TO_IANA` option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP\_CHARSET function with the MAIL\_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP\_CHARSET function with the MAIL\_CONTEXT | MAIL\_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP\_CHARSET function with the ORACLE\_TO\_IANA | GENERIC\_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

 **Note:**

Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

## Examples

### Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_ORACLE)
```

This returns 'WE8ISO8859P1'.

### Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

 **See Also:**

*Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

## 257.4.13 MAP\_FROM\_SHORT\_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

### Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 257-14** MAP\_FROM\_SHORT\_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table `customers` is from the `oe` user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the `GET_DEFAULT_LINGUISTIC_SORT` procedure.

```
DECLARE
 short_n VARCHAR2(10);
 ling_n VARCHAR2(50);
BEGIN
 SELECT nls_language INTO short
 FROM customers WHERE customer_id = 9000;
 ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
 UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
 DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

## 257.4.14 MAP\_LANGUAGE\_FROM\_ISO Function

This function returns an Oracle language name from an ISO locale name.

### Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
 isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 257-15** MAP\_LANGUAGE\_FROM\_ISO Function Parameters

Parameter	Description
isolocale	Specifies the ISO locale. The mapping is case-insensitive.

## Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, en\_ instead of en\_US), then the function returns the default language name for the specified language (for example, American).

## Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

 **See Also:**

*Oracle Database Globalization Support Guide* for a list of valid Oracle languages

## 257.4.15 MAP\_LOCALE\_TO\_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name.

A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

## Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
 ora_language IN VARCHAR2,
 ora_territory IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 257-16** MAP\_LOCALE\_TO\_ISO Function Parameters

Parameter	Description
ora_language	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

### Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

### Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en\_US'.

#### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

## 257.4.16 MAP\_TERRITORY\_FROM\_ISO Function

This function returns an Oracle territory name from an ISO locale.

### Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (
 isocale IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 257-17 MAP\_TERRITORY\_FROM\_ISO Function Parameters**

Parameter	Description
isocale	Specifies the ISO locale. The mapping is case-insensitive.

### Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, France).

### Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

#### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle territories

## 257.4.17 MAP\_TO\_SHORT\_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

### Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 257-18** MAP\_TO\_SHORT\_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Returns the short language name for the language.

```
DECLARE retval VARCHAR2(100);BEGIN retval :=
UTL_I18N.MAP_TO_SHORT_LANGUAGE('american'); DBMS_OUTPUT.PUT_LINE(retval);END; /US
```

## 257.4.18 RAW\_TO\_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

### Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL,
 scanned_length OUT PLS_INTEGER,
 shift_status IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

## Parameters

**Table 257-19 RAW\_TO\_CHAR Function Parameters**

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. <b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

## Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

## Examples

### Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde' || chr(170)
```

### Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde' || chr(170)
```

It also sets shf to SHIFT\_IN and slen to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection (remote_host => 'localhost',
```

```

remote_port => 2000);

LOOP
 tlen := utl_tcp.read_raw(conn, rvalue, 1024);
 rvalue := utl_raw.concat(rtemp, rvalue);
 nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
 if (converted_len < utl_raw.length(rvalue))
 then
 rtemp := utl_raw.substr(rvalue, converted_len+1);
 else
 rtemp := '';
 end if;
 /* do anything you want with nvalue */
 /* e.g http.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
 WHEN utl_tcp.end_of_input THEN
 utl_tcp.close_connection(conn);
END;
```

## 257.4.19 RAW\_TO\_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

### Syntax

Buffer Conversion:

```

UTL_I18N.RAW_TO_NCHAR (
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```

UTL_I18N.RAW_TO_NCHAR (
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL,
 scanned_length OUT PLS_INTEGER,
 shift_status IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

### Parameters

**Table 257-20 RAW\_TO\_NCHAR Function Parameters**

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned

**Table 257-20 (Cont.) RAW\_TO\_NCHAR Function Parameters**

Parameter	Description
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion.  <b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

### Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

### Examples

#### Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde' || chr(170)
```

#### Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde' || chr(170)
```

It also sets shf to SHIFT\_IN and slen to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection (remote_host => 'localhost',
 remote_port => 2000);

LOOP
 tlen := utl_tcp.read_raw(conn, rvalue, 1024);
 rvalue := utl_raw.concat(rtemp, rvalue);
 nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
 conversion_stat);
 if (converted_len < utl_raw.length(rvalue))
```

```

then
 rtemp := utl_raw.substr(rvalue, converted_len+1);
else
 rtemp := '';
end if;
/* do anything you want with nvalue */
/* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
WHEN utl_tcp.end_of_input THEN
 utl_tcp.close_connection(conn);
END;
```

## 257.4.20 STRING\_TO\_RAW Function

This function converts a `VARCHAR2` or `NVARCHAR2` string to another valid Oracle character set and returns the result as `RAW` data.

### Syntax

```

UTL_I18N.STRING_TO_RAW(
 data IN VARCHAR2 CHARACTER SET ANY_CS,
 dst_charset IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

### Parameters

**Table 257-21** STRING\_TO\_RAW Function Parameters

Parameter	Description
<code>data</code>	Specifies the <code>VARCHAR2</code> or <code>NVARCHAR2</code> string to convert.
<code>dst_charset</code>	Specifies the destination character set. If <code>dst_charset</code> is <code>NULL</code> , then the database character set is used for <code>CHAR</code> data and the national character set is used for <code>NCHAR</code> data.

### Usage Notes

If the user specifies an invalid character set, a `NULL` string, or a string whose length is 0, then the function returns a `NULL` string.

### Examples

```

DECLARE
 r raw(50);
 s varchar2(20);
BEGIN
 s:='abcdef' || chr(170);
 r:=utl_i18n.string_to_raw(s,'utf8');
 dbms_output.put_line(rawtohex(r));
end;
```

This returns a hex value of '616263646566C2AA'.

## 257.4.21 TRANSLITERATE Function

This function performs script transliteration. In this release, the `TRANSLITERATE` function only supports Japanese Kana conversion.

### Syntax

```
UTL_I18N.TRANSLITERATE (
 data IN VARCHAR2 CHARACTER SET ANY_CS,
 name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

### Parameters

**Table 257-22 TRANSLITERATE Function Parameters**

Parameter	Description
<code>data</code>	Specifies the data to be converted. Either <code>CHAR</code> or <code>NCHAR</code> datatype can be specified.
<code>name</code>	Specifies the transliteration name string. For a list of valid names, see <a href="#">Table 257-23</a> .

### Constants

These options specify Japanese Kana conversions.

**Table 257-23 TRANSLITERATE Function Constants**

Constant Name	Value	Description
<code>KANA_FWKATAKANA</code>	<code>'kana_fwkatkana'</code>	Converts any type of Kana character to a fullwidth Katakana character.
<code>KANA_HWKATAKANA</code>	<code>'kana_hwkatakana'</code>	Converts any type of Kana character to a halfwidth Katakana character.
<code>KANA_HIRAGANA</code>	<code>'kana_hiragana'</code>	Converts any type of Kana character to a fullwidth Hiragana character.
<code>FWKATAKANA_HWKAT AKANA</code>	<code>'fwkatakana_hwka takana'</code>	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
<code>FWKATAKANA_HIRAG ANA</code>	<code>'fwkatakana_hira gana'</code>	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
<code>HWKATAKANA_FWKAT AKANA</code>	<code>'hwkatakana_fwka takana'</code>	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
<code>HWKATAKANA_HIRAG ANA</code>	<code>'hwkatakana_hira gana'</code>	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
<code>HIRAGANA_FWKATAK ANA</code>	<code>'hiragana_fwkata kana'</code>	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
<code>HIRAGANA_HWKATAK ANA</code>	<code>'hiragana_hwkata kana'</code>	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

## Usage Notes

The function returns the converted string.

## Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
 SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

The following figure shows how this output might look.

**Figure 257-1 Loading Locale-Specific Data to the Database**

The diagram illustrates the process of normalizing a Japanese name. On the left, the name is shown in three forms: the katakana 'タナカ' (Tanaka), the hiragana 'たなか' (Tanaka), and the kanji '田中' (Tanaka). A downward-pointing arrow indicates the transformation from the katakana form to the hiragana form. On the right, the name is shown in three forms: the hiragana 'たなか' (Tanaka), the katakana 'タナカ' (Tanaka), and the kanji '田中' (Tanaka).

The following statement normalizes one kana name to hiragana:

```
DECLARE
 Name japanese_emp.ename%TYPE;
 Eno CONSTANT NUMBER(4) := 1;
BEGIN
 SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
 name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
 UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
 WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
 DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

## 257.4.22 UNESCAPE\_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

### See Also:

"[ESCAPE\\_REFERENCE Function](#)" for more information about escape sequences

**Syntax**

```

UTL_I18N.UNESCAPE_REFERENCE (
 str IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

```

**Parameters****Table 257-24 UNESCAPE\_REFERENCE Function Parameters**

Parameter	Description
str	Specifies the input string

**Usage Notes**

If the user specifies a NULL string or a string whose length is 0, then the function returns a NULL string. If the function fails, then it returns the original string.

**Examples**

```
UTL_I18N.UNESCAPE_REFERENCE('hello < å')
```

This returns 'hello <' || chr(229).

## 257.4.23 VALIDATE\_CHARACTER\_ENCODING Functions

This function validates the character encoding of VARCHAR2, NVARCHAR2, CLOB, and NCLOB data. The validation is based on the database character set for VARCHAR2 and CLOB data and national character set for NVARCHAR2 and NCLOB data.

For Unicode character sets, such as AL32UTF8, AL16UTF16, AL16UTF16LE, UTF8, and UTFE, any byte sequences mapped to the following Unicode code points are considered invalid:

- Unpaired surrogate code point
- Non-character code point

In addition, any irregular or illegal UTF-8 byte sequence is considered invalid for AL32UTF8 and UTF8 character sets.

The VALIDATE\_CHARACTER\_ENCODING function is overloaded. One function is for validating VARCHAR2 and NVARCHAR2 data, while the other function is for validating CLOB and NCLOB data.

- **Validating VARCHAR2 and NVARCHAR2 data**

A VARCHAR2 or NVARCHAR2 byte or its byte sequence is considered invalid for a character set, if it does not map to any of the characters defined in the character set.

- **Validating CLOB and NCLOB data**

A LOB character is considered invalid for a character set if a byte (in case of a single-byte database character set) or a byte pair (in case of UTF-16 encoding used with a multibyte database character set) corresponding to the encoding of

the LOB character does not map to any of the characters defined in the character set.

### Syntax

This function validates VARCHAR2 and NVARCHAR2 data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
 data IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

This function validates CLOB and NCLOB data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (
 lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

### Parameters

**Table 257-25 VALIDATE\_CHARACTER\_ENCODING Function Parameters**

Parameter	Description
data	VARCHAR2 or NVARCHAR2 data to validate.
lob_loc	CLOB or NCLOB data to validate.

### Usage Notes

This function returns the offset of the first invalid byte for the VARCHAR2 or NVARCHAR2 data. It returns the offset of the first invalid character for the CLOB or NCLOB data. It returns 0, if all the bytes in the character data are valid. It returns NULL, if the value of the parameter data or lob\_loc is NULL.

### Examples

This example validates the character encoding of NVARCHAR2 and CLOB data where the database character set is AL32UTF8 while the national character set is AL16UTF16.

```
CREATE TABLE temp(col1 NVARCHAR2(20), col2 CLOB);
INSERT INTO temp VALUES(UNISTR('foo\D800bar'), UNISTR('foo\D800bar'));
COMMIT;
SELECT UTL_I18N.VALIDATE_CHARACTER_ENCODING(col1) invalid_offset_column1,
 UTL_I18N.VALIDATE_CHARACTER_ENCODING(col2) invalid_offset_column2
FROM temp;
```

The query returns:

```
INVALID_OFFSET_COLUMN1 INVALID_OFFSET_COLUMN2

 7 4
```

Here, the surrogate code point U+D800 is invalid. The number 7 is returned as INVALID\_OFFSET\_COLUMN1, because for col1, 'foo' is encoded in 6 bytes in NVARCHAR2 and the invalid code point U+D800 starts at offset 7. The number 4 is returned as INVALID\_OFFSET\_COLUMN2, because for col2, 'foo' is encoded in 3 UTF-16 code points in CLOB and the invalid code point U+D800 starts at offset 4.

# 258

## UTL\_IDENT

The UTL\_IDENT package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)

### 258.1 UTL\_IDENT Overview

The UTL\_IDENT package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

### 258.2 UTL\_IDENT Security Model

The UTL\_IDENT package runs as the package owner SYS. The public synonym UTL\_IDENT, and EXECUTE permission on this package is granted to PUBLIC.

### 258.3 UTL\_IDENT Constants

The UTL\_IDENT package defines several constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 258-1 UTL\_IDENT Constants**

Constant	Type	Value	Description
IS_ORACLE_SERVER	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Server or not
IS_ORACLE_CLIENT	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Client or not
IS_TIMESTEN	BOOLEAN	TRUE/FALSE	Stipulates if TimesTen or not
IS_ORACLE_FORMS	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Forms or not

# UTL\_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL\\_INADDR Subprograms](#)

## 259.1 UTL\_INADDR Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

 **Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

## 259.2 UTL\_INADDR Exceptions

This table describes exceptions raised by `UTL_INADDR` subprograms.

**Table 259-1** *Exception - Internet Address Package*

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

## 259.3 UTL\_INADDR Examples

This `UTL_INADDR` example retrieves the local host name and IP address.

```
SET serveroutput on
BEGIN
 DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME); -- get local host name
 DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS); -- get local IP addr
```

```
END;
/
```

## 259.4 Summary of UTL\_INADDR Subprograms

This table lists the UTL\_INADDR subprograms and briefly describes them.

**Table 259-2 UTL\_INADDR Package Subprograms**

Subprogram	Description
<a href="#">GET_HOST_ADDRESS Function</a>	Retrieves the IP address of the local or remote host given its name
<a href="#">GET_HOST_NAME Function</a>	Retrieves the name of the local or remote host given its IP address

### 259.4.1 GET\_HOST\_ADDRESS Function

This function retrieves the IP address of the specified host.

#### Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (
 host IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

#### Parameters

**Table 259-3 GET\_HOST\_ADDRESS Function Parameters**

Parameter	Description
host	The name of the host to retrieve the IP address.

#### Return Values

**Table 259-4 GET\_HOST\_ADDRESS Function Return Values**

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

#### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

#### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege on `LOCALHOST`.

## 259.4.2 GET\_HOST\_NAME Function

This function retrieves the name of the local or remote host given its IP address.

### Syntax

```
UTL_INADDR.GET_HOST_NAME (
 ip IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

### Parameters

**Table 259-5 GET\_HOST\_NAME Function Parameters**

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

### Return Values

**Table 259-6 GET\_HOST\_NAME Function Return Values**

Parameter	Description
host_name	The name of the local or remote host of the specified IP address.

### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`.

# 260

## UTL\_LMS

UTL\_LMS retrieves and formats error messages in different languages.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL\\_LMS Subprograms](#)

### See Also:

*Oracle Database Globalization Support Guide*

## 260.1 UTL\_LMS Security Model

This package must be created as the user SYS.

## 260.2 Summary of UTL\_LMS Subprograms

This table lists the UTL\_LMS subprograms and briefly describes them.

**Table 260-1 UTL\_LMS Package Subprograms**

Function	Description
<a href="#">FORMAT_MESSAGE Function</a>	Formats a retrieved error message
<a href="#">GET_MESSAGE Function</a>	Retrieves an error message based on error number, product, facility, language, and message specified

### 260.2.1 FORMAT\_MESSAGE Function

This function formats a message retrieved by the GET\_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

## Syntax

```
UTL_LMS.FORMAT_MESSAGE (
 format IN VARCHAR2 CHARACTER SET ANY_CS,
 args IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

## Parameters

**Table 260-2** FORMAT\_MESSAGE Procedure Parameters

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

## Examples

```
DECLARE
 s varchar2(200);
 i pls_integer;
BEGIN
 i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
 dbms_output.put_line('before format, message is: '||s);
 dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

## 260.2.2 GET\_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns 0 when it is successful. It returns -1 when it fails.

### See Also:

*Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

## Syntax

```
UTL_LMS.GET_MESSAGE (
 errnum IN PLS_INTEGER,
 product IN VARCHAR2,
```

```

 facility IN VARCHAR2,
 language IN VARCHAR2,
 message OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;

```

### Parameters

**Table 260-3 GET\_MESSAGE Function Parameters**

Parameter	Description
errnum	Specifies the error number. Example: '972' (for ORA-00972)
product	Specifies the product to which the error message applies Example: 'rdbms'
facility	Specifies the error message prefix Example: 'ora'
language	Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter.
message	Specifies the output buffer for the retrieved message

### Usage Notes

If the language parameter is set to NULL, then the value of the NLS\_LANGUAGE session parameter is used as the default.

### Examples

```

DECLARE
 s varchar2(200);
 i pls_integer;
BEGIN
 i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
 dbms_output.put_line('OCI--00601 is: '||s);
END
/

```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

# 261

## UTL\_MAIL

The UTL\_MAIL package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of UTL\\_MAIL Subprograms](#)

### 261.1 UTL\_MAIL Security Model

UTL\_MAIL is not installed by default because of the SMTP\_OUT\_SERVER configuration requirement and the security exposure this involves. In installing UTL\_MAIL, you should take steps to prevent the port defined by SMTP\_OUT\_SERVER being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

#### Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

### 261.2 UTL\_MAIL Operational Notes

You must both install UTL\_MAIL and define the SMTP\_OUT\_SERVER.

- To install UTL\_MAIL:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```
- You define the SMTP\_OUT\_SERVER parameter in the `init.ora` rdbms initialization file. However, if SMTP\_OUT\_SERVER is not defined, this invokes a default of DB\_DOMAIN which is guaranteed to be defined to perform appropriately.

## 261.3 UTL\_MAIL Rules and Limits

Use UTL\_MAIL only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

## 261.4 Summary of UTL\_MAIL Subprograms

This table lists the UTL\_MAIL subprograms and briefly describes them.

**Table 261-1 UTL\_MAIL Package Subprograms**

Subprogram	Description
<a href="#">SEND Procedure</a>	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
<a href="#">SEND_ATTACH_RAW Procedure</a>	Represents the SEND Procedure overloaded for RAW attachments
<a href="#">SEND_ATTACH_VARCHAR2 Procedure</a>	Represents the SEND Procedure overloaded for VARCHAR2 attachments

### 261.4.1 SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.

It hides the SMTP API and exposes a one-line email facility for ease of use.

#### Syntax

```
UTL_MAIL.SEND (
 sender IN VARCHAR2 CHARACTER SET ANY_CS,
 recipients IN VARCHAR2 CHARACTER SET ANY_CS,
 cc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 bcc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 subject IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 message IN VARCHAR2 CHARACTER SET ANY_CS,
 mime_type IN VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
 priority IN PLS_INTEGER DEFAULT 3,
 replyto IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

#### Parameters

**Table 261-2 SEND Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas

**Table 261-2 (Cont.) SEND Procedure Parameters**

Parameter	Description
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
replyto	Defines to whom the reply email is to be sent

## 261.4.2 SEND\_ATTACH\_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

### Syntax

```

UTL_MAIL.SEND_ATTACH_RAW (
 sender IN VARCHAR2 CHARACTER SET ANY_CS,
 recipients IN VARCHAR2 CHARACTER SET ANY_CS,
 cc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 bcc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 subject IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 message IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 mime_type IN VARCHAR2 DEFAULT CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-ascii',
 priority IN PLS_INTEGER DEFAULT 3,
 attachment IN RAW,
 att_inline IN BOOLEAN DEFAULT TRUE,
 att_mime_type IN VARCHAR2 CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-
ascii',
 att_filename IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 replyto IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);

```

### Parameters

**Table 261-3 SEND\_ATTACH\_RAW Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL

**Table 261-3 (Cont.) SEND\_ATTACH\_RAW Procedure Parameters**

Parameter	Description
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	RAW attachment
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE
att_mime_type	Mime type of the attachment, default is 'application/octet'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

## 261.4.3 SEND\_ATTACH\_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

### Syntax

```

UTL_MAIL.SEND_ATTACH_VARCHAR2 (
 sender IN VARCHAR2 CHARACTER SET ANY_CS,
 recipients IN VARCHAR2 CHARACTER SET ANY_CS,
 cc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 bcc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 subject IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 message IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 mime_type IN VARCHAR2 CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-
ascii',
 priority IN PLS_INTEGER DEFAULT 3,
 attachment IN VARCHAR2 CHARACTER SET ANY_CS, ,
 att_inline IN BOOLEAN DEFAULT TRUE,
 att_mime_type IN VARCHAR2 CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-ascii',
 att_filename IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 replyto IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);

```

### Parameters

**Table 261-4 SEND\_ATTACH\_VARCHAR2 Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL

**Table 261-4 (Cont.) SEND\_ATTACH\_VARCHAR2 Procedure Parameters**

Parameter	Description
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	Text attachment
att_inline	Specifies whether the attachment is inline, default TRUE
att_mime_type	Mime type of the attachment, default is 'text/plain; charset=us-ascii'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

## UTL\_MATCH

The `UTL_MATCH` package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of UTL\\_MATCH Subprograms](#)

### 262.1 UTL\_MATCH Overview

`UTL_MATCH` can use either the Edit Distance algorithm or Jaro-Winkler algorithm when determining matches.

Edit Distance, also known as Levenshtein Distance (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings,  $s_1$  and  $s_2$ . The distance is the number of insertions, deletions or substitutions required to transform  $s_1$  to  $s_2$ .

The Edit Distance between strings `shacklford` and `shackelford` = 2.

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

The following table shows similarity values returned by Jaro-Winkler and Edit Distance

**Table 262-1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms**

String 1	String 2	Jaro Winkler	Edit Distance
Dunningham	Cuningham	89	80
Abroms	Abrams	92	83
Lampley	Campley	90	86
Marhta	Martha	96	67
Jonathon	Jonathan	95	88
Jeraldine	Geraldine	92	89

### 262.2 UTL\_MATCH Security Model

The `UTL_MATCH` package runs with definer's rights. `UTL_MATCH` must be created under `SYS`. Operations provided by this package are performed with `SYS` privileges.

## 262.3 Summary of UTL\_MATCH Subprograms

This table lists the UTL\_MATCH subprograms and briefly describes them.

**Table 262-2 UTL\_MATCH Package Subprograms**

Subprogram	Description
<a href="#">EDIT_DISTANCE Function</a>	Calculates the number of changes required to transform string-1 into string-2
<a href="#">EDIT_DISTANCE_SIMILARITY Function</a>	Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match)
<a href="#">JARO_WINKLER Function</a>	Calculates the measure of agreement between string-1 and string-2
<a href="#">JARO_WINKLER_SIMILARITY Function</a>	Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)

### 262.3.1 EDIT\_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

#### Syntax

```
UTL_MATCH.EDIT_DISTANCE (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

#### Parameters

**Table 262-3 EDIT\_DISTANCE Function Parameters**

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

#### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;

returns 2
```

### 262.3.2 EDIT\_DISTANCE\_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two strings.

The value is typically between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

### Parameters

**Table 262-4 EDIT\_DISTANCE\_SIMILARITY Function Parameters**

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM
DUAL;

returns 82
```

## 262.3.3 JARO\_WINKLER Function

This function calculates the measure of agreement between two strings.

### Syntax

```
UTL_MATCH.JARO_WINKLER (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN BINARY_DOUBLE;
```

### Parameters

**Table 262-5 JARO\_WINKLER Function Parameters**

Parameter	Description
s1	Input
s2	input

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;

returns 9.818E-001
```

## 262.3.4 JARO\_WINKLER\_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.JARO_WINKLER_SIMILARITY (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

### Parameters

**Table 262-6 JARO\_WINKLER\_SIMILARITY Function Parameters**

Parameter	Description
s1	Input
s2	input

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;

returns 98
```

# UTL\_NLA

The `UTL_NLA` package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

This chapter contains the following topics:

- [Overview](#)
- [Rules and Limits](#)
- [Security Model](#)
- [Subprogram Groups](#)
  - [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
  - [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
  - [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
  - [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
  - [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)
- [Summary of UTL\\_NLA Subprograms](#)

## 263.1 UTL\_NLA Overview

The `UTL_NLA` package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

### Standards

For more information on the BLAS and LAPACK standards see

<http://www.netlib.org/blas/>

<http://www.netlib.org/lapack/>

### Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

### Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the `BLAS_` prefix (for example, the [BLAS\\_ASUM Functions](#)). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the `LAPACK_` prefix (for example, the [LAPACK\\_GBSV Procedures](#)). The subroutines in LAPACK are mapped to PL/SQL procedures.

Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The `UTL_NLA` package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

## 263.2 UTL\_NLA Rules and Limits

Vectors and matrices are stored in `VARRAYS` with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size  $R \times C \leq 1,000,000$ .

## 263.3 UTL\_NLA Security Model

The `UTL_NLA` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to `public`. The routines in the package are run with invokers' rights (run with the privileges of the current user).

## 263.4 Subprogram Groups

The `UTL_NLA` package contains subprogram groups for BLAS and LAPACK operations.

- [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
- [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
- [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
- [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
- [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)

### 263.4.1 UTL\_NLA BLAS Level 1 (Vector-Vector Operations) Subprograms

This table lists and briefly describes the `UTL_NLA` BLAS Level 1 Vector-Vector Operations subprograms.

**Table 263-1 BLAS Level 1 (Vector-Vector Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_ASUM Functions</a>	Computes the sum of the absolute values of the vector components
<a href="#">BLAS_AXPY Procedures</a>	Copies $\alpha X + Y$ into vector $Y$
<a href="#">BLAS_COPY Procedures</a>	Copies the contents of vector $X$ to vector $Y$

**Table 263-1 (Cont.) BLAS Level 1 (Vector-Vector Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_DOT Functions</a>	Returns the dot (scalar) product of two vectors $x$ and $y$
<a href="#">BLAS_IAMAX Functions</a>	Computes the index of the first element of a vector that has the largest absolute value
<a href="#">BLAS_NRM2 Functions</a>	Computes the vector 2-norm (Euclidean norm)
<a href="#">BLAS_ROT Procedures</a>	Returns the plane rotation of points
<a href="#">BLAS_ROTG Procedures</a>	Returns the Givens rotation of points
<a href="#">BLAS_SCAL Procedures</a>	Scales a vector by a constant
<a href="#">BLAS_SWAP Procedures</a>	Swaps the contents of two vectors each of size $n$

## 263.4.2 UTL\_NLA BLAS Level 2 (Matrix-Vector Operations) Subprograms

This table lists and briefly describes the UTL\_NLA BLAS Level 2 Matrix-Vector Operations subprograms.

**Table 263-2 BLAS Level 2 (Matrix-Vector Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_GBMV Procedures</a>	Performs the matrix-vector operation $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ band matrix, with $k_l$ sub-diagonals and $k_u$ super-diagonals
<a href="#">BLAS_GEMV Procedures</a>	Performs the matrix-vector operations $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ matrix
<a href="#">BLAS_GER Procedures</a>	Performs a rank 1 operation $A := \alpha * x * y' + A$ where $\alpha$ is a scalar, $x$ is an $m$ element vector, $y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix
<a href="#">BLAS_SBMV Procedures</a>	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals
<a href="#">BLAS_SPMV Procedures</a>	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SPR Procedures</a>	Performs a symmetric rank 1 operation $A := \alpha * x * x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SPR2 Procedures</a>	Performs a symmetric rank 2 operation $A := \alpha * x * y' + \alpha * y * x' + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form

Table 263-2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
<a href="#">BLAS_SBMV Procedures</a>	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals
<a href="#">BLAS_SYMV Procedures</a>	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_SYR Procedures</a>	Performs a symmetric rank 1 operation $A := \alpha x x^* + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_SYR2 Procedures</a>	Performs a symmetric rank 2 operation $A := \alpha x y^* + \alpha y x^* + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_TBMV Procedures</a>	Performs a matrix-vector operation $x := A^*x$ or $A^*x = b$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
<a href="#">BLAS_TBSV Procedures</a>	Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
<a href="#">BLAS_TPMV Procedures</a>	Performs a matrix-vector operation $x := A^*x$ or $x := A^*x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form
<a href="#">BLAS_TPSV Procedures</a>	Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form
<a href="#">BLAS_TRMV Procedures</a>	Performs a matrix-vector operation $x := A^*x$ or $x := A^*x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix
<a href="#">BLAS_TRSV Procedures</a>	Solves one of the systems of equation $A^*x = b$ or $A^*x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix

### 263.4.3 UTL\_NLA BLAS Level 3 (Matrix-Matrix Operations) Subprograms

This table lists and briefly describes the UTL\_NLA BLAS Level 3 Matrix-Matrix Operations subprograms.

**Table 263-3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_GEMM Procedures</a>	Performs one of the matrix-vector operations $C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$ where $\text{op}(X)$ is one of $\text{op}(X) = X$ or $\text{op}(X) = X'$ where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $\text{op}(A)$ an $m$ by $k$ matrix, $\text{op}(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix
<a href="#">BLAS_SYMM Procedures</a>	Performs one of the matrix-vector operations $C := \alpha * A * B + \beta * C$ or $C := \alpha * B * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $A$ is a symmetric matrix, and $B$ and $C$ are $m$ by $n$ matrices
<a href="#">BLAS_SYR2K Procedures</a>	Performs one of the symmetric rank2 $k$ operations $C := \alpha * A * A' * B + \alpha * B * A' * A + \beta * C$ or $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ and $B$ are $n$ by $k$ matrices in the first case and $k$ by $n$ matrices in the second case
<a href="#">BLAS_SYRK Procedures</a>	Performs one of the symmetric rank $k$ operations $C := \alpha * A * A' + \beta * C$ or $C := \alpha * A' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ is an $n$ by $k$ matrix in the first case and a $k$ by $n$ matrix in the second case
<a href="#">BLAS_TRMM Procedures</a>	Performs one of the matrix-vector operations $B := \alpha * \text{op}(A) * B$ or $B := \alpha * B * \text{op}(A)$ where $\alpha$ is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives
<a href="#">BLAS_TRSM Procedures</a>	Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where $\alpha$ is a scalar, $X$ and $B$ are $m$ by $n$ matrices, $A$ is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix $X$ is overwritten on $B$

## 263.4.4 UTL\_NLA LAPACK Driver Routines (Linear Equations) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (Linear Equations) subprograms.

**Table 263-4 LAPACK Driver Routines (Linear Equations) Subprograms**

Subprogram	Description
<a href="#">LAPACK_GBSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $\text{nrhs}$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .

**Table 263-4 (Cont.) LAPACK Driver Routines (Linear Equations) Subprograms**

Subprogram	Description
<a href="#">LAPACK_GESV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .
<a href="#">LAPACK_GTSV Procedures</a>	This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.
<a href="#">LAPACK_PBSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_POSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_PPSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix stored in packed format and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_PTSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite tridiagonal matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices.
<a href="#">LAPACK_SPSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix stored in packed format, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .
<a href="#">LAPACK_SYSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .

## 263.4.5 UTL\_NLA LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (LLS and Eigenvalue) subprograms.

**Table 263-5 LAPACK Driver Routines (LLS and Eigenvalue Problems)**

Subprogram	Description
<a href="#">LAPACK_GEES Procedures</a>	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues, the real Schur form $T$ , and, optionally, the matrix of Schur vectors $Z$ . This gives the Schur factorization $A = Z * T * (Z * * T)$ .

Table 263-5 (Cont.) LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
<a href="#">LAPACK_GEEV Procedures</a>	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.
<a href="#">LAPACK_GELS Procedures</a>	Solves overdetermined or underdetermined real linear systems involving an $m$ by $n$ matrix $A$ , or its transpose, using a QR or LQ factorization of $A$ . It is assumed that $A$ has full rank.
<a href="#">LAPACK_GESDD Procedures</a>	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_GESVD Procedures</a>	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * \text{transpose}(V)$ .
<a href="#">LAPACK_SBEV Procedures</a>	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix $A$
<a href="#">LAPACK_SBEVD Procedures</a>	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_SPEV Procedures</a>	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage
<a href="#">LAPACK_SPEVD Procedures</a>	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_STEV Procedures</a>	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$
<a href="#">LAPACK_STEVD Procedures</a>	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_SYEV Procedures</a>	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$
<a href="#">LAPACK_SYEVD Procedures</a>	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

## 263.5 Summary of UTL\_NLA Subprograms

This table lists the UTL\_NLA subprograms and briefly describes them.

**Table 263-6 UTL\_NLA Package Subprograms**

Subprogram	Description	Group
BLAS_ASUM Functions	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_AXPY Procedures	Copies $\alpha X + Y$ into vector $Y$	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_COPY Procedures	Copies the contents of vector $X$ to vector $Y$	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_DOT Functions	Returns the dot (scalar) product of two vectors $X$ and $Y$	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_GBMV Procedures	Performs the matrix-vector operation $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ band matrix, with $k_l$ sub-diagonals and $k_u$ super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GEMM Procedures	Performs one of the matrix-vector operations where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $op(A)$ an $m$ by $k$ matrix, $op(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_GEMV Procedures	Performs the matrix-vector operations $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GER Procedures	Performs a rank 1 operation $A := \alpha x y' + A$ where $\alpha$ is a scalar, $x$ is an $m$ element vector, $y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_IAMAX Functions	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_NRM2 Functions	Computes the vector 2-norm (Euclidean norm)	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROT Procedures	Returns the plane rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROTG Procedures	Returns the Givens rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 263-6 (Cont.) UTL\_NLA Package Subprograms

Subprogram	Description	Group
<a href="#">BLAS_SBMV Procedures</a>	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_SCAL Procedures</a>	Scales a vector by a constant	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a>
<a href="#">BLAS_SPMV Procedures</a>	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_SPR Procedures</a>	Performs a symmetric rank 1 operation $A := \alpha * x * x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_SPR2 Procedures</a>	Performs a symmetric rank 2 operation where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_SWAP Procedures</a>	Swaps the contents of two vectors each of size $n$	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a>
<a href="#">BLAS_SYMM Procedures</a>	Performs one of the matrix-vector operations where $\alpha$ and $\beta$ are scalars, $A$ is a symmetric matrix, and $B$ and $C$ are $m$ by $n$ matrices	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a>
<a href="#">BLAS_SYMV Procedures</a>	Performs a matrix-vector operation where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_SYR Procedures</a>	Performs a symmetric rank 1 operation where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>

**Table 263-6 (Cont.) UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">BLAS_SYR2 Procedures</a>	Performs a symmetric rank 2 operation where <code>alpha</code> is a scalar, <code>x</code> and <code>y</code> are <code>n</code> element vectors, and <code>A</code> is an <code>n</code> by <code>n</code> symmetric matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_SYR2K Procedures</a>	Performs one of the symmetric rank2 <code>k</code> operations where <code>alpha</code> and <code>beta</code> are scalars, <code>C</code> is an <code>n</code> by <code>n</code> symmetric matrix and <code>A</code> and <code>B</code> are <code>n</code> by <code>k</code> matrices in the first case and <code>k</code> by <code>n</code> matrices in the second case	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a>
<a href="#">BLAS_SYRK Procedures</a>	Performs one of the symmetric rank <code>k</code> operations where <code>alpha</code> and <code>beta</code> are scalars, <code>C</code> is an <code>n</code> by <code>n</code> symmetric matrix and <code>A</code> is an <code>n</code> by <code>k</code> matrix in the first case and a <code>k</code> by <code>n</code> matrix in the second case	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a>
<a href="#">BLAS_TBMV Procedures</a>	Performs a matrix-vector operation where <code>x</code> is an <code>n</code> element vector and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular band matrix, with <code>(k + 1)</code> diagonals	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_TBSV Procedures</a>	Solves one of the systems of equation where <code>b</code> and <code>x</code> are <code>n</code> element vectors and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular band matrix, with <code>(k + 1)</code> diagonals	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_TPMV Procedures</a>	Performs a matrix-vector operation where <code>x</code> is an <code>n</code> element vector and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_TPSV Procedures</a>	Solves one of the systems of equation where <code>b</code> and <code>x</code> are <code>n</code> element vectors and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_TRMM Procedures</a>	Performs one of the matrix-vector operations where <code>alpha</code> is a scalar, <code>B</code> is an <code>m</code> by <code>n</code> matrix, <code>A</code> is a unit, or non-unit, upper or lower triangular matrix and <code>op(A)</code> is one of two alternatives	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>

**Table 263-6 (Cont.) UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">BLAS_TRMV Procedures</a>	Performs a matrix-vector operation where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">BLAS_TRSM Procedures</a>	Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where $\alpha$ is a scalar, $X$ and $B$ are $m$ by $n$ matrices, $A$ is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix $X$ is overwritten on $B$	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a>
<a href="#">BLAS_TRSV Procedures</a>	Solves one of the systems of equation where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>
<a href="#">LAPACK_GBSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>
<a href="#">LAPACK_GEES Procedures</a>	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues, the real Schur form $T$ , and, optionally, the matrix of Schur vectors $Z$ . This gives the Schur factorization $A = Z * T * (Z ** T)$ .	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a>
<a href="#">LAPACK_GEEV Procedures</a>	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a>
<a href="#">LAPACK_GELS Procedures</a>	Solves overdetermined or underdetermined real linear systems involving an $m$ by $n$ matrix $A$ , or its transpose, using a QR or LQ factorization of $A$ . It is assumed that $A$ has full rank.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a>

**Table 263-6 (Cont.) UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">LAPACK_GESDD Procedures</a>	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a>
<a href="#">LAPACK_GESV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>
<a href="#">LAPACK_GESVD Procedures</a>	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * transpose(V)$ .	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a>
<a href="#">LAPACK_GTSV Procedures</a>	This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>
<a href="#">LAPACK_PBSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>
<a href="#">LAPACK_POSV Procedures</a>	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>

Table 263-6 (Cont.) UTL\_NLA Package Subprograms

## 263.5.1 BLAS\_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ASUM (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_ASUM (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 x IN UTL_NLA_ARRAY_FLT)
RETURN BINARY_FLOAT
```

## Parameters

**Table 263-7** BLAS\_ASUM Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of x. incx must not be zero.

## 263.5.2 BLAS\_AXPY Procedures

This procedure copies  $\alpha * X + Y$  into vector Y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

## Syntax

```
UTL_NLA.BLAS_AXPY (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN);
```

```
UTL_NLA.BLAS_AXPY (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN);
```

## Parameters

**Table 263-8** BLAS\_AXPY Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.

**Table 263-8 (Cont.) BLAS\_AXPY Procedure Parameters**

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$
incy	Specifies the increment for the elements of y. incy must not be zero.

### 263.5.3 BLAS\_COPY Procedures

This procedure copies the contents of vector x to vector y.

**See Also:**

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

**Syntax**

```
UTL_NLA.BLAS_COPY (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN);
```

```
UTL_NLA.BLAS_COPY (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN);
```

**Parameters**

**Table 263-9 BLAS\_COPY Procedure Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.

**Table 263-9 (Cont.) BLAS\_COPY Procedure Parameters**

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$
incy	Specifies the increment for the elements of y. incy must not be zero.

## 263.5.4 BLAS\_DOT Functions

This function returns the dot (scalar) product of two vectors x and y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_DOT (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_DOT (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN)
RETURN BINARY_FLOAT;
```

### Parameters

**Table 263-10 BLAS\_DOT Function Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.

**Table 263-10 (Cont.) BLAS\_DOT Function Parameters**

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$
incy	Specifies the increment for the elements of y. incy must not be zero.

## 263.5.5 BLAS\_GBMV Procedures

This procedure performs one of the matrix-vector operations  $y := \alpha * A * x + \beta * y$  or  $y := \alpha * A' * x + \beta * y$ , where alpha and beta are scalars, x and y are vectors and A is an m by n band matrix, with kl sub-diagonals and ku super-diagonals.

### See Also:

[BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```

UTL_NLA.BLAS_GBMV (
 trans IN flag,
 m IN POSITIVEN, n IN POSITIVEN,
 kl IN NATURALN,
 ku IN NATURALN,

```

```
x IN UTL_NLA_ARRAY_FLT,
incx IN POSITIVEN,
beta IN SCALAR_FLOAT,
y IN OUT UTL_NLA_ARRAY_FLT,
incy IN POSITIVEN,
pack IN flag DEFAULT 'C');
```

## Parameters

**Table 263-11 BLAS\_GBMV Procedure Parameters**

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n': <math>y := \alpha * A * x + \beta * y</math></li> <li>trans = 'T' or 't': <math>y := \alpha * A^T * x + \beta * y</math></li> <li>trans = 'C' or 'c': <math>y := \alpha * A^H * x + \beta * y</math></li> </ul>
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy $0 \leq kl$ .
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy $0 \leq ku$ .
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row (ku+2), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(incx))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(incx))$ otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.

**Table 263-11 (Cont.) BLAS\_GBMV Procedure Parameters**

Parameter	Description
y	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1 + (m - 1) * \text{abs}(\text{incy}))$ <p>when trans = 'N' or 'n' and at least</p> $(1 + (n - 1) * \text{abs}(\text{incy}))$ <p>otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.</p>
incy	Specifies the increment for the elements of y. Must not be zero.
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 263.5.6 BLAS\_GEMM Procedures

This procedure performs one of the matrix-matrix operations.

$C := \text{alpha} * \text{op}(A) * \text{op}(B) + \text{beta} * C$

where  $\text{op}(X)$  is one of

$\text{op}(X) = X$

or

$\text{op}(X) = X'$

where alpha and beta are scalars, and A, B and C are matrices, with  $\text{op}(A)$  an m by k matrix,  $\text{op}(B)$  a k by n matrix and C an m by n matrix.

### See Also:

```

## Parameters

**Table 263-12 BLAS\_GEMM Procedure Parameters**

Parameter	Description
transa	Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n': <math>op(A) = A</math></li> <li>transa = 'T' or 't': <math>op(A) = A^T</math></li> <li>transa = 'C' or 'c': <math>op(A) = A^H</math></li> </ul>
transb	Specifies the form of $op(B)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transb = 'N' or 'n': <math>op(B) = B</math></li> <li>transb = 'T' or 't': <math>op(B) = B^T</math></li> <li>transb = 'C' or 'c': <math>op(B) = B^H</math></li> </ul>
m	Specifies the number of rows of the matrix $op(A)$ and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix $op(B)$ and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix $op(A)$ and the number of columns of the matrix $op(B)$ . k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least $\max(1, k)$ .

**Table 263-12 (Cont.) BLAS\_GEMM Procedure Parameters**

Parameter	Description
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = 'N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the arrayb must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least max (1, n).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the arrayC is overwritten by the m by n matrix (alpha*op(A)*op(B) + beta*C).
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>• 'C': column-major (default)</li> <li>• 'R': row-major</li> </ul>

## 263.5.7 BLAS\_GEMV Procedures

This procedure performs one of the matrix-vector operations:  $y := \alpha A x + \beta y$  or  $y := \alpha A^T x + \beta y$  where alpha and beta are scalars, x and y are vectors and A is an m by n matrix.

 pack IN flag DEFAULT 'C');

```

## Parameters

**Table 263-13** BLAS\_GEMV Procedure Parameters

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n', <math>y := \alpha * A * x + \beta * y</math></li> <li>trans = 'T' or 't', <math>y := \alpha * A^T * x + \beta * y</math></li> <li>trans = 'C' or 'c', <math>y := \alpha * A^H * x + \beta * y</math></li> </ul>
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, m)$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.

**Table 263-13 (Cont.) BLAS\_GEMV Procedure Parameters**

Parameter	Description
y	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1 + (m - 1) * \text{abs}(\text{incy}))$ <p>when trans = 'N' or 'n' and at least</p> $(1 + (n - 1) * \text{abs}(\text{incy}))$ <p>otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.</p>
incy	Specifies the increment for the elements of y. Must not be zero.
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 263.5.8 BLAS\_GER Procedures

This procedure performs the rank 1 operation:  $A := \alpha * x * y' + A$  where alpha is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix.

