service	<p>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service.</p> <p>Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See <code>DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING</code> for details. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are specified, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence.</p> <p>If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service.</p> <p>If the specified service does not exist when creating the job class, then an error occurs.</p>
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <ul style="list-style-type: none"> • <code>DBMS_SCHEDULER.LOGGING_OFF</code> No logging is performed for any jobs in this class. • <code>DBMS_SCHEDULER.LOGGING_RUNS</code> The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. • <code>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</code> The Scheduler logs only jobs that failed in this class. • <code>DBMS_SCHEDULER.LOGGING_FULL</code> In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with <code>SET_ATTRIBUTE</code>), stopped, and so, an entry is recorded in the log.
log_history	<p>This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the <code>log_history</code> Scheduler attribute (set with <code>SET_SCHEDULER_ATTRIBUTE</code>).</p>
comments	<p>This attribute is for an optional comment about the job class. By default, this attribute is NULL.</p>

Usage Notes

For users to create jobs that belong to a job class, the job owner must have `EXECUTE` privileges on the job class. Therefore, after the job class has been created, `EXECUTE` privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the `EXECUTE` privilege to a role.

Creating a job class requires the `MANAGE SCHEDULER` system privilege.

146.6.18 CREATE_JOBS Procedure

This procedure creates multiple jobs and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
  jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
  commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 146-30 CREATE_JOBS Procedure Parameters

Parameter	Description
jobdef_array	The array of job definitions. See "Data Structures" for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION datatypes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> STOP_ON_FIRST_ERROR returns on the first error. Previous successfully created jobs are committed to disk. This is the default. TRANSACTIONAL returns on the first error and everything that happened before that error is rolled back. ABSORB_ERRORS tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size. Calling CREATE_JOBS with a small array size may not be much faster than calling CREATE_JOB once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the destination attribute of the job_definition object cannot reference a destination group.

Examples

See *Oracle Database Administrator's Guide*.

146.6.19 CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (
  program_name      IN VARCHAR2,
  program_type      IN VARCHAR2,
  program_action    IN VARCHAR2,
```

```
number_of_arguments    IN PLS_INTEGER DEFAULT 0,  
enabled                IN BOOLEAN DEFAULT FALSE,  
comments               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-31 CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_name	The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.

Table 146-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_type	<p>This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for program_type:</p> <ul style="list-style-type: none"> 'PLSQL_BLOCK' <p>This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.</p> 'STORED_PROCEDURE' <p>This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported.</p> 'EXECUTABLE' <p>This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. AnyData arguments are not supported with job or program type EXECUTABLE.</p> 'EXTERNAL_SCRIPT' <p>project 25230, this bullet and next two</p> <p>This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the sh shell, unless a different interpreter is specified by prefixing the first line of the script with #!. </p> 'SQL_SCRIPT' <p>This specifies that the program is a SQL*Plus script. A job using this program must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by SQL*Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script.</p> <p>Note that if you choose to use connect credential, you must use set_attribute to specify the Connect_Credential_Name attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password.</p> 'BACKUP_SCRIPT' <p>This specifies that the program is an RMAN backup script.</p> <p>The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.</p>

Table 146-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_action	<p>This attribute specifies the action of the program. If program_action is not specified, an error is generated.</p> <p>project 25230 last 3 bullets</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc();</code> <code>END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN</code> <code>my_proc2(arg);</code> <code>END;</code> Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 146-40 for details on available metadata attributes. If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: job_name, job_owner, job_start, window_start, window_end. For more information, see the "DEFINE_METADATA_ARGUMENT Procedure". For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>program_action=>' "Schema" . "Procedure" '.</code> For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign('@') and the job is local, the at sign is replaced with the SID of the current Oracle instance. For an external script, the action must be either the path to an operating system script or an inline operating system script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The program_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The program points

Table 146-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
	<p>to a credential that contains a valid operating system username and password.</p> <ul style="list-style-type: none"> For a SQL script, the action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.</p> <ul style="list-style-type: none"> For a backup script, the action must be either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.</p>
<code>number_of_arguments</code>	<p>This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments.</p> <p>If the <code>program_type</code> is <code>PLSQL_BLOCK</code>, then this parameter is ignored.</p>
<code>enabled</code>	<p>This flag specifies whether the program should be created as enabled or not. If the flag is set to <code>TRUE</code>, then validity checks are made and the program is created as <code>ENABLED</code> if all the checks be successful. By default, this flag is set to <code>FALSE</code>, meaning not created enabled. You can also call the <code>ENABLE</code> procedure to enable the program before it can be used.</p>
<code>comments</code>	<p>A comment about the program. By default, this attribute is <code>NULL</code>.</p>

Usage Notes

To create a program in their own schema, users need the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the `enabled` parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

To use your programs, other users must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

["DEFINE_PROGRAM_ARGUMENT Procedure"](#)

146.6.20 CREATE_RESOURCE Procedure

This procedure allows users to specify the resources used by jobs or to create a new resource.

Syntax

```
DBMS_SCHEDULER.CREATE_RESOURCE (
  resource_name  IN VARCHAR2,
  units          IN PLS_INTEGER,
  status         IN VARCHAR2 DEFAULT 'ENFORCE_CONSTRAINTS',
  constraint_level IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  comments       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-32 CREATE_RESOURCE Procedure Parameters

Parameter	Description
resource_name	The name of the resource.
units	The number of units of this resource that the job or program uses.
status	The status of the resource. <ul style="list-style-type: none"> 'ENFORCE_CONSTRAINTS'. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached no additional jobs using this resource will get started. 'IGNORE_CONSTRAINTS'. When set, the scheduler will ignore any constraints on this resource. 'BLOCKED_ALL_JOBS'. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
constraint_level	Level of the constraint: JOB_LEVEL or PROGRAM_LEVEL. For incompatibilities, for JOB_LEVEL, the incompatibility members must be jobs; for PROGRAM_LEVEL the incompatibility members must be programs.
comments	Descriptive comment about the resource.

Usage Notes

The following example creates a new resource.

```
BEGIN
  DBMS_SCHEDULER.CREATE_RESOURCE(
    resource_name => 'my_resource',
    units => 3,
    state => 'ENFORCE_CONSTRAINTS',
    comments => 'Resource1'
  )
END;
/
```

 **See Also:**

- [Creating or Dropping a Resource in *Oracle Database Administrator's Guide*](#)
- [SET_RESOURCE_CONSTRAINT Procedure](#)

146.6.21 CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
  schedule_name      IN VARCHAR2,
  start_date         IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  repeat_interval    IN VARCHAR2,
  end_date           IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-33 CREATE_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date; it depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval if it is not specified. If start_date is null, then the date that the job or window is enabled is used. start_date and repeat_interval cannot both be null.
repeat_interval	This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See " Calendaring Syntax " for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
end_date	The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error is generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

146.6.22 CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the `SYS` schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  schedule_name        IN VARCHAR2,
  duration             IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments             IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval      IN VARCHAR2,
  end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  duration             IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-34 CREATE_WINDOW Procedure Parameters

Parameter	Description
<code>window_name</code>	The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the <code>SYS</code> schema, so the preface 'SYS' is optional.

Table 146-34 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
resource_plan	<p>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window.</p> <p>Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> <p>If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</p>
start_date	<p>This attribute specifies the first date and time on which this window is scheduled to open. If the value for <code>start_date</code> specified is in the past or is not specified, the window opens as soon as it is created.</p> <p>For repeating windows that use a calendaring expression to specify the repeat interval, the value for <code>start_date</code> is a reference date. The first time the window opens depends on the repeat interval specified and the value for <code>start_date</code>.</p>
duration	<p>This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.</p>
schedule_name	<p>This attribute specifies the name of the schedule associated with the window.</p>
repeat_interval	<p>This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See "Calendaring Syntax" for more information.</p> <p>A PL/SQL expression cannot be used to specify the repeat interval for a window.</p> <p>The expression specified is evaluated to determine the next time the window opens. If no <code>repeat_interval</code> is specified, the window opens only once at the specified start date.</p>
end_date	<p>This attribute specifies the date and time after which the window no longer opens. When the value for <code>end_date</code> is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE.</p> <p>A non-repeating window that has no value for <code>end_date</code> opens only once for the duration of the window. For a repeating window, if no <code>end_date</code> is specified, then the window keeps repeating forever.</p> <p>The <code>end_date</code> must be after the <code>start_date</code>. If it is not, then an error is generated when the window is created.</p>
window_priority	<p>This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'.</p>

Table 146-34 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
comments	This attribute specifies an optional comment about the window. By default, this attribute is NULL.

Usage Notes

Creating a window requires the `MANAGE SCHEDULER` privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN` statement or the `DBMS_RESOURCE_MANAGER.SWITCH_PLAN` package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and "[SWITCH_PLAN Procedure](#)".

146.6.23 DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an `ANYDATA` object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN SYS.ANYDATA,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-35 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique, so it can replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure .
argument_type	The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.

Table 146-35 (Cont.) DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
default_value	The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from one to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

 **See Also:**

- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#)
- ["SET_JOB_ANYDATA_VALUE Procedure"](#)

146.6.24 DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event.

Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  event_schedule_name IN VARCHAR2,
  timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  event_condition     IN VARCHAR2,
  queue_spec          IN VARCHAR2,
  timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

Parameters

Table 146-36 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the CREATE_EVENT_SCHEDULE Procedure
queue_spec	See the CREATE_EVENT_SCHEDULE Procedure

Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the queue_spec parameter, or use a file watcher schedule for the event_schedule_name parameter.

See Also:

"DEFINE_CHAIN_STEP Procedure"

146.6.25 DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form SCHED_RULE\${N}.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
  chain_name          IN VARCHAR2,
  condition           IN VARCHAR2,
  action              IN VARCHAR2,
  rule_name           IN VARCHAR2 DEFAULT NULL,
  comments            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-37 DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
condition	<p>A boolean expression which must evaluate to TRUE for the action to be performed. Every chain must have a rule that evaluates to TRUE to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</p> <ul style="list-style-type: none"> Scheduler Chain Condition Syntax See "Scheduler Chain Condition Syntax" and <i>Oracle Database Administrator's Guide</i> for details SQL WHERE Clause Syntax Conditions expressed with SQL must use the syntax of a SELECT statement WHERE clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is <code>:step_name.attribute</code>. (<i>step_name</i> refers to a typed object.) Possible attributes are: <code>completed</code>, <code>state</code>, <code>start_date</code>, <code>end_date</code>, <code>error_code</code>, and <code>duration</code>. Possible values for the state attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its completed attribute is set to 'TRUE', otherwise completed is 'FALSE'.
action	<p>The action to be performed when the rule evaluates to TRUE. The action must consist of at least one keyword with an optional value and an optional delay clause.</p> <p>Possible actions include:</p> <ul style="list-style-type: none"> [AFTER <i>delay_interval</i>] START <i>step_1</i>[,<i>step_2</i> ...] STOP <i>step_1</i>[,<i>step_2</i> ...] END [{<i>end_value</i> <i>step_name.error_code</i>}] <p>At the beginning of the START action, a delay clause can specify a delay interval before performing the action. <i>delay_interval</i> is a formatted datetime interval of the form HH:MM:SS.</p> <p>The END action ends the chain with an error code equal to either the supplied <i>end_value</i> or the error code that <i>step_name</i> completes with. The default error code is 0, indicating a successful chain run.</p>
rule_name	The name of the rule being created. If no <i>rule_name</i> is given, one is generated in the form SCHED_RULE\$_{N}.
comments	An optional comment describing the rule. This is stored in the rule object created.

Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.

Chain Condition Syntax

The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

```
TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer
```

These boolean operators are available to create more complex conditions:

```
expression AND expression
expression OR expression
NOT (expression)
```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the NOT operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

Usage Notes

Defining a chain rule requires `ALTER` privileges on the chain (either as the owner, or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```
'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when
any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
```

Rule Conditions Using SQL Syntax

```

:step1.completed = 'TRUE' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

:step1.duration > interval '5' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to
complete

```

Rule Actions

```

'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has
not completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.

```

146.6.26 DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

Syntax

```

DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    program_name        IN VARCHAR2);

```

Parameters

Table 146-38 DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
<code>chain_name</code>	The name of the chain to alter.
<code>step_name</code>	The name of the step being defined. If a step already exists with this name, the new step replaces the old one.

Table 146-38 (Cont.) DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
program_name	The name of a program or chain to run during this step. The chain owner must have EXECUTE privileges on this program or chain.

Usage Notes

Defining a chain step requires ALTER privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

See Also:

- "ALTER_CHAIN Procedure"
- "DEFINE_CHAIN_EVENT_STEP Procedure"

146.6.27 DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
    program_name          IN VARCHAR2,
    metadata_attribute    IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-39 DEFINE_METADATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered
metadata_attribute	The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table 146-40 describes these attributes in detail.
argument_position	The position of the argument as it is passed to the executable. The position cannot be greater than the number_of_arguments specified for the program. It must be unique, so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

Table 146-40 Metadata Attributes

Metadata Attribute	Datatype	Description
job_name	VARCHAR2	Name of the currently running job
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_scheduled_start	TIMESTAMP WITH TIME ZONE	When the currently running job was scheduled to start
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The datatype of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See " SCHEDULER_FILEWATCHER_RESULT Object Type ".

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event_message can be used in PL/SQL blocks that you enter into the job_action or program_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

146.6.28 DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-41 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure .
argument_type	The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses <code>argument_type</code> when deciding what value to assign to the argument. Any valid SQL datatype is allowed.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to <code>FALSE</code> .

Usage Notes

All program arguments from 1 to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

`DEFINE_PROGRAM_ARGUMENT` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

See Also:

- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#)
- ["SET_JOB_ARGUMENT_VALUE Procedure"](#)

146.6.29 DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

Syntax

```
DBMS_SCHEDULER.DISABLE (
    name           IN VARCHAR2,
    force          IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 146-42 DISABLE Procedure Parameters

Parameter	Description
<code>name</code>	The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.
<code>force</code>	If <code>TRUE</code> , objects are disabled even if other objects depend on them. See the usage notes for more information.
<code>commit_semantics</code>	The commit semantics. The following types are supported: <ul style="list-style-type: none"> <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. <code>TRANSACTIONAL</code>: The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when <code>force</code> is set to <code>TRUE</code>. <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when disabling a job or a list of jobs.

Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

You can use `DISABLE` with any schema except the `SYS` schema.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

Programs

When a program is disabled, the status is changed to `disabled`. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue.

No arguments that pertain to the program are affected when the program is disabled.

File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run. If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur. If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime. Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

146.6.30 DROP_AGENT_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE_SCHEDULER` privilege.

**Note:**

External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable CREATE_AGENT_DESTINATION procedure.

Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (
    destination_name          IN VARCHAR2);
```

Parameters**Table 146-43 DROP_AGENT_DESTINATION Procedure Parameters**

Parameter	Description
destination_name	<p>A comma-separated list of external destinations to drop. Because user SYS owns all external destinations, do not prefix them with a schema name.</p> <p>The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped.</p> <p>Cannot be NULL.</p>

Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to NULL.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

146.6.31 DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
    chain_name          IN VARCHAR2,
    force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-44 DROP_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to drop. Can also be a comma-delimited list of chains.
force	If <i>force</i> is set to <code>FALSE</code> , the chain must not be referenced by any job, otherwise an error will occur. If <i>force</i> is set to <code>TRUE</code> , all jobs pointing to the chain are disabled before the chain is dropped. Running jobs that point to this chain are stopped before the chain is dropped.

Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the `DBMS_RULE_ADM.DROP_RULE_SET` and `DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT` procedures for more information.

If *force* is `FALSE`, no jobs may be using this chain. If *force* is `TRUE`, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

146.6.32 DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
    chain_name          IN VARCHAR2,
    rule_name          IN VARCHAR2,
    force              IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-45 DROP_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If <i>force</i> is set to <code>TRUE</code> , the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If <i>force</i> is set to <code>FALSE</code> and the chain is running, an error is generated.

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

146.6.33 DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-46 DROP_CHAIN_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If force is set to FALSE and this chain is currently running, an error is thrown.

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

146.6.34 DROP_CREDENTIAL Procedure

This deprecated procedure drops a credential.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the [DBMS_CREDENTIAL](#) package, specifically the [DROP_CREDENTIAL Procedure](#).

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (
    credential_name      IN VARCHAR2,
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-47 DROP_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL.
force	If set to FALSE, the credential must not be referenced by any job, or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

146.6.35 DROP_DATABASE_DESTINATION Procedure

This procedure drops one or more database destinations.

Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (
    destination_name    IN VARCHAR2);
```

Parameters

Table 146-48 DROP_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
destination_name	The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name. The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped. Cannot be NULL.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the *_SCHEDULER_JOB_DESTS views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

See Also:

[CREATE_DATABASE_DESTINATION Procedure](#)

146.6.36 DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (
    file_watcher_name      IN VARCHAR2,
    force                  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-49 DROP_FILE_WATCHER Procedure Parameters

Parameter	Description
file_watcher_name	The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.
force	If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.

Usage Notes

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

146.6.37 DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (  
    group_name      IN VARCHAR2,  
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-50 DROP_GROUP Procedure Parameters

Parameter	Description
group_name	A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be NULL.
force	If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

146.6.38 DROP_INCOMPATIBILITY Procedure

This procedure drops an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.DROP_INCOMPATIBILITY (  
    incompatibility_name  IN VARCHAR2);
```

Parameters

Table 146-51 DROP_INCOMPATIBILITY Procedure Parameters

Parameter	Description
incompatibility_name	The name of the incompatibility definition.

Usage Notes

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

146.6.39 DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
    job_name          IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE,
    defer             IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 146-52 DROP_JOB Procedure Parameters

Parameter	Description
job_name	The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
force	If force is set to TRUE, the Scheduler first attempts to stop the running job instances (by issuing the STOP_JOB call with the force flag set to false), and then drops the jobs.
defer	If defer is set to TRUE, the Scheduler allows the running jobs to complete and then drops the jobs.

Table 146-52 (Cont.) DROP_JOB Procedure Parameters

Parameter	Description
<code>commit_semantics</code>	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> returns on the first error and previous successful drop operations are committed to disk. This is the default. • <code>TRANSACTIONAL</code> returns on the first error. Everything that happened before that error is rolled back. This type is not supported when <code>force</code> is set to <code>TRUE</code>. • <code>ABSORB_ERRORS</code> tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. <p>Only <code>STOP_ON_FIRST_ERROR</code> is permitted when job classes are included in the <code>job_name</code> list.</p>

Usage Notes

If both `force` and `defer` are set to `FALSE` and a job is running at the time of the call, the attempt to drop that job fails. The entire call to `DROP_JOB` may then fail, depending on the setting of `commit_semantics`.

Setting both `force` and `defer` to `TRUE` results in an error.

Dropping a job requires `ALTER` privileges on the job either as the owner of the job or as a user with the `ALTER` object privilege on the job or the `CREATE ANY JOB` system privilege.

146.6.40 DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
    job_class_name      IN VARCHAR2,
    force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-53 DROP_JOB_CLASS Procedure Parameters

Parameter	Description
<code>job_class_name</code>	The name of the job class. Can be a comma-delimited list.
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, a class being dropped must not be referenced by any jobs, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped.</p> <p>Running jobs that belong to the job class are not affected.</p>

Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

146.6.41 DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
  program_name          IN VARCHAR2,
  force                 IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-54 DROP_PROGRAM Procedure Parameters

Parameter	Description
<code>program_name</code>	The name of the program to be dropped. Can be a comma-delimited list.
<code>force</code>	If <code>force</code> is set to <code>FALSE</code> , the program must not be referenced by any job, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code> , all jobs referencing the program are disabled before the program is dropped. Running jobs that point to the program are not affected by the <code>DROP_PROGRAM</code> call and are allowed to continue.

Usage Notes

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.

146.6.42 DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
  program_name          IN VARCHAR2,
  argument_position    IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
  program_name          IN VARCHAR2,
  argument_name         IN VARCHAR2);
```

Parameters

Table 146-55 DROP_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_name	The name of the argument being dropped
argument_position	The position of the argument to be dropped

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.

146.6.43 DROP_RESOURCE Procedure

This procedure drops a resource.

Syntax

```
DBMS_SCHEDULER.DROP_RESOURCE (
    resource_name IN VARCHAR2,
    force         IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-56 DROP_RESOURCE Procedure Parameters

Parameter	Description
resource_name	The name of the resource to be dropped. Can be a comma-delimited list.
force	If <i>force</i> is set to FALSE, the resource must not have any existing constraints, otherwise an error occurs. If <i>force</i> is set to TRUE, the resource will be dropped and any constraints defined on this resource will also be dropped.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the resource.

 **See Also:**

Creating or Dropping a Resource in *Oracle Database Administrator's Guide*

146.6.44 DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (  
    schedule_name    IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-57 DROP_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	If <i>force</i> is set to <code>FALSE</code> , the schedule must not be referenced by any job or window, otherwise an error will occur. If <i>force</i> is set to <code>TRUE</code> , any jobs or windows that use this schedule are disabled before the schedule is dropped Running jobs and open windows that point to the schedule are not affected.

Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.

146.6.45 DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (  
    window_name      IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-58 DROP_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.

Table 146-58 (Cont.) DROP_WINDOW Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, the window must be not be open or referenced by any job, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply.</p> <p>Running jobs that have the window as their schedule is allowed to continue, unless the <code>stop_on_window_close</code> flag is set to <code>TRUE</code> for the job. If this is the case, the job is stopped when the window is dropped.</p>

Usage Notes

Dropping a window requires the `MANAGE SCHEDULER` privilege.

146.6.46 ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group.

When an object is enabled, its `enabled` attribute is set to `TRUE`. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job `RUN_COUNT`, `FAILURE_COUNT` and `RETRY_COUNT` columns in the `*_SCHEDULER_JOBS` data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
    name           IN VARCHAR2,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 146-59 ENABLE Procedure Parameters

Parameter	Description
name	The name of the Scheduler object being enabled. Can be a comma-delimited list of names. If a job class name is specified, then all the jobs in the job class are enabled. If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> • STOP_ON_FIRST_ERROR - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default. • TRANSACTIONAL - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. • ABSORB_ERRORS - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. This type is only supported when enabling a job or a list of jobs.

Usage Notes

Window names must be preceded by SYS.

To run `ENABLE` for a window or group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

You can use `ENABLE` with any schema except the `SYS` schema.

146.6.47 END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`.

A detached job run does not end until this procedure or the [STOP_JOB Procedure](#) is called.

Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
  job_name          IN VARCHAR2,
  error_number      IN PLS_INTEGER DEFAULT 0,
  additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-60 END_DETACHED_JOB_RUN Procedure Parameters

Parameter	Description
job_name	The name of the job to end. Must be a detached job that is running.
error_number	If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If any other number, then the job run is logged as failed with that error number.
additional_info	This text is stored in the additional_info column of the *_scheduler_job_run_details views for this job run.

Usage Notes

This procedure requires that you either own the job or have ALTER privileges on it. You can also end any detached job run if you have the CREATE ANY JOB privilege.

See Also:

Oracle Database Administrator's Guide for information about detached jobs.

146.6.48 EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the next_run_date returned by one invocation as the return_date_after argument of the next invocation.

See the calendaring syntax described in "[Operational Notes](#)".

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
  calendar_string  IN  VARCHAR2,
  start_date       IN  TIMESTAMP WITH TIME ZONE,
  return_date_after IN  TIMESTAMP WITH TIME ZONE,
  next_run_date    OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 146-61 EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
calendar_string	The calendar expression to be evaluated. The string must be in the calendaring syntax described in " Operational Notes ".

Table 146-61 (Cont.) EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
start_date	The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.
return_date_after	The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value.
next_run_date	The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument.

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date          TIMESTAMP;
return_date_after  TIMESTAMP;
next_run_date      TIMESTAMP;
BEGIN
start_date :=
to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
    DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
        'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
        start_date, return_date_after, next_run_date);
    DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.
```

Usage Notes

No specific Scheduler privileges are required.

146.6.49 EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (RUN_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE_RUNNING_CHAIN is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
    job_name          IN VARCHAR2);
```

Parameters

Table 146-62 EVALUATE_RUNNING_CHAIN Procedure Parameter

Parameter	Description
job_name	The name of the running job (pointing to a chain) to reevaluate the rules for

Usage Notes

Running EVALUATE_RUNNING_CHAIN on a job requires alter privileges on the job (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

Note:

The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. EVALUATE_RUNNING_CHAIN should be used only under the following circumstances:

- After manual intervention of a running chain with the ALTER_RUNNING_CHAIN procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, EVALUATE_RUNNING_CHAIN may not be needed if you set the evaluation_interval attribute when you created the chain.

146.6.50 GENERATE_JOB_NAME Function

This function returns a unique name for a job.

The name will be of the form {prefix}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB\$_1, JOB\$_2, JOB\$_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
    prefix          IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 146-63 GENERATE_JOB_NAME Function Parameter

Parameter	Description
prefix	The prefix to use when generating the job name

Usage Notes

If the prefix is explicitly set to NULL, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE_JOB_NAME function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

146.6.51 GET_AGENT_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_INFO (
    agent_name      IN VARCHAR2,
    attribute       IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 146-64 GET_AGENT_INFO Function Parameter

Parameter	Description
agent_name	The name of an external destination where the agent is running

Table 146-64 (Cont.) GET_AGENT_INFO Function Parameter

Parameter	Description
attribute	<p>Possible Attributes values</p> <ul style="list-style-type: none"> • VERSION: Returns the agent version number. Requires the CREATE JOB system privilege. • UPTIME: Returns the time the agent has been up and running. Requires the CREATE JOB system privilege. • NUMBER_OF_RUNNING_JOBS: Returns the number of jobs that the agent is currently running. Requires the CREATE JOB system privilege. • TOTAL_JOBS_RUN: Returns the number of jobs run by the agent since it was started. Requires the CREATE JOB system privilege. • RUNNING_JOBS: Returns a comma-separated list of the names of the jobs running currently. Requires the MANAGE SCHEDULER system privilege. • ALL: Returns all the information the previous options return. It requires the MANAGE SCHEDULER system privilege.

Usage Notes

This function returns the same information as the `schagent` utility status option. See *Oracle Database Administrator's Guide*.

146.6.52 GET_AGENT_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. `GET_AGENT_VERSION` throws an error if the agent is not registered with the database or if the agent is not currently running.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
    agent_host          IN VARCHAR2) RETURN VARCHAR2;
```

Parameters**Table 146-65 GET_AGENT_VERSION Function Parameter**

Parameter	Description
agent_host	Either the hostname and port on which the agent is running in the form <code>hostname:port</code> or the name of the agent as shown in the <code>destination_name</code> column of the <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> view which lists all Scheduler agents registered with the database.

Usage Notes

This function requires the `CREATE EXTERNAL JOB` system privilege.

146.6.53 GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                  TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                  INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT VARCHAR2,
  value2       OUT VARCHAR2);
```

Parameters

Table 146-66 GET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved. See the SET_ATTRIBUTE Procedure for tables of attribute values.
value	The existing value of the attribute
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

Usage Notes

To run `GET_ATTRIBUTE` for a job class, you must have the `MANAGE SCHEDULER` privilege or have `EXECUTE` privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have `ALTER` or `EXECUTE` privileges on that object or have the `CREATE ANY JOB` privilege.

See the [SET_ATTRIBUTE Procedure](#) for tables of attribute values that you can retrieve for the various Scheduler object types.

146.6.54 GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedure differs from the equivalent UTL_FILE procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host           IN VARCHAR2,
    credential_name       IN VARCHAR2,
    file_contents         IN OUT NOCOPY {BLOB|CLOB});
```

```
DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host           IN VARCHAR2,
    credential_name       IN VARCHAR2,
    destination_file_name IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-67 GET_FILE Procedure Parameters

Parameter	Description
source_file	<p>Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host.</p> <p>If the format of this parameter is <i>external_log_id_stdout</i>, then the stdout from the designated external job run is returned.</p> <p>If the format of this parameter is <i>external_log_id_stderr</i>, the error text from the designated external job run is returned.</p> <p>You obtain the value of <i>external_log_id</i> from the ADDITIONAL_INFO column of the *_SCHEDULER_JOB_RUN_DETAILS views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the external_log_id name/value pair, and then append either "_stdout" or "_stderr" to its value.</p> <p>The external job must have an associated credential. The credential_name parameter of GET_FILE must name the same credential that is used by the job, and the source_host parameter must be the same as the destination attribute of the job.</p>
source_host	<p>If the file is to be retrieved from a remote host, then this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)</p> <p>If source_host is NULL or set to 'localhost', then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the schagent.conf file, which is located in the Scheduler agent home directory on the remote host.</p>
credential_name	The name of the credential to use for accessing the file system.

Table 146-67 (Cont.) GET_FILE Procedure Parameters

Parameter	Description
file_contents	The variable into which the file contents is read.
destination_file_name	The file to which the file contents is written.
destination_directory_object	The directory object that specifies the path to the destination file, when <code>destination_file_name</code> is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the `CREATE EXTERNAL JOB` system privilege and have `EXECUTE` privileges on the credential.

146.6.55 GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
    attribute    IN VARCHAR2,
    value        OUT VARCHAR2);
```

Parameters

Table 146-68 GET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	The name of the attribute
value	The existing value of the attribute

Usage Notes

To run `GET_SCHEDULER_ATTRIBUTE`, you must have the `MANAGE SCHEDULER` privilege.

[Table 146-69](#) lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see [Table 146-101](#) and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 146-69 Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
current_open_window	Name of the currently open window
default_timezone	Default time zone used by the Scheduler for repeat intervals and windows

Table 146-69 (Cont.) Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
email_sender	The default e-mail address of the sender for job state e-mail notifications
email_server	The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.
log_history	Retention period in days for job and window logs. The range of valid values is 0 through 1000000.
max_job_slave_processes	This Scheduler attribute is not used.

146.6.56 OPEN_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule.

The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
  window_name          IN VARCHAR2,
  duration             IN INTERVAL DAY TO SECOND,
  force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 146-70 OPEN_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window
duration	The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata.

Table 146-70 (Cont.) OPEN_WINDOW Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, then opening an already open window generates an error.</p> <p>If <code>force</code> is set to <code>TRUE</code>:</p> <p>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the <code>OPEN_WINDOW</code> command was issued.</p> <p>For example: <code>window1</code> was created with a duration of four hours. It has now been open for two hours. If, at this point, you reopen <code>window1</code> using the <code>OPEN_WINDOW</code> call and do not specify a duration, then <code>window1</code> stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</p> <p>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</p>

Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE SCHEDULER` privilege.

146.6.57 PURGE_LOG Procedure

The `PURGE_LOG` procedure purges rows from the job and window log that were not purged automatically by the scheduler.

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure can be used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
    log_history          IN PLS_INTEGER DEFAULT 0,
```

```

which_log          IN VARCHAR2          DEFAULT 'JOB_AND_WINDOW_LOG',
job_name           IN VARCHAR2          DEFAULT NULL);

```

Parameters

Table 146-71 PURGE_LOG Procedure Parameters

Parameter	Description
log_history	This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.
which_log	This specifies the log type. Valid values are: job_log, window_log, and job_and_window_log.
job_name	This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.

Usage Notes

This procedure requires the `MANAGE SCHEDULER` privilege.

Examples

The following completely purges all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in `jobclass1` and older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

146.6.58 PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer.

It differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```

DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,
  file_contents          IN {BLOB|CLOB},
  destination_permissions IN VARCHAR2 DEFAULT NULL);

```

```

DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,

```

```
credential_name          IN VARCHAR2,
source_file_name        IN VARCHAR2,
source_directory_object IN VARCHAR2,
destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-72 PUT_FILE Procedure Parameters

Parameter	Description
destination_file	Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
destination_host	If NULL or set to 'localhost', the file is saved to the file system of the local computer. To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)
credential_name	The name of the credential to use for accessing the destination file system.
file_contents	The variable from which the file contents is read.
source_file_name	The file from which the file contents is written
source_directory_object	The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

146.6.59 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-73 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Advanced Queuing (AQ) agent to remove the subscription from. If NULL, the user name of the calling user is used.

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

146.6.60 REMOVE_FROM_INCOMPATIBILITY Procedure

This procedure removes jobs or programs from an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.REMOVE_FROM_INCOMPATIBILITY (
    incompatibility_name    IN VARCHAR2,
    object_name             IN VARCHAR2);
```

Parameters

Table 146-74 REMOVE_FROM_INCOMPATIBILITY Procedure Parameters

Parameter	Description
incompatibility_name	The name of the incompatibility definition.
object_name	One or more (comma-separated) programs or jobs

Usage Notes

This procedure does not raise an error if any specified objects do not already exist in the incompatibility definition.

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

146.6.61 REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (
    group_name              IN VARCHAR2,
    member                  IN VARCHAR2);
```

Parameters

Table 146-75 REMOVE_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member_name	The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

See Also:

"CREATE_GROUP Procedure"

146.6.62 REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
    job_name          IN VARCHAR2,
    recipients        IN VARCHAR2 DEFAULT NULL,
    events            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-76 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job to remove e-mail notifications for. Cannot be NULL.
recipients	E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses.

Table 146-76 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
events	Job state event to remove e-mail notification for. Comma-separated list of job state events.

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If `recipients` is `NULL`, e-mail notifications for the specified events are removed for all existing recipients. If `events` is `NULL`, notifications for all events are removed for the specified recipients. If both `recipients` and `events` are `NULL`, all e-mail notifications are removed for the job.

For example, if `recipients` is `'jsmith@example.com,rjones@example.com'` and `events` is `'JOB_FAILED,JOB_BROKEN'`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for both `jsmith` and `rjones`. If `recipients` is `NULL`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for `jsmith`, `rjones`, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the `CREATE ANY JOB` system privilege or `ALTER` object privilege on the job.

**See Also:**

["ADD_JOB_EMAIL_NOTIFICATION Procedure"](#)

146.6.63 RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

`RESET_JOB_ARGUMENT_VALUE` is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2);
```

Parameters

Table 146-77 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job being altered
argument_position	The position of the program argument being reset
argument_name	The name of the program argument being reset

Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RESET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

146.6.64 RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given.

If no job_name is given, one is generated of the form RUN_CHAIN\$_chainnameN, where chainname is the first 8 characters of the chain name and N is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run).

If start_steps is NULL, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    start_steps         IN VARCHAR2,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
```

```

step_state_list      IN SYS.SCHEDULER$_STEP_TYPE_LIST,
job_name             IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 146-78 RUN_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to run
job_name	The name of the job to create to run the chain
start_steps	Comma-separated list of the steps to start when the chain starts running
step_state_list	List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each. Set the attributes of sys.scheduler\$_step_type as follows: step_name The name of the step step_type 'SUCCEEDED' or 'FAILED' error_number' where error_number is a positive or negative integer.

Usage Notes

Running a chain requires CREATE JOB if the job is being created in the user's schema, or CREATE ANY JOB otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the EXECUTE privilege on the chain or the EXECUTE ANY PROGRAM system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```

declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/

```

146.6.65 RUN_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call RUN_JOB to run a job according to its schedule. Use RUN_JOB to run a job outside of its normal schedule.

Syntax

```
DBMS_SCHEDULER.RUN_JOB (
    job_name           IN VARCHAR2,
    use_current_session IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 146-79 RUN_JOB Procedure Parameters

Parameter	Description
job_name	<p>A job name or a comma-separated list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator.</p> <p>If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.</p>
use_current_session	<p>This specifies whether or not the job run should occur in the same session that the procedure was invoked from. The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential.</p> <p>When use_current_session is set to TRUE:</p> <ul style="list-style-type: none"> You can test a job and see any possible errors on the command line. state, run_count, last_start_date, last_run_duration, and failure_count of *_scheduler_jobs are not updated. RUN_JOB can be run in parallel with a regularly scheduled job run. <p>When use_current_session is set to FALSE:</p> <ul style="list-style-type: none"> You need to check the job log to find error information. All relevant fields in *_scheduler_jobs are updated. RUN_JOB fails if a regularly scheduled job is running. <p>For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to TRUE, use_current_session must be FALSE.</p>

Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

A TRUE value for use_current_session is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the destination_name attribute

- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).
above bug fix 1261887 6.12.11

When `use_current_session` is `TRUE`, the call to `RUN_JOB` blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the `RUN_JOB` procedure.

Using `RUN_JOB` with `use_current_session=TRUE` does not update the job state and the job will not appear in `*_SCHEDULER_RUNNING_JOBS` views.

above bug fix 19185117 9.15.14

When `use_current_session` is `FALSE`, `RUN_JOB` returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

`RUN_JOB` requires that you own the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

Example

The following is an example of using `RUN_JOB`.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB(
    JOB_NAME          => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

146.6.66 SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database.

A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
  registration_password  IN VARCHAR2,
  expiration_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  max_uses                IN NUMBER DEFAULT NULL);
```

Parameters

Table 146-80 SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
<code>registration_password</code>	This is the password that remote agents must specify in order to successfully register with the database. If this is <code>NULL</code> , then no agents will be able to register with the database.

Table 146-80 (Cont.) SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
expiration_date	If this is set to a non-NULL value, then the registration_password is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the `MANAGE SCHEDULER` system privilege.

By default, `max_uses` is set to `NULL`, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to `NULL` if no new agents are being registered.

146.6.67 SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types.

To set an attribute to `NULL`, use the `SET_ATTRIBUTE_NULL` procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        IN {BOOLEAN|DATE|TIMESTAMP|
                    TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                    INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        IN VARCHAR2,
    value2       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 146-81 SET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object.
attribute	See Table 146-83 through Table 146-93 .
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

[Table 146-82](#) is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in *Oracle Database Administrator's Guide*.

Table 146-82 Attribute Tables for Scheduler Object Types

Scheduler Object Type	Table of Attributes
Job	Table 146-83
Program	Table 146-85
Schedule	Table 146-86
File Watcher	Table 146-87
Job Class	Table 146-88
Window	Table 146-89
Chain	Table 146-90
Database Destination	Table 146-91
External Destination	Table 146-92
Group	Table 146-93
Credential	Table 146-94
Resource	Table 146-95

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run SET_ATTRIBUTE for a window, a group of type WINDOW, or job class, you must have the MANAGE_SCHEDULER privilege. Otherwise, you must be the owner of the object

being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

Job

If there is a running instance of the job when the `SET_ATTRIBUTE` call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan.

Job Attribute Values

Table 146-83 lists attribute values for jobs.

 **Note:**

See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

Table 146-83 Job Attribute Values

Name	Description
<code>allow_runs_in_restricted_mode</code>	If <code>TRUE</code> , the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. <code>FALSE</code> by default.
<code>auto_drop</code>	This attribute, if <code>TRUE</code> , causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if: <ul style="list-style-type: none"> Its end date (or the end date of the schedule) has passed. It has run <code>max_runs</code> number of times. <code>max_runs</code> must be set with <code>SET_ATTRIBUTE</code>. It is not a repeating job and has run once. A job is automatically disabled when it has failed <code>max_failures</code> times. <code>max_failures</code> is also set with <code>SET_ATTRIBUTE</code> . If this attribute is set to <code>FALSE</code> , the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the <code>DROP_JOB</code> procedure. By default, jobs are created with <code>auto_drop</code> set to <code>TRUE</code> .
<code>comments</code>	An optional comment.
<code>connect_credential_name</code>	feature 25230 This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails. Using a <code>connect_credential_name</code> is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script.
<code>credential_name</code>	This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is <code>NULL</code> (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.

Table 146-83 (Cont.) Job Attribute Values

Name	Description
database_role	<p>This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby.</p> <p>Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.</p>
destination	<p>*** Deprecated in Oracle Database 11g Release 2. Use destination_name instead.</p> <p>This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format:</p> <p><i>hostname:port</i></p> <p>This attribute is set to NULL by default.</p>
destination_name	<p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL. See Table 146-28 for details about this attribute.</p>
end_date	<p>Specifies the date and time after which the job expires and is no longer run. After the end_date, if is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</p>
event_spec	<p>This attribute takes two values: the value argument specifies the event condition and the value2 argument specifies the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments in the "CREATE_JOB Procedure".</p>

Table 146-83 (Cont.) Job Attribute Values

Name	Description
follow_default_timezone	<p>If TRUE and if the job <code>start_date</code> is null, then when the <code>default_timezone</code> scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.</p> <p>For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone.</p> <p>If the job <code>start_date</code> is not null, then the time zone for the run date and time for the job is always specified by the time zone of the <code>start_date</code>.</p> <p>If FALSE, the next start date and time for the job is not recomputed when the <code>default_timezone</code> scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.</p> <p>Summer and winter transitions do not change the default time zone name.</p>
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.
instance_stickiness	<p>This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to TRUE. If you set <code>instance_stickiness</code> to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, <code>instance_stickiness</code> is ignored and the job is handled as if it were a non-sticky job.</p> <p>If <code>instance_stickiness</code> is set to FALSE, each instance of the job runs on the first instance available.</p> <p>For environments other than Oracle RAC, this attribute is not useful because there is only one instance.</p>
job_action	The action that the job performs, depending on the <code>job_type</code> attribute. For example, if <code>job_type</code> is 'STORED_PROCEDURE', <code>job_action</code> contains the name of the stored procedure.
job_class	The class this job is associated with.
job_priority	<p>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.</p> <p>If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</p>
job_type	<p>The type of this job. Valid values are: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT'.</p> <p>If this is set, <code>program_name</code> must be NULL.</p>
job_weight	<p>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1.</p> <p>Weight of the job for parallel execution.</p>

Table 146-83 (Cont.) Job Attribute Values

Name	Description
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <p><code>DBMS_SCHEDULER.LOGGING_OFF</code></p> <p>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</p> <p><code>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</code></p> <p>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_RUNS</code></p> <p>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_FULL</code></p> <p>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with <code>SET_ATTRIBUTE</code>), stop, and so on.</p>
max_failures	<p>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its <code>STATE</code> is set to <code>BROKEN</code> in the <code>*_SCHEDULER_JOB</code> views.</p> <p><code>max_failures</code> can be an integer between 1 to 1,000,000. By default, it is set to <code>NULL</code>, which indicates that new instances of the job are started regardless of how many previous instances have failed.</p>
max_run_duration	<p>This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is <code>INTERVAL DAY TO SECOND</code>. If this attribute is set to a non-zero and non-<code>NULL</code> value, and job duration exceeds this value, the Scheduler raises an event of type <code>JOB_OVER_MAX_DUR</code>. It is then up to your event handler to decide whether or not to allow the job to continue.</p>
max_runs	<p>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once <code>max_runs</code> is reached, the job is disabled and its state is changed to <code>COMPLETED</code>.</p> <p><code>max_runs</code> can be an integer between 1 and 1,000,000. By default, it is set to <code>NULL</code>, which means that it repeats forever or until <code>end_date</code> or <code>max_failures</code> is reached.</p>
number_of_arguments	<p>The number of arguments if the program is inlined. If this is set, <code>program_name</code> should be <code>NULL</code>.</p>

Table 146-83 (Cont.) Job Attribute Values

Name	Description
parallel_instances	<p>This is a boolean attribute that can be set only for event-based jobs.</p> <p>If FALSE (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored.</p> <p>If TRUE, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its <i>parent job</i>). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources.</p> <p>The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.</p>
program_name	The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.
raise_events	<p>This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.</p> <ul style="list-style-type: none"> • job_started CONSTANT PLS_INTEGER := 1 • job_succeeded CONSTANT PLS_INTEGER := 2 • job_failed CONSTANT PLS_INTEGER :=4 • job_broken CONSTANT PLS_INTEGER :=8 • job_completed CONSTANT PLS_INTEGER :=16 • job_stopped CONSTANT PLS_INTEGER :=32 • job_sch_lim_reached CONSTANT PLS_INTEGER :=64 • job_disabled CONSTANT PLS_INTEGER :=128 • job_chain_stalled CONSTANT PLS_INTEGER :=256 • job_all_events CONSTANT PLS_INTEGER := 511 • job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped <p>Table 146-84 describes these event types in detail.</p>
repeat_interval	Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See " Calendaring Syntax " for more information.

Table 146-83 (Cont.) Job Attribute Values

Name	Description
restartable	<p>This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it is restarted from the beginning point of the job.</p> <p>In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The <code>restart_on_recovery</code> attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)</p> <p>Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job.</p> <p>Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.</p> <p>The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter.</p> <p>Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.</p> <p>The Scheduler stops retrying a job when:</p> <ul style="list-style-type: none"> • One of the retries succeeds. • All of its six retries have failed. • The next retry would occur after the next regularly scheduled run of the job. <p>The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.</p>
schedule_limit	<p>In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.</p> <p>If <code>schedule_limit</code> is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.</p>
schedule_name	<p>The name of a schedule, window, or group of type WINDOW to use as the schedule for this job. If this is set, <code>end_date</code>, <code>start_date</code> and <code>repeat_interval</code> should all be NULL.</p>
start_date	<p>The original date and time on which this job started or is scheduled to start. If this is set, <code>schedule_name</code> should be NULL.</p>

Table 146-83 (Cont.) Job Attribute Values

Name	Description
stop_on_window_close	<p>This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should stop once the associated window is closed. The job is stopped using the stop_job procedure with force set to FALSE.</p> <p>By default, stop_on_window_close is set to FALSE. Therefore, if you do not set this attribute, the job continues after the window closes.</p> <p>Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.</p>
store_output	<p>This is a boolean attribute. If set to TRUE, then for job runs that are logged, all job output and error messages are stored in the *_JOB_RUN_DETAILS views. If set to FALSE, then the output and messages are not stored. For new jobs, this is set, by default, to TRUE.</p>

The following event types are valid values for the raise_events attribute in [Table 146-83](#).

Table 146-84 Event Types Raised by the Scheduler

Event Type	Description
job_all_events	Not an event, but a constant that provides an easy way for you to enable all events
job_broken	The job has been disabled and has changed to the BROKEN state because it exceeded the number of failures defined by the max_failures job attribute
job_chain_stalled	A job running a chain is in the CHAIN_STALLED state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain evaluation_interval is set to NULL. No progress is made in the chain unless there is manual intervention.
job_completed	The job completed because it reached its max_runs or end_date
job_disabled	The job was disabled by the Scheduler or by a call to SET_ATTRIBUTE
job_failed	The job failed, either due to an error or an abnormal termination.
job_over_max_dur	The job exceeded the maximum run duration specified by its max_run_duration attribute. (Note: you do not need to enable this event with the raise_events job attribute; it is always enabled.)
job_run_completed	A job run either failed, succeeded, or was stopped
job_sch_lim_reached	The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the schedule_limit job attribute.
job_started	The job started
job_stopped	The job was stopped by a call to STOP_JOB
job_succeeded	The job completed successfully

Program Attribute Values

Table 146-85 lists program attribute values.

Note:

See the "[CREATE_PROGRAM Procedure](#)" for more complete descriptions of the attributes in this table.

Table 146-85 Program Attribute Values

Name	Description
comments	An optional comment. This can describe what the program does or give usage details.
detached	If TRUE, the program is a detached program. See <i>Oracle Database Administrator's Guide</i> for information about detached jobs and detached programs.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
program_action	The action that the program performs, indicated by the <code>program_type</code> attribute. For example, if <code>program_type</code> is 'STORED_PROCEDURE', <code>program_action</code> contains the name of the stored procedure.
program_type	The type of program. This must be one of these supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.

Schedule Attribute Values

Table 146-86 lists schedule attribute values.

Note:

See "[CREATE_SCHEDULE Procedure](#)" for more complete descriptions of the attributes in this table.

Table 146-86 Schedule Attribute Values

Name	Description
comments	An optional comment.
end_date	The cutoff date and time after which the schedule does not specify any dates.
event_spec	This attribute takes two values: the <code>value</code> argument should contain the event condition and the <code>value2</code> argument should contain the queue specification. For more details, see the descriptions for the <code>event_condition</code> and <code>queue_spec</code> arguments to the " CREATE_JOB Procedure ".
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. See " Calendaring Syntax " for more information.

Table 146-86 (Cont.) Schedule Attribute Values

Name	Description
start_date	The start or reference date and time used by the calendaring syntax.

File Watcher Attribute Values

[Table 146-87](#) lists file watcher attribute values.

Table 146-87 File Watcher Attribute Values

Parameter	Description
destination	Remote host name or IP address where the file is expected to arrive. If NULL, destination is the local host.
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbs/log' denotes the rdbs/log subdirectory of the Oracle home directory.
file_name	Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the EXECUTE privilege on the credential. Cannot be NULL.
min_file_size	Minimum file size in bytes before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If NULL, an internal value is used. The lower limit for this attribute is 10 seconds.
comments	Optional comment.

Job Class Attribute Values

[Table 146-88](#) lists job class attribute values.

 **Note:**

See the "[CREATE_JOB_CLASS Procedure](#)" for more complete descriptions of the attributes in this table.

Table 146-88 Job Class Attribute Values

Name	Description
comments	An optional comment about the class.

Table 146-88 (Cont.) Job Class Attribute Values

Name	Description
log_history	<p>This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately.</p> <p>The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).</p>
logging_level	<p>This attribute specifies how much information is logged. The valid values are:</p> <ul style="list-style-type: none"> DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. DBMS_SCHEDULER.LOGGING_FULL The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.
resource_consumer_group	<p>The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See <i>Oracle Database Administrator's Guide</i> for a description of resource consumer groups and the Database Resource Manager.</p>
service	<p>The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.</p>

Window Attribute Values

Table 146-89 lists window attribute values.

Note:

See the "[CREATE_WINDOW Procedure](#)" for more complete descriptions of the attributes in this table.

Table 146-89 Window Attribute Values

Name	Description
comments	An optional comment about the window.
duration	The duration of the window.

Table 146-89 (Cont.) Window Attribute Values

Name	Description
end_date	The date after which the window no longer opens. If this is set, schedule_name must be NULL.
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See " Calendaring Syntax " for more information.
resource_plan	The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the force option, no resource plan switch occurs. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.
schedule_name	The name of a schedule to use with this window. If this is set, start_date, end_date, and repeat_interval must all be NULL.
start_date	The next date and time on which this window is scheduled to open. If this is set, schedule_name must be NULL.
window_priority	The priority of the window. Must be either 'LOW' (default) or 'HIGH'.

Chain Attribute Values

Table 146-90 lists chain attribute values.

 **Note:**

See the "[CREATE_CHAIN Procedure](#)" for more complete descriptions of the attributes in this table.

Table 146-90 Chain Attribute Values

Name	Description
comments	An optional comment describing the purpose of the chain.
evaluation_interval	If not NULL, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives) This attribute should only be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient.

Table 146-90 (Cont.) Chain Attribute Values

Name	Description
rule_set_name	<p>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them.</p> <p>Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX\${N}</code></p>

Database Destination Attribute Values

Table 146-91 lists database destination attribute values.

Note:

See the "[CREATE_DATABASE_DESTINATION Procedure](#)" for more complete descriptions of the attributes in this table.

Table 146-91 Database Destination Attribute Values

Name	Description
agent	<p>The name of the external destination (also known as agent destination) that is used to connect to the remote database.</p> <p>You can obtain valid external destination names from the view <code>ALL_SCHEDULER_EXTERNAL_DESTS</code>.</p>
connect_info	<p>The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in <code>tnsnames.ora</code> that resolves to the connect descriptor.</p> <p>Note: This corresponds to the <code>tns_name</code> argument of <code>CREATE_DATABASE_DESTINATION</code>.</p>
enabled	If <code>TRUE</code> , the database destination is enabled.
comments	An optional comment about the database destination.

External Destination Attribute Values

Table 146-92 lists external destination attribute values.

 **Note:**

External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

Table 146-92 External Destination Attribute Values

Name	Description
hostname	(GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.
port	(GET_ATTRIBUTE only) The TCP port number on which the agent listens.
ip_address	(GET_ATTRIBUTE only) The IP address of the host on which the agent resides.
enabled	If TRUE, the external destination is enabled.
comments	An optional comment about the external destination.

Group Attribute Values

[Table 146-93](#) lists group attribute values.

 **Note:**

See the "[CREATE_GROUP Procedure](#)" for more complete descriptions of the attributes in this table.

Table 146-93 Group Attribute Values

Name	Description
group_type	(GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).
member_name	Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER. Note: this attribute corresponds to the member argument of CREATE_GROUP.
enabled	If TRUE, the group is enabled.
comments	An optional comment about the group.
number_of_members	(GET_ATTRIBUTE only) The number of members in the group.

Credential Attribute Values

[Table 146-94](#) lists credential attribute values.

 **Note:**

Credential attribute values for the `SET_ATTRIBUTE` and `GET_ATTRIBUTE` procedures are deprecated with Oracle Database Release 12c Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the [DBMS_CREDENTIAL](#) package, specifically the attribute parameter in the [UPDATE_CREDENTIAL Procedure](#).

Table 146-94 Credential Attribute Values

Name	Description
username	The user name for logging into to the host operating system or remote Oracle database. Maximum length is 64.
password	The password for the user name. Maximum length is 128.
comments	A description of the credential. Maximum length is 240.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.
database_role	The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: SYSDBA and SYSOPER.

Resource Attribute Values

[Table 146-95](#) lists resource attribute values.

Table 146-95 Resource Attribute Values

Name	Description
resource_name	The name of the resource
units	The number of units of this resource that the job or program uses.
status	The status of the resource. ENFORCE_CONSTRAINTS. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached, no additional jobs using this resource will get started. IGNORE_CONSTRAINTS. When set, the scheduler will ignore any constraints on this resource. BLOCKED_ALL_JOBS. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
constraint_level	Level of the constraint: JOB_LEVEL or PROGRAM_LEVEL For incompatibilities, for JOB_LEVEL, the incompatibility members must be jobs; for PROGRAM_LEVEL the incompatibility members must be programs.
comments	Descriptive comment about the resource.

146.6.68 SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to `NULL`.

The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2);
```

Parameters

Table 146-96 SET_ATTRIBUTE_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

Usage Notes

To run `SET_ATTRIBUTE_NULL` for a window, group of type `WINDOW`, or job class, you must have the `MANAGE SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

146.6.69 SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an `AnyData` object.

It overrides any default value set for the program argument. `NULL` is a valid assignment for a program argument.

The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_ANYDATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

`SET_JOB_ANYDATA_VALUE` is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name      IN VARCHAR2,
```

```
argument_position    IN PLS_INTEGER,
argument_value      IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN SYS.ANYDATA);
```

Parameters

Table 146-97 SET_JOB_ANYDATA_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be assigned to the program argument, encapsulated in an AnyData object

Usage Notes

SET_JOB_ANYDATA_VALUE requires that you own the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- ["SET_JOB_ARGUMENT_VALUE Procedure"](#)
- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#)

146.6.70 SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument for a job.

It overrides any default value set for the corresponding program or stored procedure argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_PROGRAM_ARGUMENT Procedure](#) or the [DEFINE_METADATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER,
  argument_value     IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN VARCHAR2);
```

Parameters

Table 146-98 SET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- "SET_JOB_ANYDATA_VALUE Procedure"
- "DEFINE_PROGRAM_ARGUMENT Procedure"

146.6.71 SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
    jobattr_array    IN JOBATTR_ARRAY,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 146-99 SET_JOB_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> STOP_ON_FIRST_ERROR returns on the first error and commits previous successful attribute changes to disk. This is the default. TRANSACTIONAL returns on the first error and rolls back everything that happened before that error. ABSORB_ERRORS tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

146.6.72 SET_RESOURCE_CONSTRAINT Procedure

This procedure allows users to specify the resources used by jobs.

Syntax

```
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (
    object_name    IN VARCHAR2,
    resource_name  IN VARCHAR2,
    units          IN NUMBER DEFAULT 1);
```

Parameters

Table 146-100 SET_RESOURCE_CONSTRAINT Procedure Parameters

Parameter	Description
object_name	The name of a program or a job, or a comma separated list of these objects.
resource_name	The name of the resource.

Table 146-100 (Cont.) SET_RESOURCE_CONSTRAINT Procedure Parameters

Parameter	Description
units	The number of units of this resource that the job or program uses.

Usages Notes

`object_name` can be the name or comma-separated list of names of either programs or jobs. This creates a constraint on the named resource for these programs or jobs.

`units` specifies the number of units of the resource that the program or job can use. If `units` is set to 0, then the program or job does not use this resource anymore, and the resulting constraint is deleted. Setting `units` to 0 on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.

146.6.73 SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

[Table 146-101](#) provides short attribute descriptions for the `SET_SCHEDULER_ATTRIBUTE` procedure. For complete descriptions, see section "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (
    attribute      IN VARCHAR2,
    value          IN VARCHAR2);
```

Parameters

Table 146-101 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	<p>The name of the Scheduler attribute. Possible values are:</p> <ul style="list-style-type: none"> • 'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when start_date is not specified. See "Calendaring Syntax" for more information. • 'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL. • 'email_sender': The default e-mail address of the sender of job state e-mail notifications. • 'email_server_credential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications. • 'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are: <ul style="list-style-type: none"> – NONE: the default, indicating no encryption used – SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection – STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption • 'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours. • 'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 1000000. • 'max_job_slave_processes': This Scheduler attribute is not used.
value	The new value of the attribute

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the `MANAGE SCHEDULER` privilege.

See Also:

Oracle Database Administrator's Guide for more detailed descriptions of Scheduler attributes

146.6.74 STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class.

After stopping the job, the state of a one-time job is set to `STOPPED`, whereas the state of a repeating job is set to `SCHEDULED` or `COMPLETED`, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, `STOP_JOB` stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

For in-memory full jobs in an Oracle Real Application Clusters environment, `STOP_JOB` uses the `instance_id` attribute of the job definition to determine in which instance (or all of them if the attribute is left null) to stop the in-memory full job. (In-memory full jobs are kept cached in memory, and as such are limited to the instance currently caching them. Because of this, the same `job_name` can in some conditions be used for different jobs on different instances.)

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
    job_name          IN VARCHAR2
    force             IN BOOLEAN DEFAULT FALSE
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 146-102 STOP_JOB Procedure Parameters

Parameter	Description
<code>job_name</code>	<p>Name of a job to stop. Can be a comma-separated list of jobs, where each entry can be one of the following:</p> <ul style="list-style-type: none"> Job name: the name of an existing job, optionally preceded by a schema name and dot separator. Job destination ID: a number, obtained from the <code>JOB_DEST_ID</code> column of the <code>*_SCHEDULER_JOB_DESTS</code> views, that represents the unique combination of a job, a credential, and a destination. Job class: the name of a job class. Must be preceded by the <code>SYS</code> schema name and a dot separator. <p>If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its <code>destination_name</code> attribute, all job instances on all destinations are stopped.</p>

Table 146-102 (Cont.) STOP_JOB Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the Scheduler immediately terminates the job slave. Oracle recommends that <code>STOP_JOB</code> with <code>force</code> set to <code>TRUE</code> be used only after a <code>STOP_JOB</code> with <code>force</code> set to <code>FALSE</code> has failed.</p> <p>Use of the <code>force</code> option requires the <code>MANAGE SCHEDULER</code> system privilege.</p>
<code>commit_semantics</code>	<p>The commit semantics. The following two types are supported:</p> <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default. • <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the <code>job_name</code> list. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.

Usage Notes

`STOP_JOB` without the `force` option requires that you be the owner of the job or have `ALTER` privileges on that job. You can also stop a job if you have the `CREATE ANY JOB` or `MANAGE SCHEDULER` privilege.

`STOP_JOB` with the `force` option requires that you have the `MANAGE SCHEDULER` privilege.

Example

The following is an example of using `STOP_JOB`.

```
BEGIN
    DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB, 984, 1223, SYS.ETL_JOBCLASS');
END;
```

DBMS_SERVER_ALERT

The `DBMS_SERVER_ALERT` package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- [Security Model](#)
- [Object Types](#)
- [Relational Operators](#)
- [Supported Metrics](#)
- [Summary of DBMS_SERVER_ALERT Subprograms](#)

147.1 DBMS_SERVER_ALERT Security Model

The user needs `DBA` or `IMP_FULL_DATABASE` roles to use the `DBMS_SERVER_ALERT` package.

147.2 DBMS_SERVER_ALERT Object Types

You qualify the metric by an individual object for the listed object types.

Table 147-1 Object Types Defined as Constants

Constant	Description
<code>OBJECT_TYPE_SYSTEM</code>	Metrics collected on the system level for each instance.
<code>OBJECT_TYPE_FILE</code>	Metrics collected on the file level. These are used for <code>AVG_FILE_READ_TIME</code> and <code>AVG_FILE_WRITE_TIME</code> metrics.
<code>OBJECT_TYPE_SERVICE</code>	Metrics collected on the service level. Currently <code>ELAPSED_TIME_PER_CALL</code> and <code>CPU_TIME_PER_CALL</code> are collected.
<code>OBJECT_TYPE_TABLESPACE</code>	Metrics collected on the tablespace level. Note: Dictionary managed tablespaces are not supported.
<code>OBJECT_TYPE_EVENT_CLASS</code>	Metrics collected on wait event class level. Currently supported metrics are <code>AVG_USERS_WAITING</code> and <code>DB_TIME_WAITING</code> .

Table 147-1 (Cont.) Object Types Defined as Constants

Constant	Description
OBJECT_TYPE_SESSION	Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.
OBJECT_TYPE_WRCCLIENT	Refers to a group of metrics (WCR_ . . .) used during replay to monitor the replay clients' performance

147.3 DBMS_SERVER_ALERT Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 147-2 Relational Operators Defined as Constants

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

147.4 DBMS_SERVER_ALERT Supported Metrics

These metrics are supported. All internal metric names are supplied as package constants.

Table 147-3 List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
AVG_FILE_READ_TIME	Average File Read Time	Microseconds

Table 147-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
AVG_FILE_WRITE_TIME	Average File Write Time	Microseconds
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second

Table 147-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
HARD_PARSSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
LOGONS_CURRENT	Current Number of Logons	Number of Logons
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OS_SCHED_CPU_WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second

Table 147-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction

Table 147-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSSES_SEC	Total Parses (for each second)	Parses for each Second
TOTAL_PARSSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
USER_CALLS_PCT	User Calls (%)	% of all calls
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
WCR_AVG_IO_LAT	Average IO response time (for a WRC client)	Milliseconds
WCR_PCPU	Percentage of replay threads on CPU (for a WRC client)	% of total replay threads

Table 147-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
WCR_PIO	Percentage of replay threads doing IOs (for a WRC client)	% of total replay threads

147.5 Summary of DBMS_SERVER_ALERT Subprograms

This table lists the DBMS_SERVER_ALERT subprograms and briefly describes them.

Table 147-4 DBMS_SERVER_ALERT Package Subprograms

Subprogram	Description
EXPAND_MESSAGE Function	Expands alert messages
GET_THRESHOLD Procedure	Gets the current threshold settings for a specified metric
SET_THRESHOLD Procedure	Sets the warning and critical thresholds for a specified metric

147.5.1 EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE(
  user_language      IN  VARCHAR2,
  message_id         IN  NUMBER,
  argument_1         IN  VARCHAR2,
  argument_2         IN  VARCHAR2,
  argument_3         IN  VARCHAR2,
  argument_4         IN  VARCHAR2,
  argument_5         IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 147-5 EXPAND_MESSAGE Function Parameters

Parameter	Description
user_language	The language of the current session.
message_id	Id of the alert message
argument_1	The first argument in the alert message.
argument_2	The second argument in the alert message.
argument_3	The third argument in the alert message.
argument_4	The fourth argument in the alert message.
argument_5	The fifth argument in the alert message.

147.5.2 GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD(
  metrics_id          IN  BINARY_INTEGER,
  warning_operator    OUT BINARY_INTEGER,
  warning_value       OUT VARCHAR2,
  critical_operator    OUT BINARY_INTEGER,
  critical_value       OUT VARCHAR2,
  observation_period  OUT BINARY_INTEGER,
  consecutive_occurrences OUT BINARY_INTEGER,
  instance_name       IN  VARCHAR2,
  object_type         IN  BINARY_INTEGER,
  object_name         IN  VARCHAR2);
```

Parameters

Table 147-6 GET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See " Supported Metrics ".
warning_operator	The operator for the comparing the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV\$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid.

147.5.3 SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD(
  metrics_id           IN   BINARY_INTEGER,
  warning_operator     IN   BINARY_INTEGER,
  warning_value        IN   VARCHAR2,
  critical_operator    IN   BINARY_INTEGER,
  critical_value       IN   VARCHAR2,
  observation_period   IN   BINARY_INTEGER,
  consecutive_occurrences IN BINARY_INTEGER,
  instance_name        IN   VARCHAR2,
  object_type          IN   BINARY_INTEGER,
  object_name          IN   VARCHAR2);
```

Parameters

Table 147-7 SET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See " Supported Metrics ".
warning_operator	The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See " Relational Operators ".
warning_value	The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.
critical_operator	The operator for the comparing the actual value with the critical threshold. See " Relational Operators ".
critical_value	The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.
observation_period	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts.
object_type	See " Object Types ".
object_name	The name of the object. This is NULL for SYSTEM.

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.

DBMS_SERVICE

The `DBMS_SERVICE` package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Exceptions](#)
- [Summary of DBMS_SERVICE Subprograms](#)

 **See Also:**

Oracle Real Application Clusters Administration and Deployment Guide for administering services in Oracle Real Application Clusters.

148.1 DBMS_SERVICE Overview

`DBMS_SERVICE` supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through `SRVCTL`. The `DBMS_SERVICE` package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

 **See Also:**

For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

148.2 DBMS_SERVICE Security Model

The DBMS_SERVICE package has certain security requirements.

Privileges

The client using this package must have the ALTER SYSTEM execution privilege and the V\$SESSION table read privilege.

Schemas

This package must be installed under SYS schema.

Roles

The EXECUTE privilege of the package is granted to the DBA role only.

148.3 DBMS_SERVICE Constants

The DBMS_SERVICE package provides constants that can be used for specifying parameter values.

- Constants used in calling arguments are described in [Table 148-1](#)
- Constants used in connection balancing goal arguments are described in [Table 148-2](#)
- Constants used in TAF failover attribute arguments are described in [Table 148-3](#)

Table 148-1 Constants Used in Calling Arguments

Name	Type	Value	Description
GOAL_NONE	NUMBER	0	Disables Load Balancing Advisory
GOAL_SERVICE_TIME	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
GOAL_THROUGHPUT	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

Table 148-2 Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_SHORT	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either goal_service_time or goal_throughput). When GOAL=NONE (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.

Table 148-2 (Cont.) Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

Table 148-3 Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_METHOD_N ONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_B ASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time.
FAILOVER_TYPE_NON E	VARCHAR		Server side TAF type is NONE
FAILOVER_TYPE_SES SION	VARCHAR		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF reconnects to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_SEL ECT	VARCHAR		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of connection attempts when failover occurs. Specifies the number of times for Application Continuity and TAF to attempt the reconnect and re-authenticate pair. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) for Application Continuity is 30.
FAILOVER_RESTORE_ NONE	CONSTANT VARCHAR2	NONE	The initial state is not restored before replaying for Application Continuity and TAF. This is recommended for OCI applications that use Application Continuity and build their own state in the request. For example, SQLPLUS.

Table 148-3 (Cont.) Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_RESTORE_BASIC	VARCHAR2	LEVEL1	This is the recommended value for Java and ODP.NET applications using Application Continuity. The initial states that the user knows are restored automatically before replaying. If the user needs additional states, a callback must be registered.
FAILOVER_DELAY	NUMBER		Number of seconds delay between each connection attempt. This is the delay that Application Continuity and TAF waits if a reconnect and re-authentication fails. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) is 10s when using Application Continuity. Using FAILOVER_DELAY the failover can be delayed until the service is next available. This can work well in conjunction with a planned outage that may make a service temporarily unavailable (such as for several minutes).
STOP_OPTION_NONE	VARCHAR		Sessions are not disconnected.
STOP_OPTION_IMMEDIATE	VARCHAR		Sessions are disconnected immediately after the drain_timeout expires.
STOP_OPTION_TRANSACTIONAL	VARCHAR		Sessions are disconnected after the transactions during the drain_timeout. The sessions disconnect immediately when drain_timeout expires.
DYNAMIC	NUMBER		For Application Continuity, this parameter specifies whether the session state that is not transactional is changed by the application during request execution. A value of DYNAMIC is recommended for all applications. If you are in any doubt, or the application can be customized, you must use DYNAMIC.

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay must be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to BASIC. Delay and retries are optional and may be specified independently.

148.4 DBMS_SERVICE Operating Procedures

You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart, and Oracle Global Data Services.

- – [CREATE_SERVICE Procedure](#)
- [DELETE_SERVICE Procedure](#)
- [MODIFY_SERVICE Procedure](#)
- [START_SERVICE Procedure](#)
- [STOP_SERVICE Procedure](#)
- With Oracle Database 12c release 1, you are advised to use the parameter interface in all service -related subprograms.
- If you wish to use DBMS_SERVICE on a pluggable database (PDB) in a single instance, you must connect to that PDB first.

148.5 DBMS_SERVICE Exceptions

This table lists the exceptions raised by the DBMS_SERVICE package.

Table 148-4 DBMS_SERVICE Exceptions

Exception	Error Code	Description
NULL_SERVICE_NAME	44301	Service name argument was found to be NULL
NULL_NETWORK_NAME	44302	Network name argument was found to be NULL
SERVICE_EXISTS	44303	Service name already exists
SERVICE_DOES_NOT_EXIST	44304	Specified service does not exist
SERVICE_IN_USE	44305	Specified service was running
SERVICE_NAME_TOO_LONG	44306	Service name was too long
NETWORK_PREFIX_TOO_LONG	44307	Network name, excluding the domain, was too long
NOT_INITIALIZED	44308	Services layer was not yet initialized
GENERAL_FAILURE	44309	An unknown failure
MAX_SERVICES_EXCEEDED	44310	Maximum number of services has been reached
SERVICE_NOT_RUNNING	44311	Specified service was not running
DATABASE_CLOSED	44312	Database was closed
INVALID_INSTANCE	44313	Instance name argument was not valid
NETWORK_EXISTS	44314	Network name already exists
NULL_ATTRIBUTES	44315	All attributes specified were NULL
INVALID_ARGUMENT	44316	Invalid argument supplied

Table 148-4 (Cont.) DBMS_SERVICE Exceptions

Exception	Error Code	Description
DATABASE_READONLY	44317	Database is open read-only
MAX_SN_LENGTH	44318	Total length of all running service network names exceeded the maximum allowable length
ERR_AQ_SERVICE	44319	Cannot delete AQ service
ERR_GLB_SERVICE	44320	Cannot delete global service
ERR_INVALID_PDB_NAME	44771	Invalid name for a pluggable database
ERR_CRS_API	44772	Cluster ready services (CRS) operation failed
ERR_PDB_CLOSED	44773	Cannot perform requested service operation
ERR_PDB_INVALID	44774	Pluggable database attribute cannot be changed
ERR_PDB_NAME	44775	Pluggable database service cannot be created
ERR_PDB_EXP	44776	Pluggable database service cannot be deleted
ERR_PDB_FAIL	44777	Pluggable database service cannot be started

148.6 Summary of DBMS_SERVICE Subprograms

This table lists the DBMS_SERVICE subprograms and briefly describes them.

Table 148-5 DBMS_SERVICE Package Subprograms

Subprogram	Description
CREATE_SERVICE Procedure	Creates service
DELETE_SERVICE Procedure	Deletes service
DISCONNECT_SESSION Procedure	Disconnects sessions running under this service
MODIFY_SERVICE Procedure	Modifies service
START_SERVICE Procedure	Activates service
STOP_SERVICE Procedure	Stops service

148.6.1 CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

Note:

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
  service_name          IN VARCHAR2,
  network_name          IN VARCHAR2,
  parameter_array       IN TABLE OF VARCHAR2(100));
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.CREATE_SERVICE(
  service_name          IN VARCHAR2,
  network_name          IN VARCHAR2,
  goal                  IN NUMBER DEFAULT NULL,
  dtp                   IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications  IN BOOLEAN DEFAULT NULL,
  failover_method       IN VARCHAR2 DEFAULT NULL,
  failover_type         IN VARCHAR2 DEFAULT NULL,
  failover_retries      IN NUMBER DEFAULT NULL,
  failover_delay        IN NUMBER DEFAULT NULL,
  clb_goal              IN NUMBER DEFAULT NULL,
  edition               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 148-6 CREATE_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary

Table 148-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
network_name	Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET service_names character set (see <i>Oracle Database Net Services Reference</i>).
parameter_array	Associative array with name-value pairs of the service attributes. Supported names: <ul style="list-style-type: none"> • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_retries • failover_restore • failover_delay • clb_goal • edition • commit_outcome • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • drain_timeout • stop_option • placement_policy
goal	Workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)
aq_ha_notifications	Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity
failover_method	Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.
failover_type	TRANSACTION for Application Continuity. SELECT or BASIC for TAF.

Table 148-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
failover_retries	Number of connection retries for Application Continuity and TAF. Using the <code>failover_retries</code> and <code>failover_delay</code> parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
failover_delay	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available.
edition	<p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802</code> (edition does not exist).</p>
drain_timeout	If this parameter is defined, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, so stopping and relocating drains for this time by default.
stop_option	<p>Provides options to terminate a session. The supported values are:</p> <ul style="list-style-type: none"> • <code>TRANSACTIONAL</code> <code>drain_timeout</code> applies to the transactions. After the <code>drain_timeout</code> expire, the sessions are immediately killed. • <code>IMMEDIATE</code> The sessions are killed after <code>drain_timeout</code> expires. • <code>NONE</code> Sessions are not terminated. <p>However, these parameter values can be overridden using the command line.</p>
commit_outcome	<p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> • Invoking the GET_LTXID_OUTCOME Procedure of the <code>DBMS_APP_CONT</code> package requires that the <code>commit_outcome</code> attribute be set. • <code>commit_outcome</code> has no effect on active Data Guard and read-only databases. • <code>commit_outcome</code> is only allowed on the database service and on user-defined database services

Table 148-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
retention_timeout	Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
replay_initiation_timeout	For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.
session_state_consistency	Describes how nontransactional is changed during a request (values are <code>DYNAMIC</code> or <code>STATIC</code>). This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to <code>DYNAMIC</code> (default). Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.
sql_translation_name	Name of SQL translation unit
clb_goal	Method used for Connection Load Balancing (see Table 148-2)
placement_policy	NUMBER Placement policy for the service. Possible values: <ul style="list-style-type: none"> • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');

DECLARE
  params dbms_service.svc_parameter_array;
BEGIN
  params('FAILOVER_TYPE')           := 'TRANSACTION';
  params('REPLAY_INITIATION_TIMEOUT') := 1800;
  params('RETENTION_TIMEOUT')       := 86400;
  params('FAILOVER_DELAY')          := 10;
  params('FAILOVER_RETRIES')        := 30;
  params('DRAIN_TIMEOUT')           := 60;
  params('STOP_OPTION')              := 'DBMS_SERVICE.STOP_OPTION_IMMEDIATE';
```

```

params('FAILOVER_RESTORE')           := 'DBMS_SERVICE.FAILOVER_RESTORE_BASIC';
params('commit_outcome')             := 'true';
params('aq_ha_notifications')        := 'true';
DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;

```

148.6.2 DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Note:

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.

Syntax

```

DBMS_SERVICE.DELETE_SERVICE(
  service_name  IN VARCHAR2);

```

Parameters

Table 148-7 DELETE_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary

Examples

```

DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');

```

148.6.3 DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```

DBMS_SERVICE.DISCONNECT_SESSION(
  service_name      IN VARCHAR2,
  disconnect_option IN NUMBER DEFAULT POST_TRANSACTION);

```

Parameters

Table 148-8 DISCONNECT_SESSION Procedure Parameters

Parameter	Description
service_name	Name of the service, limited to 64 characters in the Data Dictionary
disconnect_option	The options, package constants, are expressed as NUMBER: <ul style="list-style-type: none">• POST_TRANSACTION = 0: session disconnects after the current transaction commits or rolls back• IMMEDIATE = 1: session disconnects immediately• NOREPLAY = 2: session disconnects immediately and be flagged to not be replayed by application continuity, that is IMMEDIATE and NOREPLAY together Note: IMMEDIATE or POST_TRANSACTION and NOREPLAY is automatically translated as 1 or 0 or 2 respectively. However, passing a string literal (quoted using either the ' or " characters, such as "IMMEDIATE" or 'POST_TRANSACTION' or 'NOREPLAY') raises an error.

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS_JOB package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

Examples

This disconnects sessions with service_name 'ernie.example.com'.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');
```

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

```
EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);
```

148.6.4 MODIFY_SERVICE Procedure

This procedure modifies an existing service.

Note:

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
  service_name          IN VARCHAR2,
  parameter_array       IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.MODIFY_SERVICE(
  service_name          IN VARCHAR2,
  goal                  IN NUMBER DEFAULT NULL,
  dtp                   IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications  IN BOOLEAN DEFAULT NULL,
  failover_method       IN VARCHAR2 DEFAULT NULL,
  failover_type         IN VARCHAR2 DEFAULT NULL,
  failover_retries     IN NUMBER DEFAULT NULL,
  failover_delay        IN NUMBER DEFAULT NULL,
  clb_goal              IN NUMBER DEFAULT NULL,
  edition               IN VARCHAR2 DEFAULT NULL,
  modify_edition        IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 148-9 MODIFY_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service, limited to 64 characters in the Data Dictionary

Table 148-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
parameter_array	<p>Associative array with name/value pairs of the service attributes. Supported names:</p> <ul style="list-style-type: none"> • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_restore • failover_retries • failover_delay • drain_timeout • stop_option • edition • commit_outcome • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_name • placement_policy
goal	<p>Workload management goal directive for the service. Valid values:</p> <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	<p>Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)</p>
aq_ha_notifications	<p>Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity</p>
failover_method	<p>Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.</p>
failover_type	<p>Failover TYPE for the service for Application Continuity and TAF.</p>
failover_restore	<p>For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state. For AC OCI, use NONE for applications that are not STATIC.</p>

Table 148-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
<code>failover_retries</code>	Number of connection retries for Application Continuity and TAF. Using the <code>failover_retries</code> and <code>failover_delay</code> parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
<code>failover_delay</code>	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available.
<code>drain_timeout</code>	When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, to stop and relocate drains for this time by default.
<code>edition</code>	<p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802</code> (edition does not exist).</p>
<code>commit_outcome</code>	<p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> Invoking the GET_LTXID_OUTCOME Procedure of the DBMS_APP_CONT package requires that the <code>commit_outcome</code> attribute be set. <code>commit_outcome</code> has no effect on active Data Guard and read-only databases. <code>commit_outcome</code> is allowed only on user-defined database services
<code>retention_timeout</code>	Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
<code>replay_initiation_timeout</code>	For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.

Table 148-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
session_state_consistency	Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.
sql_translation_name	Name of SQL translation unit
modify_edition	If TRUE, the edition service attribute is updated to use the edition argument value. If FALSE or NULL, the edition attribute is not updated.
clb_goal	Method used for Connection Load Balancing (see Table 148-2)
placement_policy	NUMBER Placement policy for the service. Possible values: <ul style="list-style-type: none"> • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Usage Notes

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` are lost unless they are also made with the corresponding `srvctl` command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by `srvctl`.
- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.

148.6.5 START_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

 **Note:**

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.START_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2);
```

Parameters

Table 148-10 *START_SERVICE Procedure Parameters*

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
instance_name	Name of the instance where the service must be activated (optional). NULL results in starting of the service on the local instance. In single instance, this can only be the current instance or NULL. Specify DBMS_SERVICE.ALL_INSTANCES to start the service on all configured instances.

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.example.com');
```

148.6.6 STOP_SERVICE Procedure

This procedure stops a service.

 **Note:**

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.STOP_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2 DEFAULT NULL,  
    stop_option IN VARCHAR2 DEFAULT NULL,
```

```

drain_timeout IN NUMBER    DEFAULT NULL,
replay       IN BOOLEAN   DEFAULT TRUE);

```

Parameters

Table 148-11 STOP_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
instance_name	Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances.
stop_option	To specify how sessions are stopped with draining. The possible values are as follows: <ul style="list-style-type: none"> IMMEDIATE: sessions are aborted immediately after the time specified in drain_timeout. TRANASCTIONAL: applies for transactions. After the transaction expires, the sessions are immediately terminated. NONE: sessions are not terminated. These values can be overridden on the command line using SRVCTL.
drain_timeout	The time in seconds for the session to drain.
replay	Enable application continuity replay.

