**Syntax**

```
TYPE mounts_t IS TABLE OF mount_t;
```

**Related Topics**

- [DBMS\\_DBFS\\_CONTENT MOUNT\\_T Record Type](#)  
This type describes a store mount point and its properties.

### 48.6.9 DBMS\_DBFS\_CONTENT PATH\_ITEMS\_T Table Type

A table type of PATH\_ITEM\_T Record Type

**Syntax**

```
TYPE path_items_t IS TABLE OF path_item_t;
```

### Related Topics

- [DBMS\\_DBFS\\_CONTENT PATH\\_ITEM\\_T Record Type](#)  
A `PATH_ITEM_T` is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

## 48.6.10 DBMS\_DBFS\_CONTENT PROP\_ITEMS\_T Table Type

A table type of `PATH_ITEM_T` Record Type.

### Syntax

```
TYPE prop_items_t IS TABLE OF prop_item_t;
```

### Related Topics

- [DBMS\\_DBFS\\_CONTENT PATH\\_ITEM\\_T Record Type](#)  
A `PATH_ITEM_T` is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

## 48.6.11 DBMS\_DBFS\_CONTENT PROPERTIES\_T Table Type

This is a name-indexed hash table of property tuples. The implicit hash-table association between the index and the value allows the client to build up the full `DBMS_DBFS_CONTENT_PROPERTY_T` tuples for a `PROPERTIES_T`.

### Syntax

```
TYPE properties_t IS TABLE OF property_t INDEX BY propname_t;
```

## 48.6.12 STORES\_T Table Type

This type describes a store registered with and managed by the `DBMS_DBFS_CONTENT` interface.

### Syntax

```
TYPE stores_t IS TABLE OF store_t;
```

## 48.7 Summary of DBMS\_DBFS\_CONTENT Subprograms

This table lists and describes the subprograms used in the `DBMS_DBFS_CONTENT` Package.

**Table 48-19 DBMS\_DBFS\_CONTENT Package Subprograms**

Subprogram	Description
<a href="#">CHECKACCESS Function</a>	Reports if the user (principal) can perform the specified operation on the given path
<a href="#">CHECKSPI Functions and Procedures</a>	Checks if a user-provided package implements all of the <code>DBMS_DBFS_CONTENT_SPI</code> subprograms with the proper signatures, and reports on the conformance.
<a href="#">CREATEDIRECTORY Procedures</a>	Creates a directory

**Table 48-19 (Cont.) DBMS\_DBFS\_CONTENT Package Subprograms**

Subprogram	Description
CREATEFILE Procedures	Creates a file
CREATELINK Procedures	Creates a new reference to the source file system element
CREATEREFERENCE Procedures	Creates a physical link to an already existing file system element
DECODEFEATURES Function	Given a feature bit set integer value, returns a <code>FEATURES_T</code> table of the feature bits as <code>FEATURE_T</code> records
DELETECONTENT Procedure	Deletes the file specified by the given contentID
DELETEDIRECTORY Procedure	Deletes a directory
DELETEFILE Procedure	Deletes a file
FEATURENAME Function	Given a feature bit, returns a <code>VARCHAR2</code> of that feature's name
FLUSHSTATS Function	Flushes <code>DBMS_DBFS_CONTENT</code> statistics to disk
GETDEFAULTACL Procedure	Returns the <code>ACL</code> parameter of the default context
GETDEFAULTASOF Procedure	Returns the <code>asof</code> parameter of the default context
GETDEFAULTCONTEXT Procedure	Returns the default context
GETDEFAULTOWNER Procedure	Returns the <code>owner</code> parameter of the default context
GETDEFAULTPRINCIPAL Procedure	Returns the <code>principal</code> parameter of the default context
GETFEATURESBYMOUNT Function	Returns features of a store by mount point
GETFEATURESBYNAME Function	Returns features of a store by store name
GETFEATURESBYPATH Function	Returns features of a store by path
GETPATHBYMOUNTID Function	Returns the full absolute path name
GETPATH Procedures	Returns existing path items (such as files and directories)
GETPATHBYSTOREID Function	If the underlying GUID is found in the underlying store, returns the store-qualified path name
GETPATHNOWAIT Procedures	Implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.
GETSTOREBYMOUNT Function	Returns a store by way of its mount point
GETSTOREBYNAME Function	Returns a store by way of its name
GETSTOREBYPATH Function	Returns a store by way of its path
GETSTATS Procedure	Returns information about <code>DBMS_DBFS_CONTENT</code> statistics collection
GETTRACE Function	Returns whether or not <code>DBMS_DBFS_CONTENT</code> tracing is turned on

**Table 48-19 (Cont.) DBMS\_DBFS\_CONTENT Package Subprograms**

Subprogram	Description
<a href="#">GETVERSION Function</a>	Returns the version of the DBMS_DBFS_CONTENT interface in a standardized format associated with a store
<a href="#">LIST Function</a>	Lists the path items in the specified path meeting the specified filter and other criteria
<a href="#">LISTALLCONTENT Function</a>	Lists all path items in all mounts
<a href="#">LISTALLPROPERTIES Function</a>	Returns a table of all properties for all path items in all mounts
<a href="#">LISTMOUNTS Function</a>	Lists all available mount points, their backing stores, and the store features
<a href="#">LISTSTORES Function</a>	Lists all available stores and their features
<a href="#">LOCKPATH Procedure</a>	Applies user-level locks to the given valid path name
<a href="#">MOUNTSTORE Procedure</a>	Mounts a previously registered store and binds it to the mount point
<a href="#">NORMALIZEPATH Functions</a>	Converts a store-specific or full-absolute path name into normalized form
<a href="#">PROPANY Functions</a>	Provides constructors that take one of a variety of types and return a PROPERTY_T
<a href="#">PROPERTIESH2T Function</a>	Converts a PROPERTY_T hash to a DBMS_DBFS_CONTENT_PROPERTIES_T table
<a href="#">PROPERTIEST2H Function</a>	Converts a DBMS_DBFS_CONTENT_PROPERTIES_T table to a PROPERTY_T hash
<a href="#">PROPNUMBER Function</a>	Is a constructor that takes a NUMBER and returns a PROPERTY_T
<a href="#">PROPRAW Function</a>	Is a constructor that takes a RAW and returns a PROPERTY_T
<a href="#">PROPTIMESTAMP Function</a>	Is a constructor that takes a TIMESTAMP and returns a PROPERTY_T
<a href="#">PROPVARCHAR2 Function</a>	Is a constructor that takes a VARCHAR2 and returns a PROPERTY_T
<a href="#">PURGEALL Procedure</a>	Purges all soft-deleted entries matching the path and optional filter criteria
<a href="#">PURGEPATH Procedure</a>	Purges any soft-deleted versions of the given path item
<a href="#">PUTPATH Procedures</a>	Creates a new path item
<a href="#">REGISTERSTORE Procedure</a>	Registers a new store
<a href="#">RENAMEPATH Procedures</a>	Renames or moves a path
<a href="#">RESTOREALL Procedure</a>	Restores all soft-deleted path items meeting the path and filter criteria
<a href="#">RESTOREPATH Procedure</a>	Restores all soft-deleted path items that match the given path and filter criteria
<a href="#">SETDEFAULTACL Procedure</a>	Sets the ACL parameter of the default context
<a href="#">SETDEFAULTASOF Procedure</a>	Sets the "as of" parameter of the default context
<a href="#">SETDEFAULTCONTEXT Procedure</a>	Sets the default context