### See Also:

[BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```

UTL_NLA.BLAS_GER (
 m IN POSITIVEN,
 n IN POSITIVEN,

 y IN UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN,
 a IN OUT UTL_NLA_ARRAY_FLT,

```

```
lda IN POSITIVEN,
pack IN flag DEFAULT 'C');
```

## Parameters

**Table 263-14 BLAS\_GER Procedure Parameters**

Parameter	Description
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( m - 1 ) * \text{abs}( \text{incx} ) )$  Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$  Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incx must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\text{max}( 1, m )$
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>• 'C': column-major (default)</li> <li>• 'R': row-major</li> </ul>

## 263.5.9 BLAS\_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_IAMAX (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 RETURN POSITIVEN;
```

```
UTL_NLA.BLAS_IAMAX (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 RETURN POSITIVEN;
```

### Parameters

**Table 263-15 BLAS\_IAMAX Function Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of x. incx must not be zero.

## 263.5.10 BLAS\_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

## Syntax

```

UTL_NLA.BLAS_NRM2 (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN)
RETURN BINARY_DOUBLE;

```

```

UTL_NLA.BLAS_NRM2 (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN)
RETURN BINARY_FLOAT;

```

## Parameters

**Table 263-16** BLAS\_NRM2 Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of x. incx must not be zero.

## 263.5.11 BLAS\_ROT Procedures

This procedure returns the plane rotation of points.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

## Syntax

```

UTL_NLA.BLAS_ROT (
 n IN POSITIVEN,
 x IN OUT UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN,
 c IN SCALAR_DOUBLE,
 s IN SCALAR_DOUBLE);

```

```

 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_FLT,

```

```

incy IN POSITIVEN,
c IN SCALAR_DOUBLE,
s IN SCALAR_DOUBLE);

```

### Parameters

**Table 263-17 BLAS\_ROT Procedure Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1+(n-1) * \text{abs}(\text{incy}))$
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE.Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE.Specifies the scalar S.

## 263.5.12 BLAS\_ROTG Procedures

This procedure returns the Givens rotation of points.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```

UTL_NLA.BLAS_ROTG (
 a IN OUT SCALAR_DOUBLE,
 b IN OUT SCALAR_DOUBLE,
 c IN OUT SCALAR_DOUBLE,
 s IN OUT SCALAR_DOUBLE);

```

```

UTL_NLA.BLAS_ROTG (
 a IN OUT SCALAR_FLOAT,
 b IN OUT SCALAR_FLOAT,
 c IN OUT SCALAR_FLOAT,
 s IN OUT SCALAR_FLOAT);

```

## Parameters

**Table 263-18** BLAS\_ROTG Procedure Parameters

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

## 263.5.13 BLAS\_SCAL Procedures

This procedure scales a vector by a constant.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

## Syntax

```
UTL_NLA.BLAS_SCAL (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 x IN OUT UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN);
```

```
UTL_NLA.BLAS_SCAL (
 n IN POSITIVEN,
 alpha IN SCALAR_FLOAT,
 x IN OUT UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN);
```

## Parameters

**Table 263-19** BLAS\_SCAL Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1)*abs(incx))$
incx	Specifies the increment for the elements of x. incx must not be zero.

## 263.5.14 BLAS\_SPMV Procedures

This procedure performs the matrix-vector operation  $y := \alpha * A * x + \beta * y$ , where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  symmetric matrix, supplied in packed form.

### See Also:

[BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SPMV (
 uplo IN flag,
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 ap IN UTL_NLA_ARRAY_DBL,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 beta IN SCALAR_DOUBLE,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN,
 pack IN flag DEFAULT 'C');
```

```
UTL_NLA.BLAS_SPMV (
 uplo IN flag,
 n IN POSITIVEN,
 alpha IN SCALAR_FLOAT,

 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN,
 pack IN flag DEFAULT 'C');
```

## Parameters

**Table 263-23 BLAS\_SBMV Procedure Parameters**

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the band matrix A is being supplied: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u'. The upper triangular part of A is supplied.</li> <li>uplo = 'L' or 'l'. The lower triangular part of A is supplied.</li> </ul>
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies the number of super-diagonals of the matrix A. k must satisfy $0 \leq k$ .
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). <p>Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.</p> <p>Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.</p> <p>Unchanged on exit</p>
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1)*abs(incx))$  <p>Before entry, the incremented array X must contain the n element vector x.</p>
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1)*abs(incy))$  <p>Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.</p>
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 263.5.18 BLAS\_SWAP Procedures

This procedure swaps the contents of two vectors each of size  $n$ .

### Syntax

```
UTL_NLA.BLAS_SWAP (
 n IN POSITIVEN,
 x IN OUT UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN);
```

```
UTL_NLA.BLAS_SWAP (
 n IN POSITIVEN,
 x IN OUT UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN);
```

### Parameters

**Table 263-24** BLAS\_SWAP Procedure Parameters

Parameter	Description
$n$	Specifies the number of elements of the vectors $x$ and $y$ . $n$ must be at least zero.
$x$	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1)*abs(incx))$
$incx$	Specifies the increment for the elements of $x$ . $incx$ must not be zero.
$y$	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1+(n-1)*abs(incy))$
$incy$	Specifies the increment for the elements of $y$ . $incy$ must not be zero.

## 263.5.19 BLAS\_SYMM Procedures

This procedure performs one of the matrix-matrix operations  $C := \alpha*A*B + \beta*C$  or  $C := \alpha*B*A + \beta*C$ , where  $\alpha$  and  $\beta$  are scalars,  $A$  is a symmetric matrix, and  $B$  and  $C$  are  $m$  by  $n$  matrices.

## Parameters

**Table 263-25 BLAS\_SYMM Procedure Parameters**

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l' : <math>C := \alpha * A * B + \beta * C</math></li> <li>side = 'R' or 'r' : <math>C := \alpha * B * A + \beta * C</math></li> </ul>
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced.</li> <li>uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.</li> </ul>
m	Specifies the number of rows of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix C. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.

Table 263-25 (Cont.) BLAS\_SYMM Procedure Parameters

Parameter	Description
a	<p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is m when side = 'L' or 'l', and is n otherwise.</p> <p>Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.</p> <p>Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.</p>
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least $\max(1, m)$ , otherwise lda must be at least $\max(1, n)$ .
b	<p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n).</p> <p>Before entry, the leading m by n part of the array B must contain the matrix B.</p>
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least $\max(1, m)$ .
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, m)$ .
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>• 'C': column-major (default)</li> <li>• 'R': row-major</li> </ul>

## 263.5.20 BLAS\_SYMV Procedures

This procedure performs the matrix-vector operation  $y := \alpha A x + \beta y$ , where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  symmetric matrix.

## Parameters

**Table 263-32 BLAS\_TBSV Procedure Parameters**

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>• uplo = 'U' or 'u'. A is an upper triangular matrix.</li> <li>• uplo = 'L' or 'l'. A is a lower triangular matrix.</li> </ul>
trans	Specifies the equations to be solved: <ul style="list-style-type: none"> <li>• trans = 'N' or 'n': <math>A*x = b</math></li> <li>• trans = 'T' or 't': <math>A'*x = b</math></li> <li>• trans = 'C' or 'c': <math>A'*x = b</math></li> </ul>
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>• diag = 'U' or 'u': A is assumed to be unit triangular.</li> <li>• diag = 'N' or 'n': A is not assumed to be unit triangular.</li> </ul>
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>• with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A.</li> <li>• with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A.</li> </ul> K must satisfy $0 \leq k$ .
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	On entry, lda specifies the first dimension of A as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) *abs( incx ) )$ Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.

**Table 263-32 (Cont.) BLAS\_TBSV Procedure Parameters**

Parameter	Description
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

**Usage Notes**

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## 263.5.27 BLAS\_TPMV Procedures

This procedure performs the matrix-vector operations  $x := A*x$  or  $x := A'*x$ , where  $x$  is an  $n$  element vector and  $A$  is an  $n$  by  $n$  unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

incx	<p>Specifies the increment for the elements of x. incx must not be zero.</p>
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>• 'C': column-major (default)</li> <li>• 'R': row-major</li> </ul>

**Usage Notes**

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## 263.5.29 BLAS\_TRMM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the following matrix-matrix operations:

$B := \alpha * op(A) * B$

or

$B := \alpha * B * op(A)$

where alpha is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of

$op(A) = A$

or

$op(A) = A'$

 **See Also:**

 lda IN POSITIVEN,
 b IN OUT UTL_NLA_ARRAY_FLT,
 ldb IN POSITIVEN,
 pack IN flag DEFAULT 'C');
```

**Parameters****Table 263-35 BLAS\_TRMM Procedure Parameters**

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l' : B := alpha*op(A)*B</li> <li>side = 'R' or 'r' : B := alpha*B*op(A)</li> </ul>
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l' : A is a lower triangular matrix.</li> </ul>
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n' : op(A) = A</li> <li>transa = 'T' or 't' : op(A) = A'</li> <li>transa = 'C' or 'c' : op(A) = A'</li> </ul>

**Table 263-35 (Cont.) BLAS\_TRMM Procedure Parameters**

Parameter	Description
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u'. A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n'. A is not assumed to be unit triangular.</li> </ul>
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

### 263.5.30 BLAS\_TRMV Procedures

This procedure performs the matrix-vector operations  $x := A*x$  or  $x := A'*x$ , where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix.

n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, n)$ .

**Table 263-36 (Cont.) BLAS\_TRMV Procedure Parameters**

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * as(incx))$ . Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 263.5.31 BLAS\_TRSM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the matrix-matrix operations:

$op(A) * X = alpha * B$

or

$X * op(A) = alpha * B$

where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of

$op(A) = A$

or

$op(A) = A'$

The matrix X is overwritten on B.

## Parameters

**Table 263-38 BLAS\_TRSV Procedure Parameters**

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u'. A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l'. A is a lower triangular matrix.</li> </ul>
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n'. <math>Ax = b</math></li> <li>trans = 'T' or 't'. <math>A^T x = b</math></li> <li>trans = 'C' or 'c'. <math>A^T x = b</math></li> </ul>
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u'. A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n'. A is not assumed to be unit triangular.</li> </ul>
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least $\max(1, n)$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$  Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## 263.5.33 LAPACK\_GBSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where  $a$  is a band matrix of order  $n$  with  $k_l$  sub diagonals and  $k_u$  superdiagonals, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor  $A$  as

$$a = L * U$$

where  $L$  is a product of permutation and unit lower triangular matrices with  $k_l$  sub diagonals, and  $U$  is upper triangular with  $k_l+k_u$  superdiagonals. The factored form of  $a$  is then used to solve the system of equations

$$a * x = b$$

## 263.5.34 LAPACK\_GEES Procedures

This procedure computes for an *n* by *n* real nonsymmetric matrix *A*, the eigenvalues, the real Schur form *T*, and, optionally, the matrix of Schur vectors *Z*.

This gives the Schur factorization  $A = Z^*T^*(Z^{**T})$ .

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

$$\begin{bmatrix} a & b \\ c & a \end{bmatrix}$$

where  $b*c < 0$ . The eigenvalues of such a block are  $a \pm \sqrt{bc}$ .

## 263.5.35 LAPACK\_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.

The following options are provided:

- If TRANS = 'N' and m >= n: find the least squares solution of an overdetermined system, that is, solve the least squares problem.  

$$\text{minimize } || B - A * X ||$$
- If TRANS = 'N' and m < n: find the minimum norm solution of an underdetermined system  $A * X = B$ .
- If TRANS = 'T' and m >= n: find the minimum norm solution of an undetermined system  $A^{**T} * X = B$ .
- If TRANS = 'T' and m < n: find the least squares solution of an overdetermined system, that is, solve the least squares problem  $\text{minimize } || B - A^{**T} * X ||$ .

## 263.5.36 LAPACK\_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

$$A = U * SIGMA * transpose(V)$$

where SIGMA is an m by n matrix which is zero except for its  $\min(m,n)$  diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A, they are real and non-negative, and are returned in descending order. The first  $\min(m,n)$  columns of U and V are the left and right singular vectors of A.

Note that the routine returns V\*\*T, not V.

## 263.5.37 LAPACK\_GESV Procedure

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n matrix and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

$$a = P * L * U$$

where  $P$  is a permutation matrix,  $L$  is unit lower triangular, and  $U$  is upper triangular. The factored form of  $a$  is then used to solve the system of equations

$$a * x = b$$

## 263.5.38 LAPACK\_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real  $m$  by  $n$  matrix  $A$ , optionally computing the left and/or right singular vectors.

The SVD is written

$$A = U * \text{SIGMA} * \text{transpose}(V)$$

where SIGMA is an  $m$  by  $n$  matrix which is zero except for its  $\min(m,n)$  diagonal elements,  $U$  is an  $m$  by  $m$  orthogonal matrix, and  $V$  is an  $n$  by  $n$  orthogonal matrix. The diagonal elements of SIGMA are the singular values of  $A$ , they are real and non-negative, and are returned in descending order. The first  $\min(m,n)$  columns of  $U$  and  $V$  are the left and right singular vectors of  $A$ .

Note that the routine returns  $V^{*T}$ , not  $V$ .

## 263.5.39 LAPACK\_GEEV Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector v(j) of A satisfies  $A * v(j) = \text{lambda}(j) * v(j)$  where lambda(j) is its eigenvalue.

- The left eigenvector  $u(j)$  of  $A$  satisfies  $u(j)^{**H} * A = \text{lambda}(j) * u(j)^{**H}$  where  $u(j)^{**H}$  denotes the conjugate transpose of  $u(j)$ .

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

## 263.5.40 LAPACK\_GTSV Procedure

This procedure solves the equation  $a * x = b$ , where  $a$  is an  $n$  by  $n$  tridiagonal matrix, by Gaussian elimination with partial pivoting.

Note that the equation  $a' * x = b$  may be solved by interchanging the order of the arguments  $du$  and  $d1$ .

<code>nrhs</code>	The number of right-hand sides, which is the number of columns of the matrix $b$ . $nrhs \geq 0$ .
<code>dl</code>	<p>UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1).</p> <p>On entry, <code>dl</code> must contain the (n-1) sub-diagonal elements of <math>a</math>.</p> <p>On exit, <code>dl</code> is overwritten by the (n-2) elements of the second super-diagonal of the upper triangular matrix <math>U</math> from the LU factorization of <math>a</math>, in <code>dl(1), ..., dl(n-2)</code>.</p>

**Table 263-46 (Cont.) LAPACK\_GTSV Procedure Parameters**

Parameter	Description
d	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). On entry, d must contain the diagonal elements of a. On exit, d is overwritten by the n diagonal elements of U.
du	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, du must contain the (n-1) super-diagonal elements of a. On exit, du is overwritten by the (n-1) elements of the first super-diagonal of U.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (LDB, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max (1, n)
info	<ul style="list-style-type: none"> <li>= 0 : successful exit</li> <li>&lt; 0 : if info = -i , the i-th argument had an illegal value</li> <li>&gt; 0 : if info = i, U(i,i) is exactly zero, and the solution has not been computed. The factorization has not been completed unless i = n.</li> </ul>
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 263.5.41 LAPACK\_PBSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n symmetric positive definite band matrix and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

$$A = U^{**T}U \text{ if } UPLO = 'U'$$

or

$$A = L * L^{**T} \text{ if } UPLO = 'L'$$

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations  $A * X = B$ .

## 263.5.49 LAPACK\_SPSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where  $a$  is an  $n$  by  $n$  symmetric matrix stored in packed format, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The diagonal pivoting method is used to factor  $A$  as

$A = U * D * U^{**T}$ , if  $UPLO = 'U'$

or

$A = L * D * L^{**T}$ , if  $UPLO = 'L'$

where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

## 263.5.54 LAPACK\_SYSV Procedures

This procedure computes the solution to a real system of linear equations  $A * X = B$ , where A is an n by n symmetric matrix, and X and B are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$$A = U * D * U^{**T}, \text{ if UPLO} = 'U'$$

or

$$A = L * D * L^{**T}, \text{ if UPLO} = 'L'$$

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations  $A * X = B$ .

## Parameters

**Table 263-60 LAPACK\_SYSV Procedure Parameters**

Parameter	Description
uplo	<ul style="list-style-type: none"> <li>uplo = 'U'. Upper triangular of A is stored.</li> <li>uplo = 'L'. Lower triangular of A is stored.</li> </ul>
n	The number of linear equations, which is the order of the matrix a. N >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, the symmetric matrix a. If UPLO = 'U', the leading n by n upper triangular part of a contains the upper triangular part of the matrix a, and the strictly lower triangular part of a is not referenced. If uplo = 'L', the leading n by n lower triangular part of a contains the lower triangular part of the matrix a, and the strictly upper triangular part of a is not referenced. On exit, if info = 0, the block diagonal matrix d and the multipliers used to obtain the factor U or L from the factorization $A = U * D * U^{*T}$ or $A = L * D * L^{*T}$ as computed by SSSYTRF.
lda	The leading dimension of the array a. lda >= max(1,n)

**Table 263-60 (Cont.) LAPACK\_SYSV Procedure Parameters**

Parameter	Description
ipiv	<p>INTEGER array, DIMENSION (ldb, nrhs).</p> <p>Details of the interchanges and the block structure of d, as determined by SSYTRF.</p> <ul style="list-style-type: none"> <li>• If <math>ipiv(k) &gt; 0</math>, then rows and columns k and <math>ipiv(k)</math> were interchanged, and <math>d(k,k)</math> is a 1 by 1 diagonal block.</li> <li>• If <math>uplo = 'U'</math> and <math>ipiv(k) = ipiv(k-1) &lt; 0</math>, then rows and columns k-1 and <math>-ipiv(k)</math> were interchanged and <math>d(k-1:k, k-1:k)</math> is a 2 by 2 diagonal block.</li> <li>• If <math>uplo = 'L'</math> and <math>ipiv(k) = ipiv(k+1) &lt; 0</math>, then rows and columns k+1 and <math>-ipiv(k)</math> were interchanged and <math>d(k:k+1, k:k+1)</math> is a 2 by 2 diagonal block.</li> </ul>
b	<p>UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs).</p> <p>On entry, the n by nrhs matrix of right hand side matrix b.</p> <p>On exit, if <math>info = 0</math>, the n by nrhs solution matrix X.</p>
ldb	<p>The leading dimension of the array b.</p> <p><math>ldb \geq \max(1, n)</math></p>
info	<ul style="list-style-type: none"> <li>• = 0 : successful exit</li> <li>• &lt; 0 : if <math>info = -i</math>, the i-th argument had an illegal value</li> <li>• &gt; 0 : if <math>info = i</math>, <math>d(i,i)</math> is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.</li> </ul>
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>• 'C': column-major (default)</li> <li>• 'R': row-major</li> </ul>

# UTL\_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of UTL\\_RAW Subprograms](#)

## 264.1 UTL\_RAW Overview

This package is necessary because normal SQL functions do not operate on `RAW`s, and PL/SQL does not allow overloading between a `RAW` and a `CHAR` datatype. `UTL_RAW` also includes subprograms that convert various COBOL number formats to, and from, `RAW`s.

`UTL_RAW` is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix `UTL` has been given to the package, instead of `DBMS`.

## 264.2 UTL\_RAW Operational Notes

`UTL_RAW` allows a `RAW` "record" to be composed of many elements. By using the `RAW` datatype, character set conversion will not be performed, keeping the `RAW` in its original format when being transferred through remote procedure calls.

With the `RAW` functions, you can manipulate binary data that was previously limited to the `hexraw` and `rawtohex` functions.

 **Note:**

Notes on datatypes:

- The `PLS_INTEGER` and `BINARY_INTEGER` datatypes are identical. This document uses `BINARY_INTEGER` to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
- The `INTEGER` and `NUMBER(38)` datatypes are also identical. This document uses `INTEGER` throughout.

## 264.3 Summary of UTL\_RAW Subprograms

This table lists the UTL\_RAW subprograms and briefly describes them.

**Table 264-1 UTL\_RAW Package Subprograms**

Subprogram	Description
<a href="#">BIT_AND Function</a>	Performs bitwise logical "and" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "anded" result RAW
<a href="#">BIT_COMPLEMENT Function</a>	Performs bitwise logical "complement" of the values in RAW <i>r</i> and returns the "complement'ed" result RAW
<a href="#">BIT_OR Function</a>	Performs bitwise logical "or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "or'd" result RAW
<a href="#">BIT_XOR Function</a>	Performs bitwise logical "exclusive or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "xor'd" result RAW
<a href="#">CAST_FROM_BINARY_DOUBLE Function</a>	Returns the RAW binary representation of a BINARY_DOUBLE value
<a href="#">CAST_FROM_BINARY_FLOAT Function</a>	Returns the RAW binary representation of a BINARY_FLOAT value
<a href="#">CAST_FROM_BINARY_INTEGER Function</a>	Returns the RAW binary representation of a BINARY_INTEGER value
<a href="#">CAST_FROM_NUMBER Function</a>	Returns the RAW binary representation of a NUMBER value
<a href="#">CAST_TO_BINARY_DOUBLE Function</a>	Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE
<a href="#">CAST_TO_BINARY_FLOAT Function</a>	Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT
<a href="#">CAST_TO_BINARY_INTEGER Function</a>	Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER
<a href="#">CAST_TO_NUMBER Function</a>	Casts the RAW binary representation of a NUMBER into a NUMBER
<a href="#">CAST_TO_NVARCHAR2 Function</a>	Converts a RAW value into a VARCHAR2 value
<a href="#">CAST_TO_RAW Function</a>	Converts a VARCHAR2 value into a RAW value
<a href="#">CAST_TO_VARCHAR2 Function</a>	Converts a RAW value into a VARCHAR2 value
<a href="#">COMPARE Function</a>	Compares RAW <i>r1</i> against RAW <i>r2</i>
<a href="#">CONCAT Function</a>	Concatenates up to 12 RAWs into a single RAW
<a href="#">CONVERT Function</a>	Converts RAW <i>r</i> from character set <i>from_charset</i> to character set <i>to_charset</i> and returns the resulting RAW
<a href="#">COPIES Function</a>	Returns <i>n</i> copies of <i>r</i> concatenated together
<a href="#">LENGTH Function</a>	Returns the length in bytes of a RAW <i>r</i>
<a href="#">OVERLAY Function</a>	Overlays the specified portion of target RAW with overlay RAW, starting from byte position <i>pos</i> of target and proceeding for <i>len</i> bytes
<a href="#">REVERSE Function</a>	Reverses a byte sequence in RAW <i>r</i> from end to end

**Table 264-1 (Cont.) UTL\_RAW Package Subprograms**

Subprogram	Description
<a href="#">SUBSTR Function</a>	Returns <code>len</code> bytes, starting at <code>pos</code> from RAW <code>r</code>
<a href="#">TRANSLATE Function</a>	Translates the bytes in the input RAW <code>r</code> according to the bytes in the translation RAWs <code>from_set</code> and <code>to_set</code>
<a href="#">TRANSLITERATE Function</a>	Converts the bytes in the input RAW <code>r</code> according to the bytes in the transliteration RAWs <code>from_set</code> and <code>to_set</code>
<a href="#">XRANGE Function</a>	Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value <code>start_byte</code> and ending with the value <code>end_byte</code>

## 264.3.1 BIT\_AND Function

This function performs bitwise logical "and" of the values in RAW `r1` with RAW `r2` and returns the "anded" result RAW.

### Syntax

```
UTL_RAW.BIT_AND (
 r1 IN RAW,
 r2 IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-2 BIT\_AND Function Parameters**

Parameter	Description
<code>r1</code>	RAW to "and" with <code>r2</code>
<code>r2</code>	RAW to "and" with <code>r1</code>

### Return Values

**Table 264-3 BIT\_AND Function Return Values**

Return	Description
RAW	Containing the "and" of <code>r1</code> and <code>r2</code>
NULL	Either <code>r1</code> or <code>r2</code> input parameter was NULL

### Usage Notes

If `r1` and `r2` differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 264.3.2 BIT\_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW *r* and returns the complemented result RAW. The result length equals the input RAW *r* length.

### Syntax

```
UTL_RAW.BIT_COMPLEMENT (
 r IN RAW)
 RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-4 BIT\_COMPLEMENT Function Parameters**

Parameter	Description
<i>r</i>	RAW to perform "complement" operation

### Return Values

**Table 264-5 BIT\_COMPLEMENT Function Return Values**

Return	Description
RAW	The "complement" of <i>r1</i>
NULL	If <i>r</i> input parameter was NULL

## 264.3.3 BIT\_OR Function

This function performs bitwise logical "or" of the values in RAW *r1* with RAW *r2* and returns the or'd result RAW.

### Syntax

```
UTL_RAW.BIT_OR (
 r1 IN RAW,
 r2 IN RAW)
 RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 264-6 BIT\_OR Function Parameters**

Parameters	Description
r1	RAW to "or" with r2
r2	RAW to "or" with r1

## Return Values

**Table 264-7 BIT\_OR Function Return Values**

Return	Description
RAW	Containing the "or" of r1 and r2
NULL	Either r1 or r2 input parameter was NULL

## Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 264.3.4 BIT\_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

### Syntax

```
UTL_RAW.BIT_XOR (
 r1 IN RAW,
 r2 IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 264-8 BIT\_XOR Function Parameters**

Parameter	Description
r1	RAW to "xor" with r2
r2	RAW to "xor" with r1

## Return Values

**Table 264-9 BIT\_XOR Function Return Values**

Return	Description
RAW	Containing the "xor" of r1 and r2
NULL	If either r1 or r2 input parameter was NULL

## Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 264.3.5 CAST\_FROM\_BINARY\_DOUBLE Function

This function returns the RAW binary representation of a BINARY\_DOUBLE value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
 n IN BINARY_DOUBLE,
 endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-10 CAST\_FROM\_BINARY\_DOUBLE Function Parameters**

Parameter	Description
n	BINARY_DOUBLE value
endianness	A BINARY_INTEGER value indicating the endianness. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.

## Return Values

The binary representation of the BINARY\_DOUBLE value, or NULL if the input is NULL.

## Usage Notes

- An 8-byte binary\_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
```

```

byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0

```

- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

endianess	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<code>big_endian</code>	db0	db1	db2	db3	db4	db5	db6	db7
<code>little_endian</code>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `BINARY_DOUBLE` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 264.3.6 CAST\_FROM\_BINARY\_FLOAT Function

This function returns the `RAW` binary representation of a `BINARY_FLOAT` value.

### Syntax

```

UTL_RAW.CAST_FROM_BINARY_FLOAT(
 n IN BINARY_FLOAT,
 endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;

```

### Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-11 CAST\_FROM\_BINARY\_FLOAT Function Parameters**

Parameter	Description
<code>n</code>	<code>BINARY_FLOAT</code> value
<code>endianess</code>	A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation (`RAW`) of the `BINARY_FLOAT` value, or `NULL` if the input is `NULL`.

### Usage Notes

- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit 8
byte 3: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

Endianess	rb0	rb1	rb2	rb3
<b>big_endian</b>	fb0	fb1	fb2	fb3
<b>little_endian</b>	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the `BINARY_FLOAT` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 264.3.7 CAST\_FROM\_BINARY\_INTEGER Function

This function returns the `RAW` binary representation of a `BINARY_INTEGER` value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
 n IN BINARY_INTEGER
 endianess IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-12** CAST\_FROM\_BINARY\_INTEGER Function Parameters

Parameter	Description
<code>n</code>	<code>BINARY_INTEGER</code> value.
<code>endianess</code>	A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation of the `BINARY_INTEGER` value.

## 264.3.8 CAST\_FROM\_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

### Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
 n IN NUMBER)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-13** CAST\_FROM\_NUMBER Function Parameters

Parameter	Description
n	NUMBER value

### Return Values

The binary representation of the NUMBER value.

## 264.3.9 CAST\_TO\_BINARY\_DOUBLE Function

This function casts the RAW binary representation of a BINARY\_DOUBLE into a BINARY\_DOUBLE.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
 r IN RAW
 endianess IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-14** CAST\_TO\_BINARY\_DOUBLE Function Parameters

Parameter	Description
r	Binary representation of a BINARY_DOUBLE
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

### Return Values

The BINARY\_DOUBLE value.

### Usage Notes

- If the `RAW` argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is `-0`, `+0` is returned. If the result is `NaN`, the value `BINARY_DOUBLE_NAN` is returned.
- If the `RAW` argument is less than 8 bytes, a `VALUE_ERROR` exception is raised.
- An 8-byte `binary_double` value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

Architecture	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<code>big_endian</code>	db0	db1	db2	db3	db4	db5	db6	db7
<code>little_endian</code>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 264.3.10 CAST\_TO\_BINARY\_FLOAT Function

This function casts the `RAW` binary representation of a `BINARY_FLOAT` into a `BINARY_FLOAT`.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
 r IN RAW
 endianess IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-15 CAST\_TO\_BINARY\_FLOAT Function Parameters**

Parameter	Description
<code>r</code>	Binary representation of a <code>BINARY_FLOAT</code>

**Table 264-15 (Cont.) CAST\_TO\_BINARY\_FLOAT Function Parameters**

Parameter	Description
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

**Return Values**

The BINARY\_FLOAT value.

**Usage Notes**

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY\_FLOAT\_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE\_ERROR exception is raised.
- A 4-byte binary\_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit 8
byte 3: bit 7 ~ bit 0
```

- The parameter endianess describes how the bytes of BINARY\_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY\_FLOAT.

Endianness	rb0	rb1	rb2	rb3
big_endian	fb0	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY\_FLOAT return value. The effect is the same if the user has passed big\_endian on a big-endian machine, or little\_endian on a little-endian machine.

## 264.3.11 CAST\_TO\_BINARY\_INTEGER Function

This function casts the RAW binary representation of a BINARY\_INTEGER into a BINARY\_INTEGER.

**Syntax**

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
 r IN RAW
 endianess IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

**Pragmas**

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 264-16 CAST\_TO\_BINARY\_INTEGER Function Parameters**

Parameter	Description
r	Binary representation of a BINARY_INTEGER
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

## Return Values

The BINARY\_INTEGER value

## 264.3.12 CAST\_TO\_NUMBER Function

This function casts the RAW binary representation of a NUMBER into a NUMBER.

### Syntax

```
UTL_RAW.CAST_TO_NUMBER (
 r IN RAW)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 264-17 CAST\_TO\_NUMBER function Parameters**

Parameter	Description
r	Binary representation of a NUMBER

## Return Values

The NUMBER value.

## 264.3.13 CAST\_TO\_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

### Note:

When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.

**Syntax**

```
UTL_RAW.CAST_TO_NVARCHAR2 (
 r IN RAW)
RETURN NVARCHAR2;
```

**Pragmas**

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

**Parameters****Table 264-18 CAST\_TO\_NVARCHAR2 Function Parameters**

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2)

**Return Values****Table 264-19 CAST\_TO\_NVARCHAR2 Function Return Values**

Return	Description
NVARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

## 264.3.14 CAST\_TO\_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

**Syntax**

```
UTL_RAW.CAST_TO_RAW (
 c IN VARCHAR2)
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

**Parameters****Table 264-20 CAST\_TO\_RAW Function Parameters**

Parameter	Description
c	VARCHAR2 to be changed to a RAW

## Return Values

**Table 264-21 CAST\_TO\_RAW Function Return Values**

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field
NULL	If c input parameter was NULL

## 264.3.15 CAST\_TO\_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

### Note:

When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

### Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
 r IN RAW)
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-22 CAST\_TO\_VARCHAR2 Function Parameters**

Parameter	Description
r	RAW (without leading length field) to be changed to a VARCHAR2

## Return Values

**Table 264-23 CAST\_TO\_VARCHAR2 Function Return Values**

Return	Description
VARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

## 264.3.16 COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional `pad` parameter.

### Syntax

```
UTL_RAW.COMPARE (
 r1 IN RAW,
 r2 IN RAW,
 pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-24 COMPARE Function Parameters**

Parameter	Description
<code>r1</code>	1st RAW to be compared, may be NULL or 0 length
<code>r2</code>	2nd RAW to be compared, may be NULL or 0 length
<code>pad</code>	This is an optional parameter. Byte to extend whichever of <code>r1</code> or <code>r2</code> is shorter. The default: <code>x'00'</code>

### Return Values

**Table 264-25 COMPARE Function Return Values**

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte

## 264.3.17 CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

### Syntax

```
UTL_RAW.CONCAT (
 r1 IN RAW DEFAULT NULL,
 r2 IN RAW DEFAULT NULL,
 r3 IN RAW DEFAULT NULL,
 r4 IN RAW DEFAULT NULL,
 r5 IN RAW DEFAULT NULL,
 r6 IN RAW DEFAULT NULL,
 r7 IN RAW DEFAULT NULL,
 r8 IN RAW DEFAULT NULL,
 r9 IN RAW DEFAULT NULL,
```

```
r10 IN RAW DEFAULT NULL,
r11 IN RAW DEFAULT NULL,
r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

r1...r12 are the RAW items to concatenate.

### Return Values

**Table 264-26** CONCAT Function Return Values

Return	Description
RAW	Containing the items concatenated

### Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

## 264.3.18 CONVERT Function

This function converts RAW *r* from character set *from\_charset* to character set *to\_charset* and returns the resulting RAW.

Both *from\_charset* and *to\_charset* must be supported character sets defined to the Oracle server.

### Syntax

```
UTL_RAW.CONVERT (
 r IN RAW,
 to_charset IN VARCHAR2,
 from_charset IN VARCHAR2)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-27** CONVERT Function Parameters

Parameter	Description
<i>r</i>	RAW byte-string to be converted
<i>to_charset</i>	Name of the character set to which <i>r</i> is converted
<i>from_charset</i>	Name of the character set in which <i>r</i> is supplied

## Return Values

**Table 264-28** CONVERT Function Return Values

Return	Description
RAW	Byte string <i>r</i> converted according to the specified character sets.

## Exceptions

**Table 264-29** CONVERT Function Exceptions

Error	Description
ORA-06502	PL/SQL: numeric or value error
ORA-12703	This character set conversion is not supported
ORA-12705	Cannot access NLS data files or invalid environment specified

## Usage Notes

- The NLS\_LANG parameter form *language\_territory.character set* is also accepted for *to\_charset* and *from\_charset*. However, this form is deprecated and should be avoided. Note that *language* and *territory* are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than  $\text{floor}(32767/4) = 8191$  bytes if you want to avoid this truncation for all possible combinations of *to\_charset* and *from\_charset*. You can use the maximum character width of the target character set *to\_charset*, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is  $\text{floor}(32767/2) = 16383$  bytes. For single-byte target character sets, no truncation is ever necessary.

## 264.3.19 COPIES Function

This function returns *n* copies of *r* concatenated together.

### Syntax

```
UTL_RAW.COPIES (
 r IN RAW,
 n IN NUMBER)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 264-30 COPIES Function Parameters**

Parameters	Description
<i>r</i>	RAW to be copied
<i>n</i>	Number of times to copy the RAW (must be positive)

## Return Values

This returns the RAW copied *n* times.

## Exceptions

**Table 264-31 COPIES Function Exceptions**

Error	Description
VALUE_ERROR	Either: - <i>r</i> is missing, NULL or 0 length - <i>n</i> < 1 - Length of result exceeds maximum length of a RAW

## 264.3.20 LENGTH Function

This function returns the length in bytes of a RAW *r*.

### Syntax

```
UTL_RAW.LENGTH (
 r IN RAW)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 264-32 LENGTH Function Parameters**

Parameter	Description
<i>r</i>	RAW byte stream to be measured

## Return Values

**Table 264-33 LENGTH Function Return Values**

Return	Description
NUMBER	Current length of the RAW

## 264.3.21 OVERLAY Function

This function overlays the specified portion of target RAW with overlay\_str RAW, starting from byte position pos of target and proceeding for len bytes.

### Syntax

```
UTL_RAW.OVERLAY (
 overlay_str IN RAW,
 target IN RAW,
 pos IN BINARY_INTEGER DEFAULT 1,
 len IN BINARY_INTEGER DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-34 OVERLAY Function Parameters**

Parameters	Description
overlay_str	Byte-string used to overlay target
target	Byte-string which is to be overlaid
pos	Position in target (numbered from 1) to start overlay
len	The number of target bytes to overlay
pad	Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length

### Defaults and Optional Parameters

**Table 264-35 OVERLAY Function Optional Parameters**

Optional Parameter	Description
pos	1
len	To the length of overlay_str
pad	x'00'

### Return Values

**Table 264-36 OVERLAY Function Return Values**

Return	Description
RAW	The target byte_string overlaid as specified.

### Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of `target` exceeds the length of `target`, then `target` is extended to contain the entire length of `overlay_str`.

If `len` is specified, it must be greater than or equal to 0. If `pos` is specified, it must be greater than or equal to 1. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

### Exceptions

**Table 264-37 OVERLAY Function Exceptions**

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"> <li>- <code>Overlay_str</code> is NULL or has 0 length</li> <li>- <code>Target</code> is missing or undefined</li> <li>- Length of <code>target</code> exceeds maximum length of a RAW</li> <li>- <code>len</code> &lt; 0</li> <li>- <code>pos</code> &lt; 1</li> </ul>

## 264.3.22 REVERSE Function

This function reverses a byte sequence in RAW `r` from end to end.

For example, `x'0102F3'` would be reversed to `x'F30201'`, and `'xyz'` would be reversed to `'zyx'`. The result length is the same as the input RAW length.

### Syntax

```
UTL_RAW.REVERSE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-38 REVERSE Function Parameters**

Parameter	Description
<code>r</code>	RAW to reverse

## Return Values

**Table 264-39 REVERSE Function Return Values**

Return	Description
RAW	Containing the "reverse" of <i>r</i>

## Exceptions

**Table 264-40 REVERSE Function Exceptions**

Error	Description
VALUE_ERROR	<i>R</i> is NULL or has 0 length

## 264.3.23 SUBSTR Function

This function returns *len* bytes, starting at *pos* from RAW *r*.

### Syntax

```
UTL_RAW.SUBSTR (
 r IN RAW,
 pos IN BINARY_INTEGER,
 len IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-41 SUBSTR Function Parameters**

Parameter	Description
<i>r</i>	RAW byte-string from which a portion is extracted
<i>pos</i>	Byte position in <i>r</i> at which to begin extraction
<i>len</i>	Number of bytes from <i>pos</i> to extract from <i>r</i> (optional)

### Defaults and Optional Parameters

**Table 264-42 SUBSTR Function Optional Parameter**

Optional Parameter	Description
<i>len</i>	Position <i>pos</i> through to the end of <i>r</i>

## Return Values

**Table 264-43 SUBSTR Function Return Values**

Return	Description
portion of <i>r</i>	Beginning at <i>pos</i> for <i>len</i> bytes long
NULL	<i>r</i> input parameter was NULL

## Usage Notes

- If *pos* is positive, then `SUBSTR` counts from the beginning of *r* to find the first byte. If *pos* is negative, then `SUBSTR` counts backward from the end of the *r*. The value *pos* cannot be 0.
- If *len* is omitted, then `SUBSTR` returns all bytes to the end of *r*. The value *len* cannot be less than 1.

## Exceptions

**Table 264-44 SUBSTR Function Exceptions**

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: <ul style="list-style-type: none"> <li>• <i>pos</i> = 0 or &gt; length of <i>r</i></li> <li>• <i>len</i> &lt; 1 or &gt; length of <i>r</i> - (<i>pos</i>-1)</li> </ul>

## 264.3.24 TRANSLATE Function

This function translates the bytes in the input RAW *r* according to the bytes in the translation RAWs *from\_set* and *to\_set*.

If a byte in *r* has a matching byte in *from\_set*, then it is replaced by the byte in the corresponding position in *to\_set*, or deleted.

Bytes in *r*, but undefined in *from\_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from\_set* is used. Subsequent duplicates are not scanned and are ignored.

### Syntax

```
UTL_RAW.TRANSLATE (
 r IN RAW,
 from_set IN RAW,
 to_set IN RAW)
RETURN RAW;
```

#### Note:

Be aware that *to\_set* and *from\_set* are reversed in the calling sequence compared to `TRANSLITERATE`.

## Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 264-45 TRANSLATE Function Parameters**

Parameter	Description
<code>r</code>	RAW source byte-string to be translated
<code>from_set</code>	RAW byte-codes to be translated, if present in <code>r</code>
<code>to_set</code>	RAW byte-codes to which corresponding <code>from_str</code> bytes are translated

## Return Values

**Table 264-46 TRANSLATE Function Return Values**

Return	Description
RAW	Translated byte-string

## Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding translation bytes. Bytes from the input RAW that match any such `from_set` bytes are not translated or included in the result. They are effectively translated to NULL.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

 **Note:**

Differences from the [TRANSLITERATE Function](#):

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

## Exceptions

**Table 264-47 TRANSLATE Function Exceptions**

Error	Description
VALUE_ERROR	Either: - <i>r</i> is NULL or has 0 length - <i>from_set</i> is NULL or has 0 length - <i>to_set</i> is NULL or has 0 length

## 264.3.25 TRANSLITERATE Function

This function converts the bytes in the input RAW *r* according to the bytes in the transliteration RAWs *from\_set* and *to\_set*.

Successive bytes in *r* are looked up in the *from\_set*, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the *to\_set*, or the *pad* byte when no correspondence exists.

Bytes in *r*, but undefined in *from\_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from\_set* is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as *r*.

### Syntax

```
UTL_RAW.TRANSLITERATE (
 r IN RAW,
 to_set IN RAW DEFAULT NULL,
 from_set IN RAW DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

### Note:

Be aware that *to\_set* and *from\_set* are reversed in the calling sequence compared to TRANSLATE.

### Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-48 TRANSLITERATE Function Parameters**

Parameter	Description
<i>r</i>	RAW input byte-string to be converted
<i>to_set</i>	RAW byte-codes to which corresponding <i>from_set</i> bytes are converted (any length)

**Table 264-48 (Cont.) TRANSLITERATE Function Parameters**

Parameter	Description
<code>from_set</code>	RAW byte-codes to be converted, if presenting <code>r</code> (any length)
<code>pad</code>	1 byte used when <code>to_set</code> is shorter than the <code>from_set</code>

**Defaults and Optional Parameters****Table 264-49 TRANSLITERATE Function Optional Parameters**

Optional Parameter	Description
<code>to_set</code>	To the NULL string and effectively extended with <code>pad</code> to the length of <code>from_set</code> as necessary
<code>from_set</code>	<code>x'00'</code> through <code>x'fff'</code>
<code>pad</code>	<code>x'00'</code>

**Return Values****Table 264-50 TRANSLITERATE Function Return Values**

Return	Description
RAW	Converted byte-string.

**Usage Notes**

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such `from_set` bytes are converted in the result to the `pad` byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

 **Note:**Differences from the [TRANSLATE Function](#):

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by `pad` in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

## Exceptions

**Table 264-51** TRANSLITERATE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length

## 264.3.26 XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the `start_byte` value is greater than the `end_byte` value, then the succession of resulting bytes begins with `start_byte`, wraps through `x'FF'` back to `x'00'`, then ends at `end_byte`.

### Syntax

```
UTL_RAW.XRANGE (
 start_byte IN RAW DEFAULT NULL,
 end_byte IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 264-52** XRANGE Function Parameters

Parameters	Description
<code>start_byte</code>	Beginning byte-code value of resulting sequence. The default is <code>x'00'</code> .
<code>end_byte</code>	Ending byte-code value of resulting sequence. The default is <code>x'FF'</code> .

### Return Values

**Table 264-53** XRANGE Function Return Values

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings

# UTL\_RECOMP

The UTL\_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of UTL\\_RECOMP Subprograms](#)

## 265.1 UTL\_RECOMP Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to [RECOMP\\_PARALLEL Procedure](#).

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

## 265.2 UTL\_RECOMP Operational Notes

UTL\_RECOMP has several operational notes.

- This package uses the job queue for parallel recompilation.
- This package must be run using SQL\*PLUS.
- You must be connected AS SYSDBA to run this script.
- This package expects the following packages to have been created with VALID status:
  - STANDARD (standard.sql)
  - DBMS\_STANDARD (dbmsstdx.sql)
  - DBMS\_JOB (dbmsjob.sql)
  - DBMS\_RANDOM (dbmsrand.sql)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

## 265.3 UTL\_RECOMP Examples

These examples show various ways that UTL\_RECOMP can recompile objects.

- Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

- Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

- Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

- Recompile objects in schema JOE using the number of threads specified in the parameter JOB\_QUEUE\_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

## 265.4 Summary of UTL\_RECOMP Subprograms

This table lists the UTL\_RECOMP subprograms and briefly describes them.

**Table 265-1 UTL\_RECOMP Package Subprograms**

Subprogram	Description
<a href="#">RECOMP_PARALLEL Procedure</a>	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
<a href="#">RECOMP_SERIAL Procedure</a>	Recompiles invalid objects in a given schema or all invalid objects in the database

### 265.4.1 RECOMP\_PARALLEL Procedure

This procedure uses the information exposed in the DBA\_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

#### Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
 threads IN PLS_INTEGER DEFAULT NULL,
 schema IN VARCHAR2 DEFAULT NULL,
 flags IN PLS_INTEGER DEFAULT 0);
```

#### Parameters

**Table 265-2 RECOMP\_PARALLEL Procedure Parameters**

Parameter	Description
threads	The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.