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
```

DBMS_SESSION

This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_SESSION Subprograms](#)

149.1 DBMS_SESSION Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

149.2 DBMS_SESSION Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

149.3 DBMS_SESSION Data Structures

The `DBMS_SESSION` package defines `TABLE` types.

Table Types

- [INTEGER_ARRAY Table Type](#)
- [LNAME_ARRAY Table Type](#)

149.3.1 DBMS_SERVICE INTEGER_ARRAY Table Type

`INTEGER_ARRAY` is a table type of `BINARY_INTEGER`.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

149.3.2 DBMS_SERVICE LNAME_ARRAY Table Type

`LNAME_ARRAY` is a table type of `VARCHAR2`.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

149.4 Summary of DBMS_SESSION Subprograms

This table lists the DBMS_SESSION subprograms in alphabetical order and briefly describes them.

Table 149-1 DBMS_SESSION Package Subprograms

Subprogram	Description
CLEAR_ALL_CONTEXT Procedure	Clears all context information
CLEAR_CONTEXT Procedure	Clears the context
CLEAR_IDENTIFIER Procedure	Clears the identifier
CLOSE_DATABASE_LINK Procedure	Closes database link
CURRENT_IS_ROLE_ENABLED Function	Determines if the named role is currently enabled.
FREE_UNUSED_USER_MEMORY Procedure	Lets you reclaim unused memory after performing operations requiring large amounts of memory
GET_PACKAGE_MEMORY_UTILIZATION Procedure	Describes static package memory usage
IS_ROLE_ENABLED Function	Determines if the named role is enabled for the session.
IS_SESSION_ALIVE Function	Determines if the specified session is active
LIST_CONTEXT Procedures	Returns a list of active namespace and context for the current session
MODIFY_PACKAGE_STATE Procedure	Used to perform various actions (as specified by the <code>action_flags</code> parameter) on the session state of all PL/SQL program units active in the session
RESET_PACKAGE Procedure	De-instantiates all packages in the session
SESSION_IS_ROLE_ENABLED Function	Determines if the named role is enabled at the session level.
SESSION_TRACE_DISABLE Procedure	Resets the session-level SQL trace for the session from which it was called.
SESSION_TRACE_ENABLE Procedure	Enables session-level SQL trace for the invoking session
SET_CONTEXT Procedure	Sets or resets the value of a context attribute
SET_EDITION_DEFERRED Procedure	Requests a switch to the specified edition
SET_IDENTIFIER Procedure	Sets the identifier
SET-NLS Procedure	Sets Globalization Support (NLS)
SET_ROLE Procedure	Sets role
SET_SQL_TRACE Procedure	Turns tracing on or off
SLEEP Procedure	Suspends the session for a specified period of time.
SWITCH_CURRENT_CONSUMER_GROUP Procedure	Facilitates changing the current resource consumer group of a user's current session
UNIQUE_SESSION_ID Function	Returns an identifier that is unique for all sessions currently connected to this database

149.4.1 ADD_SQL_CONNECTION_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

Syntax

```
DBMS_SESSION.ADD_SQL_CONNECTION_TEST (
    connection_test      IN VARCHAR2
    service_name         IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 149-2 ADD_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections.
SERVICE_NAME	Optional service name qualifier.

Usage Notes

The `ADD_SQL_CONNECTION_TEST` Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view `DBA_CONNECTION_TESTS`.

This procedure is owned by `SYS` and is granted to users for execution at `CDB$ROOT` or `PDB` levels, or when not multitenant, at dictionary level.

149.4.2 CLEAR_ALL_CONTEXT Procedure

This procedure clears application context information in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
    namespace          VARCHAR2);
```

Parameters

Table 149-3 CLEAR_ALL_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

149.4.3 CLEAR_CONTEXT Procedure

This procedure clears application context in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
  namespace      VARCHAR2,
  client_identifier VARCHAR2
  attribute      VARCHAR2);
```

Parameters

Table 149-4 CLEAR_CONTEXT Procedure Parameters

Parameter	Description
namespace	Namespace in which the application context is to be cleared. Required. For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context. For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.
client_identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum
attribute	Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.

- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

149.4.4 CLEAR_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

149.4.5 CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement: `ALTER SESSION CLOSE DATABASE LINK <name>`

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (
    dblink VARCHAR2);
```

Parameters

Table 149-5 CLOSE_DATABASE_LINK Procedure Parameters

Parameter	Description
<code>dblink</code>	Name of the database link to close

149.4.6 CURRENT_IS_ROLE_ENABLED Function

This function determines if the named role is currently enabled.

Syntax

```
DBMS_SESSION.CURRENT_IS_ROLE_ENABLED (
    rolename VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 149-6 CURRENT_IS_ROLE_ENABLED Function Parameters

Parameter	Description
<code>rolename</code>	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

149.4.7 FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

Note:

This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies.

They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing indexed table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure FREE_UNUSED_USER_MEMORY.

```
CREATE PACKAGE foobar
  type number_idx_tbl is table of number indexed by binary_integer;

  store1_table number_idx_tbl;    -- PL/SQL indexed table
  store2_table number_idx_tbl;    -- PL/SQL indexed table
  store3_table number_idx_tbl;    -- PL/SQL indexed table
  ...
END;                                -- end of foobar

DECLARE
  ...
  empty_table number_idx_tbl;    -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;        -- load data
  END LOOP;
  ...
  store1_table := empty_table;    -- "truncate" the indexed table
  ...
  -
  dbms_session.free_unused_user_memory; -- give memory back to system

  store1_table(1) := 100;        -- index tables still declared;
  store2_table(2) := 200;        -- but truncated.
  ...
END;
```

149.4.8 GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the [FREE_UNUSED_USER_MEMORY Procedure](#) is invoked.

Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
  owner_names      OUT NOCOPY LNAME_ARRAY,
  unit_names       OUT NOCOPY LNAME_ARRAY,
  unit_types       OUT NOCOPY INTEGER_ARRAY,
  used_amounts     OUT NOCOPY INTEGER_ARRAY,
  free_amounts     OUT NOCOPY INTEGER_ARRAY);
```

Parameters

Table 149-7 GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

Parameter	Description
owner_name	Owner of package
unit_name	Name of package
unit_types	Value of the type# columns of the dictionary table obj\$
used_amounts	Amount of allocated memory specified in bytes
free_amounts	Amount of available memory specified in bytes

149.4.9 IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Note:

This function is deprecated starting in Oracle Database 19c. Use `DBMS_SESSION.CURRENT_IS_ROLE_ENABLED` or `DBMS_SESSION.SESSION_IS_ROLE_ENABLED` instead.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (
  rolename  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 149-8 IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.\

Return Values

Table 149-9 IS_ROLE_ENABLED Function Return Values

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled

149.4.10 IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (
    uniqueid VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 149-10 IS_SESSION_ALIVE Function Parameters

Parameter	Description
uniqueid	Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.

Return Values

Table 149-11 IS_SESSION_ALIVE Function Return Values

Return	Description
is_session_alive	TRUE or FALSE, depending on whether the session is active

149.4.11 LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
    namespace VARCHAR2(30),
    attribute VARCHAR2(30),
```

```

value      VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
  list OUT AppCtxTabTyp,
  size OUT NUMBER);

```

Parameters

Table 149-12 LIST_CONTEXT Procedure Parameters

Parameter	Description
list	Buffer to store a list of application context set in the current session

Return Values

Table 149-13 LIST_CONTEXT Procedure Return Values

Return	Description
list	A list of (namespace, attribute, values) set in current session
size	Returns the number of entries in the buffer returned

Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because list is a table type variable, its size is dynamically adjusted to the size of returned list.

149.4.12 MODIFY_PACKAGE_STATE Procedure

This procedure is used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running.

The procedure uses the DBMS_SESSION constants listed in [Table 149-15](#).

Syntax

```

DBMS_SESSION.MODIFY_PACKAGE_STATE(
  action_flags IN PLS_INTEGER);

```

Parameters

Table 149-14 MODIFY_PACKAGE_STATE Procedure Parameters

Parameter	Description
action_flags	<p>Bit flags that determine the action taken on PL/SQL program units:</p> <p>DBMS_SESSION.FREE_ALL_RESOURCES (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstated and package globals are reinitialized. Invoking MODIFY_PACKAGE_STATE with the DBMS_SESSION.FREE_ALL_RESOURCES parameter provides functionality identical to the DBMS_SESSION.RESET_PACKAGE() interface.</p> <p>DBMS_SESSION.REINITIALIZE (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the DBMS_SESSION.REINITIALIZE flag is similar to the DBMS_SESSION.FREE_ALL_RESOURCES flag in that both have the effect of reinitializing all packages.</p> <p>However, DBMS_SESSION.REINITIALIZE should exhibit better performance than the DBMS_SESSION.FREE_ALL_RESOURCES option because:</p> <ul style="list-style-type: none"> • Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. • Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. • The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.

Usage Notes

See the parameter descriptions in [Table 149-17](#) for the differences between the flags and why DBMS_SESSION.REINITIALIZE exhibits better performance than DBMS_SESSION.FREE_ALL_RESOURCES.

Table 149-15 Action_flags Constants for MODIFY_PACKAGE_STATE

Constant	Description
FREE_ALL_RESOURCES	PLS_INTEGER:= 1
REINITIALIZE	PLS_INTEGER:= 2

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ....
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using FREE_ALL_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.
- Because DBMS_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE_ALL_RESOURCES flag or the RESET_PACKAGE procedure had been used. For instance, after performing DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until DBMS_SESSION.RESET_PACKAGE is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example,

DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

Instead, use DBMS_SESSION.MODIFY_PACKAGE_STATE(2) on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of DBMS_SESSION.MODIFY_PACKAGE_STATE. Consider a package P with some global state (a cursor c and a number cnt). When the package is first initialized, the package variable cnt is 0 and the cursor c is CLOSED. Then, in the session, change the value of cnt to 111 and also execute an OPEN operation on the cursor. If you call print_status to display the state of the package, you see that cnt is 111 and that the cursor is OPEN. Next, call DBMS_SESSION.MODIFY_PACKAGE_STATE. If you print the status of the package P again using print_status, you see that cnt is 0 again and the cursor is CLOSED. If the call to DBMS_SESSION.MODIFY_PACKAGE_STATE had not been made, then the second print_status would have printed 111 and OPEN.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2   P.cnt := 111;
  3   open p.c;
  4   P.print_status;
  5 end;
  6 /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2   dbms_session.modify_package_state(dbms_session.reinitialize);
  3 end;
  4 /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
```

```
SQL>
SQL> begin
  2   P.print_status;
  3   end;
  4   /
P.cnt = 0
P.c is CLOSED
```

PL/SQL procedure successfully completed.

149.4.13 RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

Note:

See "[SESSION_TRACE_ENABLE Procedure](#)". The `MODIFY_PACKAGE_STATE` interface, introduced in Oracle9i, provides an equivalent of the `RESET_PACKAGE` capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

 **Note:**

RESET_PACKAGE only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

149.4.14 SESSION_IS_ROLE_ENABLED Function

This function determines if the named role is enabled for the login user session.

Syntax

```
DBMS_SESSION.SESSION_IS_ROLE_ENABLED (
    rolename    VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 149-16 SESSION_IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

149.4.15 SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```

149.4.16 SESSION_TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(
  waits      IN   BOOLEAN DEFAULT TRUE,
  binds      IN   BOOLEAN DEFAULT FALSE,
  plan_stat  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 149-17 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
waits	Specifies if wait information is to be traced
binds	Specifies if bind information is to be traced
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

149.4.17 SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of the five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (
  namespace VARCHAR2,
  attribute VARCHAR2,
  value      VARCHAR2,
  username   VARCHAR2,
  client_id  VARCHAR2 );
```

Parameters

Table 149-18 SET_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure.
attribute	The attribute of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure.
value	Value of the application context to be set, limited to 4 kilobytes.
username	Database username attribute of the application context, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure. The default value is NULL.
client_id	Application-specific client_id attribute of the application context, limited to 64 bytes. The default value is NULL.

Usage Notes

- The first three parameters are required for all types of context.
- The `username` parameter must be a valid SQL identifier.
- The `client_id` parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for `set_identifier`.
- If the `namespace` parameter is a global context namespace, then the `username` parameter is matched against the current database user name in the session, and the `client_id` parameter is matched against the current `client_id` in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of `SET_CONTEXT` must be in the calling stack of a procedure that has been associated to the context namespace through a `CREATE CONTEXT` statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.
- If the value of the parameter in the namespace has been set, `SET_CONTEXT` overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

 **See Also:**

Oracle Database Security Guide for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

149.4.18 SET_EDITION_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (
    edition    IN    VARCHAR2);
```

Parameters

Table 149-19 SET_EDITION_DEFERRED Procedure Parameters

Parameter	Description
edition	Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double quotation marks are not used, the contents are set in uppercase. The caller must have <code>USE</code> privilege on the named edition.

149.4.19 SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (
    client_id VARCHAR2);
```

Parameters

Table 149-20 SET_IDENTIFIER Procedure Parameters

Parameter	Description
client_id	Case-sensitive application-specific identifier of the current database session. The maximum number of bytes for this parameter is 64 bytes. If the input exceeds 64 bytes, the additional bytes are truncated.

Usage Notes

- SET_IDENTIFIER sets the session's client id to the given value. This value can be used to identify sessions in v\$session by means of v\$session.client_identifier. It can also be used to identify sessions by means of sys_context('USERENV', 'CLIENT_IDENTIFIER').
- This procedure is executable by PUBLIC.

149.4.20 SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the SQL statement: ALTER SESSION SET <nls_parameter> = <value>.

Syntax

```
DBMS_SESSION.SET_NLS (
    param VARCHAR2,
    value VARCHAR2);
```

Parameters**Table 149-21 SET_NLS Procedure Parameters**

Parameter	Description
param	Globalization Support parameter. The parameter name must begin with 'NLS'.
value	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "set_nls ('nls_date_format','DD-MON-YY')".

149.4.21 SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the SET ROLE SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (
    role_cmd VARCHAR2);
```

Parameters**Table 149-22 SET_ROLE Procedure Parameters**

Parameter	Description
role_cmd	Text is appended to "set role" and then run as SQL

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

149.4.22 SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the SQL statement `ALTER SESSION SET SQL_TRACE . . .`

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (  
    sql_trace boolean);
```

Parameters

Table 149-23 SET_SQL_TRACE Procedure Parameters

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off

149.4.23 SLEEP Procedure

This procedure suspends the session for a specified period of time.

Syntax

```
DBMS_SESSION.SLEEP (  
    seconds IN NUMBER);
```

Parameters

Table 149-24 SLEEP Procedure Parameters

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

149.4.24 SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
    new_consumer_group    IN  VARCHAR2,
    old_consumer_group    OUT VARCHAR2,
    initial_group_on_error IN  BOOLEAN);
```

Parameters

Table 149-25 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

Parameter	Description
<code>new_consumer_group</code>	Name of consumer group to which you want to switch
<code>old_consumer_group</code>	Name of the consumer group from which you just switched out
<code>initial_group_on_error</code>	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error

Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

 **Note:**

You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

Exceptions

Table 149-26 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

Exception	Description
29368	Non-existent consumer group
1031	Insufficient privileges
29396	Cannot switch to OTHER_GROUPS consumer group

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, `SWITCH_CURRENT_CONSUMER_GROUP` puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
  old_group varchar2(30);
  prev_group varchar2(30);
  curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error is thrown, but the consumer group does not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrpl', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

  EXCEPTION
    WHEN OTHERS THEN
      -- It is possible that the procedure owner does not have privileges
      -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
      -- that the user is moved out of the privileged group in such a
      -- situation

      dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
      RAISE;
    END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
```

149.4.25 UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```
DBMS_SESSION.UNIQUE_SESSION_ID
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

Table 149-27 UNIQUE_SESSION_ID Function Return Values

Return	Description
unique_session_id	Returns up to 24 bytes

150

DBMS_SFW_ACL_ADMIN

The DBMS_SFW_ACL_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature. Each policy is represented by an access control list (ACL) containing hosts that are allowed access to a specific database service. Local listeners and server processes validate all inbound client connections against the ACL.

This chapter contains the following topics:

- [DBMS_SFW_ACL_ADMIN Security Model](#)
- [DBMS_SFW_ACL_ADMIN Operational Notes](#)
- [DBMS_SFW_ACL_ADMIN Examples](#)
- [Summary of DBMS_SFW_ACL_ADMIN Subprograms](#)

150.1 DBMS_SFW_ACL_ADMIN Security Model

This package is owned by the DBSFUSER schema. The procedures in this package can be run only by the DBSFUSER user.

150.2 DBMS_SFW_ACL_ADMIN Operational Notes

These operation notes apply to DBMS_SFW_ACL_ADMIN.

- An ACL contains entries, which are called "ace", for "access control entries".
- You add entries to an ACL using the [IP_ADD_ACE Procedure](#) and [IP_ADD_PDB_ACE Procedure](#). After calling these procedures, you call the [COMMIT_ACL Procedure](#) to send the updated ACL to the listeners. Similarly, if you remove entries from an ACL using the [IP_REMOVE_ACE Procedure](#), [IP_REMOVE_ACL Procedure](#), [IP_REMOVE_PDB_ACE Procedure](#), or [IP_REMOVE_PDB_ACL Procedure](#), you need to call the [COMMIT_ACL Procedure](#) to update the ACL on the listeners.
- Access control must be enabled using the new FIREWALL endpoint attribute and the new LOCAL_REGISTRATION_ADDRESS_ *listenerName* parameter. The configuration can be done manually in `listener.ora` or through the Server Control Utility (SRVCTL). Refer to the *Oracle Database Net Services Reference* and the *Oracle Real Application Clusters Administration and Deployment Guide* for configuration instructions.
- You can query the IP_ACL table to show the committed ACLs. But to see the ACLs that have been sent to the local listeners, you have to query the V\$IP_ACL or GV\$IP_ACL view. The IP_ACL table can contain ACLs that are not in [G]V\$IP_ACL because the database services for those ACLs were not running at the time of the commit. When the services are running, you can call the COMMIT_ACL procedure again to send the committed ACLs in the IP_ACL table to the local listeners.

In an Oracle RAC environment, GV\$IP_ACL can be used to query ACLs across the database cluster, and V\$IP_ACL to query ACLs in the connected instance.

150.3 DBMS_SFW_ACL_ADMIN Examples

These three examples show how DBMS_SFW_ACL_ADMIN can be used to administer and manage access control policies.

The following example adds three access control entries to the ACL and commits them.

```
## Connect to DBSFUSER
SQL> connect dbsfuser/Welcomel
Connected.

## Create an ACL for database service SVC1
SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.1');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.2');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','test02.example.com');
PL/SQL procedure successfully completed.

## Commit the ACLs to the DB ACL table.
## This sends the ACLs for running services to ALL local Listeners
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

The following example retrieves the ACLs committed from the previous example.

```
SQL> select * from ip_acl;
SERVICE_NAME          HOST
-----
"SVC1.EXAMPLE.COM"    192.168.12.1
"SVC1.EXAMPLE.COM"    192.168.12.2
"SVC1.EXAMPLE.COM"    TEST02.EXAMPLE.COM

## View ACLs sent to the local Listeners
## NOTE: ACLs are sent ONLY to running services
SQL> select * from v$ip_acl;
SERVICE_NAME          HOST          CON_ID
-----
SVC1.EXAMPLE.COM      192.168.12.1      1
SVC1.EXAMPLE.COM      192.168.12.2      1
SVC1.EXAMPLE.COM      TEST02.EXAMPLE.COM  1
```

The following example adds access control entries for pluggable database "PDB1" using various host formats.

```
SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.3');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.0/23');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.*');
PL/SQL procedure successfully completed.
```

```
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

150.4 Summary of DBMS_SFW_ACL_ADMIN Subprograms

This table lists the DBMS_SFW_ACL_ADMIN subprograms and briefly describes them.

Table 150-1 DBMS_SFW_ACL_ADMIN Package Subprograms

Subprogram	Description
COMMIT_ACL Procedure	Commits changes to the ACL tables, and propagates the changes to the local listeners for database instances.
IP_ADD_ACE Procedure	Adds an access control entry to the ACL for a database service.
IP_ADD_PDB_ACE Procedure	Adds an access control entry to the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_ACE Procedure	Removes an entry from the ACL for a database service.
IP_REMOVE_ACL Procedure	Removes all entries from the ACL for a database service.
IP_REMOVE_PDB_ACE Procedure	Removes an access control entry from the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_PDB_ACL Procedure	Removes all entries from the ACL for all the database services in a pluggable database (PDB).

150.4.1 COMMIT_ACL Procedure

This procedure commits changes to the ACL tables. It also propagates the changes to the local listeners for database instances.

If you have changed access entries for database services, but the database services were not running at the time when you called the COMMIT_ACL procedure, then those changes will be committed to the ACL tables, but they will not be sent to the local listener. To send the entries to the listener, start up the database services, and call the COMMIT_ACL procedure again.

This procedure returns when the operation has completed successfully.

Syntax

```
DBMS_SFW_ACL_ADMIN.COMMIT_ACL;
```

Parameters

None

150.4.2 IP_ADD_ACE Procedure

This procedure adds an access control entry to the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN  VARCHAR2);
```

Parameters

Table 150-2 IP_ADD_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service for which you want to add an access control entry.
p_host	The host of the client that is allowed access to the service. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

150.4.3 IP_ADD_PDB_ACE Procedure

This procedure adds an access control entry to the ACL for all the database services in a pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host     IN  VARCHAR2);
```

Parameters

Table 150-3 IP_ADD_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.
p_host	The host of the client that is allowed access to the database services in the PDB. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

150.4.4 IP_REMOVE_ACE Procedure

This procedure removes an entry from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN  VARCHAR2);
```

Parameters

Table 150-4 IP_REMOVE_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service from which you want to remove an access control entry.
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service.

150.4.5 IP_REMOVE_ACL Procedure

This procedure removes all entries from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACL (
  p_service_name IN VARCHAR2);
```

Parameters

Table 150-5 IP_REMOVE_ACL Procedure Parameters

Parameter	Description
p_service_name	The name of the database service whose ACL you want to clear.

150.4.6 IP_REMOVE_PDB_ACE Procedure

This procedure removes an access control entry from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host      IN VARCHAR2);
```

Parameters

Table 150-6 IP_REMOVE_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.

Table 150-6 (Cont.) IP_REMOVE_PDB_ACE Procedure Parameters

Parameter	Description
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service.

150.4.7 IP_REMOVE_PDB_ACL Procedure

This procedure removes all entries from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACL (
  p_pdb_name IN VARCHAR2);
```

Parameters

Table 150-7 IP_REMOVE_PDB_ACL Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.

DBMS_SODA

The `DBMS_SODA` package is a `PL/SQL` package implementing Simple Oracle Document Access (SODA). SODA allows you to use the Oracle Database as a NoSQL document store. The core abstraction provided by SODA is that of document collections. The `DBMS_SODA` package allows you to create, list, and delete document collections from `PL/SQL`, and to perform CRUD (create, replace, update, delete) operations on documents. All `DDL` functions are encapsulated within this package.

This chapter contains the following topics:

- [DBMS_SODA Security Model](#)
- [Summary of DBMS_SODA Subprograms](#)

See Also:

- *Oracle Database SODA for PL/SQL Developer's Guide*
- [SODA Types](#)

151.1 DBMS_SODA Security Model

This package is available to users with the `SODA_APP` role.

All SODA types (packages and types) are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the `DBMS_SODA` described in this chapter.

151.2 Summary of DBMS_SODA Subprograms

This table lists the `DBMS_SODA` subprograms in alphabetical order and briefly describes them.

Table 151-1 DBMS_SODA Package Subprograms

Subprogram	Purpose
CREATE_COLLECTION Function	Creates a collection using the collection name and metadata.
DROP_COLLECTION Function	Drops an existing collection from the user's schema. This also removes all the documents in the collection.
LIST_COLLECTION_NAMES Function	Lists the collection names in the user's schema as a table of <code>NVARCHAR2</code> .
OPEN_COLLECTION Function	Opens an existing collection.

Table 151-1 (Cont.) DBMS_SODA Package Subprograms

Subprogram	Purpose
TO_UUID Function	This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the REMAP_DATA feature of Data Pump.

151.2.1 CREATE_COLLECTION Function

Creates a collection using the collection name and metadata. Uses the settings specified in the metadata and auto-assigns the ones that are not, and returns the collection object. If the metadata argument is omitted or set to `NULL`, a collection is created with default metadata. The returned collection is open for `read` and/or `write` operations. If a collection already exists, the function just opens and returns the collection object.

Syntax

```
DBMS_SODA.CREATE_COLLECTION (
    collection_Name    IN NVARCHAR2,
    metadata           IN VARCHAR2 DEFAULT NULL,
    create_Mode        IN PLS_INTEGER DEFAULT CREATE_MODE_DDL)
RETURN SODA_Collection_T;
```

Parameters

Table 151-2 CREATE_COLLECTION Parameters

Parameter	Description
<code>collection_Name</code>	The name of the collection. The value of <code>collection_Name</code> is case-sensitive.
<code>metadata</code>	The metadata of the collection in <code>VARCHAR2</code> format.
<code>create_Mode</code>	Valid values are: <ul style="list-style-type: none"> <code>DBMS_SODA.CREATE_MODE_DDL</code> (default). First attempts to create a new table for the collection. If table exists already, tries to map that existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned). <code>DBMS_SODA.CREATE_MODE_MAP</code>. Tries to map an existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned).

Return Values

The function returns a `Soda_Collection_T` object representing the collection.

Exceptions

- `Descriptor Error`—if the input descriptor is invalid
- `Error`—if an error occurs while creating the collection

 **See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

151.2.2 DROP_COLLECTION Function

Drops an existing collection from the user's schema. This also removes all the documents in the collection.

Syntax

```
DBMS_SODA.DROP_COLLECTION (
    collection_Name      IN NVARCHAR2)
RETURN NUMBER;
```

Parameters

Table 151-3 DROP_COLLECTION Parameters

Parameter	Description
<code>collection_Name</code>	The name of the collection. The value of <code>collection_Name</code> is case-sensitive.

Return values

This function returns the following values:

- 1—if the collection was dropped successfully
- 0—if the collection does not exist

Exceptions

If an error occurs while dropping the collection, for example, due to uncommitted writes to the collection or privilege issues.

 **See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

151.2.3 LIST_COLLECTION_NAMES Function

This function returns a list of collection names in the user's schema as a table of NVARCHAR2.

Syntax

```
DBMS_SODA.LIST_COLLECTION_NAMES ( )
RETURN SODA_CollName_List_T;
```

Return Values

This function returns a list of collection names as a table of NVARCHAR2(255). The collection list is empty if there are no collections in the schema.

Exceptions

Error—if an error occurs while listing the collection names.

See Also:

Oracle Database SODA for PL/SQL Developer's Guide

151.2.4 OPEN_COLLECTION Function

Opens an existing collection for read and/or write operations.

Syntax

```
DBMS_SODA.OPEN_COLLECTION (
    collection_Name IN NVARCHAR2)
RETURN SODA_Collection_T;
```

Parameters

Table 151-4 OPEN_COLLECTION Parameters

Parameter	Description
collection_Name	The name of the collection. The value of collection_Name is case-sensitive.

Return Values

This function returns the following values:

- a collection object which is open
- NULL, if the collection does not exist

Exceptions

Error—if an error occurs while creating the collection

See Also:

- Opening an Existing Document Collection with SODA for PL/SQL
- Checking Whether a Given Collection Exists with SODA for PL/SQL

151.2.5 TO_UUID Function

This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the `REMAP_DATA` feature of Data Pump.

Syntax

```
DBMS_SODA.TO_UUID (  
    placeholder      IN    NVARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 151-5 TO_UUID Parameters

Parameter	Description
placeholder	This parameter is not used and can be ignored. It is used due to the syntactic constraints for the Data Pump <code>REMAP_DATA</code> function.

Return values

This function returns a hexadecimal string that can be used as a `UUID` value.

See Also:

`REMAP_DATA` in the *Oracle® Database Utilities Guide*.

DBMS_SHARED_POOL

The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS_SHARED_POOL Subprograms](#)

152.1 DBMS_SHARED_POOL Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

`DBMS_SHARED_POOL` is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, `DBMS_SHARED_POOL` supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. `DBMS_SHARED_POOL` is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

152.2 DBMS_SHARED_POOL Operational Notes

To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPOOL.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.

152.3 Summary of DBMS_SHARED_POOL Subprograms

This table lists the `DBMS_SHARED_POOL` subprograms and briefly describes them.

Table 152-1 *DBMS_SHARED_POOL Package Subprograms*

Subprogram	Description
ABORTED_REQUEST_THRES HOLD Procedure	Sets the aborted request threshold for the shared pool
KEEP Procedure	Keeps an object in the shared pool
MARKHOT Procedure	Marks a library cache object as a hot object

Table 152-1 (Cont.) DBMS_SHARED_POOL Package Subprograms

Subprogram	Description
PURGE Procedure	Purges the named object or specified heap(s) of the object
SIZES Procedure	Shows objects in the shared pool that are larger than the specified size
UNKEEP Procedure	Unkeeps the named object
UNMARKHOT Procedure	Unmarks a library cache object as a hot object

152.3.1 ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
    threshold_size NUMBER);
```

Parameters

Table 152-2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

Parameter	Description
threshold_size	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than thresh_hold size. This user gets the 'out of memory' error without attempting to search the LRU list.

152.3.2 KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for

frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P');
```

```
DBMS_SHARED_POOL.KEEP (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.KEEP (
    hash          VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER);
```

Parameters

Table 152-3 KEEP Procedure Parameters

Parameter	Description
name	The name of the object to keep.
flag	A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. <ul style="list-style-type: none"> Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'Q' or 'q' to specify that the input is the name of a sequence. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'JS' or 'js' to specify that the input is the name of a java source. Set to 'JC' or 'jc' to specify that the input is the name of a java class. Set to 'JD' or 'jd' to specify that the input is the name of a java shared data. Set to 'C' or 'c' to specify that the input is the name of a cursor.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to keep.
namespace	A number indicating the library cache namespace in which the object has to be searched for.
heaps	The heaps to keep. For example, if heap 0 and heap 6 are to be kept.

Table 152-3 (Cont.) KEEP Procedure Parameters

Parameter	Description
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

An exception is raised if the named object is not found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, types, and Java objects, which are specified by name.
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP('0034CDFF, 20348871', 'C')`, 0034CDFF being the ADDRESS and 20348871 the HASH_VALUE. Note that the complete hexadecimal address must be in the first 8 characters.

152.3.3 MARKHOT Procedure

This procedure marks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.MARKHOT (
  schema          VARCHAR2,
  objname         VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE,
  edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.MARKHOT (
  hash           VARCHAR2,
  namespace      NUMBER DEFAULT 1,
  global         BOOLEAN DEFAULT TRUE);
```

Parameters**Table 152-4 MARKHOT Procedure Parameters**

Parameter	Description
schema	User name or the schema to which the object belongs

Table 152-4 (Cont.) MARKHOT Procedure Parameters

Parameter	Description
objname	Name of the object
namespace	Number indicating the library cache namespace in which the object is to be searched. Views, such as USER_OBJECTS and DBA_OBJECTS, reflect the namespace as a number column, as do most dictionary tables such as OBJ\$.
global	If TRUE (default), mark the object hot on all Oracle RAC instances
hash	16-byte hash value for the object
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

Users can examine column, V\$DB_OBJECT_CACHE.PROPERTY, to see whether or not the object has been marked hot. The values for PROPERTY are:

- HOTCOPYnnn- An object that is a hot copy with integer identifier of 'nnn'. For example, HOTCOPY5, HOTCOPY94, and HOTCOPY125.
- HOTCOPY-As above but the identifier is unknown
- HOT-The "root" kgl object that has been marked as hot
- NULL-A normal object

152.3.4 PURGE Procedure

This procedure purges the named object or specified heaps of the object.

Syntax

```
DBMS_SHARED_POOL.PURGE (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P',
    heaps        NUMBER DEFAULT 1);
```

```
DBMS_SHARED_POOL.PURGE (
    schema       VARCHAR2,
    objname      VARCHAR2,
    namespace    NUMBER,
    heaps        NUMBER,
    edition_name VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.PURGE (
    hash          VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER);
```

Parameters

Table 152-5 PURGE Procedure Parameters

Parameter	Description
name	Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default value is 1, that is, heap 0 which means the whole object would be purged
schema	User name or the schema to which the object belongs
objname	Name of the object to purge
namespace	Parameter is a number indicating the library cache namespace in which the object is to be searched
hash	16-byte hash value for the object
edition_name	The name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged if marked as permanently kept

Usage Notes

All objects supported by the [KEEP Procedure](#) are supported for PURGE.

152.3.5 SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (  
    minsize NUMBER);
```

Parameters

Table 152-6 SIZES Procedure Parameters

Parameter	Description
<code>minsize</code>	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

Usage Notes

Issue the `SQLDBA` or `SQLPLUS` `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

152.3.6 UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (  
    name          VARCHAR2,  
    flag          CHAR DEFAULT 'P');  
  
DBMS_SHARED_POOL.UNKEEP (  
    schema        VARCHAR2,  
    objname       VARCHAR2,  
    namespace     NUMBER,  
    edition_name  VARCHAR2 DEFAULT NULL);  
  
DBMS_SHARED_POOL.UNKEEP (  
    hash          VARCHAR2,  
    namespace     NUMBER);
```

WARNING:

This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 152-7 UNKEEP Procedure Parameters

Parameter	Description
name	The name of the object to unkeep.
flag	A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to unkeep.
namespace	A number that indicates the library cache namespace in which the object has to be searched for.
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found

152.3.7 UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.UNMARKHOT (
    schema          VARCHAR2,
    objname         VARCHAR2,
    namespace       NUMBER DEFAULT 1,
    global          BOOLEAN DEFAULT TRUE,
    edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.UNMARKHOT (
    hash           VARCHAR2,
    namespace       NUMBER DEFAULT 1,
    global          BOOLEAN DEFAULT TRUE);
```

Parameters

Table 152-8 UNMARKHOT Procedure Parameters

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object

Table 152-8 (Cont.) UNMARKHOT Procedure Parameters

Parameter	Description
namespace	Number indicating the library cache namespace in which the object is to be searched
global	If TRUE, unmark the object hot on all Oracle RAC instances. The default value of this parameter is TRUE.
hash	A 16-byte hash value for the object
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

153

DBMS_SPACE

The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- [Security Model](#)
- [Data Structures](#)
- [Summary of DBMS_SPACE Subprograms](#)

153.1 DBMS_SPACE Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

153.2 DBMS_SPACE Data Structures

The `DBMS_SPACE` package defines an `OBJECT` type, a `RECORD` type, and a `TABLE` type.

OBJECT Types

[CREATE_TABLE_COST_COLINFO Object Type](#)

RECORD Types

[ASA_RECO_ROW Record Type](#)

TABLE Types

[ASA_RECO_ROW_TB Table Type](#)

153.2.1 DBMS_SPACE CREATE_TABLE_COST_COLINFO Object Type

This type describes the datatype and size of a column in the table.

Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(  
    col_type    VARCHAR(200),  
    col_size    NUMBER)
```

Attributes**Table 153-1 CREATE_TABLE_COST_COLINFO Object Type**

Attribute	Description
col_type	Column type
col_size	Column size

153.2.2 DBMS_SPACE ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```
TYPE asa_reco_row IS RECORD (
  tablespace_name    VARCHAR2(30),
  segment_owner      VARCHAR2(30),
  segment_name       VARCHAR2(30),   segment_type      VARCHAR2(18),
  partition_name     VARCHAR2(30),
  allocated_space    NUMBER,
  used_space         NUMBER,
  reclaimable_space  NUMBER,
  chain_rowexcess    NUMBER,
  recommendations    VARCHAR2(1000),
  c1                 VARCHAR2(1000),
  c2                 VARCHAR2(1000),
  c3                 VARCHAR2(1000),
  task_id            NUMBER,
  mesg_id            NUMBER);
```

Attributes**Table 153-2 ASA_RECO_ROW Attributes**

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation

Table 153-2 (Cont.) ASA_RECO_ROW Attributes

Field	Description
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

Related Topics

- [DBMS_SPACE ASA_RECOMMENDATIONS Function](#)
This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

153.2.3 DBMS_SPACE ASA_RECO_ROW_TB Table Type

The type `asa_reco_row_tb` is a table of `asa_reco_row`.

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

153.3 Summary of DBMS_SPACE Subprograms

This table lists the `DBMS_SPACE` subprograms and briefly describes them.

Table 153-3 DBMS_SPACE Package Subprograms

Subprogram	Description
ASA_RECOMMENDATIONS Function	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
CREATE_INDEX_COST Procedure	Determines the cost of creating an index on an existing table
CREATE_TABLE_COST Procedures	Determines the size of the table given various attributes
FREE_BLOCKS Procedure	Returns information about free blocks in an object (table, index, or cluster)
ISDATAFILEDROPPABLE_NAME Procedure	Checks whether a datafile is droppable
OBJECT_DEPENDENT_SEGMENTS Function	Returns the list of segments that are associated with the object
OBJECT_GROWTH_TREND Function	A table function where each row describes the space usage of the object at a specific point in time
SPACE_USAGE Procedures	Returns information about free blocks in an auto segment space managed segment
UNUSED_SPACE Procedure	Returns information about unused space in an object (table, index, or cluster)

153.3.1 DBMS_SPACE ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
    all_runs          IN    VARCHAR2 DEFAULT := TRUE,
    show_manual      IN    VARCHAR2 DEFAULT := TRUE,
    show_findings    IN    VARCHAR2 DEFAULT := FALSE)
RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 153-4 ASA_RECOMMENDATIONS Procedure Parameters

Parameter	Description
all_runs	If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
show_manual	If TRUE, we show the results of manual invocations only. The auto advisor results are excluded. If FALSE, results of manual invocation of segment advisor are not returned.
show_findings	Show only the findings instead of the recommendations

153.3.2 CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
    ddl              IN    VARCHAR2,
    used_bytes      OUT   NUMBER,
    alloc_bytes     OUT   NUMBER,
    plan_table      IN    VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

Table 153-5 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
ddl	The create index DDL statement
used_bytes	The number of bytes representing the actual index data

Table 153-5 (Cont.) CREATE_INDEX_COST Procedure Parameters

Parameter	Description
alloc_bytes	Size of the index when created in the tablespace
plan_table	Which plan table to use, default NULL

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

153.3.3 CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```

DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    avg_row_size       IN NUMBER,
    row_count           IN NUMBER,
    pct_free            IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);

DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    colinfos           IN CREATE_TABLE_COST_COLUMNS,
    row_count           IN NUMBER,
    pct_free            IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);

CREATE TYPE create_table_cost_colinfo IS OBJECT (
    COL_TYPE    VARCHAR(200),
    COL_SIZE    NUMBER);

```

Parameters

Table 153-6 CREATE_TABLE_COST Procedure Parameters

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, `pctfree` etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  c1 sys.create_table_cost_columns;
BEGIN
  c1 :=
  sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
                                sys.create_table_cost_colinfo('VARCHAR2',30),
                                sys.create_table_cost_colinfo('VARCHAR2',30),
                                sys.create_table_cost_colinfo('DATE',NULL));
```

```

DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',c1,100000,0,ub,ab);

DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/

```

153.3.4 FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster).

See [SPACE_USAGE Procedures](#) for returning free block information in an auto segment space managed segment.

Syntax

```

DBMS_SPACE.FREE_BLOCKS (
  segment_owner      IN  VARCHAR2,
  segment_name       IN  VARCHAR2,
  segment_type       IN  VARCHAR2,
  freelist_group_id  IN  NUMBER,
  free_blks          OUT NUMBER,
  scan_limit         IN  NUMBER DEFAULT NULL,
  partition_name     IN  VARCHAR2 DEFAULT NULL);

```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 153-7 FREE_BLOCKS Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group

Table 153-7 (Cont.) FREE_BLOCKS Procedure Parameters

Parameter	Description
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

**Note:**

An error is raised if `scan_limit` is not a positive number.

153.3.5 ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (
  filename  IN   VARCHAR2,
  value     OUT  NUMBER);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters**Table 153-8 ISDATAFILEDROPPABLE_NAME Procedure Parameters**

Parameter	Description
filename	Name of the file
value	Values: 0 if the file is not droppable, 1 if the file is droppable.

Examples

```
DECLARE fname  VARCHAR2(100); retval  NUMBER;BEGIN
SELECT file_name INTO fname FROM dba_data_files WHERE
file_name like '%empty%';DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname,
retval);DBMS_OUTPUT.PUT_LINE(retval);END;/
```

153.3.6 OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
  objowner   IN   VARCHAR2,
  objname    IN   VARCHAR2,
  partname   IN   VARCHAR2,
  objtype    IN   NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 153-9 OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition
objtype	Type of the object: <ul style="list-style-type: none"> • OBJECT_TYPE_TABLE constant positive := 1; • OBJECT_TYPE_NESTED_TABLE constant positive := 2; • OBJECT_TYPE_INDEX constant positive := 3; • OBJECT_TYPE_CLUSTER constant positive := 4; • OBJECT_TYPE_TABLE_PARTITION constant positive := 7; • OBJECT_TYPE_INDEX_PARTITION constant positive := 8; • OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; • OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; • OBJECT_TYPE_MV constant positive := 13; • OBJECT_TYPE_MVLOG constant positive := 14;

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
  segment_owner   VARCHAR2(100),
  segment_name    VARCHAR2(100),
  segment_type    VARCHAR2(100),
  tablespace_name VARCHAR2(100),
  partition_name  VARCHAR2(100),
  lob_column_name VARCHAR2(100));
```

Table 153-10 OBJECT_DEPENDENT_SEGMENT Type Parameters

Parameter	Description
segment_owner	The schema containing the segment
segment_name	The name of the segment
segment_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

153.3.7 OBJECT_GROWTH_TREND Function

This is a table function. The output is one or more rows where each row describes the space usage of the object at a specific point in time.

Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
  object_owner      IN   VARCHAR2,
  object_name       IN   VARCHAR2,
  object_type       IN   VARCHAR2,
  partition_name    IN   VARCHAR2 DEFAULT NULL,
  start_time        IN   TIMESTAMP DEFAULT NULL,
  end_time          IN   TIMESTAMP DEFAULT NULL,
  interval          IN   DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
  skip_interpolated IN   VARCHAR2 DEFAULT 'FALSE',
  timeout_seconds   IN   NUMBER DEFAULT NULL,
  single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 153-11 OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
object_owner	The schema containing the object
object_name	The name of the object
object_type	The type of the object
partition_name	The name of the partition
start_time	Statistics generated after this time will be used in generating the growth trend
end_time	Statistics generated until this time will be used in generating the growth trend
interval	The interval at which to sample
skip_interpolated	Whether interpolation of missing values should be skipped

Table 153-11 (Cont.) OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
timeout_seconds	The time-out value for the function in seconds
single_data_point_flag	Whether in the absence of statistics the segment should be sampled

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
    timepoint      TIMESTAMP,
    space_usage    NUMBER,
    space_alloc    NUMBER,
    quality        VARCHAR(20));
```

Table 153-12 OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
timepoint	The time at which the statistic was recorded
space_usage	The space used by data
space_alloc	The size of the segment including overhead and unused space
quality	The quality of result: "GOOD", "INTERPOLATED", "PROJECTION"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

153.3.8 SPACE_USAGE Procedures

This procedure has two variations to show space usage.

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBS, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBS.

 **Note:**

For LOB segments, the number of blocks that is returned from `full_blocks` and `unformatted_blocks` is actually the number of chunks for the LOB segment.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBS in the LOB segment. The procedure displays the space actively used by the LOB

column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBS.

Syntax

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes  OUT NUMBER,
    fs1_blocks         OUT NUMBER,
    fs1_bytes          OUT NUMBER,
    fs2_blocks         OUT NUMBER,
    fs2_bytes          OUT NUMBER,
    fs3_blocks         OUT NUMBER,
    fs3_bytes          OUT NUMBER,
    fs4_blocks         OUT NUMBER,
    fs4_bytes          OUT NUMBER,
    full_blocks        OUT NUMBER,
    full_bytes         OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    segment_size_blocks OUT NUMBER,
    segment_size_bytes OUT NUMBER,
    used_blocks        OUT NUMBER,
    used_bytes         OUT NUMBER,
    expired_blocks     OUT NUMBER,
    expired_bytes      OUT NUMBER,
    unexpired_blocks   OUT NUMBER,
    unexpired_bytes    OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-13 SPACE_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed

Table 153-13 (Cont.) SPACE_USAGE Procedure Parameters

Parameter	Description
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
unformatted_blocks	For LOB segments, the number of blocks that is returned from unformatted_blocks is actually the number of chunks for the LOB segment.
unformatted_bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
full_blocks	The number of blocks that is returned from full_blocks is actually the number of chunks for the LOB segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

Examples

```

variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                      'TABLE',
                      :unfb, :unfb,
                      :fs1, :fs1b,
                      :fs2, :fs2b,
                      :fs3, :fs3b,
                      :fs4, :fs4b,
                      :full, :fullb);

end;
/
print unfb ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;

```

153.3.9 UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```

DBMS_SPACE.UNUSED_SPACE (
    segment_owner      IN VARCHAR2,
    segment_name       IN VARCHAR2,
    segment_type       IN VARCHAR2,
    total_blocks       OUT NUMBER,
    total_bytes        OUT NUMBER,
    unused_blocks      OUT NUMBER,
    unused_bytes       OUT NUMBER,
    last_used_extent_file_id OUT NUMBER,
    last_used_extent_block_id OUT NUMBER,
    last_used_block    OUT NUMBER,
    partition_name     IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 153-14 UNUSED_SPACE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
    :total_bytes, :unused_blocks, :unused_bytes, :lastextf,
    :last_extb, :lastusedblock);
```

DBMS_SPACE_ADMIN

The `DBMS_SPACE_ADMIN` package provides functionality for locally managed tablespaces.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Summary of DBMS_SPACE_ADMIN Subprograms](#)

See Also:

Oracle Database Administrator's Guide for an example and description of using `DBMS_SPACE_ADMIN`.

154.1 DBMS_SPACE_ADMIN Security Model

This package runs with `SYS` privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

154.2 DBMS_SPACE_ADMIN Constants

The `DBMS_SPACE_ADMIN` package provides constants that can be used for specifying parameter values.

Table 154-1 DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
<code>SEGMENT_VERIFY_EXTENT_S</code>	<code>POSITIVE</code>	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
<code>SEGMENT_VERIFY_EXTENT_S_GLOBAL</code>	<code>POSITIVE</code>	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
<code>SEGMENT_MARK_CORRUPT</code>	<code>POSITIVE</code>	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)

Table 154-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAP_FREE	POSITIVE	7	Marks the block range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAP_USED	POSITIVE	8	Marks the block range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks high water mark (HWM)
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option

Table 154-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace, taking either the BASIC or the DEEP option
SEGMENTS_DUMP_BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

154.3 DBMS_SPACE_ADMIN Operational Notes

Before migrating the `SYSTEM` tablespace, certain conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

154.4 Summary of DBMS_SPACE_ADMIN Subprograms

This table lists the `DBMS_SPACE_ADMIN` subprograms and briefly describes them.

Table 154-2 DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
ASSM_SEGMENT_VERIFY Procedure	Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces
ASSM_TABLESPACE_VERIFY Procedure	Verifies ASSM tablespaces
DROP_EMPTY_SEGMENTS Procedure	Drops segments from empty tables or table fragments and dependent objects
GET_SEGADV_ATTRIB Procedure	returns the values of attributes of <code>DBSM_SPACE_ADMIN</code> package
MATERIALIZER_DEFERRED_SEGMENTS Procedure	Materializes segments for tables and table fragments with deferred segment creation and their dependent objects
SEGMENT_CORRUPT Procedure	Marks the segment corrupt or valid so that appropriate error recovery can be done

Table 154-2 (Cont.) DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
SEGMENT_DROP_CORRUPT Procedure	Drops a segment currently marked corrupt (without reclaiming space)
SEGMENT_DUMP Procedure	Dumps the segment header and extent maps of a given segment
SEGMENT_VERIFY Procedure	Verifies the consistency of the extent map of the segment
SET_SEGADV_ATTRIB Procedure	Sets/changes the values of attributes of DBSM_SPACE_ADMIN package
TABLESPACE_FIX_BITMAPS Procedure	Marks the appropriate block range (extent) as free or used in bitmap
TABLESPACE_FIX_SEGMENT_STATES Procedure	Fixes the state of the segments in a tablespace in which migration was aborted
TABLESPACE_MIGRATE_FROM_LOCAL Procedure	Migrates a locally managed tablespace to dictionary-managed tablespace
TABLESPACE_MIGRATE_TO_LOCAL Procedure	Migrates a tablespace from dictionary-managed format to locally managed format
TABLESPACE_REBUILD_BITMAPS Procedure	Rebuilds the appropriate bitmaps
TABLESPACE_REBUILD_QUOTAS Procedure	Rebuilds quotas for given tablespace
TABLESPACE_RELOCATE_BITMAPS Procedure	Relocates the bitmaps to the destination specified
TABLESPACE_VERIFY Procedure	Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized

154.4.1 ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
    segment_owner   IN VARCHAR2,
    segment_name    IN VARCHAR2,
    segment_type    IN VARCHAR2,
```

```

partition_name IN VARCHAR2,
verify_option  IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,
attrib        IN POSITIVE  DEFAULT NULL);

```

Parameters

Table 154-3 ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
segment_owner	Schema that owns the segment
segment_name	Name of the segment to be verified
segment_type	Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	One of the following options: <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9. Performs the basic metadata checks (Default) SEGMENT_VERIFY_DEEP := 10. Performs deep verification SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment
attrib	When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following: <ul style="list-style-type: none"> HWM_CHECK := 12. Checks whether high water mark information is accurate BMB_CHECK := 13. Checks whether space bitmap blocks have correct backpointers to the segment header SEG_DICT_CHECK := 14. Checks whether dictionary information for segment is accurate EXTENT_TS_BITMAP_CHECK := 15. Checks whether extent maps are consistent with file level bitmaps DB_BACKPOINTER_CHECK := 16. Checks whether datablocks have correct backpointers to the space metadata blocks EXTENT_SEGMENT_BITMAP_CHECK := 17. Checks whether extent map in the segment matches the bitmaps in the segment BITMAPS_CHECK := 18. Checks whether space bitmap blocks are accurate

Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.

154.4.2 ASSM_TABLESPACE_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
    tablespace_name  IN VARCHAR2,
    ts_option        IN POSITIVE,
    segment_option   IN POSITIVE DEFAULT NULL);
```

Parameters

Table 154-4 ASSM_TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of the tablespace to verify. The tablespace must be an ASSM tablespace.
ts_option	<ul style="list-style-type: none"> TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file\$ and control file. TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments. TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY.
segment_option	<p>When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:</p> <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9 SEGMENT_VERIFY_DEEP := 10 <p>The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified.</p>

Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the `USER_DUMP_DEST` initialization parameter.

154.4.3 DROP_EMPTY_SEGMENTS Procedure

This procedure drops segments from empty tables or table fragments and dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (
    schema_name  IN VARCHAR2 DEFAULT NULL,
```

```

table_name      IN      VARCHAR2  DEFAULT NULL,
partition_name  IN      VARCHAR2  DEFAULT NULL);

```

Parameters

Table 154-5 DROP_EMPTY_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

154.4.4 GET_SEGADV_ATTRIB Procedure

This procedure returns the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

```

DBMS_SPACE_ADMIN.GET_SEGADV_ATTRIB(
  attribute IN NUMBER,
  value     OUT NUMBER);

```

Parameters

Table 154-6 GET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
attribute	Supported attributes: <ul style="list-style-type: none"> COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.
value	Supported values: <ul style="list-style-type: none"> ATTR_ENABLE : 1 ATTR_DISABLE : 0

154.4.5 MATERIALIZE_DEFERRED_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (
  schema_name      IN      VARCHAR2  DEFAULT NULL,
  table_name       IN      VARCHAR2  DEFAULT NULL,
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 154-7 MATERIALIZE_DEFERRED_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No schema_name is specified, in which case tables belonging to all schemas are scanned
- Both schema_name and table_name are specified to perform the operation on a specified table

- All three arguments are supplied, restricting the operation to the partition and its dependent objects

154.4.6 SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be performed.

It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
  tablespace_name      IN   VARCHAR2,
  header_relative_file IN   POSITIVE,
  header_block         IN   NUMBER,
  corrupt_option       IN   POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 154-8 SEGMENT_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
corrupt_option	SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID

Usage Notes

You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```

154.4.7 SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space).

For this to work, the segment must be marked *temporary*. To mark a corrupt segment as temporary, issue a `DROP` command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
  tablespace_name      IN   VARCHAR2,
```

```
header_relative_file    IN    POSITIVE,
header_block           IN    NUMBER);
```

Parameters

Table 154-9 SEGMENT_DROP_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

Usage Notes

- The space for the segment is not released, and it must be fixed by using the [TABLESPACE_FIX_BITMAPS Procedure](#) or the [TABLESPACE_REBUILD_BITMAPS Procedure](#).
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

154.4.8 SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
  tablespace_name    IN    VARCHAR2,
  header_relative_file IN  POSITIVE,
  header_block       IN    NUMBER,
  dump_option        IN    POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 154-10 SEGMENT_DUMP Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
dump_option	One of the following options: <ul style="list-style-type: none"> • SEGMENT_DUMP_EXTENT_MAP • SEGMENT_DUMP_BITMAP_SUMMARY

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass `SEGMENT_DUMP_BITMAP_SUMMARY` as the `dump_option` parameter.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS.HEADER_FILE`. If `HEADER_FILE` is greater than 1023 then use `DBA_DATA_FILES.RELATIVE_FNO`.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

154.4.9 SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
  tablespace_name      IN   VARCHAR2,
  header_relative_file IN   POSITIVE,
  header_block         IN   NUMBER,
  verify_option        IN   POSITIVE DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

Table 154-11 SEGMENT_VERIFY Procedure Parameters

Parameters	Description
<code>tablespace_name</code>	Name of tablespace in which segment resides
<code>header_relative_file</code>	Relative file number of segment header
<code>header_block</code>	Block number of segment header
<code>verify_option</code>	What kind of check to do: <code>SEGMENT_VERIFY_EXTENTS</code> or <code>SEGMENT_VERIFY_EXTENTS_GLOBAL</code>

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```

154.4.10 SET_SEGADV_ATTRIB Procedure

This procedure sets the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

```
DBMS_SPACE_ADMIN.SET_SEGADV_ATTRIB(
    attribute IN NUMBER,
    value     IN NUMBER);
```

Parameters

Table 154-12 SET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
attribute	Supported attributes: <ul style="list-style-type: none"> COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.
value	Supported values: <ul style="list-style-type: none"> ATTR_ENABLE : 1 ATTR_DISABLE : 0

154.4.11 TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
    tablespace_name IN VARCHAR2,
    dbarange_relative_file IN POSITIVE,
    dbarange_begin_block IN POSITIVE,
    dbarange_end_block IN POSITIVE,
    fix_option IN POSITIVE);
```

Parameters

Table 154-13 TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
dbrange_relative_file	Relative file number of block range (extent)
dbrange_begin_block	Block number of beginning of extent
dbrange_end_block	Block number (inclusive) of end of extent
fix_option	One of the following options: <ul style="list-style-type: none"> TABLESPACE_EXTENT_MAKE_FREE TABLESPACE_EXTENT_MAKE_USED

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83,
DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of TABLESPACE_EXTENT_MAKE_FREE marks the bits free in bitmaps. The BEGIN and END blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

154.4.12 TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted.

During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
    tablespace_name    IN    VARCHAR);
```

Parameters

Table 154-14 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace whose segments must be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1');
```

154.4.13 TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
    tablespace_name    IN    VARCHAR2);
```

Parameter

Table 154-15 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

154.4.14 TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
    tablespace_name    IN    VARCHAR2,
    unit_size          IN    POSITIVE DEFAULT NULL,
    rfnno              IN    POSITIVE DEFAULT NULL);
```

Parameters

Table 154-16 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace to be migrated
unit_size	Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks
rfno	Relative File Number of the file where the bitmap blocks are placed

Usage Notes

- Before you migrate the `SYSTEM` tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the `SYSTEM` tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

 **See Also:**

Oracle Database Administrator's Guide

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.
- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the `MINIMUM EXTENT` for the tablespace (5 if `MINIMUM EXTENT` is not specified). Thus, the calculated value will not be larger than the `MINIMUM EXTENT` for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the `unit_size` calculated by the system; otherwise an error message is returned.
- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps are placed in file with relative file number 2.

154.4.15 TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the `SYSTEM` tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
  tablespace_name      IN    VARCHAR2,
  bitmap_relative_file IN    POSITIVE  DEFAULT NULL,
  bitmap_block         IN    POSITIVE  DEFAULT NULL);
```

Parameters

Table 154-17 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

154.4.16 TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
    tablespace_name      IN      VARCHAR2);
```

Parameters

Table 154-18 TABLESPACE_REBUILD_QUOTAS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

154.4.17 TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
    tablespace_name      IN      VARCHAR2,
    filno                IN      POSITIVE,
    blkno                IN      POSITIVE);
```

Parameters

Table 154-19 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

Parameter Name	Description
tablespace_name	Name of tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination range

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of `SPACE HEADER` segment that contains the bitmap blocks. The `SPACE HEADER` segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the `TABLESPACE_RELOCATE_BITMAPS` command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the `SYSTEM` tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

 **Note:**

The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

154.4.18 TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (  
    tablespace_name      IN    VARCHAR2,  
    verify_option        IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 154-20 TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	One option is supported: TABLESPACE_VERIFY_BITMAP

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

DBMS_SPD

The `DBMS_SPD` package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Summary of DBMS_SPD Subprograms](#)

See Also:

- [DBMS_STATS](#)
- *Oracle Database SQL Tuning Guide* regarding SQL plan directives

155.1 DBMS_SPD Overview

This package provides subprograms for managing SQL plan directives (SPD).

SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.

155.2 DBMS_SPD Security Model

`DBMS_SPD` is an invoker-rights package. The invoker requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.

155.3 DBMS_SPD Views

The DBA view `DBA_SQL_PLAN_DIRECTIVES` shows all the directives created in the system and the view `DBA_SQL_PLAN_DIR_OBJECTS` displays the objects that are included in the directives.

155.4 Summary of DBMS_SPD Subprograms

This table lists and briefly describes the DBMS_SPD package subprograms.

Table 155-1 DBMS_SPD Package Subprograms

Subprogram	Description
ALTER_SQL_PLAN_DIRECTIVE Procedure	Changes different attributes of a SQL plan directive
CREATE_STGTAB_DIRECTIVE Procedure	Creates a staging table into which to pack (export) SQL plan directives.
DROP_SQL_PLAN_DIRECTIVE Procedure	Drops a SQL plan directive
FLUSH_SQL_PLAN_DIRECTIVE Procedure	Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.
GET_PREFS Function	Gets the values for preferences for SQL plan directives
PACK_STGTAB_DIRECTIVE Function	Packs (exports) SQL plan directives into a staging table.
SET_PREFS Procedure	Allows the setting of different preferences for SQL plan directives
UNPACK_STGTAB_DIRECTIVE Function	Unpacks (imports) SQL plan directives from a staging table.

155.4.1 ALTER_SQL_PLAN_DIRECTIVE Procedure

This procedure changes different attributes of a SQL plan directive.

Syntax

```
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (
  directive_id      IN      NUMBER,
  attribute_name    IN      VARCHAR2,
  attribute_value   IN      VARCHAR2);
```

Parameters

Table 155-2 ALTER_SQL_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
directive_id	SQL plan directive ID
attribute_name	<ul style="list-style-type: none"> ENABLED AUTO_DROP

Table 155-2 (Cont.) ALTER_SQL_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
attribute_value	Possible values: <ul style="list-style-type: none"> • ENABLED: <ul style="list-style-type: none"> - If YES directive is enabled and may be used - If NO directive is not enabled and will not be used • AUTO_DROP: <ul style="list-style-type: none"> - If YES directive will be dropped automatically if not used for SPD_RETENTION_WEEKS. This is the default behavior. - If NO directive will not be dropped automatically

Exceptions

- **ORA-38171 INSUFFICIENT_PRIVILEGE:** The user does not have proper privilege to perform the operation.
- **ORA-28104 INVALID_INPUT:** The input value is not valid.
- **ORA-13158 OBJECT_DOES_NOT_EXIST:** The specified object does not exist.

Usage Notes

The **ADMINISTER SQL MANAGEMENT OBJECT** privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```

155.4.2 CREATE_STGTAB_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

Syntax

```
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (
  table_name          IN VARCHAR2,
  table_owner         IN VARCHAR2 := USER,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 155-3 CREATE_STGTAB_DIRECTIVE Procedure Parameters

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.
tablespace_name	Name of tablespace. Default NULL means create staging table in the default tablespace:

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-44001 `INVALID_SCHEMA`: The input schema does not exist.
- ORA-13159 `TABLE_ALREADY_EXISTS`: The specified table already exists.
- ORA-29304 `TABLESPACE_MISSING`: The specified tablespace does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

155.4.3 DROP_SQL_PLAN_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

Syntax

```
DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (
    directive_id      IN      NUMBER);
```

Parameters

Table 155-4 *DROP_SQL_PLAN_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>directive_id</code>	SQL plan directive ID

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
    DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);
END;
```

155.4.4 FLUSH_SQL_PLAN_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.

The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

Syntax

```
DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
```

Exceptions

ORA-38171 *INSUFFICIENT_PRIVILEGE*: The user does not have proper privilege to perform the operation.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```

155.4.5 GET_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

Syntax

```
DBMS_SPD.GET_PREFS (
  pname      IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 155-5 *GET_PREFS Function Parameters*

Parameter	Description
pname	Preference name. The procedure supports the preference <code>SPD_RETENTION_WEEKS</code> .

Return Values

Preference value

Exceptions

- ORA-38171 *INSUFFICIENT_PRIVILEGE*: The user does not have proper privilege to perform the operation.
- ORA-28104 *INVALID_INPUT*: The input value is not valid.

Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;
```

155.4.6 PACK_STGTAB_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (
    table_name          IN VARCHAR2,
    table_owner         IN VARCHAR2 := USER,
    directive_id        IN NUMBER   := NULL,
    obj_list            IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 155-6 *PACK_STGTAB_DIRECTIVE Function Parameters*

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.
directive_id	SQL plan directive ID. Default NULL means all directives in the system.
obj_list	Used to filter the directives to be packed based on the objects used in directives. If obj_list is not NULL, a directive is packed only if all the objects in the directive exist in obj_list.

Return Values

Number of SQL plan directives packed.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```

-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Pack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := NULL;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

```

155.4.7 SET_PREFS Procedure

This procedure allows the setting of different preferences for SQL plan directives.

Syntax

```

DBMS_SPD.SET_PREFS (
  pname      IN   VARCHAR2,
  pvalue     IN   VARCHAR2);

```

Parameters

Table 155-7 SET_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The procedure supports the preference SPD_RETENTION_WEEKS.
pvalue	Preference value. <ul style="list-style-type: none"> SPD_RETENTION_WEEKS: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (SPD_RETENTION_WEEKS_DEFAULT) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value NULL can be passed to set the preference to default.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.

Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
BEGIN
  DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```

155.4.8 UNPACK_STGTAB_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

Syntax

```
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := USER,
  directive_id    IN NUMBER    := NULL,
  obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 155-8 UNPACK_STGTAB_DIRECTIVE Function Parameters

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.
directive_id	SQL plan directive ID. Default NULL means all directives in the system.
obj_list	Used to filter the directives to be unpacked based on the objects used in directives. If obj_list is not NULL, a directive is unpacked only if all the objects in the directive exist in obj_list.

Return Values

Number of SQL plan directives unpacked.

Exceptions

- ORA-38171 *INSUFFICIENT_PRIVILEGE*: The user does not have proper privilege to perform the operation.
- ORA-28104 *INVALID_INPUT*: The input value is not valid.
- ORA-44001 *INVALID_SCHEMA*: The input schema does not exist.
- ORA-29304 *INVALID_STGTAB*: The specified staging table is invalid or does not exist.
- ORA-13158 *OBJECT_DOES_NOT_EXIST*: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
-- Unack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt number;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := null;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

```
-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt NUMBER;
begin
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

DBMS_SPM

The `DBMS_SPM` package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SPM Subprograms](#)

See Also:

For more information about "Using SQL Plan Management" in the *Oracle Database SQL Tuning Guide*

156.1 DBMS_SPM Overview

The `DBMS_SPM` package allows the user to manage SQL execution plans using SQL plan management.

SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution

plans developed under a standard test configuration for the new SQL statements. If the system production configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

156.2 DBMS_SPM Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.

156.3 DBMS_SPM Constants

The DBMS_SPM package provides constants that can be used for specifying parameter values.

These are shown in the following table. These constants are defined as standard input for the time_limit parameter of the EVOLVE_SQL_PLAN_BASELINE Function.

Table 156-1 DBMS_SPM Constants

Constant	Type	Value	Description
AUTO_LIMIT	INTEGER	2147483647	Oracle determines the appropriate time spent by the EVOLVE_SQL_PLAN_BASELINE Function.
NO_LIMIT	INTEGER	2147483647 -1	There is no limit to the time spent by the EVOLVE_SQL_PLAN_BASELINE Function.

156.4 DBMS_SPM Examples

These examples will help you understand use of DBMS_SPM.

Detailed examples are located under the following topics:

- Migrating Stored Outlines to SQL Plan Baselines
- Migrating Outlines to Utilize SQL Plan Management Features
- Migrating Outlines to Preserve Stored Outline Behavior
- Performing Follow-Up Tasks After Stored Outline Migration

156.5 DBMS_SPM Data Structures

The DBMS_SPM package defines a TABLE type.

Table Types

- DBMS_SPM NAMELIST Table Type

156.5.1 DBMS_SPM NAMEDLIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```
TYPE name_list IS TABLE OF VARCHAR2(30);
```

156.6 Summary of DBMS_SPM Subprograms

This table lists and briefly describes the DBMS_SPM package subprograms.

Table 156-2 DBMS_SPM Package Subprograms

Subprogram	Description
ACCEPT_SQL_PLAN_BA SELIN Procedure	Accepts a plan based on the recommendation of an evolve task
ALTER_SQL_PLAN_BASE LINE Function	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
CANCEL_EVOLVE_TASK Procedure	Cancels a currently executing evolve task
CONFIGURE Procedure	Sets configuration options for SQL management base, in parameter/value format
CREATE_EVOLVE_TASK Function	Creates an advisor task and sets its parameters
CREATE_STGTAB_BASE LINE Procedure	Creates a staging table that used for transporting SQL plan baselines from one system to another
DROP_EVOLVE_TASK Procedure	Drops an evolved task
DROP_SQL_PLAN_BASE LINE Function	Drops a single plan, or all plans associated with a SQL statement
EVOLVE_SQL_PLAN_BA SELIN Function	Evolves SQL plan baselines associated with one or more SQL statements
EXECUTE_EVOLVE_TAS K Function	Executes a previously created evolve task
IMPLEMENT_EVOLVE_TA SK Function	Implements a plan based on the recommendation of an evolve task
INTERRUPT_EVOLVE_TA SK Procedure	Interrupts a currently executing evolve task
LOAD_PLANS_FROM_CU RSOR_CACHE Functions	Loads one or more plans present in the cursor cache for a SQL statement
LOAD_PLANS_FROM_A WR Function	Loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded
LOAD_PLANS_FROM_SQ LSET Function	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines
MIGRATE_STORED_OUT LINE Functions	Migrates existing stored outlines to SQL plan baselines

Table 156-2 (Cont.) DBMS_SPM Package Subprograms

Subprogram	Description
PACK_STGTAB_BASELINE Function	Packs (exports) SQL plan baselines from SQL management base into a staging table
RESET_EVOLVE_TASK Procedure	Resets an evolve task to its initial state
RESUME_EVOLVE_TASK Procedure	Resumes a previously interrupted task
REPORT_AUTO_EVOLVE_TASK Function	Displays the results of an execution of an automatic evolve task.
REPORT_EVOLVE_TASK Function	Displays the results of an evolved task
SET_EVOLVE_TASK_PARAMETER Procedure	Sets a parameter of an evolve task
UNPACK_STGTAB_BASELINE Function	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

156.6.1 ACCEPT_SQL_PLAN_BASELINE Procedure

The procedure accepts a plan based on the recommendation of an evolve task.

Syntax

```
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER      := NULL,
  task_owner     IN  VARCHAR2    := NULL,
  force         IN  BOOLEAN      := FALSE);
```

Parameters

Table 156-3 ACCEPT_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Identifier of task to implement
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
force	Accept the plan even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

156.6.2 ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  attribute_name  IN VARCHAR2,
  attribute_value IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

Table 156-4 ALTER_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of plan attribute to set (see table below).
attribute_value	Value of plan attribute to use (see table below)

Table 156-5 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30 characters
description	Plan description.	String of up to 500 bytes

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

156.6.3 CANCEL_EVOLVE_TASK Procedure

The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

Syntax

```
DBMS_SPM.CANCEL_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters**Table 156-6 CANCEL_EVOLVE_TASK Procedure Parameters**

Parameter	Description
task_name	Identifier of task to cancel

156.6.4 CONFIGURE Procedure

This procedure sets configuration options for the SQL management base and for the maintenance of SQL plan baselines. You can call this function multiple times, setting a different configuration option each time.

Syntax

```
DBMS_SPM.CONFIGURE (
    parameter_name     IN VARCHAR2,
    parameter_value    IN VARCHAR2 := NULL,
    allow              IN BOOLEAN := TRUE);
```

Parameters**Table 156-7 CONFIGURE Procedure Parameters**

Parameter	Description
parameter_name	Name of parameter to set (see table below).
parameter_value	Value of parameter to use (see table below). The maximum length of parameter_value is 1000 characters.

Table 156-7 (Cont.) CONFIGURE Procedure Parameters

Parameter	Description
allow	Whether to include (true) or exclude (false) matching SQL statements and plans for the auto_capture_* parameters. If null, then the procedure ignores the specified parameter.

Table 156-8 Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
auto_capture_action	Action to include (=) or exclude (<>) for SQL plan management automatic capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely.	Action name, for example, R%
auto_capture_module	Module to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Module name, for example, LOGGER
auto_capture_parsing_schema_name	Parsing schema to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Schema name, for example, HR
auto_capture_sql_text	Search pattern to apply to SQL text of LIKE or NOT LIKE, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Text of a SQL statement, for example, SELECT a%

Table 156-8 (Cont.) Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
auto_spm_evolve_task	<p>Setting to enable or disable the high-frequency SPM Evolve Advisor task. The high-frequency task runs every hour and runs for no longer than 30 minutes. These settings are not configurable. The frequent executions mean that the optimizer has more opportunities to find and evolve better performing plans.</p> <p>The default value is <code>OFF</code>, which means the high-frequency SPM Evolve Advisor task is disabled. In this release, <code>AUTO</code> is equivalent to <code>OFF</code>. The value of <code>allow</code> is ignored.</p> <p>Note: See <i>Oracle Database Licensing Information User Manual</i> for details on which features are supported for different editions and services.</p>	ON, OFF, AUTO
plan_retention_weeks	<p>Number of weeks to retain unused plans before the database purges them.</p> <p>A null value resets to the default value of 53 weeks, or 1 year plus 1 week. (This retains plans for annually executing queries.) The value of <code>allow</code> is ignored.</p>	5–523 (default is 53)
space_budget_percent	<p>Maximum percent of <code>SYSAUX</code> space that can be used for SQL management base.</p> <p>The database issues alerts when this amount is exceeded. A null value resets the percentage to the default value of 10%. The value of <code>allow</code> is ignored.</p>	1–50 (default is 10)

Exceptions

Table 156-9 CONFIGURE Exceptions

Error Number	Description
ORA-38133	Invalid parameter name
ORA-38134	Invalid parameter value
ORA-38150	Not enough space for new filter
ORA-38151	Module name too long
ORA-38152	Action name too long
ORA-38304	Missing or invalid user name

Usage Notes

- When `parameter_name` is `auto_capture_sql_text`, the `parameter_value` is an automatic search filter. The filter uses the search pattern of `LIKE parameter_name` when `allow=>>true`. The filter uses the pattern `NOT LIKE parameter_name` when `allow=>>false`.

For all other non-null `parameter_name` values, the search pattern depends on the `allow` setting. The parameter uses an equal sign (=) when `allow=>>true`. The parameter uses a not-equal sign (<>) when `allow=>>false`.

- You can configure multiple automatic capture parameters of different types. You cannot specify multiple values for the same parameter. Instead, the values specified for a particular parameter are combined. For example, specifying `auto_capture_sql_text` to be '%TABLE1%', TRUE, and '%TABLE2%', FALSE will result in matching SQL text LIKE '%TABLE1%' and NOT LIKE '%TABLE2%'. The database uses these configuration settings only when the initialization parameter `OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES` is set to TRUE.
- A null value for `parameter_value` removes the filter for `parameter_name` entirely. By using `parameter_value=>''` in combination with `allow=FALSE`, you can filter out all values for a parameter, and then create a separate filter to include only specified values. The `DBA_SQL_MANAGEMENT_CONFIG` view shows the current filters.
- The default space budget for SQL management base is no more than ten percent of the size of `SYSAUX` tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

Examples

The following example creates a filter for SQL text that is like `SELECT a%:`

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', 'TRUE');
```

The following example filters out the `HR` parsing schema:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_PARSING_SCHEMA_NAME', 'HR',  
'FALSE');
```

The following example removes any existing filters for SQL text:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', NULL, NULL);
```

The following example removes any LIKE or NOT LIKE filters for the SQL text `select a%:`

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', NULL);
```

The following example creates a filter with the predicate `(action LIKE 'R%') OR (action LIKE '%E')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', 'R%', 'TRUE');  
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', '%E_', 'TRUE');
```

The following example creates a filter with the predicate NOT(module LIKE 'LOGGER') AND NOT(module LIKE 'UTIL__'):

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'LOGGER', 'FALSE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'UTIL__', 'FALSE');
```

156.6.5 CREATE_EVOLVE_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

Syntax

```
DBMS_SPM.CREATE_EVOLVE_TASK (
    sql_handle      IN  VARCHAR2  := NULL,
    plan_name       IN  VARCHAR2  := NULL,
    time_limit      IN  NUMBER     := DBMS_SPM.AUTO_LIMIT,
    task_name       IN  VARCHAR2  := NULL,
    description     IN  VARCHAR2  := NULL)
RETURN VARCHAR2;

DBMS_SPM.CREATE_EVOLVE_TASK (
    plan_list       IN  DBMS_SPM.NAME_LIST,
    time_limit      IN  NUMBER     := DBMS_SPM.AUTO_LIMIT,
    task_name       IN  VARCHAR2  := NULL,
    description     IN  VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Parameters

Table 156-10 CREATE_EVOLVE_TASK Function Parameters

Parameter	Description
sql_handle	Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans.
plan_list	List of plan names. The plans may belong to different SQL statements.
plan_name	Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL.
time_limit	Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit.
task_name	Evolve task name
description	Description of the task (maximum 256 characters)

Return Values

SQL evolve task unique name

156.6.6 CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
    table_name          IN VARCHAR2,
    table_owner         IN VARCHAR2 := NULL,
    tablespace_name    IN VARCHAR2 := NULL);
```

Parameters**Table 156-11 CREATE_STGTAB_BASELINE Procedure Parameters**

Parameter	Description
table_name	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
table_owner	Name of owner of the staging table. Default NULL means current schema is the table owner.
tablespace_name	Name of tablespace. Default NULL means create staging table in the default tablespace.

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

156.6.7 DROP_EVOLVE_TASK Procedure

The procedure drops an evolved task.

Syntax

```
DBMS_SPM.DROP_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 156-12 DROP_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to drop

156.6.8 DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
    sql_handle      IN VARCHAR2 := NULL,
    plan_name      IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 156-13 DROP_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.

Return Values

The number of plans dropped

156.6.9 EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans.

If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
    sql_handle      IN VARCHAR2 := NULL,
```

```

plan_name      IN VARCHAR2 := NULL,
time_limit     IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
verify        IN VARCHAR2 := 'YES',
commit        IN VARCHAR2 := 'YES')
RETURN CLOB;

DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  plan_list     IN DBMS_SPM.NAME_LIST,
  time_limit    IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;

```

Parameters

Table 156-14 EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement identifier. Unless <code>plan_name</code> is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines.
plan_name	Plan identifier. Default NULL means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if <code>sql_handle</code> is NULL.
plan_list	A list of plan names. Each plan in the list can belong to same or different SQL statement.
time_limit	Time limit in number of minutes. This applies only if <code>verify</code> = 'YES'. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. <ul style="list-style-type: none"> DBMS_SPM.AUTO_LIMIT (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. DBMS_SPM.NO_LIMIT means there is no time limit. A positive integer value represents a user specified time limit.
verify	Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan. <ul style="list-style-type: none"> 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans

Table 156-14 (Cont.) EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
commit	<p>Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'.</p> <ul style="list-style-type: none"> 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when verify = 'YES'. 'NO' - generate a report without any updates. Note that commit = 'NO' together with verify = 'NO' represents a no-op.

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = 'YES' the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

156.6.10 EXECUTE_EVOLVE_TASK Function

The function executes a previously created evolve task.

Syntax

```
DBMS_SPM.EXECUTE_EVOLVE_TASK (
    task_name          IN  VARCHAR2,
    execution_name     IN  VARCHAR2  := NULL,
    execution_desc     IN  VARCHAR2  := NULL);
RETURN VARCHAR2;
```

Parameters

Table 156-15 EXECUTE_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Evolve task name
execution_name	Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function.
execution_desc	Description of the execution (maximum 256 characters)

Return Values

Name of the new execution

156.6.11 IMPLEMENT_EVOLVE_TASK Function

The function implements all the actions recommended by an evolve task.

Syntax

```
DBMS_SPM.IMPLEMENT_EVOLVE_TASK (
  task_name      IN  VARCHAR2,
  task_owner     IN  VARCHAR2 := NULL,
  execution_name IN  VARCHAR2 := NULL,
  force          IN  BOOLEAN   := FALSE)
RETURN NUMBER;
```

Parameters

Table 156-16 IMPLEMENT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution.
force	Accept all plans even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

Return Values

The number of plans accepted

156.6.12 INTERRUPT_EVOLVE_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

Syntax

```
DBMS_SPM.INTERRUPT_EVOLVE_TASK (
  task_name      IN  VARCHAR2);
```

Parameters

Table 156-17 INTERRUPT_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to interrupt

156.6.13 LOAD_PLANS_FROM_AWR Function

This function loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_AWR
  begin_snap      IN  NUMBER,
  end_snap        IN  NUMBER,
  basic_filter    IN  VARCHAR2 := NULL,
  fixed           IN  VARCHAR2 := 'NO',
  enabled         IN  VARCHAR2 := 'YES',
  commit_rows    IN  NUMBER := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 156-18 LOAD_PLANS_FROM_AWR Function Parameters

Parameter	Description
begin_snap	Begin snapshot
end_snap	End snapshot
basic_filter	SQL predicate to filter the SQL from AWR. NULL means all plans in AWR are selected. Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW.
fixed	Default 'NO' means the loaded plans will not change the current 'fixed' property of the SQL plan baseline into which they are loaded.
enabled	Default 'YES' means the loaded plans will be considered by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit.
dbid	The DBID that is used for imported or PDB-level AWR data.

Usage Notes

Requires the `Administer SQL Management Object` privilege

See Also:

For information on the `SQLSET_ROW` objects, see [SQLSET_ROW Object Type](#).

156.6.14 LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN  VARCHAR2,
    plan_hash_value IN  NUMBER   := NULL,
    sql_text        IN  CLOB,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN  VARCHAR2,
    plan_hash_value IN  NUMBER   := NULL,
    sql_handle      IN  VARCHAR2,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN  VARCHAR2,
    plan_hash_value IN  NUMBER   := NULL,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    attribute_name  IN  VARCHAR2,
    attribute_value IN  VARCHAR2,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

Parameters

Table 156-19 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_id	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.
plan_hash_value	Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.