**Table 48-19 (Cont.) DBMS\_DBFS\_CONTENT Package Subprograms**

Subprogram	Description
<a href="#">SETDEFAULTOWNER Procedure</a>	Sets the "owner" parameter of the default context
<a href="#">SETDEFAULTPRINCIPAL Procedure</a>	Sets the "principal" parameter of the default context
<a href="#">SETPATH Procedures</a>	Assigns a path name to a path item represented by contentID
<a href="#">SETSTATS Procedure</a>	Enables and disables statistics collection
<a href="#">SETTRACE Procedure</a>	Sets DBMS_DBFS_CONTENT tracing on or off
<a href="#">SPACEUSAGE Procedure</a>	Queries file system space usage statistics
<a href="#">TRACE Procedure</a>	Returns a CLOB that contains the evaluation results
<a href="#">TRACEENABLED Function</a>	Determines if the current trace "severity" set by the <a href="#">SETTRACE Procedure</a> is at least as high as the given trace level
<a href="#">UNLOCKPATH Procedure</a>	Unlocks path items that were previously locked with the <a href="#">LOCKPATH Procedure</a>
<a href="#">UNMOUNTSTORE Procedure</a>	Unmounts a registered store
<a href="#">UNREGISTERSTORE Procedure</a>	Unregisters a store

## 48.7.1 CHECKACCESS Function

This function reports if the user (*principal*) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

### Syntax

```
DBMS_DBFS_CONTENT.CHECKACCESS (
    path          IN    VARCHAR2,
    pathtype     IN    INTEGER,
    operation     IN    VARCHAR2,
    principal    IN    VARCHAR2,
    store_name   IN    VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 48-20 CHECKACCESS Procedure Parameters**

Parameter	Description
<code>path</code>	Name of path to check for access
<code>pathtype</code>	Type of object path represents (see <a href="#">Table 48-4</a> )
<code>operation</code>	Operation to be checked (see <a href="#">Table 48-8</a> )
<code>principal</code>	File system user for whom the access check is made

**Table 48-20 (Cont.) CHECKACCESS Procedure Parameters**

Parameter	Description
store_name	Name of store

### Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

## 48.7.2 CHECKSPI Functions and Procedures

Given the name of a putative DBMS\_DBFS\_CONTENT\_SPI conforming package, this function or procedure checks whether the package implements all of the provider subprograms with the proper signatures, and reports on the conformance.

### Syntax

```
DBMS_DBFS_CONTENT.CHECKSPI (
  package_name      IN          VARCHAR2)
RETURN CLOB;
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  schema_name      IN          VARCHAR2,
  package_name     IN          VARCHAR2)
return clob;
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  package_name     IN          VARCHAR2,
  chk              IN OUT NOCOPY CLOB);
```

```
DBMS_DBFS_CONTENT.CHECKSPI (
  schema_name      in          VARCHAR2,
  package_name     in          VARCHAR2,
  chk              in out nocopy CLOB);
```

### Parameters

**Table 48-21 CHECKSPI Procedure Parameters**

Parameter	Description
package_name	Name of package
schema_name	Name of schema
chk	CLOB that contains the evaluation results

### Usage Notes

- The functional form returns a cached temporary LOB of session duration with the results of the analysis. The caller is expected to manage the lifetime of this LOB, as needed.
- The procedural form generates the results of the analysis into the `chk` LOB parameter; if the value passed in is `NULL`, the results are written to the foreground

trace file provided that DBMS\_DBFS\_CONTENT interface tracing is enabled. If neither tracing is enabled nor a valid LOB passed in, the checker does not provide any useful indication of the analysis (other than raise exceptions if it encounters a serious error).

- If `schema_name` is NULL, standard name resolution rules (current schema, private synonym, public synonym) are used to try and locate a suitable package to analyze.

## 48.7.3 CREATEDIRECTORY Procedures

This procedure creates a directory.

### Syntax

```
DBMS_DBFS_CONTENT.CREATEDIRECTORY (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    prop_flags    IN          INTEGER      DEFAULT PROP_STD,
    recurse       IN          BOOLEAN     DEFAULT FALSE,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEDIRECTORY (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY PROPERTIES_T,
    prop_flags    IN          INTEGER     DEFAULT PROP_STD,
    recurse       IN          BOOLEAN     DEFAULT FALSE,
    store_name    IN          VARCHAR2    DEFAULT NULL,
    principal     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 48-22** CREATEDIRECTORY Procedure Parameters

Parameter	Description
<code>path</code>	Name of path to the directory
<code>properties</code>	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
<code>prop_flags</code>	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting PROP_SPC (see <a href="#">Table 48-9</a> ), and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
<code>recurse</code>	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory
<code>store_name</code>	Name of store
<code>principal</code>	File system user for whom the access check is made

## 48.7.4 CREATEFILE Procedures

This procedure creates a file.

### Syntax

```
DBMS_DBFS_CONTENT.CREATEFILE (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  prop_flags   IN          INTEGER      DEFAULT (PROP_STD + PROP_DATA),
  store_name   IN          VARCHAR2    DEFAULT NULL,
  principal    IN          VARCHAR2    DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.CREATEFILE (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  prop_flags   IN          INTEGER      DEFAULT (PROP_STD + PROP_DATA),
  store_name   IN          VARCHAR2    DEFAULT NULL,
  principal    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 48-23 CREATEFILE Procedure Parameters**

Parameter	Description
path	Name of path to the file
properties	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data with which to populate the file (optional)
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
store_name	Name of store
principal	File system user for whom the access check is made

## 48.7.5 CREATELINK Procedures

This procedure creates a new link element `srcPath` with the value of `dstPath`. The value of `dstPath` is not validated or interpreted in any way by this procedure. This is analogous to a UNIX file system symbolic link.

### Syntax

```
DBMS_DBFS_CONTENT.CREATELINK (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags   IN          INTEGER      DEFAULT PROP_STD,
```

```

store_name IN          VARCHAR2  DEFAULT NULL,
principal  IN          VARCHAR2  DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATELINK (
  srcPath    IN          VARCHAR2,
  dstPath    IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  prop_flags IN          INTEGER   DEFAULT PROP_STD,
  store_name IN          VARCHAR2  DEFAULT NULL,
  principal  IN          VARCHAR2  DEFAULT NULL);

```

## Parameters

**Table 48-24 CREATELINK Procedure Parameters**

Parameter	Description
srcPath	File system entry to create.
dstPath	Value to associate with srcPath.
properties	One or more properties and their values to be set, returned depending, or both, on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
store_name	Name of store
principal	File system user for whom the access check is made

## 48.7.6 CREATEREFERENCE Procedures

This procedure creates a physical link, srcPath, to an already existing file system element, dstPath (such as file or directory). The resulting entry shares the same metadata structures as the value of the dstPath parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

### Syntax