**Table 265-2 (Cont.) RECOMP\_PARALLEL Procedure Parameters**

Parameter	Description
flags	Flag values are intended for internal testing and diagnosability only.

**Usage Notes**

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

## 265.4.2 RECOMP\_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

**Syntax**

```
UTL_RECOMP.RECOMP_SERIAL(
 schema IN VARCHAR2 DEFAULT NULL,
 flags IN PLS_INTEGER DEFAULT 0);
```

**Parameters****Table 265-3 RECOMP\_SERIAL Procedure Parameters**

Parameter	Description
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

# 266

## UTL\_REF

The `UTL_REF` package provides PL/SQL procedures to support reference-based operations. Unlike SQL, `UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Summary of UTL\\_REF Subprograms](#)

### 266.1 UTL\_REF Overview

`UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

### 266.2 UTL\_REF Security Model

The procedural option is needed to use this package. This package must be created under `SYS` (`CONNECT /AS SYSDBA`). Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

You can use the `UTL_REF` package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, `UTL_REF` verifies that the invoker has the appropriate privileges to access the object pointed to by the `REF`.

 **Note:**

This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if `UTL_REF` is defined under user `SYS`, and user `A` invokes `UTL_REF.SELECT` to select an object from a reference, then user `A` (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, `UTL_REF` operates with the privileges of the client session under which the PL/SQL execution is being done.

## 266.3 UTL\_REF Types

An object type is a composite datatype defined by the user or supplied as a library type.

You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
 name VARCHAR2(20),
 id NUMBER,

 member function GET_ID
 (name VARCHAR2)
 RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

## 266.4 UTL\_REF Exceptions

Exceptions can be returned during execution of `UTL_REF` functions for various reasons.

For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the `UTL_REF` subprogram must have the proper privilege on the object that is being selected or modified.

**Table 266-1 UTL\_REF Exceptions**

Exceptions	Description
errnum == 942	Insufficient privileges.
errnum == 1031	Insufficient privileges.
errnum == 8177	Unable to serialize, if in a serializable transaction.
errnum == 60	Deadlock detected.
errnum == 1403	No data found (if the REF is NULL, and so on.).

The UTL\_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

## 266.5 Summary of UTL\_REF Subprograms

This table lists the UTL\_REF subprograms and briefly describes them.

**Table 266-2 UTL\_REF Package Subprograms**

Subprogram	Description
<a href="#">DELETE_OBJECT Procedure</a>	Deletes an object given a reference
<a href="#">LOCK_OBJECT Procedure</a>	Locks an object given a reference
<a href="#">SELECT_OBJECT Procedure</a>	Selects an object given a reference
<a href="#">UPDATE_OBJECT Procedure</a>	Updates an object given a reference

### 266.5.1 DELETE\_OBJECT Procedure

This procedure deletes an object given a reference.

The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

#### Syntax

```
UTL_REF.DELETE_OBJECT (
 reference IN REF "<typename>");
```

#### Parameters

**Table 266-3 DELETE\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to delete.

## Exceptions

May be raised.

## Examples

The following example illustrates usage of the UTL\_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address\_t and others...

```

CREATE OR REPLACE TYPE Person_t (
 name VARCHAR2(64),
 gender CHAR(1),
 address Address_t,
 MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
 MEMBER PROCEDURE setAddress(addr IN Address_t) IS
 BEGIN
 address := addr;
 END;
);

CREATE OR REPLACE TYPE Employee_t (

```

Under Person\_t: Simulate implementation of inheritance using a REF to Person\_t and delegation of setAddress to it.

```

 thePerson REF Person_t,
 empno NUMBER(5),
 deptREF Department_t,
 mgrREF Employee_t,
 reminders StringArray_t,
 MEMBER PROCEDURE setAddress(addr IN Address_t),
 MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
 MEMBER PROCEDURE setAddress(addr IN Address_t) IS
 myMgr Employee_t;
 meAsPerson Person_t;
 BEGIN

```

Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:

```

 UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
 meAsPerson.setAddress(addr);

```

Delegate to thePerson:

```

 UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
 if mgr is NOT NULL THEN

```

Give the manager a reminder:

```

 UTL_REF.LOCK_OBJECT(mgr);
 UTL_REF.SELECT_OBJECT(mgr, myMgr);
 myMgr.addReminder
 ('Update address in the employee directory for' ||
 thePerson.name || ', new address: ' || addr.asString);
 UTL_REF.UPDATE_OBJECT(mgr, myMgr);
 END IF;
EXCEPTION
 WHEN OTHERS THEN
 errnum := SQLCODE;
 errmsg := SUBSTR(SQLERRM, 1, 200);

```

## 266.5.2 LOCK\_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object.

The semantic of this subprogram is similar to the following SQL statement:

```

SELECT VALUE(t)
 INTO object
 FROM object_table t
 WHERE REF(t) = reference
 FOR UPDATE;

```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

### Syntax

```

UTL_REF.LOCK_OBJECT (
 reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
 reference IN REF "<typename>",
 object IN OUT "<typename>");

```

### Parameters

**Table 266-4 LOCK\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to lock.
object	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

### Exceptions

May be raised.

## 266.5.3 SELECT\_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.SELECT_OBJECT (
 reference IN REF "<typename>",
 object IN OUT "<typename>");
```

### Parameters

**Table 266-5 SELECT\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference to the object to select or retrieve.
object	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

### Exceptions

May be raised.

## 266.5.4 UPDATE\_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.UPDATE_OBJECT (
 reference IN REF "<typename>",
 object IN "<typename>");
```

### Parameters

**Table 266-6 UPDATE\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to update.
object	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

### **Exceptions**

May be raised.

# UTL\_RPADV

The `UTL_RPADV` package provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment. This package uses the Oracle Replication Performance Advisor to gather statistics.

This chapter contains the following topic:

- [UTL\\_RPADV Overview](#)
- [DBMS\\_COMPARISON Security Model](#)
- [UTL\\_RPADV Operational Notes](#)
- [Summary of UTL\\_RPADV Subprograms](#)

## 267.1 UTL\_RPADV Overview

This package enables you to collect and analyze statistics about the performance or Oracle Replication components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Replication performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

## 267.2 DBMS\_COMPARISON Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Replication administrator and connect as the Oracle Replication administrator when using this package.

## 267.3 UTL\_RPADV Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Replication administrator and run the `utlrpadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlrpadv.sql` script creates the following tables:

- [STREAMS\\$\\_PA\\_COMPONENT Table](#)
- [STREAMS\\$\\_PA\\_COMPONENT\\_LINK Table](#)

- STREAMS\$\_PA\_COMPONENT\_PROP Table
- STREAMS\$\_PA\_COMPONENT\_STAT Table
- STREAMS\$\_PA\_CONTROL Table
- STREAMS\$\_PA\_DATABASE Table
- STREAMS\$\_PA\_DATABASE\_PROP Table
- STREAMS\$\_PA\_MONITORING Table
- STREAMS\$\_PA\_PATH\_BOTTLENECK Table
- STREAMS\$\_PA\_PATH\_STAT Table
- STREAMS\$\_PA\_SHOW\_COMP\_STAT Table
- STREAMS\$\_PA\_SHOW\_PATH\_STAT Table

The Oracle Replication Performance Advisor populates these tables when it is run.

### STREAMS\$\_PA\_COMPONENT Table

The STREAMS\$\_PA\_COMPONENT table displays information about the Oracle Replication components at each database.

**Table 267-1** STREAMS\$\_PA\_COMPONENT Table

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Replication Performance Advisor
COMPONENT_NAME	VARCHAR2 (194)		Name of the component
COMPONENT_DB	VARCHAR2 (128)		Name of the database that contains the component
COMPONENT_TYPE	VARCHAR2 (20)		Type of the component The following types are possible: <ul style="list-style-type: none"> <li>• CAPTURE for a capture process</li> <li>• PROPAGATION SENDER for a propagation sender</li> <li>• PROPAGATION RECEIVER for a propagation receiver</li> <li>• APPLY for an apply process</li> <li>• QUEUE for a queue</li> </ul>
COMPONENT_CHANGED_TIME	DATE		Time when the component was last changed

### STREAMS\$\_PA\_COMPONENT\_LINK Table

The STREAMS\$\_PA\_COMPONENT\_LINK table displays information about how information flows between Oracle Replication components.

**Table 267-2 STREAMS\$\_PA\_COMPONENT\_LINK Table**

Column	Datatype	NULL	Description
PATH_ID	NUMBER	NOT NULL	Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	Source component ID for the path The path starts with this component.
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	Destination component ID for the path The path ends with this component.
POSITION	NUMBER		Position of the component in the path

**STREAMS\$\_PA\_COMPONENT\_PROP Table**

The `STREAMS$_PA_COMPONENT_PROP` table displays information about capture processes and apply processes necessary for analysis by the Replication Performance Advisor.

**Table 267-3 STREAMS\$\_PA\_COMPONENT\_PROP Table**

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Replication Performance Advisor

**Table 267-3 (Cont.) STREAMS\$\_PA\_COMPONENT\_PROP Table**

Column	Datatype	NULL	Description
PROP_NAME	VARCHAR2 ( 30 )		<p>Property name</p> <p>For a capture process, the component properties include the following:</p> <ul style="list-style-type: none"> <li>• SOURCE_DATABASE - The source database for the changes captured by the capture process</li> <li>• PARALLELISM - The setting for the parallelism capture process parameter</li> <li>• OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0)</li> </ul> <p>For an apply process, the component properties include the following:</p> <ul style="list-style-type: none"> <li>• SOURCE_DATABASE - The source database for the messages applied by the apply process</li> <li>• PARALLELISM - The setting for the parallelism apply process parameter</li> <li>• APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO)</li> <li>• MESSAGE_DELIVERY_MODE - Either buffered or persistent</li> </ul>
PROP_VALUE	VARCHAR2 ( 30 )		Property value

**STREAMS\$\_PA\_COMPONENT\_STAT Table**

The STREAMS\$\_PA\_COMPONENT\_STAT table displays performance statistics and session statistics about each Oracle Replication component.

**Table 267-4 STREAMS\$\_PA\_COMPONENT\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was run for the advisor run ID
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic
SUB_COMPONENT_TYP E	VARCHAR2(64)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> <li>LOGMINER READER for a builder server of a capture process</li> <li>LOGMINER PREPARER for a preparer server of a capture process</li> <li>LOGMINER BUILDER for a reader server of a capture process</li> <li>CAPTURE SESSION for a capture process session</li> </ul> The following apply process subcomponent types are possible: <ul style="list-style-type: none"> <li>PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database</li> <li>APPLY READER for a reader server of an apply process</li> <li>APPLY COORDINATOR for a coordinator process of an apply process</li> <li>APPLY SERVER for a reader server of an apply process</li> </ul>
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.

**Table 267-4 (Cont.) STREAMS\$\_PA\_COMPONENT\_STAT Table**

Column	Datatype	NULL	Description
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.

**STREAMS\$\_PA\_CONTROL Table**

The STREAMS\$\_PA\_CONTROL table displays the parameters set for the COLLECT\_STATS procedure in this package. The parameters control the monitoring behavior.

**Table 267-5 STREAMS\$\_PA\_CONTROL Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
PARAM_NAME	VARCHAR2(30)		The name of the parameter
PARAM_VALUE	VARCHAR2(4000)		The value set for the parameter
PARAM_UNIT	VARCHAR2(30)		The unit of the parameter

**STREAMS\$\_PA\_DATABASE Table**

The STREAMS\$\_PA\_DATABASE table displays information about each database that contains Oracle Replication components.

**Table 267-6 STREAMS\$\_PA\_DATABASE Table**

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Replication Performance Advisor
LAST_QUERIED	DATE		The time when the Performance Advisor successfully collected information from a database in its last run
ERROR_NUMBER	NUMBER		The error number of the error encountered when the database was last queried
ERROR_MESSAGE	VARCHAR2(4000)		The error message of the error encountered when the database was last queried

**STREAMS\$\_PA\_DATABASE\_PROP Table**

The STREAMS\$\_PA\_DATABASE\_PROP table displays Oracle Replication database property information necessary for analysis by the Replication Performance Advisor.

**Table 267-7 STREAMS\$\_PA\_DATABASE\_PROP Table**

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Replication Performance Advisor
PROP_NAME	VARCHAR2(30)		Property name The database properties include the following: <ul style="list-style-type: none"> <li>• VERSION</li> <li>• COMPATIBILITY</li> <li>• MANAGEMENT_PACK_ACCESS</li> <li>• DB_UNIQUE_NAME</li> </ul>
PROP_VALUE	VARCHAR2(30)		Property value

**STREAMS\$\_PA\_MONITORING Table**

The STREAMS\$\_PA\_MONITORING table displays information about each monitoring job running in a database.

**Table 267-8 STREAMS\$\_PA\_MONITORING Table**

Column	Datatype	NULL	Description
JOB_NAME	VARCHAR2(30)	NOT NULL	Name of the monitoring job
CLIENT_NAME	VARCHAR2(30)		Name of the client that submitted the job <b>See Also:</b> "Full Monitoring Job Names"
QUERY_USER_NAME	VARCHAR2(30)		User granted privileges to view the monitoring results
SHOW_STATS_TABLE	VARCHAR2(30)		Name of the table used by the SHOW_STATS procedure to display statistics
STARTED_TIME	TIMESTAMP		Time the monitoring job started
STOPPED_TIME	TIMESTAMP		Time the monitoring job last stopped
ALTERED_TIME	TIMESTAMP		Time the monitoring job was last altered
STATE	VARCHAR2(30)		State of the monitoring job, either ENABLED or STOPPED

**STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

The STREAMS\$\_PA\_PATH\_BOTTLENECK table displays information about Oracle Replication components that might be slowing down the flow of messages.

**Table 267-9 STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run

**Table 267-9 (Cont.) STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
ADVISOR_RUN_REASON	VARCHAR2(4000)		Reason for the bottleneck
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
TOP_SESSION_ID	NUMBER		Session ID of the top component. Query the V\$SESSION view for information about the session.
TOP_SESSION_SERIAL#	NUMBER		Session serial number of the top component. Query the V\$SESSION view for information about the session.
ACTION_NAME	VARCHAR2(32)		Action name for the top session
BOTTLENECK_IDENTIFIED	VARCHAR2(30)		Whether a bottleneck was identified

**STREAMS\$\_PA\_PATH\_STAT Table**

The STREAMS\$\_PA\_PATH\_STAT table displays performance statistics about each stream path.

**Table 267-10 STREAMS\$\_PA\_PATH\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was run for the advisor run ID
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Replication Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic

**Table 267-10 (Cont.) STREAMS\$\_PA\_PATH\_STAT Table**

Column	Datatype	NULL	Description
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic

**STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

The STREAMS\$\_PA\_SHOW\_COMP\_STAT table displays statistics for Oracle Replication components.

**Table 267-11 STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
POSITION	NUMBER		Position of the component in the path
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Replication Performance Advisor
COMPONENT_NAME	VARCHAR2(194)		Name of the component
COMPONENT_TYPE	VARCHAR2(30)		Type of the component The following types are possible: <ul style="list-style-type: none"> <li>• CAPTURE for a capture process</li> <li>• PROPAGATION SENDER for a propagation sender</li> <li>• PROPAGATION RECEIVER for a propagation receiver</li> <li>• APPLY for an apply process</li> <li>• QUEUE for a queue</li> </ul>

**Table 267-11 (Cont.) STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

Column	Datatype	NULL	Description
SUB_COMPONENT_TYPE	VARCHAR2(30)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> <li>LOGMINER READER for a builder server of a capture process</li> <li>LOGMINER PREPARER for a preparer server of a capture process</li> <li>LOGMINER BUILDER for a reader server of a capture process</li> <li>CAPTURE SESSION for a capture process session</li> </ul> The following apply process subcomponent types are possible: <ul style="list-style-type: none"> <li>PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database</li> <li>APPLY READER for a reader server of an apply process</li> <li>APPLY COORDINATOR for a coordinator process of an apply process</li> <li>APPLY SERVER for a reader server of an apply process</li> </ul>
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.
STATISTIC_ALIAS	VARCHAR2(30)		Name of the statistic
STATISTIC_NAME	VARCHAR2(128)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(128)		Unit of measurement for the statistic

**STREAMS\$\_PA\_SHOW\_PATH\_STAT Table**

The STREAMS\$\_PA\_SHOW\_PATH\_STAT table displays statistics for the stream paths in an Oracle Replication configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

**Table 267-12** STREAMS\$\_PA\_SHOW\_PATH\_STAT Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Replication Performance Advisor
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Replication Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Replication Performance Advisor was last run
SETTING	VARCHAR2(2000)		Setting for the Oracle Replication Performance Advisor Run
STATISTICS	VARCHAR2(4000)		Component-level statistics
SESSION_STATISTICS	VARCHAR2(4000)		Session-level statistics
OPTIMIZATION	NUMBER		Whether the path uses the combined capture and apply optimization  0 (zero) means that the path does not use the combined capture and apply optimization.  1 means that the path uses the combined capture and apply optimization.

## 267.4 Summary of UTL\_RPADV Subprograms

This table lists the UTL\_RPADV subprograms and briefly describes them.

**Table 267-13** UTL\_RPADV Package Subprograms

Subprogram	Description
<a href="#">ALTER_MONITORING Procedure</a>	Alters the monitoring job submitted by the current user.
<a href="#">COLLECT_STATS Procedure</a>	Uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.
<a href="#">IS_MONITORING Function</a>	Checks whether a monitoring job is currently running.
<a href="#">SHOW_STATS Procedure</a>	Generates output that includes the statistics gathered by the COLLECT_STATS procedure.
<a href="#">SHOW_STATS_HTML Procedure</a>	Generates HTML output that includes the statistics gathered by the COLLECT_STATS procedure.
<a href="#">START_MONITORING Procedure</a>	Starts a monitoring job.
<a href="#">STOP_MONITORING Procedure</a>	Stops a monitoring job.

## 267.4.1 ALTER\_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

### Syntax

```
UTL_RPADV.ALTER_MONITORING(
 interval IN NUMBER DEFAULT NULL,
 top_event_threshold IN NUMBER DEFAULT NULL,
 bottleneck_idle_threshold IN NUMBER DEFAULT NULL,
 bottleneck_flowctrl_threshold IN NUMBER DEFAULT NULL,
 retention_time IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 267-14 ALTER\_MONITORING Procedure Parameters**

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.  If NULL, then the current value is not changed.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected.  The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.  If NULL, then the current value is not changed.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage.  The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.  If NULL, then the current value is not changed.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage.  The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.  If NULL, then the current value is not changed.

**Table 267-14 (Cont.) ALTER\_MONITORING Procedure Parameters**

Parameter	Description
retention_time	The number of hours to retain monitoring results. If NULL, then the current value is not changed.

**Exceptions****Table 267-15 ALTER\_MONITORING Procedure Exceptions**

Exception	Description
ORA-20113	no active monitoring job found

## 267.4.2 COLLECT\_STATS Procedure

This procedure uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

**Note:**

This procedure commits.

**Syntax**

```
UTL_RPADV.COLLECT_STATS(
 interval IN NUMBER DEFAULT 60,
 num_runs IN NUMBER DEFAULT 10,
 comp_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
 path_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
 top_event_threshold IN NUMBER DEFAULT 15,
 bottleneck_idle_threshold IN NUMBER DEFAULT 50,
 bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50);
```

**Parameters****Table 267-16 COLLECT\_STATS Procedure Parameters**

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.
num_runs	The number of times that the Oracle Replication Performance Advisor is run by the procedure.

**Table 267-16 (Cont.) COLLECT\_STATS Procedure Parameters**

Parameter	Description
comp_stat_table	<p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <i>[schema_name]. Object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p>
path_stat_table	<p>The name of the table that stores the statistics collected for stream paths. Specify the table name as <i>[schema_name]. Object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p>
top_event_threshold	<p>A percentage that determines whether a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p>
bottleneck_idle_threshold	<p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>IDLE</code> percentage.</p> <p>The <code>IDLE</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>
bottleneck_flowctrl_threshold	<p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>FLOW CONTROL</code> percentage.</p> <p>The <code>FLOW CONTROL</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p>

### Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

## 267.4.3 IS\_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

### See Also:

["START\\_MONITORING Procedure"](#)

### Syntax

```
UTL_RPADV.IS_MONITORING(
 job_name IN VARCHAR2 DEFAULT 'STREAMS$_MONITORING_JOB',
 client_name IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 267-17 IS\_MONITORING Function Parameters**

Parameter	Description
<code>job_name</code>	The name of the job for which to check.
<code>client_name</code>	The name of the client that submitted the job.

## 267.4.4 SHOW\_STATS Procedure

This procedure generates output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

### Note:

This procedure does not commit.

**See Also:**

- "COLLECT\_STATS Procedure"
- "START\_MONITORING Procedure"

**Syntax**

```
UTL_RPADV.SHOW_STATS(
 path_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_PATH_STAT' ,
 path_id IN NUMBER DEFAULT NULL ,
 bgn_run_id IN NUMBER DEFAULT -1 ,
 end_run_id IN NUMBER DEFAULT -10 ,
 show_path_id IN BOOLEAN DEFAULT TRUE ,
 show_run_id IN BOOLEAN DEFAULT TRUE ,
 show_run_time IN BOOLEAN DEFAULT TRUE ,
 show_optimization IN BOOLEAN DEFAULT TRUE ,
 show_setting IN BOOLEAN DEFAULT FALSE ,
 show_stat IN BOOLEAN DEFAULT TRUE ,
 show_sess IN BOOLEAN DEFAULT FALSE ,
 show_legend IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

**Table 267-18 SHOW\_STATS Procedure Parameters**

Parameter	Description
path_stat_table	The name of the table that contains the stream path statistics. Specify the table name as <i>[schema_name .]object_name</i> . If the schema is not specified, then the current user is the default.  When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS\$_ADVISOR_PATH_STAT.  When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS\$_PA_MONITORING view. The default table for a monitoring job is STREAMS\$_PA_SHOW_PATH_STAT.
path_id	A stream path ID.  If non-NULL, then the procedure shows output for the specified stream path only.  If NULL, then the procedure shows output for all active stream paths.
bgn_run_id	The first Oracle Replication Performance Advisor run ID to show in the range of runs.  See "Usage Notes" for more information about this parameter.
end_run_id	The last Oracle Replication Performance Advisor run ID to show in the range of runs.  See "Usage Notes" for more information about this parameter.

**Table 267-18 (Cont.) SHOW\_STATS Procedure Parameters**

Parameter	Description
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Replication Performance Advisor run ID is included in the output. If FALSE, then the Oracle Replication Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Replication Performance Advisor run time is included in the output. If FALSE, then the Oracle Replication Performance Advisor run time is not included in the output.
show_optimization	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

**Usage Notes**

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

## 267.4.5 SHOW\_STATS\_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

### Note:

This procedure does not commit.

### See Also:

- ["COLLECT\\_STATS Procedure"](#)
- ["START\\_MONITORING Procedure"](#)

### Syntax

```
UTL_RPADV.SHOW_STATS_HTML(
 directory IN VARCHAR2,
 reportname IN VARCHAR2 DEFAULT 'RPADVREPORT.HTML',
 comp_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
 path_id IN NUMBER DEFAULT NULL,
 bgn_run_id IN NUMBER DEFAULT -1,
 end_run_id IN NUMBER DEFAULT -10,
 detailed IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 267-19** SHOW\_STATS\_HTML Procedure Parameters

Parameter	Description
<code>directory</code>	The directory object for the directory on the local computer system into which the generated HTML report is placed The specified directory object must be created using the SQL statement <code>CREATE DIRECTORY</code> , and the user who invokes the procedure must have <code>READ</code> and <code>WRITE</code> privilege on each one.
<code>reportname</code>	The name of the HTML report

**Table 267-19 (Cont.) SHOW\_STATS\_HTML Procedure Parameters**

Parameter	Description
comp_stat_table	<p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <i>[schema_name].object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>comp_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code>.</p> <p>Oracle recommends that you start a monitoring job with the <code>START_MONITORING</code> procedure in this package and use the appropriate the <code>STREAMS\$_PA_SHOW_PATH_STAT</code> table.</p>
path_id	<p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p>
bgn_run_id	<p>The first Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p>
end_run_id	<p>The last Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p>
detailed	<p>If TRUE, then the procedure generates component-level statistics.</p> <p>If FALSE, then the procedure does not generate component-level statistics.</p>

**Usage Notes**

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

## 267.4.6 START\_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the `COLLECT_STATS` procedure to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

### Note:

This procedure commits.

### See Also:

- ["COLLECT\\_STATS Procedure"](#)

### Syntax

```
UTL_RPADV.START_MONITORING(
 job_name IN VARCHAR2 DEFAULT 'STREAMS$_MONITORING_JOB',
 client_name IN VARCHAR2 DEFAULT NULL,
 query_user_name IN VARCHAR2 DEFAULT NULL,
 interval IN NUMBER DEFAULT 60,
 top_event_threshold IN NUMBER DEFAULT 15,
 bottleneck_idle_threshold IN NUMBER DEFAULT 50,
 bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50,
 retention_time IN NUMBER DEFAULT 24);
```

### Parameters

**Table 267-20 START\_MONITORING Procedure Parameters**

Parameter	Description
job_name	The name of the monitoring job to create.
client_name	The name of the client.
query_user_name	The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables.
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the <code>COLLECT_STATS</code> procedure.

**Table 267-20 (Cont.) START\_MONITORING Procedure Parameters**

Parameter	Description
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.
retention_time	The number of hours to retain monitoring results.

### Exceptions

**Table 267-21 START\_MONITORING Procedure Exceptions**

Exception	Description
ORA-20111	cannot start monitoring due to active EM monitoring job Stop the Oracle Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.
ORA-20112	cannot start monitoring due to active Replication monitoring job Stop the Replication monitoring job, and run the START_MONITORING procedure again.

### Usage Notes

The following are usage notes for the START\_MONITORING procedure:

- [Requirements for the User Running the Procedure](#)
- [Full Monitoring Job Names](#)
- [Restrictions on Monitoring Jobs](#)

## Requirements for the User Running the Procedure

The user who runs the `START_MONITORING` procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Replication components.
- The user must have been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

## Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

Setting for <code>client_name</code> Parameter	Setting for <code>job_name</code> parameter	Full Monitoring Job Name
NULL	STREAMS\$_MONITORING_JOB	STREAMS\$_MONITORING_JOB
EM	STREAMS\$_MONITORING_JOB	EMSTREAMS\$_MONITORING_JOB
strm	STREAMS\$_MONITORING_JOB	strmSTREAMS\$_MONITORING_JOB
strm	mjob1	strmmjob1

## Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

## 267.4.7 STOP\_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

### Syntax

```
UTL_RPADV.STOP_MONITORING(
 purge IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 267-22 STOP\_MONITORING Procedure Parameters**

Parameter	Description
purge	If <b>TRUE</b> , then the procedure purges information about the monitoring job from the result tables. If <b>FALSE</b> , then the procedure retains information about the monitoring job in the result tables.

# UTL\_SMTP

The `UTL_SMTP` package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Reply Codes](#)
- [UTL\\_SMTP Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL\\_SMTP Subprograms](#)

## See Also:

*Oracle Database Development Guide*

## 268.1 UTL\_SMTP Overview

The `UTL_SMTP` protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The `UTL_SMTP` package provides interfaces to the SMTP commands.

For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL_SMTP`, all text data (in other words, those in `VARCHAR2`) is converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the `DATA` command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to `RAW` and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.

UTL\_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL\_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

## 268.2 UTL\_SMTP Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

### Note:

For more information on managing fine-grained access, see *Oracle Database Security Guide*

## 268.3 UTL\_SMTP Constants

UTL\_SMTP defines several constants to use when specifying parameter values.

These are shown in the following table.

**Table 268-1 UTL\_SMTP Constants**

Name	Type	Value	Description
ALL_SCHEMES	VARCHAR2(256)	'CRAM-MD5 PLAIN LOGIN'	List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).
NON_CLEARTEXT_PASSWORD_SCHEMES	VARCHAR2(256)	'CRAM-MD5'	List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.

## 268.4 UTL\_SMTP Types

UTL\_SMTP uses a CONNECTION record type and REPLY\_REPLIES record types.

### CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

#### Syntax

```
TYPE connection IS RECORD (
 host VARCHAR2(255),
 port PLS_INTEGER,
 tx_timeout PLS_INTEGER,
 private_tcp_con utl_tcp.connection,
 private_state PLS_INTEGER);
```

#### Fields

**Table 268-2 CONNECTION Record Type Fields**

Field	Description
host	Name of the remote host when connection is established. NULL when no connection is established.
port	Port number of the remote SMTP server connected. NULL when no connection is established.
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
private_tcp_con	Private, for implementation use only. You should not modify this field.
private_state	Private, for implementation use only. You should not modify this field.

#### Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the [OPEN\\_CONNECTION Functions](#). Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

### REPLY\_REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

**Syntax**

```
TYPE reply IS RECORD (
 code PLS_INTEGER,
 text VARCHAR2(508));
```

```
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

**Fields****Table 268-3 REPLY, REPLIES Record Type Fields**

Field	Description
code	3-digit reply code
text	Text message of the reply

## 268.5 UTL\_SMTP Reply Codes

SMTP servers send reply codes that indicate message or server status.

The following is a list of the SMTP reply codes.

**Table 268-4 SMTP Reply Codes**

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; forwards to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF.CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.

**Table 268-4 (Cont.) SMTP Reply Codes**

Reply Code	Meaning
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

## 268.6 UTL\_SMTP Operational Notes

An SMTP connection is initiated by a call to `OPEN_CONNECTION` Functions which returns a SMTP connection.

After a connection is established, the following calls are required to send a mail:

[HELO Function and Procedure](#) - identify the domain of the sender

[MAIL Function and Procedure](#)- start a mail, specify the sender

[RCPT Function](#) - specify the recipient

[OPEN\\_DATA Function and Procedure](#)- start the mail body

[WRITE\\_RAW\\_DATA Procedure](#) - write the mail body (multiple calls allowed)

[CLOSE\\_DATA Function and Procedure](#) - close the mail body and send the mail

The SMTP connection is closed by calling the `QUIT` Function and Procedure.

**Related Topics**

- [OPEN\\_CONNECTION Functions](#)  
These functions open a connection to an SMTP server.
- [QUIT Function and Procedure](#)  
This subprogram terminates an SMTP session and disconnects from the server.

## 268.7 UTL\_SMTP Exceptions

This table lists the exceptions that can be raised by the interface of the UTL\_SMTP package.

The network error is transferred to a reply code of 421- service not available.

**Table 268-5 UTL\_SMTP Exceptions**

Exception	Description
INVALID_OPERATION	Raised when an invalid operation is made. In other words, calling API other than the <a href="#">WRITE_DATA Procedure</a> , the <a href="#">WRITE_RAW_DATA Procedure</a> or the <a href="#">CLOSE_DATA Function and Procedure</a> after the <a href="#">OPEN_DATA Function and Procedure</a> is called, or calling <code>WRITE_DATA</code> , <code>WRITE_RAW_DATA</code> or <code>CLOSE_DATA</code> without first calling <code>OPEN_DATA</code> .
TRANSIENT_ERROR	Raised when receiving a reply code in 400 range
PERMANENT_ERROR	Raised when receiving a reply code in 500 range

## 268.8 UTL\_SMTP Rules and Limits

The API imposes no imitation or range-checking. However, you must be aware of the limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

The following table describes the size limitations encountered by the UTL\_SMTP subprograms.

**Table 268-6 SMTP Size Limitation**

Element	Size Limitation
user	Maximum total length of a user name is 64 characters
domain	Maximum total length of a domain name or number is 64 characters
path	Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)
command line	Maximum total length of a command line including the command word and the <CRLF> is 512 characters
reply line	Maximum total length of a reply line including the reply code and the <CRLF> is 512 characters
text line	Maximum total length of a text line including the <CRLF> is 1000 characters (but not counting the leading dot duplicated for transparency)

**Table 268-6 (Cont.) SMTP Size Limitation**

Element	Size Limitation
recipients buffer	Maximum total number of recipients that must be buffered is 100 recipients

## 268.9 UTL SMTP Examples

This example illustrates how UTL SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```

DECLARE
 c UTL SMTP.CONNECTION;

 PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
 BEGIN
 UTL SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
 END;

BEGIN
 c := UTL SMTP.OPEN_CONNECTION('smtp-server.acme.com');
 UTL SMTP.HELO(c, 'foo.com');
 UTL SMTP.MAIL(c, 'sender@foo.com');
 UTL SMTP.RCPT(c, 'recipient@foo.com');
 UTL SMTP.OPEN_DATA(c);
 send_header('From', '"Sender" <sender@foo.com>');
 send_header('To', '"Recipient" <recipient@foo.com>');
 send_header('Subject', 'Hello');
 UTL SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
 UTL SMTP.CLOSE_DATA(c);
 UTL SMTP.QUIT(c);
EXCEPTION
 WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
 BEGIN
 UTL SMTP.QUIT(c);
 EXCEPTION
 WHEN UTL SMTP.TRANSIENT_ERROR OR UTL SMTP.PERMANENT_ERROR THEN
 NULL; -- When the SMTP server is down or unavailable, we don't have
 -- a connection to the server. The QUIT call raises an
 -- exception that we can ignore.
 END;
 raise_application_error(-20000,
 'Failed to send mail due to the following error: ' || sqlerrm);
END;

```

## 268.10 Summary of UTL SMTP Subprograms

This table lists the UTL SMTP subprograms and briefly describes them.

**Table 268-7 UTL SMTP Package Subprograms**

Subprogram	Description
<a href="#">AUTH Function and Procedure</a>	Sends the AUTH command to authenticate to the SMTP server

**Table 268-7 (Cont.) UTL\_SMTP Package Subprograms**

Subprogram	Description
<a href="#">CLOSE_CONNECTION Procedure</a>	Closes the SMTP connection, causing the current SMTP operation to terminate
<a href="#">CLOSE_DATA Function and Procedure</a>	Closes the data session
<a href="#">COMMAND Function and Procedure</a>	Performs a generic SMTP command
<a href="#">COMMAND_REPLIES Function</a>	Performs a generic SMTP command and retrieves multiple reply lines
<a href="#">DATA Function and Procedure</a>	Sends the e-mail body
<a href="#">EHLO Function and Procedure</a>	Performs the initial handshake with SMTP server using the EHLO command
<a href="#">HELO Function and Procedure</a>	Performs the initial handshake with SMTP server using the HELO command
<a href="#">HELP Function</a>	Sends HELP command
<a href="#">MAIL Function and Procedure</a>	Initiates an e-mail transaction with the server, the destination is a mailbox
<a href="#">NOOP Function and Procedure</a>	NULL command
<a href="#">OPEN_CONNECTION Functions</a>	Opens a connection to an SMTP server
<a href="#">OPEN_DATA Function and Procedure</a>	Sends the DATA command
<a href="#">QUIT Function and Procedure</a>	Terminates an SMTP session and disconnects from the server
<a href="#">RCPT Function</a>	Specifies the recipient of an e-mail message
<a href="#">RSET Function and Procedure</a>	Terminates the current e-mail transaction
<a href="#">STARTTLS Function and Procedure</a>	Sends STARTTLS command to secure the SMTP connection using SSL/TLS
<a href="#">VRFY Function</a>	Verifies the validity of a destination e-mail address
<a href="#">WRITE_DATA Procedure</a>	Writes a portion of the e-mail message
<a href="#">WRITE_RAW_DATA Procedure</a>	Writes a portion of the e-mail message with RAW data

## 268.10.1 AUTH Function and Procedure

This subprogram sends the `AUTH` command to authenticate to the SMTP server. The `UTL_SMTP` package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported.

To determine the schemes the SMTP server supports from its `EHLO` reply, the user must call the [EHLO Function and Procedure](#). Otherwise, `UTL_SMTP` uses the first scheme in the list.

## Syntax

```
UTL_SMTP.AUTH (
 c IN OUT NOCOPY connection,
 username IN VARCHAR2,
 password IN VARCHAR2,
 schemes IN VARCHAR2 DEFAULT NON_CLEARTXT_PASSWORD_SCHEMES)
RETURN reply;
```

```
UTL_SMTP.AUTH (
 c IN OUT NOCOPY connection,
 username IN VARCHAR2,
 password IN VARCHAR2,
 schemes IN VARCHAR2 DEFAULT NON_CLEARTXT_PASSWORD_SCHEMES);
```

## Parameters

**Table 268-8 AUTH Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
username	Username
password	Password
schemes	Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTXT_PASSWORD_SCHEMES constants for suggestions.

## Return Values

**Table 268-9 AUTH Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL\_SMTP.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the [EHLO Function and Procedure](#) again for UTL\_SMTP to update the list after the [STARTTLS Function and Procedure](#) is called.

## Examples

```
DECLARE
 c utl_smtp.connection;
BEGIN
 c := utl_smtp.open_connection(
```

```

 host => 'smtp.example.com',
 port => 25,
 wallet_path => 'file:/oracle/wallets/smtp_wallet',
 wallet_password => 'password',
 secure_connection_before_smtp => FALSE);
UTL_SMTP.STARTTLS(c);
UTL_SMTP.AUTH(
 c => c,
 username => 'scott',
 password => 'password'
 schemes => utl_smtp.all_schemes);
END;
```

## 268.10.2 CLOSE\_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session.

To end the SMTP connection properly, use the [QUIT Function and Procedure](#).

### Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 268-10** CLOSE\_CONNECTION Procedure Parameters

Parameter	Description
c	SMTP connection

## 268.10.3 CLOSE\_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

### Syntax

```
UTL_SMTP.CLOSE_DATA (
 c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 268-11** CLOSE\_DATA Function and Procedure Parameters

Parameter	Description
c	SMTP connection

## Return Values

**Table 268-12 CLOSE\_DATA Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

The calls to OPEN\_DATA, WRITE\_DATA, WRITE\_RAW\_DATA and CLOSE\_DATA must be made in the right order. A program calls OPEN\_DATA to send the DATA command to the SMTP server. After that, it can call WRITE\_DATA or WRITE\_RAW\_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE\_DATA. After OPEN\_DATA is called, the only subprograms that can be called are WRITE\_DATA, WRITE\_RAW\_DATA, or CLOSE\_DATA. A call to other subprograms results in an INVALID\_OPERATION exception being raised.

CLOSE\_DATA must be called only after OPEN\_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE\_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE\_DATA.

## 268.10.4 COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

### Syntax

```
UTL_SMTP.COMMAND (
 c IN OUT NOCOPY connection,
 cmd IN VARCHAR2,
 arg IN VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
 c IN OUT NOCOPY connection,
 cmd IN VARCHAR2,
 arg IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 268-13 COMMAND Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

## Return Values

**Table 268-14** COMMAND Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTI_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## 268.10.5 COMMAND\_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

### Syntax

```
UTL_SMTP.COMMAND_REPLIES (
 c IN OUT NOCOPY connection,
 cmd IN VARCHAR2,
 arg IN VARCHAR2 DEFAULT NULL)
RETURN replies;
```

### Parameters

**Table 268-15** COMMAND\_REPLIES Function Parameters

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

## Return Values

**Table 268-16** COMMAND\_REPLIES Function Return Values

Return Value	Description
replies	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTI_SMTP Types</a> )

## Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## 268.10.6 DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

### Syntax

```
UTL_SMTP.DATA (
 c IN OUT NOCOPY connection
 body IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;
```

```
UTL_SMTP.DATA (
 c IN OUT NOCOPY connection
 body IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 268-17 DATA Function and Procedure Parameters**

Parameter	Description
c	SMTP Connection
body	Text of the message to be sent, including headers, in [RFC822] format

### Return Values

**Table 268-18 DATA Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The `DATA` subprogram must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL` and `RCPT` have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial `DATA` command is not returned to the caller.

## 268.10.7 EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `EHLO` command.

### Syntax

```
UTL_SMTP.EHLO (
 c IN OUT NOCOPY connection,
 domain IN)
RETURN replies;

UTL_SMTP.EHLO (
 c IN OUT NOCOPY connection,
 domain IN);
```

### Parameters

**Table 268-19** EHLO Function and Procedure Parameters

Parameter	Description
<code>c</code>	SMTP connection
<code>domain</code>	Domain name of the local (sending) host. Used for identification purposes.

### Return Values

**Table 268-20** EHLO Function and Procedure Return Values

Return Value	Description
<code>replies</code>	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> ).

### Usage Notes

The `EHLO` interface is identical to `HELO` except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with `HELO`, each line of text returned by the server begins with status code 250.

### Related Functions

[HELO Function and Procedure](#)

## 268.10.8 HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the HELO command.

### Syntax

```
UTL_SMTP.HELO (
 c IN OUT NOCOPY connection,
 domain IN VARCHAR2)
RETURN reply;
```

```
UTL_SMTP.HELO (
 c IN OUT NOCOPY connection,
 domain IN VARCHAR2);
```

### Parameters

**Table 268-21 HELO Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
domain	Domain name of the local (sending) host. Used for identification purposes.

### Return Values

**Table 268-22 HELO Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to [OPEN\\_CONNECTION Functions](#) before calling this routine.

The expected response from the server is a message beginning with status code 250.

### Related Functions

[EHLO Function and Procedure](#)

## 268.10.9 HELP Function

This function sends the `HELP` command.

### Syntax

```
UTL_SMTP.HELP (
 c IN OUT NOCOPY connection,
 command IN VARCHAR2 DEFAULT NULL)
RETURN replies;
```

### Parameters

**Table 268-23 HELP Function Parameters**

Parameter	Description
c	SMTP connection
command	Command to get the help message

### Return Values

**Table 268-24 HELP Function Return Values**

Return Value	Description
replies	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> )

## 268.10.10 MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

### Syntax

```
UTL_SMTP.MAIL (
 c IN OUT NOCOPY connection,
 sender IN VARCHAR2,
 parameters IN VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.MAIL (
 c IN OUT NOCOPY connection,
 sender IN VARCHAR2,
 parameters IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 268-25 MAIL Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

**Table 268-25 (Cont.) MAIL Function and Procedure Parameters**

Parameter	Description
sender	E-mail address of the user sending the message.
parameters	Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ....)".

### Return Values

**Table 268-26 MAIL Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.

## 268.10.11 NOOP Function and Procedure

This subprogram issues the NULL command.

### Syntax

```
UTL_SMTP.NOOP (
 c IN OUT NOCOPY connection)
RETURN reply;
```

```
UTL_SMTP.NOOP (
 c IN OUT NOCOPY connection);
```

### Parameter

**Table 268-27 NOOP Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

## Return Values

**Table 268-28 NOOP Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTI_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN\_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.

## 268.10.12 OPEN\_CONNECTION Functions

These functions open a connection to an SMTP server.

### Syntax

```
UTL_SMTP.OPEN_CONNECTION (
 host IN VARCHAR2,
 port IN PLS_INTEGER DEFAULT 25,
 c OUT connection,
 tx_timeout IN PLS_INTEGER DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE,
 secure_host IN VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (
 host IN VARCHAR2,
 port IN PLS_INTEGER DEFAULT 25,
 tx_timeout IN PLS_INTEGER DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE,
 secure_host IN VARCHAR2 DEFAULT NULL)
RETURN connection;
```

### Parameters

**Table 268-29 OPEN\_CONNECTION Functions Parameters**

Parameter	Description
host	Name of the SMTP server host
port	Port number on which SMTP server is listening (usually 25)
c	SMTP connection

**Table 268-29 (Cont.) OPEN\_CONNECTION Functions Parameters**

Parameter	Description
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <directory-path>
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.
secure_connection_before_smtp	If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.
secure_host	The host name to be matched against the common name (CN) of the SMTP server's certificate when a secure connection is used. It can also be a domain name like "*.example.com". If NULL, the SMTP host name to connect to will be used.

### Return Values

**Table 268-30 OPEN\_CONNECTION Functions Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN\_CONNECTION that returns UTL\_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of OPEN\_CONNECTION that returns REPLY.
- tx\_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx\_timeout from governing write operations in the current release.

### Examples

```
DECLARE
 c utl_smtp.connection;
BEGIN
 c := UTL_SMTP.OPEN_CONNECTION(
 host => 'smtp.example.com',
 port => 465,
```

```
wallet_path => 'file:/oracle/wallets/smtp_wallet',
wallet_password => 'password',
secure_connection_before_smtp => TRUE);
END;
```

## 268.10.13 OPEN\_DATA Function and Procedure

This subprogram sends the `DATA` command after which you can use `WRITE_DATA` and `WRITE_RAW_DATA` to write a portion of the e-mail message.

### Syntax

```
UTL_SMTP.OPEN_DATA (
 c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 268-31 OPEN\_DATA Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in RFC822 format.