Table 156-19 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_text	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
sql_handle	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The <code>sql_handle</code> must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
attribute_name	One of possible attribute names: <ul style="list-style-type: none"> SQL_TEXT" 'PARSING_SCHEMA_NAME' 'MODULE' 'ACTION'
attribute_value	Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying <code>attribute_name => 'SQL_TEXT'</code> , and <code>attribute_value => '% HR-123 %'</code> means applying <code>SQL_TEXT LIKE '% HR-123 %'</code> as a selection filter. Similarly, specifying <code>attribute_name => 'MODULE'</code> , and <code>attribute_value => 'HR'</code> means applying <code>'MODULE = 'HR'</code> as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

156.6.15 LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted

plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sqlset_owner     IN  VARCHAR2 := NULL,
    basic_filter     IN  VARCHAR2 := NULL,
    fixed            IN  VARCHAR2 := 'NO',
    enabled          IN  VARCHAR2 := 'YES'
    commit_rows     IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 156-20 LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.
basic_filter	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DBA_SQLSET_STATEMENTS. For example basic_filter => 'sql_text like 'select /*LOAD_STS*/%' or basic_filter => 'sql_id='b62q7nc33gzwx''.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

156.6.16 MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
  attribute_name      IN  VARCHAR2,
  attribute_value     IN  CLOB,
  fixed               IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
  outln_list         IN  DBMS_SPM.NAME_LIST,
  fixed              IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

Parameters

Table 156-21 MIGRATE_STORED_OUTLINE Function Parameters

Parameter	Description
attribute_name	Specifies the type of parameter used in attribute_value to identify the migrated stored outlines. It is case insensitive. Possible values: <ul style="list-style-type: none"> outline_name sql_text category all
attribute_value	Based on attribute_name, this can be: <ul style="list-style-type: none"> Name of stored outline to be migrated SQL text of stored outlines to be migrated Category of stored outlines to be migrated NULL if attribute_name is all
fixed	NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans.
outln_list	List of outline names to be migrated

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated

- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate `all`, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

156.6.17 PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner    IN VARCHAR2 := NULL,
    sql_handle     IN VARCHAR2 := NULL,
    plan_name      IN VARCHAR2 := NULL,
    sql_text       IN CLOB      := NULL,
    creator        IN VARCHAR2 := NULL,    origin          IN VARCHAR2 := NULL,
    enabled        IN VARCHAR2 := NULL,
    accepted       IN VARCHAR2 := NULL,
    fixed          IN VARCHAR2 := NULL,
    module         IN VARCHAR2 := NULL,
    action         IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 156-22 PACK_STGTAB_BASELINE Function Parameters

Parameter	Description
<code>table_name</code>	Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)
<code>table_owner</code>	Name of staging table owner. Default <code>NULL</code> means current schema is the table owner
<code>sql_handle</code>	SQL handle (case sensitive)
<code>plan_name</code>	Plan name (case sensitive, % wildcards accepted)
<code>sql_text</code>	SQL text string (case sensitive, % wildcards accepted)

Table 156-22 (Cont.) PACK_STGTAB_BASELINE Function Parameters

Parameter	Description
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of SQL plan baselines packed

156.6.18 RESET_EVOLVE_TASK Procedure

This procedure resets an evolve task to its initial state.

All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

Syntax

```
DBMS_SPM.RESET_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters**Table 156-23 RESET_EVOLVE_TASK Procedure Parameters**

Parameter	Description
task_name	Identifier of task to reset

156.6.19 RESUME_EVOLVE_TASK Procedure

The procedure resumes a previously interrupted task.

Syntax

```
DBMS_SPM.RESUME_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters

Table 156-24 RESUME_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to resume

156.6.20 REPORT_AUTO_EVOLVE_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

Syntax

```
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK (
  type          IN  VARCHAR2 := TYPE_TEXT,
  level         IN  VARCHAR2 := LEVEL_TYPICAL,
  section       IN  VARCHAR2 := SECTION_ALL,
  object_id     IN  NUMBER   := NULL,
  execution_name IN  VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 156-25 REPORT_AUTO_EVOLVE_TASK Function Parameters

Parameter	Description
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

156.6.21 REPORT_EVOLVE_TASK Function

The procedure displays the results of an evolved task.

Syntax

```
DBMS_SPM.REPORT_EVOLVE_TASK (
  task_name     IN  VARCHAR2,
  type          IN  VARCHAR2 := TYPE_TEXT,
  level         IN  VARCHAR2 := LEVEL_TYPICAL,
  section       IN  VARCHAR2 := SECTION_ALL,
  object_id     IN  NUMBER   := NULL,
```

```

task_owner      IN VARCHAR2 := NULL,
execution_name  IN VARCHAR2 := NULL)
RETURN CLOB;

```

Parameters

Table 156-26 REPORT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

156.6.22 SET_EVOLVE_TASK_PARAMETER Procedure

The procedure sets a parameter of an evolve task, either a VARCHAR2 or a NUMBER.

Syntax

```

DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
  task_name      IN VARCHAR2,
  parameter      IN VARCHAR2,
  value          IN NUMBER);

```

```

DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
  task_name      IN VARCHAR2 := NULL,
  parameter      IN VARCHAR2,
  value          IN VARCHAR2);

```

Parameters

Table 156-27 SET_EVOLVE_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Evolve task name
parameter	Name of the parameter to set (see following table)

Table 156-27 (Cont.) SET_EVOLVE_TASK_PARAMETER Procedure Parameters

Parameter	Description
value	Value of the parameter (see following table)

The following table describes parameters for the SET_EVOLVE_TASK_PARAMETER procedure.

Table 156-28 DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
alternate_plan_source	<p>Determines which sources to search for additional plans:</p> <ul style="list-style-type: none"> AUTO (the database selects the source automatically) AUTOMATIC_WORKLOAD_REPOSITORY CURSOR_CACHE SQL_TUNING_SET <p>You can combine multiple values with the plus sign (+).</p>	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is AUTO. If manual, the default is CURSOR_CACHE+AUTOMATIC_WORKLOAD_REPOSITORY.
alternate_plan_baseline	<p>Determines which alternative plans should be loaded:</p> <ul style="list-style-type: none"> AUTO lets Autonomous Database choose whether to load plans for statements with or without baselines. EXISTING loads alternate plans with for statements with existing baselines. NEW loads alternative plans for statements without a baseline, in which case a new baseline is created. <p>You can combine multiple values with the plus sign (+), as in EXISTING+NEW.</p>	EXISTING
alternate_plan_limit	Specifies the maximum number of plans to load in total (that is, not the limit for each SQL statement).	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is UNLIMITED. If manual, the default is 10.

Table 156-28 (Cont.) DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
accept_plans	Specifies whether to accept recommended plans automatically. When ACCEPT_PLANS is true, SQL plan management automatically accepts all plans recommended by the task. When ACCEPT_PLANS is false, the task verifies the plans and generates a report of its findings, but does not evolve the plans automatically. You can use a report to identify new SQL plan baselines and accept them manually.	true (regardless of whether the advisor is run automatically or manually)
time_limit	Global time limit in seconds. This is the total time allowed for the task.	The default depends on whether the SPM Evolve Advisor task is automated or manual: <ul style="list-style-type: none"> • If automated, the default is 3600. • If manual, the default is 2147483646.

156.6.23 UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := NULL,
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    sql_text        IN CLOB      := NULL,
    creator         IN VARCHAR2 := NULL,    origin         IN VARCHAR2 := NULL,
    enabled        IN VARCHAR2 := NULL,
    accepted       IN VARCHAR2 := NULL,
    fixed          IN VARCHAR2 := NULL,
    module         IN VARCHAR2 := NULL,
    action         IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 156-29 UNPACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of plans unpacked

DBMS_SQL

The `DBMS_SQL` package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL.

For example, you can enter a `DROP TABLE` statement from within a stored procedure by using the [PARSE Procedures](#) supplied with the `DBMS_SQL` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SQL Subprograms](#)

See Also:

For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference*.

157.1 DBMS_SQL Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using `DBMS_SQL`. For tasks that require `DBMS_SQL`, see *Oracle Database PL/SQL Language Reference*.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

**See Also:**

Oracle Call Interface Programmer's Guide

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI binds by address and the `DBMS_SQL` package binds by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULLs` are fully supported as values of a PL/SQL variable.

157.2 DBMS_SQL Security Model

`DBMS_SQL` is a SYS-owned package compiled with `AUTHID CURRENT_USER`. Any `DBMS_SQL` subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

**See Also:**

Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, `ORA-29471`, is raised when any `DBMS_SQL` subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and `DBMS_SQL` becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the [IS_OPEN Function](#) denotes a cursor currently open in the session, the return value is `TRUE`. If the actual value is `NULL`, then the return value is `FALSE`. Otherwise, this raises an `ORA-29471` error.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single `DBMS_SQL` subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.
- The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram, which takes a formal parameter, `security_level`, with allowed values `NULL`, `1` and `2`.

- When `security_level = 1` (or is `NULL`), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in the previous releases. As a consequence, users of `DBMS_SQL` may encounter runtime errors on upgrade.

157.3 DBMS_SQL Constants

The `DBMS_SQL Constants` package provides constants that are used with the `language_flag` parameter of the `PARSE` Procedures.

These constants are described in the following table.

Table 157-1 DBMS_SQL Constants

Name	Type	Value	Description
V6	INTEGER	0	Specifies Oracle database version 6 behavior
NATIVE	INTEGER	1	Specifies normal behavior for the database to which the program is connected
V7	INTEGER	2	Specifies Oracle database version 7 behavior
FOREIGN_SYNTAX	INTEGER	4294967295	Specifies a non-Oracle database syntax and behavior. The SQL statement to be parsed needs to be translated first using the SQL translation profile set in the database session. The SQL translation profile is a database schema object that directs how SQL statements are translated to Oracle. An error is raised if a profile is not set.

Related Topics

- [PARSE Procedures](#)
This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

157.4 DBMS_SQL Operational Notes

These operational notes describe processing queries, processing updates, inserts, and deletes, and locating errors.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the [DEFINE_COLUMN Procedures](#), the [DEFINE_COLUMN_LONG Procedure](#), or the [DEFINE_ARRAY Procedure](#).
2. Run your `SELECT` statement by calling the [EXECUTE Function](#).
3. Call the [FETCH_ROWS Function](#) (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call [COLUMN_VALUE Procedure](#) or [COLUMN_VALUE_LONG Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#) for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. Run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the [EXECUTE Function](#).
2. If statements have the `returning` clause, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables.

Locating Errors

The `DBMS_SQL` package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain `DBMS_SQL` calls. For example, you call the [LAST_ERROR_POSITION Function](#) immediately after calling one of the [PARSE Procedures](#).

157.5 DBMS_SQL Execution Flow

These functions comprise the `DBMS_SQL` execution flow.

1. [OPEN_CURSOR](#)

2. [PARSE](#)
3. [BIND_VARIABLE](#), [BIND_VARIABLE_PKG](#) or [BIND_ARRAY](#)
4. [DEFINE_COLUMN](#), [DEFINE_COLUMN_LONG](#) or [DEFINE_ARRAY](#)
5. [EXECUTE](#)
6. [FETCH_ROWS](#) or [EXECUTE_AND_FETCH](#)
7. [VARIABLE_VALUE](#), [VARIABLE_PKG](#), [COLUMN_VALUE](#) or [COLUMN_VALUE_LONG](#)
8. [CLOSE_CURSOR](#)

157.5.1 OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the `OPEN_CURSOR` Functions, you receive a cursor ID number for the data structure representing a valid cursor maintained by Oracle.

These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the `DBMS_SQL` package.

Related Topics

- [OPEN_CURSOR Functions](#)
This function opens a new cursor.

157.5.2 PARSE

Every SQL statement must be parsed by calling the `PARSE` procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of `DBMS_SQL` is shown in [Figure 157-1](#).

Figure 157-1 DBMS_SQL Execution Flow

illustration: arpls008
 release: 9
 caption: DBMS_SQL Execution Flow
 date: 7/31/01
 platform: pc
 ref: ADG8013

Related Topics

- [PARSE Procedures](#)
 This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

157.5.3 BIND_VARIABLE, BIND_VARIABLE_PKG or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the [BIND_ARRAY Procedures](#), or [BIND_VARIABLE Procedures](#), or the [BIND_VARIABLE_PKG Procedure](#) to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The [BIND_ARRAY](#) procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each `EXECUTE`. This is similar to the array interface supported by the OCI.

Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

157.5.4 DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The [DEFINE_COLUMN](#), [DEFINE_COLUMN_LONG](#), and [DEFINE_ARRAY](#) procedures specify the variables that receive `SELECT` values on a query.

The columns of the row being selected in a `SELECT` statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures ([DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), or [DEFINE_ARRAY Procedure](#)) to specify the variables that are to receive the `SELECT` values, much the way an `INTO` clause does for a static query.

Use the [DEFINE_COLUMN_LONG](#) procedure to define `LONG` columns, in the same way that [DEFINE_COLUMN](#) is used to define non-`LONG` columns. You must call [DEFINE_COLUMN_LONG](#) before using the [COLUMN_VALUE_LONG Procedure](#) to fetch from the `LONG` column.

Use the [DEFINE_ARRAY](#) procedure to define a PL/SQL collection into which you want to fetch rows in a single `SELECT` statement. [DEFINE_ARRAY](#) provides an interface to fetch multiple rows at one fetch. You must call [DEFINE_ARRAY](#) before using the [COLUMN_VALUE](#) procedure to fetch the rows.

157.5.5 EXECUTE

Call the `EXECUTE` Function to run your SQL statement.

Related Topics

- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.

157.5.6 FETCH_ROWS or EXECUTE_AND_FETCH

The `FETCH_ROWS` Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of calling `EXECUTE` Function and then `FETCH_ROWS`, you may find it more efficient to call `EXECUTE_AND_FETCH` Function if you are calling `EXECUTE` for a single execution.

Related Topics

- [FETCH_ROWS Function](#)
This function fetches a row from a given cursor.
- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.
- [EXECUTE_AND_FETCH Function](#)
This function executes the given cursor and fetches rows.

157.5.7 VARIABLE_VALUE, VARIABLE_VALUE_PKG, COLUMN_VALUE, or COLUMN_VALUE_LONG

The type of call determines which procedure or function to use.

For queries, call the [COLUMN_VALUE Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#).

For anonymous blocks containing calls to `PL/SQL` procedures or `DML` statements with `returning` clause, call the [VARIABLE_VALUE Procedures](#) or the [VARIABLE_VALUE_PKG Procedure](#) to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a `LONG` database column (which can be up to two gigabytes in size), use the [DEFINE_COLUMN_LONG Procedure](#). You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

157.5.8 CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling the `CLOSE_CURSOR` Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

Related Topics

- [CLOSE_CURSOR Procedure](#)
This procedure closes a given cursor.

157.6 DBMS_SQL Exceptions

This exception is raised by the `COLUMN_VALUE` Procedure or the `VARIABLE_VALUE` Procedures when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

```
inconsistent_type EXCEPTION;
pragma exception_init(inconsistent_type, -6562);
```

Related Topics

- [COLUMN_VALUE Procedure](#)
This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.
- [VARIABLE_VALUE Procedures](#)
This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

157.7 DBMS_SQL Examples

These example procedures use the `DBMS_SQL` package.

Example : Using DBMS_SQL Demo

This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The `DEMO` procedure deletes all of the employees from the `EMP` table whose salaries are greater than the salary that you specify when you run `DEMO`.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
    cursor_name INTEGER;
    rows_processed INTEGER;
BEGIN
    cursor_name := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
        DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(string IN varchar2) AS
    cursor_name INTEGER;
```

```

    ret INTEGER;
BEGIN
    cursor_name := DBMS_SQL.OPEN_CURSOR;

```

DDL statements are run by the parse call, which performs the implied commit.

```

    DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
    ret := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;

```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@domain.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```

id          of type NUMBER
name        of type VARCHAR2(30)
birthdate  of type DATE

```

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

```

CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var      NUMBER;
    name_var    VARCHAR2(30);
    birthdate_var DATE;
    source_cursor INTEGER;
    destination_cursor INTEGER;
    ignore      INTEGER;
BEGIN
    -- Prepare a cursor to select from the source table:
    source_cursor := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(source_cursor,
        'SELECT id, name, birthdate FROM ' || source,
        DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
    ignore := DBMS_SQL.EXECUTE(source_cursor);

```

```

-- Prepare a cursor to insert into the destination table:
destination_cursor := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(destination_cursor,
                'INSERT INTO ' || destination ||
                ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
                DBMS_SQL.NATIVE);

-- Fetch a row from the source table and insert it into the destination table:
LOOP
  IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
    -- get column values of the row
    DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

    -- Bind the row into the cursor that inserts into the destination table. You
    -- could alter this example to require the use of dynamic SQL by inserting an
    -- if condition before the bind.
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                           birthdate_var);
    ignore := DBMS_SQL.EXECUTE(destination_cursor);
  ELSE

    -- No more rows to copy:
    EXIT;
  END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
  WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(source_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(source_cursor);
    END IF;
    IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(destination_cursor);
    END IF;
    RAISE;
END;
/

```

Example 4: RETURNING clause

With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use DBMS_SQL.BIND_VARIABLE to bind these outbinds. To get the values in these bind variables, call DBMS_SQL.VARIABLE_VALUE

 **Note:**

This process is similar to `DBMS_SQL.VARIABLE_VALUE`, which must be called after running a PL/SQL block with an outbind inside `DBMS_SQL`.

i) Single-row insert

```
CREATE OR REPLACE PROCEDURE single_Row_insert
  (c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/
```

ii) Single-row update

```
CREATE OR REPLACE PROCEDURE single_Row_update
  (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
      'WHERE rownum < 2 ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/
```

iii) Single-row delete

```
CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n number;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
      'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
    n := DBMS_SQL.EXECUTE(c);
```

```

        DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
        DBMS_SQL.CLOSE_CURSOR(c);
    END;
/

```

iv) Multiple-row insert

```

CREATE OR REPLACE PROCEDURE multi_Row_insert
    (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
     r OUT DBMS_SQL.NUMBER_TABLE) IS
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
    DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
    DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

v) Multiple-row update.

```

CREATE OR REPLACE PROCEDURE multi_Row_update
    (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

Note:

bnd1 and bnd2 can be arrays too. The value of the expression for all the rows updated will be in bnd3. There is no way to determine which rows were updated for each value of bnd1 and bnd2.

vi) Multiple-row delete

```

CREATE OR REPLACE PROCEDURE multi_row_delete
    (c1 DBMS_SQL.NUMBER_TABLE,
     r OUT DBMS_SQL.NUMBER_TABLE) IS
    c NUMBER;
    n NUMBER;

```

```

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

vii) outbind in bulk PL/SQL

```

CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
  (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/

```

Note:

DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 5: Binds and Defines of User-defined Types in DBMS_SQL

```

CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts VALUES('Asia',
dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
  some_dnames dnames_var;
  c          NUMBER;
  r          NUMBER;
  sql_stmt  VARCHAR2(32767) :=

```

```
'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
INTO :b3';

BEGIN

    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
    DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

    r := DBMS_SQL.EXECUTE(c);

    -- Get value of outbind variable
    DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- select dept_names
    sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

    r := DBMS_SQL.EXECUTE_AND_FETCH(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through some_dnames collections
    FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
        DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
    END LOOP;
END;
/

DECLARE
    new_dnames dnames_var;
BEGIN
    new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                             'Executive', 'Marketing');
    update_depts(new_dnames, 'Asia');
END;
/
```

157.8 DBMS_SQL Data Structures

The `DBMS_SQL` package defines `RECORD` type and `TABLE` type data structures.

RECORD Types

- [DBMS_SQL DESC_REC Record Type](#) (deprecated)
- [DBMS_SQL DESC_REC2 Record Type](#)

- [DBMS_SQL DESC_REC3 Record Type](#)
- [DBMS_SQL DESC_REC4 Record Type](#)

TABLE Types for DESCRIBE_COLUMNS Procedures

- [DBMS_SQL DESC_TAB Table Type](#)
- [DBMS_SQL DESC_TAB2 Table Type](#)
- [DBMS_SQL DESC_TAB3 Table Type](#)
- [DBMS_SQL DESC_TAB4 Table Type](#)

TABLE Types For Scalar and LOB Collections

DBMS_SQL bulk operations are only supported with these predefined DBMS_SQL TABLE types.

- [BFILE_TABLE Table Type](#)
- [BINARY_DOUBLE_TABLE Table Type](#)
- [BINARY_FLOAT_TABLE Table Type](#)
- [BLOB_TABLE Table Type](#)
- [CLOB_TABLE Table Type](#)
- [DATE_TABLE Table Type](#)
- [INTERVAL_DAY_TO_SECOND_TABLE Table Type](#)
- [INTERVAL_YEAR_TO_MONTH_TABLE Table Type](#)
- [NUMBER_TABLE Table Type](#)
- [TIME_TABLE Table Type](#)
- [TIME_WITH_TIME_ZONE_TABLE Table Type](#)
- [TIMESTAMP_TABLE Table Type](#)
- [TIMESTAMP_WITH_LTZ_TABLE Table Type](#)
- [TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type](#)
- [UROWID_TABLE Table Type](#)
- [VARCHAR2_TABLE Table Type](#)
- [VARCHAR2A Table Type](#)
- [VARCHAR2S Table Type](#)

157.8.1 DBMS_SQL DESC_REC Record Type

This record type holds the describe information for a single column in a dynamic query.

Note:

This type has been deprecated in favor of the [DESC_REC2 Record Type](#).

It is the element type of the `DESC_TAB` table type and the [DESCRIBE_COLUMNS Procedure](#).

Syntax

```
TYPE desc_rec IS RECORD (
    col_type          BINARY_INTEGER := 0,
    col_max_len       BINARY_INTEGER := 0,
    col_name          VARCHAR2(32)   := '',
    col_name_len      BINARY_INTEGER := 0,
    col_schema_name   VARCHAR2(32)   := '',
    col_schema_name_len BINARY_INTEGER := 0,
    col_precision     BINARY_INTEGER := 0,
    col_scale         BINARY_INTEGER := 0,
    col_charsetid     BINARY_INTEGER := 0,
    col_charsetform   BINARY_INTEGER := 0,
    col_null_ok       BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Fields

Table 157-2 DESC_REC Fields

Field	Description
<code>col_type</code>	Type of column
<code>col_max_len</code>	Maximum column length
<code>col_name</code>	Name of column
<code>col_name_len</code>	Length of column name
<code>col_schema_name</code>	Column schema name
<code>col_schema_name_len</code>	Length of column schema name
<code>col_precision</code>	Precision of column
<code>col_scale</code>	Scale of column
<code>col_charsetid</code>	Column character set id
<code>col_charsetform</code>	Column character set form
<code>col_null_ok</code>	NULL column flag; TRUE, if NULL possible

157.8.2 DBMS_SQL DESC_REC2 Record Type

`DESC_REC2` is the element type of the `DESC_TAB2` table type and the `DESCRIBE_COLUMNS2 Procedure`.

This record type is identical to `DESC_REC` except for the `col_name` field, which has been expanded to the maximum possible size for `VARCHAR2`. It is therefore preferred to `DESC_REC` because column name values can be greater than 32 characters. `DESC_REC` is deprecated as a result.

Syntax

```
TYPE desc_rec2 IS RECORD (
    col_type          binary_integer := 0,
    col_max_len       binary_integer := 0,
    col_name          varchar2(32767) := '',
```

```

col_name_len      binary_integer := 0,
col_schema_name   varchar2(32)   := '',
col_schema_name_len binary_integer := 0,
col_precision     binary_integer := 0,
col_scale         binary_integer := 0,
col_charsetid     binary_integer := 0,
col_charsetform   binary_integer := 0,
col_null_ok       boolean       := TRUE);

```

Fields

Table 157-3 DESC_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

Related Topics

- [DESCRIBE_COLUMNS2 Procedure](#)
This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

157.8.3 DBMS_SQL DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (`type_name`) and type name len (`type_name_len`) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The `col_type_name` and `col_type_name_len` fields are only populated when the `col_type` field's value is 109, the Oracle type number for user-defined types.

Syntax

```

TYPE desc_rec3 IS RECORD (
  col_type      binary_integer := 0,
  col_max_len   binary_integer := 0,
  col_name      varchar2(32767) := '',
  col_name_len  binary_integer := 0,
  col_schema_name varchar2(32) := '',

```

```

col_schema_name_len    binary_integer := 0,
col_precision          binary_integer := 0,
col_scale              binary_integer := 0,
col_charsetid          binary_integer := 0,
col_charsetform        binary_integer := 0,
col_null_ok            boolean := TRUE,
col_type_name          varchar2(32767) := '',
col_type_name_len      binary_integer := 0);

```

Fields

Table 157-4 DESC_REC3 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set ID
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible
col_type_name	User-define type column type name, this field is valid when col_type is 109
col_type_name_len	Length of user-define type column type name, this field is valid when col_type is 109

Related Topics

- [DESCRIBE_COLUMNS3 Procedure](#)
This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

157.8.4 DBMS_SQL DESC_REC4 Record Type

DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC4 is identical to DESC_REC3 except that it supports longer identifiers in the fields that hold the schema name (col_schema_name) and type name (col_type_name) of a column in a dynamic query.

Syntax

```

TYPE desc_rec4 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,

```

```

col_schema_name      DBMS_ID := '',
col_schema_name_len  binary_integer := 0,
col_precision        binary_integer := 0,
col_scale            binary_integer := 0,
col_charsetid        binary_integer := 0,
col_charsetform      binary_integer := 0,
col_null_ok          boolean := TRUE,
col_type_name        DBMS_ID := '',
col_type_name_len    binary_integer := 0);

```

See Also:

Oracle Database PL/SQL Language Reference for more information about the predefined subtype `DBMS_ID`.

Fields

Table 157-5 DESC_REC4 Fields

Field	Description
<code>col_type</code>	Type of column
<code>col_max_len</code>	Maximum column length
<code>col_name</code>	Name of column
<code>col_name_len</code>	Length of column name
<code>col_schema_name</code>	Column schema name
<code>col_schema_name_len</code>	Length of column schema name
<code>col_precision</code>	Precision of column
<code>col_scale</code>	Scale of column
<code>col_charsetid</code>	Column character set ID
<code>col_charsetform</code>	Column character set form
<code>col_null_ok</code>	NULL column flag; TRUE, if NULL possible
<code>col_type_name</code>	User-define type column type name, this field is valid when <code>col_type</code> is 109
<code>col_type_name_len</code>	Length of user-define type column type name, this field is valid when <code>col_type</code> is 109

Related Topics

- [DESCRIBE_COLUMNS3 Procedure](#)
This procedure describes the specified column. This is an alternative to `DESCRIBE_COLUMNS` Procedure.

157.8.5 DBMS_SQL BFILE_TABLE Table Type

This is a table of `BFILE`.

Syntax

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

157.8.6 DBMS_SQL BINARY_DOUBLE_TABLE Table Type

This is a table of BINARY_DOUBLE.

Syntax

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

157.8.7 DBMS_SQL BINARY_FLOAT_TABLE Table Type

This is a table of BINARY_FLOAT.

Syntax

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

157.8.8 DBMS_SQL BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

157.8.9 DBMS_SQL CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

157.8.10 DBMS_SQL DATE_TABLE Table Type

This is a table of DATE.

Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

157.8.11 DBMS_SQL DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC Record Type](#)
This record type holds the describe information for a single column in a dynamic query.

157.8.12 DBMS_SQL DESC_TAB2 Table Type

This is a table of DESC_REC2 Record Type.

Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC2 Record Type](#)
DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

157.8.13 DBMS_SQL DESC_TAB3 Table Type

This is a table of DESC_REC3 Record Type.

Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC3 Record Type](#)
DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

157.8.14 DBMS_SQL DESC_TAB4 Table Type

This is a table of DBMS_SQL DESC_REC4 Record Type.

Syntax

```
TYPE DESC_TAB4 IS TABLE OF DESC_REC4 INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC4 Record Type](#)
DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

157.8.15 DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of DSINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF  
DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

157.8.16 DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of `YMINTERVAL_UNCONSTRAINED`.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;
```

157.8.17 DBMS_SQL NUMBER_TABLE Table Type

This is a table of `NUMBER`.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

157.8.18 DBMS_SQL TIME_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

157.8.19 DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;;
```

157.8.20 DBMS_SQL TIMESTAMP_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

157.8.21 DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of `TIMESTAMP_LTZ_UNCONSTRAINED`

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF  
TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

157.8.22 DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF  
TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

157.8.23 DBMS_SQL UROWID_TABLE Table Type

This is a table of `UROWID`.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

157.8.24 DBMS_SQL VARCHAR2_TABLE Table Type

This is table of `VARCHAR2(2000)`.

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

157.8.25 DBMS_SQL VARCHAR2A Table Type

This is table of `VARCHAR2(32767)`.

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

157.8.26 DBMS_SQL VARCHAR2S Table Type

This is table of `VARCHAR2(256)`.

Note:

This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

157.9 Summary of DBMS_SQL Subprograms

This table lists the DBMS_SQL subprograms and briefly describes them.

Table 157-6 DBMS_SQL Package Subprograms

Subprogram	Description
BIND_ARRAY Procedures	Binds a given value to a given collection.
BIND_VARIABLE Procedures	Binds a given value to a given variable.
BIND_VARIABLE_PKG Procedure	Binds a given value to a given package variable.
CLOSE_CURSOR Procedure	Closes given cursor and frees memory.
COLUMN_VALUE Procedure	Returns value of the cursor element for a given position in a cursor.
COLUMN_VALUE_LONG Procedure	Returns a selected part of a LONG column, that has been defined using DEFINE_COLUMN_LONG .
DEFINE_ARRAY Procedure	Defines a collection to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN Procedures	Defines a column to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_CHAR Procedure	Defines a column of type CHAR to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_LONG Procedure	Defines a LONG column to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_RAW Procedure	Defines a column of type RAW to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_ROWID Procedure	Defines a column of type ROWID to be selected from the given cursor, used only with SELECT statements.
DESCRIBE_COLUMNS Procedure	Describes the columns for a cursor opened and parsed through DBMS_SQL.
DESCRIBE_COLUMNS2 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure.
DESCRIBE_COLUMNS3 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure.
EXECUTE Function	Executes a given cursor.
EXECUTE_AND_FETCH Function	Executes a given cursor and fetch rows.
FETCH_ROWS Function	Fetches a row from a given cursor.
GET_NEXT_RESULT Procedures	Gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.
IS_OPEN Function	Returns TRUE if given cursor is open.
LAST_ERROR_POSITION Function	Returns byte offset in the SQL statement text where the error occurred.
LAST_ROW_COUNT Function	Returns cumulative count of the number of rows fetched
LAST_ROW_ID Function	Returns ROWID of last row processed.

Table 157-6 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
LAST_SQL_FUNCTION_CODE Function	Returns SQL function code for statement.
OPEN_CURSOR Functions	Returns cursor ID number of new cursor.
PARSE Procedures	Parses given statement.
RETURN_RESULT Procedures	Returns the result of an executed statement to the client application.
TO_CURSOR_NUMBER Function	Takes an OPENED strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.
TO_REFCURSOR Function	Takes an OPENED, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.
VARIABLE_VALUE Procedures	Returns value of named variable for given cursor.
VARIABLE_VALUE_PKG Procedure	Returns value of named variable for given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification.

157.9.1 BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
    c                IN INTEGER,
    name             IN VARCHAR2,
    <table_variable> IN <datatype>
    [,index1        IN INTEGER,
    index2          IN INTEGER]) );
```

Where the <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>      Clob_Table
<bflt_tab>      Binary_Float_Table
<bdbl_tab>      Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>    Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
<tm_tab>       Time_Table
<ttz_tab>      Time_With_Time_Zone_Table
<tms_tab>      Timestamp_Table
<tstz_tab>     Timestamp_With_ltz_Table
<tstz_tab>     Timestamp_With_Time_Zone_Table
```

```
<ids_tab>      Interval_Day_To_Second_Table
<iym_tab>      Interval_Year_To_Month_Table
```

Notice that the `BIND_ARRAY` procedure is overloaded to accept different datatype.

Parameters

Table 157-7 BIND_ARRAY Procedure Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to which you want to bind a value.
<code>name</code>	Name of the collection in the statement.
<code>table_variable</code>	Local variable that has been declared as <code><datatype></code> .
<code>index1</code>	Index for the table element that marks the lower bound of the range.
<code>index2</code>	Index for the table element that marks the upper bound of the range.

Usage Notes

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local

DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```

TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
    IS TABLE OF dsinterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
    IS TABLE OF yminterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
    IS TABLE OF time_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_table
    IS TABLE OF timestamp_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
    IS TABLE OF timestamp_ltz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
    IS TABLE OF timestamp_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

Example 157-1 Examples Using Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

```

DECLARE
    stmt VARCHAR2(200);
    empno_array DBMS_SQL.NUMBER_TABLE;
    empname_array DBMS_SQL.VARCHAR2_TABLE;
    jobs_array DBMS_SQL.VARCHAR2_TABLE;
    mgr_array DBMS_SQL.NUMBER_TABLE;
    hiredate_array DBMS_SQL.VARCHAR2_TABLE;
    sal_array DBMS_SQL.NUMBER_TABLE;
    comm_array DBMS_SQL.NUMBER_TABLE;
    deptno_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
BEGIN

```

```
empno_array(1) := 9001;
empno_array(2) := 9002;
empno_array(3) := 9003;
empno_array(4) := 9004;
empno_array(5) := 9005;
empno_array(6) := 9006;
empno_array(7) := 9007;

empname_array(1) := 'Dopey';
empname_array(2) := 'Grumpy';
empname_array(3) := 'Doc';
empname_array(4) := 'Happy';
empname_array(5) := 'Bashful';
empname_array(6) := 'Sneezy';
empname_array(7) := 'Sleepy';

jobs_array(1) := 'Miner';
jobs_array(2) := 'Miner';
jobs_array(3) := 'Miner';
jobs_array(4) := 'Miner';
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1) := 1000;
sal_array(2) := 1000;
sal_array(3) := 1000;
sal_array(4) := 1000;
sal_array(5) := 1000;
sal_array(6) := 1000;
sal_array(7) := 1000;

comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

deptno_array(1) := 11;
deptno_array(2) := 11;
deptno_array(3) := 11;
deptno_array(4) := 11;
deptno_array(5) := 11;
```

```

deptno_array(6) := 11;
deptno_array(7) := 11;

stmt := 'INSERT INTO emp VALUES(
        :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
        :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;

```

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```

DECLARE
    stmt VARCHAR2(200);
    empno_array    DBMS_SQL.NUMBER_TABLE;
    salary_array   DBMS_SQL.NUMBER_TABLE;
    c              NUMBER;
    dummy         NUMBER;
BEGIN

    empno_array(1) := 7369;
    empno_array(2) := 7876;
    empno_array(3) := 7900;
    empno_array(4) := 7934;

    salary_array(1) := 10000;
    salary_array(2) := 10000;
    salary_array(3) := 10000;
    salary_array(4) := 10000;

    stmt := 'update emp set sal = :salary_array
            WHERE empno = :num_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
    DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;

```

```

        END IF;
        RAISE;
    END;
/

```

In a DELETE statement, for example, you could bind an array in the WHERE clause and have the statement be run for each element in the array:

```

DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
begin
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/

```

In the preceding example, only elements 1 through 4 are used as specified by the BIND_ARRAY call. Each element of the array potentially deletes a large number of employees from the database.

157.9.2 BIND_VARIABLE Procedures

These procedures bind a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```

DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name       IN VARCHAR2,
    value      IN <datatype>);

```

Where <datatype> can be any one of the following types:

```

ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table

```

```

NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED

```

Notice that `BIND_VARIABLE` is overloaded to accept different datatype.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets `[]` indicate an optional parameter for the `BIND_VARIABLE` procedure.

```

DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);

```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```

DBMS_SQL.BIND_VARIABLE_CHAR (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);

```

```

DBMS_SQL.BIND_VARIABLE_RAW (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN RAW [,out_value_size IN INTEGER]);

```

```

DBMS_SQL.BIND_VARIABLE_ROWID (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN ROWID);

```

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 157-8 BIND_VARIABLE Procedures Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to which you want to bind a value.
<code>name</code>	Name of the variable in the statement. The length of the bind variable name must be <=30 bytes.
<code>value</code>	Value that you want to bind to the variable in the cursor. For <code>IN</code> and <code>IN/OUT</code> variables, the value has the same type as the type of the value being passed in for this parameter.

Table 157-8 (Cont.) BIND_VARIABLE Procedures Parameters

Parameter	Description
out_value_size	Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

157.9.3 BIND_VARIABLE_PKG Procedure

This procedure binds a variable given value or set of values to a given variable in a cursor, based on the name of the variable in the statement. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.BIND_VARIABLE_PKG (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN <datatype>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Table 157-9 BIND_VARIABLE_PKG Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable in the statement for which you are retrieving the value.
value	<ul style="list-style-type: none"> Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. Array option: Local variable that has been declared <code><table_type></code>

Example 157-2 Dynamic SQL using DBMS_SQL.BIND_VARIABLE_PKG to Bind a Package Variable

The variables types are declared in the package specification. The `BIND_VARIABLE_PKG` is used to bind the variable `v1` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
    TYPE rec IS RECORD ( n1 NUMBER, n2 NUMBER);
    TYPE trec IS TABLE OF REC INDEX BY BINARY_INTEGER;
    TYPE trecv IS TABLE OF NUMBER;
    TYPE trecv IS VARRAY(100) OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_ibbi AS
    dummy NUMBER;
    cur NUMBER;
    v1 ty_pkg.trec;
    str VARCHAR2(3000);
    n1 NUMBER;
    n2 NUMBER;
BEGIN
    FOR i in 1..3 LOOP
        v1(i).n1 := i*10;
        v1(i).n2 := i*20;
    END LOOP;
    str := 'SELECT * FROM TABLE(:v1)';
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.DEFINE_COLUMN(cur, 1, n1);
    DBMS_SQL.DEFINE_COLUMN(cur, 2, n2);

    LOOP
        IF DBMS_SQL.FETCH_ROWS(cur) > 0 THEN
            -- get column values of the row
```

```

        DBMS_SQL.COLUMN_VALUE(cur, 1, n1);
        DBMS_SQL.COLUMN_VALUE(cur, 2, n2);
        DBMS_OUTPUT.PUT_LINE('n1 = ' || n1 || ' n2 = ' || n2);
    ELSE
        -- No more rows
        EXIT;
    END IF;
END LOOP;
DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_ibbi;
/
EXEC dyn_sql_ibbi;

n1 = 10 n2 = 20
n1 = 20 n2 = 40
n1 = 30 n2 = 60

```

157.9.4 CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```
DBMS_SQL.CLOSE_CURSOR (
    c      IN OUT INTEGER);
```

Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

Table 157-10 CLOSE_CURSOR Procedure Parameters

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

157.9.5 COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling FETCH_ROWS.

Syntax

```
DBMS_SQL.COLUMN_VALUE (
    c                IN  INTEGER,
    position         IN  INTEGER,
    value            OUT <datatype>
    [,column_error  OUT NUMBER]
    [,actual_length OUT INTEGER]);
```

Where square brackets [] indicate optional parameters and <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT CHAR CHARACTER SET ANY_CS
    [,column_error  OUT NUMBER]
    [,actual_length  OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT RAW
    [,column_error  OUT NUMBER]
    [,actual_length  OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_ROWID (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT ROWID
    [,column_error  OUT NUMBER]
    [,actual_length  OUT INTEGER]);
```

The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE(
    c           IN           INTEGER,
    position    IN           INTEGER,
    <param_name> IN OUT NOCOPY <table_type>);
```

Where the <param_name> and its corresponding <table_type> can be any one of these matching pairs:

```
bdbl_tab      Binary_Double_Table
bflt_tab      Binary_Float_Table
```

bf_tab	Bfile_Table
bl_tab	Blob_Table
cl_tab	Clob_Table
d_tab	Date_Table
ids_tab	Interval_Day_To_Second_Table
iy_m_tab	Interval_Year_To_Month_Table
n_tab	Number_Table
tm_tab	Time_Table
ttz_tab	Time_With_Time_Zone_Table
tms_tab	Timestamp_Table
tstz_tab	Timestamp_With_ltz_Table
tstz_tab	Timestamp_With_Time_Zone_Table
ur_tab	Urowid_Table
c_tab	Varchar2_Table

Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

Table 157-11 COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
value	Returns the value at the specified column. Oracle raises exception ORA-06562, <i>inconsistent_type</i> , if the type of this output parameter differs from the actual type of the value, as defined by the call to <i>DEFINE_COLUMN</i> .
column_error	Returns any error code for the specified column value.
actual_length	The actual length, before any truncation, of the value in the specified column.

Table 157-12 COLUMN_VALUE Procedure Parameters (Bulk)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
<param_name>	Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the <i>cnt</i> parameter) of 10 rows was specified and a start index (<i>lower_bound</i>) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

Exceptions

`INCONSISTENT_TYPE` (ORA-06562) is raised if the type of the given `OUT` parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure `DEFINE_COLUMN`.

157.9.6 COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (
  c           IN  INTEGER,
  position   IN  INTEGER,
  length     IN  INTEGER,
  offset     IN  INTEGER,
  value      OUT VARCHAR2,
  value_length OUT INTEGER);
```

Pragmas

```
pragma restrict_references(column_value_long,RNDS,WNDS);
```

Parameters

Table 157-13 COLUMN_VALUE_LONG Procedure Parameters

Parameter	Description
<code>c</code>	Cursor ID number of the cursor from which to get the value.
<code>position</code>	Position of the column of which to get the value.
<code>length</code>	Number of bytes of the long value to fetch.
<code>offset</code>	Offset into the long field for start of fetch.
<code>value</code>	Value of the column as a <code>VARCHAR2</code> .
<code>value_length</code>	Number of bytes actually returned in value.

157.9.7 DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a `FETCH_ROWS` call). This procedure lets you do batch fetching of rows from a single `SELECT` statement. A single fetch call brings over a number of rows into the `PL/SQL` aggregate object.

When you fetch the rows, they are copied into `DBMS_SQL` buffers until you run a `COLUMN_VALUE` call, at which time the rows are copied into the table that was passed as an argument to the `COLUMN_VALUE` call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using `DBMS_SQL`. (These are the same types as you can specify for the `BIND_ARRAY` procedure.)

```

TYPE binary_double_table
           IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
           IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
           IS TABLE OF dsinterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
           IS TABLE OF yminterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
           IS TABLE OF time_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_table
           IS TABLE OF timestamp_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
           IS TABLE OF timestamp_ltz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
           IS TABLE OF timestamp_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

Syntax

```

DBMS_SQL.DEFINE_ARRAY (
    c           IN INTEGER,
    position    IN INTEGER,
    <table_variable> IN <datatype>
    cnt         IN INTEGER,
    lower_bnd   IN INTEGER);

```

Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs, DEFINE_ARRAY being overloaded to accept different datatypes:

```

<clob_tab>      Clob_Table
<bflt_tab>      Binary_Float_Table
<bdbl_tab>      Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>     Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Vvarchar2_Table
<tm_tab>       Time_Table
<ttz_tab>     Time_With_Time_Zone_Table
<tms_tab>      Timestamp_Table
<tstz_tab>     Timestamp_With_ltz_Table
<tstz_tab>     Timestamp_With_Time_Zone_Table
<ids_tab>     Interval_Day_To_Second_Table
<iym_tab>     Interval_Year_To_Month_Table

```

Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent `FETCH_ROWS` call fetch "count" rows. When the `COLUMN_VALUE` call is made, these rows are placed in positions `lower_bnd`, `lower_bnd+1`, `lower_bnd+2`, and so on. While there are still rows coming, the user keeps issuing `FETCH_ROWS/COLUMN_VALUE` calls. The rows keep accumulating in the table specified as an argument in the `COLUMN_VALUE` call.

Parameters

Table 157-14 DEFINE_ARRAY Procedure Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to which you want to bind an array.
<code>position</code>	Relative position of the column in the array being defined. The first column in a statement has position 1.
<code>table_variable</code>	Local variable that has been declared as <code><datatype></code> .
<code>cnt</code>	Number of rows that must be fetched.
<code>lower_bnd</code>	Results are copied into the collection, starting at this lower bound index.

Usage Notes

The count (`cnt`) must be an integer greater than zero; otherwise an exception is raised. The `lower_bnd` can be positive, negative, or zero. A query on which a `DEFINE_ARRAY` call was issued cannot contain array binds.

Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
  TYPE namelist IS TABLE OF employees.last_name%TYPE;
  TYPE sallist IS TABLE OF employees.salary%TYPE;
  names      namelist;
  sals       sallist;
  c          NUMBER;
  r          NUMBER;
  sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

  DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

  DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
  DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

  r := DBMS_SQL.EXECUTE(c);

  LOOP
    r := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, names);
    DBMS_SQL.COLUMN_VALUE(c, 2, sals);
```

```

        EXIT WHEN r != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST LOOP
        DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/

```

Example 157-3 Example: Defining an Array

The following examples show how to use the `DEFINE_ARRAY` procedure:

```

declare
    c          NUMBER;
    d          NUMBER;
    n_tab     DBMS_SQL.NUMBER_TABLE;
    indx      NUMBER := -10;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

    d := DBMS_SQL.EXECUTE(c);
    loop
        d := DBMS_SQL.FETCH_ROWS(c);

        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

        EXIT WHEN d != 10;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/

```

Each time the preceding example calls [FETCH_ROWS Function](#), it fetches 10 rows that are kept in `DBMS_SQL` buffers. When the [COLUMN_VALUE Procedure](#) is called, those rows move into the PL/SQL table specified (in this case `n_tab`), at positions -10 to -1, as specified in the `DEFINE` statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at `EXECUTE` time and is updated every time `COLUMN_VALUE` is called. If you reexecute at any point, then the current index for each `DEFINE` is reinitialized to "indx".

In this way the entire result of the query is fetched into the table. When `FETCH_ROWS` cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the `DEFINE_ARRAY` procedure:

Consider a table MULTI_TAB defined as:

```
CREATE TABLE multi_tab (num NUMBER,  
                        dat1 DATE,  
                        var VARCHAR2(24),  
                        dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
DECLARE  
  c      NUMBER;  
  d      NUMBER;  
  n_tab  DBMS_SQL.NUMBER_TABLE;  
  d_tab1 DBMS_SQL.DATE_TABLE;  
  v_tab  DBMS_SQL.VARCHAR2_TABLE;  
  d_tab2 DBMS_SQL.DATE_TABLE;  
  indx  NUMBER := 10;  
BEGIN  
  
  c := DBMS_SQL.OPEN_CURSOR;  
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);  
  
  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);  
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);  
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);  
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);  
  
  d := DBMS_SQL.EXECUTE(c);  
  
  LOOP  
    d := DBMS_SQL.FETCH_ROWS(c);  
  
    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);  
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);  
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);  
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);  
  
    EXIT WHEN d != 5;  
  END LOOP;  
  
  DBMS_SQL.CLOSE_CURSOR(c);  
  
  /*  
  
  The four tables can be used for anything. One usage might be to use BIND_ARRAY  
  to move the rows to another table by using a statement such as 'INSERT into SOME_T  
  values (:a, :b, :c, :d);  
  
  */  
  
  EXCEPTION WHEN OTHERS THEN  
    IF DBMS_SQL.IS_OPEN(c) THEN  
      DBMS_SQL.CLOSE_CURSOR(c);  
    END IF;  
    RAISE;  
END;  
/
```

157.9.8 DEFINE_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN (  
    c           IN INTEGER,  
    position    IN INTEGER,  
    column      IN <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE  
BINARY_FLOAT  
BFILE  
BLOB  
CLOB CHARACTER SET ANY_CS  
DATE  
DSINTERVAL_UNCONSTRAINED  
NUMBER  
TIME_UNCONSTRAINED  
TIME_TZ_UNCONSTRAINED  
TIMESTAMP_LTZ_UNCONSTRAINED  
TIMESTAMP_TZ_UNCONSTRAINED  
TIMESTAMP_UNCONSTRAINED  
UROWID  
YMINTERVAL_UNCONSTRAINED  
user-defined object types  
collections (VARRAYs and nested tables)  
REFs  
Opaque types
```

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```
DBMS_SQL.DEFINE_COLUMN (  
    c           IN INTEGER,  
    position    IN INTEGER,  
    column      IN VARCHAR2 CHARACTER SET ANY_CS,  
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 157-15 DEFINE_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of type VARCHAR2.

Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type VARCHAR2 is calculated as: `column_size * maximum character byte size for the current character set`. For example, specifying the `column_size` as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

157.9.9 DEFINE_COLUMN_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN CHAR CHARACTER SET ANY_CS,
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 157-16 DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected

Table 157-16 (Cont.) DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in characters for columns of type CHAR.

157.9.10 DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (
    c           IN INTEGER,
    position    IN INTEGER);
```

Parameters

Table 157-17 DEFINE_COLUMN_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

157.9.11 DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor.

This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
    c           IN INTEGER,
    position    IN INTEGER,
```

```
column          IN RAW,
column_size    IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 157-18 DEFINE_COLUMN_RAW Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of RAW type.

157.9.12 DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type ROWID to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_RAW Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
    c          IN INTEGER,
    position   IN INTEGER,
    column     IN ROWID);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 157-19 DEFINE_COLUMN_ROWID Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.

157.9.13 DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (
  c           IN INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT DESC_TAB);
```

Parameters

Table 157-20 DESCRIBE_COLUMNS Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described
col_cnt	Number of columns in the select list of the query
desc_t	Describe table to fill in with the description of each of the columns of the query

Example 157-4 Describe Columns

This code can be used as a substitute to the SQL*Plus DESCRIBE call by using a SELECT * query on the table that you want to describe.

```
DECLARE
  c           NUMBER;
  d           NUMBER;
  col_cnt    INTEGER;
  f           BOOLEAN;
  rec_tab    DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
  PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
  BEGIN
    DBMS_OUTPUT.NEW_LINE;
    DBMS_OUTPUT.PUT_LINE('col_type           = ' || rec.col_type);
    DBMS_OUTPUT.PUT_LINE('col_maxlen       = ' ||
rec.col_max_len);
    DBMS_OUTPUT.PUT_LINE('col_name        = ' || rec.col_name);
    DBMS_OUTPUT.PUT_LINE('col_name_len    = ' ||
rec.col_name_len);
    DBMS_OUTPUT.PUT_LINE('col_schema_name = ' ||
rec.col_schema_name);
    DBMS_OUTPUT.PUT_LINE('col_schema_name_len = ' ||
rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision   = ' ||
rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale       = ' || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok           = ');
    IF (rec.col_null_ok) THEN
      DBMS_OUTPUT.PUT_LINE('true');
```

```

        ELSE
            DBMS_OUTPUT.PUT_LINE('false');
        END IF;
    END;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

    d := DBMS_SQL.EXECUTE(c);

    DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */
    col_num := rec_tab.first;
    IF (col_num IS NOT NULL) THEN
        LOOP
            print_rec(rec_tab(col_num));
            col_num := rec_tab.next(col_num);
            EXIT WHEN (col_num IS NULL);
        END LOOP;
    END IF;

    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

157.9.14 DESCRIBE_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```

DBMS_SQL.DESCRIBE_COLUMNS2 (
    c           IN  INTEGER,
    col_cnt    OUT INTEGER,
    desc_t     OUT DESC_TAB2);

```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

Parameters

Table 157-21 DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.

Table 157-21 (Cont.) DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Related Topics

- [DESCRIBE_COLUMNS Procedure](#)
This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

157.9.15 DESCRIBE_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
    c          IN  INTEGER,
    col_cnt   OUT INTEGER,
    desc_t    OUT DESC_TAB3);
```

```
BMS_SQL.DESCRIBE_COLUMNS3 (
    c          IN  INTEGER,
    col_cnt   OUT INTEGER,
    desc_t    OUT DESC_TAB4);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters**Table 157-22 DESCRIBE_COLUMNS3 Procedure Parameters**

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Usage Notes

The cursor passed in by the cursor ID has to be OPENED and PARSED, otherwise an "invalid cursor id" error is raised.

Examples

```
CREATE TYPE PROJECT_T AS OBJECT
    ( projname          VARCHAR2(20),
```

```

        mgr          VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
    curid          NUMBER;
    desctab        DBMS_SQL.DESC_TAB3;
    colcnt         NUMBER;
    sql_stmt       VARCHAR2(200) := 'select * from projecttab';
BEGIN

    curid := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 109 THEN
            DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
            DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                desctab(i).col_type_name);
        END IF;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

```

Output:

```
PROJECT is user-defined type: HR.PROJECT_T
```

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

157.9.16 EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed.

The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and must be ignored.

Syntax

```

DBMS_SQL.EXECUTE (
    c    IN INTEGER)
RETURN INTEGER;

```

Parameters

Table 157-23 EXECUTE Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to execute.

Return Values

Returns number of rows processed

Usage Notes

The DBMS_SQL cursor that is returned by the [TO_CURSOR_NUMBER Function](#) performs in the same way as a DBMS_SQL cursor that has already been executed. Consequently, calling EXECUTE for this cursor will cause an error.

157.9.17 EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows.

This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (
    c                IN INTEGER,
    exact            IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(execute_and_fetch,WNDS);
```

Parameters

Table 157-24 EXECUTE_AND_FETCH Function Parameters

Parameter	Description
c	ID number of the cursor to execute and fetch.
exact	Set to TRUE to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch TRUE option with LONG columns. Even if an exception is raised, the rows are still fetched and available.

Return Values

Returns designated rows

157.9.18 FETCH_ROWS Function

This function fetches a row from a given cursor.

You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (
    c          IN INTEGER)
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 157-25 `FETCH_ROWS` Function Parameters

Parameter	Description
c	ID number.

Return Values

Returns a row from a given cursor

157.9.19 GET_NEXT_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.

The statements are returned in same order as they are returned by the [RETURN_RESULT Procedures](#).

Syntax

```
DBMS_SQL.GET_NEXT_RESULT(
    c          IN          INTEGER,
    rc         OUT        SYS_REFCURSOR);
```

```
DBMS_SQL.GET_NEXT_RESULT(
    c          IN          INTEGER,
    rc         OUT        INTEGER);
```

Parameters

Table 157-26 GET_NEXT_RESULT Procedure Parameters

Parameter	Description
c	Recursive statement cursor
rc	Cursor or ref cursor of the statement of the next returned result

Exceptions

ORA-01403 no_data_found: This is raised when there is no further returned statement result.

Usage Notes

- After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.
- The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.

Examples

```

DECLARE
  c INTEGER;
  rc SYS_REFCURSOR;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
  DBMS_SQL.PARSE(c           => c,
                 statement   => 'begin proc; end;');
  DBMS_SQL.EXECUTE(c);
  LOOP
    BEGIN
      DBMS_SQL.GET_NEXT_RESULT(c, rc);
    EXCEPTIONS
      WHEN no_data_found THEN
        EXIT;
    END;
    LOOP
      FETCH rc INTO ...
      ...
    END LOOP;
  END LOOP;
END;

```

157.9.20 IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```

DBMS_SQL.IS_OPEN (
  c           IN INTEGER)
RETURN BOOLEAN;

```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 157-27 IS_OPEN Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to check.

Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the [CLOSE_CURSOR Procedure](#) Procedure `NULLS` out the cursor variable passed to it.

Exceptions

ORA-29471 DBMS_SQL access denied: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.

157.9.21 LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Return Values

Returns the byte offset in the SQL statement text where the error occurred

Usage Notes

Call this function after a `PARSE` call, before any other DBMS_SQL procedures or functions are called.

157.9.22 LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Return Values

Returns the cumulative count of the number of rows fetched

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

157.9.23 LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID  
RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Return Values

Returns the ROWID of the last row processed

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call.

157.9.24 LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement.

These codes are listed in the *Oracle Call Interface Programmer's Guide*.

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Return Values

Returns the SQL function code for the statement

Usage Notes

You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

157.9.25 OPEN_CURSOR Functions

This function opens a new cursor.

The `security_level` parameter allows for application of fine-grained control to the security of the opened cursor.

Syntax

```
DBMS_SQL.OPEN_CURSOR (
    treat_as_client_for_results    IN    BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

```
DBMS_SQL.OPEN_CURSOR (
    security_level                IN    INTEGER,
    treat_as_client_for_results    IN    BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

Parameters

Table 157-28 OPEN_CURSOR Function Parameters

Parameter	Description
<code>security_level</code>	<p>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of <code>open_cursor</code> without the <code>security_level</code> parameter, the default security level value 1 will be enforced on the opened cursor.</p> <ul style="list-style-type: none"> Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. Level 1 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. Level 2 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.
<code>treat_as_client_for_results</code>	<p>Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the GET_NEXT_RESULT Procedures.</p>

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

Returns the cursor ID number of the new cursor

Usage Notes

- When you no longer need this cursor, you must close it explicitly by calling the [CLOSE_CURSOR Procedure](#).
- You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

157.9.26 PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are multiple versions of the PARSE procedure:

- Taking a VARCHAR2 statement as an argument
- Taking a segmented string, one taking VARCHAR2A, a TABLE OF VARCHAR2(32767), and another, taking VARCHAR2S, a TABLE OF VARCHAR2(256), as argument. These overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
- Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

Each version has multiple overloads.

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2,
    language_flag    IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    CLOB,
    language_flag    IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2A,
```

```

lb                IN    INTEGER,
ub                IN    INTEGER,
lfflg            IN    BOOLEAN,
language_flag    IN    INTEGER[
[,edition        IN    VARCHAR2 DEFAULT NULL],
  apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
  fire_apply_trigger    IN    BOOLEAN DEFAULT TRUE]
[,schema        IN    VARCHAR2 DEFAULT NULL]
[,container     IN    VARCHAR2)];

DBMS_SQL.PARSE (
  c                IN    INTEGER,
  statement        IN    VARCHAR2s,
  lb                IN    INTEGER,
  ub                IN    INTEGER,
  lfflg            IN    BOOLEAN,
  language_flag    IN    INTEGER[
[,edition        IN    VARCHAR2 DEFAULT NULL],
  apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
  fire_apply_trigger    IN    BOOLEAN DEFAULT TRUE]
[,schema        IN    VARCHAR2 DEFAULT NULL]
[,container     IN    VARCHAR2)];

```

Parameters

Table 157-29 PARSE Procedure Parameters

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs. Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example: DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2); DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);
lb	Lower bound for elements in the statement
ub	Upper bound for elements in the statement
lfflg	If TRUE, then insert a linefeed after each element on concatenation.
language_flag	Specifies the behavior for the SQL statement. For more information about the possible values and its corresponding behaviors, see DBMS_SQL Constants
edition	Specifies the edition in which to run the statement under the following conditions: <ul style="list-style-type: none"> • If NULL and container is NULL, the statement will be run in the current edition. • If a valid container is specified, passing NULL indicates the statement is to run in the target container's default edition. • Given the user and the edition with which the statement is to be executed, the user must have USE privilege on the edition. <p>The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.</p>

Table 157-29 (Cont.) PARSE Procedure Parameters

Parameter	Description
<code>apply_crossedition_trigger</code>	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and <code>current_schema</code> setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement. If a non-NULL value is specified, the specified crossedition trigger will be executed assuming <code>fire_apply_trigger</code> is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's <code>dml_event_clause</code> , any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the trigger's actual name, and if double quotation marks are not used, the contents will be uppercased.
<code>fire_apply_trigger</code>	Indicates whether the specified <code>apply_crossedition_trigger</code> is itself to be executed, or must only be a guide used in selecting other triggers. This is typically set FALSE when the statement is a replacement for the actions the <code>apply_crossedition_trigger</code> would itself perform. If FALSE, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The <code>apply_crossedition_trigger</code> and <code>fire_apply_trigger</code> parameters are ignored if the statement is not a DML.
<code>schema</code>	Specifies the schema in which to resolve unqualified object names. If NULL, the current schema is the effective user's schema.
<code>container</code>	Name of the target container in which the cursor is to run. If NULL or unspecified, the name of the target container is that of the calling container and no container switch is performed. If a valid container name is specified, the current user must be a common user with SET CONTAINER privilege to switch to the target container. If a container switch completes, the effective user will have its default roles.

Usage Notes

- Using DBMS_SQL to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
```

- The `VARCHAR2S` type is currently supported for backward compatibility of legacy code. However, you are advised to use `VARCHAR2A` both for its superior capability and because `VARCHAR2S` will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new `CLOB` overload version of the `PARSE` procedure can be used instead of the `VARCHAR2A` overload.
- If the `container` parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

Exceptions

If you create a type, procedure, function, or package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the PL/SQL unit is still created.

157.9.27 RETURN_RESULT Procedures

This procedure returns the result of an executed statement to the client application.

The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:

- A PL/SQL stored procedure executing the recursive statement using `DBMS_SQL`
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

Syntax

```
DBMS_SQL.RETURN_RESULT(
    rc          IN OUT    SYS_REFCURSOR,
    to_client   IN        BOOLEAN          DEFAULT TRUE);
```

```
DBMS_SQL.RETURN_RESULT(
    rc          IN OUT    INTEGER,
    to_client   IN        BOOLEAN          DEFAULT TRUE);
```

Parameters

Table 157-30 RETURN_RESULT Procedure Parameters

Parameter	Description
<code>rc</code>	Statement cursor or ref cursor
<code>to_client</code>	Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller.

Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.
- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because EXECUTE IMMEDIATE statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the EXECUTE IMMEDIATE statement will be closed when the statement completes. To retrieve the returned statement results from a recursive statement in PL/SQL, use DBMS_SQL to execute the recursive statement.

Examples

```
CREATE PROCEDURE proc AS
  rc1 sys_refcursor;
  rc2 sys_refcursor;
BEGIN
  OPEN rc1 FOR SELECT * FROM t1;
  DBMS_SQL.RETURN_RESULT(rc1);
  OPEN rc2 FOR SELECT * FROM t2;
  DBMS_SQL.RETURN_RESULT(rc2);
END;
/
```

157.9.28 TO_CURSOR_NUMBER Function

This function takes an OPENED strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
  rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

Parameters

Table 157-31 TO_CURSOR_NUMBER Function Parameters

Parameter	Description
rc	REF CURSOR to be transformed into a cursor number

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENED, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```

CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur      CurType;
  curid        NUMBER;
  desctab      DBMS_SQL.DESCTAB;
  colcnt       NUMBER;
  namevar      VARCHAR2(50);
  numvar       NUMBER;
  datevar      DATE;
  empno        NUMBER := 100;
BEGIN

  -- sql_stmt := 'select ..... from employees where employee_id = :b1';
  OPEN src_cur FOR sql_stmt USING empno;

  -- Switch from native dynamic SQL to DBMS_SQL
  curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);

  DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

  -- Define columns
  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 2 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
    ELSIF desctab(i).col_type = 12 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
    .....
    ELSE
      DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
    END IF;
  END LOOP;

  -- Fetch Rows
  WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
      IF (desctab(i).col_type = 1) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
      ELSIF (desctab(i).col_type = 2) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
      ELSIF (desctab(i).col_type = 12) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
      ....
    END IF;
  END LOOP;
END LOOP;

  DBMS_SQL.CLOSE_CURSOR(curid);

```

```
END;
/
```

157.9.29 TO_REFCURSOR Function

This function takes an `OPENED`, `PARSED`, and `EXECUTED` cursor and transforms/migrates it into a PL/SQL manageable `REF CURSOR` (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.

This subprogram is only used with `SELECT` cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
  cursor_number IN OUT INTEGER)
RETURN SYS_REFCURSOR;
```

Parameters

Table 157-32 TO_REFCURSOR Function Parameters

Parameter	Description
<code>cursor_number</code>	Cursor number of the cursor to be transformed into <code>REF CURSOR</code>

Return Values

Returns a PL/SQL `REF CURSOR` transformed from a `DBMS_SQL` cursor number

Usage Notes

- The cursor passed in by the `cursor_number` has to be `OPENED`, `PARSED`, and `EXECUTED`; otherwise an error is raised.
- Once the `cursor_number` is transformed into a `REF CURSOR`, the `cursor_number` is no longer accessible by any `DBMS_SQL` operations.
- After a `cursor_number` is transformed into a `REF CURSOR`, using `DBMS_SQL.IS_OPEN` to check to see if the `cursor_number` is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a `REF CURSOR`.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
  TYPE CurType IS REF CURSOR;
  src_cur      CurType;
  curid        NUMBER;
  sql_stmt     VARCHAR2(200);
  ret          INTEGER;
  empnos       DBMS_SQL.Number_Table;
  depts        DBMS_SQL.Number_Table;
BEGIN

  -- DBMS_SQL.OPEN_CURSOR
  curid := DBMS_SQL.OPEN_CURSOR;

  sql_stmt := 'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where
```

```

MANAGER_ID = :b1';

DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
ret := DBMS_SQL.EXECUTE(curid);

-- Switch from DBMS_SQL to native dynamic SQL
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
  DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
  DBMS_OUTPUT.PUT_LINE('-----');
  -- Loop through the empnos and depts collections
  FOR i IN 1 .. empnos.COUNT LOOP
    DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
  END LOOP;
END IF;
-- Close cursor
CLOSE src_cur;
END;
/

```

157.9.30 VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

Syntax

```

DBMS_SQL.VARIABLE_VALUE (
  c           IN INTEGER,
  name        IN VARCHAR2,
  value       OUT NOCOPY <datatype>);

```

Where <datatype> can be any one of the following types:

```

ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID

```

```

VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED

```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```

DBMS_SQL.VARIABLE_VALUE_CHAR (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT CHAR CHARACTER SET ANY_CS);

```

```

DBMS_SQL.VARIABLE_VALUE_RAW (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT RAW);

```

```

DBMS_SQL.VARIABLE_VALUE_ROWID (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT ROWID);

```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```

DBMS_SQL.VARIABLE_VALUE (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT NOCOPY <table_type>);

```

For bulk operations, <table_type> must be a supported DBMS_SQL predefined TABLE type.

See [DBMS_SQL Data Structures](#)

Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

Parameters

Table 157-33 VARIABLE_VALUE Procedure Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE</code>. Array option: Local variable that has been declared <table_type>. For bulk operations, value is an <code>OUT NOCOPY</code> parameter.

157.9.31 VARIABLE_VALUE_PKG Procedure

This procedure returns the value of the named variable for a given cursor.

It is used to return the values of bind variables of collection or record types inside PL/SQL blocks or DML statements with `returning` clause for a declared package. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.VARIABLE_VALUE_PKG (
  c           IN   INTEGER,
  name        IN   VARCHAR2,
  value       OUT NOCOPY <table_type>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Parameters

Table 157-34 VARIABLE_VALUE_PKG Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> • Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. • Array option: Local variable that has been declared <table_type>.

Example 157-5 Dynamic SQL using DBMS_SQL.VARIABLE_VALUE_PKG to Get the Value of a Bind Variable

The data types are declared in the package specification. The `VARIABLE_VALUE_PKG` is used to get the value of the bind variable `v2` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
TYPE rec IS RECORD
  ( n1 NUMBER,
```

```
        n2 NUMBER);
TYPE trect IS TABLE OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_nt AS
    dummy NUMBER;
    cur    NUMBER;
    v1 ty_pkg.trect;
    v2 ty_pkg.trect;
    str VARCHAR2(3000);
BEGIN
    v1 := ty_pkg.trect(1000);
    str := 'declare v1 ty_pkg.trect; begin v1:=v1; v1(1) :=
2000; :v2 := v1; end;' ;
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v2', v2);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.VARIABLE_VALUE_PKG(cur, ':v2', v2);
    DBMS_OUTPUT.PUT_LINE('n = '
    || v2(1));
    DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_nt;
/
EXEC dyn_sql_nt;

n = 2000
```

DBMS_SQL_MONITOR

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

This chapter contains the following topics:

- [DBMS_SQL_MONITOR Overview](#)
- [DBMS_SQL_MONITOR Security Model](#)
- [DBMS_SQL_MONITOR Constants](#)
- [Summary of DBMS_SQL_MONITOR Subprograms](#)

See Also:

[DBMS_SQLTUNE](#)

158.1 DBMS_SQL_MONITOR Overview

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered high-cost. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in the `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views.

The following subprograms begin and end monitoring of a composite database operation:

- [BEGIN_OPERATION Function](#)
- [END_OPERATION Procedure](#)

The following subprograms report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`:

- [REPORT_SQL_MONITOR Function](#)
- [REPORT_SQL_MONITOR_XML Function](#)
- [REPORT_SQL_MONITOR_LIST Function](#)
- [REPORT_SQL_MONITOR_LIST_XML Function](#)

158.2 DBMS_SQL_MONITOR Security Model

This package is available to `PUBLIC` and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role `SELECT_CATALOG_ROLE`.

158.3 DBMS_SQL_MONITOR Constants

The `DBMS_SQL_MONITOR` package uses the constants shown in the following table.

Table 158-1 DBMS_SQL_MONITOR Constants

Constant	Type	Value	Description
<code>FORCE_TRACKING</code>	<code>VARCHAR2(30)</code>	'Y'	Force track the composite database operation when the operation starts
<code>NO_FORCE_TRACKING</code>	<code>VARCHAR2(30)</code>	'N'	Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time.

158.4 Summary of DBMS_SQL_MONITOR Subprograms

This table lists and describes the `DBMS_SQL_MONITOR` package subprograms.

Table 158-2 DBMS_SQL_MONITOR Package Subprograms

Subprogram	Description
BEGIN_OPERATION Function	This function starts a database operation in the current session.
END_OPERATION Procedure	This function ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.
REPORT_SQL_MONITOR Function	This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.
REPORT_SQL_MONITOR_XML Function	This function is identical to the <code>REPORT_SQL_MONITOR</code> function, except that the return type is <code>XMLType</code> .
REPORT_SQL_MONITOR_LIST Function	This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.
REPORT_SQL_MONITOR_LIST_XML Function	This function is identical to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code> .

158.4.1 BEGIN_OPERATION Function

This function starts a database operation in the current session.

Syntax

```
DBMS_SQL_MONITOR.BEGIN_OPERATION (
    dbop_name          IN VARCHAR2,
    dbop_eid           IN NUMBER    := NULL,
    forced_tracking    IN VARCHAR2  := NO_FORCE_TRACKING,
    attribute_list     IN VARCHAR2  := NULL,
    session_id         IN NUMBER    := NULL,
    session_serial     IN NUMBER    := NULL)
RETURN NUMBER;
```

Parameters

Table 158-3 *BEGIN_OPERATION Procedure Parameters*

Parameter	Description
dbop_name	Name for the composite database operation.
dbop_eid	Unique identifier for the current execution of the composite database operation.
forced_tracking	Whether tracking is forced. Possible values are: <ul style="list-style-type: none"> FORCE_TRACKING - forces the composite database operation to be tracked when the operation starts. You can also use the string variable Y. NO_FORCE_TRACKING - tracks the operation only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable N. See " DBMS_SQL_MONITOR Constants ".
attribute_list	List of user-created attributes. It is a comma-separated list of name-value pairs (for example, 'table_name=emp, operation=load').
session_id	Session ID of the session to be monitored. If omitted (or null), then the database monitors the current session.
session_serial	Serial number of the session to be monitored. If omitted (or null), then the database uses only the session ID to determine the session.

Return Values

This function returns the database operation execution ID. If the value is null for dbop_eid, then the database generates a unique value.

158.4.2 END_OPERATION Procedure

This procedure ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.

Syntax

```
DBMS_SQL_MONITOR.END_OPERATION(
    dbop_name      IN VARCHAR2,
    dbop_eid       IN NUMBER);
```

Parameters

Table 158-4 END_OPERATION Procedure Parameters

Parameter	Description
dbop_name	Name of a composite database operation
dbop_eid	Unique identifier for the current execution of the composite database operation

158.4.3 REPORT_SQL_MONITOR Function

This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle Database (default, no parameter).
- The last database operation executed in the specified session and monitored by Oracle Database. The session is identified by its session ID and optionally its serial number (-1 is current session).
- The last execution of a specific database operation identified by its `sql_id`.
- A specific execution of a database operation identified by the combination `sql_id`, `sql_exec_start`, and `sql_exec_id`.
- The last execution of a specific database operation identified by `dbop_name`.
- The specific execution of a database operation identified by the combination `dbop_name`, `dbop_exec_id`.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (
    sql_id          IN VARCHAR2 DEFAULT NULL,
    dbop_name       IN VARCHAR2 DEFAULT NULL,
    dbop_exec_id    IN NUMBER   DEFAULT NULL,
    session_id      IN NUMBER   DEFAULT NULL,
    session_serial  IN NUMBER   DEFAULT NULL,
```

```

sql_exec_start      IN DATE      DEFAULT NULL,
sql_exec_id        IN NUMBER     DEFAULT NULL,
inst_id            IN NUMBER     DEFAULT NULL,
start_time_filter  IN DATE      DEFAULT NULL,
end_time_filter    IN DATE      DEFAULT NULL,
instance_id_filter IN NUMBER     DEFAULT NULL,
parallel_filter    IN VARCHAR2  DEFAULT NULL,
plan_line_filter   IN NUMBER     DEFAULT NULL,
event_detail       IN VARCHAR2  DEFAULT 'YES',
bucket_max_count   IN NUMBER     DEFAULT 128,
bucket_interval    IN NUMBER     DEFAULT NULL,
base_path          IN VARCHAR2  DEFAULT NULL,
last_refresh_time  IN DATE      DEFAULT NULL,
report_level       IN VARCHAR2  DEFAULT 'TYPICAL',
type              IN VARCHAR2  DEFAULT 'TEXT',
sql_plan_hash_value IN NUMBER     DEFAULT NULL,
con_name          IN VARCHAR2  DEFAULT NULL)
RETURN CLOB;

```

Parameters

Table 158-5 *REPORT_SQL_MONITOR Procedure Parameters*

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed
dbop_exec_id	Execution ID for the composite database operation for which monitoring information is displayed
session_id	Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
sql_exec_start	Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
sql_exec_id	A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
inst_id	Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances.

Table 158-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

Parameter	Description
start_time_filter	If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started.
end_time_filter	If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started before this date. If NULL, the reported activity ends when the targeted database operation has ended or SYSDATE if the operation is still executing.
instance_id_filter	Only looks at activity for the specified instance. Use NULL (the default) to target all instances. Only relevant if the query runs in parallel.
parallel_filter	Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string parallel_filter can be: <ul style="list-style-type: none"> • NULL - target all parallel execution servers as well as the query coordinator • ['qc'] [servers(<svr_grp>[,] <svr_set>[,] <svr_num>)] where any NULL value is interpreted as ALL
plan_line_filter	Selects activity and execution statistics for the specified line number in the plan of a SQL.
event_detail	When set to NO, the activity is aggregated by wait_class only. Use YES (default) to aggregate by wait_class, event_name.
bucket_max_count	Specifies the maximum number of buckets to create in the report
bucket_interval	Represents the exact time interval, in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
base_path	URL path for flex HTML resources since flex HTML format requires access to external files (Java scripts and the flash swf file).
last_refresh_time	If not NULL (default), the time when the report was last retrieved (SYSDATE attribute of the report tag). Use this option when you want to display the report of a running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized: <ul style="list-style-type: none"> • SQL text will not be returned when this option is specified • Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket

Table 158-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

Parameter	Description
report_level	<p>Level of detail for the report. Of the following, only one can be specified:</p> <ul style="list-style-type: none"> NONE: Minimum possible BASIC: This is equivalent to <code>sql_text-plan-xplan-sessions-instance-activity_histogram-plan_histogram-metrics</code> where the token "-" implies that report section will not be included in the report. TYPICAL: Everything but <code>plan_histogram</code> ALL: Everything <p>In addition, individual report sections can also be enabled or disabled by using a <code>±section_name</code>. Several sections are defined:</p> <ul style="list-style-type: none"> XPLAN: Shows explain plan. ON by default. PLAN: Shows plan monitoring statistics. ON by default. SESSIONS: Show session details. Applies only to parallel queries. ON by default. INSTANCE: Shows instance details. Applies only to parallel and cross instance queries. ON by default. PARALLEL: An umbrella parameter for specifying sessions as well as instance details ACTIVITY: Shows activity summary at global level, plan line level and session INSTANCE LEVEL: (If applicable). ON by default. BINDS: Shows bind information when available. ON by default. METRICS: Shows metric data (such as CPU and IOs) over time. ON by default ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default. PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default. OTHER: Other information. ON by default. <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> -SQL_TEXT: No SQL text in report +SQL_TEXT: Alright with partial SQL text, that is, up to the first 2000 chars as stored in <code>GV\$SQL_MONITOR</code> SQL_FULLTEXT: No full SQL text, that is, <code>+sql_text</code> +SQL_FULLTEXT: Show full SQL text (default)
type	<p>Report type:</p> <ul style="list-style-type: none"> TEXT: text report (default) HTML: simple HTML report ACTIVE: database active report. Some information (explain plan, <code>activity_histogram</code>, <code>metrics</code> and <code>plan_histogram</code>) is only shown when this type is selected XML: raw data for the report
sql_plan_hash_value	Targets only those with the specified plan hash value. Default is NULL.
con_name	Container name in a multitenant database.

Return Values

SQL monitor report, an XML document.

Usage Notes

The user invoking this function must have privilege to access the following fixed views:

- GV\$SQL_MONITOR
- GV\$SQL_PLAN_MONITOR
- GV\$ACTIVE_SESSION_HISTORY
- GV\$SESSION_LONGOPS
- GV\$SQL if SQL full text is requested and its length is greater than 2 KB

158.4.4 REPORT_SQL_MONITOR_XML Function

This function is identical to the `REPORT_SQL_MONITOR` function, except that the return type is `XMLType`.

Related Topics

- [REPORT_SQL_MONITOR Function](#)
This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

158.4.5 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

For each database operation, it gives key information and associated global statistics.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (
  sql_id                IN VARCHAR2 DEFAULT NULL,
  dbop_name             IN VARCHAR2 DEFAULT NULL,
  monitor_type          IN NUMBER   DEFAULT MONITOR_TYPE_ALL,
  session_id           IN NUMBER   DEFAULT NULL,
  session_serial       IN NUMBER   DEFAULT NULL,
  inst_id              IN NUMBER   DEFAULT NULL,
  active_since_date    IN DATE     DEFAULT NULL,
  active_since_sec     IN NUMBER   DEFAULT NULL,
  last_refresh_time    IN DATE     DEFAULT NULL,
  report_level         IN VARCHAR2 DEFAULT 'TYPICAL',
  auto_refresh         IN NUMBER   DEFAULT NULL,
  base_path            IN VARCHAR2 DEFAULT NULL,
  type                 IN VARCHAR2 DEFAULT 'TEXT',
  con_name             IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 158-6 *REPORT_SQL_MONITOR_LIST Procedure Parameters*

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last operation monitored by Oracle Database.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed.
monitor_type	Monitor type: <ul style="list-style-type: none"> • MONITOR_TYPE_SQL returns only simple database operations • MONITOR_TYPE_DBOP returns composite database operations • MONITOR_TYPE_ALL returns all types
session_id	Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
inst_id	Looks only at monitored database operations originating from the specified instance. Use -1 to target the instance where the report executed. To target all instances, use NULL (default).
active_since_date	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time.
active_since_sec	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to limit the report to all operations that have been active in the past 1 hour.
last_refresh_time	If not NULL (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, and sql_exec_id). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned.
report_level	Level of detail for the report. The level can be BASIC (SQL text up to 200 character), TYPICAL (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or ALL which is the same as TYPICAL.

Table 158-6 (Cont.) REPORT_SQL_MONITOR_LIST Procedure Parameters

Parameter	Description
auto_refresh	Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types.
base_path	URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash swf file).
type	Report type: <ul style="list-style-type: none"> TEXT: text report (default) HTML: simple HTML report ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics, and plan_histogram) is only shown when this type is selected. XML: raw data for the report
con_name	Container name in a multitenant database.

Return Values

A report in text, XML, or HTML format that contains the list of the database operations monitored.

Usage Notes

- Use the [REPORT_SQL_MONITOR Function](#) to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views GV\$SQL_MONITOR and GV\$SQL.

158.4.6 REPORT_SQL_MONITOR_LIST_XML Function

This function is identical to the REPORT_SQL_MONITOR_LIST function, except that it returns XMLType.

Related Topics

- [REPORT_SQL_MONITOR_LIST Function](#)
This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

DBMS_SQL_TRANSLATOR

The `DBMS_SQL_TRANSLATOR` package provides an interface for creating, configuring, and using SQL translation profiles.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of `DBMS_SQL_TRANSLATOR` Subprograms](#)

See Also:

SQL Translation Framework Architecture and Overview in *Oracle Database Migration Guide*

159.1 DBMS_SQL_TRANSLATOR Security Model

`DBMS_SQL_TRANSLATOR` is an invoker's rights package.

When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the `TRANSLATE SQL` user privilege on the current user.

Additionally, the current user must be granted the `EXECUTE` privilege on the translator package.