```

DBMS_DBFS_CONTENT.CREATEREFERENCE (
  srcPath    IN          VARCHAR2,
  dstPath    IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags IN          INTEGER   DEFAULT PROP_STD,
  store_name IN          VARCHAR2  DEFAULT NULL,
  principal  IN          VARCHAR2  DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEREFERENCE (
  srcPath    IN          VARCHAR2,
  dstPath    IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  prop_flags IN          INTEGER   DEFAULT PROP_STD,
  store_name IN          VARCHAR2  DEFAULT NULL,
  principal  IN          VARCHAR2  DEFAULT NULL);

```

## Parameters

**Table 48-25 CREATEREference Procedure Parameters**

Parameter	Description
srcPath	File system entry to create.
dstPath	Path that is the reference to srcPath.
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
store_name	Name of store
principal	File system user for whom the access check is made

## 48.7.7 DECODEFEATURES Function

Given a feature bit set integer value, this function returns a FEATURES\_T table of the feature bits as FEATURE\_T records.

### Syntax

```
DBMS_DBFS_CONTENT.DECODEFEATURES (
    featureSet      IN      INTEGER)
RETURN FEATURES_T DETERMINISTIC PIPELINED;
```

### Parameters

**Table 48-26 DECODEFEATURES Function Parameters**

Parameter	Description
featureSet	Feature set

### Return Values

[FEATURES\\_T Table Type](#)

## 48.7.8 DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

### Syntax

```
DBMS_DBFS_CONTENT.DELETECONTENT (
    store_name      IN      VARCHAR2      DEFAULT NULL,
    contentID       IN      RAW,
    filter          IN      VARCHAR2      DEFAULT NULL,
```

```

soft_delete    IN    BOOLEAN    DEFAULT NULL,
principal     IN    VARCHAR2   DEFAULT NULL);

```

### Parameters

**Table 48-27 DELETEDCONTENT Procedure Parameters**

Parameter	Description
store_name	Name of store
contentID	Unique identifier for the file to be deleted
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations).
principal	File system user for whom the access check is made

## 48.7.9 DELETEDIRECTORY Procedure

This procedure deletes a directory.

If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

### Syntax

```

DBMS_DBFS_CONTENT.DELETEDIRECTORY (
  path          IN    VARCHAR2,
  filter        IN    VARCHAR2   DEFAULT NULL,
  soft_delete   IN    BOOLEAN   DEFAULT NULL,
  recurse       IN    BOOLEAN   DEFAULT FALSE,
  store_name    IN    VARCHAR2   DEFAULT NULL,
  principal     IN    VARCHAR2   DEFAULT NULL);

```

### Parameters

**Table 48-28 DELETEDIRECTORY Procedure Parameters**

Parameter	Description
path	Name of path to the directory
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations.
recurse	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
store_name	Name of store
principal	File system user for whom the access check is made

## 48.7.10 DELETEFILE Procedure

This procedure deletes the specified file.

### Syntax

```
DBMS_DBFS_CONTENT.DELETEFILE (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  soft_delete   IN      BOOLEAN    DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 48-29** DELETEFILE Procedure Parameters

Parameter	Description
path	Name of path to the file
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations).
store_name	Name of store
principal	File system user for whom the access check is made

## 48.7.11 FEATURENAME Function

Given a feature bit, this function returns a VARCHAR2 of that feature's name.

### Syntax

```
DBMS_DBFS_CONTENT.FEATURENAME (
  featureBit    IN      INTEGER)
RETURN VARCHAR2 DETERMINISTIC;
```

### Parameters

**Table 48-30** FEATURENAME Function Parameters

Parameter	Description
featureBit	Bit representation of the feature (see <a href="#">Table 48-5</a> )

### Return Values

Name of the feature

## 48.7.12 FLUSHSTATS Function

This procedure flushes DBMS\_DBFS\_CONTENT statistics to disk.

### Syntax

```
DBMS_DBFS_CONTENT.FLUSHSTATS;
```

## 48.7.13 GETDEFAULTACL Procedure

This procedure returns the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTACL (  
    acl    OUT NOCOPY    VARCHAR2);
```

### Parameters

**Table 48-31** GETDEFAULTACL Procedure Parameters

Parameter	Description
acl	ACL for all new elements created (implicitly or explicitly) by the current operation

## 48.7.14 GETDEFAULTASOF Procedure

This procedure returns the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTASOF (  
    asof    OUT NOCOPY    TIMESTAMP);
```

### Parameters

**Table 48-32** GETDEFAULTASOF Procedure Parameters

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

## 48.7.15 GETDEFAULTCONTEXT Procedure

This procedure returns the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTCONTEXT (
  principal  OUT NOCOPY   VARCHAR2,
  owner      OUT NOCOPY   VARCHAR2,
  acl        OUT NOCOPY   VARCHAR2,
  asof       OUT NOCOPY   TIMESTAMP);
```

### Parameters

**Table 48-33 GETDEFAULTCONTEXT Procedure Parameters**

Parameter	Description
principal	Agent (principal) invoking the current operation
owner	Owner for new elements created (implicitly or explicitly) by the current operation
acl	ACL for all new elements created (implicitly or explicitly) by the current operation
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

## 48.7.16 GETDEFAULTOWNER Procedure

This procedure returns the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTOWNER (
  principal  IN   VARCHAR2);
```

### Parameters

**Table 48-34 GETDEFAULTOWNER Procedure Parameters**

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

## 48.7.17 GETDEFAULTPRINCIPAL Procedure

This procedure returns the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTPRINCIPAL (  
    principal    OUT NOCOPY    VARCHAR2);
```

### Parameters

**Table 48-35** GETDEFAULTPRINCIPAL Procedure Parameters

Parameter	Description
principal	Agent (principal) invoking the current operation

## 48.7.18 GETFEATURESBYMOUNT Function

This function returns features of a store by mount point.

### Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYMOUNT (  
    store_mount    IN    VARCHAR2)  
    RETURN INTEGER;
```

### Parameters

**Table 48-36** GETFEATURESBYMOUNT Function Parameters

Parameter	Description
store_mount	Mount point

### Return Values

A bit mask of supported features (see [FEATURES\\_T Table Type](#))

## 48.7.19 GETFEATURESBYNAME Function

This function returns features of a store by store name.

### Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYNAME (  
    store_name    IN    VARCHAR2)  
    RETURN INTEGER;
```

## Parameters

**Table 48-37** GETFEATURESBYNAME Function Parameters

Parameter	Description
store_name	Name of store

## Return Values

A bit mask of supported features (see [FEATURES\\_T Table Type](#))

## 48.7.20 GETFEATURESBYPATH Function

This function returns features of a store by path.

### Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYPATH (
    path          IN          PATH_T)
RETURN INTEGER;
```

## Parameters

**Table 48-38** GETFEATURESBYPATH Function Parameters

Parameter	Description
path	PATH_T

## Return Values

A bit mask of supported features (see [FEATURES\\_T Table Type](#))

## 48.7.21 GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the `prop_data` bitmask in `prop_flags` (see [Table 48-9](#)) or by passing one or more RAW buffers.