### Return Values

**Table 268-32 OPEN\_DATA Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY_ REPLIES Record Types in UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- `OPEN_DATA` must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

## 268.10.14 QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

### Syntax

```
UTL_SMTP.QUIT (
 c IN OUT NOCOPY connection)
RETURN reply;
```

```
UTL_SMTP.QUIT (
 c IN OUT NOCOPY connection);
```

### Parameter

**Table 268-33 QUIT Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

### Return Values

**Table 268-34 QUIT Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The QUIT command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by OPEN\_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is canceled in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE\_HOST and REMOTE\_PORT of c are reset.

### Related Functions

[RSET Function and Procedure](#)

## 268.10.15 RCPT Function

This subprogram specifies the recipient of an e-mail message.

### Syntax

```
UTL_SMTP.RCPT (
 c IN OUT NOCOPY connection,
 recipient IN VARCHAR2,
```

```

 parameters IN VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
 c IN OUT NOCOPY connection,
 recipient IN VARCHAR2,
 parameters IN VARCHAR2 DEFAULT NULL);

```

**Table 268-35 RCPT Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
recipient	E-mail address of the user to which the message is being sent
parameters	Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ...)".

### Return Values

**Table 268-36 RCPT Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY_ REPLIES Record Types in UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

## 268.10.16 RSET Function and Procedure

This subprogram terminates the current mail transaction.

### Syntax

```

UTL_SMTP.RSET (
 c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
 c IN OUT NOCOPY connection);

```

## Parameters

**Table 268-37 RSET Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

## Return Values

**Table 268-38 RSET Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call `RSET` at any time after the connection to the SMTP server has been opened by means of `OPEN_CONNECTION` until `DATA` or `OPEN_DATA` is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to `RSET` with a message beginning with status code 250.

## Related Functions

[QUIT Function and Procedure](#)

## 268.10.17 STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Functions](#).

### Syntax

```
UTL_SMTP.STARTTLS (
 c IN OUT NOCOPY connection,
 secure_host IN VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.STARTTLS (
 c IN OUT NOCOPY connection,
 secure_host IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 268-39 STARTTLS Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
secure_host	The host name to be matched against the common name (CN) of the SMTP server's certificate. It can also be a domain name like "*.example.com".  If NULL, the SMTP host name to connect to will be used.

## Return Values

**Table 268-40 STARTTLS Function and Procedure Return Values**

Return Value	Description
reply	SMTP reply

## Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

## Examples

```
DECLARE
 c utl_smtp.connection;
BEGIN
 c := utl_smtp.open_connection(
 host => 'smtp.example.com',
 port => 25,
 wallet_path => 'file:/oracle/wallets/smtp_wallet',
 wallet_password => 'password',
 secure_connection_before_smtp => FALSE);
 utl_smtp.starttls(c);
END
```

## 268.10.18 VRFY Function

This function verifies the validity of a destination e-mail address.

### Syntax

```
UTL_SMTP.VRFY (
 c IN OUT NOCOPY connection
 recipient IN VARCHAR2)
RETURN reply;
```

## Parameters

**Table 268-41 VRFY Function Parameters**

Parameter	Description
c	SMTP connection
recipient	E-mail address to be verified

## Return Values

**Table 268-42 VRFY Function Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

## 268.10.19 WRITE\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_DATA` appends data to the e-mail message.

### Syntax

```
UTL_SMTP.WRITE_DATA (
 c IN OUT NOCOPY connection,
 data IN VARCHAR2 CHARACTER SET ANY_CS);
```

## Parameters

**Table 268-43 WRITE\_DATA Procedure Parameters**

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

## Usage Notes

- The calls to the [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#)

must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF> . <CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF> . <CR><LF>` (single period) in the body to `<CR><LF> . . <CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be called only after [OPEN\\_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#).
- Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the `EHLO` subprogram, multibyte `VARCHAR2` data can be sent by first converting the text to `RAW` using the `UTL_RAW` package, and then sending the `RAW` data using `WRITE_RAW_DATA`.

## 268.10.20 WRITE\_RAW\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_RAW_DATA` appends data to the e-mail message.

### Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
 c IN OUT NOCOPY connection
 data IN RAW);
```

### Parameters

**Table 268-44** WRITE\_RAW\_DATA Procedure Parameters

Parameter	Description
<code>c</code>	SMTP connection
<code>data</code>	Portion of the text of the message to be sent, including headers, in [RFC822] format

### Usage Notes

- The calls to the [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#)

must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF> . <CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF> . <CR><LF>` (single period) in the body to `<CR><LF> . . <CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be called only after [OPEN\\_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#).

# UTL\_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL\\_TCP Subprograms](#)

## 269.1 UTL\_TCP Overview

The `UTL_TCP` package provides TCP/IP client-side access functionality in PL/SQL.

## 269.2 UTL\_TCP Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

 **Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*

## 269.3 UTL\_TCP Types

The `UTL_TCP` package includes a `CONNECTION` type and a carriage-return line-feed (CRLF) type.

### **CONNECTION Type**

This is a PL/SQL record type used to represent a TCP/IP connection.

## Syntax

```

TYPE connection IS RECORD (
 remote_host VARCHAR2(255),
 remote_port PLS_INTEGER,
 local_host VARCHAR2(255),
 local_port PLS_INTEGER,
 charset VARCHAR2(30),
 newline VARCHAR2(2),
 tx_timeout PLS_INTEGER,
 private_sd PLS_INTEGER);

```

## Fields

**Table 269-1 Connection Record Type Fields**

Field	Description
remote_host	Name of the remote host when connection is established. NULL when no connection is established.
remote_port	Port number of the remote host connected. NULL when no connection is established.
local_host	Name of the local host used to establish the connection. NULL when no connection is established.
local_port	Port number of the local host used to establish the connection. NULL when no connection is established.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

## Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using OPEN\_CONNECTION. Changing the values of those fields has no effect on the connection. The fields private\_XXXX are for implementation use only. You should not modify the values.

In the current release of the UTL\_TCP package, the parameters local\_host and local\_port are ignored when open\_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local\_host and local\_port fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL\_TCP package.

### CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

### Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

### Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

## 269.4 UTL\_TCP Exceptions

UTL\_TCP will raise an exception when it encounters a processing issue.

The exceptions raised by the TCP/IP package are listed in the following table.

**Table 269-2 TCP/IP Exceptions**

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead
END_OF_INPUT	Raised when no more data is available to read from the connection
NETWORK_ERROR	Generic network error
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size)
TRANSFER_TIMEOUT	No data is read and a read time out occurred
PARTIAL_MULTIBYTE_CHARACTER	No complete character is read and a partial multibyte character is found at the end of the input

## 269.5 UTL\_TCP Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

## 269.6 UTL\_TCP Examples

Some possible uses for UTL\_TCP include retrieving a Web page over HTTP or sending an e-mail.

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```

DECLARE
 c utl_tcp.connection; -- TCP/IP connection to the Web server
 ret_val pls_integer;
BEGIN
 c := utl_tcp.open_connection(remote_host => 'www.acme.com',
 remote_port => 80,
 charset => 'US7ASCII'); -- open connection
 ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0'); -- send HTTP request
 ret_val := utl_tcp.write_line(c);
 BEGIN
 LOOP
 dbms_output.put_line(utl_tcp.get_line(c, TRUE)); -- read result
 END LOOP;
 EXCEPTION
 WHEN utl_tcp.end_of_input THEN
 NULL; -- end of input
 END;
 utl_tcp.close_connection(c);
END;

```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```

PROCEDURE send_mail (sender IN VARCHAR2,
 recipient IN VARCHAR2,
 message IN VARCHAR2) IS
 mailhost VARCHAR2(30) := 'mailhost.mydomain.com';
 smtp_error EXCEPTION;
 mail_conn utl_tcp.connection;
 PROCEDURE smtp_command(command IN VARCHAR2,
 ok IN VARCHAR2 DEFAULT '250')
 IS
 response varchar2(3);
 len pls_integer;
 BEGIN
 len := utl_tcp.write_line(mail_conn, command);
 response := substr(utl_tcp.get_line(mail_conn), 1, 3);
 IF (response <> ok) THEN
 RAISE smtp_error;
 END IF;
 END;
END;

BEGIN
 mail_conn := utl_tcp.open_connection(remote_host => mailhost,
 remote_port => 25,
 charset => 'US7ASCII');

```

## 269.7 Summary of UTL\_TCP Subprograms

This table lists the UTL\_TCP subprograms and briefly describes them.

**Table 269-3 UTL\_TCP Package Subprograms**

Subprogram	Description
<a href="#">AVAILABLE</a> Function	Determines the number of bytes available for reading from a TCP/IP connection
<a href="#">CLOSE_ALL_CONNECTIONS</a> Procedure	Closes all open TCP/IP connections
<a href="#">CLOSE_CONNECTION</a> Procedure	Closes an open TCP/IP connection
<a href="#">FLUSH</a> Procedure	Transmits immediately to the server all data in the output buffer, if a buffer is used
<a href="#">GET_LINE</a> Function	Returns the line of data read
<a href="#">GET_LINE_NCHAR</a> Function	Returns the line of data read in NCHAR form
<a href="#">GET_RAW</a> Function	Return the data read instead of the amount of data read
<a href="#">GET_TEXT</a> Function	Returns the text data read
<a href="#">GET_TEXT_NCHAR</a> Function	Returns the text data read in NCHAR form
<a href="#">OPEN_CONNECTION</a> Function	Opens a TCP/IP connection to a specified service
<a href="#">READ_LINE</a> Function	Receives a text line from a service on an open connection
<a href="#">READ_RAW</a> Function	Receives binary data from a service on an open connection
<a href="#">READ_TEXT</a> Function	Receives text data from a service on an open connection
<a href="#">SECURE_CONNECTION</a> Procedure	Secures a TCP/IP connection using SSL/TLS
<a href="#">WRITE_LINE</a> Function	Transmits a text line to a service on an open connection
<a href="#">WRITE_RAW</a> Function	Transmits a binary message to a service on an open connection
<a href="#">WRITE_TEXT</a> Function	Transmits a text message to a service on an open connection

## 269.7.1 AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

### Syntax

```
UTL_TCP.AVAILABLE (
 c IN OUT NOCOPY connection,
 timeout IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

### Parameters

**Table 269-4** AVAILABLE Function Parameters

Parameter	Description
c	TCP connection to determine the amount of data that is available to be read
timeout	Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

### Return Values

The number of bytes available for reading without blocking

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
 c utl_tcp.connection
 data VARCHAR2(256);
 len PLS_INTEGER;
BEGIN
 c := utl_tcp.open_connection(...);
 LOOP
 IF (utl_tcp.available(c) > 0) THEN
 len := utl_tcp.read_text(c, data, 256);
 ELSE
 ---do some other things
```

```

 END IF
 END LOOP;
END;
```

## 269.7.2 CLOSE\_ALL\_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

### Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

### Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

## 269.7.3 CLOSE\_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

### Syntax

```
UTL_TCP.CLOSE_CONNECTION (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 269-5 CLOSE\_CONNECTION Procedure Parameters**

Parameter	Description
c	TCP connection to close

### Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

## 269.7.4 FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

### Syntax

```
UTL_TCP.FLUSH (
 c IN OUT NOCOPY connection);
```

## Parameters

**Table 269-6 FLUSH Procedure Parameters**

Parameter	Description
c	TCP connection to which to send data

## Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## 269.7.5 GET\_LINE Function

This function returns the line of data read.

### Syntax

```
UTL_TCP.GET_LINE (
 c IN OUT NOCOPY connection,
 remove_crlf IN BOOLEAN DEFAULT FALSE,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

## Parameters

**Table 269-7 GET\_LINE Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

## Return Values

The text line read

## Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

## 269.7.6 GET\_LINE\_NCHAR Function

This function returns the line of data read in NCHAR form.

### Syntax

```
UTL_TCP.GET_LINE_NCHAR (
 c IN OUT NOCOPY connection,
 remove_crlf IN BOOLEAN DEFAULT FALSE,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

### Parameters

**Table 269-8 GET\_LINE\_NCHAR Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The text line read

### Usage Notes

- The connection must have already been opened through a call to OPEN\_CONNECTION.
- See READ\_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

## 269.7.7 GET\_RAW Function

This function returns the data read instead of the amount of data read.

### Syntax

```
UTL_TCP.GET_RAW (
 c IN OUT NOCOPY connection,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN RAW;
```

## Parameters

**Table 269-9 GET\_RAW Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.

## Return Values

The binary data read

## Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `read_*` API for character set conversion, buffer size, and multibyte character issues.

## 269.7.8 GET\_TEXT Function

This function returns the text data read.

### Syntax

```
UTL_TCP.GET_TEXT (
 c IN OUT NOCOPY connection,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

## Parameters

**Table 269-10 GET\_TEXT Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
len	Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.

**Table 269-10 (Cont.) GET\_TEXT Function Parameters**

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.

#### Return Values

The text data read

#### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

## 269.7.9 GET\_TEXT\_NCHAR Function

This function returns the text data read in NCHAR form.

#### Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
 c IN OUT NOCOPY connection,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

#### Parameters

**Table 269-11 GET\_TEXT\_NCHAR Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for <code>VARCHAR2</code> ) of data to receive. Default is 1.

**Table 269-11 (Cont.) GET\_TEXT\_NCHAR Function Parameters**

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.

**Return Values**

The text data read

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

## 269.7.10 OPEN\_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

**Syntax**

```
UTL_TCP.OPEN_CONNECTION (
 remote_host IN VARCHAR2,
 remote_port IN PLS_INTEGER,
 local_host IN VARCHAR2 DEFAULT NULL,
 local_port IN PLS_INTEGER DEFAULT NULL,
 in_buffer_size IN PLS_INTEGER DEFAULT NULL,
 out_buffer_size IN PLS_INTEGER DEFAULT NULL,
 charset IN VARCHAR2 DEFAULT NULL,
 newline IN VARCHAR2 DEFAULT CRLF,
 tx_timeout IN PLS_INTEGER DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 RETURN connection;
```

**Parameters**

**Table 269-12 OPEN\_CONNECTION Function Parameters**

Parameter	Description
remote_host	Name of the host providing the service. When <code>remote_host</code> is <code>NULL</code> , it connects to the local host.

**Table 269-12 (Cont.) OPEN\_CONNECTION Function Parameters**

Parameter	Description
remote_port	Port number on which the service is listening for connections
local_host	Name of the host providing the service. NULL means does not care.
local_port	Port number on which the service is listening for connections. NULL means don't care.
in_buffer_size	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
out_buffer_size	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	Time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is <i>file:directory-path</i>
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password may be set to NULL.

**Return Values**

A connection to the targeted TCP/IP service

**Usage Notes**

- Note that connections opened by this UTL\_TCP package can remain open and be passed from one database call to another in a shared server configuration.

However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

- In the current release of the UTL\_TCP package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields is not set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

### Examples

```
DECLARE
 c UTL_TCP.CONNECTION;
BEGIN
 c := UTL_TCP.OPEN_CONNECTION(
 host => 'www.example.com',
 port => 443,
 wallet_path => 'file:/oracle/wallets/smtp_wallet',
 wallet_password => '****');
 UTL_TCP.SECURE_CONNECTION (c => c);
END;
```

## 269.7.11 READ\_LINE Function

This function receives a text line from a service on an open connection.

A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

### Syntax

```
UTL_TCP.READ_LINE (
 c IN OUT NOCOPY connection,
 data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

### Parameters

**Table 269-13 READ\_LINE Function Parameters**

Parameter	Description
<code>c</code>	TCP connection from which to receive data
<code>data</code>	Data received.
<code>remove_crlf</code>	If TRUE, then one or more trailing CRLF characters are removed from the received message.

**Table 269-13 (Cont.) READ\_LINE Function Parameters**

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

**Return Values**

The number of characters of data received

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## 269.7.12 READ\_RAW Function

This function receives binary data from a service on an open connection.

**Syntax**

```
UTL_TCP.READ_RAW (
 c IN OUT NOCOPY connection,
 data IN OUT NOCOPY RAW,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

## Parameters

**Table 269-14 READ\_RAW Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
data (IN OUT COPY)	Data received
len	Number of bytes of data to receive
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

## Return Values

The number of bytes of data received

## Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

## 269.7.13 READ\_TEXT Function

This function receives text data from a service on an open connection.

### Syntax

```
UTL_TCP.READ_TEXT (
 c IN OUT NOCOPY connection,
 data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

## Parameters

**Table 269-15 READ\_TEXT Function Parameters**

Parameter	Description
c	TCP connection from which to receive data

**Table 269-15 (Cont.) READ\_TEXT Function Parameters**

Parameter	Description
<code>data</code>	Data received
<code>len</code>	Number of characters of data to receive
<code>peek</code>	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The number of characters of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a `VARCHAR2` buffer is specified in terms of bytes, while the parameter `len` refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the `VARCHAR2` buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## 269.7.14 SECURE\_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Function](#).

### Syntax

```
UTL_TCP.SECURE_CONNECTION (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 269-16 SECURE\_CONNECTION Procedure Parameters**

Parameter	Description
c	TCP connection from which to receive data

## 269.7.15 WRITE\_LINE Function

This function transmits a text line to a service on an open connection. The newline character sequence is appended to the message before it is transmitted.

### Syntax

```
UTL_TCP.WRITE_LINE (
 c IN OUT NOCOPY connection,
 data IN VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

### Parameters

**Table 269-17 WRITE\_LINE Function Parameters**

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent

### Return Values

The actual number of characters of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

## 269.7.16 WRITE\_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

### Syntax

```
UTL_TCP.WRITE_RAW (
 c IN OUT NOCOPY connection,
 data IN RAW,
 len IN PLS_INTEGER DEFAULT NULL)
RETURN PLS_INTEGER;
```

### Parameters

**Table 269-18** WRITE\_RAW Function Parameters

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent
len	The number of bytes of data to transmit. When len is NULL, the whole length of data is written.

### Return Values

The number of bytes of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## 269.7.17 WRITE\_TEXT Function

This function transmits a text message to a service on an open connection.

### Syntax

```
UTL_TCP.WRITE_TEXT (
 c IN OUT NOCOPY connection,
 data IN VARCHAR2 CHARACTER SET ANY_CS,
 len IN PLS_INTEGER DEFAULT NULL)
RETURN num_chars PLS_INTEGER;
```

### Parameters

**Table 269-19** WRITE\_TEXT Function Parameters

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent

**Table 269-19 (Cont.) WRITE\_TEXT Function Parameters**

Parameter	Description
len	The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition.

**Return Values**

The actual number of characters of data transmitted

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

# UTL\_URL

The `UTL_URL` package has two functions: `ESCAPE` and `UNESCAPE`.

This chapter contains the following topics:

- [Overview](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL\\_URL Subprograms](#)

**See Also:**

[UTL\\_HTTP](#)

## 270.1 UTL\_URL Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP).

For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign (\$), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent ('), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), percentage sign (%), and comma (,)

The `UTL_URL` package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the

URL is used to fetch a Web page by way of the UTL\_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

## 270.2 UTL\_URL Exceptions

UTL\_URL raises an exception when it encounters a processing issue.

The following table lists the exceptions that can be raised when the UTL\_URL package API is invoked.

**Table 270-1 UTL\_URL Exceptions**

Exception	Error Code	Reason
BAD_URL	29262	The URL contains badly formed escape code sequences
BAD_FIXED_WIDT H_CHARSET	29274	Fixed-width multibyte character set is not allowed as a URL character set.

## 270.3 UTL\_URL Examples

UTL\_URL can be used for encoding and decoding.

You can implement the x-www-form-urlencoded encoding using the UTL\_URL.ESCAPE function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
 data IN VARCHAR2,
 charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
 RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the form-URL-encode scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
 data IN VARCHAR2,
 charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
 RETURN utl_url.unescape(
 replace(data, '+', ' '),
 charset);
END;
```

## 270.4 Summary of UTL\_URL Subprograms

This table lists and briefly describes the UTL\_URL subprograms.

**Table 270-2 UTL\_URL Package Subprograms**

Subprogram	Description
<a href="#">ESCAPE Function</a>	Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format
<a href="#">UNESCAPE Function</a>	Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters

## 270.4.1 ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

### Syntax

```
UTL_URL.ESCAPE (
 url IN VARCHAR2 CHARACTER SET ANY_CS,
 escape_reserved_chars IN BOOLEAN DEFAULT FALSE,
 url_charset IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

### Parameters

**Table 270-3 ESCAPE Function Parameters**

Parameter	Description
url	The original URL
escape_reserved_chars	Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.
url_charset	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the UTL_HTTP package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

### Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent ('), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using `escape_url`. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An `escape_url` cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=scott/tiger` into the query string of a URL, escape the `$` and `/` separately as `%24logon=scott%2Ftiger` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://www.acme.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign (\$), and space characters in 'Is the use of the "\$" sign okay?' but not the ? after `search` in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

## 270.4.2 UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

### Syntax

```
UTL_URL.UNESCAPE (
 url IN VARCHAR2 CHARACTER SET ANY_CS,
 url_charset IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

## Parameters

**Table 270-4 UNESCAPE Function Parameters**

Parameter	Description
<code>url</code>	The URL to unescape
<code>url_charset</code>	After a character is unescaped, the character is assumed to be in the <code>source_charset</code> character set and it will be converted from the <code>source_charset</code> to the database character set before the URL is returned. If <code>source_charset</code> is <code>NULL</code> , the database character set is assumed and no character set conversion occurred. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

## Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

# WPG\_DOCLOAD

The `WPG_DOCLOAD` package provides an interface to download files, BLOBS and BFILES.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#)
- [Summary of WPG\\_DOCLOAD Subprograms](#)

## 271.1 WPG\_DOCLOAD Constants

`WPG_DOCLOAD` defines several constants to use when specifying parameter values.

The `WPG_DOCLOAD` constants are listed below:

- `NAME_COL_LEN`
- `MIMET_COL_LEN`
- `MAX_DOCTABLE_NAME_LEN`

### **NAME\_COL\_LEN**

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

### **MIMET\_COL\_LEN**

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

### **MAX\_DOCTABLE\_NAME\_LEN**

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

## 271.2 Summary of WPG\_DOCLOAD Subprograms

The WPG\_DOCLOAD package uses one subprogram, the `DOWNLOAD_FILE` procedure.

**Table 271-1 WPG\_DOCLOAD Package Subprograms**

Subprogram	Description
<a href="#">DOWNLOAD_FILE Procedures</a>	Downloads files, BLOBS and BFILES

### 271.2.1 DOWNLOAD\_FILE Procedures

There are three versions of this download file procedure.

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

#### Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
 p_filename IN VARCHAR2,
 p_bcaching IN BOOLEAN DEFAULT TRUE);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
 p_blob IN OUT NOCOPY BLOB);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
 p_bfile IN OUT BFILE);
```

#### Parameters

**Table 271-2 DOWNLOAD\_FILE Procedure Parameters**

Parameter	Description
<code>p_filename</code>	The file to download from the document table.
<code>p_blob</code>	The BLOB to download.
<code>p_bfile</code>	The BFILE to download (see <a href="#">Usage Notes</a> ).
<code>p_bcaching</code>	Whether browser caching is enabled (see <a href="#">Usage Notes</a> ).

#### Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status

message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bccaching` parameter should be set to `FALSE` to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.

- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

# ANYDATA TYPE

An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- [Restrictions](#)
- [Operational Notes](#)
- [Summary of ANYDATA Subprograms](#)

## 272.1 ANYDATA TYPE Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILES is not currently supported.

## 272.2 ANYDATA TYPE Operational Notes

This section contains notes related to ANYDATA TYPE construction and access.

### Construction

There are 2 ways to construct an ANYDATA. The CONVERT\* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```

STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(inv IN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertUrowid(rid IN UROWID) return ANYDATA,

```

```

STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,

```

The second way to construct an ANYDATA is a piece by piece approach. The [BEGINCREATE Static Procedure](#) call begins the construction process and [ENDCREATE Member Procedure](#) call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET\* calls. For piece by piece access of the attributes of objects and elements of collections, the [PIECEWISE Member Procedure](#) should be invoked prior to GET\* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

### Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```

MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
 DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
 DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
 TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
 TIMEZONE,
MEMBER FUNCTION AccessUrowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,

```

## 272.3 Summary of ANYDATA Subprograms

This table lists the ANYDATA subprograms in alphabetical order and briefly describes them.

**Table 272-1 ANYDATA Type Subprograms**

Subprogram	Description
<a href="#">BEGINCREATE Static Procedure</a>	Begins creation process on a new ANYDATA
<a href="#">ENDCREATE Member Procedure</a>	Ends creation of an ANYDATA
<a href="#">GET* Member Functions</a>	Gets the current data value (which should be of appropriate type)
<a href="#">GETTYPE Member Function</a>	Gets the Type of the ANYDATA
<a href="#">GETTYPENAME Member Function</a>	Get the fully qualified type name for the ANYDATA
<a href="#">PIECEWISE Member Procedure</a>	Sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT)
<a href="#">SET* Member Procedures</a>	Sets the current data value.

## 272.3.1 BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

### Syntax

```
STATIC PROCEDURE BeginCreate(
 dtype IN OUT NOCOPY AnyType,
 adata OUT NOCOPY ANYDATA);
```

### Parameters

**Table 272-2 BEGINCREATE Procedure Parameters**

Parameter	Description
dtype	The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)
adata	ANYDATA being constructed.

### Exception

DBMS\_TYPES.INVALID\_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

### Usage Notes

There is no need to call `PIECEWISE` immediately after this call. The construction process begins in a piece-wise manner automatically.

## 272.3.2 ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE EndCreate(
 self IN OUT NOCOPY ANYDATA);
```

### Parameters

**Table 272-3 ENDCREATE Procedure Parameter**

Parameter	Description
self	An ANYDATA.

## 272.3.3 GET\* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE by which it is accessed (depending on whether the PIECEWISE call is invoked).

If PIECEWISE has NOT been called, the ANYDATA is accessed in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, the ANYDATA is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GetBDouble(
 self IN ANYDATA,
 dbl OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBfile(
 self IN ANYDATA,
 b OUT NOCOPY BFILE)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBFloat(
 self IN ANYDATA,
 fl OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBlob(
 self IN ANYDATA,
 b OUT NOCOPY BLOB)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetChar(
 self IN ANYDATA,
 c OUT NOCOPY CHAR)
```

```
RETURN PLS_INTEGER;

MEMBER FUNCTION GetClob(
 self IN ANYDATA,
 c OUT NOCOPY CLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetCollection(
 self IN ANYDATA,
 col OUT NOCOPY "<collection_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GetDate(
 self IN ANYDATA,
 dat OUT NOCOPY DATE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
 self IN ANYDATA,
 inv OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
 self IN ANYDATA,
 inv OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNchar(
 self IN ANYDATA,
 nc OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNClob(
 self IN ANYDATA,
 nc OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNumber(
 self IN ANYDATA,
 num OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
 self IN ANYDATA,
 nc OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetObject(
 self IN ANYDATA,
 obj OUT NOCOPY "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GetRaw(
 self IN ANYDATA,
 r OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetRef(
 self IN ANYDATA,
 rf OUT NOCOPY REF "<object_type>")
RETURN PLS_INTEGER;
```

```

MEMBER FUNCTION GetTimestamp(
 self IN ANYDATA,
 ts OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
 self IN ANYDATA,
 ts OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
 self IN ANYDATA,
 ts OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
 self IN ANYDATA,
 c OUT NOCOPY VARCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
 self IN ANYDATA,
 c OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;

```

## Parameters

**Table 272-4 GET\* Function Parameter**

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

## Return Values

DBMS\_TYPES.SUCCESS or DBMS\_TYPES.NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

## Exceptions

DBMS\_TYPES.TYPE\_MISMATCH: When the expected type is different from the passed in type.

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage.

## 272.3.4 GETTYPE Member Function

This function gets the typecode of the ANYDATA.

### Syntax

```
MEMBER FUNCTION GETTYPE(
 self IN ANYDATA,
 typ OUT NOCOPY AnyType)
RETURN PLS_INTEGER;
```

### Parameters

**Table 272-5** GETTYPE Function Parameter

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

### Return Values

The typecode corresponding to the type of the ANYDATA.

## 272.3.5 GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema\_name.type\_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

### Syntax

```
MEMBER FUNCTION GETTYPENAME(
 self IN ANYDATA)
RETURN VARCHAR2;
```

### Parameters

**Table 272-6** GETTYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

### Return Values

Type name of the ANYDATA.

## 272.3.6 PIECEWISE Member Procedure

This procedure sets the **MODE** of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the **MODE** of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to `SET*` and `GET*` will sequentially obtain individual attributes or collection elements.

### Syntax

```
MEMBER PROCEDURE PIECEWISE(
 self IN OUT NOCOPY ANYDATA);
```

### Parameters

**Table 272-7** PIECEWISE Procedure Parameters

Parameter	Description
<code>self</code>	The current data value.

### Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`
- `DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

### Usage Notes

The current data value must be of an `OBJECT` or `COLLECTION` type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

## 272.3.7 SET\* Member Procedures

This procedure sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

### Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
 self IN OUT NOCOPY ANYDATA,
 dbl IN BINARY_DOUBLE,
 last_elem IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFILE(
 self IN OUT NOCOPY ANYDATA,
 b IN BFILE,
 last_elem IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFLOAT(
```

```

self IN OUT NOCOPY ANYDATA,
fl IN BINARY_FLOAT,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
self IN OUT NOCOPY ANYDATA,
b IN BLOB,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
self IN OUT NOCOPY ANYDATA,
c IN CHAR,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
self IN OUT NOCOPY ANYDATA,
c IN CLOB,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
self IN OUT NOCOPY ANYDATA,
col IN "<collection_type>",
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
self IN OUT NOCOPY ANYDATA,
dat IN DATE,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALS(
self IN OUT NOCOPY ANYDATA,
inv IN INTERVAL DAY TO SECOND,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
self IN OUT NOCOPY ANYDATA,
inv IN INTERVAL YEAR TO MONTH,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
self IN OUT NOCOPY ANYDATA,
nc IN NCHAR,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
self IN OUT NOCOPY ANYDATA,
nc IN NClob,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
self IN OUT NOCOPY ANYDATA,
num IN NUMBER,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
self IN OUT NOCOPY ANYDATA,
nc IN NVarchar2,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
self IN OUT NOCOPY ANYDATA,

```

```

obj IN "<object_type>",
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
 self IN OUT NOCOPY ANYDATA,
 r IN RAW,
 last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
 self IN OUT NOCOPY ANYDATA,
 rf IN REF "<object_type>",
 last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
 self IN OUT NOCOPY ANYDATA,
 ts IN TIMESTAMP,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(self IN OUT NOCOPY ANYDATA,
 ts IN TIMESTAMP WITH TIME ZONE,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPLTZ(
 self IN OUT NOCOPY ANYDATA,
 ts IN TIMESTAMP WITH LOCAL TIME ZONE,
 last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
 self IN OUT NOCOPY ANYDATA,
 c IN VARCHAR,
 last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
 self IN OUT NOCOPY ANYDATA,
 c IN VARCHAR2,
 last_elem IN boolean DEFAULT FALSE);

```

## Parameters

**Table 272-8 SET\* Procedure Parameters**

Parameter	Description
self	An ANYDATA.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

### Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the `ANYDATA` is a standalone collection, the `SET*` call will set the successive collection elements.

## ANYDATASET TYPE

An `ANYDATASET TYPE` contains a description of a given type plus a set of data instances of that type. An `ANYDATASET` can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- [Construction](#)
- [Summary of ANYDATASET TYPE Subprograms](#)

### 273.1 ANYDATASET TYPE Construction

The `ANYDATASET` needs to be constructed value by value, sequentially.

For each data instance (of the type of the `ANYDATASET`), the `ADDINSTANCE` function must be invoked. This adds a new data instance to the `ANYDATASET`. Subsequently, `SET*` can be called to set each value in its entirety.

The `MODE` of construction/access can be changed to attribute/collection element wise by making calls to `PIECEWISE`.

- If the type of the `ANYDATASET` is `TYPECODE_OBJECT`, individual attributes will be set with subsequent `SET*` calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent `SET*` calls. Likewise on access. This call is very similar to `ANYDATA.PIECEWISE` call defined for the type `ANYDATA`.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

`ENDCREATE` should be called to finish the construction process (before which no access calls can be made).

### 273.2 Summary of ANYDATASET TYPE Subprograms

This table lists the `ANYDATASET` Type subprograms and briefly describes them.

**Table 273-1 ANYDATASET Type Subprograms**

Subprogram	Description
<a href="#">ADDINSTANCE Member Procedure</a>	Adds a new data instance to an <code>ANYDATASET</code> .
<a href="#">BEGINCREATE Static Procedure</a>	Creates a new <code>ANYDATASET</code> which can be used to create a set of data values of the given <code>ANYTYPE</code> .

**Table 273-1 (Cont.) ANYDATASET Type Subprograms**

Subprogram	Description
<a href="#">ENDCREATE Member Procedure</a>	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
<a href="#">GET* Member Functions</a>	Gets the current data value (which should be of appropriate type).
<a href="#">GETCOUNT Member Function</a>	Gets the number of data instances in an ANYDATASET.
<a href="#">GETINSTANCE Member Function</a>	Gets the next instance in an ANYDATASET.
<a href="#">GETTYPE Member Function</a>	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
<a href="#">GETTYPENAME Member Function</a>	Gets the AnyType describing the type of the data instances in an ANYDATASET.
<a href="#">PIECEWISE Member Procedure</a>	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
<a href="#">SET* Member Procedures</a>	Sets the current data value.

## 273.2.1 ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

### Syntax

```
MEMBER PROCEDURE AddInstance(
 self IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 273-2 ADDINSTANCE Procedure Parameter**

Parameter	Description
self	The ANYDATASET being constructed.

### Exceptions

DBMS\_TYPES.invalid\_parameters: Invalid parameters.  
DBMS\_TYPES.incorrect\_usage: On incorrect usage.

### Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call `PIECEWISE` if a piece-wise construction of the instance is intended.

## 273.2.2 BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

### Syntax

```
STATIC PROCEDURE BeginCreate(
 typecode IN PLS_INTEGER,
 rtype IN OUT NOCOPY AnyType,
 aset OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 273-3 BEGINCREATE Procedure Parameter**

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

### Exceptions

DBMS\_TYPES.invalid\_parameters: dtype is invalid (not fully constructed, and like errors.)

## 273.2.3 ENDCREATE Member Procedure

This procedure ends creation of a ANYDATASET. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE ENDCREATE(
 self IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 273-4 ENDCREATE Procedure Parameter**

Parameter	Description
self	The ANYDATASET being constructed.

## 273.2.4 GET\* Member Functions

These functions get the current data value (which should be of the appropriate type).

The type of the current data value depends on the MODE used for accessing it (depending on how the PIECEWISE call is invoked). If PIECEWISE has not been called,

the instance is accessed in its entirety, and the type of the data value should match the type of the ANYDATASET.

If `PIECEWISE` has been called, the instance is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GETBDOUBLE(
 self IN ANYDATASET,
 dbl OUT NOCOPY BINARY_DOUBLE)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFLOAT(
 self IN ANYDATASET,
 fl OUT NOCOPY BINARY_FLOAT)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFILE(
 self IN ANYDATASET,
 b OUT NOCOPY BFILE)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBLOB(
 self IN ANYDATASET,
 b OUT NOCOPY BLOB)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETCHAR(
 self IN ANYDATASET,
 c OUT NOCOPY CHAR)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETCLOB(
 self IN ANYDATASET,
 c OUT NOCOPY CLOB)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETCOLLECTION(
 self IN ANYDATASET,
 col OUT NOCOPY "<collection_type>")
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETDATE(
 self IN ANYDATASET,
 dat OUT NOCOPY DATE)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALDS(
 self IN ANYDATASET,
 inv IN OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(
 self IN ANYDATASET,
 inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETNCHAR(
 self IN ANYDATASET,
```

```
 nc OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
 self IN ANYDATASET,
 nc OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
 self IN ANYDATASET,
 num OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
 self IN ANYDATASET,
 nc OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
 self IN ANYDATASET,
 obj OUT NOCOPY "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETRAW(
 self IN ANYDATASET,
 r OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETREF(
 self IN ANYDATASET,
 rf OUT NOCOPY REF "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
 self IN ANYDATASET,
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPLTZ(
 self IN ANYDATASET,
 ts OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPTZ(
 self IN ANYDATASET,
 ts OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
 self IN ANYDATASET,
 rid OUT NOCOPY UROWID)
RETURN PLS_INTEGER

MEMBER FUNCTION GETVARCHAR(
 self IN ANYDATASET,
 c OUT NOCOPY VARCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
 self IN ANYDATASET,
 c OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;
```

## Parameters

**Table 273-5 GET\* Function Parameters**

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

## Return Values

DBMS\_TYPES.SUCCESS or DBMS\_TYPES.NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

## Exceptions

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage

DBMS\_TYPES.TYPE\_MISMATCH: When the expected type is different from the passed in type.

## 273.2.5 GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

### Syntax

```
MEMBER FUNCTION GetCount(
 self IN ANYDATASET)
RETURN PLS_INTEGER;
```

### Parameter

**Table 273-6 GETCOUNT Function Parameter**

Parameter	Description
self	The ANYDATASET being accessed.

## Return Values

The number of data instances.

## 273.2.6 GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed.

After this function has been called, the GET\* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET\* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

### Syntax

```
MEMBER FUNCTION GETINSTANCE(
 self IN OUT NOCOPY ANYDATASET)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 273-7** GETINSTANCE Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

### Return Values

DBMS\_TYPES.SUCCESS or DBMS\_TYPES.NO\_DATA

DBMS\_TYPES.NO\_DATA signifies the end of the ANYDATASET (all instances have been accessed).

### Usage Notes

This function should be called even before accessing the first instance.

## 273.2.7 GETTYPE Member Function

This function gets the AnyType describing the type of the data instances in an ANYDATASET.

### Syntax

```
MEMBER FUNCTION GETTYPE(
 self IN ANYDATASET,
 typ OUT NOCOPY AnyType)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 273-8** GETTYPE Function Parameter

Parameter	Description
self	The ANYDATASET.

**Table 273-8 (Cont.) GETTYPE Function Parameter**

Parameter	Description
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

**Return Values**

The typecode corresponding to the type of the ANYDATA.

## 273.2.8 GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema\_name.type\_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

**Syntax**

```
MEMBER FUNCTION GETTYPENAME(
 self IN ANYDATASET)
RETURN VARCHAR2;
```

**Parameter**

**Table 273-9 GETTYPENAME Function Parameter**

Parameter	Description
self	The ANYDATASET being constructed.

**Return Values**

Type name of the ANYDATASET.

## 273.2.9 PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE\_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET\* and GET\* calls will sequentially obtain individual attributes or collection elements.

**Syntax**

```
MEMBER PROCEDURE PIECEWISE(
 self IN OUT NOCOPY ANYDATASET);
```

## Parameters

**Table 273-10** **PIECEWISE Procedure Parameter**

Parameter	Description
self	The ANYDATASET being constructed.

## Exceptions

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid parameters.

DBMS\_TYPES.INCORRECT\_USAGE: On incorrect usage.

## Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

## 273.2.10 SET\* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the `MODE` with which we are constructing (depending on how we have invoked the `PIECEWISE` call). The type of the current data should be the type of the `ANYDATASET` if `PIECEWISE` has NOT been called. The type should be the type of the attribute at the current position if `PIECEWISE` has been called.

### Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
 self IN OUT NOCOPY ANYDATASET,
 dbl IN BINARY_DOUBLE,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFLOAT(
 self IN OUT NOCOPY ANYDATASET,
 fl IN BINARY_FLOAT,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFILE(
 self IN OUT NOCOPY ANYDATASET,
 b IN BFILE,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBLOB(
 self IN OUT NOCOPY ANYDATASET,
 b IN BLOB,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETCHAR(
 self IN OUT NOCOPY ANYDATASET,
 c IN CHAR,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETCLOB(
```

```

self IN OUT NOCOPY ANYDATASET,
c IN CLOB,
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
self IN OUT NOCOPY ANYDATASET,
col IN "<collection_type>",
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
self IN OUT NOCOPY ANYDATASET,
dat IN DATE,
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
self IN OUT NOCOPY ANYDATASET,
inv IN INTERVAL DAY TO SECOND,
last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
self IN OUT NOCOPY ANYDATASET,
inv IN INTERVAL YEAR TO MONTH,
last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
self IN OUT NOCOPY ANYDATASET,
nc IN NCHAR,
last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
self IN OUT NOCOPY ANYDATASET,
nc IN NClob,
last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
self IN OUT NOCOPY ANYDATASET,
num IN NUMBER,
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
self IN OUT NOCOPY ANYDATASET,
nc IN NVarchar2,
last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
self IN OUT NOCOPY ANYDATASET,
obj IN "<object_type>",
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
self IN OUT NOCOPY ANYDATASET,
r IN RAW,
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
self IN OUT NOCOPY ANYDATASET,
rf IN REF "<object_type>",
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
self IN OUT NOCOPY ANYDATASET,

```

```

 ts IN TIMESTAMP,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPLTZ(
 self IN OUT NOCOPY ANYDATASET,
 ts IN TIMESTAMP WITH LOCAL TIME ZONE,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPTZ(
 self IN OUT NOCOPY ANYDATASET,
 ts IN TIMESTAMP WITH TIME ZONE,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
 self IN OUT NOCOPY ANYDATASET,
 rid IN UROWID,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE(
 self IN OUT NOCOPY ANYDATASET,
 c IN VARCHAR,
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE2(
 self IN OUT NOCOPY ANYDATASET,
 c IN VARCHAR2,
 last_elem BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 273-11 SET\* Procedure Parameters**

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if <code>PIECEWISE</code> has been already called (for a collection). Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise.

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

# ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERSISTENT` static function.

This chapter discusses the following:

- [Summary of ANYTYPE Subprograms](#)

## 274.1 Summary of ANYTYPE Subprograms

This table lists the `ANYTYPE` subprograms in alphabetical order and briefly describes them.

**Table 274-1** *ANYTYPE Subprograms*

Subprogram	Description
<a href="#">BEGINCREATE Static Procedure</a>	Creates a new instance of <code>ANYTYPE</code> which can be used to create a transient type description.
<a href="#">SETINFO Member Procedure</a>	Sets any additional information required for constructing a <code>COLLECTION</code> or builtin type.
<a href="#">ADDATTR Member Procedure</a>	Adds an attribute to an <code>ANYTYPE</code> (of typecode <code>DBMS_TYPES.TYPECODE_OBJECT</code> ).
<a href="#">ENDCREATE Member Procedure</a>	Ends creation of a transient <code>ANYTYPE</code> . Other creation functions cannot be called after this call.
<a href="#">GETINFO Member Function</a>	Gets the type information for the <code>ANYTYPE</code> .
<a href="#">GETATTRELEMINFO Member Function</a>	Gets the type information for an attribute of the type (if it is of <code>TYPECODE_OBJECT</code> ). Gets the type information for a collection's element type if the <i>self</i> parameter is of a collection type.
<a href="#">GETANYTYPEFROMPERSISTENT Function</a>	This standalone function replaces the old static function <code>GETPERSISTENT</code> . This returns an <code>ANYTYPE</code> corresponding to a persistent type created earlier using the <code>CREATE TYPE SQL</code> statement.

## 274.1.1 BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

### Syntax

```
STATIC PROCEDURE BEGINCREATE(
 typecode IN PLS_INTEGER,
 atype OUT NOCOPY ANYTYPE);
```

### Parameters

**Table 274-2 BEGINCREATE Procedure Parameters**

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: <ul style="list-style-type: none"> <li>DBMS_TYPES.TYPECODE_OBJECT</li> <li>DBMS_TYPES.TYPECODE_VARRAY or</li> <li>DBMS_TYPES.TYPECODE_TABLE</li> </ul> Typecodes for builtin types: <ul style="list-style-type: none"> <li>DBMS_TYPES.TYPECODE_NUMBER, and similar types.</li> </ul>
atype	ANYTYPE for a transient type

## 274.1.2 SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

### Syntax

```
MEMBER PROCEDURE SETINFO(
 self IN OUT NOCOPY ANYTYPE,
 prec IN PLS_INTEGER,
 scale IN PLS_INTEGER,
 len IN PLS_INTEGER,
 csid IN PLS_INTEGER,
 csfrm IN PLS_INTEGER,
 atype IN ANYTYPE DEFAULT NULL,
 elem_tc IN PLS_INTEGER DEFAULT NULL,
 elem_count IN PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 274-3 SETINFO Procedure Parameters**

Parameter	Description
self	The transient ANYTYPE that is being constructed.
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.