159.2 DBMS_SQL_TRANSLATOR Constants

`DBMS_SQL_TRANSLATOR` defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 159-1 DBMS_SQL_TRANSLATOR Constants

Constant	Value	Type	Description
ATTR_EDITIONABLE	'EDITIONABLE'	VARCHAR2(30)	Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner's schema (see Operational Notes)
ATTR_FOREIGN_SQL_SYNTAX	'FOREIGN_SQL_SYNTAX'	VARCHAR2(30)	Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see Operational Notes)
ATTR_LOG_TRANSLATION_ERROR	'TRANSLATION_ERROR'	VARCHAR2(30)	Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see Operational Notes)
ATTR_RAISE_TRANSLATION_ERROR	'TRANSLATION_ERROR'	VARCHAR2(30)	Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see Operational Notes)
ATTR_TRANSLATE_NEW_SQL	'TRANSLATE_NEW_SQL'	VARCHAR2(30)	Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see Operational Notes)
ATTR_TRACE_TRANSLATION	'TRACE_TRANSLATION'	VARCHAR2(30)	Name of the SQL translation profile attribute that controls tracing (see Operational Notes)
ATTR_TRANSLATOR	'TRANSLATOR'	VARCHAR2(30)	Name of the SQL translation profile attribute that specifies the translator package (see Operational Notes)
ATTR_VALUE_TRUE	'TRUE'	VARCHAR2(30)	Value to set a SQL translation profile attribute to true (see Operational Notes)
ATTR_VALUE_FALSE	'FALSE'	VARCHAR2(30)	Value to set a SQL translation profile attribute to false (see Operational Notes)

159.3 DBMS_SQL_TRANSLATOR Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

ATTR_EDITIONABLE Constant

Editable is true by default.

ATTR_FOREIGN_SQL_SYNTAX Constant

Foreign SQL syntax is true by default.

ATTR_LOG_TRANSLATION_ERROR Constant

- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
- Log translation error is false by default.

ATTR_RAISE_TRANSLATION_ERROR Constant

Raise translation error is false by default.

ATTR_TRANSLATE_NEW_SQL Constant

- The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error
- Translate new SQL statements and errors is true by default.

ATTR_TRACE_TRANSLATION Constant

- If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session's trace file.
- Tracing is disabled by default.

ATTR_TRANSLATOR Constant

- The translator package must be a PL/SQL package with the following three procedures. The [TRANSLATE_SQL Procedure](#) and the [TRANSLATE_ERROR Procedure](#) are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

```
PROCEDURE TRANSLATE_SQL(
    sql_text      IN CLOB,
    translated_text OUT CLOB);
```

```
PROCEDURE TRANSLATE_ERROR(
    error_code     IN BINARY_INTEGER,
    translated_code OUT BINARY_INTEGER,
    translated_sqlstate OUT VARCHAR2);
```

Parameters:

```
profile_name      - profile name
sql_text          - SQL statement to be translated
translated_text   - translated SQL statement
error_code        - Oracle error code
translated_code   - translated error code
translated_sqlstate - translated SQLSTATE
```

- When NULL is returned in translated_text, translated_code, or translated_sqlstate, it means that no translation is required and the original SQL statement, error code, or SQLSTATE is used instead.
- The name of the translator package follows the naming rules for database packages of the form [schema.]package_name. When the schema and package

names are used, they are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, `translator => 'dbms_tsql_translator'` is the same as `translator => 'Dbms_Tsql_Translator'` and `translator => 'DBMS_TSQL_TRANSLATOR'`, but not the same as `translator => '"dbms_tsql_translator"'`. The default schema name is the profile owner.

- The translator attribute is not set by default.

ATTR_VALUE_TRUE Constant

The value to set a SQL translation profile attribute to true.

ATTR_VALUE_FALSE Constant

The value to set a SQL translation profile attribute to false.

159.4 DBMS_SQL_TRANSLATOR Exceptions

This table lists the exceptions raised by the `DBMS_SQL_TRANSLATOR` package.

Table 159-2 Exceptions Raised by DBMS_SQL_TRANSLATOR

Exception	Error Code	Description
BAD_ARGUMENT	29261	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	1031	User has insufficient privilege for the operation
NO_SUCH_PROFILE	24252	Profile does not exist
NO_SUCH_USER	1918	Profile owner does not exist
NO_TRANSLATION_FOUND	24253	No translation of the SQL statement or error code found
PROFILE_EXISTS	955	Profile already exists

159.5 DBMS_SQL_TRANSLATOR Examples

This is an example of basic SQL translation using `DBMS_SQL_TRANSLATOR`.

Basic SQL Translation

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
    profile_name => ' tsql_application');
  DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
    profile_name => ' tsql_application',
    attribute_name => DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
    attribute_value => 'migration_repo.sybase_tsql_translator');
END;
```

159.6 Summary of DBMS_SQL_TRANSLATOR Subprograms

This table lists the DBMS_SQL_TRANSLATOR subprograms and briefly describes them.

Table 159-3 DBMS_SQL_TRANSLATOR Package Subprograms

Subprogram	Description
CREATE_PROFILE Procedure	Creates a SQL translation profile
DEREGISTER_SQL_TRANSLATION Procedure	Deregisters the custom translation of a SQL statement in a SQL translation profile
DEREGISTER_ERROR_TRANSLATION Procedure	Deregisters the translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile
DROP_PROFILE Procedure	Drops a SQL translation profile and its contents
ENABLE_ERROR_TRANSLATION Procedure	Enables or disables a custom translation of an Oracle error code in a SQL translation profile
ENABLE_SQL_TRANSLATION Procedure	Enables or disables a custom translation of a SQL statement in a SQL translation profile
EXPORT_PROFILE Procedure	Exports the content of a SQL translation profile
IMPORT_PROFILE Procedure	Imports the content of a SQL translation profile
REGISTER_ERROR_TRANSLATION Procedure	Registers a custom translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile
REGISTER_SQL_TRANSLATION Procedure	Registers a custom translation of a SQL statement in a SQL translation profile
SET_ATTRIBUTE Procedure	Sets an attribute of a SQL translation profile
SQL_HASH Function	Computes the hash value of a SQL statement in a SQL translation profile
SQL_ID Function	Computes the SQL identifier of a SQL statement in a SQL translation profile
TRANSLATE_ERROR Procedure	Translates an Oracle error code and an ANSI <code>SQLSTATE</code> using a SQL translation profile
TRANSLATE_SQL Procedure	Translates a SQL statement using a SQL translation profile

159.6.1 CREATE_PROFILE Procedure

This procedure creates a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
    profile_name    IN VARCHAR2);
```

Parameters

Table 159-4 CREATE_PROFILE Procedure Parameters

Parameter	Description
profile_name	Name of profile

Exceptions

Table 159-5 CREATE_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
PROFILE_EXISTS	Profile already exists

Usage Notes

- A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form [schema.]name. When the schema and profile names are used in the DBMS_SQL_TRANSLATOR package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile profile_name => 'tsql_application' is the same as profile_name => 'Tsql_Application' and profile_name => 'TSQL_APPLICATION', but not the same as profile_name => "tsql_application".
- A SQL translation profile is an editionable object type.
- A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).
- To destroy a SQL translation profile, use the [DROP_PROFILE Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;
```

159.6.2 DEREGISTER_SQL_TRANSLATION Procedure

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
  profile_name      IN  VARCHAR2,
  sql_text          IN  CLOB);
```

Parameters

Table 159-6 *DEREGISTER_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement

Exceptions

Table 159-7 *DEREGISTER_SQL_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
PROFILE_EXISTS	Profile already exists

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp');
END;
```

159.6.3 DEREGISTER_ERROR_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code        IN  PLS_INTEGER);
```

Parameters

Table 159-8 *DEREGISTER_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
error_code	Oracle error code

Exceptions

Table 159-9 Deregister_Error_Translation Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    error_code   => 1);
END;
```

159.6.4 DROP_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

Syntax

```
DBMS_SQL_TRANSLATOR.DROP_PROFILE (
  profile_name IN VARCHAR2);
```

Parameters

Table 159-10 DROP_PROFILE Procedure Parameters

Parameter	Description
profile_name	Name of profile

Exceptions

Table 159-11 DROP_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DROP_PROFILE(
    profile_name => 'tsql_application');
END;
```

159.6.5 ENABLE_ERROR_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  sql_text          IN  CLOB,
  enable            IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 159-12 *ENABLE_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 159-13 *ENABLE_ERROR_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'SELECT TOP 5 * FROM emp'
    enable       => TRUE);
END;
```

159.6.6 ENABLE_SQL_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (
  profile_name      IN  VARCHAR2,
  sql_text          IN  CLOB,
  enable            IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 159-14 *ENABLE_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 159-15 *ENABLE_SQL_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    enable       => TRUE);
END;
```

159.6.7 EXPORT_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (
  profile_name  IN          VARCHAR2,
  content       OUT NOCOPY CLOB);
```

Parameters

Table 159-16 *EXPORT_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile
content	Content of profile

Exceptions

Table 159-17 EXPORT_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```
SQLTranslationProfile Translator="translator package name"
                      ForeignSQLSyntax="TRUE|FALSE"
                      TranslateNewSQL="TRUE|FALSE"
                      RaiseTranslationError="TRUE|FALSE"
                      LogTranslationError="TRUE|FALSE"
                      TraceTranslation="TRUE|FALSE"
                      Editionable="TRUE|FALSE">
<SQLTranslations>
  <SQLTranslation Enabled="TRUE|FALSE">
    <SQLText>original SQL text</SQLText>
    <TranslatedText>translated SQL text</TranslatedText>
  </SQLTranslation>
  ...
</SQLTranslations>
<ErrorTranslations>
  <ErrorTranslation Enabled="TRUE|FALSE">
    <ErrorCode>Oracle error code</ErrorCode>
    <TranslatedCode>translated error code</TranslatedCode>
    <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>
  </ErrorTranslation>
  ...
</ErrorTranslations>
</SQLTranslationProfile>
```

- To import the content to a SQL translation profile, use the [IMPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

159.6.8 IMPORT_PROFILE Procedure

This procedure imports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (
  profile_name      IN  VARCHAR2,
  content           IN  CLOB);
```

Parameters

Table 159-18 *IMPORT_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile
content	Content of profile

Exceptions

Table 159-19 *IMPORT_PROFILE Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist

Usage Notes

- The content of the SQL translation profile must be in XML format as used by the [EXPORT_PROFILE Procedure](#). All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the [EXPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

159.6.9 REGISTER_ERROR_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code        IN  PLS_INTEGER,
  translated_code   IN  PLS_INTEGER DEFAULT NULL,
  translated_sqlstate IN VARCHAR2 DEFAULT NULL,
  enable           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 159-20 REGISTER_ERROR_TRANSLATION Procedure Parameters

Parameter	Description
<code>profile_name</code>	Name of profile
<code>error_code</code>	Oracle error code
<code>translated_code</code>	Translated error code
<code>translated_sqlstate</code>	Translated <code>SQLSTATE</code>
<code>enable</code>	Enable or disable the translation

Exceptions

Table 159-21 REGISTER_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
<code>BAD_ARGUMENT</code>	Bad argument is passed to the PL/SQL interface
<code>INSUFFICIENT_PRIVILEGE</code>	User has insufficient privilege for the operation
<code>NO_SUCH_USER</code>	Profile owner does not exist
<code>NO_SUCH_PROFILE</code>	Profile does not exist

Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and `SQLSTATE`, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_ERROR_TRANSLATION Procedure](#).

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        error_code   => 1,
        translated_code => 2601);
END;
```

159.6.10 REGISTER_SQL_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
    profile_name     IN VARCHAR2,
    sql_text         IN CLOB,
    translated_text  IN CLOB DEFAULT NULL,
    enable           IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 159-22 REGISTER_SQL_TRANSLATION Procedure Parameters

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
translated_text	Translated SQL statement
enable	Enable or disable the translation

Exceptions

Table 159-23 REGISTER_SQL_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.

- When `translated_text` is `NULL`, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_SQL_TRANSLATION Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
```

159.6.11 SET_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (
  profile_name     IN VARCHAR2,
  attribute_name   IN VARCHAR2,
  attribute_value  IN VARCHAR2;)
```

Parameters

Table 159-24 *SET_ATTRIBUTE Procedure Parameters*

Parameter	Description
<code>profile_name</code>	Name of profile
<code>attribute_name</code>	Name of attribute
<code>attribute_value</code>	Value of attribute

Exceptions

Table 159-25 *SET_ATTRIBUTE Procedure Exceptions*

Exception	Description
<code>BAD_ARGUMENT</code>	Bad argument is passed to the PL/SQL interface
<code>INSUFFICIENT_PRIVILEGE</code>	User has insufficient privilege for the operation
<code>NO_SUCH_USER</code>	Profile owner does not exist
<code>NO_SUCH_PROFILE</code>	Profile does not exist

Usage Notes

See [Constants](#)

159.6.12 SQL_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_HASH (
    sql_text          IN    CLOB)
RETURN NUMBER DETERMINISTIC;
```

Parameters

Table 159-26 SQL_HASH Function Parameters

Parameter	Description
sql_text	SQL statement

Return Values

Returns hash value of the SQL statement in the SQL translation profile

Exceptions

Table 159-27 SQL_HASH Function Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```
DECLARE
    sqltext CLOB;
    txltext CLOB;
    sqlhash NUMBER;
BEGIN
    sqltext := 'SELECT TOP 1 * FROM emp';
    sqlhash := DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);
    SELECT translated_text INTO txltext
    FROM user_sql_translations
    WHERE sql_hash = sqlhash
    AND DBMS_LOB.COMPARE (sql_text, sqltext) = 0;
END;
```

159.6.13 SQL_ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_ID (
    sql_text          IN    CLOB)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 159-28 SQL_ID Function Parameters

Parameter	Description
sql_text	SQL statement

Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

Exceptions

Table 159-29 SQL_ID Function Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```

DECLARE
  sqltext CLOB;
  sqlid   VARCHAR2(13);
BEGIN
  sqltext := 'SELECT TOP 1 * FROM emp';
  sqlid   := DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;

```

159.6.14 TRANSLATE_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session's SQL translation profile

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (
  error_code          IN          PLS_INTEGER,
  translated_code     OUT         PLS_INTEGER,
  translated_sqlstate OUT NOCOPY VARCHAR2);

```

Parameters

Table 159-30 TRANSLATE_ERROR Procedure Parameters

Parameter	Description
error_code	Oracle error code
translated_code	Translated error code
translated_sqlstate	Translated SQLSTATE

Exceptions

Table 159-31 TRANSLATE_ERROR Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist
NO_TRANSLATION_FOUND	No translation of the SQL statement or error code is found

Examples

```

DECLARE
    translated_code      BINARY_INTEGER;
    translated_sqlstate  VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR(
        error_code        => 1,
        translated_code   => translated_code,
        translated_sqlstate => translated_sqlstate);
END;
```

159.6.15 TRANSLATE_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (
    sql_text           IN          CLOB,
    translated_text    OUT NOCOPY CLOB);
```

Parameters

Table 159-32 TRANSLATE_SQL Procedure Parameters

Parameter	Description
sql_text	SQL statement
translated_text	Translated SQL statement

Exceptions

Table 159-33 TRANSLATE_SQL Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist

Table 159-33 (Cont.) TRANSLATE_SQL Procedure Exceptions

Exception	Description
NO_SUCH_PROFILE	Profile does not exist

Examples

```
ALTER SESSION SET SQL_TRANSLATION_PROFILE = tsql_application;
```

```
DECLARE
    translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
        sql_text      => 'select top 5 * from emp',
        translated_text => translated_text);
END;
```

DBMS_SQLDIAG

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

This chapter contains the following topics:

- [DBMS_SQLDIAG Overview](#)
- [DBMS_SQLDIAG Security Model](#)
- [DBMS_SQLDIAG Constants](#)
- [Summary of DBMS_SQLDIAG Subprograms](#)

 **See Also:**

Oracle Database Administrator's Guide for more information about "Managing Diagnostic Data"

160.1 DBMS_SQLDIAG Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement by using the DBMS_SQLDIAG package subprograms.

The SQL Repair Advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

 **See Also:**

Oracle Database Administrator's Guide for more information about how to run the SQL Repair Advisor using the DBMS_SQLDIAG package subprograms.

160.2 DBMS_SQLDIAG Security Model

You must have the ADVISOR role to execute the DBMS_SQLDIAG package.

160.3 DBMS_SQLDIAG Constants

DBMS_SQLDIAG defines constants to use when specifying parameter values.

These constants are shown in the following tables:

- [Table 160-1](#) describes the name of SQL repair advisor as seen by the advisor framework
- [Table 160-2](#) describes SQLDIAG advisor task scope parameter values
- [Table 160-3](#) describes SQLDIAG advisor `time_limit` constants
- [Table 160-4](#) describes possible formats for a report
- [Table 160-5](#) describes possible levels of detail in the report
- [Table 160-6](#) describes possible report sections (comma delimited)
- [Table 160-7](#) describes possible values for the `problem_type` parameter of the `CREATE_DIAGNOSIS_TASK` Functions
- [Table 160-8](#) describes possible values for the `_sql_findings_mode` parameter

Table 160-1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

Constant	Type	Value	Description
ADV_SQL_DIAG_NAME	VARCHAR2(18)	SQL Repair Advisor	Name of SQL repair advisor as seen by the advisor framework

Table 160-2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

Constant	Type	Value	Description
SCOPE_COMPREHENSIVE	VARCHAR2(13)	COMPREHENSIVE	Detailed analysis of the problem which may take more time to execute
SCOPE_LIMITED	VARCHAR2(7)	LIMITED	Brief analysis of the problem

Table 160-3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

Constant	Type	Value	Description
TIME_LIMIT_DEFAULT	NUMBER	1800	Default time limit for analysis of the problem

Table 160-4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	HTML	Report from the REPORT_DIAGNOSIS_TASK Function in HTML form

Table 160-4 (Cont.) DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_TEXT	VARCHAR2(4)	TEXT	Report from the REPORT_DIAGNOSIS_TASK Function in text form
TYPE_XML	VARCHAR2(3)	XML	Report from the REPORT_DIAGNOSIS_TASK Function in XML form

Table 160-5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2(3)	ALL	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2(5)	BASIC	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2(7)	TYPICAL	Simple report shows only information about the actions taken by the advisor.

Table 160-6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2(3)	ALL	All statements
SECTION_ERRORS	VARCHAR2(6)	ERRORS	Statements with errors
SECTION_FINDINGS	VARCHAR2(8)	FINDINGS	Tuning findings
SECTION_INFORMATION	VARCHAR2(11)	INFORMATION	General information
SECTION_PLANS	VARCHAR2(5)	PLANS	Explain plans
SECTION_SUMMARY	VARCHAR2(7)	SUMMARY	Summary information

Table 160-7 DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem

Table 160-7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation
PROBLEM_TYPE_EXECUTION_ERROR	NUMBER	4	User sees a crash in execution
PROBLEM_TYPE_ALT_PLAN_GENERATION	NUMBER	5	User to explore all alternative plans

Table 160-8 DBMS_SQLDIAG Constants - Findings Filter Constants

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDATION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURES	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_PLANS	NUMBER	4	Show the alternative plans generated by the advisor
SQLDIAG_FINDINGS_CR_DIFF	NUMBER	5	Show difference between two plans
SQLDIAG_FINDINGS_MASK_VARIANT	NUMBER	6	Mask info for testing
SQLDIAG_FINDINGS_OBJECT_FEATURES	NUMBER	7	Show features usage history
SQLDIAG_FINDINGS_BASIC_INFO	NUMBER	8	Show the alternative plans generated by the advisor

160.4 Summary of DBMS_SQLDIAG Subprograms

This table lists the DBMS_SQLDIAG subprograms and briefly describes them.

Table 160-9 DBMS_SQLDIAG Package Subprograms

Subprogram	Description
ACCEPT_SQL_PATCH Function & Procedure	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
ALTER_SQL_PATCH Procedure	Alters specific attributes of an existing SQL patch object

Table 160-9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
CANCEL_DIAGNOSIS_TASK Procedure	Cancels a diagnostic task
CREATE_DIAGNOSIS_TASK Functions	Creates a diagnostic task in order to diagnose a single SQL statement
CREATE_SQL_PATCH Function	Creates an SQL patch based on a set of user specified hints for specific statements identified by SQL text.
CREATE_STGTAB_SQLPATCH Procedure	Creates the staging table used for transporting SQL patches from one system to another
DROP_DIAGNOSIS_TASK Procedure	Drops a diagnostic task
DROP_SQL_PATCH Procedure	Drops the named SQL patch from the database
EXECUTE_DIAGNOSIS_TASK Procedure	Executes a diagnostic task
EXPLAIN_SQL_TESTCASE Function	Explains a SQL test case
EXPORT_SQL_TESTCASE Procedures	Exports a SQL test case to a directory
EXPORT_SQL_TESTCASE_IDR_BY_INC Function	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
EXPORT_SQL_TESTCASE_IDR_BY_TXT Function	Generates a SQL Test Case corresponding to the SQL passed as an argument
GET_FIX_CONTROL Function	Returns the value of fix control for a given bug number
GET_SQL Function	Imports a SQL test case
IMPORT_SQL_TESTCASE Procedures	Imports a SQL test case into a schema
INCIDENTID_2_SQL Procedure	Initializes a sql_setrow from an incident ID
INTERRUPT_DIAGNOSIS_TASK Procedure	Interrupts a diagnostic task
LOAD_SQLSET_FROM_TCB Function	Loads a SQLSET from Test Case Builder (TCB) file
PACK_STGTAB_SQLPATCH Procedure	SQL patches into the staging table created by the CREATE_STGTAB_SQLPATCH Procedure
REPLAY_SQL_TESTCASE Function	Reports on a diagnostic task
REPORT_DIAGNOSIS_TASK Function	Reports on a diagnostic task
RESET_DIAGNOSIS_TASK Procedure	Resets a diagnostic task
RESUME_DIAGNOSIS_TASK Procedure	Resumes a diagnostic task
SET_DIAGNOSIS_TASK_PARAMETER Procedure	Sets a diagnosis task parameter
SQL_DIAGNOSE_AND_REPAIR Function	Diagnoses a given SQL statement for a given SQL ID for the given problem type.

Table 160-9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
UNPACK_STGTAB_SQLPATCH H Procedure	Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure , using the patch data stored in the staging table to create patches on this system

160.4.1 ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 160-10 ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.

Table 160-10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
category	Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.
replace	If the patch already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the CURSOR_SHARING parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter.

Return Values

Name of the SQL patch

Usage Notes

Requires CREATE ANY SQL PROFILE privilege

160.4.2 ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
    name           IN VARCHAR2,
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2);
```

Parameters

Table 160-11 ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
name	Name of SQL patch to alter.

Table 160-11 (Cont.) ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
attribute_name	Name of SQL patch to alter. Possible values: <ul style="list-style-type: none"> STATUS -> can be set to ENABLED or DISABLED NAME -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). DESCRIPTION -> can be set to any string of size no more than 500 CATEGORY -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive.
attribute_value	New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.

Usage Notes

Requires ALTER ANY SQL PATCH privilege

160.4.3 CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 160-12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

160.4.4 CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text          IN  CLOB,
    bind_list         IN  sql_binds := NULL,
    user_name         IN  VARCHAR2 := NULL,
    scope             IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN  NUMBER   := TIME_LIMIT_DEFAULT,
    task_name         IN  VARCHAR2 := NULL,
    description       IN  VARCHAR2 := NULL,
```

```

        problem_type      IN    NUMBER      := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```

DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id                IN    VARCHAR2,
    plan_hash_value       IN    NUMBER      := NULL,
    scope                 IN    VARCHAR2   := SCOPE_COMPREHENSIVE,
    time_limit            IN    NUMBER      := TIME_LIMIT_DEFAULT,
    task_name             IN    VARCHAR2   := NULL,
    description           IN    VARCHAR2   := NULL,
    problem_type         IN    NUMBER      := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```

DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sqlset_name           IN VARCHAR2,
    basic_filter          IN VARCHAR2 := NULL,
    object_filter         IN VARCHAR2 := NULL,
    rank1                 IN VARCHAR2 := NULL,
    rank2                 IN VARCHAR2 := NULL,
    rank3                 IN VARCHAR2 := NULL,
    result_percentage     IN NUMBER   := NULL,
    result_limit          IN NUMBER   := NULL,
    scope                 IN VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit            IN NUMBER   := TIME_LIMIT_DEFAULT,
    task_name             IN VARCHAR2 := NULL,
    description           IN VARCHAR2 := NULL,
    plan_filter           IN VARCHAR2 := 'MAX_ELAPSED_TIME',
    sqlset_owner          IN VARCHAR2 := NULL,
    problem_type         IN NUMBER   := PROBLEM_TYPE_PERFORMANCE) RETURN VARCHAR2;
```

Parameters

Table 160-13 CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	Set of bind values
user_name	Username for who the statement/sqlset will be diagnosed
scope	Diagnosis scope (limited/comprehensive)
time_limit	Maximum duration in seconds for the diagnosis session
task_name	Optional diagnosis task name
description	Maximum of 256 SQL diagnosis session description
problem_type	Determines the goal of the task. Possible values are: <ul style="list-style-type: none"> PROBLEM_TYPE_WRONG_RESULTS PROBLEM_TYPE_COMPILATION_ERROR PROBLEM_TYPE_EXECUTION_ERROR
sql_id	Identifier of the statement
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	Sqlset name

Table 160-13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
basic_filter	SQL predicate to filter the SQL from the SQL tuning set (STS)
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from (filtered/ranked) SQL
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> LAST_GENERATED: plan with most recent timestamp FIRST_GENERATED: opposite to LAST_GENERATED LAST_LOADED: plan with most recent first_load_time stat info FIRST_LOADED: opposite to LAST_LOADED MAX_ELAPSED_TIME: plan with maximum elapsed time MAX_BUFFER_GETS: plan with maximum buffer gets MAX_DISK_READS: plan with maximum disk reads MAX_DIRECT_WRITES: plan with maximum direct writes MAX_OPTIMIZER_COST: plan with maximum optimum cost
sqlset_owner	Owner of the sqlset, or null for current schema owner

160.4.5 CREATE_SQL_PATCH Function

This function creates a SQL patch based on a set of user specified hints for specific statements identified by SQL text.

A SQL patch is usually created automatically by the SQL Repair Advisor to prevent any errors during the compilation or execution of a SQL statement. This function provides a way to manually create a SQL patch based on a set of hints that resolves the error.

Syntax

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_text      IN   CLOB,
    hint_text     IN   CLOB,
    name          IN   VARCHAR2  := NULL,
    description   IN   VARCHAR2  := NULL,
    category      IN   VARCHAR2  := NULL,
    validate      IN   BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_id        IN   VARCHAR2,
    hint_text     IN   CLOB,
    name          IN   VARCHAR2  := NULL,
    description   IN   VARCHAR2  := NULL,
    category      IN   VARCHAR2  := NULL,
    validate      IN   BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

Parameters

Table 160-14 CREATE_SQL_PATCH Function Parameters

Parameter	Description
sql_text	Text of the SQL statement
sql_id	The SQL identifier for the SQL statement
hint_text	Hints to include in the SQL patch
name	Optional SQL patch name
description	Description of the SQL patch
category	Category name
validate	Whether to validate the provided hints

Return Values

Both functions return the SQL patch name.

160.4.6 CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
    table_name      IN  VARCHAR2,
    schema_name     IN  VARCHAR2 := NULL,
    tablespace_name IN  VARCHAR2 := NULL);
```

Parameters

Table 160-15 CREATE_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
table_name	(Mandatory) Name of the table to create (case-sensitive)
schema_name	Schema to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)

160.4.7 DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (
    taskname      IN  VARCHAR2);
```

Parameters**Table 160-16 DROP_DIAGNOSIS_TASK Procedure Parameters**

Parameter	Description
taskname	Name of task

160.4.8 DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (
    name      IN VARCHAR2,  ignore  IN BOOLEAN := FALSE);
```

Parameters**Table 160-17 DROP_SQL_PATCH Function & Procedure Parameters**

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

Usage Notes

Requires DROP ANY SQL PATCH privilege

160.4.9 EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname      IN VARCHAR2);
```

Parameters**Table 160-18 EXECUTE_DIAGNOSIS_TASK Procedure Parameters**

Parameter	Description
taskname	Name of task

160.4.10 EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase      IN    CLOB)
RETURN CLOB;
```

Parameters

Table 160-19 EXPLAIN_SQL_TESTCASE Function Parameters

Parameter	Description
sqlTestCase	XML document describing the SQL test case

160.4.11 EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    sql_text           IN          CLOB,
    user_name          IN          VARCHAR2 := NULL,
    bind_list          IN          sql_binds := NULL,
    exportEnvironment  IN          BOOLEAN := TRUE,
    exportMetadata    IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody     IN          BOOLEAN := FALSE,
    samplingPercent   IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit         IN          NUMBER := 0,
    testcase_name     IN          VARCHAR2 := NULL,
    testcase          IN OUT NOCOPY CLOB,
    preserveSchemaMapping IN      BOOLEAN := FALSE,
    version           IN          VARCHAR2 := 'COMPATIBLE');
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    incident_id       IN          VARCHAR2,
    exportEnvironment  IN          BOOLEAN := TRUE,
    exportMetadata    IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody     IN          BOOLEAN := FALSE,
    samplingPercent   IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit         IN          NUMBER :=
        DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name     IN          VARCHAR2 := NULL,
```

```

testcase          IN OUT NOCOPY  CLOB,
preserveSchemaMapping  IN          BOOLEAN := FALSE)
version           IN          VARCHAR2 := 'COMPATIBLE';

```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V\$SQL to get the SQL identifier and the SQL hash value.

```

DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory          IN          VARCHAR2,
  sql_id             IN          VARCHAR2,
  plan_hash_value    IN          NUMBER := NULL,
  exportEnvironment  IN          BOOLEAN := TRUE,
  exportMetadata     IN          BOOLEAN := TRUE,
  exportData         IN          BOOLEAN := FALSE,
  exportPkgbody      IN          BOOLEAN := FALSE,
  samplingPercent    IN          NUMBER := 100,
  ctrlOptions        IN          VARCHAR2 := NULL,
  timeLimit          IN          NUMBER :=
                                DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
  testcase_name      IN          VARCHAR2 := NULL,
  testcase           IN OUT NOCOPY CLOB,
  preserveSchemaMapping  IN          BOOLEAN := FALSE)
  version           IN          VARCHAR2 := 'COMPATIBLE';

```

Parameters

Table 160-20 EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to export
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
exportPkgbody	TRUE if the body of the packages referenced in the SQL are exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file

Table 160-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<code><parameter name="mexec_count">3</parameter></code>'.</p> <ul style="list-style-type: none"> <p><code>name="capture"</code> - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.</p> <p>BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</p> <p>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</p> <p>Note this must be the same value as used in the IMPORT_SQL_TESTCASE Procedures.</p> <p><code>name="mexec_count"</code> - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.</p> <p><code>name="stat_history_since"</code> - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.</p> <p><code>name="compress"</code> - This option is used to compress the SQL Test Case Builder output files into a zip file. The possible values are:</p> <ul style="list-style-type: none"> YES NO <p>The default value is NO.</p> <p><code>name="diag_event"</code> - This option is used to specify the level of trace information to include in the SQL Test Case Builder output. The possible values are:</p> <ul style="list-style-type: none"> ADS COMPILER SQLEXEC_LOW SQLEXEC_MEDIUM SQLEXEC_HIGH SQLEXEC_HIGHEST <p>The default value is ADS + COMPILER.</p> <p><code>name="problem_type"</code> - This option is used to assign an issue type for a SQL Test Case Builder test case. For example, if a test case is related to performance regression issue, then you can assign the value of PERFORMANCE to the problem_type option. The possible values are :</p> <ul style="list-style-type: none"> PERFORMANCE WRONG_RESULTS COMPILATION_ERROR EXECUTION_ERROR <p>The default value is PERFORMANCE.</p>

Table 160-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
timeLimit	How much time should we spend exporting the SQL test case
testcaseName	An optional name for the SQL test case. This is used to prefix all the generated scripts
testcase	Resulting testcase
preserveSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment
version	Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted. <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (.dmp)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source
 - a table of contents file describing the SQL test case
 - metadata. (xxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA role.
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal.

To export data, call `EXPORT_SQL_TESTCASE` with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- To export objects statistics history, the database compatibility should be set to 12.0 or higher.
- This procedure does not export data and statistics on a Global Temporary Table (GTT).

Examples

The user can specify multiple parameters in the `ctrlOptions` encapsulated either by using the `<parameters>` parent tag or without the parent tag.

Using the `<parameters>` tag

```
<parameters>
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
</parameters>
```

Without the `<parameters>` tag

```
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
```

The `compress` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
        <parameter name="capture">with_runtime_info</parameter>
        <parameter name="compress">yes</parameter>
      </parameters>';
```

The `diag_event` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
        <parameter name="capture">with_runtime_info</parameter>
        <parameter name="compress">yes</parameter>
      </parameters>';
```

The `problem_type` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
        <parameter name="capture">with_runtime_info</parameter>
        <parameter name="compress">yes</parameter>
      </parameters>';
```

160.4.12 EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL test case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
  incident_id      IN  NUMBER,
  directory        IN  VARCHAR2,
  exportEnvironment IN  VARCHAR2 := 'TRUE',
  exportMetadata   IN  VARCHAR2 := 'TRUE',
  exportData       IN  VARCHAR2 := 'FALSE',
  samplingPercent  IN  VARCHAR2 := '100',
  ctrlOptions      IN  VARCHAR2 := NULL,
  version          IN  VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

Parameters

Table 160-21 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL. For more information about Incidents, see <i>Oracle Database Performance Tuning Guide</i> .
directory	Directory path to the generated files
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file

Table 160-21 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
version	<p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.

160.4.13 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
    incident_id      IN    NUMBER,
    directory        IN    VARCHAR2,
    sql_text         IN    CLOB,
    user_name        IN    VARCHAR2 := 'SYS',
    exportEnvironment IN    VARCHAR2 := 'TRUE',
    exportMetadata   IN    VARCHAR2 := 'TRUE',
    exportData       IN    VARCHAR2 := 'FALSE',
    samplingPercent  IN    VARCHAR2 := '100',
    ctrlOptions      IN    VARCHAR2 := NULL
```

```

    version          IN  VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;

```

Parameters

Table 160-22 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to explain
username	Name of the user schema to use to parse the SQL, defaults to SYS
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <ul style="list-style-type: none"> BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
version	<p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database Release 10.0.0.

160.4.14 GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (
    bug_number IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 160-23 GET_FIX_CONTROL Function Parameters

Parameter	Description
bug_number	Bug number

160.4.15 GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (
    incident_id IN VARCHAR2)
RETURN SQLSET_ROW;
```

Parameters

Table 160-24 GET_SQL Function Parameters

Parameter	Description
incident_id	Identifier of the incident

160.4.16 IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory          IN VARCHAR2,
    sqlTestCase        IN CLOB,
    importEnvironment  IN BOOLEAN := TRUE,
    importMetadata     IN BOOLEAN := TRUE,
    importData         IN BOOLEAN := TRUE,
    importPkgbody      IN BOOLEAN := FALSE,
    importDiagnosis    IN BOOLEAN := TRUE,
    ignoreStorage      IN BOOLEAN := TRUE,
```

```
ctrlOptions          IN  VARCHAR2  := NULL,
preserveSchemaMapping IN  BOOLEAN   := FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
  directory          IN  VARCHAR2,
  filename           IN  VARCHAR2,
  importEnvironment IN  BOOLEAN := TRUE,
  importMetadata    IN  BOOLEAN := TRUE,
  importData        IN  BOOLEAN := TRUE,
  importPkgbody     IN  BOOLEAN := FALSE,
  importDiagnosis   IN  BOOLEAN := TRUE,
  ignoreStorage     IN  BOOLEAN := TRUE,
  ctrlOptions       IN  VARCHAR2 := NULL,
  preserveSchemaMapping IN  BOOLEAN := FALSE);
```

Parameters

Table 160-25 IMPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
importEnvironment	TRUE if the compilation environment should be imported
importMetadata	TRUE if the definition of the objects referenced in the SQL should be imported
importData	TRUE if the data of the objects referenced in the SQL should be imported
importPkgbody	TRUE if the body of the packages referenced in the SQL are imported
importDiagnosis	TRUE if the diagnostic information associated to the task should be imported
ignoreStorage	TRUE if the storage attributes should be ignored
ctrlOptions	Opaque control parameters, of which only <code>capture</code> is valid for this subprogram. <ul style="list-style-type: none"> <code>capture</code> - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <p>BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</p> <p>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</p>
preserveSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database). Note that when an import is run with <code>preservesSchemaMapping</code> set to TRUE, if the objects in the schemas exists then the import will overwrite the existing objects.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (.dmp)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source
 - a table of contents file describing the SQL test case
 - metadata. (xxxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the SYSDBA privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- The `capture` value used when invoking the [EXPORT_SQL_TESTCASE Procedures](#) must be used when calling this procedure.

160.4.17 INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
  incident_id  IN    VARCHAR2,
  sql_stmt    OUT   SQLSET_ROW,
  problem_type OUT   NUMBER,
  err_code    OUT   BINARY_INTEGER,
  err_mesg    OUT   VARCHAR2);
```

Parameters

Table 160-26 INCIDENTID_2_SQL Procedure Parameters

Parameter	Description
incident_id	Identifier of the incident
sql_stmt	Resulting SQL
problem_type	Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR)
err_code	Error code if any otherwise it is set to NULL
err_msg	Error message if any otherwise it is set to NULL

160.4.18 INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 160-27 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

160.4.19 LOAD_SQLSET_FROM_TCB Function

This function loads a SQLSET from a Test Case Builder file.

Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory          IN  VARCHAR2,
    filename           IN  VARCHAR2,
    sqlset_name        IN  VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 160-28 LOAD_SQLSET_FROM_TCB Function Parameters

Parameter	Description
directory	Name of directory
filename	Name of file
sqlset_name	Name of SQLSET

160.4.20 PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```
DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH (
  patch_name          IN  VARCHAR2 := '%',
  patch_category     IN  VARCHAR2 := 'DEFAULT',
  staging_table_name  IN  VARCHAR2,
  staging_schema_owner IN  VARCHAR2 := NULL);
```

Parameters

Table 160-29 PACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
patch_name	Name of patch to pack (% wildcards acceptable, case-sensitive)
patch_category	Category to which to pack patches (% wildcards acceptable, case-insensitive)
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- Requires: ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

Related Topics

- [CREATE_STGTAB_SQLPATCH Procedure](#)
This procedure creates the staging table used for transporting SQL patches from one system to another.

160.4.21 REPLAY_SQL_TESTCASE Function

This function automates the reproduction of the SQL Test Case.

Syntax

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
  directory      IN  VARCHAR2,
  filename       IN  VARCHAR2,
  ctrlOptions    IN  VARCHAR2 := NULL,
  format         IN  VARCHAR2 := 'TEXT')
RETURN CLOB;
```

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
  directory      IN  VARCHAR2,
```

```

sqlTestCase      IN  CLOB,
ctrlOptions      IN  VARCHAR2  := NULL,
format           IN  VARCHAR2  := 'TEXT')
RETURN CLOB;

```

Parameters

Table 160-30 REPLAY_SQL_TESTCASE Function Parameters

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> replay - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality. <p>EXPLAIN: Replay explains the statement without using outlines</p> <p>OUTLINE: Replay uses outlines mode and explains the statement using outlines</p> <p>EXECUTION: Replay executes the statement without using outlines</p> <p>OUTLINE EXECUTION: Replay executes the statement using outlines</p> <p>Note that if the user gives an incorrect parameter value, then the replay runs in default mode and no error is thrown.</p> name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.
sqlTestCase	SQL test case
format	Format of the replay report. Possible formats are: TEXT, XML and HTML..

Examples

TCB Replay Mode: Execute

```

SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM
emp where emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal >
1000 /* tcbdynpl_1 */

```

Explain Plan

Plan Hash Value : 2219294842

Id	Operation	Name	Rows
0	SELECT STATEMENT		13
* 1	HASH JOIN		13
2	NESTED LOOPS		
3	NESTED LOOPS		13
4	STATISTICS COLLECTOR		
5	TABLE ACCESS FULL	DEPT	4

* 6	INDEX RANGE SCAN	EMP_IDX_DEPTNO	
* 7	TABLE ACCESS BY INDEX ROWID	EMP	3
* 8	TABLE ACCESS FULL	EMP	13

Predicate Information (identified by operation id):

```

-----
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 6 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 7 - filter("EMP"."SAL">1000)
* 8 - filter("EMP"."SAL">1000)

```

Runtime Plan

Plan Hash Value : 2219294842

Id	Operation	Name	E-Card	A-Card
0	SELECT STATEMENT			0
* 1	HASH JOIN		13	0
2	TABLE ACCESS FULL	DEPT	4	0
* 3	TABLE ACCESS FULL	EMP	13	0

Predicate Information (identified by operation id):

```

-----
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 3 - filter("EMP"."SAL">1000)

```

REPLAY Note:

- ```

- Replay used dynamic sampling
- Replay forced Dynamic plan

```

## 160.4.22 REPORT\_DIAGNOSIS\_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

### Syntax

```

DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
 taskname IN VARCHAR2,
 type IN VARCHAR2 := TYPE_TEXT,
 level IN VARCHAR2 := LEVEL_TYPICAL,
 section IN VARCHAR2 := SECTION_ALL,
 object_id IN NUMBER := NULL,
 result_limit IN NUMBER := NULL,
 owner_name IN VARCHAR2 := NULL)
RETURN CLOB;

```

### Parameters

**Table 160-31** REPORT\_DIAGNOSIS\_TASK Function Parameters

| Parameter | Description            |
|-----------|------------------------|
| taskname  | Name of task to report |

**Table 160-31 (Cont.) REPORT\_DIAGNOSIS\_TASK Function Parameters**

| Parameter    | Description                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| type         | Type of the report. Possible values are: TEXT, HTML, XML (see <a href="#">Table 160-4</a> ).                                             |
| level        | Format of the recommendations. Possible values are TYPICAL, BASIC, ALL ( <a href="#">Table 160-5</a> ).                                  |
| section      | Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL ( <a href="#">Table 160-6</a> ). |
| object_id    | Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).                                  |
| result_limit | Number of statements in a STS for which the report is generated                                                                          |
| owner_name   | Name of the task execution to use. If NULL, the report will be generated for the last task execution.                                    |

## 160.4.23 RESET\_DIAGNOSIS\_TASK Procedure

This procedure resets a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (
 taskname IN VARCHAR2);
```

### Parameters

**Table 160-32 RESET\_DIAGNOSIS\_TASK Procedure Parameters**

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 160.4.24 RESUME\_DIAGNOSIS\_TASK Procedure

This procedure resumes a diagnostic path.

### Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (
 taskname IN VARCHAR2);
```

### Parameters

**Table 160-33 RESUME\_DIAGNOSIS\_TASK Procedure Parameters**

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 160.4.25 SET\_DIAGNOSIS\_TASK\_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2.

The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- MODE: diag scope (comprehensive, limited)
- \_SQLDIAG\_FINDING\_MODE: findings in the report (see "Table 160-8" for possible values)

### Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
 taskname IN VARCHAR2,
 parameter IN VARCHAR2, value IN NUMBER);
```

### Parameters

**Table 160-34 SET\_DIAGNOSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| taskname  | Identifier of the task to execute    |
| parameter | Name of the parameter to set         |
| value     | New value of the specified parameter |

## 160.4.26 SQL\_DIAGNOSE\_AND\_REPAIR Function

Diagnoses a given SQL statement for a given SQL ID for the given problem type. This function creates an incident, populate incident metadata with required information like, SQL ID, SQL text, compilation environment, and so on. It also creates a diagnostic task, executes it and accepts SQL PATCH recommendation for a given SQL ID.

### Syntax

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
 sql_text IN CLOB,
 bind_list IN sql_binds := NULL,
 scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 problem_type IN NUMBER := PROBLEM_TYPE_PERFORMANCE,
 auto_apply_patch IN VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 problem_type IN NUMBER := PROBLEM_TYPE_PERFORMANCE,
 auto_apply_patch IN VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
 incident_id IN VARCHAR2,
 scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 problem_type IN NUMBER := PROBLEM_TYPE_PERFORMANCE,
 auto_apply_patch IN VARCHAR2 := YES)
RETURN NUMBER;
```

## Parameters

**Table 160-35 SQL\_DIAGNOSE\_AND\_REPAIR Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_text         | Text of the SQL statement.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| sql_id           | SQL ID of the SQL query.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| plan_hash_value  | The plan to be used for diagnosis. The default value is NULL.                                                                                                                                                                                                                                                                                                                                                                                           |
| bind_list        | Binds to be used for diagnosis. The default value is NULL.                                                                                                                                                                                                                                                                                                                                                                                              |
| scope            | The scope of diagnostic advisor.<br>Possible values are: <ul style="list-style-type: none"> <li>SCOPE_LIMITED—only index and plan analyze are invoked for a given SQL.</li> <li>SCOPE_COMPREHENSIVE—besides index and plan analyze, auto-tune is called first to tune the statement.</li> </ul> The default value is SCOPE_COMPREHENSIVE.                                                                                                               |
| time_limit       | Time limit for diagnostic task. The default value is TIME_LIMIT_DEFAULT.                                                                                                                                                                                                                                                                                                                                                                                |
| problem_type     | Problem type that is being diagnosed. The following problem type are supported: <ul style="list-style-type: none"> <li>PROBLEM_TYPE_PERFORMANCE—performance problem.</li> <li>PROBLEM_TYPE_WRONG_RESULTS—incorrect results.</li> <li>PROBLEM_TYPE_COMPILATION_ERROR—crash during compilation of the statement.</li> <li>PROBLEM_TYPE_EXECUTION_ERROR—crash during execution of the statement.</li> </ul> The default value is PROBLEM_TYPE_PERFORMANCE. |
| auto_apply_patch | A value that decides if the recommended SQL patch needs to be accepted. Possible values are: <ul style="list-style-type: none"> <li>YES—accepts the recommended SQL patch.</li> <li>NO—does not accept recommended SQL patch automatically.<br/>User need to manually accept the SQL patch.</li> </ul> The default value is YES.                                                                                                                        |

## 160.4.27 UNPACK\_STGTAB\_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK\_STGTAB\_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT\_SQL\_PATCH Function & Procedure).

### Syntax

```
DBMS_SQLDIAG.UNPACK_STGTAB_SQLPATCH (
 patch_name IN VARCHAR2 := '%',
 patch_category IN VARCHAR2 := '%',
 replace IN BOOLEAN,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 160-36 UPPACK\_STGTAB\_SQLPATCH Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| patch_name           | Name of patch to unpack (% wildcards acceptable, case-sensitive)                                                                                                                                                                                                   |
| patch_category       | Category from which to unpack patches (% wildcards acceptable, case-insensitive)                                                                                                                                                                                   |
| replace              | Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists. |
| staging_table_name   | (Mandatory) Name of the table to use (case-sensitive)                                                                                                                                                                                                              |
| staging_schema_owner | Schema where the table resides, or NULL for current schema (case-sensitive)                                                                                                                                                                                        |

### Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT or READ privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

### Related Topics

- [PACK\\_STGTAB\\_SQLPATCH Procedure](#)  
This procedure packs SQL patches into the staging table created by a call to the CREATE\_STGTAB\_SQLPATCH Procedure.
- [ACCEPT\\_SQL\\_PATCH Function & Procedure](#)  
This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

# 161

## DBMS\_SQLPA

The DBMS\_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_SQLPA Subprograms](#)

### 161.1 DBMS\_SQLPA Overview

The DBMS\_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the [CREATE\\_ANALYSIS\\_TASK Functions](#) to create an analysis task for a single statement or a group of SQL statements.
2. The [EXECUTE\\_ANALYSIS\\_TASK Function & Procedure](#) executes a previously created analysis task.
3. The [REPORT\\_ANALYSIS\\_TASK Function](#) displays the results of an analysis task.

### 161.2 DBMS\_SQLPA Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (`XXX_ANALYSIS_TASK`) require privilege ADVISOR.

### 161.3 Summary of DBMS\_SQLPA Subprograms

This table lists the DBMS\_SQLPA subprograms and briefly describes them.

**Table 161-1 DBMS\_SQLPA Package Subprograms**

| Subprogram                                     | Description                                                                 |
|------------------------------------------------|-----------------------------------------------------------------------------|
| <a href="#">CANCEL_ANALYSIS_TASK Procedure</a> | Cancels the currently executing task analysis of one or more SQL statements |
| <a href="#">CREATE_ANALYSIS_TASK Functions</a> | Creates an advisor task to process and analyze one or more SQL statements   |
| <a href="#">DROP_ANALYSIS_TASK Procedure</a>   | Drops a SQL analysis task                                                   |

**Table 161-1 (Cont.) DBMS\_SQLPA Package Subprograms**

| Subprogram                                                     | Description                                                                                  |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a> | Executes a previously created analysis task                                                  |
| <a href="#">INTERRUPT_ANALYSIS_TASK Procedure</a>              | Interrupts the currently executing analysis task                                             |
| <a href="#">REPORT_ANALYSIS_TASK Function</a>                  | Displays the results of an analysis task                                                     |
| <a href="#">RESET_ANALYSIS_TASK Procedure</a>                  | Resets the currently executing analysis task to its initial state                            |
| <a href="#">RESUME_ANALYSIS_TASK Procedure</a>                 | Resumes a previously interrupted analysis task that was created to process a SQL tuning set. |
| <a href="#">SET_ANALYSIS_TASK_PARAMETER Procedures</a>         | Sets the SQL analysis task parameter value                                                   |
| <a href="#">SET_ANALYSIS_DEFAULT_PARAMETER Procedures</a>      | Sets the SQL analysis task parameter default value                                           |

### 161.3.1 CANCEL\_ANALYSIS\_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

#### Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
 task_name IN VARCHAR2);
```

#### Parameters

**Table 161-2 CANCEL\_ANALYSIS\_TASK Procedure Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| task_name | Name of the task to cancel |

#### Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

### 161.3.2 CREATE\_ANALYSIS\_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements.

You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.

- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

### Syntax

**SQL text format.** This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 sql_text IN CLOB,
 bind_list IN sql_binds := NULL,
 parsing_schema IN VARCHAR2 := NULL,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

**SQL ID format.** This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 task_name IN VARCHAR2 := NULL,
 con_name IN VARCHAR2 DEFAULT,
 description IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

**Workload Repository format.** This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 dbid IN NUMBER DEFAULT,
 begin_snap IN NUMBER,
 end_snap IN NUMBER,
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL)
 con_name IN VARCHAR2 DEFAULT,
RETURN VARCHAR2;
```

**SQLSET format.** This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 sqlset_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 con_name IN VARCHAR2 DEFAULT,
 order_by IN VARCHAR2 := NULL,
 top_sql IN VARCHAR2 := NULL,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 161-3** *CREATE\_ANALYSIS\_TASK Function Parameters*

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_text        | Text of a SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| bind_list       | A set of bind values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| parsing_schema  | Name of the schema where the statement can be compiled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| task_name       | Optional analysis task name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| dbid            | The DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| con_name        | <p>Container for the SPA task. The semantics depend on the function format:</p> <p>For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis.</p> <p>For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis.</p> <p>The following statements are true of all function formats:</p> <ul style="list-style-type: none"> <li>• In a non-CDB, this parameter is ignored.</li> <li>• In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, error occurs.</li> <li>• In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, error occurs.</li> </ul> |
| description     | Description of the SQL analysis task to a maximum of 256 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| sql_id          | Identifier of a SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| plan_hash_value | Hash value of the SQL execution plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| begin_snap      | Begin snapshot identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| basic_filter    | SQL predicate to filter the SQL from the SQL tuning set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| order_by        | Order-by clause on the selected SQL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| top_sql         | Top N SQL after filtering and ranking                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| sqlset_owner    | The owner of the SQL tuning set, or NULL for the current schema owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

### Examples

```

variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 sql_id => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 begin_snap => 1,
 end_snap => 2,
 sql_id => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(-
 sqlset_name => 'my_workload', -
 order_by => 'BUFFER_GETS', -
 description => 'process workload ordered by buffer gets');

```

## 161.3.3 DROP\_ANALYSIS\_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

### Syntax

```

DBMS_SQLPA.DROP_ANALYSIS_TASK(
 task_name IN VARCHAR2);

```

### Parameters

**Table 161-4 DROP\_ANALYSIS\_TASK Procedure Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| task_name | The name of the analysis task to drop |

## 161.3.4 EXECUTE\_ANALYSIS\_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

### Syntax

```

DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
 task_name IN VARCHAR2,
 execution_type IN VARCHAR2 := 'test execute',
 execution_name IN VARCHAR2 := NULL,
 execution_params IN dbms_advisor.argList := NULL,
 execution_desc IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
 task_name IN VARCHAR2,
 execution_type IN VARCHAR2 := 'test execute',
 execution_name IN VARCHAR2 := NULL,
 execution_params IN dbms_advisor.argList := NULL,
 execution_desc IN VARCHAR2 := NULL);
```

## Parameters

**Table 161-5 EXECUTE\_ANALYSIS\_TASK Function & Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name        | Identifier of the task to execute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| execution_type   | Type of the action to perform by the function. If NULL it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter.<br>Possible values are: <ul style="list-style-type: none"> <li>[TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default.</li> <li>EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task.</li> <li>COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task</li> <li>CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.</li> </ul> |
| execution_name   | A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| execution_params | List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the <a href="#">SET_ANALYSIS_DEFAULT_PARAMETER Procedures</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| execution_desc   | A 256-length string describing the execution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

## Examples

### 1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
 sqlset_name => 'my_sts');
```

### 2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
 task_name => :tname,
 execution_type => 'test execute',
 execution_name => 'before_change');
```

### 3. Make change

...

### 4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
 task_name => :tname, -
 execution_type => 'test execute',
 execution_name => 'after_change');
```

### 5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
 :tname, 'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
 task_name => :tname, -
 execution_type => 'compare performance', -
 execution_name => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
 task_name => :tname, -
 execution_type => 'compare performance',
 execution_params => dbms_advisor.arglist(
 'execution_name1',
 'before_change',
 'execution_name2',
 'after_change',
 'comparison_metric',
 'buffer_gets'));
```

## 161.3.5 INTERRUPT\_ANALYSIS\_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

### Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
 task_name IN VARCHAR2);
```

### Parameters

**Table 161-6** INTERRUPT\_ANALYSIS\_TASK Procedure Parameters

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| task_name | Identifier of the analysis task to interrupt |

### Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

## 161.3.6 REPORT\_ANALYSIS\_TASK Function

This procedure displays the results of an analysis task.

### Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
 task_name IN VARCHAR2,
 type IN VARCHAR2 := 'TEXT',
 level IN VARCHAR2 := 'TYPICAL',
 section IN VARCHAR2 := 'SUMMARY',
 object_id IN NUMBER := NULL,
 top_sql IN NUMBER := 100,
 execution_name IN VARCHAR2 := NULL,
 task_owner IN VARCHAR2 := NULL,
 order_by IN VARCHAR2 := NULL)
RETURN CLOB;
```

### Parameters

**Table 161-7** REPORT\_ANALYSIS\_TASK Function Parameters

| Parameter | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| task_name | Name of the task to report                                                                                 |
| type      | Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes). |

**Table 161-7 (Cont.) REPORT\_ANALYSIS\_TASK Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level          | Level of detail in the report: <ul style="list-style-type: none"> <li>• ALL - details of all SQL</li> <li>• BASIC - currently the same as typical</li> <li>• CHANGED - only SQL with changed performance</li> <li>• CHANGED_PLANS - only SQL with plan changes</li> <li>• ERRORS - SQL with errors only</li> <li>• IMPROVED - only improved SQL</li> <li>• REGRESSED - only regressed SQL</li> <li>• TIMEOUT - only SQL which timed-out during execution</li> <li>• TYPICAL (default) - show information about every statement analyzed, including changing and errors</li> <li>• UNCHANGED - only SQL with unchanged performance</li> <li>• UNCHANGED_PLANS - only SQL with unchanged plans</li> <li>• UNSUPPORTED - only SQL not supported by SPAs</li> </ul> |
| section        | Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> <li>• SUMMARY (default) - workload summary only</li> <li>• ALL - summary and details on SQL</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| object_id      | Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| top_sql        | Number of SQL statements in a STS for which the report is generated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| execution_name | Name of the task execution to use. If NULL, the report will be generated for the last task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| task_owner     | Owner of the relevant analysis task. Defaults to the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| order_by       | How to sort SQL statements in the report (summary and body). Possible values: <ul style="list-style-type: none"> <li>• CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric</li> <li>• NULL (default) - order SQL statement by impact on workload</li> <li>• SQL_IMPACT - order SQL statement by change impact on SQL</li> <li>• WORKLOAD_IMPACT - same as NULL</li> <li>• METRIC_DELTA - same as CHANGE_DIFF</li> </ul>                                                                                                                                                                                                                                                                                 |

**Return Values**

A CLOB containing the desired report.

**Usage Notes**

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

## Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
from dual;
```

## 161.3.7 RESET\_ANALYSIS\_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution.

All intermediate result data will be deleted.

### Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
 task_name IN VARCHAR2);
```

### Parameters

**Table 161-8** RESET\_ANALYSIS\_TASK Procedure Parameters

| Parameter | Description                              |
|-----------|------------------------------------------|
| task_name | Identifier of the analysis task to reset |

### Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

## 161.3.8 RESUME\_ANALYSIS\_TASK Procedure

This procedure resumes a previously interrupted or FAILED (with a fatal error) task execution.

### Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
 task_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL);
```

## Parameters

**Table 161-9 RESUME\_ANALYSIS\_TASK Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name    | Identifier of the analysis task to resume                                                                                                                                                                                                           |
| basic_filter | A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter basic_filter) that was specified when calling the <a href="#">CREATE_ANALYSIS_TASK Functions</a> . |

## Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

## Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

## 161.3.9 SET\_ANALYSIS\_TASK\_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

### Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
 task_name IN VARCHAR2,
 parameter IN VARCHAR2,
 value IN VARCHAR2,
 test_execute_dop IN NUMBER DEFAULT 0,
 compare_resultset IN BOOLEAN DEFAULT TRUE);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
 task_name IN VARCHAR2,
 parameter IN VARCHAR2,
 value IN NUMBER,
 test_execute_dop IN NUMBER DEFAULT 0,
 compare_resultset IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 161-10 SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | Identifier of the task to execute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| parameter | <p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"><li>• <code>APPLY_CAPTURED_COMPILEENV</code>: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li><li>• <code>BASIC_FILTER</code>: basic filter for SQL tuning set</li><li>• <code>CELL_SIMULATION_ENABLED</code>: for more details, see the helper script <code>tcellsim.sql</code> in the <code>ADMIN</code> directory.</li><li>• <code>COMPARISON_METRIC</code>: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)</li><li>• <code>DATABASE_LINK</code>: can be set to the global name of a <code>PUBLIC</code> database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</li><li>• <code>DAYS_TO_EXPIRE</code>: number of days until the task is deleted</li><li>• <code>DEFAULT_EXECUTION_TYPE</code>: the task will default to this type of execution when none is specified by the <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a>.</li></ul> |

**Table 161-10 (Cont.) SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter (contd.) | <ul style="list-style-type: none"> <li>• <b>DISABLE_MULTI_EXEC:</b> SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to <b>TRUE</b> to disable this capability. In this case, each SQL in the SQL tuning set is executed only once.</li> <li>• <b>EXECUTE_TRIGGERS:</b> Set this parameter to <b>TRUE</b> to execute all statement-level triggers in the <b>FULLDML</b> mode. If the parameter is set to <b>FALSE</b>, then the triggers will not be executed even in <b>FULLDML</b> mode of test execution. Any changes incurred due to potential execution of triggers are always rolled back by <b>SPA</b>. The default value of this parameter is <b>FALSE</b>.</li> <li>• <b>EXECUTION_DAYS_TO_EXPIRE:</b> number of days until the tasks's executions will be deleted (without deleting the task)</li> <li>• <b>EXECUTE_FULLDML:</b> <b>TRUE</b> to execute DML statement fully, including acquiring row locks and modifying rows; <b>FALSE</b> (default) to execute only the query part of the DML without modifying data. When <b>TRUE</b>, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</li> <li>• <b>EXECUTION_NAME1:</b> name of the first task execution to analyze</li> <li>• <b>EXECUTION_NAME2:</b> name of the second task execution to analyze</li> <li>• <b>LOCAL_TIME_LIMIT:</b> per-statement time out (seconds)</li> <li>• <b>METRIC_DELTA_THRESHOLD:</b> threshold of the difference between the SQL performance metric before and after the change. The default value is zero.</li> <li>• <b>NUM_ROWS_TO_FETCH:</b> specifies the number of rows to be fetched for an SQL query. You can use one of the following values: <ul style="list-style-type: none"> <li>– <b>ALL_ROWS:</b> Fetches all the rows for an SQL query</li> <li>– <b>AVERAGE:</b> Number of result rows is calculated as the ratio of total rows processed and total executions for each SQL in the STS</li> <li>– <b>AUTO:</b> Number of result rows is determined using the value of <code>optimizer_mode</code> parameter of the optimizer environment captured in the STS. If the value of <code>optimizer_mode</code> is <b>ALL_ROWS</b>, then all result rows will be fetched. If its value is <b>FIRST_ROWS_n</b>, then <b>n</b> result rows will be fetched by the <b>SPA</b>.</li> <li>– <b>A valid number:</b> Fetches the exact number of rows specified by in the SQL query</li> </ul> <p>The default value is <b>ALL_ROWS</b>.</p> </li> <li>• <b>PLAN_FILTER:</b> plan filter for SQL tuning set (see <b>SELECT_SQLSET</b> for possible values)</li> <li>• <b>PLAN_LINES_COMPARISON:</b> <ul style="list-style-type: none"> <li>- <b>ALWAYS</b> --line by line comparison of plans in all scenarios.-</li> <li><b>AUTO</b> -Line by Line comparison of plans only if <code>phv2</code> is not available and <code>phv1</code> is different- <b>NONE</b> (default) - line by line comparison of plans only if <code>phv</code> is unknown</li> </ul> </li> </ul> |

**Table 161-10 (Cont.) SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <ul style="list-style-type: none"> <li>RANK_MEASURE1: first ranking measure for SQL tuning set</li> <li>RANK_MEASURE2: second possible ranking measure for SQL tuning set</li> <li>RANK_MEASURE3: third possible ranking measure for SQL tuning set</li> <li>REPLACE_SYSDATE_WITH: Returns a fixed date for all calls to SYSDATE within the SPA task execution. You can use one of the following values: <ul style="list-style-type: none"> <li>CURRENT_SYSDATE: SYSDATE calls return the current date.</li> <li>SQLSET_SYSDATE: SYSDATE calls return the value of the column LAST_EXEC_START_TIME in the STS</li> </ul>                     The default value is CURRENT_SYSDATE.                 </li> <li>RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</li> <li>SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.</li> <li>SQL_LIMIT: maximum number of SQL statements to process</li> <li>SQL_PERCENTAGE: percentage filter of SQL tuning set statements</li> <li>SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA.</li> <li>SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME.</li> <li>TIME_LIMIT: global time out (seconds)</li> </ul> |
| parameter (contd.) | <ul style="list-style-type: none"> <li>WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.</li> <li>CON_DBID_MAPPING: provide a mapping of multitenant container database (CDB) IDs. When it is set, SQL Performance Analyzer uses the new CDB ID when it finds a match for the old CDB ID and executes the SQL in that container.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| value              | New value of the specified parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| test_execute_dop   | Specifies the requested level of concurrency with which a SPA task should be executed.<br><br>Values 0 or 1 indicate that the SPA task will run with no additional processes as it used to run in releases prior to Oracle Database 18c Release. A value of n (higher than 1) means that n background SPA processes are being requested to concurrently process the input workload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 161-10 (Cont.) SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| compare_resultset | <p>Directs SPA to detect if the result-sets between the two trials being compared are different. If differences are seen in the result-sets of any SQL statement between the two trials being compared, the SPA comparison report will indicate this for every such SQL statement.</p> <ul style="list-style-type: none"> <li>• If set to TRUE the result set comparison will be performed</li> <li>• If set to FALSE result set comparison will not be performed.</li> </ul> |

### Usage Notes

The actual number of processes granted might be equal to or lower than the number requested using the `test_execute_dop` parameter. This parameter applies only to `test-execute` or `explain plan` type of trials that process a SQL Tuning set.

### Examples

To request two concurrent processes to execute the SPA task:

```
dbms_sqlpa.set_analysis_task_parameter(:tname, 'TEST_EXECUTE_DOP', 2)
```

To enable result-set validation

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname, 'COMPARE_RESULTSET', 'TRUE')
)
```

To disable result-set validation:

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname, 'COMPARE_RESULTSET', 'FALSE')
)
```

## 161.3.10 SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

### Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
 parameter IN VARCHAR2,
 value IN VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
 parameter IN VARCHAR2,
 value IN NUMBER);
```

## Parameters

**Table 161-11 SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter | <p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"> <li>• <b>APPLY_CAPTURED_COMPILEENV</b>: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li> <li>• <b>BASIC_FILTER</b>: basic filter for SQL tuning set</li> <li>• <b>COMPARISON_METRIC</b>: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)</li> <li>• <b>DATABASE_LINK</b>: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</li> <li>• <b>DAYS_TO_EXPIRE</b>: number of days until the task is deleted</li> <li>• <b>DEFAULT_EXECUTION_TYPE</b>: the task will default to this type of execution when none is specified by the <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a>.</li> <li>• <b>EXECUTE_FULLDML</b>: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</li> <li>• <b>EXECUTION_DAYS_TO_EXPIRE</b>: number of days until the task's executions will be deleted (without deleting the task)</li> <li>• <b>EXECUTION_NAME1</b>: name of the first task execution to analyze</li> <li>• <b>EXECUTION_NAME2</b>: name of the second task execution to analyze</li> <li>• <b>LOCAL_TIME_LIMIT</b>: per-statement time out (seconds)</li> </ul> |

**Table 161-11 (Cont.) SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter (contd.) | <ul style="list-style-type: none"> <li>• PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</li> <li>• RANK_MEASURE1: first ranking measure for SQL tuning set</li> <li>• RANK_MEASURE2: second possible ranking measure for SQL tuning set</li> <li>• RANK_MEASURE3: third possible ranking measure for SQL tuning set</li> <li>• RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</li> <li>• SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.</li> <li>• SQL_LIMIT: maximum number of SQL statements to process</li> <li>• SQL_PERCENTAGE: percentage filter of SQL tuning set statements</li> <li>• TIME_LIMIT: global time out (seconds)</li> <li>• WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.</li> </ul> |
| value              | New value of the specified parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

# DBMS\_SQLQ

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

This chapter contains the following topics:

- [DBMS\\_SQLQ Overview](#)
- [Summary of DBMS\\_SQLQ Subprograms](#)

## 162.1 DBMS\_SQLQ Overview

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

You can use the `DBMS_SQLQ` package subprograms to:

- create quarantine configurations for execution plans of SQL statements and specify quarantine thresholds for their resource consumption
- query quarantine thresholds specified in quarantine configurations
- delete quarantine configurations
- transfer quarantine configurations from one database to another

## 162.2 Summary of DBMS\_SQLQ Subprograms

This table lists the `DBMS_SQLQ` subprograms and briefly describes them.

**Table 162-1 DBMS\_SQLQ Package Subprograms**

| Procedure                                              | Description                                                                                           |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_QUARANTINE Procedure</a>             | Specifies a quarantine threshold in a quarantine configuration for execution plans of a SQL statement |
| <a href="#">CREATE_QUARANTINE_BY_SQL_ID Function</a>   | Creates a quarantine configuration for execution plans of a SQL statement using SQL ID                |
| <a href="#">CREATE_QUARANTINE_BY_SQL_TEXT Function</a> | Creates a quarantine configuration for execution plans of a SQL statement using SQL text              |
| <a href="#">CREATE_STGTAB_QUARANTINE Procedure</a>     | Creates a staging table to store quarantine configurations                                            |
| <a href="#">DROP_QUARANTINE Procedure</a>              | Deletes a quarantine configuration                                                                    |

**Table 162-1 (Cont.) DBMS\_SQLQ Package Subprograms**

| Procedure                                           | Description                                                                          |
|-----------------------------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">GET_PARAM_VALUE_QUARANTINE Function</a> | Returns the value for a quarantine threshold specified in a quarantine configuration |
| <a href="#">PACK_STGTAB_QUARANTINE Function</a>     | Adds one or more quarantine configurations to a staging table                        |
| <a href="#">UNPACK_STGTAB_QUARANTINE Function</a>   | Creates quarantine configurations in a database from a staging table                 |

## 162.2.1 ALTER\_QUARANTINE Procedure

This procedure specifies a quarantine threshold for a resource in a quarantine configuration for execution plans of a SQL statement.

### Syntax

```
DBMS_SQLQ.ALTER_QUARANTINE (
 quarantine_name IN VARCHAR2,
 parameter_name IN VARCHAR2,
 parameter_value IN VARCHAR2);
```

### Parameters

**Table 162-2 ALTER\_QUARANTINE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quarantine_name | Name of the quarantine configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| parameter_name  | Name of the resource for which quarantine threshold needs to be specified. You can specify any one of the following values: <ul style="list-style-type: none"> <li>CPU_TIME: CPU time</li> <li>ELAPSED_TIME: Elapsed time</li> <li>IO_MEGABYTES: I/O in megabytes</li> <li>IO_REQUESTS: Number of physical I/O requests</li> <li>IO_LOGICAL: Number of logical I/O requests</li> <li>ENABLED: Flag to enable or disable the quarantine configuration. Specify YES to enable it and NO to disable it. The default value is YES.</li> <li>AUTOPURGE: Flag to enable or disable automatic purging of the quarantine configuration. If it is set to YES, the quarantine configuration is automatically purged after 53 weeks, if not used. If it is set to NO, the quarantine configuration is never purged. The default value is YES.</li> </ul> |

**Table 162-2 (Cont.) ALTER\_QUARANTINE Procedure Parameters**

| Parameter       | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| parameter_value | Quarantine threshold for the resource specified in parameter_name. |

**Examples**

In the following example, the quarantine threshold specified for CPU time is 5 seconds and elapsed time is 10 seconds for the quarantine configuration SQL\_QUARANTINE\_3z0mwuq3aqsm8cfe7a0e4.

```
BEGIN

 DBMS_SQLQ.ALTER_QUARANTINE (
 QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
 PARAMETER_NAME => 'CPU_TIME',
 PARAMETER_VALUE => '5');

 DBMS_SQLQ.ALTER_QUARANTINE (
 QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
 PARAMETER_NAME => 'ELAPSED_TIME',
 PARAMETER_VALUE => '10');

END;
/
```

When the SQL statement is executed using the execution plan specified in the quarantine configuration, and if the Resource Manager threshold for CPU time is 5 seconds or less, or elapsed time is 10 seconds or less, then the SQL statement is not allowed to run.

## 162.2.2 CREATE\_QUARANTINE\_BY\_SQL\_ID Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL ID.

**Syntax**

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID (
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

**Table 162-3 CREATE\_QUARANTINE\_BY\_SQL\_ID Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| sql_id    | SQL ID of the SQL statement. |

**Table 162-3 (Cont.) CREATE\_QUARANTINE\_BY\_SQL\_ID Function Parameters**

| Parameter       | Description                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_hash_value | Hash value of the execution plan of the SQL statement. Default value is NULL.<br><br>When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement. |

**Return Value**

Name of the quarantine configuration.

**Examples**

The following example creates a quarantine configuration for the SQL statement having the SQL ID of 8vu7s907prbgr. The quarantine configuration applies to all the execution plans of the SQL statement.

```
DECLARE
 quarantine_config VARCHAR2(30);
BEGIN
 quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr');
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL ID of 8vu7s907prbgr.

```
DECLARE
 quarantine_config VARCHAR2(30);
BEGIN
 quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr', PLAN_HASH_VALUE => '3488063716');
END;
/
```

## 162.2.3 CREATE\_QUARANTINE\_BY\_SQL\_TEXT Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL text.

**Syntax**

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT (
 sql_text IN CLOB,
 plan_hash_value IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 162-4 CREATE\_QUARANTINE\_BY\_SQL\_TEXT Function Parameters**

| Parameter       | Description                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_text        | SQL statement.                                                                                                                                                                          |
| plan_hash_value | Hash value of the execution plan of the SQL statement. Default value is NULL.<br>When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement. |

## Return Value

Name of the quarantine configuration.

## Examples

The following example creates a quarantine configuration that applies to all the execution plans of the SQL statement 'select count(\*) from emp'.

```
DECLARE
 quarantine_config VARCHAR2(30);
BEGIN
 quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'));
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL text of 'select count(\*) from emp'.

```
DECLARE
 quarantine_config VARCHAR2(30);
BEGIN
 quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'), PLAN_HASH_VALUE => '3488063716');
END;
/
```

## 162.2.4 CREATE\_STGTAB\_QUARANTINE Procedure

This procedure creates a staging table to store the quarantine configurations, so that the staging table can be exported from the current database and imported into another database, thus enabling the quarantine configurations to be used across databases.

### Syntax

```
DBMS_SQLQ.CREATE_STGTAB_QUARANTINE (
 staging_table_name IN VARCHAR2,
 staging_table_owner IN VARCHAR2 DEFAULT NULL,
 tablespace_name IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 162-5 CREATE\_STGTAB\_QUARANTINE Procedure Parameters**

| Parameter           | Description                                                                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| staging_table_name  | Name of the staging table.                                                                                                                                                        |
| staging_table_owner | Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.                   |
| tablespace_name     | Name of the tablespace in which the staging table needs to be created. Default value is NULL, which means the staging table is created in the default tablespace of the database. |

## Examples

The following example creates the staging table `TBL_STG_QUARANTINE` in the default tablespace of the database and sets its table owner to the database user executing this procedure.

```
BEGIN
 DBMS_SQLQ.CREATE_STGTAB_QUARANTINE(STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

## 162.2.5 DROP\_QUARANTINE Procedure

This procedure deletes a quarantine configuration.

### Syntax

```
DBMS_SQLQ.DROP_QUARANTINE(quarantine_name IN VARCHAR2);
```

## Parameters

**Table 162-6 DROP\_QUARANTINE Procedure Parameters**

| Parameter       | Description                                     |
|-----------------|-------------------------------------------------|
| quarantine_name | Name of the quarantine configuration to delete. |

## Examples

The following example deletes the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
BEGIN
 DBMS_SQLQ.DROP_QUARANTINE('SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4');
END;
/
```

## 162.2.6 GET\_PARAM\_VALUE\_QUARANTINE Function

This function returns the quarantine threshold for a resource specified in a quarantine configuration.

### Syntax

```
DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (
 quarantine_name IN VARCHAR2,
 parameter_name IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 162-7 GET\_PARAM\_VALUE\_QUARANTINE Function Parameters**

| Parameter       | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| quarantine_name | Name of the quarantine configuration.                              |
| parameter_name  | Resource for which the quarantine threshold needs to be retrieved. |

### Return Value

Returns the quarantine threshold for a resource specified in a quarantine configuration.

### Examples

The following example returns the quarantine threshold for CPU time specified in the quarantine configuration having the name SQL\_QUARANTINE\_3z0mwuq3aqsm8cfe7a0e4.

```
DECLARE
 quarantine_config_setting_value VARCHAR2(30);
BEGIN
 quarantine_config_setting_value := DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE(
 QUARANTINE_NAME =>
 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
 PARAMETER_NAME => 'CPU_TIME');
END;
```

## 162.2.7 PACK\_STGTAB\_QUARANTINE Function

This function adds one or more quarantine configurations into a staging table.

### Syntax

```
DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
 staging_table_name IN VARCHAR2,
 staging_table_owner IN VARCHAR2 DEFAULT NULL,
 name IN VARCHAR2 DEFAULT '%',
 sql_text IN VARCHAR2 DEFAULT '%');
```

```

 enabled IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

## Parameters

**Table 162-8 PACK\_STGTAB\_QUARANTINE Function Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| staging_table_name  | Name of the staging table in which the quarantine configurations need to be added.                                                                                                                                                                                  |
| staging_table_owner | Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.                                                                                                     |
| name                | Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                               |
| sql_text            | SQL statement text. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                                                 |
| enabled             | Flag indicating whether the quarantine configuration should be enabled or disabled. If it is set to YES, then the quarantine configuration is enabled, else it is disabled. Default value is NULL, which means the quarantine configuration is disabled by default. |

## Return Value

Number of quarantine configurations added to the staging table.

## Examples

The following example adds all the quarantine configurations having the names starting with SQL\_QUARANTINE\_ into the staging table TBL\_STG\_QUARANTINE.

```

DECLARE
 quarantine_configs NUMBER;
BEGIN
 quarantine_configs := DBMS_SQLQ.PACK_STGTAB_QUARANTINE(
 STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE',
 NAME => 'SQL_QUARANTINE_%');
END;
```

## 162.2.8 UNPACK\_STGTAB\_QUARANTINE Function

This function creates quarantine configurations in a database from a staging table.

### Syntax

```

DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
 staging_table_name IN VARCHAR2,
 staging_table_owner IN VARCHAR2 DEFAULT NULL,
 name IN VARCHAR2 DEFAULT '%',
```

```

 sql_text IN VARCHAR2 DEFAULT '%',
 enabled IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

## Parameters

**Table 162-9 UNPACK\_STGTAB\_QUARANTINE Function Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| staging_table_name  | Name of the staging table from which the quarantine configurations need to be created in the database.                                                                                                                                                                                          |
| staging_table_owner | Name of the schema owner of the staging table. Default value is <code>NULL</code> , which means the database user executing this procedure is set as the staging table owner.                                                                                                                   |
| name                | Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                                                           |
| sql_text            | SQL statement text. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                                                                             |
| enabled             | Flag indicating whether the quarantine configuration should be enabled or disabled. If its value is <code>YES</code> , then the quarantine configuration is enabled, else it is disabled. Default value is <code>NULL</code> , which means the quarantine configuration is disabled by default. |

## Return Value

Number of quarantine configurations created in the database from the staging table.

## Examples

The following example creates the quarantine configurations in the database from all the quarantine configurations stored in the staging table `TBL_STG_QUARANTINE`.

```

DECLARE
 quarantine_configs NUMBER;
BEGIN
 quarantine_configs := DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE(
 STAGING_TABLE_NAME =>
 'TBL_STG_QUARANTINE');
END;
```

# DBMS\_SQLSET

The `DBMS_SQLSET` package provides an interface to manage SQL tuning sets.

This package provides the same subprograms, although in some cases with slightly different names, as the SQL tuning set subprograms in `DBMS_SQLTUNE`. The difference is that `DBMS_SQLSET` does not require the Oracle Tuning Pack.

This chapter contains the following topics:

- [DBMS\\_SQLSET Overview](#)
- [DBMS\\_SQLSET Security Model](#)
- [DBMS\\_SQLSET Data Structures](#)
- [Summary of DBMS\\_SQLSET Subprograms](#)

## 163.1 DBMS\_SQLSET Overview

Use this package to manage SQL tuning sets.

 **Note:**

All `DBMS_SQLSET` subprograms have equivalents in the `DBMS_SQLTUNE` package.

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT\\_CURSOR\\_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT\\_WORKLOAD\\_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT\\_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT\\_SQLPA\\_TASK Function](#)
- SQL Trace files using the [SELECT\\_SQL\\_TRACE Function](#)

- A user-defined workload

The complete group of subprograms listed in [Summary of DBMS\\_SQLSET Subprograms](#) facilitates this functionality. As examples:

- The [CREATE\\_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.
- The [LOAD\\_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE\\_CURSOR\\_CACHE Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

## 163.2 DBMS\_SQLSET Security Model

This package is available to PUBLIC and performs its own security checking.

SQL tuning set subprograms require either the ADMINISTER SQL TUNING SET or the ADMINISTER ANY SQL TUNING SET privilege. Users having the ADMINISTER SQL TUNING SET privilege can only create and modify a SQL tuning set that they own. The ADMINISTER ANY SQL TUNING SET privilege allows users to manipulate all SQL tuning sets, even those owned by other users. For example, you can use [CREATE\\_SQLSET Procedure and Function](#) to create a SQL tuning set to be owned by a different user. In this case, the different user need not have the ADMINISTER SQL TUNING SET privilege to manipulate the SQL tuning set.

## 163.3 DBMS\_SQLSET Data Structures

The SELECT\_\* subprograms in the DBMS\_SQLTUNE package return objects of the SQLSET\_ROW type.

### Object Types

- [SQLSET\\_ROW Object Type](#)

### 163.3.1 SQLSET\_ROW Object Type

The SQLSET\_ROW object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of SQLSET\_ROW objects. Each SQLSET\_ROW contains a single SQL statement along with its execution context, statistics, binds, and plan. The SELECT\_\* subprograms each model a data source as a collection of SQLSET\_ROW objects, with each object uniquely identified by (sql\_id, plan\_hash\_value). Similarly, the LOAD\_SQLSET procedure takes as input a cursor whose row type is SQLSET\_ROW, treating each SQLSET\_ROW in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET\_ROW as defined.