When `forUpdate` is 0, this procedure also accepts a valid `asof` timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATH (
    path          IN          VARCHAR2,

```

## Parameters

**Table 48-39 GETPATH Procedure Parameters**

Parameter	Description
path	Name of path to path items
properties	One or more properties and their values to be returned depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">Table 48-4</a> )
amount	On input, number of bytes to be read. On output, number of bytes read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
forUpdate	Specifies that a lock should be taken to signify exclusive write access to the path item
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.22 GETPATHBYMOUNTID Function

If the underlying GUID is found in the underlying store, this function returns the full absolute path name.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYMOUNTID (  
    store_mount      IN      VARCHAR2,  
    guid             IN      INTEGER)  
RETURN VARCHAR2;
```

### Parameters

**Table 48-40** GETPATHBYMOUNTID Function Parameters

Parameter	Description
store_mount	Mount point in which the path item with guid resides
guid	Unique ID for the path item

### Usage Notes

If the GUID is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

### Return Values

Path of the path item represented by GUID in `store_mount`

## 48.7.23 GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYSTOREID (  
    store_name      IN      VARCHAR2,  
    guid            IN      INTEGER)  
RETURN VARCHAR2;
```

### Parameters

**Table 48-41** GETPATHBYSTOREID Function Parameters

Parameter	Description
store_name	Name of store
guid	Unique ID representing the desired path item

### Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

### Return Values

Store-qualified path name represented by the GUID

## 48.7.24 GETPATHNOWAIT Procedures

This procedure implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.

See FEATURE\_NOWAIT in [Table 48-5](#) for more information.

### Syntax

```
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA),
    deref         IN          BOOLEAN      DEFAULT FALSE,
    store_name    IN          VARCHAR2     DEFAULT NULL,
    principal     IN          VARCHAR2     DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path          IN          VARCHAR2,
    properties    IN OUT NOCOPY PROPERTIES_T,
    content       OUT NOCOPY  BLOB,
    item_type     OUT          INTEGER,
    prop_flags    IN          INTEGER      DEFAULT (PROP_STD +
                                                PROP_OPT +
                                                PROP_DATA),
    deref         IN          BOOLEAN      DEFAULT FALSE,
    store_name    IN          VARCHAR2     DEFAULT NULL,
    principal     IN          VARCHAR2     DEFAULT NULL);
```

### Parameters

**Table 48-42** GETPATHNOWAIT Procedure Parameters

Parameter	Description
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">Table 48-4</a> )

**Table 48-42 (Cont.) GETPATHNOWAIT Procedure Parameters**

Parameter	Description
prop_flags	Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.25 GETSTOREBYMOUNT Function

This function returns a store by way of its name.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYMOUNT (
    store_mount      IN      VARCHAR2)
RETURN STORE_T;
```

### Parameters

**Table 48-43 GETSTOREBYMOUNT Function Parameters**

Parameter	Description
store_mount	Location at which the store instance is mounted

### Return Values

[STORE\\_T Record Type](#)

## 48.7.26 GETSTOREBYNAME Function

This function returns a store by way of its name.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYNAME (
    store_name      IN      VARCHAR2)
RETURN STORE_T;
```

## Parameters

**Table 48-44 GETSTOREBYNAME Function Parameters**

Parameter	Description
store_name	Name of store

## Return Values

[STORE\\_T Record Type](#)

## 48.7.27 GETSTOREBYPATH Function

This function returns a store by way of its path.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYPATH (
    path      IN      PATH_T)
RETURN STORE_T;
```

## Parameters

**Table 48-45 GETSTOREBYPATH Function Parameters**

Parameter	Description
path	PATH_T S

## Return Values

[STORE\\_T Record Type](#)

## 48.7.28 GETSTATS Procedure

This procedure returns information about DBMS\_DBFS\_CONTENT statistics collection.

### Syntax

```
DBMS_DBFS_CONTENT.GETSTATS (
    enabled      OUT   BOOLEAN,
    flush_time   OUT   INTEGER,
    flush_count  OUT   INTEGER);
```

## Parameters

**Table 48-46 GETSTATS Procedure Parameters**

Parameter	Description
enabled	Whether statistics collection is enabled
flush_time	How often to flush the statistics to disk in centiseconds

**Table 48-46 (Cont.) GETSTATS Procedure Parameters**

Parameter	Description
flush_count	Number of operations to allow between statistics flushes

## 48.7.29 GETTRACE Function

This function returns whether DBMS\_DBFS\_CONTENT tracing is turned on or not.

### Syntax

```
DBMS_DBFS_CONTENT.GETTRACE
RETURN INTEGER.
```

### Return Values

Returns zero if tracing is off, non-zero if tracing is on.

## 48.7.30 GETVERSION Function

This function marks each version of the DBMS\_DBFS\_CONTENT interface.

### Syntax

```
DBMS_DBFS_CONTENT.GETVERSION (
RETURN VARCHAR2;
```

### Return Values

A string enumerating the version of the DBMS\_DBFS\_CONTENT interface in standard naming convention: string: *a.b.c* corresponding to *major*, *minor*, and *patch* components.

## 48.7.31 ISPATHLOCKED Procedure

This procedure checks if any user-level locks are applied on a given path.

### Syntax

```
DBMS_DBFS_CONTENT.ISPATHLOCKED (
  path          IN    VARCHAR2,
  who           IN    VARCHAR2,
  lock_type     IN OUT INTEGER,
  store_name    IN    VARCHAR2    DEFAULT NULL,
  principal     IN    VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 48-47 ISPATHLOCKED Procedure Parameters**

Parameter	Description
path	Name of path to file items

**Table 48-47 (Cont.) ISPATHLOCKED Procedure Parameters**

Parameter	Description
who	Transaction identifier that has locked the path
lock_type	One of the available lock types (see <a href="#">Table 48-6</a> )
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.32 LIST Function

This function lists the path items in the specified path meeting the specified filter and other criteria.

### Syntax

```
DBMS_DBFS_CONTENT.LIST (
  path          IN      VARCHAR2,
  filter        IN      VARCHAR2  DEFAULT NULL,
  recurse       IN      INTEGER    DEFAULT 0,
  asof          IN      TIMESTAMP  DEFAULT NULL,
  store_name    IN      VARCHAR2  DEFAULT NULL,
  principal     IN      VARCHAR2  DEFAULT NULL)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

### Parameters

**Table 48-48 LIST Function Parameters**

Parameter	Description
path	Name of path to directories
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
store_name	Name of repository
principal	Agent (principal) invoking the current operation

### Return Values

[DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T Table Type](#)

## 48.7.33 LISTALLPROPERTIES Function

This function returns a table of all properties for all path items in all mounts.

### Syntax

```
DBMS_DBFS_CONTENT.LISTALLPROPERTIES  
  RETURN PROP_ITEMS_T PIPELINED;
```

### Return Values

[PROP\\_ITEMS\\_T Table Type](#)

## 48.7.34 LISTALLCONTENT Function

This function lists all path items in all mounts.

### Syntax

```
DBMS_DBFS_CONTENT.LISTALLCONTENT  
  RETURN PATH_ITEMS_T PIPELINED;
```

### Return Values

[PATH\\_ITEMS\\_T Table Type](#)

## 48.7.35 LISTMOUNTS Function

This function lists all available mount points, their backing stores, and the store features.