**Table 274-3 (Cont.) SETINFO Procedure Parameters**

Parameter	Description
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
atype	Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

**Table 274-4 SETINFO Procedure Parameters - Collection Types**

Parameter	Description
elem_tc	Must be of the collection element's typecode (from DBMS_TYPES package).
elem_count	Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY.

### Exceptions

- DBMS\_TYPES.INVALID\_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

### Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

## 274.1.3 ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS\_TYPES.TYPECODE\_OBJECT).

### Syntax

```
MEMBER PROCEDURE ADDATTR(
 self IN OUT NOCOPY ANYTYPE,
 aname IN VARCHAR2,
 typecode IN PLS_INTEGER,
 prec IN PLS_INTEGER,
```

```

scale IN PLS_INTEGER,
len IN PLS_INTEGER,
csid IN PLS_INTEGER,
csfrm IN PLS_INTEGER,
attr_type IN ANYTYPE DEFAULT NULL);

```

## Parameters

**Table 274-5 ADDATTR Procedure Parameters**

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

## Exceptions

- DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

## 274.1.4 ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

### Syntax

```

MEMBER PROCEDURE ENDCREATE(
 self IN OUT NOCOPY ANYTYPE);

```

**Parameter****Table 274-6 ENDCREATE Procedure Parameter**

Parameter	Description
self	The transient ANYTYPE that is being constructed.

## 274.1.5 GETINFO Member Function

This function gets the type information for the ANYTYPE.

**Syntax**

```
MEMBER FUNCTION GETINFO (
 self IN ANYTYPE,
 prec OUT PLS_INTEGER,
 scale OUT PLS_INTEGER,
 len OUT PLS_INTEGER,
 csid OUT PLS_INTEGER,
 csfrm OUT PLS_INTEGER,
 schema_name OUT VARCHAR2,
 type_name OUT VARCHAR2,
 version OUT varchar2,
 numelems OUT PLS_INTEGER)
RETURN PLS_INTEGER;
```

**Parameters****Table 274-7 GETINFO Function Parameters**

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
numelems	If self is a TYPECODE_VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.

## Return Values

The typecode of *self*.

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

## 274.1.6 GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

### Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
 self IN ANYTYPE,
 pos IN PLS_INTEGER,
 prec OUT PLS_INTEGER,
 scale OUT PLS_INTEGER,
 len OUT PLS_INTEGER,
 csid OUT PLS_INTEGER,
 csfrm OUT PLS_INTEGER,
 attr_elt_type OUT ANYTYPE
 aname OUT VARCHAR2)
RETURN PLS_INTEGER;
```

### Parameters

**Table 274-8** GETATTRELEMINFO Function Parameters

Parameter	Description
<code>self</code>	The ANYTYPE.
<code>pos</code>	If <code>self</code> is of <code>TYPECODE_OBJECT</code> , this gives the attribute position (starting at 1). It is ignored otherwise.
<code>prec</code>	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
<code>scale</code>	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
<code>len</code>	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
<code>csid, csfrm</code>	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.
<code>attr_elt_type</code>	If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the <i>attr_elt_type</i> .
<code>aname</code>	Attribute name (if it is an attribute of an object type, NULL otherwise).

### Return Values

The typecode of the attribute or collection element.

### Exceptions

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

## 274.1.7 GETANYTYPEFROMPERSISTENT Function

This standalone function returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement. Starting with Oracle Database 19c, the GETANYTYPEFROMPERSISTENT function replaces the GETPERISTENT static function.

### Syntax

```
GETANYTYPEFROMPERSISTENT(
 schema_name IN VARCHAR2,
 type_name IN VARCHAR2)
RETURN ANYTYPE;
```

### Parameters

**Table 274-9** GETANYTYPEFROMPERSISTENT Function Parameters

Parameter	Description
schema_name	Schema name of the type.
type_name	Type name.

### Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

# Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)

## See Also:

*Oracle Database Advanced Queuing User's Guide* for information about using Oracle Database Advanced Queuing.

## 275.1 Advanced Queuing (AQ) Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

## 275.2 Oracle Database Advanced Queuing (AQ) Types — Summary of Types

Oracle Database Advanced Queuing (AQ) uses types to specify certain types of information.

- [AQ\\$\\_AGENT](#) Type
- [AQ\\$\\_AGENT\\_LIST\\_T](#) Type
- [AQ\\$\\_DESCRIPTOR](#) Type
- [AQ\\$\\_NTFN\\_DESCRIPTOR](#) Type
- [AQ\\$\\_NTFN\\_MSGID\\_ARRAY](#) Type
- [AQ\\$\\_POST\\_INFO](#) Type
- [AQ\\$\\_POST\\_INFO\\_LIST](#) Type
- [AQ\\$\\_PURGE\\_OPTIONS\\_T](#) Type
- [AQ\\$\\_RECIPIENT\\_LIST\\_T](#) Type
- [AQ\\$\\_REG\\_INFO](#) Type
- [AQ\\$\\_REG\\_INFO\\_LIST](#) Type
- [AQ\\$\\_SUBSCRIBER\\_LIST\\_T](#) Type

- [DEQUEUE\\_OPTIONS\\_T](#) Type
- [ENQUEUE\\_OPTIONS\\_T](#) Type
- [QUEUE\\_PROPS\\_T](#) Type
- [SYS.MSG\\_PROP\\_T](#) Type
- [MESSAGE\\_PROPERTIES\\_T](#) Type
- [MESSAGE\\_PROPERTIES\\_ARRAY\\_T](#) Type
- [MSGID\\_ARRAY\\_T](#) Type

## 275.2.1 AQ\$\_AGENT Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
 name VARCHAR2(512),
 address VARCHAR2(1024),
 protocol NUMBER);
```

### Attributes

**Table 275-1 AQ\$\_AGENT Attributes**

Attribute	Description
name	Name of a producer or consumer of a message. The name must follow object name guidelines in the <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.
address	Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.]queue[@dblink]</code> . For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>db1.net</code> has the address: <code>hr.emp_messages@db1.net</code>
protocol	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.

## 275.2.2 AQ\$\_AGENT\_LIST\_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

 **See Also:**  
"AQ\$\_AGENT Type"

### Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 275.2.3 AQ\$\_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

### See Also:

"MESSAGE\_PROPERTIES\_T Type"

### Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
 queue_name VARCHAR2(261),
 consumer_name VARCHAR2(512),
 msg_id RAW(16),
 msg_prop MSG_PROP_T,
 gen_desc AQ$_NTFN_DESCRIPTOR,
 msgid_array SYS.AQ$_NTFN_MSGID_ARRAY,
 ntfnsRecdInGrp NUMBER);
```

### Attributes

**Table 275-2 AQ\$\_DESCRIPTOR Attributes**

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

## 275.2.4 AQ\$\_NTFN\_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

### Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(ntfn_flags NUMBER)
```

## Attributes

**Table 275-3 AQ\$\_NTFN\_DESCRIPTOR Attributes**

Attribute	Description
ntfn_flags	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

## 275.2.5 AQ\$\_NTFN\_MSGID\_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2<sup>30</sup> which is the max varray size.

### Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY AS VARRAY(1073741824)OF RAW(16);
```

## 275.2.6 AQ\$\_POST\_INFO Type

This type specifies anonymous subscriptions to which you want to post messages.

### Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
 name VARCHAR2(512),
 namespace NUMBER,
 payload RAW(32767));
```

## Attributes

**Table 275-4 AQ\$\_POST\_INFO Attributes**

Attribute	Description
name	Name of the anonymous subscription to which you want to post
namespace	To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS
payload	The payload to be posted to the anonymous subscription

## 275.2.7 AQ\$\_POST\_INFO\_LIST Type

This type identifies the list of anonymous subscriptions to which you want to post messages.

 **See Also:**  
[AQ\\$\\_POST\\_INFO Type](#)

### Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

## 275.2.8 AQ\$\_PURGE\_OPTIONS\_T Type

This type specifies the options available for purging a queue table.

 **See Also:**  
[PURGE\\_QUEUE\\_TABLE Procedure.](#)

### Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
 block BOOLEAN DEFAULT FALSE
 delivery_mode PLS_INTEGER DEFAULT PERSISTENT);
```

**Table 275-5 AQ\$\_PURGE\_OPTIONS\_T Type Attributes**

Attribute	Description
block	TRUE/FALSE. <ul style="list-style-type: none"> <li>If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>.</li> <li>The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</li> </ul>
delivery_mode	Kind of messages to purge, either <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code>

## 275.2.9 AQ\$\_RECIPIENT\_LIST\_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

 **See Also:**  
"AQ\$\_AGENT Type"

### Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 275.2.10 AQ\$\_REG\_INFO Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
 name VARCHAR2(512),
 namespace NUMBER,
 callback VARCHAR2(4000),
 context RAW(2000) DEFAULT NULL,
 anyctx ANYDATA,
 ctxtype NUMBER,
 payloadcbk VARCHAR2(4000),
 timeout NUMBER,
 ntfn_grouping_class NUMBER,
 ntfn_grouping_value NUMBER DEFAULT 600,
 ntfn_grouping_type NUMBER,
 ntfn_grouping_start_time TIMESTAMP(6) WITH TIME ZONE,
 ntfn_grouping_repeat_count NUMBER);
```

### Attributes

**Table 275-6 AQ\$\_REG\_INFO Type Attributes**

Attribute	Description
name	Specifies the name of the subscription. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queues.

Table 275-6 (Cont.) AQ\$\_REG\_INFO Type Attributes

Attribute	Description
namespace	Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code> . To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> .
callback	Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code> . For e-mail notifications, use <code>mailto://xyz@company.com</code> . For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code> . For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code> .
context	Specifies the context that is to be passed to the callback function
anyctx	Specifies the <code>ANYDATA</code> type context that is passed to the callback function
ctxtype	Specifies the context type. Valid values are 0 ( <code>RAW</code> ) or 1 ( <code>ANYDATA</code> )
payloadcbk	Specifies payload for the callback function
timeout	Specifies the time in seconds
ntfn_grouping_class	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If <code>ntfn_grouping_class</code> is 0, all other notification grouping attributes must be 0. <ul style="list-style-type: none"> <li>• <code>NTFN_GROUPING_CLASS_TIME</code> - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.</li> </ul>
ntfn_grouping_value	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until <code>ntfn_grouping_repeat_count</code> is exhausted.
ntfn_grouping_type	<ul style="list-style-type: none"> <li>• <code>NTFN_GROUPING_TYPE_SUMMARY</code> - Summary of all notifications that occurred in the time interval. (Default)</li> <li>• <code>NTFN_GROUPING_TYPE_LAST</code> - Last notification that occurred in the interval.</li> </ul>

**Table 275-6 (Cont.) AQ\$\_REG\_INFO Type Attributes**

Attribute	Description
ntfn_grouping_start_time	Notification grouping start time. Notification grouping can start from a user-specified time that should be a valid timestamp with time zone. If ntnfn_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone
ntfn_grouping_repeat_count	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntnfn_grouping_repeat_count, if not specified, will default to <ul style="list-style-type: none"> <li>• NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.</li> </ul>

**Usage Notes**

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

[Table 275-7](#) shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. [Table 275-8](#) shows the actions performed when XML presentation is specified.

**Table 275-7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified**

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

**Table 275-8 Actions Performed for Nonpersistent Queues When XML Presentation Specified**

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
Oracle object type	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

## 275.2.11 AQ\$\_REG\_INFO\_LIST Type

Identifies the list of registrations to a queue.

 **See Also:**  
"AQ\$\_REG\_INFO Type"

### Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

## 275.2.12 AQ\$\_SUBSCRIBER\_LIST\_T Type

This type identifies the list of subscribers that subscribe to a queue.

 **See Also:**  
"AQ\$\_AGENT Type"

### Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 275.2.13 DEQUEUE\_OPTIONS\_T Type

DEQUEUE\_OPTIONS\_T specifies the options available for the dequeue operation.

### Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
 consumer_name VARCHAR2(30) DEFAULT NULL,
 dequeue_mode BINARY_INTEGER DEFAULT REMOVE,
 navigation BINARY_INTEGER DEFAULT NEXT_MESSAGE,
 visibility BINARY_INTEGER DEFAULT ON_COMMIT,
 wait BINARY_INTEGER DEFAULT FOREVER,
 msgid RAW(16) DEFAULT NULL,
 correlation VARCHAR2(128) DEFAULT NULL,
 deq_condition VARCHAR2(4000) DEFAULT NULL,
 signature aq$_sig_prop DEFAULT NULL,
 transformation VARCHAR2(61) DEFAULT NULL,
 delivery_mode PLS_INTEGER DEFAULT PERSISTENT);
```

## Attributes

**Table 275-9 DEQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
consumer_name	<p>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL.</p> <p>For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.</p>
dequeue_mode	<p>Specifies the locking behavior associated with the dequeue. Possible settings are:</p> <p><b>BROWSE:</b> Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</p> <p><b>LOCKED:</b> Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.</p> <p><b>REMOVE:</b> Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p><b>REMOVE_NODATA:</b> Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</p>
navigation	<p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</p> <p><b>NEXT_MESSAGE:</b> Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p><b>NEXT_TRANSACTION:</b> Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</p> <p><b>FIRST_MESSAGE:</b> Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p><b>FIRST_MESSAGE_MULTI_GROUP:</b> indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p> <p><b>NEXT_MESSAGE_MULTI_GROUP:</b> indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p>

Table 275-9 (Cont.) DEQUEUE\_OPTIONS\_T Attributes

Attribute	Description
visibility	<p>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are:</p> <p>ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default.</p> <p>IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</p>
wait	<p>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</p> <p>FOREVER: Wait forever. This setting is the default.</p> <p>NO_WAIT: Do not wait.</p> <p>number: Wait time in seconds.</p>
msgid	Specifies the message identifier of the message to be dequeued.
correlation	<p>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</p>
deq_condition	<p>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</p> <p>A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corrid and other columns in the queue table</p> <p>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</p>
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be BUFFERED or PERSISTENT or PERSISTENT_OR_BUFFERED. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

## 275.2.14 ENQUEUE\_OPTIONS\_T Type

ENQUEUE\_OPTIONS\_T Type specifies the options available for the enqueue operation.

### Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
 visibility BINARY_INTEGER DEFAULT ON_COMMIT,
 relative_msgid RAW(16) DEFAULT NULL,
 sequence_deviation BINARY_INTEGER DEFAULT NULL,
 transformation VARCHAR2(61) DEFAULT NULL,
 delivery_mode PLS_INTEGER NOT NULL DEFAULT PERSISTENT);
```

### Attributes

**Table 275-10 ENQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
visibility	Specifies the transactional behavior of the enqueue request. Possible settings are:  ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default.  IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueueing to a non-persistent queue.
relative_msgid	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.
sequence_deviation	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are:  BEFORE: The message is enqueued ahead of the message specified by relative_msgid.  TOP: The message is enqueued ahead of any other messages.
transformation	Specifies a transformation that will be applied before enqueueing the message. The return type of the transformation function must match the type of the queue.
delivery_mode	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

## 275.2.15 QUEUE\_PROPS\_T Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

### Syntax

```
TYPE QUEUE_PROPS_T IS RECORD (
 retry_delay NUMBER DEFAULT 0,
 retention_time NUMBER DEFAULT 0,
 sort_list VARCHAR2(30) DEFAULT NULL,
 cache_hint BINARY_INTEGER DEFAULT AUTO
);
```

### Attributes

**Table 275-11** QUEUE\_PROPS\_T Attributes

Attribute	Description
retry_delay	Specifies the number of seconds after which this message is scheduled for processing again after an application rollback
retention_time	Specifies the number of seconds a message is retained in the queue table after being dequeued from the queue
sort_list	Sharded queues can be sorted by ENQ_TIME or PRIORITY, ENQ_TIME .
cache_hint	Specifies a hint to sharded queue whether to cache messages or not. User can specify following: <ul style="list-style-type: none"> <li>UNCACHED: Message cache will not cache messages</li> <li>CACHED: Message cache will cache messages and give preference to those queues with CACHED hint.</li> <li>AUTO: Message cache does best effort based on available memory</li> </ul>

## 275.2.16 SYS.MSG\_PROP\_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

### Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
 priority NUMBER,
 delay NUMBER,
 expiration NUMBER,
 correlation VARCHAR2(128),
 attempts NUMBER,
 exception_queue VARCHAR2(51),
 enqueue_time DATE,
 state NUMBER,
 sender_id aq$_agent,
 original_msgid RAW(16),
 delivery_mode NUMBER);
```

Parameters

**Table 275-12 SYS.MSG\_PROP\_T Type Attributes**

Parameter	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: <code>NO_DELAY</code> : The message is available for immediate dequeuing number: The number of seconds to delay the message
expiration	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: <code>NEVER</code> : The message does not expire number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

Table 275-12 (Cont.) SYS.MSG\_PROP\_T Type Attributes

Parameter	Description
exception_queue	<p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> <li>RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.</li> </ul> <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</p> <ul style="list-style-type: none"> <li>A message was not dequeued before the expiration time elapsed.</li> <li>Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> <li>* There were no recipients for the multiconsumer destination queue.</li> <li>* Recipients were specified for a single-consumer destination queue.</li> <li>* Destination queue was an exception queue</li> <li>* There was an error when applying transformation.</li> </ul> </li> </ul> <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</p>
enqueue_time	<p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> <li>DBMS_AQ.READY: The message is ready to be processed.</li> <li>DBMS_AQ.WAITING: The message delay has not yet been reached.</li> <li>DBMS_AQ.PROCESSED: The message has been processed and is retained.</li> <li>DBMSAQ.EXPIRED: The message has been moved to the exception queue.</li> </ul>

**Table 275-12 (Cont.) SYS.MSG\_PROP\_T Type Attributes**

Parameter	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

## 275.2.17 MESSAGE\_PROPERTIES\_T Type

This type is defined inside the DBMS\_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

**See Also:**

[AQ\\$\\_RECIPIENT\\_LIST\\_T Type](#)

### Syntax

```
TYPE message_properties_t IS RECORD (
 priority BINARY_INTEGER NOT NULL DEFAULT 1,
 delay BINARY_INTEGER NOT NULL DEFAULT NO_DELAY,
 expiration BINARY_INTEGER NOT NULL DEFAULT NEVER,
 correlation VARCHAR2(128) DEFAULT NULL,
 attempts BINARY_INTEGER,
 recipient_list AQ$_RECIPIENT_LIST_T,
 exception_queue VARCHAR2(61) DEFAULT NULL,
 enqueue_time DATE,
 state BINARY_INTEGER,
 sender_id SYS.AQ$_AGENT DEFAULT NULL,
 original_msgid RAW(16) DEFAULT NULL,
 signature aq$_sig_prop DEFAULT NULL,
 transaction_group VARCHAR2(30) DEFAULT NULL,
 user_property SYS.ANYDATA DEFAULT NULL,
 delivery_mode PLS_INTEGER NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```

## Attributes

**Table 275-13 MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: <code>NO_DELAY</code> : The message is available for immediate dequeuing number: The number of seconds to delay the message
expiration	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: <code>NEVER</code> : The message does not expire number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
recipient_list	This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the " <a href="#">AQ\$_AGENT Type</a> ".

**Table 275-13 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
exception_queue	<p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> <li>• <code>RETRY_COUNT</code>, the number of unsuccessful dequeue attempts, has exceeded the specification for the <code>MAX_RETRIES</code> parameter in the <code>DBMS_AQADM.CREATE_QUEUE</code> procedure during queue creation.</li> </ul> <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the <code>MAX_RETRIES</code> parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than <code>MAX_RETRIES</code>. You can view <code>MAX_RETRIES</code> for a queue in the <code>ALL_QUEUES</code> data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p> <ul style="list-style-type: none"> <li>• A message was not dequeued before the expiration time elapsed.</li> <li>• Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> <li>* There were no recipients for the multiconsumer destination queue.</li> <li>* Recipients were specified for a single-consumer destination queue.</li> <li>* Destination queue was an exception queue</li> <li>* There was an error when applying transformation.</li> </ul> </li> </ul> <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a <code>NULL</code> value at dequeue time.</p>
enqueue_time	<p>The <code>enqueue_time</code> attribute specifies the time the message was enqueued. This value is always in Universal Coordinated Time (UTC), and is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> <li>• <code>DBMS_AQ.READY</code>: The message is ready to be processed.</li> <li>• <code>DBMS_AQ.WAITING</code>: The message delay has not yet been reached.</li> <li>• <code>DBMS_AQ.PROCESSED</code>: The message has been processed and is retained.</li> <li>• <code>DBMSAQ.EXPIRED</code>: The message has been moved to the exception queue.</li> </ul>

**Table 275-13 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
sender_id	<p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call. Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the <code>source_queue</code>, source database name if it was a remote database [format <code>source_queue@source_database_name</code>]</p>
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
signature	Currently not implemented
transaction_group	Specifies the <code>transaction_group</code> for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the <code>DBMS_AQ.DEQUEUE_ARRAY</code> . This attribute cannot be used to set the transaction group of a message through <code>DBMS_AQ.ENQUEUE</code> or <code>DBMS_AQ.ENQUEUE_ARRAY</code> calls.
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	The message publisher specifies the delivery mode in the <code>message_properties</code> . This can be <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code> . Array enqueue is only supported for buffered messages with an array size of '1'.

## 275.2.18 MESSAGE\_PROPERTIES\_ARRAY\_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties.

Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T` VARRAY.

**See Also:**

["MESSAGE\\_PROPERTIES\\_T Type"](#)

### Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
OF MESSAGE_PROPERTIES_T;
```

## 275.2.19 MSGID\_ARRAY\_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

### Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

# DBFS Content Interface Types

DBFS Content Interface Types are public types that support the `DBMS_DBFS_CONTENT` interface.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Data Structures](#)

## Related Topics

- [DBMS\\_DBFS\\_CONTENT](#)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## 276.1 DDBFS Content Interface Types Overview

The type definitions described in this chapter support the `DBMS_DBFS_CONTENT` interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

## 276.2 DBFS Content Interface Types Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) with the `DBFS_ROLE`. This role can be granted to users as needed.

## 276.3 DBFS Content Interface Types —Data Structures

Types that support the `DBMS_DBFS_CONTENT` interface include both Object and Table types.

### Object Types

- [DBMS\\_DBFS\\_CONTENT\\_CONTEXT\\_T](#) Object Type
- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T](#) Object Type
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T](#) Object Type

### Table Types

- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T](#) Table Type
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTIES\\_T](#) Table Type
- [DBMS\\_DBFS\\_CONTENT\\_RAW\\_T](#) Table Type

## 276.3.1 DBMS\_DBFS\_CONTENT\_CONTEXT\_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
 AUTHID DEFINER
AS OBJECT (
 principal VARCHAR2(32),
 acl VARCHAR2(1024),
 owner VARCHAR2(32),
 asof TIMESTAMP,
 read_only INTEGER);
```

### Fields

**Table 276-1** DBMS\_DBFS\_CONTENT\_CONTEXT\_T Fields

Field	Description
<code>principal</code>	File system user
<code>acl</code>	Access control list
<code>owner</code>	Path item owner
<code>asof</code>	Timestamp
<code>read_only</code>	Nonzero if the path item is read-only

## 276.3.2 DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Object Type

This type describes a type to assist in listing the contents of a directory.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
 AUTHID DEFINER
AS OBJECT (
 path VARCHAR2(1024),
 item_name VARCHAR2(256),
 item_type INTEGER);
```

### Fields

**Table 276-2** DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Fields

Field	Description
<code>path</code>	Path to the path item
<code>item_name</code>	Name of the path item

**Table 276-2 (Cont.) DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Fields**

Field	Description
item_type	Type of path item. (See <a href="#">Table 50-4</a> )

### 276.3.3 DBMS\_DBFS\_CONTENT\_PROPERTY\_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS\_DBFS\_CONTENT interface.

#### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
AUTHID DEFINER
AS OBJECT (
 propname VARCHAR2(32),
 propvalue VARCHAR2(1024),
 typecode INTEGER);
```

#### Fields

**Table 276-3 DBMS\_DBFS\_CONTENT\_PROPERTY\_T Fields**

Field	Description
prop_name	Name of property
prop_value	Value of property
typecode	Property type (See Constants in DBMS_TYPES)

### 276.3.4 DBMS\_DBFS\_CONTENT\_LIST\_ITEMS\_T Table Type

This type is a variable-sized array of DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS\_DBFS\_CONTENT interface.

#### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
TABLE OF dbms_dbfs_content_list_item_t;
```

#### Related Topics

- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T Object Type](#)  
This type describes a type to assist in listing the contents of a directory.
- [DBMS\\_DBFS\\_CONTENT](#)  
The DBMS\_DBFS\_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## 276.3.5 DBMS\_DBFS\_CONTENT\_PROPERTIES\_T Table Type

This type is a variable-sized array of property tuples of `DBMS_DBFS_CONTENT_PROPERTY_T` Object Type. It is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS
 TABLE OF dbms_dbfs_content_property_t;
```

### Related Topics

- [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T Object Type](#)  
This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

## 276.3.6 DBMS\_DBFS\_CONTENT\_RAW\_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the `DBMS_DBFS_CONTENT` interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS
 TABLE OF RAW(32767);
```

### Related Topics

- [DBMS\\_DBFS\\_CONTENT](#)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## Database URI TYPES

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- [Summary of URITYPE Supertype Subprograms](#)
- [Summary of HTTPURITYPE Subtype Subprograms](#)
- [Summary of DBURITYPE Subtype Subprograms](#)
- [Summary of XDBURITYPE Subtype Subprograms](#)
- [Summary of URIFACTORY Package Subprograms](#)

### 277.1 Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

**Table 277-1 URITYPE Type Subprograms**

Method	Description
<a href="#">GETBLOB</a>	Returns the BLOB located at the address specified by the URL.

**Table 277-1 (Cont.) URITYPE Type Subprograms**

Method	Description
<a href="#">GETCLOB</a>	Returns the CLOB located at the address specified by the URL.
<a href="#">GETCONTENTTYPE</a>	Returns the URL, in escaped format, stored inside the UriType instance.
<a href="#">GETEXTERNALURL</a>	Returns the URL, in escaped format, stored inside the UriType instance.
<a href="#">GETURL</a>	Returns the URL, in non-escaped format, stored inside the UriType instance.
<a href="#">GETXML</a>	Returns the XMLType located at the address specified by the URL.

## 277.1.1 UriType Supertype GETBLOB

This function returns the BLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the BLOB located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csId IN NUMBER)
 RETURN BLOB;
```

**Table 277-2 UriType Supertype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

## 277.1.2 UriType Supertype GETCLOB

This function returns the CLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described below.

This function returns the CLOB located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getClob()
 RETURN CLOB;
```

This function returns the CLOB located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
 RETURN CLOB;
```

**Table 277-3 UriType Supertype GETCLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 277.1.3 UriType Supertype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

### Syntax

```
MEMBER FUNCTION getContentTypeId()
 RETURN VARCHAR2;
```

## 277.1.4 UriType Supertype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the UriType instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()
 RETURN varchar2;
```

## 277.1.5 UriType Supertype GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

### Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

## 277.1.6 UriType Supertype GETXML

This function returns the `XMLType` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `XMLType` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
RETURN XMLType;
```

**Table 277-4 UriType Supertype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 277.2 Summary of HTTPURITYPE Subtype Subprograms

The `HTTPURITYPE` is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

**Table 277-5 HTTPURITYPE Type Subprograms**

Method	Description
<a href="#">CREATEURI</a>	Creates an instance of HTTPURITYPE from the given URI.
<a href="#">GETBLOB</a>	Returns the BLOB located at the address specified by the URL.
<a href="#">GETCLOB</a>	Returns the CLOB located at the address specified by the URL.
<a href="#">GETCONTENTTYPE</a>	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a>	Returns the URL, in escaped format, stored inside the UriType instance.
<a href="#">GETURL</a>	Returns the URL, in non-escaped format, stored inside the UriType instance.
<a href="#">GETXML</a>	Returns the XMLType located at the address specified by the URL.
<a href="#">HTTPURITYPE</a>	Creates an instance of HTTPURITYPE from the given URI.

## 277.2.1 HttpUriType Subtype CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
STATIC FUNCTION createUri(
 url IN varchar2)
RETURN HTTPURITYPE;
```

**Table 277-6 HttpUriType Subtype CREATEURI Parameters**

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string containing a valid HTTP URL; escaped format.

## 277.2.2 HttpUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETBLOB are described below.

This function returns the BLOB located at the address specified by the HTTP URL.

### Syntax

```
MEMBER FUNCTION getBlob()
RETURN BLOB;
```

This function returns the BLOB located at the address specified by the HTTP URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)
 RETURN BLOB;
```

**Table 277-7 HttpUriType Subtype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## 277.2.3 HttpUriType Subtype GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETCLOB are described below.

Returns the CLOB located at the address specified by the HTTP URL.

### Syntax

```
MEMBER FUNCTION getClob()
 RETURN CLOB;
```

Returns the CLOB located at the address specified by the HTTP URL and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
 RETURN CLOB;
```

**Table 277-8 HttpUriType Subtype GETCLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 277.2.4 HttpUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

### Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

## 277.2.5 HttpUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the HTTPURITYPE instance. The subtype instances override this member function.

The HTTPURITYPE function does not store the prefix `http://`, but generates it for the external URL.

### Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

## 277.2.6 HttpUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the HTTPURITYPE instance.

### Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

## 277.2.7 HttpUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

The subprograms of the URI Subtype HttpUriType member subprogram GETXML are described below.

This function returns the XMLType located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()
RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
RETURN XMLType;
```

**Table 277-9 HttpUriType Subtype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 277.2.8 HttpUriType Subtype HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(
 url IN VARCHAR2);
```

**Table 277-10 HttpUriType Subtype HTTPURITYPE Parameters**

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

## 277.3 Summary of DBURITYPE Subtype Subprograms

The `DBURITYPE` is a subtype of the `UriType` that provides support for `DBUri-refs`. A `DBUri-ref` is an intra-database URL that can be used to reference any row or row-column data in the database.

The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and views further contain the rows and columns inside them.

**Table 277-11 DBURITYPE Type Subprograms**

Method	Description
<a href="#">CREATEURI</a>	Constructs a <code>DBURITYPE</code> instance.
<a href="#">DBURITYPE</a>	Creates an instance of <code>DBURITYPE</code> from the given URI.
<a href="#">GETBLOB</a>	Returns the <code>BLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
<a href="#">GETCLOB</a>	Returns the <code>CLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
<a href="#">GETCONTENTTYPE</a>	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a>	Returns the URL, in escaped format, stored inside the <code>DBURITYPE</code> instance.
<a href="#">GETURL</a>	Returns the URL, in non-escaped format, stored inside the <code>DBURITYPE</code> instance.

**Table 277-11 (Cont.) DBURITYPE Type Subprograms**

Method	Description
<a href="#">GETXML</a>	Returns the XMLType located at the address specified by the URL

### 277.3.1 DBUriType Subtype CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

#### Syntax

```
STATIC FUNCTION createUri(
 url IN varchar2)
RETURN DBURITYPE;
```

**Table 277-12 DBUriType Subtype CREATEURI Parameters**

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid DBURITYPE.

### 277.3.2 DBUriType Subtype DBURITYPE

This constructs a DBURITYPE instance.

#### Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
 url IN varchar2);
```

**Table 277-13 DBUriType Subtype DBURITYPE Parameters**

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

### 277.3.3 DBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the URL.

The subprograms of the URI Subtype DBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

**Syntax**

```
MEMBER FUNCTION getBlob()
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

**Syntax**

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

**Syntax**

```
FUNCTION getBlob(csid IN NUMBER)
 RETURN BLOB;
```

**Table 277-14 DBUriType Subtype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## 277.3.4 DBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the DBURITYPE instance.

If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described below.

The following function returns the CLOB located at the address specified by the DBURITYPE instance.

**Syntax**

```
MEMBER FUNCTION getClob()
 RETURN CLOB;
```

The following function returns the CLOB located at the address specified by the DBURITYPE instance and the content type.

**Syntax**

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
 RETURN CLOB;
```

**Table 277-15 DBUriType Subtype GETCLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

### 277.3.5 DBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

#### Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

### 277.3.6 DBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in Web pages.

#### Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

### 277.3.7 DBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `DBURITYPE` instance.

#### Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

### 277.3.8 DBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype `DBPURITYPE` member subprogram `GETXML` are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

#### Syntax

```
MEMBER FUNCTION getXML()
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

**Syntax**

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
 RETURN XMLType;
```

**Table 277-16 DBUriType Subtype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 277.4 Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URITYPE. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URITYPE column in a table.

The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

**Table 277-17 XDBURITYPE Type Subprograms**

Method	Description
<a href="#">CREATEURI</a>	Returns the <code>UriType</code> corresponding to the specified URL.
<a href="#">GETBLOB</a>	Returns the <code>BLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
<a href="#">GETCLOB</a>	Returns the <code>CLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
<a href="#">GETCONTENTTYPE</a>	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a>	Returns the URL, in escaped format, stored inside the <code>XDBURITYPE</code> instance.
<a href="#">GETURL</a>	Returns the URL, in non-escaped format, stored inside the <code>XDBURITYPE</code> instance.
<a href="#">GETXML</a>	Returns the <code>XMLType</code> corresponding to the contents of the document specified by the URL.
<a href="#">XDBURITYPE</a>	Creates an instance of <code>XDBURITYPE</code> from the given URI.

### 277.4.1 XDBUriType Subtype CREATEURI

This static function constructs a `XDBURITYPE` instance. It parses the given URL and creates a `XDBURITYPE` instance.

**Syntax**

```
STATIC FUNCTION createUri(
 url IN varchar2)
RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid XDBURITYPE.

## 277.4.2 XDBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)
 RETURN BLOB;
```

**Table 277-18 XDBUriType Subtype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## 277.4.3 XDBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETCLOB are described below. The options are described in the following table.

Returns the CLOB located at the address specified by the XDBUriType instance.

### Syntax

```
MEMBER FUNCTION getClob()
 RETURN CLOB;
```

Returns the CLOB located at the address specified by the XDBUriType instance and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
 RETURN CLOB;
```

**Table 277-19 XDBUriType Subtype GETCLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 277.4.4 XDBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

### Syntax

```
MEMBER FUNCTION getContentType()
 RETURN VARCHAR2;
```

## 277.4.5 XDBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the XDBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()
 RETURN varchar2;
```

## 277.4.6 XDBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getUrl()
 RETURN varchar2;
```

## 277.4.7 XDBUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETXML are described below. The options are described in the following table.

This function returns the XMLType located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()
 RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
 RETURN XMLType;
```

**Table 277-20 XDBUriType Subtype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 277.4.8 XDBUriType subtype XDBURITYPE

This constructs a XDBURITYPE instance.

### Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
 url IN VARCHAR2,
 flags IN RAW := NULL)
 RETURN self AS RESULT;
```

**Table 277-21 XDBUriType subtype XDBURITYPE Parameters**

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBUriType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: <ul style="list-style-type: none"> <li>• 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised.</li> <li>• 2 - Indicates that any errors during document retrieval should be suppressed</li> <li>• 3 - Both flag bits (1, 2) are enabled</li> </ul>

## 277.5 Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

**Table 277-22 URIFACTORY Type Subprograms**

Method	Description
<a href="#">GETURI</a>	Returns the correct URL handler for the given URL string.
<a href="#">ESCAPEURI</a>	Returns a URL in escaped format.
<a href="#">UNESCAPEURI</a>	Returns a URL in unescaped format.
<a href="#">REGISTERURLHANDLER</a>	Registers a particular type name for handling a particular URL.
<a href="#">UNREGISTERURLHANDLER</a>	Unregisters a URL handler.

### 277.5.1 UriFactory Package GETURI

This factory method returns the correct URI handler for the given URI string.

It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the [REGISTERURLHANDLER](#) function. If the prefix matches, [GETURI](#) would then use that subtype.

#### Syntax

```
FUNCTION getUri(
 url IN Varchar2)
RETURN UriType;
```

**Table 277-23 UriFactory Package GETURI Parameters**

Parameter	IN / OUT	Description
<code>uri</code>	(IN)	The URL string, in escaped format, containing a valid HTTP URL.

### 277.5.2 UriFactory Package ESCAPEURI

This function returns a URL in escaped format.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this

reason, use the [GETEXTERNALURL](#) function or the [GETURI](#) function to get to the URL value instead of using the attribute present in the `UriType`.

### Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

**Table 277-24** UriFactory Package ESCAPEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in escaped format.

## 277.5.3 UriFactory Package UNESCAPEURI

This function returns a URL in unescaped format.

This function is the reverse of the [ESCAPEURI](#) function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

### Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

**Table 277-25** UriFactory Package UNESCAPEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in unescaped format.

## 277.5.4 UriFactory Package REGISTERURLHANDLER

This package registers a particular type name for handling a particular URL.

The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUrl` static member function. This function is called by the [GETURI](#) function to generate an instance of the type. The `stripprefix` parameter indicates that the prefix must be stripped off before calling this function.

### Syntax

```
PROCEDURE registerUrlHandler(
 prefix IN varchar2,
 schemaName IN varchar2,
 typename IN varchar2,
 ignoreCase IN boolean := true,
 stripprefix IN boolean := true);
```

**Table 277-26 UriFactory Package REGISTERURLHANDLER Parameters**

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to handle; for example, <code>http://</code> .
schemaName	(IN)	Name of the schema where the type resides; case sensitive.
typename	(IN)	The name of the type to handle the URL; case sensitive.
ignoreCase	(IN)	Ignore case when matching prefixes.
stripPrefix	(IN)	Strip prefix before generating the instance of the type.

## 277.5.5 UriFactory Package UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

### Syntax

```
PROCEDURE unregisterUrlHandler(
 prefix IN VARCHAR2);
```

**Table 277-27 UriFactory Package UNREGISTERURLHANDLER Parameters**

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to be unregistered.

# JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues.

The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueueing or to interpret a dequeued JMS message.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Java Versus PL/SQL Datatypes](#)
- [More on Bytes\\_ Stream and Map Messages](#)
- [Upcasting and Downcasting Between General and Specific Messages](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [CONVERT\\_JMS\\_SELECTOR](#)
- [Summary of JMS Types](#)

## 278.1 JMS Types Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules

## 278.2 JMS Types Security Model

`PUBLIC` is granted `EXECUTE` privilege in these JMS types.

- `SYS.AQ$_JMS_MESSAGE` Type
- `SYS.AQ$_JMS_TEXT_MESSAGE` Type
- `SYS.AQ$_JMS_BYTES_MESSAGE` Type
- `SYS.AQ$_JMS_MAP_MESSAGE` Type
- `SYS.AQ$_JMS_STREAM_MESSAGE` Type
- `SYS.AQ$_JMS_OBJECT_MESSAGE` Type
- `SYS.AQ$_JMS_NAMEARRAY` Type
- `SYS.AQ$_JMS_VALUE` Type
- `SYS.AQ$_JMS_EXCEPTION` Type

## 278.3 Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

### See Also:

JMS specification 3.11.3, Conversion Provided by `StreamMessage` and `MapMessage`

### New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any datatype that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

## 278.4 More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionality that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses this common functionality.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Initialize the Jserv Static Variable
- Get the Payload Data Back to PL/SQL
- Garbage Collect the Static Variable
- Use a Message Store: A Static Variable Collection
- Typical Calling Sequences
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

### Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

### Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

#### Note:

It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

### Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

### Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

### Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

## Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.  
This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.  
For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

## Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

Oracle provides member function `get_mode` for users to query the mode.

## Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using `Java ObjectOutputStream` and bytes messages are encoded using `Java DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

### Note:

All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation [JavaSoft.com](http://JavaSoft.com) for details on how the data is encoded into bytes.

## Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

## 278.5 Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of

`aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

## 278.6 JMS Types Error Reporting

This table lists Oracle JMS types related errors.

**Table 278-1 Oracle JMS Types Errors**

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the <code>get_text</code> procedure with a <code>VARCHAR2</code> parameter of <code>aq\$_jms_text_message</code> or <code>get_bytes</code> procedure with a <code>RAW</code> parameter of <code>aq\$_jms_bytes_message</code> .
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example <code>set_byte_property</code> , <code>set_short_property</code> of <code>aq\$_jms_head</code> ADT; <code>set_byte</code> and <code>set_short</code> of <code>aq\$_jms_map_message</code> ADT; <code>write_byte</code> and <code>write_short</code> of <code>aq\$_jms_stream_message</code> and <code>aq\$_jms_bytes_message</code> ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the <code>aq\$_jms_namearray</code> ADT capacity. The current size limit is 1024. You can use the <code>get_names</code> function with <code>offset</code> and <code>length</code> parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the <code>get_exception</code> static procedure of <code>aq\$_jms_map_message</code> , <code>aq\$_jms_bytes_message</code> , and <code>aq\$_jms_stream_message</code> to retrieve the exception information last thrown by the Java stored procedure.  A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT <code>aq\$_jms_exception</code> is created to represent the exception information on the PL/SQL side.

Table 278-1 (Cont.) Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the <code>clean</code> procedure after using one message. The <code>clean</code> procedure frees the message slot for use by other messages attempting access.

## 278.7 Oracle JMS Type Constants

These constants can be useful when dealing with message type functions.

### DBMS\_AQ Package Constants

DBMS\_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

### SYS.DBMS\_JMS\_PLSQL Package Constants

SYS.DBMS\_JMS\_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER CONSTANT PLS_INTEGER;
DATA_TYPE_LONG CONSTANT PLS_INTEGER;
```

```

DATA_TYPE_FLOAT CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER CONSTANT PLS_INTEGER;
DATA_TYPE_STRING CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;

```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```

ERROR_DATA_OVERFLOW CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW CONSTANT PLS_INTEGER := -24199;

```

## 278.8 CONVERT\_JMS\_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in ADD\_SUBSCRIBER operations as subscriber rules or in DEQUEUE operations as dequeue conditions. These procedures are in the SYS.dbms\_jms\_plsql package.

### Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is dbms\_jms\_plsql.DESTPLOAD\_JMSTYPE and also assumes that the J2EE compliant mode is true.

### Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type Specified

The second procedure takes one more parameter: dest\_pload\_type. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is SYS.dbms\_jms\_plsql.DESTPLOAD\_JMSTYPE or SYS.dbms\_jms\_plsql.DESTPLOAD\_ANYDATA. The function returns exactly the same VARCHAR2 value as the selector parameter if the dest\_pload\_type parameter is SYS.dbms\_jms\_plsql.DESTPLOAD\_USERADT. The function returns null if dest\_pload\_type parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

### Syntax

```
Function convert_jms_selector(
 selector IN VARCHAR2,
 dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

### Syntax

```
Function convert_jms_selector(
 selector IN VARCHAR2,
 dest_pload_type IN PLS_INTEGER,
 compliant IN BOOLEAN)
```

### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

## 278.9 Summary of JMS Types

This lists shows the JMS types.