## Syntax

```

CREATE TYPE sqlset_row AS object (
 sql_id VARCHAR(13),
 force_matching_signature NUMBER,
 sql_text CLOB,
 object_list sql_objects,
 bind_data RAW(2000),
 parsing_schema_name VARCHAR2(30),
 module VARCHAR2(48),
 action VARCHAR2(32),
 elapsed_time NUMBER,
 cpu_time NUMBER,
 buffer_gets NUMBER,
 disk_reads NUMBER,
 direct_writes NUMBER,
 rows_processed NUMBER,
 fetches NUMBER,
 executions NUMBER,
 end_of_fetch_count NUMBER,
 optimizer_cost NUMBER,
 optimizer_env RAW(2000),
 priority NUMBER,
 command_type NUMBER,
 first_load_time VARCHAR2(19),
 stat_period NUMBER,
 active_stat_period NUMBER,
 other CLOB,
 plan_hash_value NUMBER,
 sql_plan sql_plan_table_type,
 bind_list sql_binds,
 con_dbid NUMBER,
 last_exec_start_time VARCHAR2(19))

```

## Attributes

**Table 163-1 SQLSET\_ROW Attributes**

| Attribute                  | Description                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id                     | Unique SQL ID.                                                                                                                                          |
| forcing_matching_signature | Signature with literals, case, and whitespace removed.                                                                                                  |
| sql_text                   | Full text for the SQL statement.                                                                                                                        |
| object_list                | Currently not implemented.                                                                                                                              |
| bind_data                  | Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive. |
| parsing_schema_name        | Schema where the SQL is parsed.                                                                                                                         |
| module                     | Last application module for the SQL.                                                                                                                    |

**Table 163-1 (Cont.) SQLSET\_ROW Attributes**

| Attribute            | Description                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action               | Last application action for the SQL.                                                                                                                                                                              |
| elapsed_time         | Sum total elapsed time for this SQL statement.                                                                                                                                                                    |
| cpu_time             | Sum total CPU time for this SQL statement.                                                                                                                                                                        |
| buffer_gets          | Sum total number of buffer gets.                                                                                                                                                                                  |
| disk_reads           | Sum total number of disk reads.                                                                                                                                                                                   |
| direct_writes        | Sum total number of direct path writes.                                                                                                                                                                           |
| rows_processed       | Sum total number of rows processed by this SQL.                                                                                                                                                                   |
| fetches              | Sum total number of fetches.                                                                                                                                                                                      |
| executions           | Total executions of this SQL statement.                                                                                                                                                                           |
| end_of_fetch_count   | Number of times the SQL statement was fully executed with all of its rows fetched.                                                                                                                                |
| optimizer_cost       | Optimizer cost for this SQL.                                                                                                                                                                                      |
| optimizer_env        | Optimizer environment for this SQL statement.                                                                                                                                                                     |
| priority             | User-defined priority (1,2,3).                                                                                                                                                                                    |
| command_type         | Statement type, such as INSERT or SELECT.                                                                                                                                                                         |
| first_load_time      | Load time of the parent cursor.                                                                                                                                                                                   |
| stat_period          | Period of time (seconds) when the statistics of this SQL statement were collected.                                                                                                                                |
| active_stat_period   | Effective period of time (in seconds) during which the SQL statement was active.                                                                                                                                  |
| other                | Other column for user-defined attributes.                                                                                                                                                                         |
| plan_hash_value      | Plan hash value of the plan.                                                                                                                                                                                      |
| sql_plan             | Execution plan for the SQL statement.                                                                                                                                                                             |
| bind_list            | List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive. |
| con_dbid             | DBID of the PDB or CDB root.                                                                                                                                                                                      |
| last_exec_start_time | Most recent execution start time of this SQL statement.                                                                                                                                                           |

## 163.4 Summary of DBMS\_SQLSET Subprograms

This table lists the DBMS\_SQLSET subprograms and briefly describes them.

**Table 163-2 DBMS\_SQLSET Package Subprograms**

| Subprogram                             | Description                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">ADD_REFERENCE Function</a> | This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client. |

Table 163-2 (Cont.) DBMS\_SQLSET Package Subprograms

| Subprogram                                           | Description                                                                                                                                                                                          |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CAPTURE_CURSOR_CACHE Procedure</a>       | This procedure captures a workload from the shared SQL area into a SQL tuning set.                                                                                                                   |
| <a href="#">CREATE_SQLSET Procedure and Function</a> | This procedure or function creates a SQL tuning set object in the database.                                                                                                                          |
| <a href="#">CREATE_STGTAB Procedure</a>              | This procedure creates a staging table through which SQL tuning sets are imported and exported.                                                                                                      |
| <a href="#">DELETE_SQLSET Procedure</a>              | This procedure deletes a set of SQL statements from a SQL tuning set.                                                                                                                                |
| <a href="#">DROP_SQLSET Procedure</a>                | This procedure drops a SQL tuning set if it is not active.                                                                                                                                           |
| <a href="#">LOAD_SQLSET Procedure</a>                | This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements. |
| <a href="#">PACK_STGTAB Procedure</a>                | This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.                                                   |
| <a href="#">REMAP_STGTAB Procedure</a>               | This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.                                                                      |
| <a href="#">REMOVE_REFERENCE Procedure</a>           | This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.                                                                                                     |
| <a href="#">SELECT_CURSOR_CACHE Function</a>         | This function collects SQL statements from the workload repository.                                                                                                                                  |
| <a href="#">SELECT_SQL_TRACE Function</a>            | This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of sqlset_row.                                                                |
| <a href="#">SELECT_SQLPA_TASK Function</a>           | This function collects SQL statements from a SQL Performance Analyzer comparison task.                                                                                                               |
| <a href="#">SELECT_SQLSET Function</a>               | This is a table function that reads the contents of a SQL tuning set.                                                                                                                                |
| <a href="#">SELECT_WORKLOAD_REPOSITORY Function</a>  | This function collects SQL statements from the workload repository.                                                                                                                                  |
| <a href="#">UNPACK_STGTAB Procedure</a>              | This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.                                      |
| <a href="#">UPDATE_SQLSET Procedures</a>             | This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.                                                                                                            |

## 163.4.1 ADD\_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

### Syntax

```
DBMS_SQLSET.ADD_REFERENCE (
 sqlset_name IN VARCHAR2,
 description IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 :=NULL)
RETURN NUMBER;
```

### Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

**Table 163-3 ADD\_SQLSET\_REFERENCE and ADD\_REFERENCE Function Parameters**

| Parameter                 | Description                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>  | Specifies the name of the SQL tuning set.                                                                                    |
| <code>description</code>  | Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.                                |

### Return Values

The identifier of the added reference.

### Usage Notes

Adding a reference to a SQL tuning set prevents the tuning set from being modified while it is being used. Invoking SQL Tuning Advisor on the SQL tuning set adds a reference automatically, so use `ADD_REFERENCE` only when the automatically generated reference is not sufficient. The `ADD_REFERENCE` function returns a reference ID that you can later supply to the `REMOVE_SQLSET_REFERENCE` procedure. Query the `DBA_SQLSET_REFERENCES` view to find all references to a specified SQL tuning set.

### Examples

This example generates a reference to the SQL tuning set named `my_workload` and stores it in the `b_rid` variable.

```
VARIABLE b_rid NUMBER;
EXEC :b_rid := DBMS_SQLSET.ADD_REFERENCE(sqlset_name => 'my_workload',
description => 'my sts ref');
```

## 163.4.2 CAPTURE\_CURSOR\_CACHE Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

### Syntax

```
DBMS_SQLSET.CAPTURE_CURSOR_CACHE (
 sqlset_name IN VARCHAR2,
 time_limit IN POSITIVE := 1800,
 repeat_interval IN POSITIVE := 300,
 capture_option IN VARCHAR2 := 'MERGE',
 capture_mode IN NUMBER := MODE_REPLACE_OLD_STATS,
 basic_filter IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL,
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

### Parameters

The parameters are the same for both DBMS\_SQLTUNE.CAPTURE\_CURSOR\_CACHE\_SQLSET and DBMS\_SQLSET.CAPTURE\_CURSOR\_CACHE.

**Table 163-4 CAPTURE\_CURSOR\_CACHE\_SQLSET and CAPTURE\_CURSOR\_CACHE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Specifies the SQL tuning set name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| time_limit      | Defines the total amount of time, in seconds, to execute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| repeat_interval | Defines the amount of time, in seconds, to pause between sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| capture_option  | Specifies whether to insert new statements, update existing statements, or both.<br>Values are INSERT, UPDATE, or MERGE. The values are the same as for load_option in load_sqlset.                                                                                                                                                                                                                                                                                                                                                                 |
| capture_mode    | Specifies the capture mode (UPDATE and MERGE capture options). Possible values: <ul style="list-style-type: none"> <li>MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set</li> <li>MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</li> </ul> |
| basic_filter    | Defines a filter to apply to the shared SQL area for each sample.<br>If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.                                                                                                                                                                                                                                                                                                                        |

**Table 163-4 (Cont.) CAPTURE\_CURSOR\_CACHE\_SQLSET and CAPTURE\_CURSOR\_CACHE Procedure Parameters**

| Parameter     | Description                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------|
| sqlset_owner  | Specifies the owner of the SQL tuning set or NULL for current schema owner                                                |
| recursive_sql | Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL). |

### Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE(-
 sqlset_name =>
'my_workload', -
 time_limit => 30, -
 repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE(-
 sqlset_name => 'my_workload', -
 time_limit => 30, -
 repeat_interval => 5, -
 capture_mode =>
DBMS_SQLSET.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE(-
 sqlset_name => 'my_workload', -
 time_limit => 30, -
 repeat_interval => 5, -
 capture_option => 'INSERT');
```

## 163.4.3 CREATE\_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

### Syntax

```
DBMS_SQLSET.CREATE_SQLSET (
 sqlset_name IN VARCHAR2,
 description IN VARCHAR2 := NULL
 sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLSET.CREATE_SQLSET (
 sqlset_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 163-5 CREATE\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name. |
| description  | Provides an optional description of the SQL tuning set.                                                                                                                             |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                                                                    |

### Return Values

Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.

### Examples

```
EXEC DBMS_SQLSET.CREATE_SQLSET(-
 sqlset_name => 'my_workload', -
 description => 'complete application workload');
```

## 163.4.4 CREATE\_STGTAB Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

### Syntax

```
DBMS_SQLSET.CREATE_STGTAB (
 table_name IN VARCHAR2,
 schema_name IN VARCHAR2 := NULL,
 tablespace_name IN VARCHAR2 := NULL,
 db_version IN NUMBER := NULL);
```

### Parameters

**Table 163-6 CREATE\_STGTAB\_SQLSET and CREATE\_STGTAB Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name      | Specifies the of the table to create. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| schema_name     | Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| tablespace_name | Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| db_version      | Specifies the database version that determines the format of the staging table.<br>You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: <ul style="list-style-type: none"> <li>• NULL (default) — Specifies the current database version.</li> <li>• STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version.</li> <li>• STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version.</li> <li>• STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.</li> <li>• STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version.</li> <li>• STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.</li> </ul> |

### Examples

Create a staging table for packing and eventually exporting a SQL tuning sets:

```
EXEC DBMS_SQLSET.CREATE_STGTAB(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 12c Release 1 (12.1.0.2) format:

```
BEGIN
 DBMS_SQLSET.CREATE_STGTAB(
 table_name => 'STGTAB_SQLSET_121'
 , db_version => DBMS_SQLSET.STS_STGTAB_12_1_VERSION);
END;
```

## 163.4.5 DELETE\_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

### Syntax

```
DBMS_SQLSET.DELETE_SQLSET (
 sqlset_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 163-7** DELETE\_SQLSET Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                                                                                                                                                   |
| basic_filter | Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner.                                                                                                                                |

### Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a
second
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload', -
 basic_filter => 'elapsed_time <
1000000');
```

## 163.4.6 DROP\_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

### Syntax

```
DBMS_SQLSET.DROP_SQLSET (
 sqlset_name IN VARCHAR2,
 sqlset_owner IN VARCHAR2 := NULL);
```

## Parameters

**Table 163-8 DROP\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                  |
|--------------|------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                    |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner. |

## Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

## Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLSET.DROP_SQLSET ('my_workload');
```

## 163.4.7 LOAD\_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

## Syntax

```
DBMS_SQLSET.LOAD_SQLSET (
 sqlset_name IN VARCHAR2,
 populate_cursor IN sqlset_cursor,
 load_option IN VARCHAR2 := 'INSERT',
 update_option IN VARCHAR2 := 'REPLACE',
 update_condition IN VARCHAR2 := NULL,
 update_attributes IN VARCHAR2 := NULL,
 ignore_null IN BOOLEAN := TRUE,
 commit_rows IN POSITIVE := NULL,
 sqlset_owner IN VARCHAR2 := NULL);
```

## Parameters

**Table 163-9 LOAD\_SQLSET Procedure Parameters**

| Parameter       | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| sqlset_name     | Specifies the name of SQL tuning set to be loaded.                 |
| populate_cursor | Specifies the cursor reference to the SQL tuning set to be loaded. |

Table 163-9 (Cont.) LOAD\_SQLSET Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| load_option       | <p>Specifies which statements are loaded into the SQL tuning set. The possible values are:</p> <ul style="list-style-type: none"> <li>• INSERT (default) — Adds only new statements.</li> <li>• UPDATE — Updates existing the SQL statements and ignores any new statements.</li> <li>• MERGE — Inserts new statements and updates the information of the existing ones.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| update_option     | <p>Specifies how existing SQL statements are updated.</p> <p>This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are:</p> <ul style="list-style-type: none"> <li>• REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on.</li> <li>• ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</li> </ul>                                                                                                                                                                                           |
| update_condition  | <p>Specifies when to perform the update.</p> <p>The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</p> <ul style="list-style-type: none"> <li>• OLD — Refers to statement attributes from the SQL tuning set (destination).</li> <li>• NEW — Refers to statement attributes from the input statements (source).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| update_attributes | <p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action.</li> <li>• BASIC — Specifies statistics and binds only.</li> <li>• TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list.</li> <li>• ALL — Specifies all attributes, including the execution context attributes such as module and action.</li> <li>• List of comma separated attribute names to update: <ul style="list-style-type: none"> <li>– EXECUTION_CONTEXT</li> <li>– EXECUTION_STATISTICS</li> <li>– SQL_BINDS</li> <li>– SQL_PLAN</li> <li>– SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics)</li> </ul> </li> </ul> |

**Table 163-9 (Cont.) LOAD\_SQLSET Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ignore_null</code>  | Specifies whether to update attributes when the new value is NULL. If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional.                                                                                                                                                                                                                               |
| <code>commit_rows</code>  | Specifies whether to commit statements after DML. If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation. Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded. |
| <code>sqlset_owner</code> | Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner).                                                                                                                                                                                                                                                                                                                                               |

**Exceptions**

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

**Usage Notes**

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

**Examples**

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more, excluding statements that belong to `SYS` schema. You select all attributes of the SQL statements and load them in the tuning set using the default mode. The default mode loads only new statements because the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLSET.CREATE_SQLSET('my_workload');

-- populate the tuning set from the shared SQL area
DECLARE
 cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(
 DBMS_SQLSET.SELECT_CURSOR_CACHE(
 'parsing_schema_name <> 'SYS' AND elapsed_time > 5000000',
 NULL, NULL, NULL, NULL, 1, NULL,
```

```

 'ALL')) P;

DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload',
 populate_cursor => cur);

END;
/

```

Now you want to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache have aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the `SYS`-parsed cursors to avoid recursive SQL.

```

DECLARE
 cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(
 DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2,
 'parsing_schema_name <>
''SYS'',
 NULL, NULL,NULL,NULL,
 1,
 NULL,
 'ALL')) P;

 DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload',
 populate_cursor => cur,
 load_option => 'MERGE',
 update_option => 'ACCUMULATE');

END;

```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```

DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
 DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor
=> cur);
END;
/

```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE) P;

 DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload',
 populate_cursor => cur,
 load_option => 'UPDATE');
END;
/
```

## 163.4.8 PACK\_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the `SYS` schema to a staging table created by the `CREATE_STGTAB` procedure.

### Syntax

```
DBMS_SQLSET.PACK_STGTAB (
 sqlset_name IN VARCHAR2,
 sqlset_owner IN VARCHAR2 := NULL,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL,
 db_version IN NUMBER := NULL);
```

### Parameters

The parameters are identical for the `DBMS_SQLTUNE.PACK_STGTAB_SQLSET` and `DBMS_SQLSET.PACK_STGTAB` procedures.

**Table 163-10** `PACK_STGTAB_SQLSET` and `PACK_STGTAB` Procedure Parameters

| Parameter                         | Description                                                                                                                   |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>          | Specifies the name of the SQL tuning set to pack. The name is case sensitive. Wildcard characters (%) are permitted.          |
| <code>sqlset_owner</code>         | Specifies the category from which to pack SQL tuning sets. The name is case sensitive. Wildcard characters (%) are permitted. |
| <code>staging_table_name</code>   | Specifies the name of the table to use. The value is case sensitive.                                                          |
| <code>staging_schema_owner</code> | Specifies the schema where the table resides, or <code>NULL</code> for the current schema. The value is case sensitive.       |

**Table 163-10 (Cont.) PACK\_STGTAB\_SQLSET and PACK\_STGTAB Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| db_version | Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use any of the following values: <ul style="list-style-type: none"><li>• NULL (default) — Specifies the current database version.</li><li>• STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version.</li><li>• STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version.</li><li>• STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.</li></ul> |

### Usage Notes

- To move more than one SQL tuning set, call this procedure multiple times. You can then move the populated staging table to a destination database using any method, such as a database link or Oracle Data Pump, and then unpack the SQL tuning set in the destination database.
- This function issues a COMMIT after packing each SQL tuning set. If an error is raised mid-execution, then clear the staging table by deleting its rows.

### Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
 DBMS_SQLSET.PACK_STGTAB(
 sqlset_name => '%'
 , sqlset_owner => '%'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
 DBMS_SQLSET.PACK_STGTAB(
 sqlset_name => '%'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
 DBMS_SQLSET.PACK_STGTAB(
 sqlset_name => 'my_workload'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
 DBMS_SQLSET.PACK_STGTAB(
 sqlset_name => 'workload_subset'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 2 (11.2):

```
BEGIN
 DBMS_SQLSET.PACK_STGTAB(
 sqlset_name => 'workload_subset'
 , staging_table_name => 'STGTAB_SQLSET'
 , db_version => DBMS_SQLSET.STS_STGTAB_11_2_VERSION);
END;
```

## 163.4.9 REMAP\_STGTAB Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

### Syntax

```
DBMS_SQLSET.REMAP_STGTAB (
 old_sqlset_name IN VARCHAR2,
 old_sqlset_owner IN VARCHAR2 := NULL,
 new_sqlset_name IN VARCHAR2 := NULL,
 new_sqlset_owner IN VARCHAR2 := NULL,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL,
 old_con_dbid IN NUMBER := NULL,
 new_con_dbid IN NUMBER := NULL);
);
```

### Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMAP_STGTAB_SQLSET` and `DBMS_SQLSET.REMAP_SQLSET` procedures.

**Table 163-11** REMAP\_STGTAB\_SQLSET and REMAP\_SQLSET Procedure Parameters

| Parameter                     | Description                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>old_sqlset_name</code>  | Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported. |
| <code>old_sqlset_owner</code> | Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner    |
| <code>new_sqlset_name</code>  | Specifies the new name for the tuning set, or NULL to keep the same tuning set name.                             |

**Table 163-11 (Cont.) REMAP\_STGTAB\_SQLSET and REMAP\_SQLSET Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| new_sqlset_owner     | Specifies the new owner for the tuning set, or NULL to keep the same owner name.                                                                                                                    |
| staging_table_name   | Specifies the name of the table on which to perform the remap operation. The value is case sensitive.                                                                                               |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.                                                                                       |
| old_con_dbid         | Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |
| new_con_dbid         | Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |

**Usage Notes**

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

**Examples**

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
 DBMS_SQLSET.REMAP_STGTAB(
 old_sqlset_name =>
'my_workload'
 , old_sqlset_owner => 'SH'
 , new_sqlset_name =>
'imp_workload'
 , staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
 DBMS_SQLSET.REMAP_STGTAB(
 old_sqlset_name => 'imp_workload'
 , old_sqlset_owner => 'SH'
 , new_sqlset_owner => 'SYS'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

## 163.4.10 REMOVE\_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

### Syntax

```
DBMS_SQLSET.REMOVE_REFERENCE (
 sqlset_name IN VARCHAR2,
 reference_id IN NUMBER,
 sqlset_owner IN VARCHAR2 := NULL,
 force_remove IN NUMBER := 0);
```

### Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

**Table 163-12 REMOVE\_SQLSET\_REFERENCE and REMOVE\_REFERENCE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>  | Specifies the name of the SQL tuning set.                                                                                                                                                                                                                                                                  |
| <code>reference_id</code> | Specifies the identifier of the reference to remove.                                                                                                                                                                                                                                                       |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner).                                                                                                                                                                                                             |
| <code>force_remove</code> | Specifies whether references can be removed for other users (1) or whether they cannot be removed (0).<br><br>Setting this parameter to 1 only takes effect when the user has the <code>ADMINISTER ANY SQL TUNING SET</code> privilege. Otherwise, the database only removes references owned by the user. |

### Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLSET.REMOVE_REFERENCE(sqlset_name => 'my_workload', -
 reference_id => :rid);
```

Use the `DBA_SQLSET_REFERENCES` view to find all references to a given SQL tuning set.

## 163.4.11 SELECT\_CURSOR\_CACHE Function

This function collects SQL statements from the shared SQL area.

### Syntax

```
DBMS_SQLSET.SELECT_CURSOR_CACHE (
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 ranking_measure1 IN VARCHAR2 := NULL,
 ranking_measure2 IN VARCHAR2 := NULL,
 ranking_measure3 IN VARCHAR2 := NULL,
 result_percentage IN NUMBER := 1,
 result_limit IN NUMBER := NULL,
 attribute_list IN VARCHAR2 := 'TYPICAL',
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 163-13 SELECT\_CURSOR\_CACHE Function Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                       |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| basic_filter            | Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW.<br>If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE. |
| object_filter           | Currently not supported.                                                                                                                                                                                                                                                          |
| ranking_measure(n)<br>) | Defines an ORDER BY clause on the selected SQL.                                                                                                                                                                                                                                   |
| result_percentage       | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure.<br>The value applies only if one ranking measure is supplied.                                                                                                                         |
| result_limit            | Defines the top limit SQL from the filtered source ranked by the ranking measure.                                                                                                                                                                                                 |

**Table 163-13 (Cont.) SELECT\_CURSOR\_CACHE Function Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>attribute_list</code> | <p>Specifies the list of SQL statement attributes to return in the result. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default).</li> <li>• <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li> <li>• <code>ALL</code> — Specifies all attributes.</li> <li>• Comma-separated list of attribute names.</li> </ul> <p>This values returns only a subset of SQL attributes:</p> <ul style="list-style-type: none"> <li>– <code>EXECUTION_STATISTICS</code></li> <li>– <code>BIND_LIST</code></li> <li>– <code>OBJECT_LIST</code></li> <li>– <code>SQL_PLAN</code></li> <li>– <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics</li> </ul> |
| <code>recursive_sql</code>  | <p>Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>, which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

### Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

#### Example 163-1 Statements with 500 or More Buffer Gets

This query obtains the SQL IDs and SQL text for statements with 500 buffer gets:

```
SELECT SQL_ID, SQL_TEXT
FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

#### Example 163-2 All Information About a Statement

The following query obtains all information about the SQL statement with the SQL ID `4rm4183czbs7j`:

```
SELECT * FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('sql_id =
''4rm4183czbs7j''));
```

**Example 163-3 Multiple Plans for a SQL Statement**

A data source may store multiple plans for each SQL statement. The output of the `SELECT_CURSOR_CACHE` function is a SQL row set object that is uniquely identified by SQL ID and plan hash value. This example queries the plan hash values for the statement with the SQL ID `ay1m3ssvtrh24`:

```
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLSET.select_cursor_cache('sql_id =
'ay1m3ssvtrh24'))
ORDER BY sql_id, plan_hash_value;
```

**Example 163-4 Processing All Statements in the Shared SQL Area**

This example processes all statements in the shared SQL area:

```
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(p)
 FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE) p;

 -- Process each statement in cursor (or pass cursor to load_sqlset).

 CLOSE cur;
END;
/
```

**Example 163-5 Process Statements Not Parsed by SYS**

This example processes all statements not parsed in the `SYS` schema:

```
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur for
 SELECT VALUE(p)
 FROM TABLE(
 DBMS_SQLSET.SELECT_CURSOR_CACHE('parsing_schema_name <> 'SYS'))
 p;

 -- Process each statement (or pass cursor to load_sqlset).

 CLOSE cur;
end;
/
```

**Example 163-6 All Statements from an Application Module and Action**

This example processes all statements from a specified application module and action:

```
DECLARE
 cur sys_refcursor;
```

```
BEGIN
 OPEN cur FOR
 SELECT VALUE(p)
 FROM TABLE(
 DBMS_SQLSET.SELECT_CURSOR_CACHE(
 'module = 'MY_APPLICATION' and action = 'MY_ACTION''') p;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;
```

### Example 163-7 All Statements Whose Elapsed Time Is At Least Five Seconds

This example processes all statements that ran for at least five seconds:

```
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE('elapsed_time >
5000000')) P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;
/
```

### Example 163-8 Statements Parsed in the APPS Schema

This example processes all SQL statements that were parsed in the APPS schema and had more than 100 buffer gets:

```
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(p)
 FROM TABLE(
 DBMS_SQLSET.SELECT_CURSOR_CACHE(
 'buffer_gets > 100 and parsing_schema_name = 'APPS'''))p;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;
/
```

**Example 163-9 Plans and SQL Statements**

This example processes all SQL statements exceeding 5 seconds. It also selects the plans for these statements. For performance reasons, the example selects execution statistics and SQL binds. The `SQL_PLAN` attribute of `sqlset_row` is `NULL`.

```
-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of
sqlset_row
-- is NULL)
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(p)
 FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
 basic_filter => 'elapsed_time > 5000000',
 object_filter => NULL,
 ranking_measure1 => NULL,
 ranking_measure2 => NULL,
 ranking_measure3 => NULL,
 result_percentage => 1,
 result_limit => NULL,
 attribute_list => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN',
 recursive_sql => HAS_RECURSIVE_SQL)) p;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;/
```

**Example 163-10 Top 100 Statements Ordered by Elapsed Time**

This example selects the top 100 statements in the shared SQL area, ordered by elapsed time:

```
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(p)
 FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
 basic_filter => NULL,
 object_filter => NULL,
 ranking_measure_1 => 'ELAPSED_TIME',
 ranking_measure_2 => NULL,
 ranking_measure_3 => NULL,
 result_percentage => 1,
 result_limit => 100,
 attribute_list => 'TYPICAL',
 recursive_sql => HAS_RECURSIVE_SQL))) p;

 -- Process each statement (or pass cursor to load_sqlset)
```

```

 CLOSE cur;
END;
/

```

### Example 163-11 Statements Responsible for Most Buffer Gets

This example processes statements that cumulatively account for 90% of the buffer gets in the shared SQL area. The buffer gets of all statements added together is approximately 90% of the sum of all statements currently in the shared SQL area.

```

DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE(
 basic_filter => NULL,
 object_filter => NULL,
 ranking_measure_1 => 'BUFFER_GETS',
 ranking_measure_2 => NULL,
 ranking_measure_3 => NULL,
 result_percentage => .9,
 result_limit => NULL,
 attribute_list => 'TYPICAL',
 recursive_sql => HAS_RECURSIVE_SQL))) p;

 -- Process each statement (or pass cursor to load_sqlset).

 CLOSE cur;
END;
/

```

## 163.4.12 SELECT\_SQL\_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

### Syntax

```

DBMS_SQLSET.SELECT_SQL_TRACE (
 directory IN VARCHAR2,
 file_name IN VARCHAR2 := NULL,
 mapping_table_name IN VARCHAR2 := NULL,
 mapping_table_owner IN VARCHAR2 := NULL,
 select_mode IN POSITIVE := SINGLE_EXECUTION,
 options IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
 pattern_start IN VARCHAR2 := NULL,
 pattern_end IN VARCHAR2 := NULL,
 result_limit IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

## Parameters

**Table 163-14 SELECT\_SQL\_TRACE Function Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directory           | Defines the directory object containing the trace files. This field is mandatory.                                                                                                                                                                                                                                                             |
| file_name           | Specifies all or part of the name of the trace files.<br>If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.                                                                                                                        |
| mapping_table_name  | Specifies the mapping table name.<br>Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.                                                                                                                                                    |
| mapping_table_owner | Specifies the mapping table owner.<br>If it is NULL, then the function uses the current user.                                                                                                                                                                                                                                                 |
| select_mode         | Specifies the mode for selecting SQL from the trace.<br>Possible values are: <ul style="list-style-type: none"> <li>SINGLE_EXECUTION — Returns one execution of a SQL. This is the default.</li> <li>ALL_EXECUTIONS — Returns all executions.</li> </ul>                                                                                      |
| options             | Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> <li>LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default.</li> <li>ALL_COMMAND_TYPE — Returns the SQL statements with all command types.</li> </ul> |
| pattern_start       | Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.                                                                                                                                                                                                                                                |
| pattern_end         | Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.                                                                                                                                                                                                                                         |
| result_limit        | Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.                                                                                                                                                                                                                                                                    |

## Return Values

This function returns a `SQLSET_ROW` object.

## Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

## Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
 FROM dba_objects
 WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
 'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
 'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
 'LOB', 'OPERATOR', 'PACKAGE',
 'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
 'RESOURCE PLAN', 'TRIGGER', 'TYPE',
 'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
 FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLSET.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT value(p)
 FROM TABLE(
 DBMS_SQLSET.SELECT_SQL_TRACE(
 directory=>'SQL_TRACE_DIR',
 file_name=>'%trc',
 mapping_table_name=>'mapping')) p;
 DBMS_SQLSET.LOAD_SQLSET('my_sts', cur);
 CLOSE cur;
END;
/
```

## 163.4.13 SELECT\_SQLPA\_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

 **See Also:**

*Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

### Syntax

```
DBMS_SQLSET.SELECT_SQLPA_TASK(
 task_name IN VARCHAR2,
 task_owner IN VARCHAR2 := NULL,
 execution_name IN VARCHAR2 := NULL,
 level_filter IN VARCHAR2 := 'REGRESSED',
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 attribute_list IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 163-15** SELECT\_SQLPA\_TASK Function Parameters

| Parameter                   | Description                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>      | Specifies the name of the SQL Performance Analyzer task.                                                                                                                                                                                                   |
| <code>task_owner</code>     | Specifies the owner of the SQL Performance Analyzer task. If <code>NULL</code> , then assume the current user.                                                                                                                                             |
| <code>execution_name</code> | Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code> ) from which the provided filters will be applied. If <code>NULL</code> , then assume the most recent <code>COMPARE PERFORMANCE</code> execution. |

**Table 163-15 (Cont.) SELECT\_SQLPA\_TASK Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level_filter   | <p>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</p> <ul style="list-style-type: none"> <li>IMPROVED includes only improved SQL.</li> <li>REGRESSED includes only regressed SQL (default).</li> <li>CHANGED includes only SQL with changed performance.</li> <li>UNCHANGED includes only SQL with unchanged performance.</li> <li>CHANGED_PLANS includes only SQL with plan changes.</li> <li>UNCHANGED_PLANS includes only SQL with unchanged plans.</li> <li>ERRORS includes only SQL with errors only.</li> <li>MISSING_SQL includes only missing SQL statements (across STS).</li> <li>NEW_SQL includes only new SQL statements (across STS).</li> </ul> |
| basic filter   | Specifies the SQL predicate to filter the SQL in addition to the level filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| object_filter  | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| attribute_list | <p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default.</li> <li>BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li> <li>ALL — Returns all attributes.</li> <li>Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</li> </ul>                                                             |

### Return Values

This function returns a SQL tuning set object.

### Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

## 163.4.14 SELECT\_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

### Syntax

```
DBMS_SQLSET.SELECT_SQLSET (
 sqlset_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 ranking_measure1 IN VARCHAR2 := NULL,
 ranking_measure2 IN VARCHAR2 := NULL,
 ranking_measure3 IN VARCHAR2 := NULL,
```

```

result_percentage IN NUMBER := 1,
result_limit IN NUMBER := NULL)
attribute_list IN VARCHAR2 := 'TYPICAL',
plan_filter IN VARCHAR2 := NULL,
sqlset_owner IN VARCHAR2 := NULL,
recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;

```

## Parameters

**Table 163-16 SELECT\_SQLSET Function Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name                | Specifies the name of the SQL tuning set to query.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| basic_filter               | Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the <code>SQLSET_ROW</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| object_filter              | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ranking_measure(<br>n<br>) | Specifies an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| result_percentage          | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure.<br><br>Note that this parameter applies only if one ranking measure is supplied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| result_limit               | The top limit SQL from the filtered source, ranked by the ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| attribute_list             | Defines the SQL statement attributes to return in the result.<br><br>The possible values are: <ul style="list-style-type: none"> <li>• BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result.</li> <li>• TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default.</li> <li>• ALL — Returns all attributes.</li> <li>• Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> <li>– EXECUTION_STATISTICS</li> <li>– SQL_BINDS</li> <li>– SQL_PLAN_STATISTICS (similar to <code>SQL_PLAN</code> plus row source statistics)</li> </ul> </li> </ul> |

**Table 163-16 (Cont.) SELECT\_SQLSET Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_filter   | <p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> <li>LAST_GENERATED — Returns the plan with the most recent timestamp.</li> <li>FIRST_GENERATED — Returns the plan with the least recent timestamp.</li> <li>LAST_LOADED — Returns the plan with the most recent FIRST_LOAD_TIME statistical information.</li> <li>FIRST_LOADED — Returns the plan with the least recent FIRST_LOAD_TIME statistical information.</li> <li>MAX_ELAPSED TIME — Returns the plan with the maximum elapsed time.</li> <li>MAX_BUFFER_GETS — Returns the plan with the maximum buffer gets.</li> <li>MAX_DISK_READS — Returns the plan with the maximum disk reads.</li> <li>MAX_DIRECT_WRITES — Returns the plan with the maximum direct writes.</li> <li>MAX_OPTIMIZER_COST — Returns the plan with the maximum optimizer cost value.</li> </ul> |
| sqlset_owner  | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| recursive_sql | Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Return Values**

This function returns one SQLSET\_ROW per SQL\_ID or PLAN\_HASH\_VALUE pair found in each data source.

**Usage Notes**

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

**Examples**

```
-- select from a sql tuning set
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE (P)
 FROM table(DBMS_SQLSET.SELECT_SQLSET('my_workload')) P;

 -- Process each statement (or pass cursor to load_sqlset)
```

```

 CLOSE cur;
END;
/

```

## 163.4.15 SELECT\_WORKLOAD\_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

### Syntax

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
 begin_snap IN NUMBER,
 end_snap IN NUMBER,
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 ranking_measure1 IN VARCHAR2 := NULL,
 ranking_measure2 IN VARCHAR2 := NULL,
 ranking_measure3 IN VARCHAR2 := NULL,
 result_percentage IN NUMBER := 1,
 result_limit IN NUMBER := NULL,
 attribute_list IN VARCHAR2 := 'TYPICAL',
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL,
 dbid IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
 baseline_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 ranking_measure1 IN VARCHAR2 := NULL,
 ranking_measure2 IN VARCHAR2 := NULL,
 ranking_measure3 IN VARCHAR2 := NULL,
 result_percentage IN NUMBER := 1,
 result_limit IN NUMBER := NULL,
 attribute_list IN VARCHAR2 := 'TYPICAL',
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL,
 dbid IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

### Parameters

**Table 163-17 SELECT\_WORKLOAD\_REPOSITORY Function Parameters**

| Parameter               | Description                                         |
|-------------------------|-----------------------------------------------------|
| <code>begin_snap</code> | Defines the beginning AWR snapshot (non-inclusive). |
| <code>end_snap</code>   | Defines the ending AWR snapshot (inclusive).        |

**Table 163-17 (Cont.) SELECT\_WORKLOAD\_REPOSITORY Function Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| baseline_name          | Specifies the name of the AWR baseline period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| basic_filter           | Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> .<br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| object_filter          | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ranking_measure(n<br>) | Defines an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| result_percentage      | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| result_limit           | Specifies the top limit SQL from the source according to the supplied ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| attribute_list         | Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <li>• <code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default.</li> <li>• <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li>• <code>ALL</code> — Returns all attributes</li> <li>• Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).</li> </ul> |
| recursive_sql          | Specifies the filter that includes recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> ) or excludes it ( <code>NO_RECURSIVE_SQL</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| dbid                   | Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

### Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

### Examples

```
-- select statements from snapshots 1-2
DECLARE
 cur sys_refcursor;
BEGIN
```

```

OPEN cur FOR
 SELECT VALUE (P)
 FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/

```

## 163.4.16 UNPACK\_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

### Syntax

```

DBMS_SQLSET.UNPACK_STGTAB (
 sqlset_name IN VARCHAR2 := '%',
 sqlset_owner IN VARCHAR2 := NULL,
 replace IN BOOLEAN,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL);

```

### Parameters

The parameters are identical for `DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET` and `DBMS_SQLSET.UNPACK_STGTAB`.

**Table 163-18 UNPACK\_STGTAB\_SQLSET and UNPACK\_STGTAB Procedure Parameters**

| Parameter                         | Description                                                                                                                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>          | Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table. |
| <code>sqlset_owner</code>         | Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.                                                                                                       |
| <code>replace</code>              | Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.                                                              |
| <code>staging_table_name</code>   | Specifies the name of the staging table, moved after a call to the <code>DBMS_SQLTUNE.PACK_STGTAB_SQLSET</code> or <code>DBMS_SQLSET.PACK_STGTAB</code> procedure (case-sensitive).                                        |
| <code>staging_schema_owner</code> | Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).                                                                                                                          |

## Examples

```

-- unpack all STS in the staging table
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name => '%', -
 sqlset_owner => '%', -
 replace => FALSE, -
 staging_table_name => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table
-- has the
-- same name/owner as STS on the system. In this case, users should
-- call
-- remap_stgtab_sqlset to patch the staging table and with which to
-- call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name => '%', -
 sqlset_owner => '%', -
 replace => TRUE, -
 staging_table_name => 'STGTAB_SQLSET');

```

## 163.4.17 UPDATE\_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

### Syntax

```

DBMS_SQLSET.UPDATE_SQLSET (
 sqlset_name IN VARCHAR2,
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 attribute_name IN VARCHAR2,
 attribute_value IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL);

```

```

DBMS_SQLSET.UPDATE_SQLSET (
 sqlset_name IN VARCHAR2,
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 attribute_name IN VARCHAR2,
 attribute_value IN NUMBER := NULL,
 sqlset_owner IN VARCHAR2 := NULL);

```

### Parameters

**Table 163-19** UPDATE\_SQLSET Procedure Parameters

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| sqlset_name | Specifies the name of the SQL tuning set.                    |
| sql_id      | Specifies the identifier of the SQL statement to be updated. |

**Table 163-19 (Cont.) UPDATE\_SQLSET Procedure Parameters**

| <b>Parameter</b>             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>plan_hash value</code> | Specifies the hash value of the execution plan for a SQL statement.<br>Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.                                                                                                                                                                    |
| <code>attribute_name</code>  | Specifies the name of the attribute to be modified.<br>You can update the text field for <code>MODULE</code> , <code>ACTION</code> , <code>PARSING_SCHEMA_NAME</code> , and <code>OTHER</code> . The only numerical field that you can update is <code>PRIORITY</code> .<br>If a statement has multiple plans, then the procedure changes the attribute value for all plans. |
| <code>attribute_value</code> | Specifies the new value of the attribute.                                                                                                                                                                                                                                                                                                                                    |

# DBMS\_SQLTUNE

The `DBMS_SQLTUNE` package is the interface for tuning SQL on demand. The related package `DBMS_AUTO_SQLTUNE` package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- [DBMS\\_SQLTUNE Overview](#)
- [DBMS\\_SQLTUNE Security Model](#)
- [DBMS\\_SQLTUNE Data Structures](#)
- [DBMS\\_SQLTUNE Subprogram Groups](#)
- [Summary of DBMS\\_SQLTUNE Subprograms](#)

**See Also:**

["DBMS\\_AUTO\\_SQLTUNE Overview"](#)

## 164.1 DBMS\_SQLTUNE Overview

The `DBMS_SQLTUNE` package provides a number of interrelated areas of functionality.

This section contains the following topics:

- [DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS\\_SQLTUNE SQL Profile Subprograms](#)
- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#)

### SQL Tuning Advisor

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of [DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. [CREATE\\_TUNING\\_TASK Functions](#) creates a tuning task for tuning one or more SQL statements.
2. The [EXECUTE\\_TUNING\\_TASK Function and Procedure](#) executes a previously created tuning task.

3. The [REPORT\\_TUNING\\_TASK Function](#) displays the results of a tuning task.
4. You use the [SCRIPT\\_TUNING\\_TASK Function](#) to create a SQL\*Plus script which can then be executed to implement a set of Advisor recommendations

### SQL Profile Subprograms

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of [DBMS\\_SQLTUNE SQL Profile Subprograms](#) provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the [ACCEPT\\_SQL\\_PROFILE Procedure and Function](#) to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the `STATUS`, `NAME`, `DESCRIPTION`, and `CATEGORY` attributes of an existing SQL profile with the [ALTER\\_SQL\\_PROFILE Procedure](#).
- You can drop a SQL profile with the [DROP\\_SQL\\_PROFILE Procedure](#).

### SQL Tuning Sets

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT\\_CURSOR\\_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT\\_WORKLOAD\\_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT\\_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT\\_SQLPA\\_TASK Function](#)
- SQL Trace files using the [SELECT\\_SQL\\_TRACE Function](#)
- A user-defined workload

The complete group of [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) facilitates this functionality. As examples:

- The [CREATE\\_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.

- The [LOAD\\_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE\\_CURSOR\\_CACHE\\_SQLSET Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

 **Note:**

When manipulating SQL tuning sets, you can use [DBMS\\_SQLSET](#) as an alternative to [DBMS\\_SQLTUNE](#).

### Import and Export of SQL Tuning Sets and SQL Profiles

Use [DBMS\\_SQLTUNE](#) subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the [CREATE\\_STGTAB\\_SQLPROF Procedure](#) or the [CREATE\\_STGTAB\\_SQLSET Procedure](#).
2. To populate the staging table with information from the source system, call the [PACK\\_STGTAB\\_SQLPROF Procedure](#) or [PACK\\_STGTAB\\_SQLSET Procedure](#).
3. Move the staging table to the destination system.
4. To re-create the object on the new system, call the [UNPACK\\_STGTAB\\_SQLPROF Procedure](#) or the [UNPACK\\_STGTAB\\_SQLSET Procedure](#).

 **See Also:**

*Oracle Database SQL Tuning Guide* for more information about programmatic flow

### Automatic Tuning Task Functions

The automated system task [SYS\\_AUTO\\_SQL\\_TUNING\\_TASK](#) is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the [DBMS\\_AUTO\\_SQLTUNE.REPORT\\_AUTO\\_TUNING\\_TASK](#) API.

 **See Also:**

[DBMS\\_AUTO\\_SQLTUNE](#) for the list of subprograms that you can use to manage the automated SQL tuning task.

### Real-Time SQL Monitoring

Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views expose these statistics. In addition, `DBMS_SQLTUNE` provides the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions to report monitoring information.

 **Note:**

`DBMS_SQL_MONITOR` also contains the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions.

### Tuning a Standby Database Workload

In some cases, a standby database can assume a reporting role in addition to its data protection role. The standby database can have its own workload of queries, some of which may require tuning. You can issue SQL Tuning Advisor statements on a standby database, which is read-only. A standby-to-primary database link enables `DBMS_SQLTUNE` to write data to and read data from the primary database. The procedures that are eligible for tuning standby workloads include the `database_link_to` parameter.

## 164.2 DBMS\_SQLTUNE Security Model

This package is available to `PUBLIC` and performs its own security checking.

Note the following:

- Because SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (`*_TUNING_TASK`) require the `ADVISOR` privilege.
- SQL tuning set subprograms (`*_SQLSET`) require either of the following privileges:
  - `ADMINISTER SQL TUNING SET`  
You can only create and modify a SQL tuning set that you own.
  - `ADMINISTER ANY SQL TUNING SET`  
You can operate on all SQL tuning sets, even those owned by other users.
- In earlier releases, three different privileges were needed to invoke subprograms involving SQL profiles:
  - `CREATE ANY SQL PROFILE`

- ALTER ANY SQL PROFILE
- DROP ANY SQL PROFILE

The preceding privileges have been deprecated in favor of `ADMINISTER SQL MANAGEMENT OBJECT`.

## 164.3 DBMS\_SQLTUNE Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

### Object Types

- [SQLSET\\_ROW Object Type](#)

### 164.3.1 SQLSET\_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

### Syntax

```
CREATE TYPE sqlset_row AS object (
 sql_id VARCHAR(13),
 force_matching_signature NUMBER,
 sql_text CLOB,
 object_list sql_objects,
 bind_data RAW(2000),
 parsing_schema_name VARCHAR2(30),
 module VARCHAR2(48),
 action VARCHAR2(32),
 elapsed_time NUMBER,
 cpu_time NUMBER,
 buffer_gets NUMBER,
 disk_reads NUMBER,
 direct_writes NUMBER,
 rows_processed NUMBER,
 fetches NUMBER,
 executions NUMBER,
 end_of_fetch_count NUMBER,
 optimizer_cost NUMBER,
 optimizer_env RAW(2000),
 priority NUMBER,
```

|                      |                      |
|----------------------|----------------------|
| command_type         | NUMBER,              |
| first_load_time      | VARCHAR2(19),        |
| stat_period          | NUMBER,              |
| active_stat_period   | NUMBER,              |
| other                | CLOB,                |
| plan_hash_value      | NUMBER,              |
| sql_plan             | sql_plan_table_type, |
| bind_list            | sql_binds,           |
| con_dbid             | NUMBER,              |
| last_exec_start_time | VARCHAR2(19))        |

## Attributes

**Table 164-1 SQLSET\_ROW Attributes**

| Attribute                  | Description                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id                     | Unique SQL ID.                                                                                                                                                       |
| forcing_matching_signature | Signature with literals, case, and whitespace removed.                                                                                                               |
| sql_text                   | Full text for the SQL statement.                                                                                                                                     |
| object_list                | Currently not implemented.                                                                                                                                           |
| bind_data                  | Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive. |
| parsing_schema_name        | Schema where the SQL is parsed.                                                                                                                                      |
| module                     | Last application module for the SQL.                                                                                                                                 |
| action                     | Last application action for the SQL.                                                                                                                                 |
| elapsed_time               | Sum total elapsed time for this SQL statement.                                                                                                                       |
| cpu_time                   | Sum total CPU time for this SQL statement.                                                                                                                           |
| buffer_gets                | Sum total number of buffer gets.                                                                                                                                     |
| disk_reads                 | Sum total number of disk reads.                                                                                                                                      |
| direct_writes              | Sum total number of direct path writes.                                                                                                                              |
| rows_processed             | Sum total number of rows processed by this SQL.                                                                                                                      |
| fetches                    | Sum total number of fetches.                                                                                                                                         |
| executions                 | Total executions of this SQL statement.                                                                                                                              |
| end_of_fetch_count         | Number of times the SQL statement was fully executed with all of its rows fetched.                                                                                   |
| optimizer_cost             | Optimizer cost for this SQL.                                                                                                                                         |
| optimizer_env              | Optimizer environment for this SQL statement.                                                                                                                        |
| priority                   | User-defined priority (1,2,3).                                                                                                                                       |
| command_type               | Statement type, such as INSERT or SELECT.                                                                                                                            |
| first_load_time            | Load time of the parent cursor.                                                                                                                                      |
| stat_period                | Period of time (seconds) when the statistics of this SQL statement were collected.                                                                                   |

**Table 164-1 (Cont.) SQLSET\_ROW Attributes**

| Attribute            | Description                                                                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| active_stat_period   | Effective period of time (in seconds) during which the SQL statement was active.                                                                                                                                                |
| other                | Other column for user-defined attributes.                                                                                                                                                                                       |
| plan_hash_value      | Plan hash value of the plan.                                                                                                                                                                                                    |
| sql_plan             | Execution plan for the SQL statement.                                                                                                                                                                                           |
| bind_list            | List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for <code>bind_data</code> : they are mutually exclusive. |
| con_dbid             | DBID of the PDB or CDB root.                                                                                                                                                                                                    |
| last_exec_start_time | Most recent execution start time of this SQL statement.                                                                                                                                                                         |

## 164.4 DBMS\_SQLTUNE Subprogram Groups

DBMS\_SQLTUNE subprograms are grouped by function.

- [DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS\\_SQLTUNE SQL Profile Subprograms](#)
- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#)
- [DBMS\\_SQLTUNE Real-Time SQL Monitoring Subprograms](#)
- [DBMS\\_SQLTUNE SQL Performance Reporting Subprograms](#)

### 164.4.1 DBMS\_SQLTUNE SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

**Table 164-2 SQL Tuning Task Subprograms**

| Subprogram                                                   | Description                                                                            |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <a href="#">"CANCEL_TUNING_TASK Procedure"</a>               | Cancels the currently executing tuning task                                            |
| <a href="#">"CREATE_SQL_PLAN_BASELINE Procedure"</a>         | Creates a SQL plan baseline for an existing plan                                       |
| <a href="#">"CREATE_TUNING_TASK Functions"</a>               | Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor |
| <a href="#">"DROP_TUNING_TASK Procedure"</a>                 | Drops a SQL tuning task                                                                |
| <a href="#">"EXECUTE_TUNING_TASK Function and Procedure"</a> | Executes a previously created tuning task                                              |
| <a href="#">"IMPLEMENT_TUNING_TASK Procedure"</a>            | Implements a set of SQL profile recommendations made by SQL Tuning Advisor             |
| <a href="#">"INTERRUPT_TUNING_TASK Procedure"</a>            | Interrupts the currently executing tuning task                                         |

**Table 164-2 (Cont.) SQL Tuning Task Subprograms**

| Subprogram                             | Description                                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------|
| "REPORT_AUTO_TUNING_TASK Function"     | Displays a report from the automatic tuning task, reporting on a range of executions                          |
| "REPORT_TUNING_TASK Function"          | Displays the results of a tuning task                                                                         |
| "RESET_TUNING_TASK Procedure"          | Resets the currently executing tuning task to its initial state                                               |
| "RESUME_TUNING_TASK Procedure"         | Resumes a previously interrupted task that was created to process a SQL tuning set                            |
| "SCHEDULE_TUNING_TASK Function"        | Creates a tuning task and schedules its execution as a scheduler job                                          |
| "SCRIPT_TUNING_TASK Function"          | Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations |
| "SET_TUNING_TASK_PARAMETER Procedures" | Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER                                        |

"Summary of DBMS\_SQLTUNE Subprograms" contains a complete listing of all subprograms in the package.

## 164.4.2 DBMS\_SQLTUNE SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

**Table 164-3 SQL Profile Subprograms**

| Subprogram                                | Description                                                                                       |
|-------------------------------------------|---------------------------------------------------------------------------------------------------|
| ACCEPT_ALL_SQL_PROFILES Procedure         | Accepts all SQL profiles recommended by a specific execution of a tuning task                     |
| ACCEPT_SQL_PROFILE Procedure and Function | Creates a SQL profile for the specified tuning task                                               |
| ALTER_SQL_PROFILE Procedure               | Alters specific attributes of an existing SQL profile object                                      |
| CREATE_STGTAB_SQLPROF Procedure           | Creates the staging table used for copying SQL profiles from one system to another                |
| DROP_SQL_PROFILE Procedure                | Drops the named SQL profile from the database                                                     |
| PACK_STGTAB_SQLPROF Procedure             | Moves profile data out of the SYS schema into the staging table                                   |
| REMAP_STGTAB_SQLPROF Procedure            | Changes the profile data values kept in the staging table prior to performing an unpack operation |
| SQLTEXT_TO_SIGNATURE Function             | Returns a SQL text's signature                                                                    |
| UNPACK_STGTAB_SQLPROF Procedure           | Uses the profile data stored in the staging table to create profiles on this system               |

"Summary of DBMS\_SQLTUNE Subprograms" contains a complete listing of all subprograms in the package.

### 164.4.3 DBMS\_SQLTUNE SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

**Table 164-4 SQL Tuning Set Subprograms**

| Subprogram                                            | Description                                                                                                                                      |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_SQLSET_REFERENCE Function</a>         | Adds a new reference to an existing SQL tuning set to indicate its use by a client                                                               |
| <a href="#">CAPTURE_CURSOR_CACHE_SQLSET Procedure</a> | Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set                                  |
| <a href="#">CREATE_SQLSET Procedure and Function</a>  | Creates a SQL tuning set object in the database                                                                                                  |
| <a href="#">CREATE_STGTAB_SQLSET Procedure</a>        | Creates a staging table through which SQL Tuning Sets are imported and exported                                                                  |
| <a href="#">DELETE_SQLSET Procedure</a>               | Deletes a set of SQL statements from a SQL tuning set                                                                                            |
| <a href="#">DROP_SQLSET Procedure</a>                 | Drops a SQL tuning set if it is not active                                                                                                       |
| <a href="#">LOAD_SQLSET Procedure</a>                 | Populates the SQL tuning set with a set of selected SQL                                                                                          |
| <a href="#">PACK_STGTAB_SQLSET Procedure</a>          | Copies tuning sets out of the SYS schema into the staging table                                                                                  |
| <a href="#">REMAP_STGTAB_SQLSET Procedure</a>         | Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system |
| <a href="#">REMOVE_SQLSET_REFERENCE Procedure</a>     | Deactivates a SQL tuning set to indicate it is no longer used by the client                                                                      |
| <a href="#">SELECT_CURSOR_CACHE Function</a>          | Collects SQL statements from the shared SQL area                                                                                                 |
| <a href="#">SELECT_SQL_TRACE Function</a>             | Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>                    |
| <a href="#">SELECT_SQLPA_TASK Function</a>            | Collects SQL statements from a SQL performance analyzer comparison task                                                                          |
| <a href="#">SELECT_SQLSET Function</a>                | Collects SQL statements from an existing SQL tuning set                                                                                          |
| <a href="#">SELECT_WORKLOAD_REPOSITORY Function</a>   | Collects SQL statements from the workload repository                                                                                             |
| <a href="#">UNPACK_STGTAB_SQLSET Procedure</a>        | Copies one or more SQL tuning sets from the staging table                                                                                        |
| <a href="#">UPDATE_SQLSET Procedures</a>              | Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set      |

The [Summary of DBMS\\_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

## 164.4.4 DBMS\_SQLTUNE Real-Time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in V\$SQL\_MONITOR and V\$SQL\_PLAN\_MONITOR.

**Table 164-5 Real-Time SQL Monitoring Subprograms**

| Subprogram                                           | Description                                                                         |
|------------------------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">REPORT_SQL_MONITOR Function</a>          | Reports on Real-Time SQL Monitoring                                                 |
| <a href="#">REPORT_SQL_MONITOR_LIST Function</a>     | Builds a report for all or a subset of statements monitored by Oracle Database      |
| <a href="#">REPORT_SQL_MONITOR_LIST_XML Function</a> | Builds an XML report for all or a subset of statements monitored by Oracle Database |

## 164.4.5 DBMS\_SQLTUNE SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the shared SQL area and automatic workload repository (AWR).

**Table 164-6 SQL Performance Reporting Subprograms**

| Subprogram                                       | Description                                                                                                                                                                      |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REPORT_SQL_DETAIL Function</a>       | This function reports on a specific SQL ID.                                                                                                                                      |
| <a href="#">REPORT_SQL_MONITOR Function</a>      | This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.                      |
| <a href="#">REPORT_SQL_MONITOR_LIST Function</a> | This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics. |
| <a href="#">REPORT_TUNING_TASK Function</a>      | This function displays the results of a tuning task.                                                                                                                             |
| <a href="#">REPORT_TUNING_TASK_XML Function</a>  | This function displays an XML report of a tuning task.                                                                                                                           |

## 164.5 Summary of DBMS\_SQLTUNE Subprograms

This table lists the DBMS\_SQLTUNE subprograms and briefly describes them.

**Table 164-7 DBMS\_SQLTUNE Package Subprograms**

| Subprogram                                         | Description                                                                                | Group                                                |
|----------------------------------------------------|--------------------------------------------------------------------------------------------|------------------------------------------------------|
| <a href="#">ACCEPT_ALL_SQL_PROFILE S Procedure</a> | Accepts all SQL profiles recommended by a particular execution of a particular tuning task | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a> |

Table 164-7 (Cont.) DBMS\_SQLTUNE Package Subprograms

| Subprogram                                 | Description                                                                                                     | Group                                       |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| ACCEPT_SQL_PROFILE Procedure and Function  | Creates a SQL profile for the specified tuning task                                                             | DBMS_SQLTUNE SQL Profile Subprograms        |
| ADD_SQLSET_REFERENCE Function              | Adds a new reference to an existing SQL tuning set to indicate its use by a client                              | DBMS_SQLTUNE SQL Tuning Set Subprograms     |
| ALTER_SQL_PROFILE Procedure                | Alters specific attributes of an existing SQL profile object                                                    | DBMS_SQLTUNE SQL Profile Subprograms        |
| CANCEL_TUNING_TASK Procedure               | Cancels the currently executing tuning task                                                                     | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| CAPTURE_CURSOR_CACHE_SQLSET Procedure      | Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set | DBMS_SQLTUNE SQL Tuning Set Subprograms     |
| CREATE_SQL_PLAN_BASELINE Procedure         | Creates a SQL plan baseline for an existing plan                                                                | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| CREATE_SQLSET Procedure and Function       | Creates a SQL tuning set object in the database                                                                 | DBMS_SQLTUNE SQL Tuning Set Subprograms     |
| CREATE_STGTAB_SQLPROF Procedure            | Creates the staging table used for copying SQL profiles from one system to another                              | DBMS_SQLTUNE SQL Profile Subprograms        |
| CREATE_STGTAB_SQLSET Procedure             | Creates a staging table through which SQL tuning sets are imported and exported                                 | DBMS_SQLTUNE SQL Tuning Set Subprograms     |
| CREATE_TUNING_TASK Functions               | Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor                          | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| DELETE_SQLSET Procedure                    | Deletes a set of SQL statements from a SQL tuning set                                                           | DBMS_SQLTUNE SQL Tuning Set Subprograms     |
| DROP_SQL_PROFILE Procedure                 | Drops the named SQL profile from the database                                                                   | DBMS_SQLTUNE SQL Profile Subprograms        |
| DROP_SQLSET Procedure                      | Drops a SQL tuning set if it is not active                                                                      | DBMS_SQLTUNE SQL Tuning Set Subprograms     |
| DROP_TUNING_TASK Procedure                 | Drops a SQL tuning task                                                                                         | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| EXECUTE_TUNING_TASK Function and Procedure | Executes a previously created tuning task                                                                       | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| IMPLEMENT_TUNING_TASK Procedure            | implements a set of SQL profile recommendations made by SQL Tuning Advisor                                      | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| INTERRUPT_TUNING_TASK Procedure            | Interrupts the currently executing tuning task                                                                  | DBMS_SQLTUNE SQL Tuning Advisor Subprograms |
| LOAD_SQLSET Procedure                      | Populates the SQL tuning set with a set of selected SQL                                                         | DBMS_SQLTUNE SQL Tuning Set Subprograms     |

**Table 164-7 (Cont.) DBMS\_SQLTUNE Package Subprograms**

| Subprogram                                           | Description                                                                                                                                                               | Group                                                              |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">PACK_STGTAB_SQLPROF Procedure</a>        | Moves profile data out of the SYS schema into the staging table                                                                                                           | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>               |
| <a href="#">PACK_STGTAB_SQLSET Procedure</a>         | Moves tuning sets out of the SYS schema into the staging table                                                                                                            | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REMAP_STGTAB_SQLPROF Procedure</a>       | Changes the profile data values kept in the staging table prior to performing an unpack operation                                                                         | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>               |
| <a href="#">REMAP_STGTAB_SQLSET Procedure</a>        | Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system                          | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REMOVE_SQLSET_REFERENCE Procedure</a>    | Deactivates a SQL tuning set to indicate it is no longer used by the client                                                                                               | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REPORT_AUTO_TUNING_TASK Function</a>     | Displays a report from the automatic tuning task, reporting on a range of subtasks                                                                                        | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REPORT_SQL_DETAIL Function</a>           | Reports on a specific SQL ID                                                                                                                                              | <a href="#">DBMS_SQLTUNE SQL Performance Reporting Subprograms</a> |
| <a href="#">REPORT_SQL_MONITOR Function</a>          | Builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution                              | <a href="#">DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms</a>  |
| <a href="#">REPORT_SQL_MONITOR_LIST Function</a>     | Builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics | <a href="#">DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms</a>  |
| <a href="#">REPORT_SQL_MONITOR_LIST_XML Function</a> | Equivalent to the <a href="#">REPORT_SQL_MONITOR_LIST</a> function, except that it returns XMLType                                                                        | <a href="#">DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms</a>  |
| <a href="#">REPORT_TUNING_TASK Function</a>          | Displays the results of a tuning task                                                                                                                                     | <a href="#">DBMS_SQLTUNE SQL Performance Reporting Subprograms</a> |
| <a href="#">REPORT_TUNING_TASK_XML Function</a>      | Displays an XML report of a tuning task                                                                                                                                   | <a href="#">DBMS_SQLTUNE SQL Performance Reporting Subprograms</a> |
| <a href="#">RESET_TUNING_TASK Procedure</a>          | Resets the currently executing tuning task to its initial state                                                                                                           | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |

Table 164-7 (Cont.) DBMS\_SQLTUNE Package Subprograms

| Subprogram                                           | Description                                                                                                                   | Group                                                       |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <a href="#">RESUME_TUNING_TASK Procedure</a>         | Resumes a previously interrupted task that was created to process a SQL tuning set                                            | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a> |
| <a href="#">SCHEDULE_TUNING_TASK Function</a>        | Creates a SQL tuning task and schedule its execution as a scheduler job                                                       | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a> |
| <a href="#">SCRIPT_TUNING_TASK Function</a>          | Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations                 | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a> |
| <a href="#">SELECT_CURSOR_CACHE Function</a>         | Collects SQL statements from the shared SQL area                                                                              | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |
| <a href="#">SELECT_SQL_TRACE Function</a>            | Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code> | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |
| <a href="#">SELECT_SQLPA_TASK Function</a>           | Collects SQL statements from a SQL Performance Analyzer comparison task                                                       | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |

| <a href="#">SELECT_WORKLOAD_REPOSITORY Function</a>  | Collects SQL statements from the workload repository                                                                          | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |
| <a href="#">SET_TUNING_TASK_PARAMETER Procedures</a> | Updates the value of a SQL tuning parameter of type <code>VARCHAR2</code> or <code>NUMBER</code>                              | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a> |
| <a href="#">SQLTEXT_TO_SIGNATURE Function</a>        | Returns a SQL text's signature                                                                                                | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>        |
| <a href="#">UNPACK_STGTAB_SQLPROF Procedure</a>      | Uses the profile data stored in the staging table to create profiles on this system                                           | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>        |
| <a href="#">UNPACK_STGTAB_SQLSET Procedure</a>       | Moves one or more SQL tuning sets from the staging table                                                                      | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |
| <a href="#">UPDATE_SQLSET Procedures</a>             | Updates selected fields for a SQL statement in a SQL tuning set                                                               | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |

## 164.5.1 ACCEPT\_ALL\_SQL\_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (
 task_name IN VARCHAR2,
 category IN VARCHAR2 := NULL,
 replace IN BOOLEAN := FALSE,
 force_match IN BOOLEAN := FALSE,
 profile_type IN VARCHAR2 := REGULAR_PROFILE,
 autotune_period IN NUMBER := NULL,
 execution_name IN VARCHAR2 := NULL,
 task_owner IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL);
```

### Parameters

**Table 164-8** ACCEPT\_ALL\_SQL\_PROFILES Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | The (mandatory) name of the SQL tuning task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| category  | This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated. |
| replace   | If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.                                                                                                                                                                                                                                                                                                                            |

**Table 164-8 (Cont.) ACCEPT\_ALL\_SQL\_PROFILES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force_match     | <p>If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter.</p> <p>If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.</p>                                                                        |
| profile_type    | <p>Options:</p> <ul style="list-style-type: none"> <li>REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</li> <li>PX_PROFILE - regular profile with a change to parallel execution</li> </ul>                                                                                                                                                                                         |
| autotune_period | <p>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</p> <ul style="list-style-type: none"> <li>null or negative value (default) - all or full. The result includes all task executions.</li> <li>0 - result of the current or most recent task execution.</li> <li>1 - result for the most recent 24-hour period.</li> <li>7 - result for the most recent 7-day period.</li> </ul> <p>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</p> |
| execution_name  | <p>Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| task_owner      | <p>Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |
| description     | <p>A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 164-8 (Cont.) ACCEPT\_ALL\_SQL\_PROFILES Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_link_to | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Security Model

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

## 164.5.2 ACCEPT\_SQL\_PROFILE Procedure and Function

This subprogram creates a SQL profile recommended by SQL Tuning Advisor.

The SQL text is normalized for matching purposes although it is stored in the data dictionary in denormalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement does not exist, then the database reports an error.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
 task_name IN VARCHAR2,
 object_id IN NUMBER := NULL,
 name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 category IN VARCHAR2 := NULL);
task_owner IN VARCHAR2 := NULL,
```

## Parameters

**Table 164-9 ACCEPT\_SQL\_PROFILE Procedure and Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name   | The (mandatory) name of the SQL tuning task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| object_id   | The identifier of the advisor framework object representing the SQL statement associated with the tuning task                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| name        | The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.                                                                                                                                                                                                                                                                                                                                                                                        |
| description | A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.                                                                                                                                                                                                                                                                                                                                                                                                  |
| category    | The category name. This name must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated. |
| task_owner  | Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.                                                                                                                                                                                                                                                                                                                                                                  |
| replace     | If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .                                                                                                                                                                                                                                                                                                                       |

**Table 164-9 (Cont.) ACCEPT\_SQL\_PROFILE Procedure and Function Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force_match</code>      | <p>If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the <code>cursor_sharing</code> parameter.</p> <p>If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the <code>cursor_sharing</code> parameter.</p>                                                                                                                                                                                                                                                                                                                                                      |
| <code>profile_type</code>     | <p>Options:</p> <ul style="list-style-type: none"> <li>REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</li> <li>PX_PROFILE - regular profile with a change to parallel execution</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>database_link_to</code> | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Return Values

The name of the SQL profile.

### Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

### Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
 begin_snap => 1, -
 end_snap => 2, -
 sql_id => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
 task_name => :stmt_task, -
 category => 'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
 force_match => TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to 5. You must pass an object ID to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object ID is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK (-
 sqlset_name => 'my_workload', -
 rank1 => 'ELAPSED_TIME', -
 time_limit => 3600, -
 description => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

```
-- create the profile for the sql statement corresponding to object_id
= 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
 task_name => :sts_task, -
 object_id => 5);
```

### 164.5.3 ADD\_SQLSET\_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

#### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

#### Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
 sqlset_name IN VARCHAR2,
 description IN VARCHAR2 := NULL)
RETURN NUMBER;
```

#### Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

**Table 164-10** ADD\_SQLSET\_REFERENCE and ADD\_REFERENCE Function Parameters

| Parameter    | Description                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                                                                    |
| description  | Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                             |

#### Return Values

The identifier of the added reference.

#### Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You

use the REMOVE\_SQLSET\_REFERENCE procedure to delete references to a SQL tuning set.

```
VARIABLE rid NUMBER;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE(-
 sqlset_name => 'my_workload', -
 description => 'my sts reference');
```

You can use the DBA\_SQLSET\_REFERENCES view to find all references on a given SQL tuning set.

## 164.5.4 ALTER\_SQL\_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object.

The following attributes can be altered (using these attribute names):

- STATUS can be set to ENABLED or DISABLED.
- NAME can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- DESCRIPTION can be set to any string of size no more than 500 characters.
- CATEGORY can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text).

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
 name IN VARCHAR2,
 attribute_name IN VARCHAR2,
 value IN VARCHAR2);
```

### Parameters

**Table 164-11 ALTER\_SQL\_PROFILE Procedure Parameters**

| Parameter      | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| name           | The (mandatory) name of the existing SQL profile to alter                              |
| attribute_name | The (mandatory) attribute name to alter (case insensitive) using valid attribute names |
| value          | The (mandatory) new value of the attribute using valid attribute values                |

## Usage Notes

Requires the ALTER ANY SQL PROFILE privilege.

## Examples

```
-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name => :pname, -
 attribute_name => 'STATUS', -
 value => 'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name => :pname, -
 attribute_name => 'STATUS', -
 value => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this
profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name => :pname, -
 attribute_name => 'CATEGORY', -
 value => 'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name => :pname, -
 attribute_name => 'CATEGORY', -
 value => 'DEFAULT');
```

## 164.5.5 CANCEL\_TUNING\_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK (
 task_name IN VARCHAR2);
```

## Parameters

**Table 164-12 CANCEL\_TUNING\_TASK Procedure Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| task_name | Specifies the name of the task to cancel |

## Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

## 164.5.6 CAPTURE\_CURSOR\_CACHE\_SQLSET Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
 sqlset_name IN VARCHAR2,
 time_limit IN POSITIVE := 1800,
 repeat_interval IN POSITIVE := 300,
 capture_option IN VARCHAR2 := 'MERGE',
 capture_mode IN NUMBER := MODE_REPLACE_OLD_STATS,
 basic_filter IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL,
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

## Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

**Table 164-13 CAPTURE\_CURSOR\_CACHE\_SQLSET and CAPTURE\_CURSOR\_CACHE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Specifies the SQL tuning set name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| time_limit      | Defines the total amount of time, in seconds, to execute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| repeat_interval | Defines the amount of time, in seconds, to pause between sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| capture_option  | Specifies whether to insert new statements, update existing statements, or both.<br>Values are INSERT, UPDATE, or MERGE. The values are the same as for load_option in load_sqlset.                                                                                                                                                                                                                                                                                                                                                                 |
| capture_mode    | Specifies the capture mode (UPDATE and MERGE capture options). Possible values: <ul style="list-style-type: none"> <li>MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set</li> <li>MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</li> </ul> |
| basic_filter    | Defines a filter to apply to the shared SQL area for each sample.<br>If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.                                                                                                                                                                                                                                                                                                                        |
| sqlset_owner    | Specifies the owner of the SQL tuning set or NULL for current schema owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| recursive_sql   | Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time\_limit and repeat\_interval parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET(-
 sqlset_name =>
'my_workload', -
 time_limit => 30, -
 repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET(-
 sqlset_name => 'my_workload', -
 time_limit => 30, -
 repeat_interval => 5, -
 capture_mode =>
dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET(-
 sqlset_name => 'my_workload', -
 time_limit => 30, -
 repeat_interval => 5, -
 capture_option => 'INSERT');
```

## 164.5.7 CREATE\_SQL\_PLAN\_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
 task_name IN VARCHAR2,
 object_id IN NUMBER := NULL,
 plan_hash_value IN NUMBER,
 owner_name IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL);
```

### Parameters

**Table 164-14 CREATE\_SQL\_PLAN\_BASELINE Procedure Parameters**

| Parameter       | Description                                |
|-----------------|--------------------------------------------|
| task_name       | Name of the task for which to get a script |
| object_id       | Object ID to which the SQL corresponds     |
| plan_hash_value | Plan to create plan baseline               |

**Table 164-14 (Cont.) CREATE\_SQL\_PLAN\_BASELINE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner_name       | Owner of the relevant tuning task. Defaults to the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

## 164.5.8 CREATE\_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

### Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
 sqlset_name IN VARCHAR2,
 description IN VARCHAR2 := NULL
 sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.CREATE_SQLSET (
 sqlset_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 164-15 CREATE\_SQLSET Procedure Parameters**

| Parameter   | Description                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name | Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name. |

**Table 164-15 (Cont.) CREATE\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                      |
|--------------|----------------------------------------------------------------------------------|
| description  | Provides an optional description of the SQL tuning set.                          |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner. |

**Examples**

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
 sqlset_name => 'my_workload', -
 description => 'complete application workload');
```

## 164.5.9 CREATE\_STGTAB\_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

**See Also:**

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
 table_name IN VARCHAR2,
 schema_name IN VARCHAR2 := NULL,
 tablespace_name IN VARCHAR2 := NULL);
```

**Parameters****Table 164-16 CREATE\_STGTAB\_SQLPROF Procedure Parameters**

| Parameter       | Description                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name      | The name of the table to create (case-insensitive unless double quoted).                                                                          |
| schema_name     | The schema to create the table in, or NULL for the current schema (case-insensitive unless double quoted).                                        |
| tablespace_name | The tablespace to store the staging table within, or NULL for the default tablespace of the current user (case-insensitive unless double quoted). |

**Usage Notes**

- Call this procedure once before issuing a call to the [PACK\\_STGTAB\\_SQLPROF Procedure](#).

- To put different SQL profiles in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.

### Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name =>
'PROFILE_STGTAB');
```

## 164.5.10 CREATE\_STGTAB\_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
 table_name IN VARCHAR2,
 schema_name IN VARCHAR2 := NULL,
 tablespace_name IN VARCHAR2 := NULL,
 db_version IN NUMBER := NULL);
```

### Parameters

**Table 164-17 CREATE\_STGTAB\_SQLSET and CREATE\_STGTAB Procedure Parameters**

| Parameter       | Description                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name      | Specifies the of the table to create. The name is case sensitive.                                                                                 |
| schema_name     | Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.                                      |
| tablespace_name | Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive. |

**Table 164-17 (Cont.) CREATE\_STGTAB\_SQLSET and CREATE\_STGTAB Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| db_version | <p>Specifies the database version that determines the format of the staging table.</p> <p>You can also create an older database version staging table to export an STS to an older database version. Use one of the following values:</p> <ul style="list-style-type: none"> <li>• NULL (default) — Specifies the current database version.</li> <li>• STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version.</li> <li>• STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version.</li> <li>• STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.</li> <li>• STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version.</li> <li>• STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.</li> </ul> |

### Security Model

You must have CREATE TABLE permissions in the specified schema and tablespace.

### Usage Notes

- Call this procedure once before packing the SQL set.
- To have different tuning sets in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.
- The staging table contains nested table columns and indexes, so it should not be renamed.

### Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 2 (11.2) format

```
BEGIN
 DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
 table_name => 'STGTAB_SQLSET'
 , db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;
```

## 164.5.11 CREATE\_TUNING\_TASK Functions

This function creates a SQL Tuning Advisor task.

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.

- Create a tuning task for a single statement from the shared SQL area given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create a tuning task for SQL Performance Analyzer.

In all cases, the function mainly creates a SQL Tuning Advisor task and sets its parameters.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
 sql_text IN CLOB,
 bind_list IN sql_binds := NULL,
 user_name IN VARCHAR2 := NULL,
 scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 con_name IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 con_name IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

AWR format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
 begin_snap IN NUMBER,
 end_snap IN NUMBER,
 sql_id IN VARCHAR2,
```

```

plan_hash_value IN NUMBER := NULL,
scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
task_name IN VARCHAR2 := NULL,
description IN VARCHAR2 := NULL,
con_name IN VARCHAR2 := NULL,
dbid IN NUMBER := NULL,
database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

#### SQL tuning set format:

```

DBMS_SQLTUNE.CREATE_TUNING_TASK (
 sqlset_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 rank1 IN VARCHAR2 := NULL,
 rank2 IN VARCHAR2 := NULL,
 rank3 IN VARCHAR2 := NULL,
 result_percentage IN NUMBER := NULL,
 result_limit IN NUMBER := NULL,
 scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 plan_filter IN VARCHAR2 := 'MAX_ELAPSED_TIME',
 sqlset_owner IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

#### SQL Performance Analyzer format:

```

DBMS_SQLTUNE.CREATE_TUNING_TASK (
 spa_task_name IN VARCHAR2,
 spa_task_owner IN VARCHAR2 := NULL,
 spa_compare_exec IN VARCHAR2 := NULL,
 basic_filter IN VARCHAR2 := NULL,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

#### Parameters

**Table 164-18** *CREATE\_TUNING\_TASK* Function Parameters

| Parameter  | Description                                  |
|------------|----------------------------------------------|
| sql_text   | Specifies the text of a SQL statement.       |
| begin_snap | Specifies the begin snapshot identifier.     |
| end_snap   | Specifies the end snapshot identifier.       |
| sql_id     | Specifies the identifier of a SQL statement. |

**Table 164-18 (Cont.) CREATE\_TUNING\_TASK Function Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bind_list         | Defines an ordered list of bind values in ANYDATA type.<br><b>NOTE:</b> This parameter is not supported on a standby database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| plan_hash_value   | Specifies the hash value of the SQL execution plan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| sqlset_name       | Specifies the SQL tuning set name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| basic_filter      | Specifies the predicate used to filter the SQL from the SQL tuning set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| object_filter     | Specifies the object filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| rank(i)           | Specifies an ORDER BY clause on the selected SQL statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| result_percentage | Specifies the percentage on the sum of a ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| result_limit      | Specifies the top L(imit) SQL from the filtered or ranked SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| user_name         | Specifies the user name for whom the statement is to be tuned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| scope             | Specifies the tuning scope: <ul style="list-style-type: none"> <li>LIMITED: SQL Tuning Advisor produces recommendations based on statistical checks, access path analysis, and SQL structure analysis. SQL profile recommendations are not generated.</li> <li>COMPREHENSIVE: SQL Tuning Advisor carries out all the analysis it performs under limited scope plus SQL profiling.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| time_limit        | Specifies the maximum duration in seconds for the tuning session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| task_name         | Specifies an optional tuning task name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| description       | Provides a description of the SQL tuning session, up to a maximum of 256 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| plan_filter       | Specifies the plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> <li>LAST_GENERATED: most recent timestamp</li> <li>FIRST_GENERATED: earliest timestamp, the opposite to LAST_GENERATED</li> <li>LAST_LOADED: most recent first_load_time statistics information</li> <li>FIRST_LOADED: earliest first_load_time statistics information, the opposite to LAST_LOADED</li> <li>MAX_ELAPSED_TIME: maximum elapsed time</li> <li>MAX_BUFFER_GETS: maximum buffer gets</li> <li>MAX_DISK_READS: maximum disk reads</li> <li>MAX_DIRECT_WRITES: maximum direct writes</li> <li>MAX_OPTIMIZER_COST: maximum optimizer cost</li> </ul> |
| sqlset_owner      | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| spa_task_name     | Specifies the name of the SQL Performance Analyzer task whose regressions are to be tuned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| spa_task_owner    | Specifies the owner of specified SQL Performance Analyzer task or NULL for current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 164-18 (Cont.) CREATE\_TUNING\_TASK Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spa_compare_exec | Specifies the execution name of the Compare Performance trial of SQL Performance Analyzer task. If NULL, then the advisor uses the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| dbid             | Specifies the DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| con_name         | <p>Specifies the container for the tuning task. The semantics depend on the function format:</p> <ul style="list-style-type: none"> <li>For the SQL text format, this parameter specifies the container in which SQL Tuning Advisor tunes the SQL statement. If null (default), then SQL Tuning Advisor uses the current container.</li> <li>For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the cursor cache of all valid containers executing the SQL statement, and tunes the most expensive statement in its container.</li> <li>For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the AWR of all valid containers that have this SQL statement, and tunes the most expensive statement in its container.</li> </ul> <p>The following statements are true of all function formats:</p> <ul style="list-style-type: none"> <li>In a non-CDB, this parameter is ignored.</li> <li>In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, an error occurs.</li> <li>In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, an error occurs.</li> </ul> |
| database_link_to | <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

## Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

### Example 164-1 Examples

The following examples assume the following variable definitions:

```
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);
VARIABLE spa_tune_task VARCHAR2(64);
```

### Example 164-2 Create Tuning Task with SQL Text Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(-
 sql_text => 'SELECT quantity_sold FROM sales s, times t WHERE
s.time_id = t.time_id AND s.time_id = TO_DATE(''24-NOV-00'')');
```

### Example 164-3 Create Tuning Task with SQL ID Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'aylm3ssvtrh24');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'aylm3ssvtrh24', -
 scope => 'LIMITED');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'aylm3ssvtrh24', -
 time_limit => 600);
```

### Example 164-4 Create Tuning Task with AWR Snapshot Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
 end_snap => 2, sql_id => 'aylm3ssvtrh24');
```

### Example 164-5 Create Tuning Task with SQL Tuning Set Format

This example creates a task that tunes SQL statements in order by buffer gets, and also sets a time limit of one hour. The default ranking measure is elapsed time.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(-
 sqlset_name => 'my_workload', -
 rank1 => 'BUFFER_GETS', -
```

```
time_limit => 3600, -
description => 'tune my workload ordered by buffer gets');
```

### Example 164-6 Create Tuning Task with SPA Task Format

This example tunes the SQL statement that were reported as having regressed from the compare performance execution of the SQL Performance Analyzer task named task\_123.