### Syntax

```
DBMS_DBFS_CONTENT.LISTMOUNTS  
  RETURN MOUNTS_T PIPELINED;
```

### Return Values

[MOUNTS\\_T Table Type](#)

### Usage Notes

A single mount results in a single returned row, with its `store_mount` field of the returned records set to `NULL`.

## 48.7.36 LISTSTORES Function

This function lists all available stores and their features.

### Syntax

```
DBMS_DBFS_CONTENT.LISTSTORES  
  RETURN STORES_T PIPELINED;
```

**Return Values****STORES\_T Table Type****Usage Notes**

The `store_mount` field of the returned records is set to `NULL` (since mount-points are separate from stores themselves).

## 48.7.37 LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

**Syntax**

```
DBMS_DBFS_CONTENT.LOCKPATH (
    path          IN    VARCHAR2,
    who           IN    VARCHAR2,
    lock_type     IN    INTEGER,
    waitForRowLock IN    INTEGER    DEFAULT 1,
    store_name    IN    VARCHAR2    DEFAULT NULL,
    principal     IN    VARCHAR2    DEFAULT NULL);
```

**Parameters****Table 48-49 LOCKPATH Procedure Parameters**

Parameter	Description
<code>path</code>	Name of path to file items
<code>who</code>	Transaction identifier that has locked the path
<code>lock_type</code>	One of the available lock types (see <a href="#">Table 48-6</a> )
<code>waitForRowLock</code>	Determines if a row is locked by a transaction or not
<code>store_name</code>	Name of store
<code>principal</code>	Agent (principal) invoking the current operation

## 48.7.38 MOUNTSTORE Procedure

This procedure mounts a previously registered store and binds it to the mount point.

**Syntax**

```
DBMS_DBFS_CONTENT.MOUNTSTORE (
    store_mount  in    VARCHAR2    DEFAULT NULL,
    singleton    in    BOOLEAN     DEFAULT FALSE,
    principal    in    VARCHAR2    DEFAULT NULL,
    owner        in    VARCHAR2    DEFAULT NULL,
    acl          in    VARCHAR2    DEFAULT NULL,
    asof         in    TIMESTAMP   DEFAULT NULL,
    read_only    in    BOOLEAN     DEFAULT FALSE);
```

## Parameters

**Table 48-50 MOUNTSTORE Procedure Parameters**

Parameter	Description
store_mount	Path name to use to mount this store
singleton	Whether the mount is a single backend store on the system
principal	Agent (principal) invoking the current operation
owner	Owner for new elements created (implicitly or explicitly) by the current operation
acl	ACL for all new elements created (implicitly or explicitly) by the current operation
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
read_only	Whether the mount is read-only

## Usage Notes

### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for information on mounting a registered store

## 48.7.39 NORMALIZEPATH Functions

This function converts a store-specific or full-absolute path name into normalized form.

It does the following:

- verifies that the path name is absolute, and so starts with "/"
- collapses multiple consecutive "/" into a single "/"
- strips trailing "/"
- breaks up a store-specific normalized path name into 2 components - parent pathname, trailing component name
- breaks up a full-absolute normalized path name into 3 components - store name, parent pathname, trailing component name

### Syntax

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
    path          IN          VARCHAR2,
    parent       OUT NOCOPY  VARCHAR2,
    tpath        OUT NOCOPY  VARCHAR2)
RETURN VARCHAR2;
```

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
    path          IN          VARCHAR2,
```

```

store_name OUT NOCOPY VARCHAR2,
parent     OUT NOCOPY VARCHAR2,
tpath     OUT NOCOPY VARCHAR2)
RETURN VARCHAR2;

```

### Parameters

**Table 48-51 NORMALIZEPATH Function Parameters**

Parameter	Description
path	Name of path to file items
store_name	Name of store
parent	Parent path name
tpath	Name of trailing path item

### Return Values

The completely normalized store-specific or full-absolute path name

## 48.7.40 PROPANY Functions

This function provides constructors that take one of a variety of types and return a PROPERTY\_T.

### Syntax

```

DBMS_DBFS_CONTENT.PROPANY (
    val     IN     NUMBER)
RETURN PROPERTY_T;

```

```

DBMS_DBFS_CONTENT.PROPANY (
    val     IN     VARCHAR2)
RETURN PROPERTY_T;

```

```

DBMS_DBFS_CONTENT.PROPANY (
    val     IN     TIMESTAMP)
RETURN PROPERTY_T;

```

```

DBMS_DBFS_CONTENT.PROPANY (
    val     IN     RAW)
RETURN PROPERTY_T;

```

### Parameters

**Table 48-52 PROPANY Function Parameters**

Parameter	Description
val	Value

### Return Values

[PROPERTY\\_T Record Type](#)

## 48.7.41 PROPERTIESH2T Function

This function converts a PROPERTY\_T hash to a DBMS\_DBFS\_CONTENT\_PROPERTIES\_T table.

### Syntax

```
DBMS_DBFS_CONTENT.PROPERTIESH2T (
    pprops      IN      PROPERTIES_T)
RETURN DBMS_DBFS_CONTENT_PROPERTIES_T;
```

### Parameters

**Table 48-53** PROPERTIESH2T Function Parameters

Parameter	Description
sprops	A PROPERTIES_T hash

### Return Values

[DBMS\\_DBFS\\_CONTENT\\_PROPERTIES\\_T Table Type](#)

## 48.7.42 PROPERTIEST2H Function

This function converts a DBMS\_DBFS\_CONTENT\_PROPERTIES\_T table to a PROPERTY\_T hash.

### Syntax

```
DBMS_DBFS_CONTENT.PROPERTIEST2H (
    sprops      IN      DBMS_DBFS_CONTENT_PROPERTIES_T)
RETURN properties_t;
```

### Parameters

**Table 48-54** PROPERTIEST2H Function Parameters

Parameter	Description
sprops	A DBMS_DBFS_CONTENT_PROPERTIES_T table

### Return Values

[PROPERTIES\\_T Table Type](#)

## 48.7.43 PROPNUMBER Function

This function is a constructor that takes a number and returns a PROPERTY\_T.

### Syntax

```
DBMS_DBFS_CONTENT.PROPNUMBER (
    val      IN      NUMBER)
RETURN PROPERTY_T;
```

## Parameters

**Table 48-55 PROPNUMBER Function Parameters**

Parameter	Description
val	Value

## Return Values

[PROPERTY\\_T Record Type](#)

## 48.7.44 PROPRAW Function

This function is a constructor that takes a RAW and returns a PROPERTY\_T.

### Syntax

```
DBMS_DBFS_CONTENT.PROPRAW (
    val      IN      RAW)
RETURN PROPERTY_T;
```

## Parameters

**Table 48-56 PROPRAW Function Parameters**

Parameter	Description
val	Value

## Return Values

[PROPERTY\\_T Record Type](#)

## 48.7.45 PROPTIMESTAMP Function

This function is a constructor that takes a TIMESTAMP and returns a PROPERTY\_T.

### Syntax

```
DBMS_DBFS_CONTENT.PROPTIMESTAMP (
    val      IN      TIMESTAMP)
RETURN PROPERTY_T;
```

## Parameters

**Table 48-57 PROPTIMESTAMP Function Parameters**

Parameter	Description
val	Value

## Return Values

[PROPERTY\\_T Record Type](#)

## 48.7.46 PROPVARCHAR2 Function

This function is a constructor that takes a VARCHAR2 and returns a PROPERTY\_T.