- [SYS.AQ\\$\\_JMS\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_TEXT\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_BYTES\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_MAP\\_MESSAGE](#) Type

- [SYS.AQ\\$\\_JMS\\_STREAM\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_OBJECT\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_NAMEARRAY](#) Type
- [SYS.AQ\\$\\_JMS\\_VALUE](#) Type
- [SYS.AQ\\$\\_JMS\\_EXCEPTION](#) Type

## 278.9.1 SYS.AQ\$\_JMS\_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- [CONSTRUCT](#) Static Functions
- [Cast Methods](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```

MEMBER PROCEDURE get_bytes (payload OUT BLOB);

```

### CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

#### **STATIC FUNCTION construct (mtype IN INT) RETURN aq\$\_jms\_message**

Creates an instance of aq\$\_jms\_message, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created aq\$\_jms\_message instance depends on the mtype parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The mtype parameter must be one of the following constants described in "[Oracle JMS Type Constants](#)":

DBMS\_AQ.JMS\_TEXT\_MESSAGE  
DBMS\_AQ.JMS\_BYTES\_MESSAGE  
DBMS\_AQ.JMS\_STREAM\_MESSAGE  
DBMS\_AQ.JMS\_MAP\_MESSAGE  
DBMS\_AQ.JMS\_OBJECT\_MESSAGE

**STATIC FUNCTION construct (text\_msg IN aq\$\_jms\_text\_message) RETURN aq\$\_jms\_message**

Creates an aq\$\_jms\_message from an aq\$\_jms\_text\_message.

**STATIC FUNCTION construct (bytes\_msg IN aq\$\_jms\_bytes\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_bytes\_message.

**STATIC FUNCTION construct (stream\_msg IN aq\$\_jms\_stream\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_stream\_message.

**STATIC FUNCTION construct (map\_msg IN aq\$\_jms\_map\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_map\_message.

**STATIC FUNCTION construct (object\_msg IN aq\$\_jms\_object\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_object\_message.

### Cast Methods

**cast\_to\_bytes\_msg RETURN aq\$\_jms\_bytes\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_bytes\_message. Returns an aq\$\_jms\_bytes\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_BYTES\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_BYTES\_MESSAGE.

**cast\_to\_map\_msg RETURN aq\$\_jms\_map\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_map\_message. Returns an aq\$\_jms\_map\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_MAP\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_MAP\_MESSAGE.

**cast\_to\_object\_msg RETURN aq\$\_jms\_object\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_object\_message. Returns an aq\$\_jms\_object\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_OBJECT\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_OBJECT\_MESSAGE.

**cast\_to\_stream\_msg RETURN aq\$\_jms\_stream\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_stream\_message. Returns an aq\$\_jms\_stream\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_STREAM\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_STREAM\_MESSAGE.

**cast\_to\_text\_msg RETURN aq\$\_jms\_text\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_text\_message. Returns an aq\$\_jms\_text\_message or null if the message\_type attribute of the aq\$\_jms\_message is

not `DBMS_AQ.JMS_TEXT_MESSAGE`. This function raises `ORA-24198` if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_TEXT_MESSAGE`.

### JMS Header Methods

#### **set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the `replyto` parameter, which corresponds to `JMSReplyTo`.

#### **get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

#### **set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text and corresponds to `JMSType`.

#### **get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

### System Properties Methods

#### **set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID`.

#### **set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID`.

#### **set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID`.

#### **set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

#### **get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

#### **get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

#### **get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

#### **get\_groupseq RETURN VARCHAR**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

### User Properties Methods

#### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

#### **set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods**

**set\_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

**set\_text (payload IN CLOB),**

Sets the payload, a `CLOB` value, to an internal representation.

**set\_bytes (payload IN RAW)**

Sets the payload, a `RAW` value, to an internal representation.

**set\_bytes (payload IN BLOB)**

Sets the payload, a `BLOB` value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a `CLOB` variable payload.

**get\_bytes (payload OUT RAW)**

Puts the internal representation of the payload into a `RAW` variable payload.

**get\_bytes (payload OUT BLOB)**

Puts the internal representation of the payload into a `BLOB` variable payload.

## 278.9.2 SYS.AQ\$\_JMS\_TEXT\_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT `aq\$\_jms\_text\_message` Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)

MEMBER PROCEDURE get_text (payload OUT CLOB);

```

### CONSTRUCT aq\$\_jms\_text\_message Function

#### STATIC FUNCTION construct RETURN aq\$\_jms\_text\_message

Creates an empty aq\$\_jms\_text\_message.

### JMS Header Methods

#### set\_replyto (replyto IN sys.aq\$\_agent)

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

#### set\_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

#### get\_replyto RETURN sys.aq\$\_agent

Returns `replyto`, which corresponds to `JMSReplyTo`.

#### get\_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

### System Properties Methods

#### set\_userid (userid IN VARCHAR)

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

#### set\_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

#### set\_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

#### set\_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

#### get\_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

#### get\_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

#### get\_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

#### get\_groupseq RETURN INT

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

## User Properties Methods

### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

### **set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_short\_property property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods**

**set\_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

**set\_text (payload IN CLOB)**

Sets the payload, a `CLOB` value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a VARCHAR2 variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a CLOB variable payload.

## 278.9.3 SYS.AQ\$\_JMS\_BYTES\_MESSAGE Type

The SYS.AQ\$\_JMS\_BYTES\_MESSAGE type is the ADT used to store a BytesMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_bytes\\_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

**Syntax**

```

TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(

```

### CONSTRUCT aq\$\_jms\_bytes\_message Function

#### STATIC FUNCTION construct RETURN aq\$\_jms\_bytes\_message

Creates an empty aq\$\_jms\_bytes\_message.

### JMS Header Methods

#### set\_replyto (replyto IN sys.aq\$\_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

**set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

**get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

**System Properties Methods**

**set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods**

**clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `Float` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `Long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `String` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_bytes (payload in RAW)**

Sets the payload, a `RAW` value, to an internal representation.

**set\_bytes (payload in BLOB)**

Sets the payload, a `BLOB` value, to an internal representation.

**get\_bytes (payload out RAW)**

Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

**get\_bytes (payload out BLOB)**

Puts the internal representation of the payload into a `BLOB` variable payload.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_bytes_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`.

Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call

the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or `SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in

PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**`read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER`**

Reads length of the bytes from bytes message stream into `value` and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**`read_char (id IN PLS_INTEGER) RETURN CHAR`**

Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**`read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION`**

Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**`read_float (id IN PLS_INTEGER) RETURN FLOAT`**

Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**`read_int (id IN PLS_INTEGER) RETURN INT`**

Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**`read_long (id IN PLS_INTEGER) RETURN NUMBER`**

Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**`read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER`**

Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_utf (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN PLS\_INTEGER, length IN PLS\_INTEGER)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## 278.9.4 SYS.AQ\$\_JMS\_MAP\_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_map\\_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```

TYPE aq$_jms_map_message AS object(
 header aq$_jms_header,
 bytes_len int,
 bytes_raw raw(2000),
 bytes_lob blob,
 STATIC FUNCTION construct RETURN aq$_jms_map_message,
 MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),
 MEMBER PROCEDURE set_type (type IN VARCHAR),
 MEMBER FUNCTION get_replyto RETURN sys.aq$_agent,
 MEMBER FUNCTION get_type RETURN VARCHAR,
 MEMBER PROCEDURE set_userid (userid IN VARCHAR),

```

### CONSTRUCT `aq$_jms_map_message` Function

#### **STATIC FUNCTION** `construct` RETURN `aq$_jms_map_message`

Creates an empty `aq$_jms_map_message` object.

### JMS Header Methods

#### **set\_replyto** (`replyto` IN `sys.aq$_agent`)

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

#### **set\_type** (`type` IN `VARCHAR`)

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

#### **get\_replyto** RETURN `sys.aq$_agent`

Returns `replyto`, which corresponds to `JMSReplyTo`.

#### **get\_type** RETURN `VARCHAR`

Returns `type`, which corresponds to `JMSType`.

### System Properties Methods

#### **set\_userid** (`userid` IN `VARCHAR`)

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

#### **set\_appid** (`appid` IN `VARCHAR`)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

#### **set\_groupid** (`groupid` IN `VARCHAR`)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

#### **set\_groupseq** (`groupseq` IN `INT`)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

#### **get\_userid** RETURN `VARCHAR`

Returns `userid`, which corresponds to `JMSXUserID`.

#### **get\_appid** RETURN `VARCHAR`

Returns `appid`, which corresponds to `JMSXAppID`.

#### **get\_groupid** RETURN `VARCHAR`

Returns `groupid`, which corresponds to `JMSXGroupID`.

#### **get\_groupseq** RETURN `NUMBER`

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

### User Properties Methods

#### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `Long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_bytes (payload IN RAW)**

Sets the internal payload as a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `RAW` variable without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

**get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions `ORA-24190` if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a BLOB variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` Or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**set\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BOOLEAN)**

Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_byte (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the BYTE value with the specified name in the map. Because there is no BYTE type in PL/SQL, PLS\_INTEGER is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_char (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CHAR)**

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_double (id IN PLS\_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)**

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_float (id IN PLS\_INTEGER, name IN VARCHAR2, value IN FLOAT)**

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_int (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_long (id IN PLS\_INTEGER, name IN VARCHAR2, value IN NUMBER)**

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_short (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN VARCHAR2)**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CLOB)**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_byte (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)**

Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_char (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN CHAR**

Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_double (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION**

Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_float (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN FLOAT**

Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_int (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_long (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN NUMBER**

Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_short (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)**

Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_names (id IN PLS\_INTEGER) RETURN aq\$\_jms\_namearray**

Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

**get\_names (id IN PLS\_INTEGER, names OUT aq\$\_jms\_namearray, offset IN PLS\_INTEGER, length IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message. Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_object (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT AQ\$\_JMS\_VALUE. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See the map in the AQ\$\_JMS\_VALUE ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and AQ\$\_JMS\_VALUE attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_size (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**item\_exists (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

## 278.9.5 SYS.AQ\$\_JMS\_STREAM\_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_stream\\_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```
TYPE aq$_jms_stream_message AS object(
 header aq$_jms_header,
 bytes_len int,
 bytes_raw raw(2000),
 bytes_lob blob,
 STATIC FUNCTION construct RETURN aq$_jms_stream_message,
 MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),
```

```

MEMBER PROCEDURE set_type (type IN VARCHAR),

```

### CONSTRUCT aq\$\_jms\_stream\_message Function

#### STATIC FUNCTION construct RETURN aq\$\_jms\_stream\_message

Creates an empty aq\$\_jms\_stream\_message object.

### JMS Header Methods

#### set\_replyto (replyto IN sys.aq\$\_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

#### set\_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

#### get\_replyto RETURN sys.aq\$\_agent

Returns replyto, which corresponds to JMSReplyTo.

#### get\_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

### System Properties Methods

#### set\_userid (userid IN VARCHAR)

Sets userid, which corresponds to JMSXUserID in JMS.

#### set\_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

#### set\_groupid (groupid IN VARCHAR)

Sets groupid, which corresponds to JMSXGroupID in JMS.

#### set\_groupseq (groupseq IN INT)

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

#### get\_userid RETURN VARCHAR

Returns userid, which corresponds to JMSXUserID.

#### get\_appid RETURN VARCHAR

Returns appid, which corresponds to JMSXAppID.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods****clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB variable without interpreting it.

**set\_bytes (payload IN RAW)**

Sets the internal payload as the RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function sets a payload as raw bytes without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as the BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`.

Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_bytes (id IN PLS\_INTEGER) RETURN BLOB**

Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_bytes (id IN PLS\_INTEGER, value OUT NOCOPY BLOB)**

Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_char (id IN PLS\_INTEGER) RETURN CHAR**

Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected

type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_double (id IN PLS\_INTEGER) RETURN DOUBLE PRECISION**

Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_float (id IN PLS\_INTEGER) RETURN FLOAT**

Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_int (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_long (id IN PLS\_INTEGER) RETURN NUMBER**

Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_string RETURN CLOB**

Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_string (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_object (id IN PLS\_INTEGER, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT AQ\$\_JMS\_VALUE. Users can use the type attribute of this ADT to interpret the data. See [Table 278-2](#) for the correspondence among `dbms_jms_plsql` package constants, Java datatype and AQ\$\_JMS\_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN INT)**

Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## 278.9.6 SYS.AQ\$\_JMS\_OBJECT\_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Database Advanced Queuing queue.

### Syntax

```
TYPE aq$_jms_object_message AS object(
 header aq$_jms_header,
 bytes_len int,
 bytes_raw raw(2000),
 bytes_lob blob);
```

## 278.9.7 SYS.AQ\$\_JMS\_NAMEARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`.

The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```

### Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
 offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

## 278.9.8 SYS.AQ\$\_JMS\_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`.

The `type` field in this ADT is used to decide which type of data this object is really holding. The following table lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
 type number(2),
 num_val number,
 char_val char(1),
 text_val clob,
 bytes_val blob);
```

**Table 278-2 AQ\$\_JMS\_VALUE Type Fields and Java Fields**

Type	Java Type	aq\$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

### 278.9.9 SYS.AQ\$\_JMS\_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side.

The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

#### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
 id number, -- Reserved and not used. Right now always return 0.
 exp_name varchar(200),
 err_msg varchar(500),
 stack varchar(4000));
```

# JSON Data Structures

To work with JSON data in PL/SQL, you can use these data structures.

- [JSON\\_ELEMENT\\_T Object Type](#)
- [JSON\\_OBJECT\\_T Object Type](#)
- [JSON\\_ARRAY\\_T Object Type](#)
- [JSON\\_SCALAR\\_T Object Type](#)
- [JSON\\_KEY\\_LIST Type](#)

## Related Topics

- [Oracle Database JSON Developer's Guide](#)
- [The JSON standard](#)

## 279.1 JSON\_ELEMENT\_T Object Type

`JSON_ELEMENT_T` is the supertype for the `JSON_OBJECT_T`, `JSON_SCALAR_T`, and `JSON_ARRAY_T` object types.

### Description

Note the following:

- To create an instance of `JSON_ELEMENT_T`, use the `parse` function. See the “Constructors” section below for details.
- You cannot create an empty `JSON_ELEMENT_T` instance. To create an empty JSON container, create it based on one of the subtypes.
- To cast a `JSON_ELEMENT_T` into a subtype (for example, `JSON_OBJECT_T`), you need to perform an explicit cast using `TREAT AS`. For example:

```
TREAT (elem AS JSON_OBJECT_T)
```

### Constructors

You create a `JSON_ELEMENT_T` instance using the `parse` function. The function takes as input `VARCHAR2`, `CLOB`, or `BLOB` data, and returns a `JSON_ELEMENT_T` instance.

```
STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json CLOB) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json BLOB) RETURN JSON_ELEMENT_T
```

Only UTF8-encoded JSON is passed as a `BLOB`.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. Valid JSON has to pass the lax check of the “IS JSON” SQL condition.

## Serialization

Serialization is the inverse of the `parse` function. The serialization operation takes the in-memory representation of the JSON data and prints it to a string. The serialization functions and procedures are:

```
MEMBER FUNCTION to_String RETURN VARCHAR2
MEMBER FUNCTION to_Number RETURN NUMBER
MEMBER FUNCTION to_Date RETURN DATE
MEMBER FUNCTION to_Timestamp RETURN TIMESTAMP
MEMBER FUNCTION to_Boolean RETURN BOOLEAN
MEMBER FUNCTION to_Clob RETURN CLOB
MEMBER FUNCTION to_Blob RETURN BLOB
```

```
MEMBER PROCEDURE to_Clob(c IN OUT CLOB)
MEMBER PROCEDURE to_Blob(c IN OUT BLOB)
```

The `to_Clob` and `to_Blob` *procedures* accept a CLOB or BLOB input and enable you to provide a LOB to be used as the serialization destination. For instance, `EMPTY_LOB` can be provided. The input LOB cannot be `NULL`.

If the `to_Clob` *function* is used, then a new CLOB is created. If you do not want to create a CLOB first, then you can use the `to_Clob` or `to_Blob` *functions*, which take no parameter and generate a temp lob.

`to_Blob` serializes to UTF8 format only.

## Introspection

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION is_Object RETURN BOOLEAN
MEMBER FUNCTION is_Array RETURN BOOLEAN
MEMBER FUNCTION is_Scalar RETURN BOOLEAN
MEMBER FUNCTION is_String RETURN BOOLEAN
MEMBER FUNCTION is_Number RETURN BOOLEAN
MEMBER FUNCTION is_Boolean RETURN BOOLEAN
MEMBER FUNCTION is_True RETURN BOOLEAN
MEMBER FUNCTION is_False RETURN BOOLEAN
MEMBER FUNCTION is_Null RETURN BOOLEAN
MEMBER FUNCTION is_Date RETURN BOOLEAN
MEMBER FUNCTION is_Timestamp RETURN BOOLEAN
MEMBER FUNCTION get_Size RETURN NUMBER
```

The return value of the `get_size` function depends on the JSON type:

- For a scalar, it returns 1.
- For an object, it returns the number of keys.
- For an array, it returns the number of items.

Note that JSON does not support dates and timestamps natively. Instead they are typically modeled as strings. The DOM API enables you to add dates and timestamps as scalar values and preserve them until serialization to JSON, where they are printed as string following the ISO 8601 format. If a SQL value of type date or timestamp has been added, then the `is_Date` and `is_Timestamp` functions return true. If a date has been added as a string (e.g. as ISO 8601), then the `is_Date` and `is_Timestamp` functions return false. You can use Oracle conversion function `to_Date`

and `to_Timestamp` to convert a string representation of a date, and timestamp to the Oracle representation.

### Error Handling

You can set the level of error handling for JSON processing. You might not want an error to be raised for every mismatch. The `on_Error` procedure enables you to specify when errors should be raised:

```
MEMBER PROCEDURE on_Error(value NUMBER)
```

The `on_Error` procedure defines what happens if an error is encountered during a PL/SQL operation, for instance, a get call.

The default is to not raise an error but to return NULL instead.

You invoke `On_error` on a `JSON_ELEMENT_T` instance and it sets the error behavior for all subsequent calls. To reset the behavior to the default, you can call `on_Error(0)`.

Values for the `value` parameter are:

**Table 279-1 Values for the value Parameter in the ON\_ERROR Procedure**

Value	Description
0	Reset to the default behavior, which is to return NULL instead of raising an error.
1	Raise all errors.
2	Raise an error if no value is detected.
3	Raise an error if the data types do not match, for example, if you call <code>GET_NUMBER</code> on a string value.
4	Raise an error if the input is invalid, for example, if the array is out of bounds.

You can combine values. For example, you can specify 7 to indicate a combination of 3 and 4.

In the following example, an error is raised because the value of "a" is "xyz", which cannot be converted to a number. If the `on_Error` procedure had not been called, then NULL would be returned, and no error would be raised.

```
declare
 jo JSON_OBJECT_T;
begin
 jo := JSON_OBJECT_T.parse('{a:"xyz"}');
 jo.On_error(1);
 dbms_output.put_line(jo.get_Number('a'));
end;
/
```

## 279.2 JSON\_OBJECT\_T Object Type

JSON\_OBJECT\_T is a subtype of the JSON\_ELEMENT\_T object type. It corresponds to the JSON object structure.

### Constructors

You can create an empty JSON\_OBJECT\_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T RETURN SELF AS RESULT
```

You can create a JSON\_OBJECT\_T instance using one of the following `parse` functions:

```
STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json CLOB) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json BLOB) RETURN JSON_OBJECT_T
```

You can also create a JSON\_OBJECT\_T instance using one of the following constructors:

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn VARCHAR2) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn CLOB) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn BLOB) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not a valid JSON object, then an error message is raised. The input has to specify a JSON object, not an array.

### Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON object:

```
MEMBER FUNCTION get(key VARCHAR2) RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Number(key VARCHAR2) RETURN NUMBER
MEMBER FUNCTION get_Date(key VARCHAR2) RETURN DATE
MEMBER FUNCTION get_Timestamp(key VARCHAR2) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Clob(key VARCHAR2) RETURN CLOB
MEMBER FUNCTION get_Blob(key VARCHAR2) RETURN BLOB
MEMBER FUNCTION get_Object(key VARCHAR2) RETURN JSON_OBJECT_T
MEMBER FUNCTION get_Array(key VARCHAR2) RETURN JSON_ARRAY_T

MEMBER PROCEDURE get_Clob(key NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(key NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned JSON\_ELEMENT\_T is modified, then the containing JSON\_ELEMENT\_T is also changed. See the [Reference Semantics](#) section below for details.

- The `GET_STRING` function converts the value to a string if it is not already a string. Thus, the `GET_STRING` function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

### Set Procedures

The following procedures enable you to set the value of a JSON object. Existing values, if present, will be overwritten.

```
MEMBER PROCEDURE put(key VARCHAR2, value JSON_ELEMENT_T)
MEMBER PROCEDURE put(key VARCHAR2, value VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, value NUMBER)
MEMBER PROCEDURE put(key VARCHAR2, value BOOLEAN)
MEMBER PROCEDURE put(key VARCHAR2, value DATE)
MEMBER PROCEDURE put(key VARCHAR2, value TIMESTAMP)
MEMBER PROCEDURE put_Null(key VARCHAR2)
```

### Introspection Functions

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION has(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Type(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Keys RETURN JSON_KEY_LIST
```

The `get_Keys` function returns an object type of `JSON_KEY_LIST`, which is a varray of `VARCHAR2(4000)`. The varray contains the names of keys in the JSON object. The `get_Keys` function returns at most 32767 field names for a given JSON object. An error is raised if it is applied to an object with more than 32767 fields.

The example below walks through the items of the varray to build a `JSON_ARRAY_T` object that contains all key names.

```
declare
 jo JSON_OBJECT_T;
 ja JSON_ARRAY_T;
 keys JSON_KEY_LIST;
 keys_string VARCHAR2(100);

begin
 ja := new JSON_ARRAY_T;
 jo := JSON_OBJECT_T.parse('{"name":"fred",
 "jobTitle":"codemonkey",
 "projects":["json", "xml"]}');

 keys := jo.get_keys;
 for i in 1..keys.count loop
 ja.append(keys(i));
 end loop;
```

```
 keys_string := ja.to_string;
 dbms_output.put_line(keys_string);
end;
/
```

The output is:

```
["name", "jobTitle", "projects"]
```

### Modification Procedures

The following procedures enable you to remove or rename keys in a JSON object.

```
MEMBER PROCEDURE remove(key VARCHAR2)
MEMBER PROCEDURE rename_Key(keyOld VARCHAR2, keyNew VARCHAR2)
```

Duplicate key names are not supported and will raise an error.

### Clone Function

This function makes a copy of the JSON object. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_OBJECT_T
```

### Reference Semantics

Calling the `get` function that returns a `JSON_ELEMENT_T` object always returns a reference to the complex values instead of a copy. This means that changing the returned value affects its container. See the example below.

```
declare
 data JSON_OBJECT_T;
 address JSON_OBJECT_T;
 zip number;

begin

 data := new JSON_OBJECT_T('{
 "first": "John",
 "last": "Doe",
 "address": {
 "country": "USA",
 "zip": "94065"
 }
 }');

 address := data.get_object('address');
 dbms_output.put_line(address.to_string);

 -- 1) VALUE SEMANTICS for scalar values
 -- (changing the value has no effect on container)
 zip := address.get_number('zip');
 dbms_output.put_line(zip);
 zip := 12345;
 dbms_output.put_line(zip);
 -- address is still the same
 dbms_output.put_line(address.to_string);
```

```

-- 2) REFERENCE SEMANTICS for complex values
-- 'address' is a reference to the complex address values inside 'data'
address.put('zip', 12345);
address.put('street', 'Detour Road');
dbms_output.put_line(data.to_string);
end;
/

```

In cases where you do not want the reference semantics, you can use the `clone` function to create a copy of the returned object. This decouples the value from its container. In the example above, you can create a copy of the “address” object by replacing this line:

```
address := data.get_object('address');
```

with this line:

```
address := data.get_object('address').clone;
```

After this, changing the address will have no effect on the value of the ‘data’ containing object.

### Update Example

The following example updates the price of an item by 10%.

```

WITH
 FUNCTION updatePrice(jsonTxt in VARCHAR2) RETURN VARCHAR2 IS
 jo JSON_OBJECT_T;
 oldPrice NUMBER;

 BEGIN
 jo := new JSON_OBJECT_T(jsonTxt);
 oldPrice := jo.get_number('price');
 jo.put('price', oldPrice * 1.1);
 RETURN jo.to_string();
 END;
SELECT updatePrice(col)
FROM t1;

```

## 279.3 JSON\_ARRAY\_T Object Type

JSON\_ARRAY\_T is a subtype of the JSON\_ELEMENT\_T object type. JSON\_ARRAY\_T corresponds to the JSON array structure.

### Constructors

You can create an empty JSON\_ARRAY\_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_ARRAY_T RETURN SELF AS RESULT
```

You can create a JSON\_ARRAY\_T instance using one of the following parse functions:

```

STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json CLOB) RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json BLOB) RETURN JSON_ARRAY_T

```

You can also create a JSON\_ARRAY\_T instance using one of the following constructors:

```

CONSTRUCTOR FUNCTION JSON_Array_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT

```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. The input has to specify a JSON array, not an object.

### Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON array:

```

MEMBER FUNCTION get(pos NUMBER) RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(pos NUMBER) RETURN VARCHAR2
MEMBER FUNCTION get_Number(pos NUMBER) RETURN NUMBER
MEMBER FUNCTION get_Date(pos NUMBER) RETURN DATE
MEMBER FUNCTION get_Timestamp(pos NUMBER) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(pos NUMBER) RETURN BOOLEAN
MEMBER FUNCTION get_Clob(pos NUMBER) RETURN CLOB
MEMBER FUNCTION get_Blob(pos NUMBER) RETURN BLOB

MEMBER PROCEDURE get_Clob(pos NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(pos NUMBER, c IN OUT BLOB)

```

#### Note:

- The `get` function has reference semantics. This means that if the returned `JSON_ELEMENT_T` is modified, then the containing `JSON_ELEMENT_T` is changed too.
- The `GET_STRING` function converts the value to a string if it is not already a string. The function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

### Set Procedures

The following procedures enable you to set the value at the specified position in the JSON array. These procedures insert (not overwrite) at the specified position unless overwrite is requested.

```

MEMBER PROCEDURE put(pos NUMBER, value VARCHAR2, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value NUMBER, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value BOOLEAN, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value JSON_ELEMENT_T, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value DATE, overwrite BOOLEAN DEFAULT FALSE)

```

```
MEMBER PROCEDURE put(pos NUMBER, value TIMESTAMP, overwrite BOOLEAN DEFAULT
FALSE)
MEMBER PROCEDURE put_Null(pos NUMBER, overwrite BOOLEAN DEFAULT FALSE)
```

The following procedures append the specified value to the end of the JSON array:

```
MEMBER PROCEDURE append(value JSON_ELEMENT_T)
MEMBER PROCEDURE append(value VARCHAR2)
MEMBER PROCEDURE append(value NUMBER)
MEMBER PROCEDURE append(value BOOLEAN)
MEMBER PROCEDURE append(value DATE)
MEMBER PROCEDURE append(value TIMESTAMP)
MEMBER PROCEDURE append_Null
```

### Introspection Function

Introspection enables you to discover properties of the JSON array without modifying them.

```
MEMBER FUNCTION get_Type(pos NUMBER) RETURN VARCHAR2
```

### Modification Procedure

The following procedure enables you to remove the value at the specified position in the JSON array.

```
MEMBER PROCEDURE remove(pos NUMBER)
```

### Clone Function

This function makes a copy of the JSON array. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_ARRAY_T
```

## 279.4 JSON\_SCALAR\_T Object Type

JSON\_SCALAR\_T is a subtype of the JSON\_ELEMENT\_T object type.

### Description

A JSON\_SCALAR\_T instance captures one scalar values, for example, the string “fred” or the number 1. This type does not have any functions or procedures other than the ones inherited from JSON\_ELEMENT\_T. You cannot create an instance of this type directly.

## 279.5 JSON\_KEY\_LIST Type

JSON\_KEY\_LIST is a varray of VARCHAR2(4000).

### Description

This type is used by the get\_Keys function in the [JSON\\_OBJECT\\_T Object Type](#).

# Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Logical Change Record Types](#)
- [Common Subprograms for LCR\\$\\_DDL\\_RECORD and LCR\\$\\_ROW\\_RECORD](#)

## 280.1 Logical Change Record TYPEs Overview

In Replication (Oracle GoldenGate and XStream), logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Replication (Oracle GoldenGate and XStream), the capture process captures changes in the form of LCRs and enqueues them into a queue. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueueing, and dequeuing LCRs manually.

## 280.2 Logical Change Record Types Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

## 280.3 Summary of Logical Change Record Types

This table lists the Logical Change Record TYPEs and briefly describes them.

**Table 280-1 Logical Change Record (LCR) Types**

Type	Description
<a href="#">LCR\$_DDL_RECORD Type</a>	Represents a data definition language (DDL) change to a database object
<a href="#">LCR\$_ROW_RECORD Type</a>	Represents a data manipulation language (DML) change to a database object
<a href="#">LCR\$_ROW_LIST Type</a>	Identifies a list of column values for a row in a table
<a href="#">LCR\$_ROW_UNIT Type</a>	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS\_APPLY\_ADM
- DBMS\_AQ
- DBMS\_AQADM
- DBMS\_CAPTURE\_ADM
- DBMS\_PROPAGATION\_ADM
- DBMS\_RULE
- DBMS\_RULE\_ADM
- DBMS\_STREAMS
- DBMS\_STREAMS\_ADM
- DBMS\_TRANSFORM

### 280.3.1 LCR\$\_DDL\_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This topic contains information about the constructor for row LCRs and information about the member subprograms for this type.

#### Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

#### LCR\$\_DDL\_RECORD Constructor

Creates a `SYS.LCR$_DDL_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
 source_database_name IN VARCHAR2,
 command_type IN VARCHAR2,
 object_owner IN VARCHAR2,
 object_name IN VARCHAR2,
 object_type IN VARCHAR2,
 ddl_text IN CLOB,
 logon_user IN VARCHAR2,
 current_schema IN VARCHAR2,
```

```

base_table_owner IN VARCHAR2,
base_table_name IN VARCHAR2,
tag IN RAW DEFAULT NULL,
transaction_id IN VARCHAR2 DEFAULT NULL,
scn IN NUMBER DEFAULT NULL,
position IN RAW DEFAULT NULL,
edition_name IN VARCHAR2 DEFAULT NULL,
root_name IN VARCHAR2 DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;

```

### LCR\$\_DDL\_RECORD Constructor Function Parameters

**Table 280-2** Constructor Function Parameters for LCR\$\_DDL\_RECORD

Parameter	Description
source_database_name	<p>The database where the DDL statement occurred</p> <p>If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p>
command_type	<p>The type of command executed in the DDL statement</p> <p>Set this parameter to a non-NULL value.</p> <p><b>See Also:</b> The "SQL Command Codes" table in the <i>Oracle Call Interface Programmer's Guide</i> for a complete list of command types</p> <p>The following command types <i>are not supported</i> in DDL LCRs:</p> <pre> ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME </pre> <p>The snapshot equivalents of the materialized view command types are also not supported.</p>
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed

**Table 280-2 (Cont.) Constructor Function Parameters for LCR\$\_DDL\_RECORD**

Parameter	Description
object_type	<p>The type of object on which the DDL statement was executed</p> <p>The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>
ddl_text	<p>The text of the DDL statement</p> <p>Set this parameter to a non-NULL value.</p>
logon_user	<p>The user whose session executed the DDL statement</p>
current_schema	<p>The schema that is used if no schema is specified explicitly for the modified database objects in ddl_text</p> <p>If a schema is specified in ddl_text that differs from the one specified for current_schema, then the function uses the schema specified in ddl_text.</p> <p>Set this parameter to a non-NULL value.</p>
base_table_owner	<p>If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.</p>
base_table_name	<p>If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL.</p>
tag	<p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used.</p>
transaction_id	<p>The identifier of the transaction</p>
scn	<p>The SCN at the time when the change record for a captured LCR was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p>

**Table 280-2 (Cont.) Constructor Function Parameters for LCR\$\_DDL\_RECORD**

Parameter	Description
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. <b>See Also:</b> <i>Oracle Database XStream Guide</i>
edition_name	The name of the edition in which the DDL statement was executed
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

### Summary of LCR\$\_DDL\_RECORD Subprograms

**Table 280-3 LCR\$\_DDL\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">EXECUTE Member Procedure</a>	Executes the LCR under the security domain of the current user
<a href="#">GET_BASE_TABLE_NAME Member Function</a>	Gets the base (dependent) table name
<a href="#">GET_BASE_TABLE_OWNER Member Function</a>	Gets the base (dependent) table owner
<a href="#">GET_CURRENT_SCHEMA Member Function</a>	Gets the default schema (user) name
<a href="#">GET_DDL_TEXT Member Procedure</a>	Gets the DDL text in a CLOB
<a href="#">GET_EDITION_NAME Member Function</a>	Gets the name of the edition in which the DDL statement was executed
<a href="#">GET_LOGON_USER Member Function</a>	Gets the logon user name
<a href="#">GET_OBJECT_TYPE Member Function</a>	Gets the type of the object involved for the DDL
<a href="#">SET_BASE_TABLE_NAME Member Procedure</a>	Sets the base (dependent) table name
<a href="#">SET_BASE_TABLE_OWNER Member Procedure</a>	Sets the base (dependent) table owner
<a href="#">SET_CURRENT_SCHEMA Member Procedure</a>	Sets the default schema (user) name
<a href="#">SET_DDL_TEXT Member Procedure</a>	Sets the DDL text
<a href="#">SET_EDITION_NAME Member Procedure</a>	Sets the name of the edition in which the DDL statement was executed
<a href="#">SET_LOGON_USER Member Procedure</a>	Sets the logon user name
<a href="#">SET_OBJECT_TYPE Member Procedure</a>	Sets the object type

**Table 280-3 (Cont.) LCR\$\_DDL\_RECORD Type Subprograms**

Subprogram	Description
Common Subprograms	See " <a href="#">Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD</a> " for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

### EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

#### Syntax

```
MEMBER PROCEDURE EXECUTE;
```

### GET\_BASE\_TABLE\_NAME Member Function

Gets the base (dependent) table name.

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```

### GET\_BASE\_TABLE\_OWNER Member Function

Gets the base (dependent) table owner.

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;
```

### GET\_CURRENT\_SCHEMA Member Function

Gets the current schema name.

#### Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

### GET\_DDL\_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
 ddl_text CLOB;
BEGIN
 DBMS_OUTPUT.PUT_LINE(' -----');
 DBMS_OUTPUT.PUT_LINE(' Displaying DDL text in a DDL LCR: ');
```

```

DBMS_OUTPUT.PUT_LINE(' -----');
DBMS_LOB.CREATETEMPORARY(ddl_text, true);
ddl_lcr.GET_DDL_TEXT(ddl_text);
DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/

```

 **Note:**

GET\_DDL\_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

**Syntax**

```

MEMBER FUNCTION GET_DDL_TEXT(
 ddl_text IN/OUT CLOB);

```

**Parameter**

**Table 280-4 GET\_DDL\_TEXT Procedure Parameter**

Parameter	Description
ddl_text	The DDL text in the DDL LCR

**GET\_EDITION\_NAME Member Function**

Gets the name of the edition in which the DDL statement was executed.

 **See Also:**

*Oracle Database Development Guide*

**Syntax**

```

MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;

```

**GET\_LOGON\_USER Member Function**

Gets the logon user name.

**Syntax**

```

MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;

```

**GET\_OBJECT\_TYPE Member Function**

Gets the type of the object involved for the DDL.

### Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

### SET\_BASE\_TABLE\_NAME Member Procedure

Sets the base (dependent) table name.

### Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
 base_table_name IN VARCHAR2);
```

### Parameter

**Table 280-5 SET\_BASE\_TABLE\_NAME Procedure Parameter**

Parameter	Description
base_table_name	The name of the base table

### SET\_BASE\_TABLE\_OWNER Member Procedure

Sets the base (dependent) table owner.

### Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
 base_table_owner IN VARCHAR2);
```

### Parameter

**Table 280-6 SET\_BASE\_TABLE\_OWNER Procedure Parameter**

Parameter	Description
base_table_owner	The name of the base table owner

### SET\_CURRENT\_SCHEMA Member Procedure

Sets the default schema (user) name.

### Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(
 current_schema IN VARCHAR2);
```

### Parameter

**Table 280-7 SET\_CURRENT\_SCHEMA Procedure Parameter**

Parameter	Description
current_schema	The name of the schema to set as the current schema Set this parameter to a non-NULL value.

### SET\_DDL\_TEXT Member Procedure

Sets the DDL text.

#### Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(
 ddl_text IN CLOB);
```

#### Parameter

**Table 280-8 SET\_DDL\_TEXT Procedure Parameter**

Parameter	Description
ddl_text	The DDL text Set this parameter to a non-NULL value.

### SET\_EDITION\_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

#### See Also:

*Oracle Database Development Guide*

#### Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(
 edition_name IN VARCHAR2);
```

#### Parameter

**Table 280-9 SET\_EDITION\_NAME Procedure Parameter**

Parameter	Description
edition_name	Name of the edition

### SET\_LOGON\_USER Member Procedure

Sets the logon user name.

#### Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(
 logon_user IN VARCHAR2);
```

## Parameter

**Table 280-10 SET\_LOGON\_USER Procedure Parameter**

Parameter	Description
logon_user	The name of the schema to set as the logon user

## SET\_OBJECT\_TYPE Member Procedure

Sets the object type.

### Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
 object_type IN VARCHAR2);
```

## Parameter

**Table 280-11 SET\_OBJECT\_TYPE Procedure Parameter**

Parameter	Description
object_type	<p>The object type</p> <p>The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>

## 280.3.2 LCR\$\_ROW\_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR\$\_ROW\_LIST type.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This topic contains information about the constructor for DDL LCRs and information about the member subprograms for this type.

 **Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

 **See Also:**

[LCR\\$\\_ROW\\_LIST Type](#)

### LCR\$\_ROW\_RECORD Constructor

Creates a SYS.LCR\$\_ROW\_RECORD object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
 source_database_name IN VARCHAR2,
 command_type IN VARCHAR2,
 object_owner IN VARCHAR2,
 object_name IN VARCHAR2,
 tag IN RAW DEFAULT NULL,
 transaction_id IN VARCHAR2 DEFAULT NULL,
 scn IN NUMBER DEFAULT NULL,
 old_values IN SYS.LCR$_ROW_LIST DEFAULT NULL,
 new_values IN SYS.LCR$_ROW_LIST DEFAULT NULL,
 position IN RAW DEFAULT NULL,

 statement IN VARCHAR2 DEFAULT NULL,

 bind_variables IN SYS.LCR$_ROW_LIST DEFAULT NULL,

 bind_by_position IN VARCHAR2 DEFAULT 'N',

 root_name IN VARCHAR2 DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

## LCR\$\_ROW\_RECORD Constructor Function Parameters

**Table 280-12 Constructor Function Parameters for LCR\$\_ROW\_RECORD**

Parameter	Description
source_database_name	<p>The database where the row change occurred</p> <p>If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p>
command_type	<p>The type of command executed in the DML statement</p> <p>Set this parameter to a non-NULL value.</p> <p>Valid values are the following:</p> <p>INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM</p> <p>If INSERT, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.</p> <p>If UPDATE, then ensure that the LCR has a new_values collection that is not empty and an old_values collection that is not empty.</p> <p>If DELETE, then ensure that the LCR has a NULL or empty new_values collection and an old_values collection that is not empty.</p> <p>If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.</p>
object_owner	<p>The user who owns the table on which the row change occurred</p> <p>Set this parameter to a non-NULL value.</p>
object_name	<p>The table on which the DML statement was executed</p> <p>Set this parameter to a non-NULL value.</p>
tag	<p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.</p>
transaction_id	<p>The identifier of the transaction</p>
scn	<p>The SCN at the time when the change record was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p>

**Table 280-12 (Cont.) Constructor Function Parameters for LCR\$\_ROW\_RECORD**

Parameter	Description
old_values	The column values for the row before the DML change If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.
new_values	The column values for the row after the DML change If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. <b>See Also:</b> <i>Oracle Database XStream Guide</i>
statement	This parameter is reserved for internal use only.
bind_variables	This parameter is reserved for internal use only.
bind_by_position	This parameter is reserved for internal use only.
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

**Summary of LCR\$\_ROW\_RECORD Subprograms**

**Table 280-13 LCR\$\_ROW\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">ADD_COLUMN Member Procedure</a>	Adds the value as old or new, depending on the value type specified, for the column
<a href="#">CONVERT_LONG_TO_LOB_CHUNK Member Procedure</a>	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
<a href="#">DELETE_COLUMN Member Procedure</a>	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
<a href="#">EXECUTE Member Procedure</a>	Executes the LCR under the security domain of the current user
<a href="#">GET_LOB_INFORMATION Member Function</a>	Gets the LOB information for the column
<a href="#">GET_LOB_OFFSET Member Function</a>	Gets the LOB offset for the specified column

**Table 280-13 (Cont.) LCR\$\_ROW\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">GET_LOB_OPERATION_SIZE Member Function</a>	Gets the operation size for the LOB column
<a href="#">GET_LONG_INFORMATION Member Function</a>	Gets the LONG information for the column
<a href="#">GET_ROW_TEXT Member Procedure</a>	Gets the SQL statement for the change that is encapsulated in the LCR
<a href="#">GET_VALUE Member Function</a>	Gets the old or new value for the specified column, depending on the value type specified
<a href="#">GET_VALUES Member Function</a>	Gets a list of old or new values, depending on the value type specified
<a href="#">GET_WHERE_CLAUSE Member Procedure</a>	Gets a WHERE clause for the change that is encapsulated in the row LCR
<a href="#">GET_XML_INFORMATION Member Function</a>	Gets the XML information for the specified column
<a href="#">IS_STATEMENT_LCR Member Function</a>	Reserved for internal use only
<a href="#">KEEP_COLUMNS Member Procedure</a>	Keeps a list of columns a row LCR
<a href="#">RENAME_COLUMN Member Procedure</a>	Renames a column in an LCR
<a href="#">SET_LOB_INFORMATION Member Procedure</a>	Sets LOB information for the column
<a href="#">SET_LOB_OFFSET Member Procedure</a>	Sets the LOB offset for the specified column
<a href="#">SET_LOB_OPERATION_SIZE Member Procedure</a>	Sets the operation size for the LOB column
<a href="#">SET_ROW_TEXT Member Procedure</a>	Reserved for internal use only
<a href="#">SET_VALUE Member Procedure</a>	Overwrites the value of the specified column
<a href="#">SET_VALUES Member Procedure</a>	Replaces the existing old or new values for the LCR, depending on the value type specified
<a href="#">SET_XML_INFORMATION Member Procedure</a>	Sets the XML information for the column
Common Subprograms	See <a href="#">Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD</a> for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

#### **ADD\_COLUMN Member Procedure**

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

#### **Note:**

To set a column value that already exists, run `SET_VALUE`.

 **See Also:**[SET\\_VALUE Member Procedure](#)

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

### Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 column_value IN ANYDATA);
```

## Parameters

**Table 280-14 ADD\_COLUMN Procedure Parameters**

Parameter	Description
value_type	The type of value to add for the column Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column.
column_name	The column name This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
column_value	The value of the column If <code>NULL</code> , then this procedure raises an error. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A <code>NULL</code> column value can be specified by encapsulating the <code>NULL</code> value in an <code>ANYDATA</code> wrapper.

### CONVERT\_LONG\_TO\_LOB\_CHUNK Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- `LONG` data can be sent as a part of a row LCR with one of the following operation codes: `INSERT`, `UPDATE`, or `LONG_WRITE`. Because `LONG` data can be sent in multiple pieces, make sure that this method is invoked on either none or all `LONG` pieces.
- `LOB` to `LONG` conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

### Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

### DELETE\_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

### Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
 column_name IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*');
```

## Parameters

**Table 280-15 DELETE\_COLUMN Procedure Parameters**

Parameter	Description
column_name	The column name An error is raised if the column does not exist in the LCR.
value_type	The type of value to delete for the column Specify <code>old</code> to delete the old value of the column. Specify <code>new</code> to delete the new value of the column. If <code>*</code> is specified, then the procedure deletes both the old and new values.

### EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.
- The LCR is in the error queue.

 **Note:**

Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lob` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lob` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.

- A DML or error handler configured with `assemble_lobs` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

### Syntax

```
MEMBER PROCEDURE EXECUTE(
 conflict_resolution IN BOOLEAN);
```

### Parameters

**Table 280-16 EXECUTE Procedure Parameters**

Parameter	Description
<code>conflict_resolution</code>	<p>If <code>TRUE</code>, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR.</p> <p>If <code>FALSE</code>, then conflict resolution is not used.</p> <p>An error is raised if this parameter is not specified or is set to <code>NULL</code>.</p>

### GET\_LOB\_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;
```

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

### Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

## Parameters

**Table 280-17 GET\_LOB\_INFORMATION Function Parameters**

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	<p>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p>

## GET\_LOB\_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS\_LCR.LAST\_LOB\_CHUNK or DBMS\_LCR.LOB\_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

## Syntax

```
GET_LOB_OFFSET(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2)
RETURN NUMBER;
```

## Parameters

**Table 280-18 GET\_LOB\_OFFSET Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

## GET\_LOB\_OPERATION\_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS\_LCR.LAST\_LOB\_CHUNK

Otherwise, returns NULL.

### Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2)
RETURN NUMBER,
```

### Parameters

**Table 280-19 GET\_LOB\_OPERATION\_SIZE Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

### GET\_LONG\_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use\_old parameter is a convenient way to get the value of the columns.

### Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

### Parameters

**Table 280-20 GET\_LONG\_INFORMATION Function Parameters**

Parameter	Description
value_type	The type of value to return for the column, either old or new

**Table 280-20 (Cont.) GET\_LONG\_INFORMATION Function Parameters**

Parameter	Description
column_name	The name of the column
use_old	<p>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p>

### GET\_ROW\_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

The following procedure returns the SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
 row_text IN/OUT CLOB);
```

The following procedure returns the SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
 row_text IN/OUT CLOB,
 variable_list IN/OUT LCR$_ROW_LIST,
 bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

### See Also:

"LCR\$\_ROW\_LIST Type"

### Parameters

**Table 280-21 GET\_ROW\_TEXT Procedure Parameters**

Parameter	Description
row_text	The SQL statement for the change that is encapsulated in the LCR
variable_list	The values for the bind variables in the order of the bind variables

**Table 280-21 (Cont.) GET\_ROW\_TEXT Procedure Parameters**

Parameter	Description
bind_var_syntax	The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> <li>Specify :, the default, for bind values to be in the form :1, :2, and so on.</li> <li>Specify ? for bind values to be in the form ?.</li> </ul>

### GET\_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use\_old parameter is a convenient way to get the value of a column.