```
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
 spa_task_name => 'task_123',
 spa_task_owner => 'SCOTT',
 spa_compare_exec => 'exec1');
```

### Example 164-7 Creating SQL Tuning Task on Standby Database

This example creates a tuning task on the standby database. The tune\_stby\_wkld task uses the lnk\_to\_primary database link to write data to the primary database, which is open read/write.

```
VAR tname VARCHAR2(30);
VAR query VARCHAR2(500);
EXEC :tname := 'tune_stby_wkld';
EXEC :query := 'SELECT /*+ FULL(t)*/ coll FROM table1 t WHERE
coll=9000';
EXEC :tname := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_text => :query,-
 task_name => :tname, database_link_to =>
'lnk_to_primary');
```

## 164.5.12 DELETE\_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

### Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
 sqlset_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 164-19 DELETE\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                                                                                                                                                   |
| basic_filter | Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner.                                                                                                                                |

## Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a
second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload', -
 basic_filter => 'elapsed_time <
1000000');
```

## 164.5.13 DROP\_SQL\_PROFILE Procedure

This procedure drops the named SQL profile from the database.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
 name IN VARCHAR2,
 ignore IN BOOLEAN := FALSE);
```

## Parameters

**Table 164-20 DROP\_SQL\_PROFILE Procedure Parameters**

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| name      | The (mandatory) name of SQL profile to be dropped. The name is case sensitive. |
| ignore    | Ignores errors due to object not existing                                      |

## Usage Notes

Requires the `DROP ANY SQL PROFILE` privilege.

## Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

## 164.5.14 DROP\_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (
 sqlset_name IN VARCHAR2,
 sqlset_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 164-21** DROP\_SQLSET Procedure Parameters

| Parameter    | Description                                                                  |
|--------------|------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                    |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner. |

### Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

### Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

## 164.5.15 DROP\_TUNING\_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK (
 task_name IN VARCHAR2);
```

## Parameters

**Table 164-22 DROP\_TUNING\_TASK Procedure Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| task_name | Specifies name of the tuning task to drop. |

## 164.5.16 EXECUTE\_TUNING\_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
 task_name IN VARCHAR2,
 execution_name IN VARCHAR2 := NULL,
 execution_params IN dbms_advisor.argList := NULL,
 execution_desc IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
 task_name IN VARCHAR2,
 execution_name IN VARCHAR2 := NULL,
 execution_params IN dbms_advisor.argList := NULL,
 execution_desc IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL);
```

## Parameters

**Table 164-23 EXECUTE\_TUNING\_TASK Function & Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| task_name | Name of the tuning task to execute. |

**Table 164-23 (Cont.) EXECUTE\_TUNING\_TASK Function & Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| execution_name   | A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| execution_params | List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the <a href="#">SET_TUNING_TASK_PARAMETER Procedures</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| execution_desc   | A 256-length string describing the execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| database_link_to | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

**Usage Notes**

A tuning task can be executed multiples times without having to reset it.

**Examples**

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

## 164.5.17 IMPLEMENT\_TUNING\_TASK Procedure

This procedure implements a set of SQL profile recommendations made by SQL Tuning Advisor.

Executing IMPLEMENT\_TUNING\_TASK is equivalent to executing the [SCRIPT\\_TUNING\\_TASK Function](#) and then running the script.

**See Also:**

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
 task_name IN VARCHAR2,
 rec_type IN VARCHAR2 := REC_TYPE_SQL_PROFILES,
 owner_name IN VARCHAR2 := NULL,
 execution_name IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL);
```

**Parameters****Table 164-24** IMPLEMENT\_TUNING\_TASK Procedure Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name        | Name of the tuning task for which to implement recommendations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| rec_type         | Filter the types of recommendations to implement. Only 'PROFILES' is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| owner_name       | Owner of the relevant tuning task or NULL for the current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| execution_name   | Name of the task execution to use. If NULL, then the procedure implements recommendations from the last task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| database_link_to | Name of a database link that exists on a standby database.<br>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.<br>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.<br>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:<br><br><pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

## 164.5.18 INTERRUPT\_TUNING\_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (
 task_name IN VARCHAR2);
```

### Parameters

**Table 164-25** INTERRUPT\_TUNING\_TASK Procedure Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| task_name | Name of the tuning task to interrupt |

### Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

## 164.5.19 LOAD\_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (
 sqlset_name IN VARCHAR2,
 populate_cursor IN sqlset_cursor,
 load_option IN VARCHAR2 := 'INSERT',
 update_option IN VARCHAR2 := 'REPLACE',
```

```

update_condition IN VARCHAR2 := NULL,
update_attributes IN VARCHAR2 := NULL,
ignore_null IN BOOLEAN := TRUE,
commit_rows IN POSITIVE := NULL,
sqlset_owner IN VARCHAR2 := NULL);

```

## Parameters

**Table 164-26 LOAD\_SQLSET Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name      | Specifies the name of SQL tuning set to be loaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| populate_cursor  | Specifies the cursor reference to the SQL tuning set to be loaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| load_option      | Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> <li>INSERT (default) — Adds only new statements.</li> <li>UPDATE — Updates existing the SQL statements and ignores any new statements.</li> <li>MERGE — Inserts new statements and updates the information of the existing ones.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                          |
| update_option    | Specifies how existing SQL statements are updated. This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are: <ul style="list-style-type: none"> <li>REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on.</li> <li>ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</li> </ul> |
| update_condition | Specifies when to perform the update. The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: <ul style="list-style-type: none"> <li>OLD — Refers to statement attributes from the SQL tuning set (destination).</li> <li>NEW — Refers to statement attributes from the input statements (source).</li> </ul>                                                                                                                                                                                                                                              |

**Table 164-26 (Cont.) LOAD\_SQLSET Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| update_attributes | <p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action.</li> <li>• BASIC — Specifies statistics and binds only.</li> <li>• TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list.</li> <li>• ALL — Specifies all attributes, including the execution context attributes such as module and action.</li> <li>• List of comma separated attribute names to update: <ul style="list-style-type: none"> <li>– EXECUTION_CONTEXT</li> <li>– EXECUTION_STATISTICS</li> <li>– SQL_BINDS</li> <li>– SQL_PLAN</li> <li>– SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics)</li> </ul> </li> </ul> |
| ignore_null       | <p>Specifies whether to update attributes when the new value is NULL. If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| commit_rows       | <p>Specifies whether to commit statements after DML.</p> <p>If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation.</p> <p>Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| sqlset_owner      | <p>Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Exceptions**

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

**Usage Notes**

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

## Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
 cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(
 DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
 'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
 NULL, NULL, NULL, NULL, 1, NULL,
 'ALL')) P;

 DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
 populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your update\_option because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the elapsed\_time filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
 cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(
 DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
 'parsing_schema_name <>
''SYS'',
 NULL, NULL, NULL, NULL,
 1,
 NULL,
 'ALL')) P;

 DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
 populate_cursor => cur,
 Using DBMS_SQLTUNE
 load_option => 'MERGE',
```

```

 update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```

DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
 DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
 populate_cursor => cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```

DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

 DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
 populate_cursor => cur,
 load_option => 'UPDATE');
END;
/
```

## 164.5.20 PACK\_STGTAB\_SQLPROF Procedure

This procedure copies profile data from the `sys.` schema into the staging table.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
 profile_name IN VARCHAR2 := '%',
 profile_category IN VARCHAR2 := 'DEFAULT',
```

```

staging_table_name IN VARCHAR2,
staging_schema_owner IN VARCHAR2 := NULL);

```

## Parameters

**Table 164-27** PACK\_STGTAB\_SQLPROF Procedure Parameters

| Parameter            | Description                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------|
| profile_name         | The name of the profile to pack (% wildcards acceptable, case-sensitive)                               |
| profile_category     | The category to pack profiles from (% wildcards acceptable, case-sensitive)                            |
| staging_table_name   | The name of the table to use (case-insensitive unless double quoted). Required.                        |
| staging_schema_owner | The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted) |

## Security Model

This procedure requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.

## Usage Notes

This function issues a COMMIT after packing each SQL profile. If an error is raised mid-execution, then clear the staging table by deleting its rows.

## Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles used by default on this system.

```

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name =>
'PROFILE_STGTAB');

```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
 staging_table_name =>
'PROFILE_STGTAB');

```

## 164.5.21 PACK\_STGTAB\_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE\_STGTAB\_SQLSET procedure.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
 sqlset_name IN VARCHAR2,
 sqlset_owner IN VARCHAR2 := NULL,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL,
 db_version IN NUMBER := NULL);
```

### Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
 DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
 sqlset_name => '%'
 , sqlset_owner => '%'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
 DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
 sqlset_name => '%'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
 DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
 sqlset_name => 'my_workload'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
 DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
 sqlset_name => 'workload_subset'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 1 (11.2):

```
BEGIN
 DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
 sqlset_name => 'workload_subset'
 , staging_table_name => 'STGTAB_SQLSET'
 , db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;
```

## 164.5.22 REMAP\_STGTAB\_SQLPROF Procedure

This procedure changes the profile data values kept in the staging table prior to performing an unpack operation.

You can use this procedure to change the category of a profile. You can also use it to change the name of a profile if one already exists on the system with the same name.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
 old_profile_name IN VARCHAR2,
 new_profile_name IN VARCHAR2 := NULL,
 new_profile_category IN VARCHAR2 := NULL,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 164-28** REMAP\_STGTAB\_SQLPROF Procedure Parameters

| Parameter                     | Description                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------|
| <code>old_profile_name</code> | The name of the profile to target for a remap operation (case-sensitive)              |
| <code>new_profile_name</code> | The new name of the profile, or <code>NULL</code> to remain the same (case-sensitive) |

**Table 164-28 (Cont.) REMAP\_STGTAB\_SQLPROF Procedure Parameters**

| Parameter            | Description                                                                               |
|----------------------|-------------------------------------------------------------------------------------------|
| new_profile_category | The new category for the profile, or NULL to remain the same (case-sensitive)             |
| staging_table_name   | The name of the table on which to perform the remap operation (case-sensitive). Required. |
| staging_schema_owner | The schema where the table resides, or NULL for current schema (case-sensitive)           |

**Security Model**

This procedure requires the UPDATE privilege on the staging table.

**Examples**

Change the name of a profile before we unpack, to avoid conflicts

```
BEGIN
 DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
 old_profile_name => :pname
 , new_profile_name => 'IMP' || :pname
 , staging_table_name => 'PROFILE_STGTAB');
END;
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```
BEGIN
 DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
 old_profile_name => :pname
 , new_profile_category => 'TEST'
 , staging_table_name => 'PROFILE_STGTAB');
END;
```

## 164.5.23 REMAP\_STGTAB\_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

** See Also:**

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
 old_sqlset_name IN VARCHAR2,
 old_sqlset_owner IN VARCHAR2 := NULL,
 new_sqlset_name IN VARCHAR2 := NULL,
 new_sqlset_owner IN VARCHAR2 := NULL,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL,
 old_con_dbid IN NUMBER := NULL,
 new_con_dbid IN NUMBER := NULL);
);
```

## Parameters

The parameters are identical for the DBMS\_SQLTUNE.REMAP\_STGTAB\_SQLSET and DBMS\_SQLSET.REMAP\_SQLSET procedures.

**Table 164-29 REMAP\_STGTAB\_SQLSET and REMAP\_SQLSET Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| old_sqlset_name      | Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.                                                                                    |
| old_sqlset_owner     | Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner                                                                                       |
| new_sqlset_name      | Specifies the new name for the tuning set, or NULL to keep the same tuning set name.                                                                                                                |
| new_sqlset_owner     | Specifies the new owner for the tuning set, or NULL to keep the same owner name.                                                                                                                    |
| staging_table_name   | Specifies the name of the table on which to perform the remap operation. The value is case sensitive.                                                                                               |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.                                                                                       |
| old_con_dbid         | Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |
| new_con_dbid         | Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |

## Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

## Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
```

```

DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
 old_sqlset_name =>
'my_workload'
 , old_sqlset_owner => 'SH'
 , new_sqlset_name =>
'imp_workload'
 , staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
 old_sqlset_name => 'imp_workload'
 , old_sqlset_owner => 'SH'
 , new_sqlset_owner => 'SYS'
 , staging_table_name => 'STGTAB_SQLSET');
END;
```

## 164.5.24 REMOVE\_SQLSET\_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
 sqlset_name IN VARCHAR2,
 reference_id IN NUMBER,
 sqlset_owner IN VARCHAR2 := NULL,
 force_remove IN NUMBER := 0);
```

### Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

**Table 164-30 REMOVE\_SQLSET\_REFERENCE and REMOVE\_REFERENCE Procedure Parameters**

| Parameter                 | Description                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>  | Specifies the name of the SQL tuning set.                                                      |
| <code>reference_id</code> | Specifies the identifier of the reference to remove.                                           |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner). |

**Table 164-30 (Cont.) REMOVE\_SQLSET\_REFERENCE and REMOVE\_REFERENCE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force_remove</code> | Specifies whether references can be removed for other users (1) or whether they cannot be removed (0).<br><br>Setting this parameter to 1 only takes effect when the user has the <code>ADMINISTER ANY SQL TUNING SET</code> privilege. Otherwise, the database only removes references owned by the user. |

### Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE(-
 sqlset_name => 'my_workload', -
 reference_id => :rid,
 sqlset_owner => NULL,
 force_remove => 0);
```

To find all references to a given SQL tuning set, query the `DBA_SQLSET_REFERENCES` view.

## 164.5.25 REPORT\_AUTO\_TUNING\_TASK Function

This function displays a report from the automatic tuning task.

This function reports on a range of task executions, whereas the [REPORT\\_TUNING\\_TASK Function](#) reports on a single execution. Note that this function is deprecated with Oracle Database 11g Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

### See Also:

- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- [REPORT\\_AUTO\\_TUNING\\_TASK Function](#)

### Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
 begin_exec IN VARCHAR2 := NULL,
 end_exec IN VARCHAR2 := NULL,
 type IN VARCHAR2 := TYPE_TEXT,
 level IN VARCHAR2 := LEVEL_TYPICAL,
 section IN VARCHAR2 := SECTION_ALL,
 object_id IN NUMBER := NULL,
```

```

 result_limit IN NUMBER := NULL)
RETURN CLOB;

```

## Parameters

**Table 164-31** REPORT\_AUTO\_TUNING\_TASK Function Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| begin_exec   | Specifies the name of the execution from which to begin the report. NULL retrieves a report on the most recent run.                                                                                                                                                                                                                                                                                                      |
| end_exec     | Specifies the name of the execution at which to end the report. NULL retrieves a report on the most recent run.                                                                                                                                                                                                                                                                                                          |
| type         | Specifies the type of the report to produce. Possible values are TYPE_TEXT which produces a text report                                                                                                                                                                                                                                                                                                                  |
| level        | Specifies the level of detail in the report: <ul style="list-style-type: none"> <li>LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented.</li> <li>LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.</li> </ul> |
| section      | Limits the report to a single section (ALL for all sections): <ul style="list-style-type: none"> <li>SECTION_SUMMARY - summary information</li> <li>SECTION_FINDINGS - tuning findings</li> <li>SECTION_PLAN - explain plans</li> <li>SECTION_INFORMATION - general information</li> <li>SECTION_ERROR - statements with errors</li> <li>SECTION_ALL - all statements</li> </ul>                                         |
| object_id    | Specifies the advisor framework object ID that represents a single statement to restrict reporting to. Specify NULL for all statements. Only valid for reports that target a single execution.                                                                                                                                                                                                                           |
| result_limit | Specifies the maximum number of SQL statements to show in the report.                                                                                                                                                                                                                                                                                                                                                    |

## Return Values

A CLOB containing the desired report.

## 164.5.26 REPORT\_SQL\_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the v\$sql views and AWR.

### See Also:

[DBMS\\_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.REPORT_SQL_DETAIL (
 sql_id IN VARCHAR2 DEFAULT NULL,
 sql_plan_hash_value IN NUMBER DEFAULT NULL,
 start_time IN DATE DEFAULT NULL,
 duration IN NUMBER DEFAULT NULL,
 inst_id IN NUMBER DEFAULT NULL,
 dbid IN NUMBER DEFAULT NULL,
 event_detail IN VARCHAR2 DEFAULT 'YES',
 bucket_max_count IN NUMBER DEFAULT 128,
 bucket_interval IN NUMBER DEFAULT NULL,
 top_n IN NUMBER DEFAULT 10,
 report_level IN VARCHAR2 DEFAULT 'TYPICAL',
 type IN VARCHAR2 DEFAULT 'ACTIVE',
 data_source IN VARCHAR2 DEFAULT 'AUTO',
 end_time IN DATE DEFAULT NULL,
 duration_stats IN NUMBER DEFAULT NULL,
 con_name IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

## Parameters

**Table 164-32** REPORT\_SQL\_DETAIL Function Parameters

| Parameter           | Description                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id              | SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.                                                                                      |
| sql_plan_hash_value | Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.                                                                                                                 |
| start_time          | If specified, shows SQL activity (from GV\$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time. |
| duration            | Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.                                                                                                                                                                           |
| inst_id             | Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.                                                                                                                                                  |
| dbid                | DBID from which to get SQL details. If NULL, uses current DBID.                                                                                                                                                                                                     |
| event_detail        | When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).                                                                                                                                  |
| bucket_max_count    | If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.                                                                                                                               |
| bucket_interval     | If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.                                                                                                                              |
| top_n               | Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.                                                                                                                             |

**Table 164-32 (Cont.) REPORT\_SQL\_DETAIL Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| report_level | <p>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> <li>'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default</li> <li>'SPM' - Show existing plan baselines for a SQL statement; OFF by default</li> <li>'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default.</li> <li>'STATS' - Show SQL execution statistics per plan from GV\$SQLAREA_PLAN_HASH; ON by default</li> <li>'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default</li> <li>'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default</li> <li>'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default</li> <li>'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default</li> <li>'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default</li> <li>'XPLAN' - Show execution plans; ON by default</li> <li>'BINDS' - show captured bind data; ON by default</li> </ul> <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> <li>-SQL_TEXT - No SQL text in report</li> <li>+SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR</li> <li>-SQL_FULLTEXT - No full SQL text (+SQL_TEXT)</li> <li>+SQL_FULLTEXT - Show full SQL text (default value)</li> </ul> <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> <li>NONE - minimum possible</li> <li>BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM</li> <li>TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR</li> <li>ALL - everything</li> </ul> <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p> |
| type         | <p>Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| data_source  | <p>Determines the data source of SQL data based on one of the following values:</p> <ul style="list-style-type: none"> <li>MEMORY: The data source is GV\$ view</li> <li>DISK: The data source is DBA_HIST_* view</li> <li>AUTO: Automatically determines the data source based on the time frame (default)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 164-32 (Cont.) REPORT\_SQL\_DETAIL Function Parameters**

| Parameter      | Description                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_time       | If specified, shows SQL activity from start_time to end_time. If NULL (default), shows SQL activity for systimestamp.                                |
| duration_stats | Duration of additional SQL execution statistics from AWR (in hours), for the report. If NULL (default), then the duration of 24 hours is considered. |
| con_name       | Name of the multitenant container database (CDB).                                                                                                    |

**Security Model**

The invoker needs the EXECUTE privilege on the [DBMS\\_XPLAN](#) package.

**Return Values**

A CLOB containing the desired report.

**Usage Notes**

- ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the SELECT or READ privilege on the following views:
  - V\$SESSION
  - DBA\_ADVISOR\_FINDINGS
  - V\$DATABASE
  - GV\$ASH\_INFO
  - GV\$ACTIVE\_SESSION\_HISTORY
  - GV\$SQLAREA\_PLAN\_HASH
  - GV\$SQL
  - DBA\_HIST\_SNAPSHOT
  - DBA\_HIST\_WR\_CONTROL
  - DBA\_HIST\_ACTIVE\_SESS\_HISTORY
  - DBA\_HIST\_SQLSTAT
  - DBA\_HIST\_SQL\_BIND\_METADATA
  - DBA\_HIST\_SQLTEXT
  - DBA\_SQL\_PLAN\_BASELINES
  - DBA\_SQL\_PROFILES
  - DBA\_ADVISOR\_TASKS
  - DBA\_SERVICES

- DBA\_USERS
- DBA\_OBJECTS
- DBA\_PROCEDURES

## 164.5.27 REPORT\_SQL\_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

### See Also:

[Real-Time SQL Monitoring](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR(
 sql_id IN VARCHAR2 DEFAULT NULL,
 dbop_name IN VARCHAR2 DEFAULT NULL,
 dbop_exec_id IN NUMBER DEFAULT NULL,
 session_id IN NUMBER DEFAULT NULL,
 session_serial IN NUMBER DEFAULT NULL,
 sql_exec_start IN DATE DEFAULT NULL,
 sql_exec_id IN NUMBER DEFAULT NULL,
 inst_id IN NUMBER DEFAULT NULL,
 start_time_filter IN DATE DEFAULT NULL,
 end_time_filter IN DATE DEFAULT NULL,
 instance_id_filter IN NUMBER DEFAULT NULL,
 parallel_filter IN VARCHAR2 DEFAULT NULL,
 plan_line_filter IN NUMBER DEFAULT NULL,
 event_detail IN VARCHAR2 DEFAULT 'YES',
 bucket_max_count IN NUMBER DEFAULT 128,
 bucket_interval IN NUMBER DEFAULT NULL,
 base_path IN VARCHAR2 DEFAULT NULL,
 last_refresh_time IN DATE DEFAULT NULL,
 report_level IN VARCHAR2 DEFAULT 'TYPICAL',
 type IN VARCHAR2 DEFAULT 'TEXT',

### Parameters

**Table 164-33** REPORT\_SQL\_MONITOR Function Parameters

| Parameter | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id    | SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle. |

**Table 164-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbop_name          | DBOP_NAME for which monitoring information of the composite database operation is displayed.                                                                                                                                                                                                                                                          |
| dbop_exec_id       | Execution ID for the composite database operation for which monitoring information is displayed.                                                                                                                                                                                                                                                      |
| session_id         | If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.                                                                                                                                                                                       |
| session_serial     | In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.                                                                                                                                                       |
| sql_exec_start     | This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.    |
| sql_exec_id        | This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown. |
| inst_id            | Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.                                                                                                                                                                                                               |
| start_time_filter  | If not NULL, the report considers only the activity (from GV\$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.                                                                                                                          |
| end_time_filter    | If not NULL, the report shows only the activity (from GV\$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.                                                                      |
| instance_id_filter | Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.                                     |

**Table 164-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parallel_filter   | <p>Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:</p> <ul style="list-style-type: none"> <li>• NULL to target all processes</li> <li>• [qc][servers(&lt;svr_grp&gt;[,] &lt;svr_set&gt;[,] &lt;srv_num&gt;)]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider.</li> </ul> <p>The following examples show how to target a subset of the parallel processes:</p> <ul style="list-style-type: none"> <li>• qc: targets only the query coordinator</li> <li>• servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel.</li> <li>• servers(, 2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers)</li> <li>• servers(1,1): consider only group 1, set 1</li> <li>• servers(1, 2, 4): consider only group 1, set 2, server number 4. This reports for a single parallel server process</li> <li>• qc servers(1, 2, 4): same as above by also including the query coordinator</li> </ul> |
| event_detail      | <p>When value is 'YES' (the default), reported activity from GV\$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| bucket_max_count  | <p>If specified, this should be the maximum number of histogram buckets created in the report</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| bucket_interval   | <p>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| base_path         | <p>URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| last_refresh_time | <p>If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:</p> <ul style="list-style-type: none"> <li>• SQL text is not returned when this option is specified</li> <li>• activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 164-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| report_level          | <p>Level of detail for the report: 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> <li>'XPLAN' - Show explain plan; ON by default</li> <li>'PLAN' - Show plan monitoring statistics; ON by default</li> <li>'SESSIONS' - Show session details. Applies only to parallel queries; ON by default</li> <li>'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default</li> <li>'PARALLEL' - An umbrella parameter for specifying sessions+instance details</li> <li>'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default</li> <li>'BINDS' - Show bind information when available; ON by default</li> <li>'METRICS' - Show metric data (CPU, I/Os, ...) over time; ON by default</li> <li>'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default</li> <li>'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default</li> <li>'OTHER' - Other info; ON by default</li> </ul> <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> <li>SQL_TEXT - No SQL text in report</li> <li>+SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR</li> <li>-SQL_FULLTEXT - No full SQL text (+SQL_TEXT)</li> <li>+SQL_FULLTEXT - Show full SQL text (default value)</li> </ul> |
| report_level (contd.) | <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> <li>NONE - minimum possible</li> <li>+BASIC - SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS</li> <li>TYPICAL - everything but PLAN_HISTOGRAM</li> <li>ALL - everything</li> </ul> <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| type                  | Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| sql_plan_hash_value   | Target only those SQL executions with the specified plan_hash_value. Default is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| con_name              | Name of the multitenant container database (CDB).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| report_id             | ID of the report in auto-report repository. Report IDs can be found in DBA_HIST_REPORTS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Return Values

A CLOB containing the desired report.

## Usage Notes

- The target SQL statement for this report can be:
  - The most recent SQL statement monitored by Oracle Database. This is the default behavior, so there is no need to specify any parameter.
  - The most recent SQL statement executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id =>` for the current session or `session_id => 20, session_serial => 103` for session ID 20, serial number 103.
  - The most recent execution of a specific statement identified by its `sql_id`.
  - A specific execution of a SQL statement identified by its execution key (`sql_id, sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).

- `GV$SQL_MONITOR`
- `GV$SQL_PLAN_MONITOR`
- `GV$SQL_PLAN`
- `GV$ACTIVE_SESSION_HISTORY`
- `GV$SESSION_LONGOPS`
- `GV$SQL`

- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram.

By default, the maximum number of buckets is set to 128. The database derives the `bucket_interval` value based on this count. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1 second) without exceeding the maximum number of buckets. For example, if the query has executed for 600 seconds, then the database selects a `bucket_interval` of 8 seconds (a power of two). The database chooses the value of 8 because  $600/8 = 74$ , which is less than 128 buckets maximum. Smaller than 8 seconds would be 4 seconds, which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the database uses the specified value instead of deriving it from `bucket_max_count`.

- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager, while not requiring any EM installation.

The report file is in HTML format. The code powering the active report is downloaded transparently by the web browser when the report is first viewed. Therefore, viewing the report requires outside connectivity.

## 164.5.28 REPORT\_SQL\_MONITOR\_LIST Function

This function builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics.

Use the [REPORT\\_SQL\\_MONITOR Function](#) to get detailed monitoring information for a single SQL statement.

 **See Also:**

[Real-Time SQL Monitoring](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST(
 sql_id IN VARCHAR2 DEFAULT NULL,
 session_id IN NUMBER DEFAULT NULL,

## Parameters

Table 164-34 REPORT\_SQL\_MONITOR\_LIST Function Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id             | SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| session_id         | If not NULL, then this parameter targets only the subset of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| session_serial     | In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.                                                                                                                                                                                                                                                                                                                                                                                            |
| inst_id            | Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| active_since_date  | If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.                                                                                                                                                                                                                                                                                                                                           |
| active_since_sec   | Same as active_since_date but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.                                                                                                                                                                                                                                                                                                                                                                                                               |
| active_before_date | If not NULL (default), returns only monitored statements that have been active before the specified date and time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| last_refresh_time  | If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics. |
| dbop_name          | DB operation name. Specify NULL to display all the monitored DB operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| monitor_type       | Type of the SQL Monitor operation. Specify one of the following values: <ul style="list-style-type: none"> <li>MONITOR_TYPE_SQL - Returns only SQL statements</li> <li>MONITOR_TYPE_DBOP - Returns only database operations</li> <li>MONITOR_TYPE_ALL - Returns SQL statements as well as database operations</li> </ul>                                                                                                                                                                                                                                                                   |
| max_sqltext_length | Maximum length of the SQL text. Default is NULL (no limit).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| top_n_count        | Limits the number of top-N SQL statements that need to be included in the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 164-34 (Cont.) REPORT\_SQL\_MONITOR\_LIST Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| top_n_rankby       | Specifies the attribute to rank the SQL statements. Specify this value when top_n_count value is not NULL. The ranking of an SQL statement is done based on one of the following values: <ul style="list-style-type: none"> <li>LAST_ACTIVE_TIME - Last active date and time (top N most recent)</li> <li>DURATION - Total duration of execution</li> <li>DB_TIME - DB time used</li> <li>CPU_TIME - CPU time used</li> <li>IO_REQUESTS - Number of I/O requests</li> <li>IO_BYTES - Number of I/O bytes</li> </ul> |
| report_level       | Level of detail for the report. The level is one of the following: <ul style="list-style-type: none"> <li>BASIC - SQL text up to 200 characters</li> <li>TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters</li> <li>ALL - currently the same as TYPICAL</li> </ul>                                                                                                                                                                |
| auto_refresh       | Currently non-operational, reserved for future use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| base_path          | URL path for flex HTML resources because flex HTML format is required to access external files (java scripts and the flash SWF file itself).                                                                                                                                                                                                                                                                                                                                                                        |
| type               | Report format: TEXT (default), HTML, or XML.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| con_name           | Name of the multitenant container database (CDB)                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| top_n_detail_count | Limits the number of top-N SQL statements for which the SQL monitor details need to be included in the report.                                                                                                                                                                                                                                                                                                                                                                                                      |

### Return Values

A report for the list of SQL statements that have been monitored. The report type is text, XML, or HTML.

### Usage Notes

You must have the privilege to access the following fixed views: GV\$SQL\_MONITOR and GV\$SQL.

## 164.5.29 REPORT\_TUNING\_TASK Function

This function displays the results of a tuning task. By default the report is in text format.

### See Also:

[DBMS\\_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(
 task_name IN VARCHAR2,
 type IN VARCHAR2 := 'TEXT',
 level IN VARCHAR2 := 'TYPICAL',
 section IN VARCHAR2 := ALL,
 object_id IN NUMBER := NULL,
 result_limit IN NUMBER := NULL,
 owner_name IN VARCHAR2 := NULL,
 execution_name IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL)
RETURN CLOB;
```

### Parameters

**Table 164-35** REPORT\_TUNING\_TASK Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | Name of the tuning task.                                                                                                                                                                                                                                                                                                                                                                      |
| type      | Type of the report to produce. Possible values are TEXT which produces a text report.                                                                                                                                                                                                                                                                                                         |
| level     | Level of detail in the report: <ul style="list-style-type: none"> <li>BASIC: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>TYPICAL: show information about every statement analyzed, including requests not implemented.</li> <li>ALL: highly detailed report level, also provides annotations about statements skipped over.</li> </ul>      |
| section   | Section of the report to include. You can limit the report to any of the following single sections (ALL for all sections): <ul style="list-style-type: none"> <li>SUMMARY - Summary information</li> <li>FINDINGS - Tuning findings</li> <li>PLAN - Explain plans</li> <li>INFORMATION - General information</li> <li>ERROR - Statements with errors</li> <li>ALL - All statements</li> </ul> |

**Table 164-35 (Cont.) REPORT\_TUNING\_TASK Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_id        | Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| result_limit     | Maximum number of SQL statements to show in the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| owner_name       | Owner of the relevant tuning task. The default is the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| execution_name   | Name of the task execution to use. If NULL, then the function generates the report for the last task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| database_link_to | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Return Values

A CLOB containing the desired report.

### Examples

```
-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL',
'SUMMARY')
FROM DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT',
'TYPICAL', 'FINDINGS', 5)
FROM DUAL;
```

## 164.5.30 REPORT\_TUNING\_TASK\_XML Function

This function displays an XML report of a tuning task.

### See Also:

[DBMS\\_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.REPORT_TUNING_TASK_LIST_XML(
 task_name IN VARCHAR2 := NULL,
 level IN VARCHAR2 := LEVEL_TYPICAL,
 section IN VARCHAR2 := SECTION_ALL,
 object_id IN NUMBER := NULL,
 result_limit IN NUMBER := 160,
 owner_name IN VARCHAR2 := NULL,
 execution_name IN VARCHAR2 := NULL,
 autotune_period IN NUMBER := NULL,
 report_tag IN VARCHAR2 := NULL)
RETURN XMLTYPE;

```

### Parameters

**Table 164-36** REPORT\_TUNING\_TASK\_XML Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | Name of the tuning task.                                                                                                                                                                                                                                                                                                                                                                 |
| level     | Level of detail in the report: <ul style="list-style-type: none"> <li>BASIC: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>TYPICAL: show information about every statement analyzed, including requests not implemented.</li> <li>ALL: highly detailed report level, also provides annotations about statements skipped over.</li> </ul> |
| section   | Section of the report to include.<br>You can limit the report to any of the following single sections (ALL for all sections): <ul style="list-style-type: none"> <li>SUMMARY - Summary information</li> <li>ALL - All statements</li> </ul>                                                                                                                                              |
| object_id | Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.                                                                                                                                                                                                                 |

**Table 164-36 (Cont.) REPORT\_TUNING\_TASK\_XML Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result_limit    | The number of statements in a SQL tuning set or snapshot range for which the report is generated. The default is 160 (20 statements * 8 categories). The categories are as follows: <ul style="list-style-type: none"> <li>• Profile</li> <li>• Index</li> <li>• Restructure SQL</li> <li>• Alternate plan</li> <li>• Statistics</li> <li>• Errors</li> <li>• Information</li> <li>• No findings</li> </ul>                                                                                                                                                                                                   |
| owner_name      | Owner of the relevant tuning task. The default is the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| execution_name  | Name of the task execution to use. If NULL, then the function generates the report for the most recent task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| autotune_period | The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows: <ul style="list-style-type: none"> <li>• Null or negative value (default) — All or full. The result includes all task executions.</li> <li>• 0 — Result of the current or most recent task execution.</li> <li>• 1 — Result for the most recent 24-hour period.</li> <li>• 7 — Result for the most recent 7-day period.</li> </ul> The procedure interprets any other value as the time of the most recent task execution minus the value of this argument. |
| report_tag      | The name of the root XML tag. By default, the tag is the report reference generated by the reporting framework.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Return Values

A CLOB containing the desired report.

## 164.5.31 RESET\_TUNING\_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(
 task_name IN VARCHAR2);
```

## Parameters

**Table 164-37** RESET\_TUNING\_TASK Procedure Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| task_name | The name of the tuning task to reset |

## Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

## 164.5.32 RESUME\_TUNING\_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
 task_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL);
```

## Parameters

**Table 164-38** RESUME\_TUNING\_TASK Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name    | The name of the tuning task to resume.                                                                                                                                                                               |
| basic_filter | A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the parameter <code>basic_filteri</code> when calling <a href="#">CREATE_TUNING_TASK Functions</a> . |

## Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

## Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or
check
-- out its results and then decide. For this example we will just
resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

## 164.5.33 SCHEDULE\_TUNING\_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS\_SCHEDULER job to execute the tuning task. One form of the function finds the information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

Shared SQL Area Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 start_date IN TIMESTAMP WITH TIME ZONE := NULL,
 scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
 time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
 task_name IN VARCHAR2 := NULL,
 description IN VARCHAR2 := NULL,
 con_name IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

AWR Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
 begin_snap IN NUMBER,
 end_snap IN NUMBER,
 sql_id IN VARCHAR2,
```

```

plan_hash_value IN NUMBER := NULL,
start_date IN TIMESTAMP WITH TIME ZONE := NULL,
scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
task_name IN VARCHAR2 := NULL,
description IN VARCHAR2 := NULL,
con_name IN VARCHAR2 := NULL,
dbid IN NUMBER := NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 164-39 SCHEDULE\_TUNING\_TASK Function Parameters**

| Parameter       | Description                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------|
| begin_snap      | The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included. |
| end_snap        | The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.           |
| sql_id          | The SQL ID of the statement to be tuned.                                                                                         |
| plan_hash_value | The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.          |
| start_date      | The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.                    |
| scope           | The scope of the tuning job: limited, or comprehensive.                                                                          |
| time_limit      | The maximum duration in seconds for the SQL tuning session.                                                                      |
| task_name       | Optional SQL tuning task name.                                                                                                   |
| description     | Description of the SQL tuning session. The description can contain a maximum of 256 characters.                                  |
| con_name        | The container from which SQL Tuning Advisor accesses the SQL statement information.                                              |
| dbid            | DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.                                        |

## Security Model

The caller must possess the `CREATE JOB` privilege for the job.

## Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

## Usage Notes

- The task is scheduled only once.
- The name of the scheduler job is created as follows:  
`sqltune_job_taskid_orahash(systimestamp)`.

## 164.5.34 SCRIPT\_TUNING\_TASK Function

This function creates a SQL\*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
 task_name IN VARCHAR2,
 rec_type IN VARCHAR2 := REC_TYPE_ALL,
 object_id IN NUMBER := NULL,
 result_limit IN NUMBER := NULL,
 owner_name IN VARCHAR2 := NULL,
 execution_name IN VARCHAR2 := NULL,
 database_link_to IN VARCHAR2 := NULL)
RETURN CLOB;
```

### Parameters

**Table 164-40** SCRIPT\_TUNING\_TASK Function Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name     | Name of the tuning task for which to apply a script.                                                                                                                                                                                                                          |
| rec_type      | Filter the script by types of recommendations to include. You can use any subset of the following values, separated by commas: 'ALL: '' PROFILES' '' STATISTICS' '' INDEXES'. For example, a script with profiles and statistics would use the filter 'PROFILES, STATISTICS'. |
| object_id     | Optionally filters by a single object ID.                                                                                                                                                                                                                                     |
| result_limit  | Optionally shows commands for only top <i>n</i> SQL (ordered by object_id and ignored if an object_id is also specified).                                                                                                                                                     |
| owner_name    | Owner of the relevant tuning task. Defaults to the current schema owner.                                                                                                                                                                                                      |
| excution_name | Name of the task execution to use. If NULL, the script is generated for the last task execution.                                                                                                                                                                              |

**Table 164-40 (Cont.) SCRIPT\_TUNING\_TASK Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_link_to | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

**Return Values**

Returns a script in the form of a CLOB.

**Usage Notes**

- After the script is returned, check it before executing it.
- Wrap with a call to DBMS\_ADVISOR.CREATE\_FILE to put it into a file.

**Examples**

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of only the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM
DUAL;

-- Get a script of only stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM
DUAL;

-- Get a script with recommendations about only one SQL statement when
we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

## 164.5.35 SELECT\_CURSOR\_CACHE Function

This function collects SQL statements from the shared SQL area.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 ranking_measure1 IN VARCHAR2 := NULL,
 ranking_measure2 IN VARCHAR2 := NULL,
 ranking_measure3 IN VARCHAR2 := NULL,
 result_percentage IN NUMBER := 1,
 result_limit IN NUMBER := NULL,
 attribute_list IN VARCHAR2 := NULL,
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 164-41** SELECT\_CURSOR\_CACHE Function Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| basic_filter       | Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW.<br>If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE. |
| object_filter      | Currently not supported.                                                                                                                                                                                                                                                          |
| ranking_measure(n) | Defines an ORDER BY clause on the selected SQL.                                                                                                                                                                                                                                   |
| result_percentage  | Specifies a filter that picks the top n% according to the supplied ranking measure.<br>The value applies only if one ranking measure is supplied.                                                                                                                                 |
| result_limit       | Defines the top limit SQL from the filtered source ranked by the ranking measure.                                                                                                                                                                                                 |

**Table 164-41 (Cont.) SELECT\_CURSOR\_CACHE Function Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>attribute_list</code> | <p>Specifies the list of SQL statement attributes to return in the result. Possible values are:</p> <ul style="list-style-type: none"> <li>• <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default).</li> <li>• <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li> <li>• <code>ALL</code> — Specifies all attributes.</li> <li>• Comma-separated list of attribute names.</li> </ul> <p>This values returns only a subset of SQL attributes:</p> <ul style="list-style-type: none"> <li>– <code>EXECUTION_STATISTICS</code></li> <li>– <code>BIND_LIST</code></li> <li>– <code>OBJECT_LIST</code></li> <li>– <code>SQL_PLAN</code></li> <li>– <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics</li> </ul> |
| <code>recursive_sql</code>  | <p>Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>, which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

### Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

### Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

```
-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id =
''4rm4183czbs7j''));
```

```
-- Notice that some statements can have multiple plans. The output of
the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value).
This is
-- because a data source can store multiple plans per sql statement.
```

```

SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id =
'aylm3ssvtrh24'))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along
the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT value(P)
 FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

 -- Process each statement (or pass cursor to load_sqlset).

 CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur for
 SELECT VALUE(P)
 FROM table(
 DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <>
'SYS')) P;

 -- Process each statement (or pass cursor to load_sqlset).

 CLOSE cur;
end;/

-- All statements from a particular module/action.
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(
 DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
 'module = 'MY_APPLICATION' and action = 'MY_ACTION')) P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;/

```

```
-- all statements that ran for at least five seconds
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time >
5000000')) P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
end;/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(
 DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
 'buffer_gets > 100 and parsing_schema_name = ''APPS'''))P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
end;/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of
sqlset_row
-- is NULL)
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(dbms_sqltune.select_cursor_cache(
 'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;/

-- Select the top 100 statements in the shared SQL area ordering by
elapsed_time.
DECLARE
```

```

 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,

 NULL,
 1,
 100)) P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
end;/

-- Select the set of statements which cumulatively account for 90% of
the
-- buffer gets in the shared SQL area. This means that the buffer gets
of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE(P)
 FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
 NULL,
 'BUFFER_GETS', NULL,
 NULL,
 .9)) P;

 -- Process each statement (or pass cursor to load_sqlset).

 CLOSE cur;
END;
/

```

### 164.5.36 SELECT\_SQL\_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

#### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

## Syntax

```

DBMS_SQLTUNE.SELECT_SQL_TRACE (
 directory IN VARCHAR2,
 file_name IN VARCHAR2 := NULL,
 mapping_table_name IN VARCHAR2 := NULL,
 mapping_table_owner IN VARCHAR2 := NULL,
 select_mode IN POSITIVE := SINGLE_EXECUTION,
 options IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
 pattern_start IN VARCHAR2 := NULL,
 pattern_end IN VARCHAR2 := NULL,
 result_limit IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

## Parameters

**Table 164-42** SELECT\_SQL\_TRACE Function Parameters

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directory           | Defines the directory object containing the trace files. This field is mandatory.                                                                                                                                                                                                                                                             |
| file_name           | Specifies all or part of the name of the trace files.<br>If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.                                                                                                                        |
| mapping_table_name  | Specifies the mapping table name.<br>Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.                                                                                                                                                    |
| mapping_table_owner | Specifies the mapping table owner.<br>If it is NULL, then the function uses the current user.                                                                                                                                                                                                                                                 |
| select_mode         | Specifies the mode for selecting SQL from the trace.<br>Possible values are: <ul style="list-style-type: none"> <li>SINGLE_EXECUTION — Returns one execution of a SQL. This is the default.</li> <li>ALL_EXECUTIONS — Returns all executions.</li> </ul>                                                                                      |
| options             | Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> <li>LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default.</li> <li>ALL_COMMAND_TYPE — Returns the SQL statements with all command types.</li> </ul> |
| pattern_start       | Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.                                                                                                                                                                                                                                                |
| pattern_end         | Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.                                                                                                                                                                                                                                         |
| result_limit        | Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.                                                                                                                                                                                                                                                                    |

## Return Values

This function returns a `SQLSET_ROW` object.

## Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

## Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
 FROM dba_objects
 WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
 'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
 'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
 'LOB', 'OPERATOR', 'PACKAGE',
 'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
 'RESOURCE PLAN', 'TRIGGER', 'TYPE',
 'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
 FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
 cur sys_refcursor;
```

```
BEGIN
 OPEN cur FOR
 SELECT value(p)
 FROM TABLE(
 DBMS_SQLTUNE.SELECT_SQL_TRACE(
 directory=>'SQL_TRACE_DIR',
 file_name=>'%trc',
 mapping_table_name=>'mapping')) p;
 DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
 CLOSE cur;
END;
/
```

## 164.5.37 SELECT\_SQLPA\_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

**See Also:**

- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- *Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

**Syntax**

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK(
 task_name IN VARCHAR2,
 task_owner IN VARCHAR2 := NULL,
 execution_name IN VARCHAR2 := NULL,
 level_filter IN VARCHAR2 := 'REGRESSED',
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 attribute_list IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

## Parameters

**Table 164-43 SELECT\_SQLPA\_TASK Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | Specifies the name of the SQL Performance Analyzer task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| task_owner     | Specifies the owner of the SQL Performance Analyzer task. If NULL, then assume the current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| execution_name | Specifies the name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| level_filter   | Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed. <ul style="list-style-type: none"> <li>IMPROVED includes only improved SQL.</li> <li>REGRESSED includes only regressed SQL (default).</li> <li>CHANGED includes only SQL with changed performance.</li> <li>UNCHANGED includes only SQL with unchanged performance.</li> <li>CHANGED_PLANS includes only SQL with plan changes.</li> <li>UNCHANGED_PLANS includes only SQL with unchanged plans.</li> <li>ERRORS includes only SQL with errors only.</li> <li>MISSING_SQL includes only missing SQL statements (across STS).</li> <li>NEW_SQL includes only new SQL statements (across STS).</li> </ul> |
| basic filter   | Specifies the SQL predicate to filter the SQL in addition to the level filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| object_filter  | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| attribute_list | Defines the SQL statement attributes to return in the result. Possible values are: <ul style="list-style-type: none"> <li>TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default.</li> <li>BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li> <li>ALL — Returns all attributes.</li> <li>Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</li> </ul>                                                                    |

## Return Values

This function returns a SQL tuning set object.

## Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

## 164.5.38 SELECT\_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
 sqlset_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 ranking_measure1 IN VARCHAR2 := NULL,
 ranking_measure2 IN VARCHAR2 := NULL,
 ranking_measure3 IN VARCHAR2 := NULL,
 result_percentage IN NUMBER := 1,
 result_limit IN NUMBER := NULL)
 attribute_list IN VARCHAR2 := NULL,
 plan_filter IN VARCHAR2 := NULL,
 sqlset_owner IN VARCHAR2 := NULL,
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 164-44** SELECT\_SQLSET Function Parameters

| Parameter              | Description                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name            | Specifies the name of the SQL tuning set to query.                                                                                                                       |
| basic_filter           | Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW.                                                           |
| object_filter          | Currently not supported.                                                                                                                                                 |
| ranking_measure(n<br>) | Specifies an ORDER BY clause on the selected SQL.                                                                                                                        |
| result_percentage      | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure.<br>Note that this parameter applies only if one ranking measure is supplied. |
| result_limit           | The top limit SQL from the filtered source, ranked by the ranking measure.                                                                                               |

**Table 164-44 (Cont.) SELECT\_SQLSET Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute_list | <p>Defines the SQL statement attributes to return in the result.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result.</li> <li>TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default.</li> <li>ALL — Returns all attributes.</li> <li>Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> <li>EXECUTION_STATISTICS</li> <li>SQL_BINDS</li> <li>SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics)</li> </ul> </li> </ul>                                                                                                                                                                       |
| plan_filter    | <p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> <li>LAST_GENERATED — Returns the plan with the most recent timestamp.</li> <li>FIRST_GENERATED — Returns the plan with the least recent timestamp.</li> <li>LAST_LOADED — Returns the plan with the most recent FIRST_LOAD_TIME statistical information.</li> <li>FIRST_LOADED — Returns the plan with the least recent FIRST_LOAD_TIME statistical information.</li> <li>MAX_ELAPSED_TIME — Returns the plan with the maximum elapsed time.</li> <li>MAX_BUFFER_GETS — Returns the plan with the maximum buffer gets.</li> <li>MAX_DISK_READS — Returns the plan with the maximum disk reads.</li> <li>MAX_DIRECT_WRITES — Returns the plan with the maximum direct writes.</li> <li>MAX_OPTIMIZER_COST — Returns the plan with the maximum optimizer cost value.</li> </ul> |
| sqlset_owner   | <p>Specifies the owner of the SQL tuning set, or NULL for the current schema owner.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| recursive_sql  | <p>Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Return Values

This function returns one SQLSET\_ROW per SQL\_ID or PLAN\_HASH\_VALUE pair found in each data source.

## Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

## Examples

```
-- select from a sql tuning set
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE (P)
 FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;
/
```

## 164.5.39 SELECT\_WORKLOAD\_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

### Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
 begin_snap IN NUMBER,
 end_snap IN NUMBER,
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
 ranking_measure1 IN VARCHAR2 := NULL,
 ranking_measure2 IN VARCHAR2 := NULL,
 ranking_measure3 IN VARCHAR2 := NULL,
 result_percentage IN NUMBER := 1,
 result_limit IN NUMBER := NULL,
 attribute_list IN VARCHAR2 := NULL,
 recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL,
 dbid IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
 baseline_name IN VARCHAR2,
 basic_filter IN VARCHAR2 := NULL,
 object_filter IN VARCHAR2 := NULL,
```

```

ranking_measure1 IN VARCHAR2 := NULL,
ranking_measure2 IN VARCHAR2 := NULL,
ranking_measure3 IN VARCHAR2 := NULL,
result_percentage IN NUMBER := 1,
result_limit IN NUMBER := NULL,
attribute_list IN VARCHAR2 := NULL,
recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL,
dbid IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

## Parameters

**Table 164-45 SELECT\_WORKLOAD\_REPOSITORY Function Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>begin_snap</code>         | Defines the beginning AWR snapshot (non-inclusive).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>end_snap</code>           | Defines the ending AWR snapshot (inclusive).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>baseline_name</code>      | Specifies the name of the AWR baseline period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>basic_filter</code>       | Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> .<br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>object_filter</code>      | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>ranking_measure(n)</code> | Defines an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>result_percentage</code>  | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>result_limit</code>       | Specifies the top limit SQL from the source according to the supplied ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>attribute_list</code>     | Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <li><code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default.</li> <li><code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li><code>ALL</code> — Returns all attributes</li> <li>Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).</li> </ul> |
| <code>recursive_sql</code>      | Specifies the filter that includes recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> ) or excludes it ( <code>NO_RECURSIVE_SQL</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>dbid</code>               | Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

### Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

### Examples

```

-- select statements from snapshots 1-2
DECLARE
 cur sys_refcursor;
BEGIN
 OPEN cur FOR
 SELECT VALUE (P)
 FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

 -- Process each statement (or pass cursor to load_sqlset)

 CLOSE cur;
END;
/

```

## 164.5.40 SET\_TUNING\_TASK\_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
 task_name IN VARCHAR2,
 parameter IN VARCHAR2,
 value IN VARCHAR2,
 database_link_to IN VARCHAR2);

```

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
 task_name IN VARCHAR2,
 parameter IN VARCHAR2,
 value IN NUMBER,
);

```

```
database_link_to IN VARCHAR2);
);
```

## Parameters

**Table 164-46 SET\_TUNING\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | Identifier of the task to execute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| parameter | <p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> <li>• APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li> <li>• BASIC_FILTER: basic filter for SQL tuning set</li> <li>• DAYS_TO_EXPIRE: number of days until the task is deleted</li> <li>• DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the <a href="#">EXECUTE_TUNING_TASK Function and Procedure</a></li> <li>• EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task)</li> <li>• LOCAL_TIME_LIMIT: per-statement time out (seconds)</li> <li>• MODE: tuning scope (comprehensive, limited)</li> <li>• OBJECT_FILTER: object filter for SQL tuning set</li> <li>• PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</li> <li>• RANK_MEASURE1: first ranking measure for SQL tuning set</li> <li>• RANK_MEASURE2: second possible ranking measure for SQL tuning set</li> <li>• RANK_MEASURE3: third possible ranking measure for SQL tuning set</li> <li>• RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</li> <li>• SQL_LIMIT: maximum number of SQL statements to tune</li> <li>• SQL_PERCENTAGE: percentage filter of SQL tuning set statements</li> <li>• TEST_EXECUTE: FULL/AUTO/OFF. <ul style="list-style-type: none"> <li>* FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</li> <li>* AUTO - test-execute for an automatically-chosen time proportional to the tuning time</li> <li>* OFF - do not test-execute</li> </ul> </li> <li>• TIME_LIMIT: global time out (seconds)</li> <li>• USERNAME: username under which the statement is parsed</li> </ul> |
| value     | New value of the specified parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 164-46 (Cont.) SET\_TUNING\_TASK\_PARAMETER Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_link_to | <p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

#### Usage Notes

When setting automatic tuning task parameters, use the [SET\\_AUTO\\_TUNING\\_TASK\\_PARAMETER Procedures](#) in the [DBMS\\_AUTO\\_SQLTUNE](#) package.

## 164.5.41 SQLTEXT\_TO\_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in dba\_sql\_profiles.

#### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

#### Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
 sql_text IN CLOB,
 force_match IN BOOLEAN := FALSE)
RETURN NUMBER;
```

## Parameters

| Parameter   | Description                                                                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_text    | SQL text whose signature is required. Required.                                                                                                                                                   |
| force_match | If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed |

## Return Values

This function returns the signature of the specified SQL text.

## 164.5.42 UNPACK\_STGTAB\_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
 profile_name IN VARCHAR2 := '%',
 profile_category IN VARCHAR2 := 'DEFAULT',
 replace IN BOOLEAN,
 staging_table_name IN VARCHAR2,
 staging_schema_owner IN VARCHAR2 := NULL);
```

## Parameters

**Table 164-48 UNPACK\_STGTAB\_SQLPROF Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| profile_name       | The name of the profile to unpack (% wildcards acceptable, case-sensitive)                                                                                                                                                                                                            |
| profile_category   | The category from which to unpack profiles (% wildcards acceptable, case-sensitive)                                                                                                                                                                                                   |
| replace            | The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists |
| staging_table_name | The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.                                                                                                                                                                      |

**Table 164-48 (Cont.) UNPACK\_STGTAB\_SQLPROF Procedure Parameters**

| Parameter                | Description                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------|
| staging_schem<br>a_owner | The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted) |

**Usage Notes**

Using this procedure requires the CREATE ANY SQL PROFILE privilege and the SELECT privilege on staging table.

**Examples**

```
-- Unpack all profiles stored in a staging table.
BEGIN
 DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
 replace => FALSE
 , staging_table_name => 'PROFILE_STGTAB');
END;

-- If there is a failure during the unpack operation, you can find the
profile
-- that caused the error and perform a remap_stgtab_sqlprof operation
targeting it.
-- You can resume the unpack operation by setting replace to TRUE so
that
-- the profiles that were already created are replaced.
BEGIN
 DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
 replace => TRUE
 , staging_table_name => 'PROFILE_STGTAB');
END;
```

## 164.5.43 UNPACK\_STGTAB\_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

 **See Also:**

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
 sqlset_name IN VARCHAR2 := '%',
 sqlset_owner IN VARCHAR2 := NULL,
 replace IN BOOLEAN,
```

```
staging_table_name IN VARCHAR2,
staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

The parameters are identical for DBMS\_SQLTUNE.UNPACK\_STGTAB\_SQLSET and DBMS\_SQLSET.UNPACK\_STGTAB.

**Table 164-49 UNPACK\_STGTAB\_SQLSET and UNPACK\_STGTAB Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name          | Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table. |
| sqlset_owner         | Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.                                                                                                       |
| replace              | Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.                                                              |
| staging_table_name   | Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).                                                                  |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).                                                                                                                          |

### Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%', -
 sqlset_owner => '%', -
 replace => FALSE, -
 staging_table_name =>
'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table
-- has the
-- same name/owner as STS on the system. In this case, users should
-- call
-- remap_stgtab_sqlset to patch the staging table and with which to
-- call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%', -
 sqlset_owner => '%', -
 replace => TRUE, -
 staging_table_name =>
'STGTAB_SQLSET');
```

## 164.5.44 UPDATE\_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
 sqlset_name IN VARCHAR2,
 sql_id IN VARCHAR2,
 attribute_name IN VARCHAR2,
 attribute_value IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.UPDATE_SQLSET (
 sqlset_name IN VARCHAR2,
 sql_id IN VARCHAR2,
 attribute_name IN VARCHAR2,
 attribute_value IN NUMBER := NULL);
```

### Parameters

**Table 164-50 UPDATE\_SQLSET Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Specifies the name of the SQL tuning set.                                                                                                                                                                                                                                                              |
| sql_id          | Specifies the identifier of the SQL statement to be updated.                                                                                                                                                                                                                                           |
| plan_hash value | Specifies the hash value of the execution plan for a SQL statement.<br>Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.                                                                                              |
| attribute_name  | Specifies the name of the attribute to be modified.<br>You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY.<br>If a statement has multiple plans, then the procedure changes the attribute value for all plans. |
| attribute_value | Specifies the new value of the attribute.                                                                                                                                                                                                                                                              |

# 165

## DBMS\_STAT\_FUNCS

The DBMS\_STAT\_FUNCS package provides statistical functions.

This chapter contains the following topic:

- [Summary of DBMS\\_STAT\\_FUNCS Subprograms](#)

### 165.1 Summary of DBMS\_STAT\_FUNCS Subprograms

This table lists and briefly describes the DBMS\_STAT\_FUNCS subprograms.

**Table 165-1 DBMS\_STAT\_FUNCS Package Subprograms**

| Subprogram                                     | Description                                                        |
|------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">EXPONENTIAL_DIST_FIT Procedure</a> | Tests how well a sample of values fits an exponential distribution |
| <a href="#">NORMAL_DIST_FIT Procedure</a>      | Tests how well a sample of values fits a normal distribution       |
| <a href="#">POISSON_DIST_FIT Procedure</a>     | Tests how well a sample of values fits a Poisson distribution      |
| <a href="#">SUMMARY Procedure</a>              | Summarizes a numerical column of a table                           |
| <a href="#">UNIFORM_DIST_FIT Procedure</a>     | Tests how well a sample of values fits a uniform distribution      |
| <a href="#">WEIBULL_DIST_FIT Procedure</a>     | Tests how well a sample of values fits a Weibull distribution      |

#### 165.1.1 EXPONENTIAL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

##### Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
 ownername IN VARCHAR2,
 tablename IN VARCHAR2,
 columnname IN VARCHAR2,
 test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
 lambda IN NUMBER,
 mu IN NUMBER,
 sig OUT NUMBER);
```

## Parameters

**Table 165-2** *EXPONENTIAL\_DIST\_FIT Procedure Parameters*

| Parameter  | Description                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                               |
| tablename  | The table where the column resides.                                                                                                                                                               |
| columnname | The column of the table against which to run the test.                                                                                                                                            |
| test_type  | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.                                                                                                               |
| lambda     | The scale parameter.                                                                                                                                                                              |
| mu         | The location parameter.                                                                                                                                                                           |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match. |

## 165.1.2 NORMAL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

### Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
 ownername IN VARCHAR2,
 tablename IN VARCHAR2,
 columnname IN VARCHAR2,
 test_type IN VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
 mean IN NUMBER,
 stdev IN NUMBER,
 sig OUT NUMBER);
```

## Parameters

**Table 165-3** *NORMAL\_DIST\_FIT Procedure Parameters*

| Parameter  | Description                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                          |
| tablename  | The table where the column resides.                                                                                                                                                          |
| columnname | The column of the table against which to run the test.                                                                                                                                       |
| test_type  | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.                                                                                         |
| mean       | The mean of the distribution against which to compare.                                                                                                                                       |
| stdev      | The standard deviation of the distribution against which to compare.                                                                                                                         |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match. |

## 165.1.3 POISSON\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

### Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
 ownername IN VARCHAR2,
 tablename IN VARCHAR2,
 columnname IN VARCHAR2,
 test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
 lambda IN NUMBER,
 sig OUT NUMBER);
```

### Parameters

**Table 165-4 POISSON\_DIST\_FIT Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                           |
| tablename  | The table where the column resides.                                                                                                                                                           |
| columnname | The column of the table against which to run the test.                                                                                                                                        |
| test_type  | The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.                                                                                                                          |
| lambda     | The lambda parameter is the shape parameter.                                                                                                                                                  |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match. |

## 165.1.4 SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`.

The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

### Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
 ownername IN VARCHAR2,
 tablename IN VARCHAR2,
 columnname IN VARCHAR2,
 sigma_value IN NUMBER DEFAULT 3,
 s OUT SummaryType);
```

## Parameters

**Table 165-5 SUMMARY Procedure Parameters**

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| ownername   | The schema where the table resides.                                |
| tablename   | The table where the column resides.                                |
| columnname  | The column of the table to be summarized.                          |
| sigma_value | The number of sigmas for the set of extreme values, defaults to 3. |
| s           | The Record containing summary information about given column.      |

### Definition of SummaryType

```

TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
 count NUMBER,
 min NUMBER,
 max NUMBER,
 range NUMBER,
 mean NUMBER,
 cmode num_table,
 variance NUMBER,
 stddev NUMBER,
 quantile_5 NUMBER,
 quantile_25 NUMBER,
 median NUMBER,
 quantile_75 NUMBER,
 quantile_95 NUMBER,
 plus_x_sigma NUMBER,
 minus_x_sigma NUMBER,
 extreme_values num_table,
 top_5_values n_arr,
 bottom_5_values n_arr);

```

## 165.1.5 UNIFORM\_DIST\_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

### Syntax

```

DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
 ownername IN VARCHAR2,
 tablename IN VARCHAR2,
 columnname IN VARCHAR2,
 var_type IN VARCHAR2 DEFAULT 'CONTINUOUS',
 test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
 paramA IN NUMBER,
 paramB IN NUMBER,
 sig OUT NUMBER);

```

## Parameters

**Table 165-6 UNIFORM\_DIST\_FIT Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                           |
| tablename  | The table where the column resides.                                                                                                                                                           |
| columnname | The column of the table against which to run the test.                                                                                                                                        |
| var_type   | The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'                                                                                                                            |
| test_type  | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.                                                                                                           |
| paramA     | Parameter A estimated from the sample (the location parameter).                                                                                                                               |
| paramB     | Parameter B estimated from the sample (the scale parameter).                                                                                                                                  |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match. |

## 165.1.6 WEIBULL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

### Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
 ownername IN VARCHAR2,
 tablename IN VARCHAR2,
 columnname IN VARCHAR2,
 test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
 alpha IN NUMBER,
 mu IN NUMBER,
 beta IN NUMBER,
 sig OUT NUMBER);
```

### Parameters

**Table 165-7 WEIBULL\_DIST\_FIT Procedure Parameters**

| Parameter  | Description                                                                         |
|------------|-------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                 |
| tablename  | The table where the column resides.                                                 |
| columnname | The column of the table against which to run the test.                              |
| test_type  | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'. |
| alpha      | The scale parameter.                                                                |
| mu         | The location parameter.                                                             |
| beta       | The slope/shape parameter.                                                          |

**Table 165-7 (Cont.) WEIBULL\_DIST\_FIT Procedure Parameters**

| <b>Parameter</b> | <b>Description</b>                                                                                                                                                                            |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sig              | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match. |

# DBMS\_STATS

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

Users can also collect statistics on Global Temporary Tables (GTTs) using the `DBMS_STATS` package. However, `DBMS_STATS` cannot collect statistics on Private Temporary Tables (PTTs).

This chapter contains the following topics:

- [DBMS\\_STATS Overview](#)
- [DBMS\\_STATS Deprecated Subprograms](#)
- [DBMS\\_STATS Types](#)
- [DBMS\\_STATS Constants](#)
- [DBMS\\_STATS Operational Notes](#)
- [DBMS\\_STATS Data Structures](#)
- [Summary of DBMS\\_STATS Subprograms](#)

## See Also:

- *Oracle Database SQL Tuning Guide*
- *Oracle Database Administrator's Guide*

## 166.1 DBMS\_STATS Overview

To improve performance, the database enables you to collect optimizer statistics.

### Note:

By default, the database collects statistics automatically, so this package is intended only for specialized cases.

Optimizer statistics can reside in the data dictionary or in a table created in the user's schema. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if you invoke the `DELETE_COLUMN_STATS` procedure on a column for which an association is defined, the database deletes both user-defined and standard statistics for this column.

Only optimizer statistics stored in the data dictionary have an effect on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel.

Optimizer Statistics Advisor inspects the statistics gathering process, automatically diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and recommendations. The advisor task runs automatically in the maintenance window. However, you can also run the job on demand.

**See Also:**

*Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics

## 166.2 DBMS\_STATS Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

Starting with Oracle Database 11g Release 2 (11.2), the following subprograms are obsolete:

- [GET\\_PARAM Function](#)  
Instead, use [GET\\_PREFS Function](#)
- [SET\\_PARAM Procedure](#)  
Instead, use [SET\\_GLOBAL\\_PREFS Procedure](#)
- [RESET\\_PARAM\\_DEFAULTS Procedure](#)  
Instead use [RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#)

The following subprogram is deprecated with Oracle Database 12c and later:

- [GENERATE\\_STATS](#)

This procedure is replaced by the [GATHER\\_INDEX\\_STAT](#) procedure.

**See Also:**

"[GATHER\\_INDEX\\_STATS Procedure](#)"

## 166.3 DBMS\_STATS Types

### Histograms

Types for the minimum and maximum values and histogram endpoints include the following:

```
TYPE numarray IS VARRAY(2050) OF NUMBER;
TYPE datearray IS VARRAY(2050) OF DATE;
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);
TYPE rawarray IS VARRAY(2050) OF RAW(2000);
TYPE fltarray IS VARRAY(2050) OF BINARY_FLOAT;
TYPE dblarray IS VARRAY(2050) OF BINARY_DOUBLE;
```

## Stale Tables

Types for listing stale tables include the following:

```

TYPE ObjectElem IS RECORD (
 ownname VARCHAR2(30), -- owner
 objtype VARCHAR2(6), -- 'TABLE' or 'INDEX'
 objname VARCHAR2(30), -- table/index
 partname VARCHAR2(30), -- partition
 subpartname VARCHAR2(30)); -- subpartition
TYPE ObjectTab IS TABLE OF ObjectElem;

```

## Statistics Difference Reports

Use the following type to displays a statistics difference report:

```

TYPE DiffRepElem IS RECORD (
 report CLOB, -- stats difference report
 maxdiffpct NUMBER); -- max stats difference (percentage)
TYPE DiffRepTab IS TABLE OF DiffRepElem;

```

## Optimizer Statistics Advisor

The following type represents database objects for which you can gather statistics:

```

TYPE ObjectElem IS RECORD (
 ownname dbms_quoted_id, -- owner
 objtype VARCHAR2(6), -- 'TABLE' or 'INDEX'
 objname dbms_quoted_id, -- table/index
 partname dbms_quoted_id, -- partition
 subpartname dbms_quoted_id -- subpartition
);
TYPE ObjectTab IS TABLE OF ObjectElem;

```

### Note:

Make sure to maintain `satisfy_obj_filter` when the `ObjectElem` type is changed

The following type represents an operation:

```

TYPE StatsAdvOpr IS RECORD (
 name VARCHAR2(64), -- name of the operation
 param VARCHAR2(4000)
); -- XML containing parameters and their values
TYPE StatsAdvOprTab IS TABLE OF StatsAdvOpr;

```

The following type represents a filter list:

```

TYPE StatsAdvFilter IS RECORD (
 rulename VARCHAR2(64), -- rule name
 objlist ObjectTab, -- object filter list
 oprlist StatsAdvOprTab, -- operation filter list

```

```
include BOOLEAN); -- include/exclude elements in the list
TYPE StatsAdvFilterTab IS TABLE OF StatsAdvFilter;
```

## 166.4 DBMS\_STATS Constants

The DBMS\_STATS package defines several constants to use specifying parameter values.

**Table 166-1 DBMS\_STATS Constants**

| Name             | Type                     | Description                                                                                                                                                                                                                                         |
|------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD_GLOBAL_PREFS | NUMBER                   | Copies global preferences                                                                                                                                                                                                                           |
| AUTO_CASCADE     | BOOLEAN                  | Lets Oracle decide whether to collect statistics for indexes or not                                                                                                                                                                                 |
| AUTO_DEGREE      | NUMBER                   | Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters                                                                                                                              |
| AUTO_INVALIDATE  | BOOLEAN                  | Lets Oracle decide when to invalidate dependent cursors                                                                                                                                                                                             |
| AUTO_SAMPLE_SIZE | NUMBER                   | Indicates that auto-sample size algorithms should be used                                                                                                                                                                                           |
| PURGE_ALL        | TIMESTAMP WITH TIME ZONE | A flag that can be passed to the <a href="#">PURGE_STATS Procedure</a> and unconditionally deletes all the history statistics. The deletion uses TRUNCATE statements on the various dictionary statistics tables holding the history of statistics. |
| RECLAIM_SYNOPSIS | TIMESTAMP WITH TIME ZONE | A constant used for reclaiming synopsis table space.                                                                                                                                                                                                |

## 166.5 DBMS\_STATS Operational Notes

Observe these operational notes when using the DBMS\_STATS package.

The DBMS\_STATS subprograms perform the following general operations:

- [Gathering Optimizer Statistics](#)
- [Setting or Getting Statistics](#)
- [Deleting Statistics](#)
- [Transferring Statistics](#)
- [Locking or Unlocking Statistics](#)
- [Restoring and Purging Statistics History](#)
- [User-Defined Statistics](#)
- [Pending Statistics](#)
- [Comparing Statistics](#)

- [Extended Statistics](#)
- [Optimizer Statistics Advisor](#)

Most of the `DBMS_STATS` procedures include the three parameters `statown`, `stattab`, and `statid`. These parameters enable you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The `stattab` parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the `statown` parameter is specified). You can create multiple tables with different `stattab` identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single `stattab` by using the `statid` parameter, which avoids cluttering the user's schema.

For the `SET` and `GET` procedures, if `stattab` is not provided (that is, `NULL`), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if `stattab` is not `NULL`, then the `SET` or `GET` operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of `DBMS_STATS` procedures using the [SET\\_DATABASE\\_PREFS Procedure](#), [SET\\_GLOBAL\\_PREFS Procedure](#), [SET\\_SCHEMA\\_PREFS Procedure](#) and [SET\\_TABLE\\_PREFS Procedure](#).

Most procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a `force` parameter that enables you to override a lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

### Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

- [GATHER\\_DATABASE\\_STATS Procedures](#)
- [GATHER\\_DICTIONARY\\_STATS Procedure](#)
- [GATHER\\_FIXED\\_OBJECTS\\_STATS Procedure](#)
- [GATHER\\_INDEX\\_STATS Procedure](#)
- [GATHER\\_SCHEMA\\_STATS Procedures](#)
- [GATHER\\_SYSTEM\\_STATS Procedure](#)
- [GATHER\\_TABLE\\_STATS Procedure](#)

The `GATHER_*` procedures also collect user-defined statistics for columns and domain indexes.

The `statown`, `stattab`, and `statid` parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

[GENERATE\\_STATS Procedure](#)

## Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

[PREPARE\\_COLUMN\\_VALUES](#) Procedures  
[PREPARE\\_COLUMN\\_VALUES\\_NVARCHAR](#) Procedure  
[PREPARE\\_COLUMN\\_VALUES\\_ROWID](#) Procedure  
  
[SEED\\_COL\\_USAGE](#) Procedure  
[SET\\_INDEX\\_STATS](#) Procedures  
[SET\\_SYSTEM\\_STATS](#) Procedure  
[SET\\_TABLE\\_STATS](#) Procedure  
  
[GET\\_COLUMN\\_STATS](#) Procedures  
[GET\\_INDEX\\_STATS](#) Procedures  
[GET\\_SYSTEM\\_STATS](#) Procedure  
[GET\\_TABLE\\_STATS](#) Procedure

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

## Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

[DELETE\\_COLUMN\\_STATS](#) Procedure  
[DELETE\\_DATABASE\\_STATS](#) Procedure  
[DELETE\\_DICTIONARY\\_STATS](#) Procedure  
[DELETE\\_FIXED\\_OBJECTS\\_STATS](#) Procedure  
[DELETE\\_INDEX\\_STATS](#) Procedure  
[DELETE\\_SCHEMA\\_STATS](#) Procedure  
[DELETE\\_SYSTEM\\_STATS](#) Procedure  
[DELETE\\_TABLE\\_STATS](#) Procedure

Note that `DELETE_TABLE_STATS`, `DELETE_DICTIONARY_STATS`, `DELETE_DATABASE_STATS` and `DELETE_SCHEMA_STATS` have a parameter `stat_category` which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are `'OBJECT_STATS'` (table statistics, column statistics and index statistics) and `'SYNOPSIS'` (auxiliary statistics created when statistics are incrementally maintained). The default is `'OBJECT_STATS, SYNOPSIS'`.

## Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

[CREATE\\_STAT\\_TABLE Procedure](#)

[DROP\\_STAT\\_TABLE Procedure](#)

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table ([EXPORT\\_\\*](#))
- from a user statistics table to the dictionary ([IMPORT\\_\\*](#))

[EXPORT\\_COLUMN\\_STATS Procedure](#)

[EXPORT\\_DATABASE\\_STATS Procedure](#)

[EXPORT\\_DICTIONARY\\_STATS Procedure](#)

[EXPORT\\_FIXED\\_OBJECTS\\_STATS Procedure](#)

[EXPORT\\_INDEX\\_STATS Procedure](#)

[EXPORT\\_SCHEMA\\_STATS Procedure](#)

[EXPORT\\_SYSTEM\\_STATS Procedure](#)

[EXPORT\\_TABLE\\_STATS Procedure](#)

[IMPORT\\_COLUMN\\_STATS Procedure](#)

[IMPORT\\_DATABASE\\_STATS Procedure](#)

[IMPORT\\_DICTIONARY\\_STATS Procedure](#)

[IMPORT\\_FIXED\\_OBJECTS\\_STATS Procedure](#)

[IMPORT\\_INDEX\\_STATS Procedure](#)

[IMPORT\\_SCHEMA\\_STATS Procedure](#)

[IMPORT\\_SYSTEM\\_STATS Procedure](#)

[IMPORT\\_TABLE\\_STATS Procedure](#)

 **Note:**

Oracle does not support export or import of statistics across databases of different character sets.

## Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

[LOCK\\_PARTITION\\_STATS Procedure](#)

[LOCK\\_SCHEMA\\_STATS Procedure](#)

[LOCK\\_TABLE\\_STATS Procedure](#)

[UNLOCK\\_PARTITION\\_STATS Procedure](#)

[UNLOCK\\_SCHEMA\\_STATS Procedure](#)

[UNLOCK\\_TABLE\\_STATS Procedure](#)

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics untouched. When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

## Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

[RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#)  
[RESTORE\\_DATABASE\\_STATS Procedure](#)  
[RESTORE\\_DICTIONARY\\_STATS Procedure](#)  
[RESTORE\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
[RESTORE\\_SCHEMA\\_STATS Procedure](#)  
[RESTORE\\_SYSTEM\\_STATS Procedure](#)  
[RESTORE\\_TABLE\\_STATS Procedure](#)

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the [ALTER\\_STATS\\_HISTORY\\_RETENTION Procedure](#).

The other DBMS\_STATS procedures related to restoring statistics are:

- [PURGE\\_STATS Procedure](#): This procedure lets you manually purge old versions beyond a time stamp.
- [GET\\_STATS\\_HISTORY\\_RETENTION Function](#): This function gets the current statistics history retention value.
- [GET\\_STATS\\_HISTORY\\_AVAILABILITY Function](#): This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

RESTORE\_\* operations are not supported for user defined statistics.

## User-Defined Statistics

The DBMS\_STATS package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the [GET\\_INDEX\\_STATS Procedures](#) invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

SET\_\* and GET\_\* operations for user-defined statistics are also supported using a special version of the SET and GET interfaces for columns and indexes.

EXPORT\_\*, IMPORT\_\* and RESTORE\_\* operations are not supported for user defined statistics.

## Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the PUBLISH option to FALSE using the SET\*PREFS procedures. The default value for PUBLISH is TRUE. The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_pending_statistics` is set to TRUE. The default value of this parameter is FALSE and this boolean parameter can be set at the

session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the [EXPORT\\_PENDING\\_STATS Procedure](#)) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

After the performance or query plans have been verified, you can publish the pending statistics using the [PUBLISH\\_PENDING\\_STATS Procedure](#) if the performance is acceptable, or delete the pending statistics using [DELETE\\_PENDING\\_STATS Procedure](#) if it is not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- [DELETE\\_PENDING\\_STATS Procedure](#)
- [EXPORT\\_PENDING\\_STATS Procedure](#)
- [PUBLISH\\_PENDING\\_STATS Procedure](#)

### Comparing Statistics

You can use the `DIFF_TABLE_STATS_*` statistics to compare statistics for a table from two different sources. The statistics can be from:

- Two different user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary history
- Pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the objects from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The database uses the statistics corresponding to the first source (`stattab1` or `time1`) as a basis for computing the differential percentage.

### Extended Statistics

This package enables you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on column group (c1, c2), the optimizer uses these statistics for estimating the combined cardinality of the predicates. The optimizer uses the expression statistics to estimate cardinality of predicates on those expressions. The extended statistics are similar to column statistics. The procedures that take columns names accept extended statistics names in place of column names.

Related subprograms:

- [CREATE\\_EXTENDED\\_STATS Function](#)
- [DROP\\_EXTENDED\\_STATS Procedure](#)
- [SHOW\\_EXTENDED\\_STATS\\_NAME Function](#)
- [REPORT\\_COL\\_USAGE Function](#)
- [SEED\\_COL\\_USAGE Procedure](#)
- [RESET\\_COL\\_USAGE Procedure](#)

### Optimizer Statistics Advisor

Optimizer Statistics Advisor is built-in diagnostic software that helps use to use best practices to manage optimizer statistics. The advisor analyzes how you are currently gathering statistics (using manual scripts, explicitly setting parameters, and so on), the effectiveness of existing statistics gathering jobs, and the quality of the gathered statistics. The advisor generates findings for any issues it finds. Based on these findings, the advisor provides recommendations, which it stores in `DBA_ADVISOR_RECOMMENDATIONS`.

The advisor organizes rules into the following classes:

- **System**  
This class checks the preferences for statistics collection, status of the automated statistics gathering job, use of SQL plan directives, and so on. Rules in this class have the value `SYSTEM` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Operation**  
This class checks whether statistics collection uses the defaults, test statistics are created using the `SET_*_STATS` procedures, and so on. Rules in this class have the value `OPERATION` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Object**  
This class checks for the quality of the statistics, staleness of statistics, unnecessary collection of statistics, and so on. Rules in this class have the value `OBJECT` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

All Optimizer Statistics Advisor subprograms require the `ADVISOR` privilege. All procedures and functions execute using the invoker's privilege for the operation instead of the task owner's privilege. For example, if a user without the `ANALYZE ANY DICTIONARY` privilege creates a task `t1`, and if a DBA then executes this task, then the task execution checks for `SYS` objects. Another example is a task that is executed by `user1`, interrupted, and then resumed by `user2`. In this case, the checks of the resumed execution are based on the privilege of `user2` rather than `user1`.

You can use the following subprograms to manage Optimizer Statistics Advisor:

- [CANCEL\\_ADVISOR\\_TASK Procedure](#)
- [CONFIGURE\\_ADVISOR\\_FILTER Function](#)
- [CONFIGURE\\_ADVISOR\\_OBJ\\_FILTER Function](#)
- [CONFIGURE\\_ADVISOR\\_OPR\\_FILTER Functions](#)
- [CONFIGURE\\_ADVISOR\\_RULE\\_FILTER Function](#)
- [CREATE\\_ADVISOR\\_TASK Function](#)

- [DROP\\_ADVISOR\\_TASK Procedure](#)
- [EXECUTE\\_ADVISOR\\_TASK Function](#)
- [GET\\_ADVISOR\\_OPR\\_FILTER Procedure](#)
- [GET\\_ADVISOR\\_RECS Function](#)
- [IMPLEMENT\\_ADVISOR\\_TASK Function](#)
- [INTERRUPT\\_ADVISOR\\_TASK Procedure](#)
- [REPORT\\_ADVISOR\\_TASK Function](#)
- [RESET\\_ADVISOR\\_TASK Procedure](#)
- [RESUME\\_ADVISOR\\_TASK Procedure](#)
- [SCRIPT\\_ADVISOR\\_TASK Function](#)
- [SET\\_ADVISOR\\_TASK\\_PARAMETER Procedure](#)

## 166.6 DBMS\_STATS Data Structures

The DBMS\_STATS package defines a RECORD type.

### RECORD Types

- [STAT\\_REC Record Type](#)

### 166.6.1 DBMS\_STATS STAT\_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

#### Syntax