### Syntax

```
DBMS_DBFS_CONTENT.PROPVARCHAR2 (
    val      IN      VARCHAR2)
RETURN PROPERTY_T;
```

### Parameters

**Table 48-58** PROPNUMBER Function Parameters

Parameter	Description
val	Value

### Return Values

[PROPERTY\\_T Record Type](#)

## 48.7.47 PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT.PURGEALL (
    path      IN      VARCHAR2,
    filter    IN      VARCHAR2  DEFAULT NULL,
    store_name IN      VARCHAR2  DEFAULT NULL,
    principal IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 48-59** PURGEALL Procedure Parameters

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied based on specified criteria
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.48 PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

### Syntax

```
DBMS_DBFS_CONTENT.PURGEPATH (
  path          IN          VARCHAR2,
  filter        IN          VARCHAR2  DEFAULT NULL,
  store_name    IN          VARCHAR2  DEFAULT NULL,
  principal     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 48-60 PURGEPATH Procedure Parameters**

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.49 PUTPATH Procedures

This procedure creates a new path item.

### Syntax

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  item_type     OUT         INTEGER,
  prop_flags    IN          INTEGER  DEFAULT (PROP_STD +
                                         PROP_OPT +
                                         PROP_DATA),
  store_name    IN          VARCHAR2  DEFAULT NULL,
  principal     IN          VARCHAR2  DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  item_type     OUT         INTEGER,
  prop_flags    IN          INTEGER  DEFAULT (PROP_STD +
                                         PROP_OPT +
                                         PROP_DATA),
  store_name    IN          VARCHAR2  DEFAULT NULL,
  principal     IN          VARCHAR2  DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.PUTPATH (
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount       IN          NUMBER,
```

```

offset      IN          NUMBER,
buffer      IN          RAW,
prop_flags  IN          INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

store_name  IN          VARCHAR2  DEFAULT NULL,
principal   IN          VARCHAR2  DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  amount     IN          NUMBER,
  offset     IN          NUMBER,
  buffer     IN          RAW,
  prop_flags IN          INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

  store_name IN          VARCHAR2  DEFAULT NULL,
  principal   IN          VARCHAR2  DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  written    OUT         NUMBER,
  offset     IN          NUMBER,
  buffers    IN          DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN          INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

  store_name IN          VARCHAR2  DEFAULT NULL,
  principal   IN          VARCHAR2  DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  written    OUT         NUMBER,
  offset     IN          NUMBER,
  buffers    IN          DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN          INTEGER    DEFAULT (PROP_STD +
                                PROP_OPT),

  store_name IN          VARCHAR2  DEFAULT NULL,
  principal   IN          VARCHAR2  DEFAULT NULL);

```

## Parameters

**Table 48-61** PUTPATH Procedure Parameters

Parameter	Description
path	Name of path to file items
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">Table 48-4</a> )
amount	Number of bytes to be read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write

**Table 48-61 (Cont.) PUTPATH Procedure Parameters**

Parameter	Description
prop_flags	Determines which properties are set. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.50 REGISTERSTORE Procedure

This procedure registers a new store backed by a provider that uses a store provider (conforming to the DBMS\_DBFS\_CONTENT\_SPI package signature).

This method is to be used primarily by store providers after they have created a new store.

### Syntax

```
DBMS_DBFS_CONTENT.REGISTERSTORE (
  store_name      IN      VARCHAR2,
  provider_name   IN      VARCHAR2,
  provider_package IN      VARCHAR2);
```

### Parameters

**Table 48-62 REGISTERSTORE Procedure Parameters**

Parameter	Description
store_name	Name of store, must be unique
provider_name	Name of provider
provider_package	Store provider

## 48.7.51 RENAMEPATH Procedures

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

### Note:

See *Oracle Database SecureFiles and Large Objects Developer's Guide* for Rename and Move operations

**Syntax**

```
DBMS_DBFS_CONTENT.RENAMEPATH (
    oldPath      IN          VARCHAR2,
    newPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    store_name   IN          VARCHAR2  DEFAULT NULL,
    principal    IN          VARCHAR2  DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.RENAMEPATH (
    oldPath      IN          VARCHAR2,
    newPath      IN          VARCHAR2,
    properties   IN OUT NOCOPY PROPERTIES_T,
    store_name   IN          VARCHAR2  DEFAULT NULL,
    principal    IN          VARCHAR2  DEFAULT NULL);
```

**Parameters****Table 48-63 RENAMEPATH Procedure Parameters**

Parameter	Description
oldPath	Name of path prior to renaming
newPath	Name of path after renaming
properties	One or more properties and their values to be set depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
store_name	Name of store, must be unique
principal	Agent (principal) invoking the current operation

**48.7.52 RESTOREALL Procedure**

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

**Syntax**

```
DBMS_DBFS_CONTENT.RESTOREALL (
    path         IN          VARCHAR2,
    filter       IN          VARCHAR2  DEFAULT NULL,
    store_name   IN          VARCHAR2  DEFAULT NULL,
    principal    IN          VARCHAR2  DEFAULT NULL);
```

**Parameters****Table 48-64 RESTOREALL Procedure Parameters**

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.53 RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT.RESTOREPATH (
  path          IN          VARCHAR2,
  filter        IN          VARCHAR2  DEFAULT NULL,
  store_name    IN          VARCHAR2  DEFAULT NULL,
  principal     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 48-65 RESTOREPATH Procedure Parameters**

Parameter	Description
path	Name of path to file items
filter	A filter, if any, to be applied
store_name	Name of store
principal	Agent (principal) invoking the current operation

## 48.7.54 SETDEFAULTACL Procedure

This procedure sets the ACL parameter of the default context.

This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTACL (
  acl  IN  VARCHAR2);
```

### Parameters

**Table 48-66 SETDEFAULTACL Procedure Parameters**

Parameter	Description
acl	ACL for all new elements created (implicitly or explicitly) by the current operation

### Usage Notes

- NULL by default, this parameter can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## 48.7.55 SETDEFAULTASOF Procedure

This procedure sets the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTASOF (
    asof      IN      TIMESTAMP);
```

### Parameters

**Table 48-67 SETDEFAULTASOF Procedure Parameters**

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

### Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## 48.7.56 SETDEFAULTCONTEXT Procedure

This procedure sets the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

### Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTCONTEXT (
    principal  IN      VARCHAR2,
    owner      IN      VARCHAR2,
    acl        IN      VARCHAR2,
    asof       IN      TIMESTAMP);
```

### Parameters

**Table 48-68 SETDEFAULTCONTEXT Procedure Parameters**

Parameter	Description
principal	Agent (principal) invoking the current operation
owner	Owner for new elements created (implicitly or explicitly) by the current operation
acl	ACL for all new elements created (implicitly or explicitly) by the current operation
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

**Usage Notes**

- All of the context parameters are `NULL` by default, and be can be cleared by setting them to `NULL`.
- The context parameters, once set, remain as defaults for the duration of the session, and are inherited by all operations for which the defaults are not explicitly overridden.

## 48.7.57 SETDEFAULTOWNER Procedure

This procedure sets the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

**Syntax**