### Syntax

```
MEMBER FUNCTION GET_VALUE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

### Parameters

**Table 280-22 GET\_VALUE Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Specify old to get the old value for the column. Specify new to get the new value for the column.
column_name	The column name If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function returns NULL if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

### GET\_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use\_old parameter is a convenient way to get the values of all columns.

## Syntax

```
MEMBER FUNCTION GET_VALUES(
 value_type IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

## Parameters

**Table 280-23 GET\_VALUES Function Parameters**

Parameter	Description
value_type	The type of values to return Specify <code>old</code> to return a list of old values. Specify <code>new</code> to return a list of new values.
use_old	If <code>Y</code> and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values.  If <code>N</code> and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR without returning any old values.  If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code> , then the function ignores the value of the <code>use_old</code> parameter.  NULL is not a valid specification for the <code>use_old</code> parameter.

## GET\_WHERE\_CLAUSE Member Procedure

Gets a `WHERE` clause for the change that is encapsulated in the row LCR.

Use the `WHERE` clause returned by `GET_WHERE_CLAUSE` instead of using the `ROWID`, because the `ROWID` is not ANSI compatible. The generated `WHERE` clause might not match the `WHERE` clause in the original DML operation.

The `ROWID` of an `INSERT` statement is the `ROWID` of the new row created by the `INSERT`. The `WHERE` clause generated for an `INSERT` operation identifies the new row. Therefore, the generated `WHERE` clause includes all of the new values inserted.

For example, consider the following insert into the `hr.departments` table:

```
INSERT INTO hr.departments (
 department_id, department_name, manager_id, location_id)
VALUES (10, 'HR', 20, 40);
```

The generated `WHERE` clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated `WHERE` clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
 "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The `ROWID` of an `UPDATE` statement is the `ROWID` of the row that was updated. The `WHERE` clause generated for an `UPDATE` operation identifies the row after the `UPDATE` executes. The generated `WHERE` clause is based on the old and new values of the `UPDATE`.

For example, consider the following update to the `hr.departments` table:

```
UPDATE hr.departments SET department_name='Management'
WHERE department_name='Administration' AND location_id = 20 AND
 manager_id = 30 AND department_id = 10;
```

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
 "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT\_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
 where_clause IN/OUT CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
 where_clause IN/OUT CLOB,
 variable_list IN/OUT LCR$_ROW_LIST,
 bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

### See Also:

[LCR\\$\\_ROW\\_LIST Type](#)

### Parameters

**Table 280-24 GET\_WHERE\_CLAUSE Procedure Parameters**

Parameter	Description
where_clause	The WHERE clause of the SQL statement for the change that is encapsulated in the LCR
variable_list	The values for the bind variables in the order of the bind variables

**Table 280-24 (Cont.) GET\_WHERE\_CLAUSE Procedure Parameters**

Parameter	Description
bind_var_syntax	The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> <li>Specify :, the default, for bind values to be in the form :1, :2, and so on.</li> <li>Specify ? for bind values to be in the form ?.</li> </ul>

**GET\_XML\_INFORMATION Member Function**

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;
```

```
DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;
```

DBMS\_LCR.NOT\_XML indicates that the column is not an XMLType column.

DBMS\_LCR.XML\_DOC indicates that the column contains an XML document.

DBMS\_LCR.XML\_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

DBMS\_LCR.XML\_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

**Syntax**

```
MEMBER FUNCTION GET_XML_INFORMATION(
 column_name IN VARCHAR2)
RETURN NUMBER;
```

**Parameter**

**Table 280-25 GET\_XML\_INFORMATION Function Parameter**

Parameter	Description
column_name	The column name

**IS\_STATEMENT\_LCR Member Function**

This function is reserved for internal use only.

**KEEP\_COLUMNS Member Procedure**

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

## Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
 column_list IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*');
```

## Parameters

**Table 280-26 KEEP\_COLUMNS Procedure Parameters**

Parameter	Description
column_list	The names of the columns kept for the row LCR Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.
value_type	The type of value for which to keep the columns Specify <i>old</i> to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify <i>new</i> to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If <i>*</i> is specified, then the procedure keeps both the old and the new columns.

## RENAME\_COLUMN Member Procedure

Renames a column in a row LCR.

## Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
 from_column_name IN VARCHAR2,
 to_column_name IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*');
```

## Parameters

**Table 280-27 RENAME\_COLUMN Procedure Parameters**

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name An error is raised if a column with the specified name already exists.
value_type	The type of value for which to rename the column Specify <i>old</i> to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify <i>new</i> to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If <i>*</i> is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

## SET\_LOB\_INFORMATION Member Procedure

Sets LOB information for the column.

### Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

## Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 lob_information IN NUMBER);
```

## Parameters

**Table 280-28 SET\_LOB\_INFORMATION Procedure Parameters**

Parameter	Description												
value_type	The type of value to set for the column, either old or new Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.												
column_name	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.												
lob_information	Specify one of the following values: <table border="0" style="margin-left: 20px;"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table>	DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;	DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;	DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;	DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;	DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;	DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;
DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;												
DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;												
DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;												
DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;												
DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;												
DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;												

## SET\_LOB\_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

### Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

## Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 lob_offset IN NUMBER);
```

## Parameters

**Table 280-29 SET\_LOB\_OFFSET Procedure Parameters**

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The column name An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

## SET\_LOB\_OPERATION\_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

### Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

## Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 lob_operation_size IN NUMBER);
```

## Parameters

**Table 280-30 SET\_LOB\_OPERATION\_SIZE Procedure Parameters**

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The name of the LOB column An exception is raised if the column value does not exist in the LCR.

**Table 280-30 (Cont.) SET\_LOB\_OPERATION\_SIZE Procedure Parameters**

Parameter	Description
<code>lob_operation_size</code>	If <code>lob_information</code> for the LOB is or will be <code>DBMS_LCR.LAST_LOB_CHUNK</code> , then this parameter can be set to either a valid <code>LOB ERASE</code> value or a valid <code>LOB TRIM</code> value. A <code>LOB ERASE</code> value must be a positive integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . A <code>LOB TRIM</code> value must be a nonnegative integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . Otherwise, set to <code>NULL</code> .

**SET\_ROW\_TEXT Member Procedure**

This procedure is reserved for internal use only.

**SET\_VALUE Member Procedure**

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

 **Note:**

To add a column to a row LCR, run `ADD_COLUMN`.

 **See Also:**

[ADD\\_COLUMN Member Procedure](#)

**Considerations for LOB Columns**

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a LONG or LONG RAW column.

### Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the column\_value parameter. The SET\_VALUE member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

### Syntax

```
MEMBER PROCEDURE SET_VALUE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 column_value IN ANYDATA);
```

## Parameters

**Table 280-31 SET\_VALUE Procedure Parameters**

Parameter	Description
value_type	The type of value to set Specify <code>old</code> to set the old value of the column. Specify <code>new</code> to set the new value of the column.
column_name	The column name An error is raised if the specified <code>column_value</code> does not exist in the LCR for the specified <code>column_type</code> .
column_value	The new value of the column If <code>NULL</code> is specified, then this procedure raises an error. To set the value to <code>NULL</code> , encapsulate the <code>NULL</code> in an <code>ANYDATA</code> instance. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

### SET\_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

#### Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), then you can use this member procedure in the handler procedure. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on LONG or LONG RAW columns.

### Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value of one or more XMLType columns in a row LCR, specify an XMLType for each XMLType column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

### Syntax

```
MEMBER PROCEDURE SET_VALUES(
 value_type IN VARCHAR2,
 value_list IN SYS.LCR$_ROW_LIST);
```

## Parameters

**Table 280-32 SET\_VALUES Procedure Parameters**

Parameter	Description
value_type	The type of values to replace Specify <code>old</code> to replace the old values. Specify <code>new</code> to replace the new values.
value_list	List of values to replace the existing list Use a <code>NULL</code> or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

## SET\_XML\_INFORMATION Member Procedure

Sets the XML information for the column.

### Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
 column_name IN VARCHAR2,
 xml_information IN NUMBER);
```

## Parameters

**Table 280-33 SET\_XML\_INFORMATION Procedure Parameters**

Parameter	Description
column_name	The name of the column An exception is raised if the column value does not exist in the LCR.
xml_information	Specify one of the following values: <code>DBMS_LCR.NOT_XML</code> <code>CONSTANT NUMBER := 1;</code> <code>DBMS_LCR.XML_DOC</code> <code>CONSTANT NUMBER := 2;</code> <code>DBMS_LCR.XML_DIFF</code> <code>CONSTANT NUMBER := 3;</code>  <code>DBMS_LCR.XML_DIFF</code> <code>CONSTANT NUMBER := 3;</code>  <code>DBMS_LCR.NOT_XML</code> indicates that the column is not an XMLType column. <code>DBMS_LCR.XML_DOC</code> indicates that the column contains an XML document. <code>DBMS_LCR.XML_DIFF</code> indicates that the column contains differences between old and new XML documents for an update operation. <code>DBMS_LCR.XML_DIFF</code> indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

## 280.3.3 Common Subprograms for LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD

These functions and procedures are common to both the LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD type.

### See Also:

For descriptions of the subprograms for these types that are exclusive to each type:

- ["LCR\\$\\_DDL\\_RECORD Type"](#)
- ["LCR\\$\\_ROW\\_RECORD Type"](#)

**Table 280-34 Summary of Common Subprograms for DDL and Row LCR Types**

Subprogram	Description
<a href="#">GET_COMMAND_TYPE Member Function</a>	Gets the command type of the logical change record (LCR)
<a href="#">GET_COMMIT_SCN Member Function</a>	Gets the commit system change number (SCN) of the transaction to which the current LCR belongs
<a href="#">GET_COMMIT_SCN_FROM_POSITION Static Function</a>	Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server
<a href="#">GET_COMMIT_TIME</a>	Gets the commit time of the transaction to which the current LCR belongs
<a href="#">GET_COMPATIBLE Member Function</a>	Gets the minimal database compatibility required to support the LCR
<a href="#">GET_EXTRA_ATTRIBUTE Member Function</a>	Gets the value for the specified extra attribute in the LCR
<a href="#">GET_OBJECT_NAME Member Function</a>	Gets the name of the object that is changed by the LCR
<a href="#">GET_OBJECT_OWNER Member Function</a>	Gets the owner of the object that is changed by the LCR
<a href="#">GET_POSITION Member Function</a>	Gets the position of the current LCR
<a href="#">GET_ROOT_NAME Member Function</a>	Gets the global name of the root for a CDB.
<a href="#">GET_SCN Member Function</a>	Gets the SCN of the LCR
<a href="#">GET_SCN_FROM_POSITION Static Function</a>	Gets the SCN from the input position, which is generated by an XStream outbound server
<a href="#">GET_SOURCE_DATABASE_NAME Member Function</a>	Gets the source database name.
<a href="#">GET_SOURCE_TIME Member Function</a>	Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created
<a href="#">GET_TAG Member Function</a>	Gets the tag for the LCR

**Table 280-34 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types**

Subprogram	Description
<a href="#">GET_THREAD_NUMBER</a> Member Function	Gets the thread number of the database instance that made the change that is encapsulated in the LCR
<a href="#">GET_TRANSACTION_ID</a> Member Function	Gets the transaction identifier of the LCR
<a href="#">IS_NULL_TAG</a> Member Function	Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL
<a href="#">SET_COMMAND_TYPE</a> Member Procedure	Sets the command type in the LCR
<a href="#">SET_EXTRA_ATTRIBUTE</a> Member Procedure	Sets the value for the specified extra attribute in the LCR
<a href="#">SET_OBJECT_NAME</a> Member Procedure	Sets the name of the object that is changed by the LCR
<a href="#">SET_OBJECT_OWNER</a> Member Procedure	Sets the owner of the object that is changed by the LCR
<a href="#">SET_ROOT_NAME</a> Member Procedure	Sets the global name of the root in a CDB.
<a href="#">SET_SOURCE_DATABASE_NAME</a> Member Procedure	Sets the source database name of the object that is changed by the LCR
<a href="#">SET_TAG</a> Member Procedure	Sets the tag for the LCR

**GET\_COMMAND\_TYPE** Member Function

Gets the command type of the LCR.

 **See Also:**

The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

**Syntax**

```
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

**GET\_COMMIT\_SCN** Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

**Syntax**

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

**GET\_COMMIT\_SCN\_FROM\_POSITION Static Function**

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

**Syntax**

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
 position IN RAW)
RETURN NUMBER;
```

**Parameters****Table 280-35 GET\_COMMIT\_SCN\_FROM\_POSITION Function Parameter**

Parameter	Description
position	The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**GET\_COMMIT\_TIME**

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns `NULL`.

**Syntax**

```
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

**GET\_COMPATIBLE Member Function**

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_9_2	9.2.0
DBMS_STREAMS.COMPATIBLE_10_1	10.1.0
DBMS_STREAMS.COMPATIBLE_10_2	10.2.0
DBMS_STREAMS.COMPATIBLE_11_1	11.1.0
DBMS_STREAMS.COMPATIBLE_11_2	11.2.0

DDL LCRs always return `DBMS_STREAMS.COMPATIBLE_9_2`.

You can use the following functions in the `DBMS_STREAMS` package for constant compatibility return values:

- The `COMPATIBLE_9_2` function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.
- The `COMPATIBLE_10_1` function returns `DBMS_STREAMS.COMPATIBLE_10_1` constant.
- The `COMPATIBLE_10_2` function returns `DBMS_STREAMS.COMPATIBLE_10_2` constant.
- The `COMPATIBLE_11_1` function returns `DBMS_STREAMS.COMPATIBLE_11_1` constant.
- The `COMPATIBLE_11_2` function returns `DBMS_STREAMS.COMPATIBLE_11_2` constant.
- The `MAX_COMPATIBLE` function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the `GET_COMPATIBLE` member function for an LCR in rule conditions and apply handlers.

#### See Also:

- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

### Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

### GET\_EXTRA\_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an `ANYDATA` instance. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

#### See Also:

[INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#)

## Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
 attribute_name IN VARCHAR2)
RETURN ANYDATA;
```

## Parameters

**Table 280-36 GET\_EXTRA\_ATTRIBUTE Function Parameter**

Parameter	Description
attribute_name	<p>The name of the extra attribute to return</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <li>• row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID.</li> <li>• serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>• session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>• thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>• tx_name The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>• username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul> <p>An error is raised if the specified attribute_name is not valid.</p> <p>If no value exists for the specified extra attribute, then the function returns a NULL.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>

## GET\_OBJECT\_NAME Member Function

Gets the name of the object that is changed by the LCR.

## Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

## GET\_OBJECT\_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

### Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;
```

### GET\_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

### Syntax

```
MEMBER FUNCTION GET_POSITION()
RETURN RAW;
```

 **Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

### GET\_ROOT\_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

### Syntax

```
MEMBER FUNCTION GET_ROOT_NAME()
RETURN VARCHAR2;
```

### GET\_SCN Member Function

Gets the system change number (SCN) of the LCR.

### Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

### GET\_SCN\_FROM\_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

### Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(
 position IN RAW)
RETURN NUMBER;
```

## Parameters

**Table 280-37 GET\_SCN\_FROM\_POSITION Function Parameter**

Parameter	Description
position	The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

 **Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

### GET\_SOURCE\_DATABASE\_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

#### Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;
```

### GET\_SOURCE\_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

#### Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;
```

### GET\_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

#### Syntax

```
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

### GET\_THREAD\_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

 **See Also:**

*Oracle Real Application Clusters Administration and Deployment Guide*

**Syntax**

```
MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;
```

**GET\_TRANSACTION\_ID Member Function**

Gets the transaction identifier of the LCR.

**Syntax**

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

**IS\_NULL\_TAG Member Function**

Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.

**Syntax**

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```

**SET\_COMMAND\_TYPE Member Procedure**

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing INSERT to GRANT would raise an error.

 **See Also:**

- The description of the `command_type` parameter in [LCR\\$\\_DDL\\_RECORD Constructor Function Parameters](#)
- The description of the `command_type` parameter in [LCR\\$\\_ROW\\_RECORD Type](#)
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

**Syntax**

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
 command_type IN VARCHAR2);
```

## Parameter

**Table 280-38 SET\_COMMAND\_TYPE Procedure Parameter**

Parameter	Description
command_type	The command type Set this parameter to a non-NULL value.

## SET\_EXTRA\_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

### See Also:

[INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#)

## Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
 attribute_name IN VARCHAR2,
 attribute_value IN ANYDATA);
```

## Parameters

**Table 280-39 SET\_EXTRA\_ATTRIBUTE Procedure Parameter**

Parameter	Description
attribute_name	<p>The name of the extra attribute to set</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <li>row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2.</li> <li>serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>tx_name The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul> <p>An error is raised if the specified attribute_name is not valid.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>
attribute_value	<p>The value to which the specified extra attribute is set</p> <p>If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.</p>

## SET\_OBJECT\_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

### Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
 object_name IN VARCHAR2);
```

### Parameter

**Table 280-40 SET\_OBJECT\_NAME Procedure Parameter**

Parameter	Description
object_name	The name of the object

**SET\_OBJECT\_OWNER Member Procedure**

Sets the owner of the object that is changed by the LCR.

**Syntax**

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
 object_owner IN VARCHAR2);
```

**Parameter****Table 280-41 SET\_OBJECT\_OWNER Procedure Parameter**

Parameter	Description
object_owner	The schema that contains the object

**SET\_ROOT\_NAME Member Procedure**

Sets the global name of the root in a CDB. The setting is the root name for the LCR.

**Syntax**

```
MEMBER PROCEDURE SET_ROOT_NAME(
 root_name IN VARCHAR2);
```

**Parameter****Table 280-42 SET\_ROOT\_NAME Procedure Parameter**

Parameter	Description
root_name	The global name of the root.

**SET\_SOURCE\_DATABASE\_NAME Member Procedure**

Sets the source database name of the object that is changed by the LCR.

**Syntax**

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
 source_database_name IN VARCHAR2);
```

**Parameter****Table 280-43 SET\_SOURCE\_DATABASE\_NAME Procedure Parameter**

Parameter	Description
source_database_name	The source database of the change If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.

### SET\_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

#### Syntax

```
MEMBER PROCEDURE SET_TAG(
 tag IN RAW);
```

#### Parameter

**Table 280-44 SET\_TAG Procedure Parameter**

Parameter	Description
tag	The binary tag for the LCR The size limit for a tag value is two kilobytes.

## 280.3.4 LCR\$\_ROW\_LIST Type

This type identifies a list of column values for a row in a table.

It uses the LCR\$\_ROW\_UNIT type and is used in the LCR\$\_ROW\_RECORD type.

#### See Also:

- [LCR\\$\\_ROW\\_UNIT Type](#)
- [LCR\\$\\_ROW\\_RECORD Type](#)

#### Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

## 280.3.5 LCR\$\_ROW\_UNIT Type

This type identifies the value for a column in a row.

It is used in the LCR\$\_ROW\_LIST type.

#### See Also:

- [LCR\\$\\_ROW\\_LIST Type](#)

## Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
 column_name VARCHAR2(4000),
 data ANYDATA,
 lob_information NUMBER,
 lob_offset NUMBER,
 lob_operation_size NUMBER
 long_information NUMBER);
/
```

## Attributes

**Table 280-45 LCR\$\_ROW\_UNIT Attributes**

Attribute	Description
column_name	The name of the column
data	The data contained in the column
lob_information	<p>Contains the LOB information for the column and contains one of the following values:</p> <pre>DBMS_LCR.NOT_A_LOB          CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB          CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB        CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB         CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK         CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK    CONSTANT NUMBER := 6;</pre>
lob_offset	<p>The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns</p> <p>Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.</p>
lob_operation_size	<p>If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE.</p> <p>If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.</p>
long_information	<p>Contains the LONG information for the column and contains one of the following values:</p> <pre>DBMS_LCR.not_a_long  CONSTANT NUMBER := 1; DBMS_LCR.null_long   CONSTANT NUMBER := 2; DBMS_LCR.inline_long CONSTANT NUMBER := 3; DBMS_LCR.long_chunk  CONSTANT NUMBER := 4; DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;</pre>

## MGD\_ID Package Types

The `MGD_ID` package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The `MGD_ID` Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification).

The `MGD_ID` package contains several predefined types.

### See Also:

*Oracle Database Development Guide* for more information.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)
- [Summary of MGD\\_ID Subprograms](#)

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

### 281.1 MGD\_ID Package Types Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`.

## 281.2 Summary of Types

This table lists and briefly describes the MGD\_ID Package object types.

**Table 281-1 MGD\_ID Package Object Types**

Object Type Name	Description
<a href="#">MGD_ID_COMPONENT Object Type</a>	Datatype that specifies the name and value pair attributes that define a component
<a href="#">MGD_ID_COMPONENT_VARRAY Object Type</a>	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
<a href="#">MGD_ID Object Type</a>	Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components

### 281.2.1 MGD\_ID\_COMPONENT Object Type

The MGD\_ID\_COMPONENT type is a datatype that specifies the name and value pair attributes that define a component.

#### Syntax

```
MGD_ID_COMPONENT as object (name VARCHAR2(256),
 value VARCHAR2(1024));
```

#### Attributes

**Table 281-2 MGD\_ID\_COMPONENT Attributes**

Attribute	Description
name	Name of component
value	Value of the component as a character

#### Examples

See the [MGD\\_ID Constructor Function](#) for an example.

### 281.2.2 MGD\_ID\_COMPONENT\_VARRAY Object Type

The MGD\_ID\_COMPONENT\_VARRAY type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

#### Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

## Examples

See the [MGD\\_ID Constructor Function](#) for an example.

## 281.2.3 MGD\_ID Object Type

The `MGD_ID` type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

### Syntax

```
MGD_ID as object (category_id VARCHAR2(256),
 components MGD_ID_COMPONENT_VARRAY);
```

### Attributes

**Table 281-3 MGD\_ID Object Type Attributes**

Attribute	Description
<code>category_id</code>	Category identifier for the code category of this code
<code>components</code>	List of components as name-value attributes

### Methods

[Table 281-5](#) describes the methods of the `MGD_ID` object type.

**Table 281-4 MGD\_ID Methods**

Method	Description
<code>MGD_ID</code> constructor function	Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result
<code>FORMAT</code> function	Returns the string representation of the <code>MGD_ID</code> in the specified format
<code>GET_COMPONENT</code> function	Returns the string value of the specified <code>MGD_ID</code> component
<code>TO_STRING</code> function	Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object
<code>TRANSLATE</code> function	Returns the result of the conversion of the identifier from one format to the specified format

### Examples

See the [Summary of MGD\\_ID Subprograms](#) section and the section about using the Identity Code package in Using the Identity Code Package in *Oracle Database Development Guide* for examples.

## 281.3 Summary of MGD\_ID Subprograms

This table describes the subprograms in the `MGD_ID` object type.

All the values and names passed to the procedures defined in the `MGD_ID` object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

**Table 281-5 MGD\_ID Object Type Subprograms**

Subprogram	Description
<a href="#">MGD_ID Constructor Function</a>	Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result
<a href="#">FORMAT Function</a>	Returns the string representation of the <code>MGD_ID</code> object in the specified format
<a href="#">GET_COMPONENT Function</a>	Returns the string value of the specified <code>MGD_ID</code> component
<a href="#">TO_STRING Function</a>	Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object
<a href="#">TRANSLATE Function</a>	Returns the result of the conversion of the identifier from one format to the specified format

### 281.3.1 MGD\_ID Constructor Function

This constructor function constructs an identity code type object, `MGD_ID`. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

#### Syntax

Constructs an `MGD_ID` object type based on the category ID and a list of components.

```
MGD_ID (
 category_id IN VARCHAR2,
 components IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
 category_id VARCHAR2,
 identifier VARCHAR2,
 parameter_list VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category name, category version, and a list of components.

```
MGD_ID (
 category_name VARCHAR2,
 category_version VARCHAR2,
 components MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD\_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
 category_name VARCHAR2,
 category_version VARCHAR2,
 identifier VARCHAR2,
 parameter_list VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

## Parameters

**Table 281-6 MGD\_ID Constructor Function Parameters**

Parameter	Description
category_id	Category identifier
components	List of component name value pairs
category_name	Category name, such as EPC
category_version	Category version. If NULL, the latest version for the specified category name will be used.
identifier	Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY.  Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:  <code>filter=3;companyprefixlength=7;taglength=96</code>

## Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is NULL, the `bit_length` is 8\* the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

## Examples

The following examples construct identity code type objects.

Construct an MGD\_ID object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
 MGD_ID_COMPONENT_VARRAY(
 MGD_ID_COMPONENT('companyprefix','0037000'),
 MGD_ID_COMPONENT('itemref','030241'),
 MGD_ID_COMPONENT('serial','1041970'),
 MGD_ID_COMPONENT('schemes','SGTIN-64')
)
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('itemref', '030241'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64'))
.
.
.
```

Constructs an MGD\_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
 'urn:epc:id:sgtin:0037000.030241.1041970',
 'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
 MGD_ID_COMPONENT('companyprefixlength', '7'),
 MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('itemref', '030241'))
.
.
.
```

Construct an MGD\_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
```

```

 MGD_ID_COMPONENT_VARRAY(
 MGD_ID_COMPONENT('companyprefix','0037000'),
 MGD_ID_COMPONENT('itemref','030241'),
 MGD_ID_COMPONENT('serial','1041970'),
 MGD_ID_COMPONENT('schemes','SGTIN-64')
)
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('itemref', '030241'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.

```

Constructs an MGD\_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```

--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
 'urn:epc:id:sgtin:0037000.030241.1041970',
 'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

```

```

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
 MGD_ID_COMPONENT('companyprefixlength', '7'),
 MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('itemref', '030241')))
.
.
.

```

## 281.3.2 FORMAT Function

This function returns the string representation of the MGD\_ID object in the specified format.

### Syntax

```

FORMAT (parameter_list IN VARCHAR2,
 output_format IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

## Parameters

**Table 281-7 FORMAT Function Parameters**

Parameter	Description
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:  filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component is formatted: <ul style="list-style-type: none"> <li>• BINARY</li> <li>• LEGACY</li> <li>• TAG_ENCODING</li> <li>• PURE_IDENTITY</li> <li>• ONS_HOSTNAME</li> </ul>

## Examples

See the example for the [GET\\_COMPONENT Function](#).

## 281.3.3 GET\_COMPONENT Function

This function returns the value of the specified MGD\_ID component.

### Syntax

```
GET_COMPONENT (
 component_name IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

### Parameters

**Table 281-8 GET\_COMPONENT Function Parameter**

Parameter	Description
component_name	Name of component

### Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

### Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));

 --PURE_IDENTIT

 dbms_output.put_line('..Testing constructor with pure identity');

 -- PURE_IDENTITY representation can be translated to BINARY and
 -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.

 id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970',
'scheme=SGTIN-64;filter=3');
 dbms_output.put_line(id.to_string);
 dbms_output.put_line('filter = ' || id.get_component('filter'));
 dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
 dbms_output.put_line('itemref = ' || id.get_component('itemref'));
 dbms_output.put_line('serial = ' || id.get_component('serial'));
 dbms_output.put_line('BINARY format = ' || id.format(NULL, 'BINARY'));
 dbms_output.put_line('PURE_IDENTITY format = ' || id.format(NULL, 'PURE_IDENTITY'));
 dbms_output.put_line('TAG_ENCODING format = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
SQL> @get_component.sql
.
.
.
..Testing constructor with pure identity
category_id =1;filter = 3;schemes = SGTIN-64;companyprefixlength =
7;companyprefix = 0037000;scheme = SGTIN-64;serial = 1041970;itemref = 030241
filter = 3
company prefix = 0037000
itemref = 030241
serial = 1041970
BINARY format =1001100000000000001000001110110001000010000011111110011000110010
PURE_IDENTITY format = urn:epc:id:sgtin:0037000.030241.1041970
TAG_ENCODING format = urn:epc:tag:sgtin-64:3.0037000.030241.1041970
PL/SQL procedure successfully completed.
.
.
.
```

## 281.3.4 TO\_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD\_ID object.

### Syntax

```
TO_STRING
RETURN VARCHAR2;
```

## Examples

The following example converts the MGD\_ID object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
 id MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
 id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
 DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
 DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @tostring3.sql
.
.
.
..Testing to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970
PL/SQL procedure successfully completed.
.
.
```

## 281.3.5 TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD\_ID object.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
 category_name IN VARCHAR2,
 identifier IN VARCHAR2,
 parameter_list IN VARCHAR2,
 output_format IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
 category_name IN VARCHAR2,
 category_version IN VARCHAR2,
```

```

 identifier IN VARCHAR2,
 parameter_list IN VARCHAR2,
 output_format IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

## Parameters

**Table 281-9 TRANSLATE Function Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version. If NULL, the latest version of the specified category name will be used.
identifier	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:  <code>filter=3;companyprefixlength=7;taglength=96</code>
output_format	One of the supported output formats into which an MGD_ID component shall be converted: <ul style="list-style-type: none"> <li>• BINARY</li> <li>• LEGACY</li> <li>• TAG_ENCODING</li> <li>• PURE_IDENTITY</li> <li>• ONS_HOSTNAME</li> </ul>

## Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

## Examples

The following examples translates one GID-96 representation into another:

```

-- Contents of translatel.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
 dbms_output.put_line(
 mgd_id.translate('EPC',
NULL, '001101010000000000001001000010001000000000001110110001000010000000000000111111100110001
10010'
, NULL, 'BINARY'));

```

```

dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is
PURE_IDENTITY');
 dbms_output.put_line(
 mgd_id.translate('EPC',
NULL,'00110101000000000001001000010001000000000001110110001000010000000000000111111100110001
10010'
, NULL, 'PURE_IDENTITY'));
dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is TAG_ENCODING');
 dbms_output.put_line(
 mgd_id.translate('EPC',
NULL,'00110101000000000001001000010001000000000001110110001000010000000000000111111100110001
10010'
, NULL, 'TAG_ENCODING'));
 dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is
BINARY');
 dbms_output.put_line(
 mgd_id.translate('EPC', NULL,
 'urn:epc:tag:gid-96:0037000.30241.1041970',
 NULL, 'BINARY'));
 dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is

# Rule TYPEs

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Rule Types](#)

## 282.1 Rule TYPEs Overview

These types are used in rules and enable clients to evaluate rules with the rules engine.

### See Also:

- [DBMS\\_RULE](#)
- [DBMS\\_RULE\\_ADM](#)

## 282.2 Rule TYPEs Security Model

PUBLIC is granted EXECUTE privilege on these RULE types.

### See Also:

*Oracle Database Security Guide* for more information about user group PUBLIC

## 282.3 Summary of Rule Types

This table lists the Rule Types and briefly describes them.

**Table 282-1 Rule Types**

Type	Description
<a href="#">RE\$ATTRIBUTE_VALUE Type</a>	Specifies the value of a variable attribute
<a href="#">RE\$ATTRIBUTE_VALUE_LIST Type</a>	Identifies a list of attribute values
<a href="#">RE\$COLUMN_VALUE Type</a>	Specifies the value of a table column

Table 282-1 (Cont.) Rule Types

Type	Description
<a href="#">RE\$COLUMN_VALUE_LIST Type</a>	Identifies a list of column values
<a href="#">RE\$NAME_ARRAY Type</a>	Identifies a list of names
<a href="#">RE\$NAME_ARRAY Type</a>	Identifies a list of name-value pairs
<a href="#">RE\$NV_LIST Type</a>	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
<a href="#">RE\$NV_NODE Type</a>	Identifies a name-value pair
<a href="#">RE\$RULE_HIT Type</a>	Specifies a rule found because of evaluation
<a href="#">RE\$RULE_HIT_LIST Type</a>	Identifies a list of rules found because of evaluation
<a href="#">RE\$RULE_NAME Type</a>	Allows users to pass a list of rule as argument.
<a href="#">RE\$RULE_NAME_LIST Type</a>	Identifies a list of Rule Name values
<a href="#">RE\$TABLE_ALIAS Type</a>	Provides the table corresponding to an alias used in a rule evaluation context
<a href="#">RE\$TABLE_ALIAS_LIST Type</a>	Identifies a list of table aliases used in a rule evaluation context
<a href="#">RE\$TABLE_VALUE Type</a>	Specifies the value of a table row using a ROWID
<a href="#">RE\$TABLE_VALUE_LIST Type</a>	Identifies a list of table values
<a href="#">RE\$VALUE Type</a>	Represents one datapoint value element
<a href="#">RE\$VALUE_LIST Type</a>	Defines a list of RE\$VALUE type
<a href="#">RE\$VARIABLE_TYPE Type</a>	Provides the type of a variable used in a rule evaluation context
<a href="#">RE\$VARIABLE_TYPE_LIST Type</a>	Identifies a list of variables and their types used in a rule evaluation context
<a href="#">RE\$VARIABLE_VALUE Type</a>	Specifies the value of a variable
<a href="#">RE\$VARIABLE_VALUE_LIST Type</a>	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- DBMS\_RULE
- DBMS\_RULE\_ADM

You can use the DBMS\_RULE\_ADM package to create and administer rules, rule sets, and evaluation contexts, and you can use the DBMS\_RULE package to evaluate rules.

When you use Replication (Oracle GoldenGate and XStream), rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Replication (Oracle GoldenGate and XStream) packages use rules:

- DBMS\_APPLY\_ADM
- DBMS\_CAPTURE\_ADM
- DBMS\_PROPAGATION\_ADM

## 282.3.1 RE\$ATTRIBUTE\_VALUE Type

RE\$ATTRIBUTE\_VALUE type specifies the value of a variable attribute.

 **Note:**

Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
 variable_name VARCHAR2(32),
 attribute_name VARCHAR2(4000),
 attribute_value ANYDATA);
```

### Attributes

**Table 282-2 RE\$ATTRIBUTE\_VALUE Attributes**

Attribute	Description
variable_name	Specifies the variable used in a rule
attribute_name	Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3.
attribute_value	Specifies the attribute value

## 282.3.2 RE\$ATTRIBUTE\_VALUE\_LIST Type

The RE\$ATTRIBUTE\_VALUE\_LIST type identifies a list of attribute values.

### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

## 282.3.3 RE\$COLUMN\_VALUE Type

RE\$COLUMN\_VALUE type specifies the value of a table column.

 **Note:**

Enclose the column name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
 table_alias VARCHAR2(32),
```

```
column_name VARCHAR2(4000),
column_value ANYDATA);
```

### Attributes

**Table 282-3** RE\$COLUMN\_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
column_name	Specifies the column name
column_value	Specifies the column value

## 282.3.4 RE\$COLUMN\_VALUE\_LIST Type

RE\$COLUMN\_VALUE\_LIST type identifies a list of column values.

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

## 282.3.5 RE\$NAME\_ARRAY Type

RE\$NAME\_ARRAY type identifies a list of names.

### Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

## 282.3.6 RE\$NV\_ARRAY Type

RE\$NV\_ARRAY type identifies a list of name-value pairs.

### Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

## 282.3.7 RE\$NV\_LIST Type

identifies an object containing a list of name-value pairs and methods that operate on this list.

This object type is used to represent the event context for rule set evaluation and the action context for a rule.

### Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
 actx_list SYS.RE$NV_ARRAY);
```

## Attributes

**Table 282-4 RE\$NV\_LIST Attributes**

Attribute	Description
actx_list	The list of name-value pairs

## RE\$NV\_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE\$NV\_LIST type:

- [ADD\\_PAIR Member Procedure](#)
- [GET\\_ALL\\_NAMES Member Function](#)
- [GET\\_VALUE Member Function](#)
- [REMOVE\\_PAIR Member Procedure](#)

### ADD\_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

 **Note:**

Enclose the name in double quotation marks (") if the name contains special characters.

### Syntax

```
MEMBER PROCEDURE ADD_PAIR(
 name IN VARCHAR2,
 value IN ANYDATA);
```

### Parameters

**Table 282-5 ADD\_PAIR Procedure Parameters**

Parameter	Description
name	The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

### GET\_ALL\_NAMES Member Function

Returns a list of all the names in the name-value pair list.

### Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

## GET\_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

## Syntax

```
MEMBER FUNCTION GET_VALUE(
 name IN VARCHAR2)
RETURN ANYDATA;
```

## Parameters

**Table 282-6 GET\_VALUE Function Parameters**

Parameter	Description
name	The name whose value to return

## REMOVE\_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

## Syntax

```
MEMBER PROCEDURE REMOVE_PAIR(
 name IN VARCHAR2);
```

## Parameters

**Table 282-7 REMOVE\_PAIR Procedure Parameters**

Parameter	Description
name	The name of the pair to remove

## 282.3.8 RE\$NV\_NODE Type

RE\$COLUMN\_VALUE type identifies a name-value pair.

### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$NV_NODE (
 nvn_name VARCHAR2(30),
 nvn_value ANYDATA);
```

### Attributes

**Table 282-8 RE\$NV\_NODE Attributes**

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

## 282.3.9 RE\$RULE\_HIT Type

The RE\$RULE\_HIT type specifies a rule found because of an evaluation.

### See Also:

- [CREATE\\_RULE Procedure](#)
- [ALTER\\_RULE Procedure](#)

### Syntax

```
TYPE SYS.RE$RULE_HIT (
 rule_name VARCHAR2(65),
 rule_action_context RE$NV_LIST);
```

## Attributes

**Table 282-9 RE\$RULE\_HIT Attributes**

Attribute	Description
rule_name	The rule name in the form <i>schema_name.rule_name</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> .
rule_action_context	The rule action context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package

## 282.3.10 RE\$RULE\_HIT\_LIST Type

The `RE$RULE_HIT_LIST` type identifies a list of rules found because of an evaluation.

### Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

## 282.3.11 RE\$RULE\_NAME Type

The `RE$RULE_HIT` type is create to allow use to pass a list of rule as argument.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME AS OBJECT(
 rule_name IN varchar2,
 evaluation_context IN varchar2);
```

## Attributes

**Table 282-10 RE\$RULE\_NAME Attributes**

Attribute	Description
rule_name	The rule name in the form <i>SCHEMA_NAME.RULE_NAME</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> .
Evaluation_context	The evaluation context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package

## 282.3.12 RE\$RULE\_NAME\_LIST Type

`RE$RULE_HIT_LIST` type identifies a list of Rule Name values.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME_LIST AS VARRAY(1024) OF SYS.RE$RULE_NAME;
```

## 282.3.13 RE\$TABLE\_ALIAS Type

RE\$TABLE\_ALIAS type provides the table corresponding to an alias used in a rule evaluation context.

A specified table name must satisfy the schema object naming rules.

### Note:

Enclose the table name in double quotation marks (") if the name contains special characters.

### See Also:

*Oracle Database SQL Language Reference* for information about schema object naming rules

### Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
 table_alias VARCHAR2(32),
 table_name VARCHAR2(194));
```

### Attributes

**Table 282-11 RE\$TABLE\_ALIAS Attributes**

Attribute	Description
table_alias	The alias used for the table in a rule
table_name	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following:  <i>schema_name.table_name</i>  <i>table_name</i>  For example, if the <i>schema_name</i> is <i>hr</i> and the <i>table_name</i> is <i>employees</i> , then enter the following:  <i>hr.employees</i>

## 282.3.14 RE\$TABLE\_ALIAS\_LIST Type

The RE\$TABLE\_ALIAS\_LIST type identifies a list of table aliases used in a rule evaluation context.

### Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

## 282.3.15 RE\$TABLE\_VALUE Type

The RE\$TABLE\_VALUE type specifies the value of a table row using a ROWID.

### Syntax

```
TYPE SYS.RE$TABLE_VALUE(
 table_alias VARCHAR2(32),
 table_rowid VARCHAR2(18));
```

### Attributes

**Table 282-12 RE\$TABLE\_VALUE Attributes**

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
table_rowid	Specifies the rowid for the table row

## 282.3.16 RE\$TABLE\_VALUE\_LIST Type

The RE\$TABLE\_VALUE\_LIST type identifies a list of table values.

### Note:

Each table alias in the list in the list must be unique.

### Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

## 282.3.17 RE\$VALUE Type

The RE\$VALUE type represents one datapoint value element.

### Syntax

```
TYPE SYS.RE$VALUE (
 table_values IN SYS.RE$TABLE_VALUE_LIST:= NULL,
 column_values IN SYS.RE$COLUMN_VALUE_LIST:=NULL,
 variable_values IN SYS.RE$VARIABLE_VALUE_LIST:=NULL,
 attribute_values IN SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL)
```

## Attributes

**Table 282-13 RE\$VALUE Attributes**

Attribute	Description
table_values	ROWID of table row for expression evaluation
column_values	Values of columns referred in the expression
variable_value	Values of variables referred in expressions
attribute_values	Values of attributes referred in expressions

### 282.3.18 RE\$VALUE\_LIST Type

RE\$TABLE\_VALUE\_LIST type is a varray for defining a list of RE\$VALUE type. It represents a list of datapoint element.

#### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$VALUE_LIST AS VARRAY(1024) OF SYS.RE$VALUE;
```

### 282.3.19 RE\$VARIABLE\_TYPE Type

The RE\$VARIABLE\_TYPE type provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

#### Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

#### See Also:

*Oracle Database SQL Language Reference* for information about schema object naming rules

#### Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
 variable_name VARCHAR2(32),
 variable_type VARCHAR2(4000),
 variable_value_function VARCHAR2(228),
 variable_method_function VARCHAR2(228));
```

## Attributes

**Table 282-14 RE\$VARIABLE\_TYPE Attributes**

Attribute	Description
<code>variable_name</code>	The variable name used in a rule
<code>variable_type</code>	The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the <i>Oracle Database SQL Language Reference</i> for more information about these types.
<code>variable_value_function</code>	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.  See the "Usage Notes" for more information.
<code>variable_method_function</code>	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function.  The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.  See the "Usage Notes" for more information.

## Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: *schema\_name*, *package\_name*, and *@dblink*.

For example, if the *schema\_name* is *hr*, the *package\_name* is *var\_pac*, the *function\_name* is *func\_value*, and the *dblink* is *dbsl.net*, then enter the following:

```
hr.var_pac.func_value@dbsl.net
```

The following sections describe the signature of the functions.