```
TYPE STATREC IS RECORD (
 epc NUMBER,
 minval RAW(2000),
 maxval RAW(2000),
 bkvals NUMARRAY,
 novals NUMARRAY,
 chvals CHARARRAY,
 eavals RAWARRAY,
 rpcnts NUMARRAY,
 eavs NUMBER);
```

**Fields of the Record type COMPARISON\_TYPE (STAT\_REC Attributes)****Table 166-2 STAT\_REC Attributes**

| Field  | Description                                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| epc    | Number of buckets in histogram                                                                                                                                                            |
| minval | Minimum value                                                                                                                                                                             |
| maxval | Maximum value                                                                                                                                                                             |
| bkvals | Array of bucket numbers                                                                                                                                                                   |
| novals | Array of normalized end point values                                                                                                                                                      |
| chvals | Array of dumped end point values                                                                                                                                                          |
| eavals | Array of end point actual values                                                                                                                                                          |
| rpnts  | Array of end point value frequencies                                                                                                                                                      |
| eavs   | A number indicating whether actual end point values are needed in the histogram. If using the <a href="#">PREPARE_COLUMN_VALUES Procedures</a> , this field will be automatically filled. |

## 166.7 Summary of DBMS\_STATS Subprograms

This table lists the DBMS\_STATS subprograms and briefly describes them.

**Table 166-3 DBMS\_STATS Package Subprograms**

| Subprogram                                              | Description                                                                                                                               |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_STATS_HISTORY_RETENTION Procedure</a> | Changes the statistics history retention value                                                                                            |
| <a href="#">CANCEL_ADVISOR_TASK Procedure</a>           | Cancels an Optimizer Statistics Advisor execution                                                                                         |
| <a href="#">CONFIGURE_ADVISOR_FILTER Function</a>       | Configures the filter list for an Optimizer Statistics Advisor task                                                                       |
| <a href="#">CONFIGURE_ADVISOR_OBJ_FILTER Function</a>   | Configures an object filter for an Optimizer Statistics Advisor task                                                                      |
| <a href="#">CONFIGURE_ADVISOR_OPR_FILTER Functions</a>  | Configures an operation filter for an Optimizer Statistics Advisor task                                                                   |
| <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a>  | Configures a rule filter for an Optimizer Statistics Advisor task                                                                         |
| <a href="#">CREATE_ADVISOR_TASK Function</a>            | Creates an advisor task for the Optimizer Statistics Advisor                                                                              |
| <a href="#">CONVERT_RAW_VALUE Procedures</a>            | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |
| <a href="#">CONVERT_RAW_VALUE_NVARCHAR Procedure</a>    | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |
| <a href="#">CONVERT_RAW_VALUE_ROWID Procedure</a>       | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |

**Table 166-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                           | Description                                                                                                                            |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">COPY_TABLE_STATS Procedure</a>           | Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling                                   |
| <a href="#">CREATE_EXTENDED_STATS Function</a>       | Creates a virtual column for a user specified column group or an expression in a table                                                 |
| <a href="#">CREATE_STAT_TABLE Procedure</a>          | Creates a table with name <code>stattab</code> in <code>ownname</code> 's schema which is capable of holding statistics                |
| <a href="#">DELETE_COLUMN_STATS Procedure</a>        | Deletes column-related statistics                                                                                                      |
| <a href="#">DELETE_DATABASE_PREFS Procedure</a>      | Deletes the statistics preferences of all the tables                                                                                   |
| <a href="#">DELETE_DATABASE_STATS Procedure</a>      | Deletes statistics for the entire database                                                                                             |
| <a href="#">DELETE_DICTIONARY_STATS Procedure</a>    | Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and database component schemas)                                         |
| <a href="#">DELETE_FIXED_OBJECTS_STATS Procedure</a> | Deletes statistics of all fixed tables                                                                                                 |
| <a href="#">DELETE_INDEX_STATS Procedure</a>         | Deletes index-related statistics                                                                                                       |
| <a href="#">DELETE_PENDING_STATS Procedure</a>       | Deletes the private statistics that have been collected but have not been published                                                    |
| <a href="#">DELETE_PROCESSING_RATE Procedure</a>     | Deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources |
| <a href="#">DELETE_SCHEMA_PREFS Procedure</a>        | Deletes the statistics preferences of all the tables owned by the specified owner name                                                 |
| <a href="#">DELETE_SCHEMA_STATS Procedure</a>        | Deletes schema-related statistics                                                                                                      |
| <a href="#">DELETE_SYSTEM_STATS Procedure</a>        | Deletes system statistics                                                                                                              |
| <a href="#">DELETE_TABLE_PREFS Procedure</a>         | Deletes statistics preferences of the specified table in the specified schema                                                          |
| <a href="#">DELETE_TABLE_STATS Procedure</a>         | Deletes table-related statistics                                                                                                       |
| <a href="#">DIFF_TABLE_STATS_IN_HISTORY Function</a> | Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps                           |
| <a href="#">DIFF_TABLE_STATS_IN_PENDING Function</a> | Compares pending statistics and statistics as of a timestamp or statistics from dictionary                                             |
| <a href="#">DIFF_TABLE_STATS_IN_STATTAB Function</a> | Compares statistics for a table from two different sources                                                                             |
| <a href="#">DROP_ADVISOR_TASK Procedure</a>          | Drops the specified Optimizer Statistics Advisor task                                                                                  |
| <a href="#">DROP_EXTENDED_STATS Procedure</a>        | Drops the statistics entry that is created for the user specified extension                                                            |
| <a href="#">DROP_STAT_TABLE Procedure</a>            | Drops a user statistics table created by <code>CREATE_STAT_TABLE</code>                                                                |
| <a href="#">EXECUTE_ADVISOR_TASK Function</a>        | Executes a previously created Optimizer Statistics Advisor task                                                                        |

**Table 166-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                               | Description                                                                                                                                                                   |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EXPORT_COLUMN_STATS Procedure</a>            | Retrieves statistics for a particular column and stores them in the user statistics table identified by <code>stattab</code>                                                  |
| <a href="#">EXPORT_DATABASE_PREFS Procedure</a>          | Exports the statistics preferences of all the tables                                                                                                                          |
| <a href="#">EXPORT_DATABASE_STATS Procedure</a>          | Retrieves statistics for all objects in the database and stores them in the user statistics table identified by <code>statown.stattab</code>                                  |
| <a href="#">EXPORT_DICTIONARY_STATS Procedure</a>        | Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by <code>stattab</code> |
| <a href="#">EXPORT_FIXED_OBJECTS_STATS Procedure</a>     | Retrieves statistics for fixed tables and stores them in the user statistics table identified by <code>stattab</code>                                                         |
| <a href="#">EXPORT_INDEX_STATS Procedure</a>             | Retrieves statistics for a particular index and stores them in the user statistics table identified by <code>stattab</code>                                                   |
| <a href="#">EXPORT_PENDING_STATS Procedure</a>           | Exports the statistics gathered and stored as pending                                                                                                                         |
| <a href="#">EXPORT_SCHEMA_PREFS Procedure</a>            | Exports the statistics preferences of all the tables owned by the specified owner name                                                                                        |
| <a href="#">EXPORT_SCHEMA_STATS Procedure</a>            | Retrieves statistics for all objects in the schema identified by <code>ownname</code> and stores them in the user statistics table identified by <code>stattab</code>         |
| <a href="#">EXPORT_SYSTEM_STATS Procedure</a>            | Retrieves system statistics and stores them in the user statistics table                                                                                                      |
| <a href="#">EXPORT_TABLE_PREFS Procedure</a>             | Exports statistics preferences of the specified table in the specified schema into the specified statistics table                                                             |
| <a href="#">EXPORT_TABLE_STATS Procedure</a>             | Retrieves statistics for a particular table and stores them in the user statistics table                                                                                      |
| <a href="#">FLUSH_DATABASE_MONITORING_INFO Procedure</a> | Flushes in-memory monitoring information for all the tables to the dictionary                                                                                                 |
| <a href="#">GATHER_DATABASE_STATS Procedures</a>         | Gathers statistics for all objects in the database                                                                                                                            |
| <a href="#">GATHER_DICTIONARY_STATS Procedure</a>        | Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components                                                                                     |
| <a href="#">GATHER_FIXED_OBJECTS_STATS Procedure</a>     | Gathers statistics of fixed objects                                                                                                                                           |
| <a href="#">GATHER_INDEX_STATS Procedure</a>             | Gathers index statistics                                                                                                                                                      |
| <a href="#">GATHER_PROCESSING_RATE Procedure</a>         | Starts the job of gathering the processing rates which end after interval defined in minutes                                                                                  |
| <a href="#">GATHER_SCHEMA_STATS Procedures</a>           | Gathers statistics for all objects in a schema                                                                                                                                |
| <a href="#">GATHER_SYSTEM_STATS Procedure</a>            | Gathers system statistics                                                                                                                                                     |
| <a href="#">GATHER_TABLE_STATS Procedure</a>             | Gathers table and column (and index) statistics                                                                                                                               |

Table 166-3 (Cont.) DBMS\_STATS Package Subprograms

| Subprogram                              | Description                                                                                                                                                    |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GENERATE_STATS Procedure                | Generates object statistics from previously collected statistics of related objects                                                                            |
| GET_ADVISOR_OPR_FILTER Procedure        | Creates an operation filter for an Optimizer Statistics Advisor operation                                                                                      |
| GET_ADVISOR_RECS Function               | Generates a recommendation report for the specified item                                                                                                       |
| GET_COLUMN_STATS Procedures             | Gets all column-related information                                                                                                                            |
| GET_INDEX_STATS Procedures              | Gets all index-related information                                                                                                                             |
| GET_PARAM Function                      | Gets the default value of parameters of DBMS_STATS procedures (see <a href="#">DBMS_STATS Deprecated Subprograms</a> )                                         |
| GET_PREFS Function                      | Gets the default value of the specified preference                                                                                                             |
| GET_STATS_HISTORY_AVAILABILITY Function | Gets the oldest timestamp where statistics history is available                                                                                                |
| GET_STATS_HISTORY_RETENTION Function    | Returns the current statistics history retention value                                                                                                         |
| GET_SYSTEM_STATS Procedure              | Gets system statistics from <code>stattab</code> , or from the dictionary if <code>stattab</code> is NULL                                                      |
| GET_TABLE_STATS Procedure               | Gets all table-related information                                                                                                                             |
| IMPLEMENT_ADVISOR_TASK Function         | Implements the recommendations made by Optimizer Statistics Advisor                                                                                            |
| IMPORT_COLUMN_STATS Procedure           | Retrieves statistics for a particular column from the user statistics table identified by <code>stattab</code> and stores them in the dictionary               |
| IMPORT_DATABASE_PREFS Procedure         | Imports the statistics preferences of all the tables                                                                                                           |
| IMPORT_DATABASE_STATS Procedure         | Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary                                          |
| IMPORT_DICTIONARY_STATS Procedure       | Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary |
| IMPORT_FIXED_OBJECTS_STATS Procedure    | Retrieves statistics for fixed tables from the user statistics table identified by <code>stattab</code> and stores them in the dictionary                      |
| IMPORT_INDEX_STATS Procedure            | Retrieves statistics for a particular index from the user statistics table identified by <code>stattab</code> and stores them in the dictionary                |
| IMPORT_SCHEMA_PREFS Procedure           | Imports the statistics preferences of all the tables owned by the specified owner name                                                                         |
| IMPORT_SCHEMA_STATS Procedure           | Retrieves statistics for all objects in the schema identified by <code>ownname</code> from the user statistics table and stores them in the dictionary         |
| IMPORT_SYSTEM_STATS Procedure           | Retrieves system statistics from the user statistics table and stores them in the dictionary                                                                   |
| IMPORT_TABLE_PREFS Procedure            | Sets the statistics preferences of the specified table in the specified schema                                                                                 |

**Table 166-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                                 | Description                                                                                                                                                                                           |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">IMPORT_TABLE_STATS Procedure</a>               | Retrieves statistics for a particular table from the user statistics table identified by <code>stattab</code> and stores them in the dictionary                                                       |
| <a href="#">INTERRUPT_ADVISOR_TASK Procedure</a>           | Interrupts a currently executing Optimizer Statistics Advisor task.                                                                                                                                   |
| <a href="#">LOCK_PARTITION_STATS Procedure</a>             | Locks statistics for a partition                                                                                                                                                                      |
| <a href="#">LOCK_SCHEMA_STATS Procedure</a>                | Locks the statistics of all tables of a schema                                                                                                                                                        |
| <a href="#">LOCK_TABLE_STATS Procedure</a>                 | Locks the statistics on the table                                                                                                                                                                     |
| <a href="#">MERGE_COL_USAGE Procedure</a>                  | Merges column usage information from a source database, by means of a <code>dblink</code> , into the local database                                                                                   |
| <a href="#">PREPARE_COLUMN_VALUES Procedures</a>           | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a> |
| <a href="#">PREPARE_COLUMN_VALUES_NVARCHAR Procedure</a>   | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a> |
| <a href="#">PREPARE_COLUMN_VALUES_ROWID Procedure</a>      | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a> |
| <a href="#">PUBLISH_PENDING_STATS Procedure</a>            | Publishes the statistics gathered and stored as pending                                                                                                                                               |
| <a href="#">PURGE_STATS Procedure</a>                      | Purges old versions of statistics saved in the dictionary                                                                                                                                             |
| <a href="#">REMAP_STAT_TABLE Procedure</a>                 | Remaps the names of objects in the user statistics table                                                                                                                                              |
| <a href="#">REPORT_ADVISOR_TASK Function</a>               | Reports the results of an Optimizer Advisor Task.                                                                                                                                                     |
| <a href="#">REPORT_COL_USAGE Function</a>                  | Reports the recorded column (group) usage information                                                                                                                                                 |
| <a href="#">REPORT_GATHER_AUTO_STATS Function</a>          | Runs the auto statistics gathering job in reporting mode                                                                                                                                              |
| <a href="#">REPORT_GATHER_DATABASE_STATS Functions</a>     | Runs the <a href="#">GATHER_DATABASE_STATS Procedures</a> in reporting mode.                                                                                                                          |
| <a href="#">REPORT_GATHER_DICTIONARY_STATS Functions</a>   | Runs the <a href="#">GATHER_DICTIONARY_STATS Procedure</a> in reporting mode                                                                                                                          |
| <a href="#">REPORT_GATHER_FIXED_OBJECTS_STATS Function</a> | Runs the <a href="#">GATHER_FIXED_OBJECTS_STATS Procedure</a> in reporting mode                                                                                                                       |
| <a href="#">REPORT_GATHER_SCHEMA_STATS Functions</a>       | Runs the <a href="#">GATHER_SCHEMA_STATS Procedures</a> in reporting mode                                                                                                                             |
| <a href="#">REPORT_GATHER_TABLE_STATS Function</a>         | Runs the <a href="#">GATHER_TABLE_STATS Procedure</a> in reporting mode                                                                                                                               |

**Table 166-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                            | Description                                                                                                                                                        |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REPORT_STATS_OPERATIONS Function</a>      | Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided                                     |
| <a href="#">RESET_ADVISOR_TASK Procedure</a>          | Resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing                                      |
| <a href="#">RESET_COL_USAGE Procedure</a>             | Resets the recorded column (group) usage information                                                                                                               |
| <a href="#">RESET_GLOBAL_PREF_DEFAULTS Procedure</a>  | Resets the default values of all parameters to Oracle recommended values                                                                                           |
| <a href="#">RESET_PARAM_DEFAULTS Procedure</a>        | Resets global preferences to default values (see <a href="#">DBMS_STATS Deprecated Subprograms</a> )                                                               |
| <a href="#">RESTORE_DICTIONARY_STATS Procedure</a>    | Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp                                   |
| <a href="#">RESTORE_FIXED_OBJECTS_STATS Procedure</a> | Restores statistics of all fixed tables as of a specified timestamp                                                                                                |
| <a href="#">RESTORE_SCHEMA_STATS Procedure</a>        | Restores statistics of all tables of a schema as of a specified timestamp                                                                                          |
| <a href="#">RESTORE_SYSTEM_STATS Procedure</a>        | Restores statistics of all tables of a schema as of a specified timestamp                                                                                          |
| <a href="#">RESTORE_TABLE_STATS Procedure</a>         | Restores statistics of a table as of a specified timestamp ( <code>as_of_timestamp</code> ), as well as statistics of associated indexes and columns               |
| <a href="#">RESUME_ADVISOR_TASK Procedure</a>         | Resumes an interrupted task. It only resumes the execution that was most recently interrupted                                                                      |
| <a href="#">SCRIPT_ADVISOR_TASK Function</a>          | Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor                                                |
| <a href="#">SEED_COL_USAGE Procedure</a>              | Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements |
| <a href="#">SET_ADVISOR_TASK_PARAMETER Procedure</a>  | Updates the value of an Optimizer Statistics Advisor task parameter                                                                                                |
| <a href="#">SET_COLUMN_STATS Procedures</a>           | Sets column-related information                                                                                                                                    |
| <a href="#">SET_DATABASE_PREFS Procedure</a>          | Sets the statistics preferences of all the tables                                                                                                                  |
| <a href="#">SET_GLOBAL_PREFS Procedure</a>            | Sets the global statistics preferences                                                                                                                             |
| <a href="#">SET_INDEX_STATS Procedures</a>            | Sets index-related information                                                                                                                                     |
| <a href="#">SET_PARAM Procedure</a>                   | Sets default values for parameters of DBMS_STATS procedures (see <a href="#">DBMS_STATS Deprecated Subprograms</a> )                                               |
| <a href="#">SET_PROCESSING_RATE Procedure</a>         | Sets the value of rate of processing for a given operation                                                                                                         |
| <a href="#">SET_SCHEMA_PREFS Procedure</a>            | Sets the statistics preferences of all the tables owned by the specified owner name                                                                                |

**Table 166-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                         | Description                                                                                                               |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_SYSTEM_STATS Procedure</a>         | Sets system statistics                                                                                                    |
| <a href="#">SET_TABLE_PREFS Procedure</a>          | Sets the statistics preferences of the specified table in the specified schema                                            |
| <a href="#">SET_TABLE_STATS Procedure</a>          | Sets table-related information                                                                                            |
| <a href="#">SHOW_EXTENDED_STAT_S_NAME Function</a> | Returns the name of the virtual column that is created for the user-specified extension                                   |
| <a href="#">TRANSFER_STATS Procedure</a>           | Transfers statistics for specified table(s) from a remote database specified by <code>dblink</code> to the local database |
| <a href="#">UNLOCK_PARTITION_STATS Procedure</a>   | Unlocks the statistics for a partition                                                                                    |
| <a href="#">UNLOCK_SCHEMA_STATS Procedure</a>      | Unlocks the statistics on all the tables in schema                                                                        |
| <a href="#">UNLOCK_TABLE_STATS Procedure</a>       | Unlocks the statistics on the table                                                                                       |
| <a href="#">UPGRADE_STAT_TABLE Procedure</a>       | Upgrades user statistics on an older table                                                                                |

## 166.7.1 ALTER\_STATS\_HISTORY\_RETENTION Procedure

This procedure changes the statistics history retention value.

Statistics history retention is used by both the automatic purge and [PURGE\\_STATS Procedure](#).

### Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
 retention IN NUMBER);
```

### Parameters

**Table 166-4 ALTER\_STATS\_HISTORY\_RETENTION Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>retention</code> | <p>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</p> <ul style="list-style-type: none"> <li>-1: Statistics history is never purged by automatic purge</li> <li>0: Old statistics are never saved. The automatic purge will delete all statistics history</li> <li>NULL: Change statistics history retention to default value</li> </ul> |

### Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

### Exceptions

ORA-20000: Insufficient privileges

## 166.7.2 CANCEL\_ADVISOR\_TASK Procedure

This procedure cancels an Optimizer Statistics Advisor execution. The advisor removes all intermediate results of the current execution from the task.

### Syntax

```
DBMS_STATS.CANCEL_ADVISOR_TASK (
 task_name IN VARCHAR2);
```

### Parameters

**Table 166-5 CANCEL\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

### Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Usage Notes

To be canceled or interrupted, the specified task must be currently executing.

### Example 166-1 Canceling an Optimizer Statistics Advisor

In this example, you start a SQL\*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
 v_tname VARCHAR2(128) := 'my_task';
 v_ename VARCHAR2(128) := NULL;
BEGIN
 -- create a task
 v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

 -- execute the task
 v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL\*Plus session, and then execute the following program:

```
EXEC DBMS_STATS.CANCEL_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13632: The user cancelled the current operation.
```

## 166.7.3 CONFIGURE\_ADVISOR\_FILTER Function

This function configures the filter list for an Optimizer Statistics Advisor task. Filters are useful for excluding irrelevant findings from a report.

### Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_FILTER (
 task_name IN VARCHAR2,
 stats_adv_opr_type IN VARCHAR2,
 configuration_type IN VARCHAR2,
 filter IN StatsAdvFilterTab := NULL)
RETURN CLOB;
```

### Parameters

**Table 166-6 CONFIGURE\_ADVISOR\_FILTER Function Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>          | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                                                                                                                                                              |
| <code>stats_adv_opr_type</code> | The type of operation to configure. Possible values are <code>EXECUTE</code> , <code>REPORT</code> , <code>SCRIPT</code> , and <code>IMPLEMENT</code> . The function permits you to specify a combination of operation types by using the plus (+) operator, for example, <code>EXECUTE +REPORT</code> . If this parameter is null, then the filter applies to all types of advisor operations. |

**Table 166-6 (Cont.) CONFIGURE\_ADVISOR\_FILTER Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| configuration_type | The type of configuration. Possible values are as follows: <ul style="list-style-type: none"> <li>• SET: Sets the specified filter list values. The submitted filter overrides existing filter values.</li> <li>• CLEAR: Clears the existing values for the specified filter.</li> <li>• SHOW: Shows the current values of the specified filter.</li> </ul> |
| filter             | The list of filter items for the script.                                                                                                                                                                                                                                                                                                                    |

**Security Model**

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

**Return Values**

This function returns a CLOB that contains the configuration of the provided filter in XML format.

**Exceptions**

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

**Usage Notes**

To provide fine-grained control and a unified interface across all procedures, `DBMS_STATS` provides the `StatsAdvFilter` type. You can use this data type to instantiate and construct a table of filters. You can then pass a parameter of type `StatsAdvFilter` to `CONFIGURE_ADVISOR_FILTER` along with a Boolean variable that specifies either of the following:

- Inclusion list  
Only include these objects in the check.
- Exclusion list  
Do not include these objects in the check.

You can also pass in a parameter specifying whether to replace the existing list. This list only filters object-level and operation-level items. The advisor always checks system-level rules.

You can create the following types of filters:

- Rule filter  
This filter takes a rule name as input. Obtain rule names from the `V$STATS_ADVISOR_RULES` view.

- **Operation filter**  
This filter is an exact match filter that takes in the name of the operation and an XML string representation of all the parameter values in the call. To obtain the XML, see the notes section of the DBA\_OPTSTAT\_OPERATIONS view. To obtain the filter for an operation, use DBMS\_STATS.GET\_ADVISOR\_OPR\_FILTER.
- **Object filter**  
This filter accept an owner name and an object name. Wildcards (%) are supported in the owner name and object name. When an object name is null or %, it means a filter for all the objects in the specified schema. If the owner name is also null or %, it means a default filter for all objects in the system.

If none of the filters is specified, then the function recognizes the filter as setting the global default value of filtering (include or exclude). During the check, if no filter has been specified for a rule, operation, or object, then the function uses the default value to determine whether to include or exclude it.

### Example 166-2 Enabling and Disabling Rules

You may want to turn off checks for all rules except for a specific rule. In this example, you want to check whether SQL plan directives have been disabled.

```

DECLARE
 v_task_name VARCHAR2(128) := 'my_task';
 v_ret VARCHAR2(128);
 filter DBMS_STATS.StatsAdvFilter := null;
 filterTab DBMS_STATS.StatsAdvFilterTab := null;
 v_counter NUMBER := 0;
 v_filterReport CLOB;
BEGIN
 -- Create the advisor task
 v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

 -- Initialize the filter table
 filterTab := DBMS_STATS.StatsAdvFilterTab();

 -- First filter: set filters to be FALSE by default
 filter.include := FALSE;

 -- Add this filter to the filter table
 v_counter := v_counter + 1;
 filterTab.extend;
 filterTab(v_counter) := filter;

 -- Second filter: turn on filter for one rule
 filter.include := TRUE;
 filter.ruleName := 'TurnOnSQLPlanDirective';

 -- Add the SQL plan directive filter to the filter table
 v_counter := v_counter + 1;
 filterTab.extend;
 filterTab(v_counter) := filter;

 v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
 task_name => v_task_name,

```

```

 stats_adv_opr_type => NULL,
 configuration_type => 'SET',
 filter => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

### Example 166-3 Configuring an Operations Filter

In this example, your shop uses customized scripts to gather statistics for a table. If you do not want to see a specific statistics operation in the report, then you can specify an operations filter.

```

DECLARE
 v_task_name VARCHAR2(128) := 'my_task';
 v_ret VARCHAR2(128);
 filter DBMS_STATS.StatsAdvFilter := null;
 filterTab DBMS_STATS.StatsAdvFilterTab := null;
 opr DBMS_STATS.StatsAdvOpr;
 oprTab DBMS_STATS.StatsAdvOprTab;
 v_oprCnt NUMBER := 0;
 TYPE numTab IS TABLE OF NUMBER;
 opr_tab numTab;
 v_filterReport CLOB;

BEGIN
 -- Create the advisor task
 v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

 -- Initialize filter table
 filterTab := DBMS_STATS.StatsAdvFilterTab();

 -- Initialize operations filter
 oprTab := DBMS_STATS.StatsAdvOprTab();

 SELECT ID
 BULK COLLECT INTO opr_tab
 FROM WRI$_OPTSTAT_OPR
 WHERE OPERATION = 'set_table_stats'
 AND TARGET = 'HR.EMPLOYEES';

 -- Populate the operations table
 FOR i IN 1..opr_tab.count LOOP

 -- Use the procedure GET_ADVISOR_OPR_FILTER to construct
 -- an operation filter
 DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);

 v_oprCnt := v_oprCnt + 1;
 oprTab.extend;
 oprTab(v_oprCnt) := opr;

 END LOOP;

 filter.include := FALSE;
```

```

filter.oprlist := oprTab;

-- Add to filter table
filterTab.extend;
filterTab(1) := filter;

v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
 task_name => v_task_name,
 stats_adv_opr_type => NULL,
 configuration_type => 'SET',
 filter => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;
```

#### Example 166-4 Reporting on a Specific Schema

In this example, you want to generate a report only for the `sh` schema. Also, you want to skip the `sh.products` table. You create an object filter as follows:

```

DECLARE
 v_task_name VARCHAR2(128) := 'my_task';
 v_ret VARCHAR2(128);
 filter DBMS_STATS.StatsAdvFilter := null;
 filterTab DBMS_STATS.StatsAdvFilterTab := null;
 v_filterReport CLOB;
 v_counter NUMBER := 0;
 obj DBMS_STATS.ObjectElem;
 objTab DBMS_STATS.ObjectTab;
 v_objCnt NUMBER := 0;
BEGIN
 -- Create the advisor task
 v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

 -- Initialize filter table
 filterTab := DBMS_STATS.StatsAdvFilterTab();

 -- Set object filter to be off by default
 filter.include := FALSE;

 objTab := DBMS_STATS.ObjectTab();

 obj.ownname := NULL;
 obj.objname := NULL;

 -- Add to the object table

 v_objCnt := v_objCnt + 1;
 objTab.extend;
 objTab(v_objCnt) := obj;

 filter.objlist := objTab;
```

```
-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 1, turn on the check only for schema SH

filter.include := TRUE;

objTab := DBMS_STATS.ObjectTab();
v_objCnt := 0;

obj.ownname := 'SH';
obj.objname := NULL;

-- add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 2, exclude the check for object sh.products

filter.include := FALSE;

objTab := dbms_stats.ObjectTab();
v_objCnt := 0;

-- Specify another object filter for sh.products
obj.ownname := 'SH';
obj.objname := 'PRODUCTS';

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

v_filterReport :=
DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
 task_name => v_task_name,
```

```

stats_adv_opr_type => NULL,
configuration_type => 'SET',
filter => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

## 166.7.4 CONFIGURE\_ADVISOR\_OBJ\_FILTER Function

This function configures an object filter for an Optimizer Statistics Advisor task.

### Syntax

```

DBMS_STATS.CONFIGURE_ADVISOR_OBJ_FILTER (
 task_name IN VARCHAR2,
 stats_adv_opr_type IN VARCHAR2,
 rule_name IN VARCHAR2,
 ownname IN VARCHAR2,
 tablename IN VARCHAR2,
 action IN VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 166-7 CONFIGURE\_ADVISOR\_OBJ\_FILTER Function Parameters**

| Parameter          | Description                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name          | The name of the Optimizer Statistics Advisor task.                                                                                                              |
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ". |
| rule_name          | The name of the rule to configure. If null, the function applies the filter to all operation-level rules.                                                       |
| ownname            | The owner name of the operation target. If null, the function applies the filter to all owner names.                                                            |
| tablename          | The table name of the operation target.                                                                                                                         |
| action             | The configuration action to take for the specified rule. See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ".                                        |

### Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

### Return Values

This function returns an XML CLOB that contains the updated values of the filter.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

## 166.7.5 CONFIGURE\_ADVISOR\_OPR\_FILTER Functions

This overloaded function configures an operation filter for an Optimizer Statistics Advisor task.

### Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
 task_name IN VARCHAR2,
 stats_adv_opr_type IN VARCHAR2,
 rule_name IN VARCHAR2,
 operation_name IN VARCHAR2,
 action IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
 task_name IN VARCHAR2,
 stats_adv_opr_type IN VARCHAR2,
 rule_name IN VARCHAR2,
 operation_name IN VARCHAR2,
 ownname IN VARCHAR2,
 tabname IN VARCHAR2,
 action IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
 task_name IN VARCHAR2,
 stats_adv_opr_type IN VARCHAR2,
 rule_name IN VARCHAR2,
 operation_id IN NUMBER,
 action IN VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 166-8 CONFIGURE\_ADVISOR\_OPR\_FILTER Function Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

**Table 166-8 (Cont.) CONFIGURE\_ADVISOR\_OPR\_FILTER Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                  |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ".                                                                                                                                              |
| rule_name          | The name of the rule to configure. If null, the function applies the filter to all operation-level rules.                                                                                                                                                                                                    |
| operation_name     | The name of the operation. For example, an operation name could be gather_table_stats. This value cannot be null.                                                                                                                                                                                            |
| operation_id       | The ID of the operation to configure. The filter applies to any operation with the same signature as the specified operation ID. If two operations have the same signature, then they have the same value for every parameter. View the operation ID in DBA_OPSTAT_OPERATIONS.ID. This value cannot be null. |
| ownname            | The owner name of the operation target. This value cannot be null.                                                                                                                                                                                                                                           |
| tabname            | The table name of the operation target.                                                                                                                                                                                                                                                                      |
| action             | The configuration action to take for the specified rule. See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ".                                                                                                                                                                                     |

### Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

### Return Values

This function returns an XML CLOB that contains the updated values of the filter.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Example 166-5 Excluding Operations for Gathering Table Statistics

In this example, your goal is to exclude operations that gather table statistics in the hr schema. User account stats has been granted the DBA role, ADVISOR privilege, and SELECT ON DBA\_OPTSTAT\_OPERATIONS privilege. You perform the following steps:

1. Log in to the database as stats.
2. Drop any existing task named opt\_adv\_task1.

```

DECLARE
 v_tname VARCHAR2(32767);
BEGIN

```

```

 v_tname := 'opt_adv_task1';
 DBMS_STATS.DROP_ADVISOR_TASK(v_tname);
END;
/

```

3. Create a procedure named `opr_filter` that configures a task to advise on all operations except those that gather statistics for tables in the `hr` schema.

```

CREATE OR REPLACE PROCEDURE opr_filter(p_tname IN VARCHAR2) IS
 v_retc CLOB;
BEGIN
 -- For all rules, prevent the advisor from operating
 -- on the operations selected in the following query
 FOR rec IN
 (SELECT ID FROM DBA_OPTSTAT_OPERATIONS WHERE OPERATION =
'gather_table_stats' AND TARGET LIKE 'HR.%')
 LOOP
 v_retc := DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER(
 task_name => p_tname
 , stats_adv_opr_type => NULL
 , rule_name => NULL
 , operation_id => rec.id
 , action => 'DISABLE');
 END LOOP;
END;
/
SHOW ERRORS

```

4. Create a task named `opt_adv_task1`, and then execute the `opr_filter` procedure for this task.

```

DECLARE
 v_tname VARCHAR2(32767);
 v_ret VARCHAR2(32767);
BEGIN
 v_tname := 'opt_adv_task1';
 v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
 opr_filter(v_tname);
END;
/

```

5. Execute the task `opt_adv_task1`.

```

DECLARE
 v_tname VARCHAR2(32767);
 v_ret VARCHAR2(32767);
begin
 v_tname := 'opt_adv_task1';
 v_ret := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

```

## 6. Print the report.

```

SPOOL /tmp/rep.txt
SET LONG 1000000
COLUMN report FORMAT A200
SET LINESIZE 250
SET PAGESIZE 1000

SELECT DBMS_STATS.REPORT_ADVISOR_TASK(
 task_name => 'opt_adv_task1'
 , execution_name => NULL
 , type => 'TEXT'
 , section => 'ALL'
) AS report
FROM DUAL;
SPOOL OFF

```

## 166.7.6 CONFIGURE\_ADVISOR\_RULE\_FILTER Function

This function configures a rule filter for an Optimizer Statistics Advisor task.

### Syntax

```

DBMS_STATS.CONFIGURE_ADVISOR_RULE_FILTER (
 task_name IN VARCHAR2,
 stats_adv_opr_Type IN VARCHAR2,
 rule_name IN VARCHAR2,
 action IN VARCHAR2)
RETURN CLOB;

```

### Parameters

**Table 166-9** SCRIPT\_ADVISOR\_TASK Function Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name          | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                                                          |
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. You can specify a combination of operation types, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of Optimizer Statistics Advisor operations. |
| rule_name          | The name of the rule to configure. If null, the function applies the filter to all rules.                                                                                                                                                                                                   |

**Table 166-9 (Cont.) SCRIPT\_ADVISOR\_TASK Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action    | The configuration action to take for the specified rule. Possible values are: <ul style="list-style-type: none"> <li>• ENABLE: Enables the filter</li> <li>• DISABLE: Disables the filter</li> <li>• DELETE: Deletes the filter</li> <li>• SHOW: Shows the current filter value</li> </ul> |

**Security Model**

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

**Return Values**

This function returns an XML CLOB that contains the updated values of the filter.

**Exceptions**

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

## 166.7.7 CONVERT\_RAW\_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value.

The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

**Syntax**

```
DBMS_STATS.CONVERT_RAW_VALUE (
 rawval RAW,
 resval OUT BINARY_FLOAT);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
 rawval RAW,
 resval OUT BINARY_DOUBLE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
 rawval RAW,
 resval OUT DATE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
 rawval RAW,
 resval OUT NUMBER);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
 rawval RAW,
 resval OUT VARCHAR2);
```

### Parameters

**Table 166-10 CONVERT\_RAW\_VALUE Procedure Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| rawval    | Raw representation of a column minimum, maximum, histogram end point actual value |
| resval    | Converted, type-specific value                                                    |

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 166.7.8 CONVERT\_RAW\_VALUE\_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

### Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
 rawval RAW,
 resval OUT NVARCHAR2);
```

### Parameters

**Table 166-11 CONVERT\_RAW\_VALUE\_NVARCHAR Procedure Parameters**

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| rawval    | The raw representation of a column minimum or maximum datatype-specific output parameters |
| resval    | The converted, type-specific value                                                        |

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 166.7.9 CONVERT\_RAW\_VALUE\_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

### Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
 rawval RAW,
 resval OUT ROWID);
```

### Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 166-12 CONVERT\_RAW\_VALUE\_ROWID Procedure Parameters**

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| rawval    | The raw representation of a column minimum or maximum datatype-specific output parameters |
| resval    | The converted, type-specific value                                                        |

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 166.7.10 COPY\_TABLE\_STATS Procedure

This procedure copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of `blks`, or number of rows) based on the given `scale_factor`.

### Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
 ownname VARCHAR2,
 tablename VARCHAR2,
 srcpartname VARCHAR2,
 dstpartname VARCHAR2,
 scale_factor VARCHAR2 DEFAULT 1,
 flags NUMBER DEFAULT NULL,
 force BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-13 COPY\_TABLE\_STATS Procedure Parameters**

| Parameter   | Description                                                    |
|-------------|----------------------------------------------------------------|
| ownname     | Schema of the table of source and destination [sub] partitions |
| tablename   | Table name of source and destination [sub] partitions          |
| srcpartname | Source [sub] partition                                         |
| dstpartname | Destination [sub] partition                                    |

**Table 166-13 (Cont.) COPY\_TABLE\_STATS Procedure Parameters**

| Parameter    | Description                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------|
| scale_factor | Scale factor to scale nblks, nrows etc. in dstpartname                                               |
| flags        | For internal Oracle use (should be left as NULL)                                                     |
| force        | When value of this argument is TRUE copy statistics even if the destination [sub]partition is locked |

### Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Invalid [sub]partition name

ORA-20001: Bad input value

### Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH`, then the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST`, then the behavior depends on the setting of the destination partition:
  - If the destination partition is a `NOT DEFAULT` partition, then the following statements are true:
    - \* The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.
    - \* The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.
  - Alternatively, if the destination partition is a `DEFAULT` partition, then the following statements are true:
    - \* The minimum value of the destination partition is set to the minimum value of the source partition.
    - \* The maximum value of the destination partition is set to the maximum value of the source partition.
- If the partitioning type is `RANGE`, then the following statements are true:
  - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.
  - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is

MAXVALUE, in which case the maximum value of the destination partition is set to the high bound of the previous partition.

- If the source partition column's minimum value is equal to its maximum value, and if both are equal to the source partition's lower bound, and if it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is  $D$  and its preceding partition is  $D-1$  and the key column to be adjusted is  $C_n$ , the maximum value for  $C_n$  is set to the upper bound of  $D$  (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column  $C_{n-1}$  are the same in partitions  $D$  and  $D-1$ .

- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, then the number of distinct values is updated as 2.
- If the source or destination is a partition of a composite partitioned table, then this procedure does not copy statistics of the underlying subpartitions.

## 166.7.11 CREATE\_ADVISOR\_TASK Function

This function creates an advisor task for the Optimizer Statistics Advisor.

### Syntax

```
DBMS_STATS.CREATE_ADVISOR_TASK (
 task_name IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 166-14** CREATE\_ADVISOR\_TASK Function Parameters

| Parameter | Description                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | Name of the task. If the task name is already specified, then the function uses the specified task name. Otherwise, the function generates a new task name automatically. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- This subprogram executes using invoker's rights.

### Return Values

This function returns the unique name of the Optimizer Statistics Advisor task.

## Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20012: Optimizer Statistics Advisor errors

## Example 166-6 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```

DECLARE
 v_tname VARCHAR2(128) := 'my_task';
BEGIN
 -- create a task
 v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
 -- execute the task
 v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

### Note:

*Oracle Database SQL Tuning Guide* to learn how manage Optimizer Statistics Advisor

## 166.7.12 CREATE\_EXTENDED\_STATS Function

This function creates a column statistics entry in the system for a user-specified column group or an expression in a table.

The database gathers statistics for this extension when a user-initiated or automatic statistics gathering job gathers statistics for the table. Statistics for such an extension are called **extended statistics**. This function returns the name of this newly created entry for the extension.

This second form of this function creates statistics extensions based on the column group usage recorded by the [SEED\\_COL\\_USAGE Procedure](#). This function returns a report of extensions created.

### Syntax

```

DBMS_STATS.CREATE_EXTENDED_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 extension VARCHAR2)
RETURN VARCHAR2;
```

```

DBMS_STATS.CREATE_EXTENDED_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2)
RETURN CLOB;
```

## Parameters

**Table 166-15 CREATE\_EXTENDED\_STATS Function Parameters**

| Parameter | Description                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name of a table                                                                                                                                                                                                        |
| tabname   | Name of the table                                                                                                                                                                                                            |
| extension | Can be either a column group or an expression. Suppose the specified table has columns <i>c1</i> , <i>c2</i> . An example column group is "( <i>c1</i> , <i>c2</i> )". An example expression is "( <i>c1</i> + <i>c2</i> )". |

## Return Values

This function returns the name of this newly created entry for the extension.

## Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

## Usage Notes

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have either the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

The extension has the following restrictions:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by `SYS`.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables, or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column cannot appear more than once in a column group.
- The extension can contain an expression only if a corresponding virtual column has been created.
- An expression must contain at least one column.
- An expression cannot contain a subquery.
- The `COMPATIBLE` parameter must be 11.0.0.0.0 or greater.

## 166.7.13 CREATE\_STAT\_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

### Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
 ownname VARCHAR2,
 stattab VARCHAR2,
 tblspace VARCHAR2 DEFAULT NULL,
 global_temporary BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-16 CREATE\_STAT\_TABLE Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>          | Name of the schema                                                                                                                                                                           |
| <code>stattab</code>          | Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly. |
| <code>tblspace</code>         | Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.                                                           |
| <code>global_temporary</code> | Whether or not the table should be created as a global temporary table                                                                                                                       |

### Security Model

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

### Exceptions

ORA-20000: Table already exists or insufficient privileges

ORA-20001: Tablespace does not exist

## 166.7.14 DELETE\_COLUMN\_STATS Procedure

This procedure deletes column-related statistics.

### Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
 ownname VARCHAR2,
 tablename VARCHAR2,
 colname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 cascade_parts BOOLEAN DEFAULT TRUE,
```

```

statown VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
force BOOLEAN DEFAULT FALSE,
col_stat_type VARCHAR2 DEFAULT 'ALL');

```

## Parameters

**Table 166-17 DELETE\_COLUMN\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Name of the schema                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| tablename     | Name of the table to which this column belongs                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| colname       | Name of the column or extension                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| partname      | Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.                                                                                                                                                                                                                                                                                                                     |
| stattab       | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.                                                                                                                                                                                                                                                                                                                  |
| statid        | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).                                                                                                                                                                                                                                                                                                                                                                    |
| cascade_parts | If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.                                                                                                                                                                                                                                                                                                             |
| statown       | Schema containing stattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                               |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | When value of this argument is TRUE, deletes column statistics even if locked                                                                                                                                                                                                                                                                                                                                                                                                       |
| col_stat_type | Type of column statistics to be deleted. This argument takes the following values: <ul style="list-style-type: none"> <li>HISTOGRAM - delete column histogram only</li> <li>ALL - delete base column statistics and histogram</li> </ul>                                                                                                                                                                                                                                            |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

## 166.7.15 DELETE\_DATABASE\_PREFS Procedure

This procedure deletes the statistics preferences set for all non-system tables. You can include system tables by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
 pname IN VARCHAR2,
 add_sys IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-18** DELETE\_DATABASE\_PREFS Procedure Parameters

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pname</code>   | <p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> <li>• APPROXIMATE_NDV_ALGORITHM</li> <li>• AUTO_STAT_EXTENSIONS</li> <li>• CASCADE</li> <li>• DEGREE</li> <li>• ESTIMATE_PERCENT</li> <li>• GLOBAL_TEMP_TABLE_STATS</li> <li>• GRANULARITY</li> <li>• INCREMENTAL</li> <li>• INCREMENTAL_LEVEL</li> <li>• INCREMENTAL_STALENESS</li> <li>• METHOD_OPT</li> <li>• NO_INVALIDATE</li> <li>• OPTIONS</li> <li>• PREFERENCE_OVERRIDES_PARAMETER</li> <li>• PUBLISH</li> <li>• STALE_PERCENT</li> <li>• STAT_CATEGORY</li> <li>• TABLE_CACHED_BLOCKS</li> </ul> |
| <code>add_sys</code> | Determines whether SYS tables will be included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 166-19 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CASCADE                   | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DEGREE                    | Determines degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ESTIMATE_PERCENT          | Determines the percentage of rows to estimate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| GLOBAL_TEMP_TABLE_STATS   | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 166-19 (Cont.) Statistics Preferences**

| <b>Preference</b> | <b>Description</b>                                                                                                  |
|-------------------|---------------------------------------------------------------------------------------------------------------------|
| GRANULARITY       | Determines the granularity of statistics to collect. This value is only relevant for partitioned tables.            |
| INCREMENTAL       | Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. |
| INCREMENTAL_LEVEL | Controls which synopses to collect when INCREMENTAL preference is set to TRUE.                                      |

Table 166-19 (Cont.) Statistics Preferences

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopsis and HyperLogLog synopsis are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS   ('sh', 'sales', 'INCREMENTAL_STALENESS',   'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS   ('sh', 'sales', 'INCREMENTAL_STALENESS',   null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |

**Table 166-19 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METHOD_OPT                     | Controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.                                                                                                                                                                                                                                                                                 |
| NO_INVALIDATE                  | Controls the invalidation of dependent cursors of the tables for which statistics are being gathered.                                                                                                                                                                                                                                                                                                                                                    |
| OPTIONS                        | Determines the options parameter used in the <a href="#">GATHER_TABLE_STATS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                              |
| PREFERENCE_OVERRIDES_PARAMETER | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> <li>TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li>FALSE — Obeys input parameter values.</li> </ul> Specifying this preference does not change the order of precedence of table, global, and default. |
| PUBLISH                        | Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.                                                                                                                                                                                                          |
| STALE_PERCENT                  | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.                                                                                                                                                                                                                                                                                                          |
| STAT_CATEGORY                  | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics (default)</li> <li>SYNOPSIS - information to support incremental statistics</li> </ul> The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopsis.                |
| TABLE_CACHED_BLOCKS            | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.                                                                                                                                                                                                                                                                                                                            |

**Security Model**

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

**Usage Notes**

All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

### Example 166-7 Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

## 166.7.16 DELETE\_DATABASE\_STATS Procedure

This procedure deletes statistics for all the tables in a database.

### Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

### Parameters

**Table 166-20 DELETE\_DATABASE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statab        | User statistics table identifier describing from where to delete the statistics. If statab is NULL, then the statistics are deleted directly in the dictionary.                                                                                                                                                                                                                                                                                                                     |
| statid        | Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)                                                                                                                                                                                                                                                                                                                                                                       |
| statown       | Schema containing statab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked                                                                                                                                                                                                                                                                                                                                                                         |

**Table 166-20 (Cont.) DELETE\_DATABASE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stat_category | <p>Statistics to delete. It accepts multiple values separated by comma:</p> <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics</li> <li>SYNOPSIS - information to support incremental statistics</li> </ul> <p>The default is 'OBJECT_STATS, SYNOPSIS'</p> |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

## 166.7.17 DELETE\_DICTIONARY\_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

### Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 stattype VARCHAR2 DEFAULT 'ALL',
 force BOOLEAN DEFAULT FALSE,
 stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

### Parameters

**Table 166-21 DELETE\_DICTIONARY\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statab    | User statistics table identifier describing from where to delete the statistics. If statab is NULL, then the statistics are deleted directly in the dictionary. |
| statid    | Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)                                                   |
| statown   | Schema containing statab (if different from current schema)                                                                                                     |

**Table 166-21 (Cont.) DELETE\_DICTIONARY\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> |
| stattype      | Statistics type                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| force         | When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked                                                                                                                                                                                                                                                                                                                                                                      |
| stat_category | Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> <li>• OBJECT_STATS - table statistics, column statistics and index statistics</li> <li>• SYNOPSES - information to support incremental statistics</li> </ul> The default is 'OBJECT_STATS, SYNOPSES'                                                                                                                                                                     |

**Usage Notes**

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## 166.7.18 DELETE\_FIXED\_OBJECTS\_STATS Procedure

This procedure deletes statistics of all fixed tables.

**Syntax**

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 166-22 DELETE\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | The user statistics table identifier describing from where to delete the current statistics. If <code>stattab</code> is NULL, the statistics will be deleted directly in the dictionary.                                                                                                                                                                                                                                                                                                      |
| statid        | The (optional) identifier to associate with these statistics within <code>stattab</code> . This only applies if <code>stattab</code> is not NULL.                                                                                                                                                                                                                                                                                                                                             |
| statown       | Schema containing <code>stattab</code> (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                     |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> |
| force         | Ignores the statistics lock on objects and deletes the statistics if set to TRUE                                                                                                                                                                                                                                                                                                                                                                                                              |

## Usage Notes

You must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege to execute this procedure.

## Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## 166.7.19 DELETE\_INDEX\_STATS Procedure

This procedure deletes index-related statistics.

### Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 cascade_parts BOOLEAN DEFAULT TRUE,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 stattype VARCHAR2 DEFAULT 'ALL',
 force BOOLEAN DEFAULT FALSE);
 stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

## Parameters

**Table 166-23 DELETE\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Name of the schema                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| indname       | Name of the index                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| partname      | Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.                                                                                                                                                                                                                                                                                                         |
| stattab       | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.                                                                                                                                                                                                                                                                                                                  |
| statid        | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)                                                                                                                                                                                                                                                                                                                                                                     |
| cascade_parts | If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well                                                                                                                                                                                                                                                                                                               |
| statown       | Schema containing stattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                               |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| stattype      | Statistics type                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| force         | When value of this argument is TRUE, deletes index statistics even if locked                                                                                                                                                                                                                                                                                                                                                                                                        |
| stat_category | Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> <li>• OBJECT_STATS - table statistics, column statistics and index statistics</li> <li>• SYNOPSSES - information to support incremental statistics</li> </ul> The default is 'OBJECT_STATS, SYNOPSSES'                                                                                                                                                                      |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

## 166.7.20 DELETE\_PENDING\_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

### Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (
 ownname IN VARCHAR2 DEFAULT USER,
 tabname IN VARCHAR2);
```

### Parameters

**Table 166-24** DELETE\_PENDING\_STATS Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ownname   | Owner name  |
| tabname   | Table name  |

### Security Model

To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be affected by this procedure. The default owner is the user who runs the procedure.

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

If the parameter `tabname` is `NULL` delete applies to all tables of the specified schema.

### Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

## 166.7.21 DELETE\_PROCESSING\_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

### Syntax

```
DBMS_STATS.DELETE_PROCESSING_RATE (
 stat_source IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-25 DELETE\_PROCESSING\_RATE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stat_source | Source of processing rates: <ul style="list-style-type: none"> <li>'MANUAL': values set by the user manually using the <a href="#">SET_PROCESSING_RATE Procedure</a></li> <li>'CALIBRATION' : values collected by the calibration <a href="#">GATHER_PROCESSING_RATE Procedure</a> run explicitly by the user</li> <li>'FEEDBACK': values obtained by time feedback</li> </ul> |

## Usage Notes

You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure since `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## 166.7.22 DELETE\_SCHEMA\_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

## Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
 ownname IN VARCHAR2,
 pname IN VARCHAR2);
```

## Parameters

**Table 166-26 DELETE\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ownname   | Owner name  |

**Table 166-26 (Cont.) DELETE\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> <li>• APPROXIMATE_NDV_ALGORITHM</li> <li>• AUTO_STAT_EXTENSIONS</li> <li>• CASCADE</li> <li>• DEGREE</li> <li>• ESTIMATE_PERCENT</li> <li>• GLOBAL_TEMP_TABLE_STATS</li> <li>• GRANULARITY</li> <li>• INCREMENTAL</li> <li>• INCREMENTAL_LEVEL</li> <li>• INCREMENTAL_STALENESS</li> <li>• METHOD_OPT</li> <li>• NO_INVALIDATE</li> <li>• OPTIONS</li> <li>• PREFERENCE_OVERRIDES_PARAMETER</li> <li>• PUBLISH</li> <li>• STALE_PERCENT</li> <li>• TABLE_CACHED_BLOCKS</li> </ul> |

**Table 166-27 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• REPEAT OR HYPERLOGLOG <ul style="list-style-type: none"> <li>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format.</li> </ul> </li> <li>• ADAPTIVE SAMPLING <ul style="list-style-type: none"> <li>The database uses the adaptive sampling algorithm for all synopses.</li> </ul> </li> <li>• HYPERLOGLOG <ul style="list-style-type: none"> <li>The database uses the HyperLogLog algorithm for all new and stale synopses.</li> </ul> </li> </ul> |

Table 166-27 (Cont.) Statistics Preferences

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• <b>ON</b> — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>• <b>OFF</b>— The database does not create column group statistics automatically. The database creates them only when the <code>CREATE_EXTENDED_STATS</code> function is executed, or when extended statistics are specified explicitly in the <code>METHOD_OPT</code> clause of <code>DBMS_STATS</code>. This is the default.</li> </ul>                                                                                                                                                                 |
| CASCADE                   | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| COORDINATOR_TRIGGER_SHARD | <p>User of each shard uses this preference to determine whether to allow shard coordinator to interact with the statistics gathering in each shards.</p> <p>While gathering the statistics in shard coordinator, if the statistics in one of the shards are not up to date, the shard coordinator will try to trigger the statistics gathering in that shard. By using this preference, user can execute or ignore that command from the shard coordinator.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• <b>TRUE</b>—Allows the shard coordinator trigger the statistics gathering on sharded table in local shard if the statistics on local shard are stale.</li> <li>• <b>FALSE</b>—Ignores the statistics gathering command triggered from the shard coordinator.</li> </ul> <p>The default value is <b>FALSE</b>.</p> |
| DEGREE                    | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ESTIMATE_PERCENT          | The value determines the percentage of rows to estimate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| METHOD_OPT                | Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| NO_INVALIDATE             | The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| GRANULARITY               | The value determines granularity of statistics to collect (only pertinent if the table is partitioned)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PUBLISH                   | This value determines whether or not newly gathered statistics will be published once the gather job has completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| INCREMENTAL               | This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 166-27 (Cont.) Statistics Preferences**

| <b>Preference</b> | <b>Description</b>                                                                       |
|-------------------|------------------------------------------------------------------------------------------|
| INCREMENTAL_LEVEL | This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. |

Table 166-27 (Cont.) Statistics Preferences

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> </li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> </li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes. <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics.</p> </li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> |

**Table 166-27 (Cont.) Statistics Preferences**

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROOT_TRIGGER_PDB        | <p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>The application PDB user, uses this preference to determine whether to allow the application root to interact with the statics gathering in PDB.</p> <p>During the statistics gathering of a metadata linked table in the application root, if the statistics in a PDB are in stale state, the application root triggers the statistics gathering for the particular PDB. Using this preference, the user can either execute or ignore the command from the application root.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• <code>TRUE</code>—Allows the application root trigger the statistics gathering on metadata linked table in application PDB if the statistics on PDB are stale.</li> <li>• <code>FALSE</code>—Ignores the statistics gathering command triggered from application root.</li> </ul> <p>The default value is <code>FALSE</code>.</p> |
| STALE_PERCENT           | <p>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| GLOBAL_TEMP_TABLE_STATS | <p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| TABLE_CACHED_BLOCKS     | <p>The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OPTIONS                 | <p>Determines the <code>options</code> parameter used in the <a href="#">GATHER_TABLE_STATS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

 **Note:**

CDB root, different from application root, never triggers statistics gathering on the PDBs and it is not controlled by this preference.

**Security Model**

To run this procedure, you must be the object owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

**Exceptions**

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or illegal input values

### Usage Notes

All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

### Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

## 166.7.23 DELETE\_SCHEMA\_STATS Procedure

This procedure deletes statistics for an entire schema.

### Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
 ownname VARCHAR2,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 166-28** DELETE\_SCHEMA\_STATS Procedure Parameters

| Parameter | Description                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Specifies the name of the schema.                                                                                                             |
| statab    | Identifies the table where statistics are stored. If statab is NULL, then the procedure deletes statistics directly from the data dictionary. |
| statid    | Specifies the identifier (optional) associated with these statistics within statab. This parameter is only relevant if statab is not NULL.    |
| statown   | Specifies the schema containing statab (if different than ownname).                                                                           |

**Table 166-28 (Cont.) DELETE\_SCHEMA\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | <p>Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.</p> <p>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| force         | Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| stat_category | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> <li>OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li> <li>SYNOPSIS — Specifies metadata for incremental statistics.</li> <li>REALTIME_STATS — Specifies only real-time statistics.</li> </ul> <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.</p>     |

### Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

## 166.7.24 DELETE\_SYSTEM\_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option), if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

### Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-29 DELETE\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| stattab   | Identifier of the user statistics table where the statistics will be saved |
| statid    | Optional identifier associated with the statistics saved in the stattab    |
| statown   | Schema containing stattab (if different from current schema)               |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

## Usage Notes

To run this procedure, you need the GATHER\_SYSTEM\_STATISTICS role.

## 166.7.25 DELETE\_TABLE\_PREFS Procedure

This procedure deletes the optimizer statistics preferences of the specified table in the specified schema.

## Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
 ownname IN VARCHAR2,
 tablename IN VARCHAR2,
 pname IN VARCHAR2);
```

## Parameters

**Table 166-30 DELETE\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ownname   | Owner name  |
| tablename | Table name  |

**Table 166-30 (Cont.) DELETE\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>Preference name. **Table 166-31 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG           <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> </li> <li>ADAPTIVE SAMPLING           <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> </li> <li>HYPERLOGLOG           <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CASCADE                   | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DEGREE                    | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ESTIMATE_PERCENT          | Determines the percentage of rows to estimate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| GRANULARITY               | Determines granularity of statistics to collect. This value is only relevant for partitioned tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 166-31 (Cont.) Statistics Preferences**

| <b>Preference</b>       | <b>Description</b>                                                                                                                    |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| GLOBAL_TEMP_TABLE_STATS | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.    |
| INCREMENTAL             | This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. |
| INCREMENTAL_LEVEL       | This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.                                              |

Table 166-31 (Cont.) Statistics Preferences

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference.<br/>For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database regathers statistics.</li> </ul> |

**Table 166-31 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                | <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>                                            |
| METHOD_OPT                     | Controls column statistics collection and histogram creation. When setting preference at the global, schema, database, or dictionary level, only 'FOR ALL' syntax is allowed.                                                                                                                                                                                                                                                                                              |
| NO_INVALIDATE                  | The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.                                                                                                                                                                                                                                                                                                                                                            |
| OPTIONS                        | Determines the options parameter used in the <a href="#">GATHER_TABLE_STATS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li>• TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li>• FALSE — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p> |
| PUBLISH                        | Determines whether newly gathered statistics will be published after the statistics gathering job has completed.                                                                                                                                                                                                                                                                                                                                                           |
| STALE_PERCENT                  | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.                                                                                                                                                                                                                                                                                                                            |
| STAT_CATEGORY                  | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> <li>• OBJECT_STATS - table statistics, column statistics and index statistics (default)</li> <li>• SYNOPSES - information to support incremental statistics</li> </ul> <p>The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses.</p>                |

**Table 166-31 (Cont.) Statistics Preferences**

| Preference          | Description                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------|
| TABLE_CACHED_BLOCKS | Specifies the average number of blocks assumed to be in the buffer cache when calculating the index clustering factor. |

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

**Usage Notes**

- To run this procedure, you need to connect as owner of the table, be granted `ANALYZE` privilege on the table, or `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

**Examples**

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

## 166.7.26 DELETE\_TABLE\_STATS Procedure

This procedure deletes table-related statistics.

**Syntax**

```
DBMS_STATS.DELETE_TABLE_STATS (
 ownname VARCHAR2,
 tablename VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 cascade_parts BOOLEAN DEFAULT TRUE,
 cascade_columns BOOLEAN DEFAULT TRUE,
 cascade_indexes BOOLEAN DEFAULT TRUE,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

Table 166-32 DELETE\_TABLE\_STATS Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname         | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| tabname         | Specifies the name of the table to which this column belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| partname        | Specifies the name of the table partition or subpartition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.                                                                                                                                                                                                                                                                                                                                                                              |
| stattab         | Identifies the user statistics table where statistics will be retrieved. If stattab is NULL, then the procedure retrieves statistics directly from the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| statid          | Specifies the identifier (optional) associated with these statistics within stattab. This parameter is only relevant if stattab is not NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| cascade_parts   | Specifies whether the procedure should operate on underlying partitions. If the table is partitioned, and if partname is NULL, then specifying TRUE deletes statistics for underlying partitions.                                                                                                                                                                                                                                                                                                                                                                                            |
| cascade_columns | Indicates whether to invoke the DELETE_COLUMN_STATS procedure. If TRUE, then this procedure calls DELETE_COLUMN_STATS for all underlying columns.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| cascade_indexes | Indicates whether to invoke the DELETE_INDEX_STATS procedure. If TRUE, then this procedure calls DELETE_INDEX_STATS for all underlying columns.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| statown         | Specifies the schema containing stattab (if different than ownname).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| no_invalidate   | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force           | Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| stat_category   | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> <li>OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li> <li>SYNOPSIS — Specifies metadata for incremental statistics.</li> <li>REALTIME_STATS — Specifies only real-time statistics.</li> </ul> You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.               |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

## 166.7.27 DIFF\_TABLE\_STATS\_IN\_HISTORY Function

This function compares statistics for a table as of two specified timestamps.

### Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
 ownname IN VARCHAR2,
 tablename IN VARCHAR2,
 time1 IN TIMESTAMP WITH TIME ZONE,
 time2 IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
 pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;
```

### Parameters

**Table 166-33 DIFF\_TABLE\_STATS\_IN\_HISTORY Function Parameters**

| Parameter    | Description                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname      | Specifies the owner of the table. Specify NULL for current schema.                                                                                       |
| tablename    | Specifies the table for which statistics are to be compared.                                                                                             |
| time1        | Specifies the first timestamp for comparison.                                                                                                            |
| time2        | Specifies the second timestamp for comparison.                                                                                                           |
| pctthreshold | Specifies the threshold limit. The function reports differences in statistics only if the change percentage exceeds this limit. The default value is 10. |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Usage Notes

If the second timestamp is `NULL`, then the function compares the current statistics in the data dictionary with the statistics as of the first timestamp.

## 166.7.28 DIFF\_TABLE\_STATS\_IN\_PENDING Function

This function compares pending statistics to either the current statistics in the data dictionary, or user-specified historical statistics.

### Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
 ownname IN VARCHAR2,
 tabname IN VARCHAR2,
 timestamp IN TIMESTAMP WITH TIME ZONE,
 pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;
```

### Parameters

**Table 166-34** DIFF\_TABLE\_STATS\_IN\_PENDING Function Parameters

| Parameter    | Description                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname      | Owner of the table. Specify NULL for the current schema.                                                                                                                                                              |
| tabname      | Table for which statistics are to be compared.                                                                                                                                                                        |
| timestamp    | Timestamp in the statistics history that corresponds to the desired statistics. If the timestamp is NULL, then this function compares the current statistics in the dictionary with the pending statistics (default). |
| pctthreshold | Limit for reporting. The function reports difference in statistics only if it exceeds the specified limit. The default value is 10.                                                                                   |

### Security Model

To invoke this procedure you must be owner of the table, or you must have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you must have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.29 DIFF\_TABLE\_STATS\_IN\_STATTAB Function

This function compares table statistics from two sources.

The function can obtain statistics from the following sources:

- Two user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary

The function also compares the statistics of the dependent objects: indexes, columns, and partitions. It displays statistics of the objects from both sources when the difference between those statistics exceeds a certain threshold (%). You can specify this threshold as an argument to the function. The function uses the statistics corresponding to the first source (`stattab1` or `time1`) as the basis for computing the difference percentage.

## Syntax

```

DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
 ownname IN VARCHAR2,
 tabname IN VARCHAR2,
 stattab1 IN VARCHAR2,
 stattab2 IN VARCHAR2 DEFAULT NULL,
 pctthreshold IN NUMBER DEFAULT 10,
 statid1 IN VARCHAR2 DEFAULT NULL,
 statid2 IN VARCHAR2 DEFAULT NULL,
 stattablowname IN VARCHAR2 DEFAULT NULL,
 stattab2own IN VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;

```

## Parameters

**Table 166-35** DIFF\_TABLE\_STATS\_IN\_STATTAB Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname        | Specifies the owner of the table. Specify NULL for current schema.                                                                                                                                                                                                        |
| tabname        | Specifies the table for which statistics are to be compared.                                                                                                                                                                                                              |
| stattab1       | Specifies the user statistics table 1.                                                                                                                                                                                                                                    |
| stattab2       | Specifies the user statistics table 2. If NULL, the function compares statistics in stattab1 with current statistics in the data dictionary. This is the default. To compare two sets within the statistics table, specify the same table as stattab1 (see statid below). |
| pctthreshold   | Specifies the percent thresholds for comparison. The function reports difference in statistics only if it exceeds this limit. The default value is 10.                                                                                                                    |
| statid1        | (optional) Identifies statistics set within stattab1.                                                                                                                                                                                                                     |
| statid2        | (optional) Identifies statistics set within stattab2.                                                                                                                                                                                                                     |
| stattablowname | Specifies the schema containing stattab1 (if other than ownname).                                                                                                                                                                                                         |
| stattab2own    | Specifies the schema containing stattab2 (if other than ownname).                                                                                                                                                                                                         |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.30 DROP\_ADVISOR\_TASK Procedure

This procedure drops the specified Optimizer Statistics Advisor task.

## Syntax

```

DBMS_STATS.DROP_ADVISOR_TASK (
 task_name IN VARCHAR2);

```

## Parameters

**Table 166-36 DROP\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

## Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

## Example 166-8 Dropping an Optimizer Statistics Advisor Task

This example drops the Optimizer Statistics Advisor task named `my_task`:

```
EXEC DBMS_STATS.DROP_ADVISOR_TASK('my_task');
```

## 166.7.31 DROP\_EXTENDED\_STATS Procedure

This function drops the statistics entry that is created for the user specified extension.

This cancels the effects of the [CREATE\\_EXTENDED\\_STATS Function](#).

## Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 extension VARCHAR2);
```

## Parameters

**Table 166-37 DROP\_EXTENDED\_STATS Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| ownname   | Owner name of a table |
| tabname   | Name of the table     |

**Table 166-37 (Cont.) DROP\_EXTENDED\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extension | Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)". |

**Exceptions**

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension

**Usage Notes**

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- If no extended statistics set is created for the extension, this function throws an error.

## 166.7.32 DROP\_STAT\_TABLE Procedure

This procedure drops a user statistics table.

**Syntax**

```
DBMS_STATS.DROP_STAT_TABLE (
 ownname VARCHAR2,
 statab VARCHAR2);
```

**Parameters**

**Table 166-38 DROP\_STAT\_TABLE Procedure Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ownname   | Name of the schema               |
| statab    | User statistics table identifier |

**Exceptions**

ORA-20000: Table does not exists or insufficient privileges.

**Usage Notes**

To invoke this procedure you need the privileges for dropping the specified table.

## 166.7.33 EXECUTE\_ADVISOR\_TASK Function

This function executes a previously created Optimizer Statistics Advisor task.

## Syntax

```
DBMS_STATS.EXECUTE_ADVISOR_TASK (
 task_name IN VARCHAR2,
 execution_name IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 166-39 EXECUTE\_ADVISOR\_TASK Parameters**

| Parameter      | Description                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | Name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                    |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it.<br><br>If the specified execution conflicts with the name of an existing execution, then the function returns an error. |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level  
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- Operation level  
The results depend on the following privileges:
  - Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
  - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
  - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
  - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- Object level

Users can perform this task for any object for which they have statistics collection privileges.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Returns

This function returns the name of the new execution.

### Usage Notes

The results of the execution depend on user privileges and the type of rules:

- System

To perform the operation on system-level rules, you must have both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges.

- Operation

If you have the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges, then you can execute this function for all operations. If you have only the `ANALYZE ANY` privilege, then you can execute this function for operations related to any schemas except `SYS`. If you have only the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function for operations related to any schemas, including `SYS`. If you have neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function only for operations in your own schema.

- Object

If you have the privilege to collect statistics for an object, then you can execute this function for the object.

### Example 166-9 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
 v_tname VARCHAR2(128) := 'my_task';
BEGIN
 -- create a task
 v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
 -- execute the task
 v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

## 166.7.34 EXPORT\_COLUMN\_STATS Procedure

This procedure exports statistics for a specified column and stores them in the user statistics table identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 colname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 166-40** EXPORT\_COLUMN\_STATS Procedure Parameters

| Parameter             | Description                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>  | Name of the schema                                                                                                                                                     |
| <code>tabname</code>  | Name of the table to which this column belongs                                                                                                                         |
| <code>colname</code>  | Name of the column or extension                                                                                                                                        |
| <code>partname</code> | Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition column statistics are exported. |
| <code>stattab</code>  | User statistics table identifier describing where to store the statistics                                                                                              |
| <code>statid</code>   | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                                   |
| <code>statown</code>  | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                       |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.35 EXPORT\_DATABASE\_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
 statab IN VARCHAR2,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL
 add_sys IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-41 EXPORT\_DATABASE\_PREFS Procedure Parameters**

| Parameter            | Description                                                                         |
|----------------------|-------------------------------------------------------------------------------------|
| <code>statab</code>  | Statistics table name to where statistics should be exported                        |
| <code>statid</code>  | (Optional) Identifier to associate with these statistics within <code>statab</code> |
| <code>statown</code> | Schema containing <code>statab</code> (if other than <code>ownname</code> )         |
| <code>add_sys</code> | Value <code>TRUE</code> will include the Oracle-owned tables                        |

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

## 166.7.36 EXPORT\_DATABASE\_STATS Procedure

This procedure exports statistics for all objects in the database and stores them in the user statistics tables identified by `statown.statab`.

### Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
 statab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
```

```
statown VARCHAR2 DEFAULT NULL,
stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 166-42 EXPORT\_DATABASE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | User statistics table identifier describing where to store the statistics                                                                                                                                                                                                                                                                                                                                                              |
| statid        | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                           |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</li> <li>SYNOPSIS - information to support incremental statistics</li> </ul> If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopses are deleted. |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.37 EXPORT\_DICTIONARY\_STATS Procedure

This procedure exports statistics for all data dictionary schemas (`SYS`, `SYSTEM`, and `RDBMS` component schemas) and stores them in the user statistics table identified by `stattab`.

## Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 166-43 EXPORT\_DICTIONARY\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | User statistics table identifier describing where to store the statistics                                                                                                                                                                                                                                                                                                                                                                |
| statid        | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                  |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                             |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</li> <li>SYNOPSSES - information to support incremental statistics</li> </ul> If 'OBJECT_STATS, SYNOPSSES' is specified, table statistics, column statistics, index statistics and synopses are deleted. |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.38 EXPORT\_FIXED\_OBJECTS\_STATS Procedure

This procedure exports statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

## Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-44 EXPORT\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| stattab   | User statistics table identifier describing where to store the statistics |
| statid    | Identifier (optional) to associate with these statistics within stattab   |
| statown   | Schema containing stattab (if different from current schema)              |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.39 EXPORT\_INDEX\_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

## Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-45 EXPORT\_INDEX\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Name of the schema                                                                                                                                                    |
| indname   | Name of the index                                                                                                                                                     |
| partname  | Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are exported. |

**Table 166-45 (Cont.) EXPORT\_INDEX\_STATS Procedure Parameters**

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| stattab   | User statistics table identifier describing where to store the statistics |
| statid    | Identifier (optional) to associate with these statistics within stattab   |
| statown   | Schema containing stattab (if different than ownname)                     |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

**Usage Notes**

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

## 166.7.40 EXPORT\_PENDING\_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

**Syntax**

```
DBMS_STATS.EXPORT_PENDING_STATS (
 ownname IN VARCHAR2 DEFAULT USER,
 tabname IN VARCHAR2,
 stattab IN VARCHAR2,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT USER);
```

**Parameters****Table 166-46 EXPORT\_PENDING\_STATS Procedure Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| ownname   | Owner name                                                              |
| tabname   | Table name                                                              |
| stattab   | Statistics table name to where to export the statistics                 |
| statid    | (Optional) Identifier to associate with these statistics within stattab |
| statown   | Schema containing stattab (if other than ownname)                       |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- If the parameter `tablename` is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

## 166.7.41 EXPORT\_SCHEMA\_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

### Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
 ownname IN VARCHAR2,
 statab IN VARCHAR2,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 166-47 EXPORT\_SCHEMA\_PREFS Procedure Parameters**

| Parameter            | Description                                                                         |
|----------------------|-------------------------------------------------------------------------------------|
| <code>ownname</code> | Owner name                                                                          |
| <code>statab</code>  | Statistics table name to where to export the statistics                             |
| <code>statid</code>  | (Optional) Identifier to associate with these statistics within <code>statab</code> |
| <code>statown</code> | Schema containing <code>statab</code> (if different than <code>ownname</code> )     |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- To run this procedure, you need to connect as owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

## 166.7.42 EXPORT\_SCHEMA\_STATS Procedure

This procedure exports statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
 ownname VARCHAR2,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 166-48 EXPORT\_SCHEMA\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>       | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>stattab</code>       | Identifies the user statistics table in which to store the exported statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>statid</code>        | Specifies the identifier (optional) associated with these statistics within <code>stattab</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>statown</code>       | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>stat_category</code> | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> <li><code>OBJECT_STATS</code> — Specifies table statistics, column statistics, and index statistics.</li> <li><code>SYNOPSIS</code> — Specifies metadata for incremental statistics.</li> <li><code>REALTIME_STATS</code> — Specifies only real-time statistics.</li> </ul> <p>You can specify a list of comma-delimited values. For example, <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopsis. The default value is <code>'OBJECT_STATS, REALTIME_STATS'</code>.</p> |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

**Usage Notes**

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.43 EXPORT\_SYSTEM\_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

**Syntax**

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 166-49 EXPORT\_SYSTEM\_STATS Procedure Parameters**

| Parameter            | Description                                                                                |
|----------------------|--------------------------------------------------------------------------------------------|
| <code>stattab</code> | Identifier of the user statistics table that describes where the statistics will be stored |
| <code>statid</code>  | Optional identifier associated with the statistics stored from the <code>stattab</code>    |
| <code>statown</code> | Schema containing <code>stattab</code> (if different from current schema)                  |

**Security Model**

To run this procedure, you must have the `GATHER_SYSTEM_STATISTICS` role.

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

**Usage Notes**

Oracle Database does not support the export or import of statistics across databases of different character sets.

## 166.7.44 EXPORT\_TABLE\_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

**Syntax**

```
DBMS_STATS.EXPORT_TABLE_PREFS (
 ownname IN VARCHAR2,
```

```

tabname IN VARCHAR2,
stattab IN VARCHAR2,
statid IN VARCHAR2 DEFAULT NULL,
statown IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 166-50 EXPORT\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| ownname   | Owner name                                                            |
| tabname   | Table name                                                            |
| stattab   | Statistics table name where to export the statistics                  |
| statid    | Optional identifier to associate with these statistics within stattab |
| statown   | Schema containing stattab (if other than ownname)                     |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

## 166.7.45 EXPORT\_TABLE\_STATS Procedure

This procedure exports statistics for a specified table (including associated index statistics) and stores them in the user statistics table identified by stattab.

## Syntax

```

DBMS_STATS.EXPORT_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 cascade BOOLEAN DEFAULT TRUE,
 statown VARCHAR2 DEFAULT NULL,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);

```

## Parameters

**Table 166-51 EXPORT\_TABLE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| tabname       | Specifies the name of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| partname      | Specifies the name of the table partition. If the table is partitioned, and if partname is NULL, then the procedure exports global and partition statistics.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| stattab       | Specifies the identifier (optional) associated with these statistics within stattab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| statid        | Specifies the identifier (optional) associated with these statistics within stattab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| cascade       | Indicates whether to export column and index statistics. If TRUE, then the procedure exports column and index statistics for the specified table. This is the default.                                                                                                                                                                                                                                                                                                                                                                                                           |
| statown       | Specifies the schema containing stattab (if different than ownname).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| stat_category | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"><li>• OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li><li>• SYNOPSES — Specifies metadata for incremental statistics.</li><li>• REALTIME_STATS — Specifies only real-time statistics.</li></ul> You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'. |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.46 FLUSH\_DATABASE\_MONITORING\_INFO Procedure

This procedure saves monitoring information for all tables in the dictionary. The database immediately updates corresponding entries in the \*\_TAB\_MODIFICATIONS, \*\_TAB\_STATISTICS and \*\_IND\_STATISTICS views.

### Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

### Security Model

The ANALYZE\_ANY system privilege is required to run this procedure.

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

Starting in Oracle Database 12c Release 2 (12.2), you do not need to call FLUSH\_DATABASE\_MONITORING\_INFO to view the latest information in \*\_TAB\_STATISTICS and \*\_IND\_STATISTICS because these views show statistics cached in the SGA and stored on disk. Because the GATHER\_\*\_STATS procedures internally save monitoring information to disk, it is not necessary to run this procedure before gathering statistics.

## 166.7.47 GATHER\_DATABASE\_STATS Procedures

This procedure gathers statistics for all objects in the database.

### Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
 estimate_percent NUMBER DEFAULT to_estimate_percent_type
 (get_param('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 options VARCHAR2 DEFAULT 'GATHER',
 objlist OUT ObjectTab,
 statown VARCHAR2 DEFAULT NULL,
 gather_sys BOOLEAN DEFAULT TRUE,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
```

```

obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DATABASE_STATS (
 estimate_percent NUMBER DEFAULT to_estimate_percent_type
 (get_param('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 options VARCHAR2 DEFAULT 'GATHER',
 statown VARCHAR2 DEFAULT NULL,
 gather_sys BOOLEAN DEFAULT TRUE,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 obj_filter_list ObjectTab DEFAULT NULL);

```

## Parameters

**Table 166-52 GATHER\_DATABASE\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| estimate_percent | <p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| block_sample     | <p>Determines whether the database uses random block sampling (TRUE) or random row sampling (FALSE). The default is FALSE.</p> <p>Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>                                                                                                                                                                |

Table 166-52 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| method_opt | <p>When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>      |
| degree     | <p>Determines the degree of parallelism used for gathering statistics.</p> <p>The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</p> |

**Table 166-52 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics</p> |
| cascade     | <p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table.</p> <p>Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| stattab     | <p>User statistics table identifier describing where to save the current statistics.</p> <p>The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| statid      | <p>Identifier (optional) to associate with these statistics within stattab.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 166-52 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options         | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>GATHER</b> — Gathers statistics on all objects in the database. This is the default.</li> <li>• <b>GATHER AUTO</b> — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <b>GATHER AUTO</b> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</li> <li>• <b>GATHER STALE</b> — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale.</li> <li>• <b>GATHER EMPTY</b> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</li> <li>• <b>LIST AUTO</b> — Returns a list of objects to be processed with <b>GATHER AUTO</b>.</li> <li>• <b>LIST STALE</b> — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views.</li> <li>• <b>LIST EMPTY</b> — Returns a list of objects that currently have no statistics.</li> </ul> |
| objlist         | List of objects found to be stale or empty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| statown         | Schema containing <code>stattab</code> (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| gather_sys      | Gathers statistics on the objects owned by the <code>SYS</code> user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| no_invalidate   | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is <code>DBMS_STATS.AUTO_INVALIDATE</code>, which means the database decides when to invalidate dependent cursors.</p> <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| obj_filter_list | A list of object filters. When provided, <code>GATHER_DATABASE_STATS</code> will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code> , <code>s2</code> , ... are specified for attributes <code>a1</code> , <code>a2</code> , ... in one object filter. An object <code>o</code> is said to satisfy this object filter if <code>(o.a1 like s1)</code> or <code>(o.a2 like s2)</code> or ... is true.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

## Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on `gather_table_stats`.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

## 166.7.48 GATHER\_DICTIONARY\_STATS Procedure

This procedure gathers statistics for dictionary schemas SYS, SYSTEM and schemas of RDBMS components.

### Syntax

```

DBMS_STATS.GATHER_DICTIONARY_STATS (
 comp_id VARCHAR2 DEFAULT NULL,
 estimate_percent NUMBER DEFAULT to_estimate_percent_type
 (get_param('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 options VARCHAR2 DEFAULT 'GATHER AUTO',
 objlist OUT ObjectTab,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
 comp_id VARCHAR2 DEFAULT NULL,
 estimate_percent NUMBER DEFAULT
to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(GET_PARAM('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade BOOLEAN DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 options VARCHAR2 DEFAULT 'GATHER AUTO',
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT
 to_no_invalidate_type(get_param('NO_INVALIDATE')),
 obj_filter_list ObjectTab DEFAULT NULL);

```

## Parameters

**Table 166-53 GATHER\_DICTIONARY\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comp_id          | Component id of the schema to analyze. NULL results in the analysis of schemas for all RDBMS components. Refer to the COMP_ID column of DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| estimate_percent | Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| block_sample     | Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| method_opt       | <p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

**Table 166-53 (Cont.) GATHER\_DICTIONARY\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree      | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned).<br>'ALL' - Gathers all (subpartition, partition, and global) statistics<br>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.<br>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.<br>'GLOBAL' - Gathers global statistics<br>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.<br>'PARTITION' - Gathers partition-level statistics<br>'SUBPARTITION' - gathers subpartition-level statistics                                                                                                   |
| cascade     | Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                       |
| stattab     | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| statid      | The (optional) identifier to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 166-53 (Cont.) GATHER\_DICTIONARY\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options         | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>GATHER AUTO</b> — Gathers all necessary statistics automatically. This is the default.<br/>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <b>GATHER AUTO</b> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</li> <li>• <b>GATHER</b> — Gathers statistics on all objects in the relevant schema.</li> <li>• <b>GATHER STALE</b> — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale.</li> <li>• <b>GATHER EMPTY</b> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</li> <li>• <b>LIST AUTO</b> — Returns a list of objects to be processed with <b>GATHER AUTO</b>.</li> <li>• <b>LIST STALE</b> — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views.</li> <li>• <b>LIST EMPTY</b> — Returns a list of objects that currently have no statistics.</li> </ul> |
| objlist         | The list of objects found to be stale or empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| statown         | Schema containing <code>stattab</code> , if different from the current schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| no_invalidate   | Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| obj_filter_list | A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code> , <code>s2</code> , ... are specified for attributes <code>a1</code> , <code>a2</code> , ... in one object filter. An object <code>o</code> is said to satisfy this object filter if ( <code>o.a1</code> like <code>s1</code> ) and ( <code>o.a2</code> like <code>s2</code> ) and ... is true. See <a href="#">Applying an Object Filter List</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Usage Notes

You must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege to execute this procedure.

If the `GATHER AUTO` option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where `GATHER AUTO` is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.
- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

### Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## 166.7.49 GATHER\_FIXED\_OBJECTS\_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

### Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')));
```

### Parameters

**Table 166-54 GATHER\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>statab</code>        | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>statid</code>        | Identifier to associate with these statistics within <code>statab</code> (optional)                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>statown</code>       | Schema containing <code>statab</code> (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>no_invalidate</code> | Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## 166.7.50 GATHER\_INDEX\_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible.

Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

### Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 estimate_percent NUMBER DEFAULT to_estimate_percent_type
 (GET_PARAM('ESTIMATE_PERCENT')),
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type
 (GET_PARAM('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-55 GATHER\_INDEX\_STATS Procedure Parameters**

| Parameter             | Description                |
|-----------------------|----------------------------|
| <code>ownname</code>  | Schema of index to analyze |
| <code>indname</code>  | Name of index              |
| <code>partname</code> | Name of partition          |

**Table 166-55 (Cont.) GATHER\_INDEX\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| estimate_percent | Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| stattab          | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| statid           | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| statown          | Schema containing stattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| degree           | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
| granularity      | Granularity of statistics to collect (only pertinent if the table is partitioned).<br>'ALL' - Gathers all (subpartition, partition, and global) statistics<br>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.<br>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.<br>'GLOBAL' - Gathers global statistics<br>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.<br>'PARTITION' - Gathers partition-level statistics<br>'SUBPARTITION' - Gathers subpartition-level statistics.                                                                                                  |

**Table 166-55 (Cont.) GATHER\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Gather statistics on object even if it is locked                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

## 166.7.51 GATHER\_PROCESSING\_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an interval defined in minutes.

### Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (
 gathering_mode IN VARCHAR2 DEFAULT 'START',
 interval IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 166-56 GATHER\_PROCESSING\_RATE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gathering_mode | Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If interval is not specified, its default value is set to 60 minutes. |
| interval       | Time interval (number of minutes) for which the processing must be gathered                                                                                                                                                                                                                                             |

### Usage Notes

- You require the OPTIMIZER\_PROCESSING\_RATE role to run this procedure.

- AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## 166.7.52 GATHER\_SCHEMA\_STATS Procedures

This procedure gathers statistics for all objects in a schema.

### Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
 ownname VARCHAR2,
 estimate_percent NUMBER DEFAULT to_estimate_percent_type
 (get_param('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 options VARCHAR2 DEFAULT 'GATHER',
 objlist OUT ObjectTab,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 obj_filter_list ObjectTab DEFAULT NULL);
```

```
DBMS_STATS.GATHER_SCHEMA_STATS (
 ownname VARCHAR2,
 estimate_percent NUMBER DEFAULT to_estimate_percent_type
 (get_param('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 options VARCHAR2 DEFAULT 'GATHER',
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 obj_filter_list ObjectTab DEFAULT NULL);
```

### Parameters

**Table 166-57 GATHER\_SCHEMA\_STATS Procedure Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| ownname   | Schema to analyze (NULL means current schema) |

Table 166-57 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| estimate_percent | <p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| block_sample     | <p>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| method_opt       | <p>Accepts:</p> <ul style="list-style-type: none"> <li>• <code>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</code><br/> <code>size_clause</code> is defined as <code>size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</code> <ul style="list-style-type: none"> <li>- <code>integer</code> : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- <code>REPEAT</code> : Collects histograms only on the columns that already have histograms</li> <li>- <code>AUTO</code> : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- <code>SKEWONLY</code> : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                 |
| degree           | <p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=&gt;NULL</code>, <code>DEGREE=&gt;n</code>, or <code>DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p> |

**Table 166-57 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p> |
| cascade     | <p>Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                       |
| stattab     | <p>User statistics table identifier describing where to save the current statistics</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| statid      | <p>Identifier (optional) to associate with these statistics within stattab</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 166-57 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options         | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>GATHER</b> — Gathers statistics on all objects in the schema. This is the default.</li> <li>• <b>GATHER AUTO</b> — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <b>GATHER AUTO</b> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</li> <li>• <b>GATHER STALE</b> — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale.</li> <li>• <b>GATHER EMPTY</b> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</li> <li>• <b>LIST AUTO</b> — Returns a list of objects to be processed with <b>GATHER AUTO</b>.</li> <li>• <b>LIST STALE</b> — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views.</li> <li>• <b>LIST EMPTY</b> — Returns a list of objects that currently have no statistics.</li> </ul> |
| objlist         | List of objects found to be stale or empty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| statown         | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| no_invalidate   | Does not invalidate the dependent cursors if set to <b>TRUE</b> . The procedure invalidates the dependent cursors immediately if set to <b>FALSE</b> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| force           | Gather statistics on objects even if they are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| obj_filter_list | A list of object filters. When provided, <code>GATHER_SCHEMA_STATS</code> will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code> , <code>s2</code> , ... are specified for attributes <code>a1</code> , <code>a2</code> , ... in one object filter. An object <code>o</code> is said to satisfy this object filter if ( <code>o.a1</code> like <code>s1</code> ) and ( <code>o.a2</code> like <code>s2</code> ) and ... is true.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

If the `GATHER AUTO` option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where `GATHER AUTO` is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.
- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

## Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

## Examples

### Applying an Object Filter List

The following example specifies that the tables `SH.SALES` and `SH.COSTS`, if stale, will have statistics gathered upon them.

```
DECLARE
 filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
 filter_lst.extend(2);
 filter_lst(1).ownname := 'SH';
 filter_lst(1).objname := 'SALES';
 filter_lst(2).ownname := 'SH';
 filter_lst(2).objname := 'COSTS';
 DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
END;
```

## 166.7.53 GATHER\_SYSTEM\_STATS Procedure

This procedure gathers system statistics.

### Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
 gathering_mode VARCHAR2 DEFAULT 'NOWORKLOAD',
 interval INTEGER DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

## Parameters

Table 166-58 GATHER\_SYSTEM\_STATS Procedure Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gathering_mode | <p>Specifies the mode in which the database gathers system statistics. Possible values are:</p> <ul style="list-style-type: none"> <li> <b>NOWORKLOAD</b><br/>           The database captures performance characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period, the database estimates the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads.<br/>           To fine tune system statistics for the workload, use <code>START</code> and <code>STOP</code> or the <code>INTERVAL</code> option. If you gather both <code>NOWORKLOAD</code> and workload-specific statistics (statistics collected using <code>INTERVAL</code> or <code>START</code> and <code>STOP</code>), the optimizer uses the workload statistics. Collected components include <code>cpuspeednw</code>, <code>ioseektim</code>, and <code>iotfrspeed</code>.         </li> <li> <b>INTERVAL</b><br/>           The database captures system activity during a specified interval in minutes. This parameter works in combination with the <code>interval</code> parameter. The database creates or updates system statistics in the dictionary or <code>stattab</code>. You can use <code>GATHER_SYSTEM_STATS (gathering_mode=&gt;'STOP')</code> to stop gathering earlier than scheduled. Collected components include <code>maxthr</code>, <code>slavethr</code>, <code>cpuspeed</code>, <code>sreadtim</code>, <code>mreadtim</code>, and <code>mbrc</code>.         </li> <li> <b>START   STOP</b><br/>           The database captures system activity during specified start and stop times and refreshes the dictionary or <code>stattab</code> with statistics for the elapsed period. The database ignores the <code>INTERVAL</code> value. Collected components include <code>maxthr</code>, <code>slavethr</code>, <code>cpuspeed</code>, <code>sreadtim</code>, <code>mreadtim</code>, and <code>mbrc</code>.         </li> <li> <b>EXADATA</b><br/>           In this mode, gathered system statistics take into account the unique capabilities of Oracle Exadata, such as large I/O size and high I/O throughput. The database sets multiblock read count and I/O throughput statistics along with CPU speed.         </li> </ul> |
| interval       | Specifies the number of minutes in which to gather system statistics. This parameter applies only when <code>gathering_mode='INTERVAL'</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| stattab        | Specifies the table in which the database stores the statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| statid         | Specifies an optional identifier associated with the statistics saved in <code>stattab</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| statown        | Specifies the schema containing <code>stattab</code> , if different from the current schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job\_queue\_processes must be >0

### Usage Notes

To run this procedure, you must have the GATHER\_SYSTEM\_STATISTICS role.

### Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
 DBMS_STATS.GATHER_SYSTEM_STATS (
 interval => 720,
 statab => 'mystats',
 statid => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
 DBMS_STATS.GATHER_SYSTEM_STATS (
 interval => 720,
 statab => 'mystats',
 statid => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE jobno number;
BEGIN
 DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
 ('mystats','OLTP');'
 sysdate, 'sysdate + 1');
 COMMIT;
END;
```

```
BEGIN
 DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
 ('mystats','OLAP');'
 sysdate + 0.5, 'sysdate + 1');
 COMMIT;
END;
```

## 166.7.54 GATHER\_TABLE\_STATS Procedure

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

### Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 estimate_percent NUMBER DEFAULT to_estimate_percent_type

 (get_param('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
 granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (

 get_param('NO_INVALIDATE')),
 stattype VARCHAR2 DEFAULT 'DATA',
 force BOOLEAN DEFAULT FALSE,
 context DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative
 options VARCHAR2 DEFAULT get_param('OPTIONS'));
```

### Parameters

**Table 166-59 GATHER\_TABLE\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname          | Schema containing the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| tabname          | Name of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| partname         | Name of the partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| estimate_percent | Determines the percentage of rows to sample.<br>The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.<br>You can change the default value using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| block_sample     | Determines whether the database uses random block sampling (TRUE) or random row sampling (FALSE). The default is FALSE.<br>Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.                                                                                                                                                         |

**Table 166-59 (Cont.) GATHER\_TABLE\_STATS Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| method_opt | <p>METHOD_OPT - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>• FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>• FOR COLUMNS [column_clause] [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| degree     | <p>Determines the degree of parallelism used for gathering statistics. The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 166-59 (Cont.) GATHER\_TABLE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity   | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if <code>partname</code> is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p> |
| cascade       | <p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the <code>GATHER_INDEX_STATS</code> procedure on each index of the table. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| stattype  | Statistics type. The only value allowed is DATA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| force     | Gather statistics of table even if it is locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| context   | Not used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| options   | Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: <ul style="list-style-type: none"> <li>GATHER — Gathers statistics for all objects in the table. This is the default.</li> <li>GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.</li> </ul> |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parallelized except for cluster, domain and join indexes.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO on gather_table_stats`.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

### Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

### Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

#### Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
 'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

## Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
 'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

## 166.7.55 GENERATE\_STATS Procedure

This **deprecated procedure** generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

 Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the `GATHER_INDEX_STAT` procedure. See "[GATHER\\_INDEX\\_STATS Procedure](#)".

## Syntax

```
DBMS_STATS.GENERATE_STATS (
 ownname VARCHAR2,
 objname VARCHAR2,
 organized NUMBER DEFAULT 7,
 force BOOLEAN default FALSE);
```

## Parameters

Table 166-60 GENERATE\_STATS Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Schema of object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| objname   | Name of object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| organized | Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one. |
| force     | If TRUE, generates statistics for the target object even if it is locked                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

### Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

## 166.7.56 GET\_ADVISOR\_OPR\_FILTER Procedure

This procedure creates an operation filter for an Optimizer Statistics Advisor task.

### Syntax

```
DBMS_STATS.GET_ADVISOR_OPR_FILTER (
 opr_id IN NUMBER,
 opr_filter IN OUT NOCOPY StatsAdvOpr);
```

### Parameters

**Table 166-61 GET\_ADVISOR\_OPR\_FILTER Procedure Parameters**

| Parameter               | Description                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------|
| <code>opr_id</code>     | The ID of the statistics operation stored in the <code>DBA_OPTSTAT_OPERATIONS</code> view.             |
| <code>opr_filter</code> | The Optimizer Statistics Advisor filter that is generated based on the specified statistics operation. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Usage Notes

You can specify the filter using either the operation ID or the filter ID, but not both at the same time.

## 166.7.57 GET\_ADVISOR\_RECS Function

This function generates a recommendation report for the specified item.

### Syntax

```
DBMS_STATS.GET_ADVISOR_RECS(
 ownname IN VARCHAR2,
 tabname IN VARCHAR2,
 rec IN VARCHAR2,
 type IN VARCHAR2 := 'TEXT')
RETURN CLOB;
```

### Parameters

**Table 166-62 GET\_ADVISOR\_RECS Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | The owner of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| tabname   | The name of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| rec       | The Optimizer Statistics Advisor recommendation. <ul style="list-style-type: none"> <li>INCREMENTAL<br/>When only a small number of range partitions are modified, this option improves the performance of statistics gathering dramatically. However, it requires additional space to store synopses for maintaining incremental statistics. The report analyzes this trade-off.</li> <li>CONCURRENT<br/>The report recommends either setting the CONCURRENT preference, or specifying AUTO_DEGREE for individual tables. If the system resources and usage satisfies the conditions, the advisor always recommends setting CONCURRENT first. The advisor only recommends AUTO_DEGREE when statistics gathering on an individual table take a long time and the CONCURRENT preference is already set.</li> </ul> |
| type      | Type of the report: TEXT, HTML, or XML.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must have the privileges to gather statistics for the objects for which recommendations are generated.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

## Usage Notes

The advisor does not make recommendations for manual statistics gathering. The database only make recommendations for automatic statistics gathering jobs, with the main goal of finishing the job within the maintenance window. As long as the automatic job finishes, the database does not make further recommendations.

## Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

## 166.7.58 GET\_COLUMN\_STATS Procedures

These overloaded procedures get column-related statistics. In the user-defined statistics version, the procedure returns the type of statistics stored.

### Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 colname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 distcnt OUT NUMBER,
 density OUT NUMBER,
 nullcnt OUT NUMBER,
 srec OUT StatRec,
 avgclen OUT NUMBER,
 statown VARCHAR2 DEFAULT NULL,
 realtime_stats BOOLEAN iDEFAULT TRUE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 colname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 ext_stats OUT RAW,
 stattyown OUT VARCHAR2 DEFAULT NULL,
 stattyname OUT VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-63 GET\_COLUMN\_STATS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname        | Name of the schema                                                                                                                                                                                                                                                     |
| tabname        | Specifies the name of the table to which this column belongs.                                                                                                                                                                                                          |
| colname        | Specifies the name of the column or extension.                                                                                                                                                                                                                         |
| partname       | Specifies the name of the table partition from which to get the statistics. If the table is partitioned, and if <code>partname</code> is <code>NULL</code> , then the procedure retrieves statistics at the global table level.                                        |
| stattab        | Specifies the statistics table ID describing where to retrieve the statistics. If <code>stattab</code> is <code>NULL</code> , then the procedure retrieves statistics directly from the data dictionary.                                                               |
| statid         | Specifies an optional identifier associated with these statistics within <code>stattab</code> . This parameter is only relevant when <code>stattab</code> is not <code>NULL</code> .                                                                                   |
| ext_stats      | Specifies the user-defined statistics.                                                                                                                                                                                                                                 |
| stattypown     | Specifies the schema of the statistics type.                                                                                                                                                                                                                           |
| stattypname    | Specifies the name of the statistics type.                                                                                                                                                                                                                             |
| distcnt        | Specifies the number of distinct values.                                                                                                                                                                                                                               |
| density        | Specifies the column density.                                                                                                                                                                                                                                          |
| nullcnt        | Specifies the number of <code>NULL</code> values.                                                                                                                                                                                                                      |
| srec           | Specifies the structure holding the internal representation of the column minimum, maximum, and histogram values.                                                                                                                                                      |
| avgclen        | Specifies the average length of the column (in bytes).                                                                                                                                                                                                                 |
| statown        | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code> ).                                                                                                                                                                        |
| realtime_stats | Specifies whether to include real-time statistics. The default value is <code>TRUE</code> . When <code>realtime_stats</code> is <code>FALSE</code> , the database only includes optimizer statistics that were gathered by the <code>GATHER_*_STATS</code> procedures. |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be the owner of the table, or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

## Usage Notes

Before invoking this procedure, ensure that the table exists.

## 166.7.59 GET\_INDEX\_STATS Procedures

This overloaded procedure gets all index-related statistics. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

### Syntax

```
DBMS_STATS.GET_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 numrows OUT NUMBER,
 numlblks OUT NUMBER,
 numdist OUT NUMBER,
 avglblk OUT NUMBER,
 avgdblks OUT NUMBER,
 clstfct OUT NUMBER,
 indlevel OUT NUMBER,
 statown VARCHAR2 DEFAULT NULL);
```

```
DBMS_STATS.GET_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 numrows OUT NUMBER,
 numlblks OUT NUMBER,
 numdist OUT NUMBER,
 avglblk OUT NUMBER,
 avgdblks OUT NUMBER,
 clstfct OUT NUMBER,
 indlevel OUT NUMBER,
 statown VARCHAR2 DEFAULT NULL,
 guessq OUT NUMBER);
```

Use the following form of the procedure for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 statab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 ext_stats OUT RAW,
 stattyown OUT VARCHAR2 DEFAULT NULL,
 stattyname OUT VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-64 GET\_INDEX\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname     | Name of the schema                                                                                                                                                                           |
| indname     | Name of the index                                                                                                                                                                            |
| partname    | Name of the index partition for which to get the statistics. If the index is partitioned and if <code>partname</code> is NULL, then the statistics are retrieved for the global index level. |
| stattab     | User statistics table identifier describing from where to retrieve the statistics. If <code>stattab</code> is NULL, then the statistics are retrieved directly from the dictionary.          |
| statid      | Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not NULL)                                                    |
| ext_stats   | User-defined statistics                                                                                                                                                                      |
| stattypown  | Schema of the statistics type                                                                                                                                                                |
| stattypname | Name of the statistics type                                                                                                                                                                  |
| numrows     | Number of rows in the index (partition)                                                                                                                                                      |
| numlblks    | Number of leaf blocks in the index (partition)                                                                                                                                               |
| numdist     | Number of distinct keys in the index (partition)                                                                                                                                             |
| avglblk     | Average integral number of leaf blocks in which each distinct key appears for this index (partition)                                                                                         |
| avgdblks    | Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)                                                                                  |
| clstfct     | Clustering factor for the index (partition)                                                                                                                                                  |
| indlevel    | Height of the index (partition)                                                                                                                                                              |
| statown     | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                             |
| guessq      | Guess quality for the index (partition)                                                                                                                                                      |

## Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

## Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values

## 166.7.60 GET\_PARAM Function

This function returns the default value of parameters of `DBMS_STATS` procedures.

 **Note:**

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [GET\\_PREFS Function](#).

See also [DBMS\\_STATS Deprecated Subprograms](#).

### Syntax

```
DBMS_STATS.GET_PARAM (
 pname IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 166-65 GET\_PARAM Function Parameters**

| Parameter | Description    |
|-----------|----------------|
| pname     | Parameter name |

## Exceptions

ORA-20001: Invalid input values

## 166.7.61 GET\_PREFS Function

This function returns the default value of the specified preference.

### Syntax

```
DBMS_STATS.GET_PREFS (
 pname IN VARCHAR2,
 ownname IN VARCHAR2 DEFAULT NULL,
 tablename IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 166-66 GET\_PREFS Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Preference Name           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>• REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>• ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>• HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>– The accuracy of the new algorithm is similar to the original algorithm.</li> <li>– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>• OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 166-67 (Cont.) Preference Descriptions

| Preference Name         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTO_TASK_STATUS        | Enables or disables the high-frequency automatic optimizer statistics collection. Values are: <ul style="list-style-type: none"> <li>ON — Enables high-frequency automatic optimizer statistics collection.</li> <li>OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.</li> </ul>                                                                                                                                                                                                                                                                      |
| AUTO_TASK_MAX_RUN_TIME  | Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.                                                                                                                                                                                                                                                                                                                                                                                                         |
| AUTO_TASK_INTERVAL      | Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).                                                                                                                                                                                                                                                                                                                                                                                                               |
| CASCADE                 | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CONCURRENT              | Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: <ul style="list-style-type: none"> <li>MANUAL — Concurrency is enabled only for manual statistics gathering.</li> <li>AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering.</li> <li>ALL — Concurrency is enabled for both manual and automatic statistics gathering.</li> <li>OFF — Concurrency is disabled for both manual and automatic statistics.</li> </ul>                                                                      |
| DEGREE                  | Determines degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ESTIMATE_PERCENT        | Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.                                                                                                                                                                                                                                                                                                                                                |
| GLOBAL_TEMP_TABLE_STATS | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: <ul style="list-style-type: none"> <li>SHARED — All sessions see the same set of statistics</li> <li>SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</li> </ul> |

Table 166-67 (Cont.) Preference Descriptions

| Preference Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANULARITY     | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>• ALL — Gathers all statistics: subpartition, partition, and global.</li> <li>• AUTO — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.</li> <li>• GLOBAL — Gathers global statistics.</li> <li>• GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• PARTITION — Gathers partition-level statistics.</li> <li>• SUBPARTITION — Gathers subpartition-level statistics.</li> </ul>                                                                                                    |
| INCREMENTAL     | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> <li>• The INCREMENTAL value for the partitioned table is set to TRUE.</li> <li>• The PUBLISH value for the partitioned table is set to TRUE.</li> <li>• The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |

Table 166-67 (Cont.) Preference Descriptions

| Preference Name   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"><li><b>PARTITION</b> — Gathers partition-level synopses.<br/>This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</li><li><b>TABLE</b> — Gathers table-level synopses.<br/>Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</li></ul> |

Table 166-67 (Cont.) Preference Descriptions

| Preference Name       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference.<br/> <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> </li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/> <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> </li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/> <p>For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics.</p> </li> </ul> |

| Preference Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| METHOD_OPT      | <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>The size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>integer — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p>REPEAT — Collects histograms only on the columns that already have histograms.</p> <p>AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p>SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

Table 166-67 (Cont.) Preference Descriptions

| Preference Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NO_INVALIDATE                  | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is <code>DBMS_STATS.AUTO_INVALIDATE</code>, which means the database decides when to invalidate dependent cursors.</p> <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                        |
| OPTIONS                        | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                       |
| PUBLISH                        | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes.</p> <p>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 166-67 (Cont.) Preference Descriptions**

| Preference Name           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAT_CATEGORY             | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> <li>• OBJECT_STATS - table statistics, column statistics and index statistics (default)</li> <li>• SYNOPSIS - information to support incremental statistics</li> </ul> <p>The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses.</p> |
| TABLE_CACHED_BLOCKS       | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                        |
| WAIT_TIME_TO_UPDATE_STATS | <p>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</p>                                                                                                                                                                                                              |

### Security Model

No special privilege or role is needed to invoke this procedure. To gather statistics concurrently, however, you must either have the DBA role, or have the following privileges in addition to privileges that are required for gathering statistics: CREATE JOB, MANAGE SCHEDULER, and MANAGE ANY QUEUE.

### Exceptions

- ORA-20000: Unable to gather statistics concurrently: Resource Manager is not enabled.
- ORA-20001: Invalid input values

### Usage Notes

Note the following guidelines:

- The CONCURRENT preference determines whether statistics are gathered concurrently when the user issues GATHER\_\*\_STATS procedures. DBMS\_STATS can collect statistics for a single object in parallel based on the value of the DEGREE parameter. However, parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers.
 

To gather statistics concurrently, Resource Manager must be enabled, and the setting for the JOB\_QUEUE\_PROCESSES initialization parameter must be at least 4.
- If the ownname and tablename are provided, and if a preference has been entered for the table, then the function returns the preference as specified for the table. In all other cases, it returns the global preference if it has been specified, otherwise it returns the default value.

## 166.7.62 GET\_STATS\_HISTORY\_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

### Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
RETURN TIMESTAMP WITH TIMEZONE;
```

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 166.7.63 GET\_STATS\_HISTORY\_RETENTION Function

This function returns the current statistics history retention value.

### Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION
RETURN NUMBER;
```

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 166.7.64 GET\_SYSTEM\_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

### Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
 status OUT VARCHAR2,
 dstart OUT DATE,
 dstop OUT DATE,
 pname IN VARCHAR2,
 pvalue OUT NUMBER,
 stattab IN VARCHAR2 DEFAULT NULL,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-68 GET\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status    | Output is one of the following: <ul style="list-style-type: none"> <li>COMPLETED:</li> <li>AUTOGATHERING:</li> <li>MANUALGATHERING:</li> <li>BADSTATS:</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| dstart    | Date when statistics gathering started.<br>If status = MANUALGATHERING, the start date is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| dstop     | Date when statistics gathering stopped. <ul style="list-style-type: none"> <li>If status = COMPLETE, the finish date is returned.</li> <li>If status = AUTOGATHERING, the future finish date is returned.</li> <li>If status = BADSTATS, the must-finished-by date is returned.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pname     | The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> <li>iotfrspeed - I/O transfer speed in bytes for each millisecond</li> <li>ioseektim - seek time + latency time + operating system overhead time, in milliseconds</li> <li>sreadtim - average time to read single block (random read), in milliseconds</li> <li>mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds</li> <li>cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</li> <li>cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option.</li> <li>mbrc - average multiblock read count for sequential read, in blocks</li> <li>maxthr - maximum I/O system throughput, in bytes/second</li> <li>slavethr - average slave I/O throughput, in bytes/second</li> </ul> |
| pvalue    | Parameter value to get                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| stattab   | Identifier of the user statistics table where the statistics will be obtained. If stattab is NULL, the statistics will be obtained from the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| statid    | Optional identifier associated with the statistics saved in the stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| statown   | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

### Usage Notes

To run this procedure, you need the GATHER\_SYSTEM\_STATISTICS role.

## 166.7.65 GET\_TABLE\_STATS Procedure

This overloaded procedure gets all table-related statistics.

### Syntax

```
DBMS_STATS.GET_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 numrows OUT NUMBER,
 numblks OUT NUMBER,
 avgrlen OUT NUMBER,
 statown VARCHAR2 DEFAULT NULL,
 realtime_stats BOOLEAN DEFAULT TRUE);
```

```
DBMS_STATS.GET_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 numrows OUT NUMBER,
 numblks OUT NUMBER,
 avgrlen OUT NUMBER,
 statown VARCHAR2 DEFAULT NULL,
 im_imcu_count OUT NUMBER,
 im_block_count OUT NUMBER,
 scanrate OUT NUMBER,
 realtime_stats BOOLEAN DEFAULT TRUE);
```

```
DBMS_STATS.GET_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2 DEFAULT NULL,
 statid VARCHAR2 DEFAULT NULL,
 numrows OUT NUMBER,
 numblks OUT NUMBER,
 avgrlen OUT NUMBER,
 cachedblk OUT NUMBER,
 cachehit OUT NUMBER,
 realtime_stats BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 166-69 GET\_TABLE\_STATS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname        | Specifies the name of the schema.                                                                                                                                                                                                                                     |
| tabname        | Specifies the name of the table to which this column belongs.                                                                                                                                                                                                         |
| partname       | Specifies the name of the table partition from which to get the statistics. If the table is partitioned and if <code>partname</code> is NULL, then the statistics are retrieved from the global table level.                                                          |
| stattab        | Specifies the user statistics table ID. This ID describes where to retrieve the statistics. If <code>stattab</code> is NULL, then the procedure gathers statistics directly from the data dictionary.                                                                 |
| statid         | Specifies the optional ID associates with these statistics within <code>stattab</code> . This ID is only relevant when <code>stattab</code> is not NULL.                                                                                                              |
| numrows        | Specifies the number of rows in the table or partition.                                                                                                                                                                                                               |
| numblks        | Specifies the number of blocks in the table or partition.                                                                                                                                                                                                             |
| avgrlen        | Specifies the average row length for the table or partition.                                                                                                                                                                                                          |
| statown        | Specifies the schema containing <code>stattab</code> (if different from <code>ownname</code> ).                                                                                                                                                                       |
| im_imcu_count  | Specifies the number of In-Memory Compression Units (IMCUs) in the table or partition.                                                                                                                                                                                |
| im_block_count | Specifies the number of In-Memory blocks in the table or partition.<br>An In-Memory block corresponds to a specific data block on disk. If the table is fully populated in the IM column store, then the number of In-Memory blocks equals the number of data blocks. |
| scanrate       | Specifies the rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.                                                                                                                                        |
| realtime_stats | Specifies whether to include real-time statistics. The default value is TRUE. When <code>realtime_stats</code> is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures.                                         |
| cachedblk      | For internal use only.                                                                                                                                                                                                                                                |
| cachehit       | For internal use only.                                                                                                                                                                                                                                                |

## Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

ORA-20002: Bad user statistics table; may need to upgrade it

### Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_*_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values
- The database does not support export or import of statistics across databases of different character sets.

## 166.7.66 IMPLEMENT\_ADVISOR\_TASK Function

This function implements the recommendations made by Optimizer Statistics Advisor.

### Syntax

```
DBMS_STATS.IMPLEMENT_ADVISOR_TASK (
 task_name IN VARCHAR2,
 execution_name IN VARCHAR2 := NULL,
 level IN VARCHAR2 := 'TYPICAL')
RETURN CLOB;
```

## Parameters

**Table 166-70** IMPLEMENT\_ADVISOR\_TASK Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                          |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it.<br>If the specified execution conflicts with the name of an existing execution, then the function returns an error.               |
| level          | The level of the implementation. Possible values are <ul style="list-style-type: none"> <li>• ALL: Ignores the filters and implements all recommendations.</li> <li>• TYPICAL: Implements the recommendations according to the filters in place.</li> </ul> |

## Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- You can execute this subprogram for AUTO\_STATS\_ADVISOR\_TASK, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level

Only users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task on system-level rules.
- Operation level

The results depend on the following privileges:

  - Users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task for all statistics operations.
  - Users with the ANALYZE ANY privilege but *not* the ANALYZE ANY DICTIONARY privilege can perform this task for statistics operations related to any schema except SYS.
  - Users with the ANALYZE ANY DICTIONARY privilege but *not* the ANALYZE ANY privilege can perform this task for statistics operations related to their own schema and the SYS schema.
  - Users with neither the ANALYZE ANY nor the ANALYZE ANY DICTIONARY privilege can only perform this operation for statistics operations relating to their own schema.
- Object level

Users can perform this task for any object for which they have statistics collection privileges.

## Return Values

This function returns an XML CLOB that indicates which recommendations were successfully implemented.

## Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

## Example 166-10 Implementing Optimizer Statistics Advisor Recommendations

This script illustrates a basic Optimizer Statistics Advisor session. It creates a task, executes it, generates a report, and then implements the recommendations.

```

DECLARE
 v_tname VARCHAR2(128) := 'my_task';
 v_ename VARCHAR2(128) := NULL;
 v_report CLOB := null;
 v_script CLOB := null;
 v_imp_result CLOB;
BEGIN
 -- create a task
 v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

 -- execute the task
 v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);

 -- view the task report
 v_report := DBMS_STATS.REPORT_ADVISOR_TASK(v_tname);
 DBMS_OUTPUT.PUT_LINE(v_report);

 -- implement all recommendations
 v_imp_result := DBMS_STATS.IMPLEMENT_ADVISOR_TASK(v_tname);
END;

```

## 166.7.67 IMPORT\_COLUMN\_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

### Syntax

```

DBMS_STATS.IMPORT_COLUMN_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 colname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (

```

```

 get_param('NO_INVALIDATE'),
force BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 166-71** IMPORT\_COLUMN\_STATS Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Name of the schema                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| tabname       | Name of the table to which this column belongs                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| colname       | Name of the column or extension                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| partname      | Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are imported.                                                                                                                                                                                                                                                                                                                                         |
| stattab       | User statistics table identifier describing from where to retrieve the statistics                                                                                                                                                                                                                                                                                                                                                                                                   |
| statid        | Identifier to associate with these statistics within stattab (optional)                                                                                                                                                                                                                                                                                                                                                                                                             |
| statown       | Schema containing stattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                               |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | If set to TRUE, imports statistics even if statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

## Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## 166.7.68 IMPORT\_DATABASE\_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
 statab IN VARCHAR2,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL
 add_sys IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-72** IMPORT\_DATABASE\_PREFS Procedure Parameters

| Parameter            | Description                                                                       |
|----------------------|-----------------------------------------------------------------------------------|
| <code>statab</code>  | Statistics table name where to import the statistics                              |
| <code>statid</code>  | Optional identifier to associate with these statistics within <code>statab</code> |
| <code>statown</code> | Schema containing <code>statab</code> (if different than <code>ownname</code> )   |
| <code>add_sys</code> | Value <code>TRUE</code> will include the Oracle-owned tables                      |

### Exceptions

ORA-20000: Insufficient privileges.

### Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

## 166.7.69 IMPORT\_DATABASE\_STATS Procedure

This procedure imports statistics for all objects in the database from the user statistics table and stores them in the data dictionary.

### Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
 statab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
```

```

 get_param('NO_INVALIDATE')),
force BOOLEAN DEFAULT FALSE,
stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);

```

## Parameters

**Table 166-73 IMPORT\_DATABASE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | Specifies the statistics table that contains the statistics to be imported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| statid        | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> <li>TRUE - Ignores the statistics lock and imports the statistics</li> <li>FALSE - The statistics will be imported only if they are not locked</li> </ul>                                                                                                                                                                                                                                                                                                                                        |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</li> <li>SYNOPSIS - information to support incremental statistics</li> </ul>                                                                                                                                                                                                                                                                                 |

## Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.70 IMPORT\_DICTIONARY\_STATS Procedure

This procedure imports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
 statab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 166-74** IMPORT\_DICTIONARY\_STATS Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statab        | User statistics table identifier describing from where to retrieve the statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| statid        | The (optional) identifier to associate with these statistics within statab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| statown       | Schema containing statab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Overrides statistics lock at the object (table) level: <ul style="list-style-type: none"> <li>TRUE - Ignores the statistics lock and imports the statistics.</li> <li>FALSE - The statistics will be imported only if there is no lock.</li> </ul>                                                                                                                                                                                                                                                                                                                                           |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</li> <li>SYNOPSIS - information to support incremental statistics</li> </ul>                                                                                                                                                                                                                                                                                 |

### Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.71 IMPORT\_FIXED\_OBJECTS\_STATS Procedure

This procedure imports statistics for fixed tables from the user statistics table and stores them in the data dictionary.

### Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
 statab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 166-75** IMPORT\_FIXED\_OBJECTS\_STATS Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statab        | User statistics table identifier describing from where to retrieve the statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| statid        | Identifier (optional) to associate with these statistics within statab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| statown       | Schema containing statab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Overrides statistics lock: <ul style="list-style-type: none"> <li>TRUE - Ignores the statistics lock and imports the statistics</li> <li>FALSE - The statistics will be imported only if there is no lock</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |

### Security Model

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.72 IMPORT\_INDEX\_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

### Syntax

```

DBMS_STATS.IMPORT_INDEX_STATS (
 ownname VARCHAR2,
 indname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE);

```

### Parameters

**Table 166-76** IMPORT\_INDEX\_STATS Procedure Parameters

| Parameter             | Description                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>  | Name of the schema                                                                                                                                      |
| <code>indname</code>  | Name of the index                                                                                                                                       |
| <code>partname</code> | Name of the index partition. If the index is partitioned and if <code>partname</code> is NULL, then global and partition index statistics are imported. |
| <code>stattab</code>  | User statistics table identifier describing from where to retrieve the statistics                                                                       |
| <code>statid</code>   | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                    |
| <code>statown</code>  | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                        |

**Table 166-76 (Cont.) IMPORT\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Imports statistics even if index statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

## 166.7.73 IMPORT\_SCHEMA\_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

### Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
 ownname IN VARCHAR2,
 statab IN VARCHAR2,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 166-77 IMPORT\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| ownname   | Owner name                                                             |
| statab    | Statistics table name from where to import the statistics              |
| statid    | (Optional) Identifier to associate with these statistics within statab |
| statown   | Schema containing statab (if other than ownname)                       |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

## 166.7.74 IMPORT\_SCHEMA\_STATS Procedure

This procedure imports statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the data dictionary.

## Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
 ownname VARCHAR2,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 166-78** IMPORT\_SCHEMA\_STATS Procedure Parameters

| Parameter            | Description                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------|
| <code>ownname</code> | Specifies the name of the schema.                                                               |
| <code>stattab</code> | Identifies the user table that stores the statistics to be imported.                            |
| <code>statid</code>  | Specifies the ID associated with these statistics within <code>stattab</code> .                 |
| <code>statown</code> | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code> ). |

**Table 166-78 (Cont.) IMPORT\_SCHEMA\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | <p>Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code>, then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.</p> <p>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                       |
| force         | <p>Specifies whether to override statistics locked at the object level. The possible values are as follows:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores the statistics lock and imports the statistics.</li> <li><code>FALSE</code> — Imports the statistics only if there is no lock. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                             |
| stat_category | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> <li><code>OBJECT_STATS</code> — Specifies table statistics, column statistics, and index statistics.</li> <li><code>SYNOPSIS</code> — Specifies metadata for incremental statistics.</li> <li><code>REALTIME_STATS</code> — Specifies only real-time statistics.</li> </ul> <p>You can specify a list of comma-delimited values. For example, <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopsis. The default value is <code>'OBJECT_STATS, REALTIME_STATS'</code>.</p> |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.75 IMPORT\_SYSTEM\_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 statown VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 166-79** IMPORT\_SYSTEM\_STATS Procedure Parameters

| Parameter            | Description                                                                                |
|----------------------|--------------------------------------------------------------------------------------------|
| <code>stattab</code> | Identifier of the user statistics table where the statistics will be retrieved             |
| <code>statid</code>  | Optional identifier associated with the statistics retrieved from the <code>stattab</code> |
| <code>statown</code> | Schema containing <code>stattab</code> (if different from current schema)                  |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to import system statistics

### Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.

## 166.7.76 IMPORT\_TABLE\_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

### Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
 ownname IN VARCHAR2,
 tablename IN VARCHAR2,
 stattab IN VARCHAR2,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 166-80** IMPORT\_TABLE\_PREFS Procedure Parameters

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| ownname   | Owner name                                                              |
| tabname   | Table name                                                              |
| stattab   | Statistics table name from where to import the statistics               |
| statid    | (Optional) Identifier to associate with these statistics within stattab |
| statown   | Schema containing stattab (if other than ownname)                       |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

## 166.7.77 IMPORT\_TABLE\_STATS Procedure

This procedure import statistics for a specified table from the user statistics table identified by stattab and stores them in the data dictionary.

## Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 stattab VARCHAR2,
 statid VARCHAR2 DEFAULT NULL,
 cascade BOOLEAN DEFAULT TRUE,
 statown VARCHAR2 DEFAULT NULL,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
 get_param('NO_INVALIDATE')),
 force BOOLEAN DEFAULT FALSE,
 stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 166-81** IMPORT\_TABLE\_STATS Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| tabname       | Specifies the name of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| partname      | Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are imported.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| stattab       | Identifies the user statistics table that describes where to retrieve the statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statid        | Specifies the ID associated with these statistics within stattab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| cascade       | Indicates whether to import column and index statistics for this table. The default is TRUE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| statown       | Specifies the schema containing stattab (if different than ownname).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> |
| force         | Specifies whether to override statistics locked at the object level. The possible values are as follows: <ul style="list-style-type: none"> <li>TRUE — Ignores the statistics lock and imports the statistics.</li> <li>FALSE — Imports the statistics only if there is no lock. This is the default.</li> </ul>                                                                                                                                                                                                                                                                           |
| stat_category | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> <li>OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li> <li>SYNOPSIS — Specifies metadata for incremental statistics.</li> <li>REALTIME_STATS — Specifies only real-time statistics.</li> </ul> You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.             |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 166.7.78 INTERRUPT\_ADVISOR\_TASK Procedure

This procedure interrupts a currently executing Optimizer Statistics Advisor task.

The task ends its operations as it does when at a normal exit, at which point you can access intermediate results. You can also resume the task using the ["RESUME\\_ADVISOR\\_TASK Procedure"](#).

### Syntax

```
DBMS_STATS.INTERRUPT_ADVISOR_TASK (
 task_name IN VARCHAR2);
```

### Parameters

**Table 166-82 INTERRUPT\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Example 166-11 Interrupting an Optimizer Statistics Advisor Task

In this example, you start a SQL\*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
 v_tname VARCHAR2(128) := 'my_task';
 v_ename VARCHAR2(128) := NULL;
```

```

BEGIN
 -- create a task
 v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

 -- execute the task
 v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

```

In a separate terminal, you start a second SQL\*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

## 166.7.79 LOCK\_PARTITION\_STATS Procedure

This procedure enables the user to lock statistics for a partition.

### Syntax

```

DBMS_STATS.LOCK_PARTITION_STATS (
 ownname VARCHAR2,
 tablename VARCHAR2,
 partname VARCHAR2);

```

### Parameters

**Table 166-83 LOCK\_PARTITION\_STATS Procedure Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| ownname   | Name of the schema to lock |
| tablename | Name of the table          |
| partname  | [Sub]Partition name        |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.80 LOCK\_SCHEMA\_STATS Procedure

This procedure locks the statistics of all tables of a schema.

### Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (
 ownname VARCHAR2);
```

### Parameters

**Table 166-84 LOCK\_SCHEMA\_STATS Procedure Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| ownname   | Name of the schema to lock |

### Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 166.7.81 LOCK\_TABLE\_STATS Procedure

This procedure locks the statistics on the table.

### Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2);
```

### Parameters

**Table 166-85** LOCK\_TABLE\_STATS Procedure Parameters

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |
| tabname   | Name of the table  |

### Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 166.7.82 MERGE\_COL\_USAGE Procedure

This procedure merges column usage information from a source database by means of a `dblink` into the local database.

If column usage information already exists for a given table or column `MERGE_COL_USAGE` will combine both the local and the remote information.

### Syntax

```
DBMS_STATS.MERGE_COL_USAGE (
 dblink IN VARCHAR2);
```

### Parameters

**Table 166-86 MERGE\_COL\_USAGE Procedure Parameters**

| Parameter           | Description                 |
|---------------------|-----------------------------|
| <code>dblink</code> | Name of <code>dblink</code> |

### Usage Notes

User must be `SYS` to execute this procedure. addition the user specified during the creation of the `dblink` is expected to have privileges to select from tables in the `SYS` schema.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Parameter `dblink` cannot be `NULL`

ORA-20002: Unable to create a `TEMP` table

## 166.7.83 PREPARE\_COLUMN\_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using `SET_COLUMN_STATS`.

### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
 srec IN OUT StatRec,
 charvals CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
 srec IN OUT StatRec,
 datevals DATEARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
 srec IN OUT StatRec,
 dblvals DBLARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
 srec IN OUT StatRec,
```

```

 fltvals FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
 srec IN OUT StatRec,
 numvals NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
 srec IN OUT StatRec,
 rawvals RAWARRAY);

```

## Parameters

**Table 166-87 PREPARE\_COLUMN\_VALUES Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srec.epc    | <p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>                    |
| srec.bkvals | <p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| srec.rpcnts | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above.</li> <li>Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.</li> </ul> |

Datatype-specific input parameters (use one) are shown in [Table 166-88](#).

**Table 166-88 Datatype-Specific Input Parameters**

| Type         | Description                                                                                                                                                                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| charvals     | The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization. |
| datevals     | Array of values when the column type is date-based                                                                                                                                                                                                                                           |
| dblvals      | Array of values when the column type is double-based                                                                                                                                                                                                                                         |
| fltvals      | Array of values when the column type is float-based                                                                                                                                                                                                                                          |
| numvals      | Array of values when the column type is numeric-based                                                                                                                                                                                                                                        |
| rawvals      | Array of values when the column type is RAW. Up to the first 64 bytes of each value should be provided.                                                                                                                                                                                      |
| nvmin, nvmax | Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.                             |
| rwmin, rwmax | Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.                                                                                                                                                                    |

**Output Parameters****Table 166-89 PREPARE\_COLUMN\_VALUES Procedure Output Parameters**

| Parameter   | Description                                                                           |
|-------------|---------------------------------------------------------------------------------------|
| srec.minval | Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS |
| srec.maxval | Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS |
| srec.bkvals | Array suitable for use in a call to SET_COLUMN_STATS                                  |
| srec.novals | Array suitable for use in a call to SET_COLUMN_STATS                                  |
| srec.eavals | Array suitable for use in a call to SET_COLUMN_STATS                                  |
| srec.rpcnts | Array suitable for use in a call to SET_COLUMN_STATS                                  |

**Exceptions**

ORA-20001: Invalid or inconsistent input values

**Usage Notes**

No special privilege or role is needed to invoke this procedure.

## 166.7.84 PREPARE\_COLUMN\_VALUES\_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET\_COLUMN\_STATS Procedures.

### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (
 srec IN OUT StatRec,
 nvmin NVARCHAR2,
 nvmax NVARCHAR2);
```

### Parameters

**Table 166-90** PREPARE\_COLUMN\_VALUES\_NVARCHAR Procedure Parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srec.epc    | Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).<br><br>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.                    |
| srec.bkvals | If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| srec.rpcnts | If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.<br><br>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.<br><br>Note: <ul style="list-style-type: none"> <li>Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above.</li> <li>Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.</li> </ul> |

Datatype-specific input parameters (use one) are shown in [Table 166-88](#).

**Table 166-91 PREPARE\_COLUMN\_VALUES\_NVARCHAR Datatype-Specific Input Parameters**

| Type         | Description                                                                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nvmin, nvmax | The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization. |

#### Output Parameters

**Table 166-92 PREPARE\_COLUMN\_VALUES\_NVARCHAR Procedure Output Parameters**

| Parameter   | Description                                                                           |
|-------------|---------------------------------------------------------------------------------------|
| srec.minval | Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS |
| srec.maxval | Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS |
| srec.bkvals | Array suitable for use in a call to SET_COLUMN_STATS.                                 |
| srec.novals | Array suitable for use in a call to SET_COLUMN_STATS                                  |
| srec.eavals | Array suitable for use in a call to SET_COLUMN_STATS                                  |
| srec.rpcnts | Array suitable for use in a call to SET_COLUMN_STATS                                  |

#### Exceptions

ORA-20001: Invalid or inconsistent input values

#### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 166.7.85 PREPARE\_COLUMN\_VALUES\_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET\_COLUMN\_STATS.

#### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
 srec IN OUT StatRec,
 rwmn ROWID,
 rwmx ROWID);
```

## Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

| rpcnts (IN)  | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above.</li> <li>Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.</li> </ul> |
| minval (OUT) | Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| maxval (OUT) | Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| bkvals (OUT) | Array suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| novals (OUT) | Array suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| eavals (OUT) | Array suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| rpcnts (OUT) | Array suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Usage Notes**

No special privilege or role is needed to invoke this procedure.

## 166.7.86 PUBLISH\_PENDING\_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

**Syntax**

```
DBMS_STATS.PUBLISH_PENDING_STATS (
 ownname IN VARCHAR2 DEFAULT USER,
 tablename IN VARCHAR2,
 no_invalidate BOOLEAN DEFAULT
 TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),
 force IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

**Table 166-95 PUBLISH\_PENDING\_STATS Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ownname   | Owner name  |

**Table 166-95 (Cont.) PUBLISH\_PENDING\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tablename     | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| no_invalidate | Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | If TRUE, will override the lock                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Security Model

To run this procedure, you must have the same privilege for gathering statistics on the tables that will be touched by this procedure.

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

- If the parameter `tablename` is NULL then `publish` applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.

### Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

## 166.7.87 PURGE\_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary.

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

### Syntax

```
DBMS_STATS.PURGE_STATS(
 before_timestamp TIMESTAMP WITH TIME ZONE);
```

## Parameters

**Table 166-96 PURGE\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| before_timestamp | Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days. |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

## Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

## 166.7.88 REMAP\_STAT\_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

## Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (
 ownname IN VARCHAR2,
 statab IN VARCHAR2,
 src_own IN VARCHAR2,
 src_tab IN VARCHAR2,
 tgt_own IN VARCHAR2,
 tgt_tab IN VARCHAR2);
```

## Parameters

**Table 166-97 REMAP\_STAT\_TABLE Procedure Parameters**

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| ownname   | Owner of the statistics table. NULL means the current schema.              |
| statab    | User statistics table identifier                                           |
| src_own   | Owner of the table to be renamed. This argument cannot be NULL.            |
| src_tab   | Name of the table to be renamed. If NULL, all tables are owned by src_own. |

**Table 166-97 (Cont.) REMAP\_STAT\_TABLE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tgt_own   | New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed. This argument cannot be NULL. |
| tgt_tab   | New name of the table. This argument is valid only if src_tab is not NULL.                                                                                                                                                 |

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Invalid input

**Examples**

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers\_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers', 'shsave', 'customers_sav');
```

## 166.7.89 REPORT\_ADVISOR\_TASK Function

This function reports the results of an Optimizer Statistics Advisor task.

**Syntax**

```
DBMS_STATS.REPORT_ADVISOR_TASK(
 task_name IN VARCHAR2,
 execution_name IN VARCHAR2 := NULL,
 type IN VARCHAR2 := 'TEXT',
 section IN VARCHAR2 := 'ALL',
 level IN VARCHAR2 := 'TYPICAL')
RETURN CLOB;
```

**Parameters**

**Table 166-98 REPORT\_ADVISOR\_TASK Function Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

**Table 166-98 (Cont.) REPORT\_ADVISOR\_TASK Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| execution_name | A name that qualifies and identifies an advisor task execution. If not specified, the function uses the latest execution of the specified task.                                                                                           |
| type           | The type of the Optimizer Statistics Advisor report. Possible values are TEXT, HTML, and XML.                                                                                                                                             |
| section        | A section in the report. Possible values are SUMMARY, FINDINGS, ERRORS, and ALL. You can specify combinations of different values can be using the plus (+) and minus (-) operator, as in 'SUMMARY +FINDINGS +ERRORS', and 'ALL -ERRORS'. |
| level          | The format of the report. Possible values are BASIC, TYPICAL, ALL, and SHOW_HIDDEN. You can specify SHOW_HIDDEN together with the other three input values, as in 'BASIC +SHOW_HIDDEN' and 'TYPICAL +SHOW_HIDDEN'.                        |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level  
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- `Operation` level  
The results depend on the following privileges:
  - Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
  - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
  - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
  - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- `Object` level  
Users can perform this task for any object for which they have statistics collection privileges.

## Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: User input errors
- ORA-20012: Optimizer Statistics Advisor errors

## Returns

This function returns a CLOB that contains the report.

## Examples

(Optional) List and briefly describe the examples for using the API or subprogram here.

### Example 166-12 Generating an HTML Report

This example creates a procedure named `myrep`, and then calls this procedure to generate an HTML report.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fctype VARCHAR2,
which VARCHAR2)
IS
 v_report CLOB := null;
 v_script CLOB := null;
 v_fctype VARCHAR2(400) := p_fctype;
 v_tname VARCHAR2(400) := p_tname;
 v_len NUMBER(10);
 v_ps NUMBER(10) := 10000;
 v_pn NUMBER(10) := 1;
 v_ret VARCHAR2(32767);
BEGIN
 IF which = 'REPORT'
 THEN
 -- generate a report
 v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
 task_name => v_tname,
 type => v_fctype,
 section => 'ALL',
 level => 'ALL');
 v_len := DBMS_LOB.getlength(v_report);
 WHILE (v_pn < v_len)
 LOOP
 DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
 v_pn := v_pn + v_ps;
 END LOOP;
 END IF;
END;
```

```

ELSE
 -- generate a script
 v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
 v_len := DBMS_LOB.getlength(v_script);
 WHILE (v_pn < v_len)
 LOOP
 DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
 v_pn := v_pn + v_ps;
 END LOOP;
END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task', 'HTML', 'REPORT');
SPOOL OFF

```

### Example 166-13 Generating a Textual Report for AUTO\_STATS\_ADVISOR\_TASK

The following example invokes the `myrep` procedure created in the preceding example for `AUTO_STATS_ADVISOR_TASK`:

```
EXEC myrep('AUTO_STATS_ADVISOR_TASK', 'TEXT', 'REPORT');
```

The following sample output shows part of the report:

```

GENERAL INFORMATION

Task Name : AUTO_STATS_ADVISOR_TASK
Execution Name : EXEC_97
Created : 07-08-16 10:18:10
Last Modified : 07-11-16 03:02:30

SUMMARY

For execution EXEC_97 of task AUTO_STATS_ADVISOR_TASK, the Statistics
Advisor
has 10 finding(s). The findings are related to the following rules:
COMPLETEAUTOJOB, MAINTAINSTATSHISTORY, USEDEFAULTPREFERENCE,
AVOIDSETPROCEDURES, USEDEFAULTPARAMS, USEGATHERSCHEMASTATS,
AVOIDSTALESTATS,
UNLOCKNONVOLATILETABLE, USEINCREMENTAL, AVOIDANALYZETABLE. Please
refer to the
finding section for detailed information.

```

FINDINGS

```

Rule Name: MaintainStatsHistory
Rule Description: Maintain Statistics History
```

Finding: Statistics history tables are too big.

Recommendation: Check the other findings of this rule, as well as the

```

 findings for the rules
AvoidFrequentStatsCollection,
 UseDefaultPreference, UseDefaultParams for possible
causes
```

and recommendations.

Rationale: The size of the statistics history table could be big because of

violations of other rules.

```

Rule Name: UseDefaultPreference
Rule Description: Use Default Preference for Stats Collection
Finding: Global preference SYS_FLAGS is set to a non-default value
'1'.
```

Recommendation: Set the value of preference SYS\_FLAGS to '0'.

Example:

```
-- Setting preference cascade to default value:
dbms_stats.set_global_prefs('CASCADE', NULL);
```

Rationale: Preference SYS\_FLAGS is for Oracle internal use only, setting it

to nondefault value '1' could cause unforeseen consequences.

```

```

## 166.7.90 REPORT\_COL\_USAGE Function

This function reports the recorded column (group) usage information.

### Syntax

```
DBMS_STATS.REPORT_COL_USAGE (
 ownname IN VARCHAR2,
 tabname IN VARCHAR2)
RETURN CLOB;
```

## Parameters

**Table 166-99** REPORT\_COL\_USAGE Function Parameters

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| ownname   | Owner name. If NULL it reports column usage information for tables in all schemas in the database. |
| tablename | Table name. If NULL it reports column usage information for all tables of ownname.                 |

## Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

## 166.7.91 REPORT\_GATHER\_AUTO\_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

### Syntax

```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (
 detail_level VARCHAR2 DEFAULT 'TYPICAL',
 format VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;
```

## Parameters

Table 166-100 REPORT\_GATHER\_AUTO\_STATS Function Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| format    | Report format: <ul style="list-style-type: none"> <li>• XML</li> <li>• HTML</li> <li>• TEXT (Default)</li> </ul> |

**Usage Notes**

Only user SYS can run the REPORT\_GATHER\_AUTO\_STATS function.

## 166.7.92 REPORT\_GATHER\_DATABASE\_STATS Functions

This function runs the GATHER\_DATABASE\_STATS function in reporting mode.

The database does not collect statistics, but reports all objects that would be affected when invoking GATHER\_DATABASE\_STATS. The input set of parameters is the same as in GATHER\_DATABASE\_STATS, with two extra parameters.

**Syntax**

```

DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
 estimate_percent IN NUMBER DEFAULT
 to_estimate_percent_type (
 GET_PARAM('ESTIMATE_PERCENT')),
 block_sample IN BOOLEAN DEFAULT FALSE,
 method_opt IN VARCHAR2 DEFAULT
 GET_PARAM('METHOD_OPT'),
 degree IN NUMBER DEFAULT TO_DEGREE_TYPE(
 GET_PARAM('DEGREE')),
 granularity IN VARCHAR2 DEFAULT
 GET_PARAM('GRANULARITY'),
 cascade IN BOOLEAN DEFAULT to_cascade_type (
 GET_PARAM('CASCADE')),
 stattab IN VARCHAR2 DEFAULT NULL,
 statid IN VARCHAR2 DEFAULT NULL,
 options IN VARCHAR2 DEFAULT 'GATHER',
 statown IN VARCHAR2 DEFAULT NULL,
 gather_sys IN BOOLEAN DEFAULT TRUE,
 no_invalidate IN BOOLEAN DEFAULT TO_NO_INVALIDATE_TYPE (
 GET_PARAM('NO_INVALIDATE')),
 gather_temp IN BOOLEAN DEFAULT FALSE,
 gather_fixed IN BOOLEAN DEFAULT FALSE,
 stattype IN VARCHAR2 DEFAULT DATA,
 obj_filter_list IN ObjectTab DEFAULT NULL,
 detail_level IN VARCHAR2 DEFAULT 'TYPICAL',
 format IN VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;

```

## Parameters

**Table 166-101 REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| estimate_percent | <p>The percentage of rows to use for the sample size. The valid range is between 0.000001 and 100. The null value means to compute.</p> <p>Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| block_sample     | <p>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| method_opt       | <p>Method options. This parameter accepts the following values: <code>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</code>.</p> <p><code>size_clause</code> is defined as <code>size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</code></p> <ul style="list-style-type: none"> <li>- <code>integer</code> : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- <code>REPEAT</code> : Collects histograms only on the columns that already have histograms.</li> <li>- <code>AUTO</code> : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- <code>SKEWONLY</code> : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

**Table 166-101 (Cont.) REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree      | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
| granularity | Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.<br>The following values are valid: <ul style="list-style-type: none"> <li>• ALL — Gathers all statistics: subpartition, partition, and global.</li> <li>• AUTO — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.</li> <li>• GLOBAL — Gathers global statistics.</li> <li>• GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• PARTITION — Gathers partition-level statistics.</li> <li>• SUBPARTITION — Gathers subpartition-level statistics.</li> </ul>           |
| cascade     | Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                    |
| stattab     | User statistics table identifier describing where to save the current statistics.<br>The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 166-101 (Cont.) REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| statid        | Identifier (optional) to associate with these statistics withinstattab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| options       | Further specification of which objects to gather statistics for:<br>GATHER: Gathers statistics on all objects in the schema.<br>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters arestattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.<br>GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.<br>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.<br>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO<br>LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views<br>LIST EMPTY: Returns a list of objects which currently have no statistics |
| statown       | Schema containing stattab, if different from current schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| gather_sys    | Gathers statistics on the objects owned by the SYS user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| gather_temp   | Gathers statistics on global temporary tables when TRUE. The default is FALSE.<br><br>The temporary table must be created with the ON COMMIT PRESERVE ROWS clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 166-101 (Cont.) REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gather_fixed    | <p>Gather statistics on fixed tables when TRUE. The default is FALSE. Only user SYS can collect statistics for fixed tables. The ownname must be SYS or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments:</p> <ul style="list-style-type: none"><li>• estimate_percent</li><li>• block_sample</li><li>• stattab</li><li>• statid</li><li>• statown</li></ul> <p>The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.</p>                                            |
| stattype        | <p>The type of statistics:</p> <ul style="list-style-type: none"><li>• DATA — Data statistics only</li><li>• CACHE — Cache statistics only</li><li>• ALL — All statistics</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| obj_filter_list | <p>A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values.</p> <p>When specified, GATHER_DATABASE_STATS gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values s1 and s2 are specified for attributes a1 and a2 in one object filter. An object o is said to satisfy this object filter when (o.a1 LIKE s1) AND (o.a2 LIKE s2) is true.</p> |

| Parameter | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| format    | The format of the report. Valid values are: <ul style="list-style-type: none"> <li>XML</li> <li>HTML</li> <li>TEXT (Default)</li> </ul> |

**Return Values**

A CLOB object that contains the report

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

**Usage Notes**

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

## 166.7.93 REPORT\_GATHER\_DICTIONARY\_STATS Functions

This function runs the GATHER\_DICTIONARY\_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER\_DICTIONARY\_STATS. The detail level for the report is defined by the detail\_level input parameter. See the descriptions of detail\_level and format in [REPORT\\_GATHER\\_DICTIONARY\\_STATS Functions](#). For all other input parameters, see [GATHER\\_DICTIONARY\\_STATS Procedure](#).

**Syntax**

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
 comp_id IN VARCHAR2 DEFAULT NULL,
 estimate_percent IN NUMBER DEFAULT
TO_ESTIMATE_PERCENT_TYPE
 (GET_PARAM('ESTIMATE_PERCENT')),
 block_sample IN BOOLEAN DEFAULT FALSE,
 method_opt IN VARCHAR2 DEFAULT
GET_PARAM('METHOD_OPT'),
 degree IN NUMBER DEFAULT TO_DEGREE_TYPE
 (GET_PARAM('DEGREE')),
 granularity IN VARCHAR2 DEFAULT
GET_PARAM('GRANULARITY'),
 cascade IN BOOLEAN DEFAULT TO_CASCADE_TYPE
 (GET_PARAM('CASCADE')),
 stattab IN VARCHAR2 DEFAULT NULL,
 options IN VARCHAR2 DEFAULT 'GATHER AUTO',
```

```

no_invalidate IN BOOLEAN DEFAULT TO_NO_INVALIDATE_TYPE
(GET_PARAM('NO_INVALIDATE')),
 stattype IN VARCHAR2 DEFAULT 'DATA',
 obj_filter_list IN ObjectTab DEFAULT NULL,
 detail_level IN VARCHAR2 DEFAULT 'TYPICAL',
 format IN VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;

```

## Parameters

**Table 166-102 REPORT\_GATHER\_DICTIONARY\_STATS Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comp_id          | Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| estimate_percent | Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| block_sample     | Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| method_opt       | <p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause] <ul style="list-style-type: none"> <li>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</li> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

**Table 166-102 (Cont.) REPORT\_GATHER\_DICTIONARY\_STATS Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree      | <p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p> |
| granularity | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>• ALL — Gathers all statistics: subpartition, partition, and global.</li> <li>• AUTO — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.</li> <li>• GLOBAL — Gathers global statistics.</li> <li>• GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• PARTITION — Gathers partition-level statistics.</li> <li>• SUBPARTITION — Gathers subpartition-level statistics.</li> </ul>                |
| cascade     | <p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                   |
| stattab     | <p>User statistics table identifier describing where to save the current statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 166-102 (Cont.) REPORT\_GATHER\_DICTIONARY\_STATS Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options         | <p>Further specification of objects for which to gather statistics:</p> <ul style="list-style-type: none"> <li>'GATHER' - Gathers statistics on all objects in the schema</li> <li>'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are <code>comp_id</code>, <code>stattab</code>, <code>statid</code> and <code>statown</code>; all other parameter settings will be ignored. Also, returns a list of objects processed.</li> <li>'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, returns a list of objects found to be stale.</li> <li>'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics.</li> <li>'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO'</li> <li>'LIST STALE' - Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views</li> <li>'LIST EMPTY' - Returns list of objects which currently have no statistics</li> </ul> |
| no_invalidate   | <p>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| stattype        | <p>The type of statistics:</p> <ul style="list-style-type: none"> <li>DATA — Data statistics only</li> <li>CACHE — Cache statistics only</li> <li>ALL — All statistics</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| obj_filter_list | <p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code>, <code>s2</code>, ... are specified for attributes <code>a1</code>, <code>a2</code>, ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1</code> like <code>s1</code>) and (<code>o.a2</code> like <code>s2</code>) and ... is true.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Return Values

A CLOB object that contains the report

### Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

### Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## 166.7.94 REPORT\_GATHER\_FIXED\_OBJ\_STATS Function

This function runs the GATHER\_FIXED\_OBJECTS\_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when GATHER\_FIXED\_OBJ\_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER\_FIXED\_OBJ\_STATS with two extra parameters.

### Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
 statab IN VARCHAR2 DEFAULT NULL,
 statid IN VARCHAR2 DEFAULT NULL,
 statown IN VARCHAR2 DEFAULT NULL,
 no_invalidate IN BOOLEAN DEFAULT TO_NO_INVALIDATE_TYPE (
 GET_PARAM('NO_INVALIDATE')),
 detail_level IN VARCHAR2 DEFAULT 'TYPICAL',
 format IN VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;
```

### Parameters

**Table 166-103** REPORT\_GATHER\_FIXED\_OBJ\_STATS Procedure Parameters

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| statab    | User statistics table identifier describing where to save the current statistics |
| statid    | Identifier to associate with these statistics within statab (optional)           |
| statown   | Schema containing statab (if different from current schema)                      |

| format    | Report format: <ul style="list-style-type: none"> <li>• XML</li> <li>• HTML</li> <li>• TEXT (Default)</li> </ul> |

### Return Values

A CLOB object that contains the report

### Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

### Related Topics

- [GATHER\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
This procedure gathers statistics for all fixed objects (dynamic performance tables).

## 166.7.95 REPORT\_GATHER\_SCHEMA\_STATS Functions

This function runs the GATHER\_SCHEMA\_STATS procedure in reporting mode.

The database does not actually gather statistics, but reports all objects that would be affected when invoking GATHER\_SCHEMA\_STATS. The input set of parameters is exactly the same as in GATHER\_SCHEMA\_STATS, with two extra parameters.

### Syntax

```
DBMS_STATS.REPORT_GATHER_SCHEMA_STATS (
 ownname IN VARCHAR2,
 estimate_percent IN NUMBER DEFAULT TO_ESTIMATE_PERCENT_TYPE (
 GET_PARAM ('ESTIMATE_PERCENT')),
 block_sample IN BOOLEAN DEFAULT FALSE,
 method_opt IN VARCHAR2 DEFAULT GET_PARAM ('METHOD_OPT'),
 degree IN NUMBER DEFAULT TO_DEGREE_TYPE (
 GET_PARAM('DEGREE')),
 granularity IN VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
 cascade IN BOOLEAN DEFAULT TO_CASCADE_TYPE (
 GET_PARAM ('CASCADE')),
 stattab IN VARCHAR2 DEFAULT NULL,
 statid IN VARCHAR2 DEFAULT NULL,
 options IN VARCHAR2 DEFAULT 'GATHER',
 statown IN VARCHAR2 DEFAULT NULL,
```

```

no_invalidate IN BOOLEAN DEFAULT TO_NO_INVALIDATE_TYPE (
 GET_PARAM ('NO_INVALIDATE')),
force IN BOOLEAN DEFAULT FALSE,
obj_filter_list IN ObjectTab DEFAULT NULL,
detail_level IN VARCHAR2 DEFAULT 'TYPICAL',
format IN VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;

```

## Parameters

**Table 166-104 REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname          | Schema to analyze (NULL means current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| estimate_percent | Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| block_sample     | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| method_opt       | <p>Accepts:</p> <ul style="list-style-type: none"> <li>• FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

**Table 166-104 (Cont.) REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree      | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned).<br>'ALL' - Gathers all (subpartition, partition, and global) statistics<br>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.<br>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.<br>'GLOBAL' - Gathers global statistics<br>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.<br>'PARTITION' - Gathers partition-level statistics<br>'SUBPARTITION' - Gathers subpartition-level statistics.                                                                                                  |
| cascade     | Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                      |
| stattab     | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| statid      | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 166-104 (Cont.) REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options         | <p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, statab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO.</p> <p>LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views.</p> <p>LIST EMPTY: Returns list of objects which currently have no statistics.</p> |
| objlist         | List of objects found to be stale or empty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| statown         | Schema containing statab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| no_invalidate   | <p>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| force           | Gather statistics on objects even if they are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| obj_filter_list | <p>A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See <a href="#">Applying an Object Filter List</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 166-104 (Cont.) REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| detail_level | <p>Detail level for the content of the report</p> <ul style="list-style-type: none"> <li>• <b>BASIC:</b> The report includes <ul style="list-style-type: none"> <li>- operation ID</li> <li>- operation name</li> <li>- operation target object</li> <li>- start time</li> <li>- end time</li> <li>- completion status (such as: succeeded, failed)</li> </ul> </li> <li>• <b>TYPICAL:</b> In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> <li>- total number of target objects</li> <li>- total number of successfully completed objects</li> <li>- total number of failed objects</li> <li>- total number of timed-out objects (applies to only auto statistics gathering)</li> </ul> <p>With regard to target objects:</p> <ul style="list-style-type: none"> <li>- owner and name of each target object</li> <li>- target object type (such as: table, index)</li> <li>- start time</li> <li>- end time</li> <li>- completion status</li> </ul> </li> <li>• <b>ALL:</b> In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> <li>- job name</li> <li>- session ID</li> <li>- parameter values</li> <li>- error message if the operation failed</li> </ul> <p>With regard to target objects:</p> <ul style="list-style-type: none"> <li>- job name</li> <li>- batching details</li> <li>- estimated cost</li> <li>- rank in the target list</li> <li>- columns for which histograms were collected</li> <li>- list of collected extended statistics (if any)</li> <li>- additional error details if the task has failed.</li> </ul> </li> </ul> <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p> |

**Table 166-104 (Cont.) REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| format    | Report format: <ul style="list-style-type: none"> <li>• XML</li> <li>• HTML</li> <li>• TEXT (Default)</li> </ul> |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

### Examples

#### Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema or any table in the `HR` schema, if stale, will have statistics gathered upon it.

```

DECLARE
 filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
 filter_lst.extend(2);
 filter_lst(1).ownname := 'SAMPLE';
 filter_lst(1).objname := 'T%';
 filter_lst(2).ownname := 'HR';
 DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
 options => 'GATHER STALE');
END;
```

## 166.7.96 REPORT\_GATHER\_TABLE\_STATS Function

This procedure runs the `GATHER_TABLE_STATS` Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when `GATHER_TABLE_STATS` is invoked are reported.

### Syntax

```

DBMS_STATS.REPORT_GATHER_TABLE_STATS (
 ownname VARCHAR2,
 tabname VARCHAR2,
 partname VARCHAR2 DEFAULT NULL,
 estimate_percent NUMBER DEFAULT to_estimate_percent_type
 (get_param('ESTIMATE_PERCENT')),
 block_sample BOOLEAN DEFAULT FALSE,
 method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
 degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
```

```

granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
stattab VARCHAR2 DEFAULT NULL,
statid VARCHAR2 DEFAULT NULL,
statown VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
 get_param('NO_INVALIDATE')),
stattype VARCHAR2 DEFAULT 'DATA',
force BOOLEAN DEFAULT FALSE)
detail_level VARCHAR2 DEFAULT 'TYPICAL', format VARCHAR2
DEFAULT 'TEXT')
RETURN CLOB;

```

## Parameters

**Table 166-105 REPORT\_GATHER\_TABLE\_STATS Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname          | Schema of table to analyze                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| tablename        | Name of table                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| partname         | Name of partition                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| estimate_percent | Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| block_sample     | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.                                                                                                                                                                                      |

**Table 166-105 (Cont.) REPORT\_GATHER\_TABLE\_STATS Function Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| method_opt | <p>Accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>• FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>• FOR COLUMNS [column_clause] [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| degree     | <p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>                                                                                                                                                                                                                                                                                                                                                                |

**Table 166-105 (Cont.) REPORT\_GATHER\_TABLE\_STATS Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity   | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if <code>partname</code> is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p> |
| cascade       | <p>Gathers statistics on the indexes for this table. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the table's indexes. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| stattab       | <p>User statistics table identifier describing where to save the current statistics</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| detail_level | <p>Detail level for the content of the report</p> <ul style="list-style-type: none"> <li>• BASIC: The report includes <ul style="list-style-type: none"> <li>- operation ID</li> <li>- operation name</li> <li>- operation target object</li> <li>- start time</li> <li>- end time</li> <li>- completion status (such as: succeeded, failed)</li> </ul> </li> <li>• TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> <li>- total number of target objects</li> <li>- total number of successfully completed objects</li> <li>- total number of failed objects</li> <li>- total number of timed-out objects (applies to only auto statistics gathering)</li> </ul> <p>With regard to target objects:</p> <ul style="list-style-type: none"> <li>- owner and name of each target object</li> <li>- target object type (such as: table, index)</li> <li>- start time</li> <li>- end time</li> <li>- completion status</li> </ul> </li> <li>• ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> <li>- job name</li> <li>- session ID</li> <li>- parameter values</li> <li>- error message if the operation failed</li> </ul> <p>With regard to target objects:</p> <ul style="list-style-type: none"> <li>- job name</li> <li>- batching details</li> <li>- estimated cost</li> <li>- rank in the target list</li> <li>- columns for which histograms were collected</li> <li>- list of collected extended statistics (if any)</li> <li>- additional error details if the task has failed.</li> </ul> </li> </ul> <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p> |

**Table 166-105 (Cont.) REPORT\_GATHER\_TABLE\_STATS Function Parameters**

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| format    | Report format: <ul style="list-style-type: none"> <li>• XML</li> <li>• HTML</li> <li>• TEXT (Default)</li> </ul> |

### Return Values

A CLOB object that contains the report

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

## 166.7.97 REPORT\_SINGLE\_STATS\_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

### Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (
 opid NUMBER,
 detail_level VARCHAR2 DEFAULT 'TYPICAL',
 format VARCHAR2 DEFAULT 'TEXT'
 container_id NUMBER DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 166-106 REPORT\_SINGLE\_STATS\_OPERATION Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| opid      | Operation ID |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format       | Report format: <ul style="list-style-type: none"> <li>• XML</li> <li>• HTML</li> <li>• TEXT (Default)</li> </ul>                                                                                                                                                                                                                                                                                                                                                   |
| container_id | ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation. |

**Usage Notes**

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

## 166.7.98 REPORT\_STATS\_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

**Syntax**

```
DBMS_STATS.REPORT_STATS_OPERATIONS (
 detail_level VARCHAR2 DEFAULT 'TYPICAL',
 format VARCHAR2 DEFAULT 'TEXT',
 latestN NUMBER DEFAULT NULL,
 since TIMESTAMP WITH TIME ZONE DEFAULT NULL,
 until TIMESTAMP WITH TIME ZONE DEFAULT NULL,
 auto_only BOOLEAN DEFAULT FALSE,
 container_ids DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)
RETURN CLOB;
```

## Parameters

| latestN       | <p>Restricts the report to contain only the latest N operations that took place between the provided time points (since and until). The default value is NULL, meaning that all qualifying operations will be reported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| since         | <p>The report will include only statistics operations that started after this timestamp.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| until         | <p>The report will include only statistics operations that before after this timestamp.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| auto_only     | <p>When TRUE, the report will contain only auto statistics gathering job runs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| container_ids | <p>A multitenant environment contains one or more pluggable databases (PDBs). container_ids represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

### Examples

Note that the type for `container_ids` input parameter is `DBMS_UTILITY.NUMBER_ARRAY` which is an associative PL/SQL array collection. Although associative array type allows for more flexible `hash` table-like organization of entries, this function treats `container_ids` as a regular table collection with the first ID located at index 1 and the last id located at index `container_ids.count` without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```
DECLARE
 conid_tab DBMS_UTILITY.NUMBER_ARRAY;
 report clob;
BEGIN
 conid_tab(1) := 124;
 conid_tab(2) := 63;
 conid_tab(3) := 98;
 report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

## 166.7.99 RESET\_ADVISOR\_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

### Syntax

```
DBMS_STATS.RESET_ADVISOR_TASK (
 task_name IN VARCHAR2);
```

### Parameters

**Table 166-108 RESET\_ADVISOR\_TASK Procedure Parameters**

| Parameter              | Description                                        |
|------------------------|----------------------------------------------------|
| <code>task_name</code> | The name of the Optimizer Statistics Advisor task. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

### Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values

- ORA-20012: Optimizer Statistics Advisor errors

## 166.7.100 RESET\_COL\_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

### Syntax

```
DBMS_STATS.RESET_COL_USAGE (
 ownname IN VARCHAR2,
 tabname IN VARCHAR2);
```

### Parameters

**Table 166-109** RESET\_COL\_USAGE Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name. If NULL it deletes column usage information for tables in all schemas in the database.                                                                                                                                            |
| tabname   | Table name. If NULL it deletes column usage information for all tables of ownname. If both the owner and tabname is NULL, the seed column usage is stopped if applicable. See <a href="#">:SEED_COL_USAGE Procedure</a> for more information. |

### Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

## 166.7.101 RESET\_GLOBAL\_PREF\_DEFAULTS Procedure

This procedure sets global preference, such as CASCADE, ESTIMATE\_PERCENT and GRANULARITY, to default values.

This reverses the global preferences set by the [SET\\_GLOBAL\\_PREFS Procedure](#).

### Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

### Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

## 166.7.102 RESET\_PARAM\_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

### Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. Instead of this procedure, use the [RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#).

See also . [DBMS\\_STATS Deprecated Subprograms](#)

### Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

## 166.7.103 RESTORE\_DATABASE\_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS(
 as_of_timestamp TIMESTAMP WITH TIME ZONE,
 force BOOLEAN DEFAULT FALSE,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type

(GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 166-110** RESTORE\_DATABASE\_STATS Procedure Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>as_of_timestamp</code> | The timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>force</code>           | Restores statistics even if their statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>no_invalidate</code>   | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## 166.7.104 RESTORE\_DICTIONARY\_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as\_of\_timestamp).

### Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS(
 as_of_timestamp TIMESTAMP WITH TIME ZONE,
 force BOOLEAN DEFAULT FALSE,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type

 (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 166-111 RESTORE\_DICTIONARY\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as_of_timestamp | Timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| force           | Restores statistics even if their statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                             |
| no_invalidate   | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## 166.7.105 RESTORE\_FIXED\_OBJECTS\_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (as\_of\_timestamp).

### Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
 as_of_timestamp TIMESTAMP WITH TIME ZONE,
```

```

force BOOLEAN DEFAULT FALSE,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type

(GET_PARAM('NO_INVALIDATE')));

```

### Parameters

**Table 166-112 RESTORE\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as_of_timestamp | The timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| force           | Restores statistics even if their statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                             |
| no_invalidate   | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

### Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values
- ORA-20006: Unable to restore statistics, statistics history not available

## 166.7.106 RESTORE\_SCHEMA\_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as\_of\_timestamp).

### Syntax

```

DBMS_STATS.RESTORE_SCHEMA_STATS(
 ownname VARCHAR2,
 as_of_timestamp TIMESTAMP WITH TIME ZONE,
 force BOOLEAN DEFAULT FALSE,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type

(GET_PARAM('NO_INVALIDATE')));

```

### Parameters

**Table 166-113 RESTORE\_SCHEMA\_STATS Procedure Parameters**

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| ownname   | Schema of the tables for which the statistics are to be restored |

**Table 166-113 (Cont.) RESTORE\_SCHEMA\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as_of_timestamp | The timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| force           | Restores statistics even if their statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                             |
| no_invalidate   | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 166.7.107 RESTORE\_SYSTEM\_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
 as_of_timestamp TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 166-114 RESTORE\_SYSTEM\_STATS Procedure Parameters**

| Parameter       | Description                                  |
|-----------------|----------------------------------------------|
| as_of_timestamp | The timestamp to which to restore statistics |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

## 166.7.108 RESTORE\_TABLE\_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (`as_of_timestamp`). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

### Syntax

```

DBMS_STATS.RESTORE_TABLE_STATS (
 ownname VARCHAR2,
 tablename VARCHAR2,
 as_of_timestamp TIMESTAMP WITH TIME ZONE,
 restore_cluster_index BOOLEAN DEFAULT FALSE,
 force BOOLEAN DEFAULT FALSE,
 no_invalidate BOOLEAN DEFAULT to_no_invalidate_type

 (GET_PARAM('NO_INVALIDATE')));

```

### Parameters

**Table 166-115 RESTORE\_TABLE\_STATS Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>               | The schema of the table for which the statistics are to be restored                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>tablename</code>             | The table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>as_of_timestamp</code>       | The timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>restore_cluster_index</code> | If the table is part of a cluster, restore statistics of the cluster index if set to <code>TRUE</code>                                                                                                                                                                                                                                                                                                                                                                                                                      |