```
DBMS_DBFS_CONTENT.SETDEFAULTOWNER (
    principal    IN    VARCHAR2);
```

**Parameters****Table 48-69 SETDEFAULTOWNER Procedure Parameters**

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

**Usage Notes**

- `NULL` by default, this parameter be can be cleared by setting it to `NULL`.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## 48.7.58 SETDEFAULTPRINCIPAL Procedure

This procedure sets the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

**Syntax**

```
DBMS_DBFS_CONTENT.SETDEFAULTPRINCIPAL (
    principal    IN    VARCHAR2);
```

**Parameters****Table 48-70 SETDEFAULTPRINCIPAL Procedure Parameters**

Parameter	Description
principal	Agent (principal) invoking the current operation

### Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

## 48.7.59 SETPATH Procedures

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedure that associates an existing contentID with a new path.

### Note:

See *Oracle Database SecureFiles and Large Objects Developer's Guide for Rename and Move operations*

### Syntax

```
DBMS_DBFS_CONTENT.SETPATH (
  store_name IN          VARCHAR2,
  contentID  IN          RAW,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  principal  IN          VARCHAR2  DEFAULT NULL);
```

```
DBMS_DBFS_CONTENT.SETPATH (
  store_name IN          VARCHAR2,
  contentID  IN          RAW,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY PROPERTIES_T,
  principal  IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 48-71 SETPATH Procedure Parameters**

Parameter	Description
store_name	Name of the store
contentID	Unique identifier for the item to be associated
path	Name of path to path item
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
principal	Agent (principal) invoking the current operation

## 48.7.60 SETSTATS Procedure

This procedure enables and disables statistics collection.

The client can optionally control the flush settings by specifying non-NULL values for the time, count or both parameters.

### Syntax

```
DBMS_DBFS_CONTENT.SETSTATS (
  enable          IN    BOOLEAN,
  flush_time      IN    INTEGER,
  flush_count     IN    INTEGER);
```

### Parameters

**Table 48-72 SETSTATS Procedure Parameters**

Parameter	Description
enable	If TRUE, enable statistics collection. If FALSE, disable statistics collection.
flush_time	How often to flush the statistics to disk in centiseconds
flush_count	Number of operations to allow between statistics flushes

### Usage Notes

The SETSTATS Procedure buffers statistics in-memory for a maximum of `flush_time` centiseconds or a maximum of `flush_count` operations (whichever limit is reached first), or both, at which time the buffers are implicitly flushed to disk.

## 48.7.61 SETTRACE Procedure

This procedure sets the DBMS\_DBFS\_CONTENT tracing severity to the given level, 0 being "off".

### Syntax

```
DBMS_DBFS_CONTENT.SETTRACE
  trclvl          IN    INTEGER);
```

### Parameters

**Table 48-73 SETTRACE Procedure Parameters**

Parameter	Description
trclvl	Level of the tracing, higher values implying more tracing

## 48.7.62 SPACEUSAGE Procedure

This procedure queries file system space usage statistics.

Providers are expected to support this subprogram for their stores (and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on).

### Syntax

```
DBMS_DBFS_CONTENT.SPACEUSAGE (
  path          IN          VARCHAR2,
  blksize      OUT         INTEGER,
  tbytes       OUT         INTEGER,
  fbytes       OUT         INTEGER,
  nfile        OUT         INTEGER,
  ndir         OUT         INTEGER,
  nlink        OUT         INTEGER,
  nref         OUT         INTEGER,
  store_name   IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 48-74** SPACEUSAGE Procedure Parameters

Parameter	Description
path	Name of path to file items
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store
store_name	Name of store

### Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

## 48.7.63 TRACE Procedure

This procedure outputs tracing to the current foreground trace file.

### Syntax

```
DBMS_DBFS_CONTENT.TRACE
  sev          IN          INTEGER,
  msg0         IN          VARCHAR2,
  msg1         IN          VARCHAR   DEFAULT '',
  msg2         IN          VARCHAR   DEFAULT '',
  msg3         IN          VARCHAR   DEFAULT '',
  msg4         IN          VARCHAR   DEFAULT '',
  msg5         IN          VARCHAR   DEFAULT '',
  msg6         IN          VARCHAR   DEFAULT '',
  msg7         IN          VARCHAR   DEFAULT '',
  msg8         IN          VARCHAR   DEFAULT '',
  msg9         IN          VARCHAR   DEFAULT '',
  msg10        IN          VARCHAR   DEFAULT '' );
```

### Parameters

**Table 48-75 TRACE Procedure Parameters**

Parameter	Description
sev	Severity at which trace message is output
msg*	One or more message strings to be output. If more than one message is specified, all are output.

### Usage Notes

- Trace information is written to the foreground trace file, with varying levels of detail as specified by the trace level arguments.
- The global trace level consists of 2 components: "severity" and "detail". These can be thought of as additive bitmasks.

The "severity" allows the separation of top level as compared to low-level tracing of different components, and allows the amount of tracing to be increased as needed. There are no semantics associated with different levels, and users are free to set trace at any severity they choose, although a good rule of thumb would use severity "1" for top level API entry and exit traces, "2" for internal operations, and "3" or greater for very low-level traces.

The "detail" controls how much additional information: timestamps, short-stack, etc. is dumped along with each trace record.

## 48.7.64 TRACEENABLED Function

This function determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level.

### Syntax

```
DBMS_DBFS_CONTENT.TRACEENABLED(
    sev          IN          INTEGER)
RETURN INTEGER;
```

### Parameters

**Table 48-76** TRACEENABLED Procedure Parameters

Parameter	Description
sev	Severity at which trace message is output

### Return Values

Returns 0 if the requested severity level is lower than the currently set trace severity level; 1 otherwise.

### Related Topics

- [SETTRACE Procedure](#)  
This procedure sets the DBMS\_DBFS\_CONTENT tracing severity to the given level, 0 being "off".

## 48.7.65 UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

### Syntax

```
DBMS_DBFS_CONTENT.UNLOCKPATH (
    path          IN          VARCHAR2,
    who           IN          VARCHAR2,
    waitForRowLock IN        INTEGER    DEFAULT 1,
    store_name    IN          VARCHAR2  DEFAULT NULL,
    principal     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 48-77** UNLOCKPATH Procedure Parameters

Parameter	Description
path	Name of path to file items
who	Transaction identifier that has locked the path
waitForRowLock	Determines if a row is locked by a transaction or not
store_name	Name of store

**Table 48-77 (Cont.) UNLOCKPATH Procedure Parameters**

Parameter	Description
principal	Agent (principal) invoking the current operation

**Related Topics**

- [LOCKPATH Procedure](#)  
This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

## 48.7.66 UNMOUNTSTORE Procedure

This procedure unmounts a registered store, either by name or by mount point.

**Syntax**

```
DBMS_DBFS_CONTENT.UNMOUNTSTORE (
  store_name      IN      VARCHAR2  DEFAULT NULL,
  store_mount     IN      VARCHAR2  DEFAULT NULL,
  ignore_unknown  IN      BOOLEAN    DEFAULT FALSE);
```

**Parameters****Table 48-78 UNMOUNTSTORE Procedure Parameters**

Parameter	Description
store_name	Name of store
store_mount	Location at which the store instance is mounted
ignore_unknown	If TRUE, attempts to unregister unknown stores will not raise an exception.