### Signature for `variable_value_function`

The function must have the following signature:

```
FUNCTION variable_value_function_name(
 evaluation_context_schema IN VARCHAR2,
 evaluation_context_name IN VARCHAR2,
 variable_name IN VARCHAR2,
 event_context IN SYS.RE$NV_LIST)
RETURN SYS.RE$VARIABLE_VALUE;
```

**Signature for variable\_method\_function**

This function must have the following signature:

```
FUNCTION variable_method_function_name(
 evaluation_context_schema IN VARCHAR2,
 evaluation_context_name IN VARCHAR2,
 variable_value IN SYS.RE$VARIABLE_VALUE,
 method_name IN VARCHAR2,
 event_context IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

## 282.3.20 RE\$VARIABLE\_TYPE\_LIST Type

The RE\$VARIABLE\_TYPE\_LIST type identifies a list of variables and their types used in a rule evaluation context.

**Syntax**

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

## 282.3.21 RE\$VARIABLE\_VALUE Type

The RE\$VARIABLE\_VALUE type specifies the value of a variable.

 **Note:**

Enclose the variable name in double quotation marks (") if the name contains special characters.

**Syntax**

```
TYPE SYS.RE$VARIABLE_VALUE (
 variable_name VARCHAR2(32),
 variable_data ANYDATA);
```

**Attributes****Table 282-15 RE\$VARIABLE\_VALUE Attributes**

Attribute	Description
variable_name	Specifies the variable name used in a rule
variable_data	Specifies the data for the variable value

## 282.3.22 RE\$VARIABLE\_VALUE\_LIST Type

The RE\$VARIABLE\_VALUE\_LIST type identifies a list of variable values.

**Syntax**

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

# SODA Types

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

This chapter contains the following topics:

- [SODA Types Overview](#)
- [SODA Types Security Model](#)

## 283.1 SODA Types Overview

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

### See Also:

- *Oracle Database SODA for PL/SQL Developer's Guide*
- [DBMS\\_SODA](#)

## 283.2 SODA Types Security Model

The SODA Types are available to users with the `SODA_APP` role.

All SODA types are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the SODA types described in this chapter:

- `TYPE SODA_Collection_T`
- `TYPE SODA_Document_T`
- `TYPE SODA_Operation_T`
- `TYPE SODA_Cursor_T`

## 283.3 Summary of SODA Types

This chapter lists the SODA types and describes them.

**Table 283-1 SODA Types**

Type	Description
<a href="#">SODA_COLLECTION_T Type</a>	This SODA type represents a SODA collection. This type is not persistable.
<a href="#">SODA_DOCUMENT_T Type</a>	This SODA type represents a document with content, usually in JSON format. This type is not persistable.
<a href="#">SODA_OPERATION_T Type</a>	This SODA type performs read/write operations, such as document finds with filtering and pagination, removes, and replaces on a SODA collection. This type is not persistable.
<a href="#">SODA_CURSOR_T Type</a>	This SODA type represents the result set of documents. This type is not persistable.

### 283.3.1 SODA\_COLLECTION\_T Type

This SODA type represents a SODA collection. A reference of SODA collection can only be obtained by either calling `DBMS_SODA.CREATE_COLLECTION()` or `DBMS_SODA.OPEN_COLLECTION()`.

**Table 283-2 SODA\_COLLECTION\_T Type Subprograms**

Subprogram	Description
<a href="#">CREATE_INDEX Function</a>	Creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.
<a href="#">CREATE_VIEW_FROM_DG Function</a>	This function creates a view with relational columns, using scalar JSON fields as specified in the data guide. A data guide enabled JSON search index is not required for this function; the data guide is passed to the function. An error is thrown if the data guide passed to the function is invalid.
<a href="#">DROP_INDEX Function</a>	Drops the named index.
<a href="#">FIND Function</a>	Returns the <code>SODA_OPERATION_T</code> object. This is the only way to get the reference of <code>SODA_Operation_T</code> as there is no constructor.
<a href="#">FIND_ONE Function</a>	Fetches the document matching the key.
<a href="#">GET_DATA_GUIDE Function</a>	Returns the JSON data guide as a CLOB.

**Table 283-2 (Cont.) SODA\_COLLECTION\_T Type Subprograms**

Subprogram	Description
<a href="#">GET_METADATA Function</a>	Returns the metadata of the collection in JSON format.
<a href="#">GET_NAME Function</a>	Returns the name of the collection.
<a href="#">INSERT_ONE Function</a>	Inserts a document into the collection.
<a href="#">INSERT_ONE_AND_GET Function</a>	Inserts a document into the collection and returns a result document with all components except for content.
<a href="#">REMOVE_ONE Function</a>	Removes the document matching the key.
<a href="#">REPLACE_ONE Function</a>	Replaces the content and (optionally) the media type of the document matching the key.
<a href="#">REPLACE_ONE_AND_GET Function</a>	Replaces the content and (optionally) the media type of the document matching the key and returns a result document with all components (except content).

### 283.3.1.1 CREATE\_INDEX Function

This function creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.

#### Syntax

```
CREATE_INDEX (
 specification VARCHAR2)
RETURN NUMBER;
```

#### Parameters

**Table 283-3 CREATE\_INDEX Function Parameters**

Parameter	Description
specification	The index specification.

#### Example 283-1 Return Values

The function returns:

- 1—if the index was successfully created
- 0—if the index was not created

#### Exceptions

**Error**—If an error occurs creating the index.

 **See Also:**

For more information about SODA Index specifications, see:

- Overview of SODA Indexing
- SODA Index Specifications (Reference)

### 283.3.1.2 CREATE\_VIEW\_FROM\_DG Function

This function creates a view with relational columns, using scalar `JSON` fields as specified in the data guide. A data guide enabled `JSON` search index is not required for this function; the data guide is passed to the function. An error is thrown if the data guide passed to the function is invalid.

This procedure is available only for Autonomous Database starting 19c release.

#### Syntax

```
CREATE_VIEW_FROM_DG (
 view_Name VARCHAR2,
 data_guide CLOB)
RETURN NUMBER;
```

#### Parameters

**Table 283-4** CREATE\_VIEW\_FROM\_DG Function Parameters

Parameter	Description
view_Name	Name of the view to be created.
data_Guide	Data guide of the collection.

#### Example 283-2 Return Values

The function returns:

- 1—if the procedure is successfully completed
- 0—if the procedure could not be successfully completed

#### Exceptions

**Error**—If an error occurs while creating the view.

 **See Also:**

For more info on the `JSON` data guide, see [JSON Data Guide](#)

### 283.3.1.3 DROP\_INDEX Function

This function drops the named index.

#### Syntax

```
DROP_INDEX (
 index_Name IN VARCHAR2,
 force IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

#### Example 283-3 Parameters

**Table 283-5 DROP\_INDEX Function Parameters**

Parameter	Description
index_Name	The name of the index.
force	The force parameter can be TRUE or FALSE. Should only be set to TRUE for dropping a JSON search index or spatial index (not B-tree index). For more information, see DROP INDEX

#### Return Values

The function returns:

- 1—If the index was successfully dropped
- 0—If the index was not dropped. For example, if there was no existing index with the specified name.

#### Exceptions

**Error**—if an error occurs while dropping the index.

### 283.3.1.4 FIND Function

This function returns the operation type for the collection. The operation type allows building and executing various read/write operations. This is the only way to get the reference of `SODA_Operation_T` as there is no constructor.

#### Syntax

```
FIND ()
RETURN SODA_Operation_T;
```

#### Return Values

This function returns `SODA_OPERATION_T` object.

#### Exceptions

This function does not throw any exception.

### 283.3.1.5 FIND\_ONE Function

This function fetches the document matching the given key.

#### Syntax

```
FIND_ONE (
 key IN VARCHAR2)
RETURN SODA_Document_T;
```

#### Parameters

**Table 283-6 FIND\_ONE Function Parameters**

Parameter	Description
key	The key of the document to be fetched.

#### Return Values

This function returns the document that matches the key. Returns `NULL` if no match is found.

#### Exceptions

`Error`—If an error occurs while finding the document.

### 283.3.1.6 GET\_DATA\_GUIDE Function

This function fetches the JSON data guide as a CLOB. The JSON data guide is essentially inferred schema for the JSON documents in the collection. In order to be able to return the JSON data guide, a collection must have a JSON Search Index defined on it, with the data guide enabled.

#### Syntax

```
GET_DATA_GUIDE (
RETURN CLOB;
```

#### Return Values

The function returns the JSON data guide as a CLOB.

#### See Also:

For more info on the JSON data guide, see [JSON Data Guide](#)

#### Exceptions

`Error`—If an error occurs while fetching the data guide.

### 283.3.1.7 GET\_METADATA Function

This function returns the metadata of the collection in JSON format.

#### Syntax

```
GET_METADATA (
 RETURN VARCHAR2;
```

#### Return Values

This function returns the metadata of the collection in JSON format.

### 283.3.1.8 GET\_NAME Function

This function returns the name of the collection.

#### Syntax

```
GET_NAME (
 RETURN NVARCHAR2;
```

#### Return Values

This function returns the name of the collection.

### 283.3.1.9 INSERT\_ONE Function

This function inserts a document into the collection.

#### Syntax

```
INSERT_ONE (
 document IN SODA_Document_T)
 RETURN NUMBER;
```

#### Parameters

**Table 283-7** INSERT\_ONE Function Parameters

Parameter	Description
document	The input document.

#### Return Values

The function returns a number—1 if the doc was inserted successfully, 0 otherwise.

#### Exceptions

**Error**—If an error occurs while inserting the document into the collection.

### 283.3.1.10 INSERT\_ONE\_AND\_GET Function

This function inserts a document into the collection.

**Syntax**

```
INSERT_ONE_AND_GET (
 document IN SODA_Document_T)
RETURN SODA_Document_T;
```

**Parameters****Table 283-8** INSERT\_ONE\_AND\_GET Function Parameters

Parameter	Description
document	The input document.

**Return Values**

The function returns the result document containing all document components supported by the given collection, with the exception of content.

**Exceptions**

**Error**—If an error occurs while inserting the document into the collection.

## 283.3.1.11 REMOVE\_ONE Function

This function removes the document matching the given key.

**Syntax**

```
REMOVE_ONE (
 key IN VARCHAR2)
RETURN NUMBER;
```

**Parameters****Table 283-9** REMOVE\_ONE Function Parameters

Parameter	Description
key	The key of the document.

**Return Values**

This function returns the following values:

- 1—If the document was successfully removed.
- 0—If the document with the specified key was not found.

**Exceptions**

**Error**—If an error occurs while deleting the document from the collection.

### 283.3.1.12 REPLACE\_ONE Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

#### Syntax

```
REPLACE_ONE (
 key IN VARCHAR2,
 document IN SODA_Document_T)
RETURN NUMBER;
```

#### Parameters

**Table 283-10 REPLACE\_ONE Parameters**

Parameter	Description
key	The key of the document.
document	The document with the new content and media type to replace the old one.

#### Return Values

This function returns a number—1 if the document was replaced, 0 otherwise.

#### Exceptions

**Error**—If an error occurs while replacing the document in the collection.

### 283.3.1.13 REPLACE\_ONE\_AND\_GET Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

#### Syntax

```
REPLACE_ONE_AND_GET (
 key IN VARCHAR2,
 document IN SODA_Document_T)
RETURN SODA_Document_T;
```

#### Parameters

**Table 283-11 REPLACE\_ONE\_AND\_GET Function Parameters**

Parameter	Description
key	The key of the document.
document	The document with the new content and media type to replace the old one.

### Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

### Exceptions

**Error**—If an error occurs while replacing the document in the collection.

## 283.3.2 SODA\_DOCUMENT\_T Type

This SODA type represents a document with content, that is usually in `JSON` format.

This type is not persistable `pl/sql` type. However, SODA is a system that basically provides persistence — it has read and write operations. So you do not persist `SODA_DOCUMENT_T` directly, but you pass it to a write operation (like `insert` or `replace`), which is defined on `SODA_COLLECTION_T`, in order to write the document content and other components to the database.

A document has the following components:

- key
- content
- created-on timestamp
- last-modified timestamp
- version
- media type

**Table 283-12 SODA\_DOCUMENT\_T Type Subprograms**

Subprogram	Description
<a href="#">GET_BLOB Function</a>	Fetches the BLOB content of a BLOB-based document.
<a href="#">GET_CLOB Function</a>	Fetches the CLOB content of a CLOB-based document.
<a href="#">GET_CREATED_ON Function</a>	Fetches the created-on timestamp in <code>VARCHAR2</code> .
<a href="#">GET_DATA_TYPE Function</a>	Fetches the SQL datatype of the document content with which it was created.
<a href="#">GET_KEY Function</a>	Fetches the document key in <code>VARCHAR2</code> .
<a href="#">GET_LAST_MODIFIED Function</a>	Fetches the last modified timestamp in <code>VARCHAR2</code> .
<a href="#">GET_MEDIA_TYPE Function</a>	Fetches the media type of the document content in <code>VARCHAR2</code> .
<a href="#">GET_VARCHAR2 Function</a>	Fetches the <code>VARCHAR2</code> content of a <code>VARCHAR2</code> -based document.

Table 283-12 (Cont.) SODA\_DOCUMENT\_T Type Subprograms

Subprogram	Description
<a href="#">GET_VERSION Function</a>	Fetches the version of the document in VARCHAR2.
<a href="#">SODA_Document_T Function</a>	There are three different SODA_DOCUMENT_T constructor functions. Each constructor function instantiates a document object using key, content, and media type.

### 283.3.2.1 GET\_BLOB Function

This functions fetches the BLOB content of the document. It assumes that the document was constructed with BLOB content, or was returned from a collection with BLOB content. Otherwise, an error is returned.

#### Syntax

```
GET_BLOB ()
RETURN BLOB;
```

#### Return Values

This function returns the BLOB content of a document.

#### Exceptions

SODA Error: If the document was initially not created with BLOB content.

### 283.3.2.2 GET\_CLOB Function

The function fetches CLOB content of the document. It assumes that the document was constructed with CLOB content, or was returned from a collection with CLOB content. Otherwise, an error is returned.

#### Syntax

```
GET_CLOB ()
RETURN CLOB;
```

#### Return Values

This function returns the CLOB content of a document.

#### Exceptions

SODA Error: If the document was initially not created with CLOB content.

### 283.3.2.3 GET\_CREATED\_ON Function

This function fetches the created-on timestamp. The timestamp string is in ISO-8601 format, in particular this form: YYYY-MM-DDThh:mm:ss.ssssssZ format. As indicated by the z at the end, timestamps are returned in UTC (z indicates zero UTC offset).

**Syntax**

```
GET_CREATED_ON ()
 RETURN VARCHAR2;
```

**Return Values**

This function returns the created-on timestamp.

### 283.3.2.4 GET\_DATA\_TYPE Function

This function fetches the SQL datatype of the document content with which it was created.

**Syntax**

```
GET_DATA_TYPE ()
 RETURN PLS_INTEGER;
```

**Return Values****Table 283-13 GET\_DATA\_TYPE Return Values**

Constant	Value	Description
DOC_VARCHAR2 CONSTANT PLS_INTEGER	1	VARCHAR2
DOC_BLOB CONSTANT PLS_INTEGER	2	BLOB
DOC_CLOB CONSTANT PLS_INTEGER	3	CLOB

### 283.3.2.5 GET\_KEY Function

This function fetches the document key.

**Syntax**

```
GET_KEY ()
 RETURN VARCHAR2;
```

**Return Values**

This function returns the document key.

### 283.3.2.6 GET\_LAST\_MODIFIED Function

This function fetches the last modified timestamp. The timestamp string is in ISO-8601 format, in particular this form: YYYY-MM-DDThh:mm:ss.ssssssZ format. As indicated by the z at the end, timestamps are returned in UTC (z indicates zero UTC offset).

**Syntax**

```
GET_LAST_MODIFIED ()
 RETURN VARCHAR2;
```

**Return Values**

This function returns the last modified timestamp.

### 283.3.2.7 GET\_MEDIA\_TYPE Function

This function fetches the media type of the document content.

**Syntax**

```
GET_MEDIA_TYPE ()
RETURN VARCHAR2;
```

**Return Values**

This function returns the media type of the document content. `application/JSON` is the media type for `JSON` documents (default).

### 283.3.2.8 GET\_VARCHAR2 Function

This function fetches the `VARCHAR2` content of the document. It assumes that the document was constructed with `VARCHAR2` content, or was returned from a collection with `VARCHAR2` content. Otherwise, an error is returned.

**Syntax**

```
GET_VARCHAR2 ()
RETURN VARCHAR2;
```

**Return Values**

This function returns the `VARCHAR2` content of a document.

**Exceptions**

`SODA Error`: If the document was initially not created with `VARCHAR2` content.

### 283.3.2.9 GET\_VERSION Function

This function fetches the version of the document.

**Syntax**

```
GET_VERSION ()
RETURN VARCHAR2;
```

**Return Values**

This function returns the version of the document.

### 283.3.2.10 SODA\_Document\_T Function

This function instantiates a document object using key, content, and media type. There are three different `SODA_DOCUMENT_T` constructor functions. The second parameter (`<v|b|c>_Content`) is different in each constructor. It is `VARCHAR2` in the first variant, `BLOB` in the second, and `CLOB` in the third.

Key and media type are optional parameters (will be defaulted to `NULL`). All three parameters can be set to `NULL`. If `media_Type` is set to `NULL`, it will be defaulted to `application/json`.

### Syntax

```
SODA_DOCUMENT_T (
 key IN VARCHAR2 DEFAULT NULL,
 v_Content IN VARCHAR2,
 media_Type IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
 key IN VARCHAR2 DEFAULT NULL,
 b_Content IN BLOB,
 media_Type IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

```
SODA_DOCUMENT_T (
 key IN VARCHAR2 DEFAULT NULL,
 c_Content IN CLOB,
 media_Type IN VARCHAR2 DEFAULT NULL)
RETURN SODA_Document_T;
```

### Parameters

**Table 283-14 SODA\_Document\_T Parameters**

Parameter	Description
<code>key</code>	The key of the document.
<code>v_Content</code>	The content of the document in <code>VARCHAR2</code> format.
<code>b_Content</code>	The content of the document in <code>BLOB</code> format.
<code>c_Content</code>	The content of the document in <code>CLOB</code> format.
<code>media_Type</code>	The media type of the document. The media type could be <code>application/json</code> for JSON documents.

#### Note:

`v_Content`, `b_Content`, and `c_Content` are not all parameters of a single `SODA_DOCUMENT_T` constructor function. Each one corresponds to a particular variant of the constructor function as shown in the *Syntax* section.

### Return Values

This function returns a document of type `SODA_Document_T`.

## 283.3.3 SODA\_OPERATION\_T Type

This SODA type is used to perform read/write operations, such as document finds with filtering and pagination, removes, and replaces on a SODA collection.

**Table 283-15 SODA\_OPERATION\_T Type Subprograms**

Subprogram	Description
<a href="#">COUNT Function</a>	Returns a count of the number of documents in the collection that match the criteria. If <code>skip(...)</code> or <code>limit(...)</code> were chained together with this <code>count()</code> , an exception is raised.
<a href="#">FILTER Function</a>	Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same <code>SODA_OPERATION_T</code> object so that further criteria can be chained together if required.
<a href="#">GET_CURSOR Function</a>	Returns a <code>SODA_CURSOR_T</code> object that can be used to iterate over the documents that match the criteria.
<a href="#">GET_ONE Function</a>	Returns a single <code>SODA_DOCUMENT_T</code> object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.
<a href="#">KEY Function</a>	Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and <code>KEYS(...)</code> , when they appear in the same chain, to be ignored. Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.
<a href="#">KEYS Function</a>	Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and <code>KEY(...)</code> , when they appear in the same chain, to be ignored. Returns the same <code>SODA_OPERATION_T</code> object, so that further operation criteria can be chained together, if needed.
<a href="#">LIMIT Function</a>	Sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as <code>GET_CURSOR</code> . For write operations, any value set using this method is ignored. Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.
<a href="#">REMOVE Function</a>	Removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.

Table 283-15 (Cont.) SODA\_OPERATION\_T Type Subprograms

Subprogram	Description
<a href="#">REPLACE_ONE Function</a>	<p>Replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p>
<a href="#">REPLACE_ONE_AND_GET Function</a>	<p>Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, <code>NULL</code> otherwise.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced.</p> <p>This function is similar to <code>REPLACE_ONE</code>. The only difference is that <code>REPLACE_ONE_AND_GET</code> also returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component.</p> <p>Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p>
<a href="#">SKIP Function</a>	<p>Sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as <code>GET_CURSOR</code>. For write operations, any value set using this method is ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p>
<a href="#">VERSION Function</a>	<p>Specifies that only documents with the supplied version should be returned. Typically, this is chained together with <code>KEY(...)</code> to implement optimistic locking for write operations such as <code>REMOVE</code> and <code>REPLACE</code>.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p>

### 283.3.3.1 COUNT Function

This function returns a count of the number of documents in the collection that match the criteria. If `skip(...)` or `limit(...)` were chained together with this `count()`, an exception is raised.

**Syntax**

```
COUNT ()
 RETURN NUMBER;
```

**Return Values**

This function returns the number of documents matching the criteria specified in the operation.

**Exceptions**

**Error**—If an error occurs while finding the count.

## 283.3.3.2 FILTER Function

Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same `SODA_OPERATION_T` object so that further criteria can be attached if needed.

**Syntax**

```
FILTER (
 qbe IN VARCHAR2)
 RETURN SODA_Operation_T;
```

**Parameters****Table 283-16** FILTER Function Parameters

Parameter	Description
qbe	The string representing the query by example.

**Return Values**

This function returns the same `SODA_OPERATION_T` object it was invoked on.

 **See Also:**

- Overview of SODA Filter Specifications (QBEs)
- SODA Filter Specifications (Reference)

## 283.3.3.3 GET\_CURSOR Function

Returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the criteria.

**Syntax**

(Optional) Enter syntax information here.

```
GET_CURSOR ()
RETURN SODA_Cursor_T;
```

### Return Values

This function returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the read operation criteria.

### Exceptions

`SODA_Error`: If an error occurs while fetching the cursor.

## 283.3.3.4 GET\_ONE Function

Returns a single `SODA_DOCUMENT_T` object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.

### Syntax

```
GET_ONE ()
RETURN SODA_Document_T;
```

### Return Values

The first matching document.

### Exceptions

`Error`—If an error occurs while fetching the document.

## 283.3.3.5 KEY Function

Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and `KEYS(...)`, when they appear in the same chain, to be ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

### Syntax

```
KEY (
 key IN VARCHAR2)
RETURN SODA_Operation_T;
```

### Parameters

**Table 283-17 KEY Function Parameters**

Parameter	Description
key	The key to be used for the operations.

### Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

### 283.3.3.6 KEYS Function

Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and `key(...)`, when they appear in the same chain, to be ignored. Returns the same `SODA_OPERATION_T` object, so that further operation criteria can be chained together, if needed.

#### Syntax

```
KEYS (
 key_List IN SODA_Key_List_T)
RETURN SODA_Operation_T;
```

#### Parameters

**Table 283-18 KEYS Function Parameters**

Parameter	Description
<code>key_List</code>	The parameter is a <code>SODA_Key_List_T</code> which is a list of <code>VARCHAR2</code> values representing keys. Assuming <code>key_list</code> is a variable of type <code>SODA_Key_List_T</code> , it can be initialized as follows: <code>key_list := SODA_Key_List_T('key1', 'key2', 'key3', etc);</code>

#### Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

### 283.3.3.7 LIMIT Function

This function sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

#### Syntax

```
LIMIT (
 limit IN NUMBER)
RETURN SODA_Operation_T;
```

#### Parameters

**Table 283-19 LIMIT Function Parameters**

Parameter	Description
<code>limit</code>	A limit on the number of results returned by read operations.

**Return Values**

This function returns the same `SODA_OPERATION_T` object it was invoked on.

**283.3.3.8 REMOVE Function**

This function removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.

**Syntax**

```
REMOVE ()
 RETURN NUMBER;
```

**Return Values**

This function returns the number of matching documents that were removed in the operation.

**Exceptions**

**Error**—If an error occurs while removing the documents.

**283.3.3.9 REPLACE\_ONE Function**

This function replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

**Syntax**

```
REPLACE_ONE (
 document IN SODA_Document_T)
 RETURN NUMBER;
```

**Parameters****Table 283-20 REPLACE\_ONE Function Parameters**

Parameter	Description
document	The document object with the new content and media type to be used for replacement.

**Return Values**

This function returns a number—1 if the document was replaced, 0 otherwise.

**Exceptions**

**Error**—If an error occurs while updating the collection.

### 283.3.3.10 REPLACE\_ONE\_AND\_GET Function

Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, `NULL` otherwise. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. This function is similar to `REPLACE_ONE`. The only difference is that `REPLACE_ONE_AND_GET` also returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

#### Syntax

```
REPLACE_ONE_AND_GET (
 document IN SODA_Document_T)
 RETURN SODA_Document_T;
```

#### Parameters

**Table 283-21 REPLACE\_ONE\_AND\_GET Function Parameters**

Parameter	Description
document	The document object with the new content and media type to be used for replacement.

#### Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

#### Exceptions

**Error**—If an error occurs while updating the collection

### 283.3.3.11 SKIP Function

This function sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

#### Syntax

```
SKIP (
 offset IN NUMBER)
 RETURN SODA_Operation_T;
```

## Parameters

**Table 283-22 SKIP Function Parameters**

Parameter	Description
offset	The number of documents to skip.

## Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on

## 283.3.3.12 VERSION Function

This function specifies that only documents with the supplied version should be returned. Typically, this is chained together with `KEY(...)` to implement optimistic locking for write operations such as `REMOVE` and `REPLACE`. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

## Syntax

```
VERSION (
 version IN VARCHAR2)
RETURN SODA_Operation_T;
```

## Parameters

**Table 283-23 VERSION Function Parameters**

Parameter	Description
version	Document version to be used for the operation.

## Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on

## 283.3.4 SODA\_CURSOR\_T Type

This `SODA` type is used to represent a result set of documents.

**Table 283-24 SODA\_CURSOR\_T Type Subprograms**

Subprogram	Description
<a href="#">CLOSE Function</a>	Closes the cursor.
<a href="#">HAS_NEXT Function</a>	Returns <code>TRUE</code> , if the next document is available for the cursor. Otherwise, returns <code>FALSE</code> .
<a href="#">NEXT Function</a>	Returns the next <code>SODA</code> document pointed by the cursor.

### 283.3.4.1 CLOSE Function

This function closes the cursor.

#### Syntax

```
CLOSE ()
RETURN BOOLEAN;
```

#### Example 283-4 Return Values

This function returns a boolean value.

### 283.3.4.2 HAS\_NEXT Function

This function returns `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

#### Syntax

```
HAS_NEXT ()
RETURN BOOLEAN;
```

#### Return Values

This function returns a boolean value. `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

#### Exceptions

**Error**—If an error occurs while checking if the next document is available.

### 283.3.4.3 NEXT Function

This function returns the next SODA document pointed by the cursor.

#### Syntax

```
NEXT ()
RETURN SODA_Document_T;
```

#### Return Values

This function returns the next SODA document pointed by the cursor. Returns `NULL` when the `HAS_NEXT` function returns `FALSE`.

#### Exceptions

**Error**—If an error occurs while getting the next document.

# UTL Streams Types

UTL Streams Types describe abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL Binary Streams Types](#)

## See Also:

For more information, see Oracle XML DB Developer's Guide

## 284.1 UTL Streams Types Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.

## 284.2 Summary of UTL Binary Streams Types

This table lists the UTL Binary Streams Types and briefly describes them.

**Table 284-1 UTL Streams Types**

Type	Description
<a href="#">UTL_BINARYINPUTSTREAM Type</a>	Reads bytes and closes a stream.
<a href="#">UTL_BINARYOUTPUTSTREAM Type</a>	Writes bytes and closes a stream.
<a href="#">UTL_CHARACTERINPUTSTREAM Type</a>	Reads chars and closes a stream.
<a href="#">UTL_CHARACTEROUTPUTSTREAM Type</a>	Writes chars and closes a stream.

### 284.2.1 UTL\_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

#### Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (
```

```

MEMBER FUNCTION available (
 self IN OUT NOCOPY Utl_BinaryInputStream)
RETURN INTEGER,

MEMBER FUNCTION read (
 self IN OUT NOCOPY Utl_BinaryInputStream,
 numBytes IN INTEGER DEFAULT 1)
RETURN RAW,

MEMBER PROCEDURE read (
 self IN OUT NOCOPY Utl_BinaryInputStream,
 bytes IN OUT NOCOPY RAW,
 numBytes IN OUT INTEGER),

MEMBER PROCEDURE read (
 self IN OUT NOCOPY Utl_BinaryInputStream,
 bytes IN OUT NOCOPY RAW,
 offset IN INTEGER,
 numBytes IN OUT INTEGER),

member function close (
 self In Out Nocopy Utl_BinaryInputStream)

) NOT FINAL;

```

## Attributes

**Table 284-2 UTL\_BINARYINPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> <li>#1 - Reads the number of bytes specified by <code>numBytes</code> (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned.</li> <li>#2 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>. Additionally, the actual number of bytes read is returned in parameter <code>numBytes</code>. If this parameter is set to 0 then there are no more bytes to be read.</li> <li>#3 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes read is returned in parameter <code>numBytes</code>. If this value is 0, then there are no additional bytes to be read.</li> </ul>
CLOSE	Releases all resources held on the node to support the stream

## 284.2.2 UTL\_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

 MEMBER FUNCTION write (
 self IN OUT NOCOPY sys.utl_BinaryOutputStream,

```

```

 bytes IN RAW,
 numBytes IN INTEGER DEFAULT 1)
RETURN INTEGER,

MEMBER PROCEDURE write (-- #2
 self IN OUT NOCOPY sys.utl_BinaryOutputStream,
 bytes IN NOCOPY RAW,
 numBytes IN OUT INTEGER),

MEMBER PROCEDURE write (-- #3
 self IN OUT NOCOPY utl_BinaryOutputStream, bytes IN
NOCOPY RAW,
 offset IN INTEGER,
 numBytes IN OUT INTEGER),

MEMBER PROCEDURE flush (
 self IN OUT NOCOPY utl_BinaryOutputStream),

MEMBER PROCEDURE close (
 self IN OUT NOCOPY utl_BinaryOutputStream)

) NOT FINAL;
```

### Attributes

**Table 284-3 UTL\_BINARYOUTPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> <li>#1 - Writes the number of bytes specified by <code>numBytes</code> (default is 1) from RAW into the stream. The actual number of bytes written is returned.</li> <li>#2 - Writes the number of bytes specified in parameter <code>numBytes</code> from parameter <code>bytes</code> to the stream. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> <li>#3 - Writes the number of bytes specified by <code>numBytes</code> to the stream, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> </ul>
FLUSH	Insures that any buffered bytes are copied to the node destination
CLOSE	Frees all resources associated with the stream

## 284.2.3 UTL\_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

 MEMBER FUNCTION available (
 self IN OUT NOCOPY utl_CharacterInputStream)
RETURN INTEGER,

 MEMBER FUNCTION read (-- #1
 self IN OUT NOCOPY utl_CharacterInputStream,
```

```

 numChars IN INTEGER DEFAULT 1,
 lineFeed IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2,

MEMBER PROCEDURE read (-- #2
 self IN OUT NOCOPY utl_CharacterInputStream,
 chars IN OUT NOCOPY VARCHAR2,
 numChars IN OUT INTEGER,
 lineFeed IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE read (-- #3
 self IN OUT NOCOPY utl_CharacterInputStream,
 chars IN OUT NOCOPY VARCHAR2,
 offset IN INTEGER,
 numChars IN OUT INTEGER,
 lineFeed IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE close (
 self IN OUT NOCOPY utl_CharacterInputStream)
) NOT FINAL;
```

### Attributes

**Table 284-4 UTL\_CHARACTERINPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> <li>#1 - Returns the number of characters remaining to be read</li> <li>#2 - Reads the number of characters specified by numChars (default value is 1) and returns the characters as a VARCHAR2. If the value of lineFeed is true (default value is FALSE) then the reading stops if a linefeed character is found. If there are no remaining characters a value of NULL is returned.</li> <li>#3 - Reads reads the number of characters specified by parameter numChars into the parameter chars. Additionally, the actual number of characters read is returned in parameter numChars. If this value is 0, then there are no more characters to be read. If the value of lineFeed is TRUE (default is FALSE), then reading stops if a linefeed character is encountered.</li> </ul>
CLOSE	Releases all resources held by the stream

## 284.2.4 UTL\_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (

MEMBER FUNCTION write (-- #1
 self IN OUT NOCOPY utl_CharacterOutputStream,
 chars IN VARCHAR2,
 numChars IN INTEGER DEFAULT 1,
 lineFeed IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER,
```

```

MEMBER PROCEDURE write (-- #2
 self IN OUT NOCOPY utl_CharacterOutputStream,
 chars IN OUT NOCOPY VARCHAR2,
 numChars IN OUT INTEGER,
 lineFeed IN BOOLEAN DEFAULT FALSE),

member procedure write (-- #3
 self IN OUT NOCOPY utl_CharacterOutputStream,
 chars IN NOCOPY varchar2,
 offset IN integer,
 numChars IN OUT integer,
 lineFeed IN boolean default false),

MEMBER PROCEDURE flush (
 self IN OUT NOCOPY utl_CharacterOutputStream),

MEMBER PROCEDURE close (
 self IN OUT NOCOPY utl_CharacterOutputStream)

) NOT FINAL;

```

### Attributes

**Table 284-5 UTL\_CHARACTEROUTPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> <li>#1 - Writes the number of characters specified by numChars (default is 1) from parameter chars into the stream and returns the actual number of characters written. If the value of lineFeed is TRUE (default is FALSE) a lineFeed character is inserted after the last character.</li> <li>#2 - writes the number of characters specified by parameter numChars, from parameter chars into the stream. The actual number of characters written is returned in parameter numChars. If the value of lineFeed is true (default is FALSE) a lineFeed character is inserted after the last character.</li> <li>#3 - Writes the number of characters specified by parameter numChars, from parameter chars, beginning at offset specified by parameter offset. The actual number of characters written is returned in parameter numChars. If the value of lineFeed is true (default is FALSE) a lineFeed character is inserted after the last character .</li> </ul>
FLUSH	Copies all characters that may be contained within buffers to the node value
CLOSE	Releases all resources held by the stream

# XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLAGG` SQL function.

This chapter contains the following topics:

- [Summary of XMLType Subprograms](#)

## See Also:

- *Oracle XML DB Developer's Guide*

## 285.1 Summary of XMLType Subprograms

This table summarizes functions and procedures of `XMLType`.

**Table 285-1 XMLTYPE Subprograms**

Method	Description
<a href="#">CREATENONSCHEMABASEDXML</a>	Creates a non schema based XML from the input schema based instance.
<a href="#">CREATESCHEMABASEDXML</a>	Creates a schema based <code>XMLType</code> instance from the non-schema based instance using the input schema URL.
<a href="#">CREATEXML</a>	Static function for creating and returning an <code>XMLType</code> instance.
<a href="#">EXISTSNODE</a>	Takes a <code>XMLType</code> instance and a <code>XPath</code> and returns 1 or 0 indicating if applying the <code>XPath</code> returns a non-empty set of nodes.
<a href="#">EXTRACT</a>	Takes a <code>XMLType</code> instance and an <code>XPath</code> , applies the <code>XPath</code> expression and returns the results as an <code>XMLType</code> .
<a href="#">GETBLOBVAL</a>	Returns the value of the <code>XMLType</code> instance as a <code>BLOB</code> .
<a href="#">GETCLOBVAL</a>	Returns the value of the <code>XMLType</code> instance as a <code>CLOB</code> .
<a href="#">GETNAMESPACE</a>	Returns the namespace for the top level element in a schema based document.
<a href="#">GETNUMBERVAL</a>	Returns the value of the <code>XMLType</code> instance as a <code>NUMBER</code> . This is only valid if the input <code>XMLType</code> instance contains a simple text node and is convertible to a number.

Table 285-1 (Cont.) XMLTYPE Subprograms

Method	Description
<a href="#">GETROOTELEMENT</a>	Returns the root element of the input instance. Returns NULL if the instance is a fragment
<a href="#">GETSCHEMAURL</a>	Returns the XML schema URL if the input is an XML Schema based.
<a href="#">GETSTRINGVAL</a>	Returns the value of the XMLType instance as a string.
<a href="#">ISFRAGMENT</a>	Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
<a href="#">ISSCHEMABASED</a>	Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.
<a href="#">ISSCHEMAVALID</a>	Checks if the input instance is schema valid according to the given schema URL.
<a href="#">ISSCHEMAVALIDATED</a>	Checks if the instance has been validated against the schema.
<a href="#">SCHEMAVALIDATE</a>	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
<a href="#">SETSCHEMAVALIDATED</a>	Sets the schema valid flag to avoid costly schema validation.
<a href="#">TOOBJECT</a>	Converts the XMLType instance to an object type.
<a href="#">TRANSFORM</a>	Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.
<a href="#">XMLTYPE</a>	Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.

## 285.1.1 CREATENONSCHEMABASEDXML

This member function creates a non-schema based XML document from a schema based instance.

### Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

## 285.1.2 CREATESCHEMABASEDXML

This member function creates a schema based XMLType instance from a non-schema based XMLType value.

It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

### Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

**Table 285-2 CREATESCHEMABASEDXML Subprogram Parameters**

Parameter	Description
schema	Optional XMLSchema URL used to convert the value to the specified schema.

## 285.1.3 CREATEXML

This static function creates and returns an XMLType instance. The string and CLOB parameters used to pass in the data must contain well-formed and valid XML documents.

The options are described in the following table.

**Table 285-3 CREATEXML Subprograms**

Syntax	Description
<pre> STATIC FUNCTION createXML(   xmlData IN varchar2) RETURN XMLType deterministic; </pre>	Creates the XMLType instance from a string.
<pre> STATIC FUNCTION createXML(   xmlData IN clob) RETURN XMLType deterministic; </pre>	Creates the XMLType instance from a CLOB.
<pre> STATIC FUNCTION createXML (   xmlData IN clob,   schema IN varchar2,   validated IN number := 0,   wellformed IN number := 0 ) RETURN XMLType deterministic; </pre>	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (   xmlData IN varchar2,   schema IN varchar2,   validated IN number := 0,   wellformed IN number := 0) RETURN XMLType deterministic; </pre>	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (   xmlData IN "&lt;ADT_1&gt;",   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN NUMBER := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from an instance of an user-defined type.

**Table 285-3 (Cont.) CREATEXML Subprograms**

Syntax	Description
<pre> STATIC FUNCTION createXML (   xmlData IN SYS_REFCURSOR,   schema IN VARCHAR2 := NULL,   element IN VARCHAR2 := NULL,   validated IN NUMBER := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.
<pre> STATIC FUNCTION createXML (   xmlData IN AnyData,   schema IN VARCHAR2 := NULL,   element IN VARCHAR2 := NULL,   validated IN NUMBER := 0) RETURN sys.XMLType deterministic   parallel_enable </pre>	Creates an XML instance from ANYDATA. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.
<pre> STATIC FUNCTION createXML (   xmlData IN blob,   csid IN number,   schema IN VARCHAR2,   validated IN NUMBER := 0,   wellformed IN NUMBER := 0) return sys.XMLType deterministic </pre>	Creates an XML instance from a BLOB.
<pre> STATIC FUNCTION createXML (   xmlData IN bfile,   csid IN number,   Schema IN VARCHAR2,   validated IN NUMBER := 0,   wellformed IN NUMBER := 0) return sys.XMLType deterministic </pre>	Creates an XML instance from a BFILE.

**Table 285-4 CREATEXML Parameters**

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)

**Table 285-4 (Cont.) CREATEXML Parameters**

Parameter	Description
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
csid	The character set id of input XML data.

## 285.1.4 EXISTSNODE

This member function checks if the node exists.

If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1.

The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION existsNode(     xpath IN varchar2) RETURN number deterministic;</pre>	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.
<pre>MEMBER FUNCTION existsNode(     xpath in varchar2,     nsmap in varchar2) RETURN number deterministic;</pre>	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

**Table 285-5 EXISTSNODE Subprogram Parameters**

Parameter	Description
xpath	The XPath expression to test.
nsmap	Optional namespace mapping.

## 285.1.5 EXTRACT

This member function extracts an XMLType fragment and returns an XMLType instance containing the result nodes. If the XPath does not result in any nodes, it then returns NULL.

The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION extract(     xpath IN varchar2) RETURN XMLType deterministic;</pre>	Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.

Syntax	Description
<pre>MEMBER FUNCTION extract(     xpath IN varchar2,     nsmmap IN varchar2) RETURN XMLType deterministic;</pre>	<p>This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.</p>

**Table 285-6 EXTRACT Subprogram Parameters**

Parameter	Description
xpath	The XPath expression to apply.
nsmmap	Optional prefix to namespace mapping information.

## 285.1.6 GETBLOBVAL

This member function returns a BLOB containing the serialized XML representation. If the BLOB returned is temporary, it must be freed after use.

### Syntax

```
MEMBER FUNCTION getBlobVal(
 csid IN NUMBER)
RETURN BLOB DETERMINISTIC;
```

**Table 285-7 GETBLOBVAL Subprogram Parameters**

Parameter	Description
csid	The desired character set ID of output BLOB

## 285.1.7 GETCLOBVAL

This member function returns a CLOB containing the serialized XML representation. If the CLOB returned is temporary, it must be freed after use.

### Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

## 285.1.8 GETNAMESPACE

GETNAMESPACE is a member function. It returns the namespace of the top level element in the instance. It returns NULL if the input is a fragment or is a non-schema based instance.

### Syntax

```
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
```

## 285.1.9 GETNUMBERVAL

This is a member function. It returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value.

The options are described in the following table.

### Syntax

```
MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
```

## 285.1.10 GETROOTELEMENT

this member function gets the root element of the `XMLType` instance. It returns `NULL` if the instance is a fragment.

### Syntax

```
MEMBER FUNCTION getRootElement
return varchar2 deterministic;
```

## 285.1.11 GETSCHEMAURL

This member function returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise, it returns `NULL`.

### Syntax

```
MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
```

## 285.1.12 GETSTRINGVAL

This member function returns the document as a string. It returns a string containing the serialized XML representation, or in the case of text nodes, the text itself.

If the XML document exceeds the `VARCHAR2` maximum size (4000), then an error is raised at run time.

### Syntax

```
MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
```

## 285.1.13 ISFRAGMENT

ISFRAGMENT determines if the XMLType instance corresponds to a well-formed document, or a fragment. It returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

### Syntax

```
MEMBER FUNCTION isFragment()
RETURN number deterministic;
```

## 285.1.14 ISSCHEMABASED

This member function determines whether the XMLType instance is schema-based or not. It returns 1 or 0 depending on whether the XMLType instance is schema-based.

### Syntax

```
MEMBER FUNCTION isSchemaBased
return number deterministic;
```

## 285.1.15 ISSCHEMAVALID

This member function checks if the input instance conforms to a specified schema. It does not change the validation status of the XML instance.

If an XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

### Syntax

```
member function isSchemaValid(
schurl IN VARCHAR2 := NULL,
elem IN VARCHAR2 := NULL)
return NUMBER deterministic;
```

**Table 285-8 ISSCHEMAVALID Subprogram Parameters**

Parameter	IN / OUT	Description
schurl	(IN)	The URL of the XML Schema against which to check conformance.
elem	(IN)	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

## 285.1.16 ISSCHEMAVALIDATED

This member function returns the validation status of the `XMLType` instance to tell if a schema-based instance has been actually validated against its schema. It returns 1 if the instance has been validated against the schema, 0 otherwise.

### Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

## 285.1.17 SCHEMAVALIDATE

This member procedure validates the XML instance against its schema, if it has not already been done.

For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

### Syntax

```
MEMBER PROCEDURE schemaValidate(
self IF OUT NOCOPY XMLType);
```

**Table 285-9 SCHEMAVALIDATE Subprogram Parameters**

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

## 285.1.18 SETSCHEMAVALIDATED

This member function sets the `VALIDATION` state of the input XML instance.

### Syntax

```
MEMBER PROCEDURE setSchemaValidated(
self IF OUT NOCOPY XMLType,
flag IN BINARY_INTEGER := 1);
```

**Table 285-10 SERTSSCHEMAVALIDATED Subprogram Parameters**

Parameter	IN / OUT	Description
self	(OUT)	XML instance.
flag	(IN)	0 - NOT VALIDATED; 1 - VALIDATED (Default)

## 285.1.19 TOOBJECT

This member procedure converts the XML value to an object type using the `XMLSCHEMA` mapping, if available. If a `SCHEMA` is not supplied or the input is a non-schema based

XML, the procedure uses canonical mapping between elements and object type attributes.

### Syntax

```
MEMBER PROCEDURE toObject(
 SELF in XMLType,
 object OUT "<ADT_1>",
 schema in varchar2 := NULL,
 element in varchar2 := NULL);
```

**Table 285-11 TOBJECT Subprogram Parameters**

Parameter	IN / OUT	Description
SELF	(IN)	Instance to be converted. Implicit if used as a member procedure.
object	(IN)	Converted object. An object instance of the required type may be passed in to this function
schema	(IN)	Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
element	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).

## 285.1.20 TRANSFORM

This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs

If any of the arguments other than the parammap is NULL, then a NULL is returned.

### Syntax

```
MEMBER FUNCTION transform(
 xsl IN XMLType,
 parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

**Table 285-12 TRANSFORM Subprogram Parameters**

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

## 285.1.21 XMLTYPE

This is an XMLType constructor.

The options are described in the following table.

**Table 285-13 XMLTYPE Member Subprogram Parameters**

Syntax	Description
<pre> constructor function XMLType(   xmlData IN clob,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN Number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType(   xmlData IN varchar2,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType (   xmlData IN "w&lt;ADT_1&gt;",   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</p>
<pre> constructor function XMLType(   xmlData IN SYS_REFCURSOR,   schema in varchar2 := NULL,   element in varchar2 := NULL,   validated in number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</p>
<pre> constructor function XMLType(   xmlData IN AnyData,   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN number := 0) return self as result deterministic parallel_enable </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p>

**Table 285-13 (Cont.) XMLTYPE Member Subprogram Parameters**

Syntax	Description
<pre> constructor function XMLType(   xmlData IN blob, csid IN   number,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</p>
<pre> constructor function XMLType(   xmlData IN bfile,   csid IN number,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.</p>

**Table 285-14 XMLTYPE Constructor Subprogram Parameters**

Parameter	Description
xmlData	The data in the form of a BFILE, BLOB, CLOB, REFs, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
validated	Indicates that the instance is valid to the given XML Schema.
wellformed	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
csid	The character set id of input XML data.