**Usage Notes** **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on unmounting a previously unmounted store

## 48.7.67 UNREGISTERSTORE Procedure

This procedure unregisters a previously registered store (invalidating all mount points associated with it).

**Syntax**

```
DBMS_DBFS_CONTENT.UNREGISTERSTORE (
  store_name      IN      VARCHAR2,
  ignore_unknown  IN      BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 48-79 UNREGISTERSTORE Procedure Parameters**

Parameter	Description
store_name	Name of store
ignore_unknown	If TRUE, attempts to unregister unknown stores will not raise an exception.

## Usage Notes

- Once unregistered all access to the store (and its mount points) are not guaranteed to work
- If the `ignore_unknown` argument is TRUE, attempts to unregister unknown stores do not raise an exception.

# DBMS\_DBFS\_CONTENT\_SPI

The `DBMS_DBFS_CONTENT_SPI` package is a specification for `DBMS_DBFS_CONTENT` store providers, which must be implemented. Application designers can create PL/SQL packages conforming to this specification to extend `DBMS_DBFS_CONTENT` to use custom store providers.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_DBFS\\_CONTENT\\_SPI Subprograms](#)

## Related Topics

- [DBMS\\_DBFS\\_CONTENT](#)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

### See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide*

## 49.1 ODBMS\_DBFS\_CONTENT\_SPI Overview

The `DBMS_DBFS_CONTENT_SPI` package describes an internal contract between the implementation of the `DBMS_DBFS_CONTENT` interface and individual store providers, and whichever package contains their code.

Since PL/SQL does not allow a compile-time, declarative type-conformation between package signatures, store providers should informally conform to the SPI, which is to say, they should implement the SPI by means of a package that contains all of the methods specified in package `DBMS_DBFS_CONTENT_SPI`, with the same method signatures and semantics.

Obviously, these provider packages can implement other methods and expose other interfaces, however, these interfaces are not to be used by the `DBMS_DBFS_CONTENT` interface itself.

Since the provider SPI is merely a contract specification, there is no package body for `DBMS_DBFS_CONTENT_SPI`, and it is not possible to actually invoke any methods using this package.

The SPI references various elements (constants, types, exceptions) defined by the `DBMS_DBFS_CONTENT` interface.

Additionally, there is an almost one-to-one correspondence between the client API exported by the `DBMS_DBFS_CONTENT` interface and the provider interface that the `DBMS_DBFS_CONTENT` interface itself expects to work against.

The main distinction in the method naming conventions is that all path name references are always store-qualified. That is, the notion of mount-points and full-absolute path names have been normalized and converted to store-qualified path names by the `DBMS_DBFS_CONTENT` interface before it invokes any of the provider SPI methods.

Since the interconnection of the `DBMS_DBFS_CONTENT` interface and the provider SPI is a 1-to-many pluggable architecture, and the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

### Related Topics

- [DBMS\\_DBFS\\_CONTENT](#)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## 49.2 DBMS\_DBFS\_CONTENT\_SPI Security Model

Implementations of the `DBMS_DBFS_CONTENT_SPI` package should be created as `AUTHID CURRENT_USER`.

## 49.3 DBMS\_DBFS\_CONTENT\_SPI Operational Notes

This topic lists operational notes for `DBMS_DBFS_CONTENT_SPI` implementation, path names, and other operations.

- [Implementation](#)
- [Path Names](#)
- [Other DBMS\\_DBFS\\_CONTENT Operations](#)

### Implementation

Since the interconnection of the `DBMS_DBFS_CONTENT` interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a store provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

### Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in [Table 48-5](#)) also support a form of addressing that is not

based on path names. Content items are identified by an explicit store name, a NULL path name, and possibly a contentID specified as a parameter or by way of the OPT\_CONTENT\_ID (see [Table 48-8](#)) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

### Other DBMS\_DBFS\_CONTENT Operations

This table lists other operations and provides links to related discussions.

**Table 49-1 Other DBMS\_DBFS\_CONTENT Operations**

Other Operations	See ...
Creation	<i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on creation operations
Deletion	<i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on deletion operations
Get (Retrieve) and Put (Insert)	<i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Get and Put operations
Rename and Move	<i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Rename and Move operations
Directory Navigation and Search	<i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Navigation and Search operations
Locking	<i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Locking operations
Access Check	<i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> for further information on Access Check operations

## 49.4 Summary of DBMS\_DBFS\_CONTENT\_SPI Subprograms

This table lists and describes the subprograms used in the DBMS\_DBFS\_CONTENT\_SPI Package.

**Table 49-2 DBMS\_DBFS\_CONTENT\_SPI Package Subprograms**

Subprogram	Description
<a href="#">CHECKACCESS Function</a>	Reports if the user (principal) can perform the specified operation on the given path
<a href="#">CREATEDIRECTORY Procedure</a>	Creates a directory
<a href="#">CREATEFILE Procedure</a>	Creates a file
<a href="#">CREATELINK Procedure</a>	Creates a physical link to an already existing file system element
<a href="#">CREATEREFERENCE Procedure</a>	Creates a new reference to the source file system element
<a href="#">DELETECONTENT Procedure</a>	Deletes the file specified by the given contentID

**Table 49-2 (Cont.) DBMS\_DBFS\_CONTENT\_SPI Package Subprograms**

Subprogram	Description
<a href="#">DELETEDIRECTORY Procedure</a>	Deletes a directory
<a href="#">DELETEFILE Procedure</a>	Deletes a file
<a href="#">GETFEATURES Function</a>	Returns the features of a store
<a href="#">GETPATH Procedures</a>	Returns existing path items (such as files and directories)
<a href="#">GETPATHBYSTOREID Function</a>	If the underlying GUID is found in the underlying store, returns the store-qualified path name
<a href="#">GETPATHNOWAIT Procedure</a>	Implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.
<a href="#">GETSTOREID Function</a>	Returns the ID of a store
<a href="#">GETVERSION Function</a>	Returns the version associated with a store
<a href="#">LIST Function</a>	Lists the contents of a directory path name
<a href="#">LOCKPATH Procedure</a>	Applies user-level locks to the given valid path name
<a href="#">PURGEALL Procedure</a>	Purges all soft-deleted entries matching the path and optional filter criteria
<a href="#">PURGEPATH Procedure</a>	Purges any soft-deleted versions of the given path item
<a href="#">PUTPATH Procedures</a>	Creates a new path item
<a href="#">RENAMEPATH Procedure</a>	Renames or moves a path
<a href="#">RESTOREALL Procedure</a>	Restores all soft-deleted path items meeting the path and filter criteria
<a href="#">RESTOREPATH Procedure</a>	Restores all soft-deleted path items that match the given path and filter criteria
<a href="#">SEARCH Function</a>	Searches for path items matching the given path and filter criteria
<a href="#">SETPATH Procedure</a>	Assigns a path name to a path item represented by contentID
<a href="#">SPACEUSAGE Procedure</a>	Queries file system space usage statistics
<a href="#">UNLOCKPATH Procedure</a>	Unlocks path items that were previously locked with the <a href="#">LOCKPATH Procedure</a>

## 49.4.1 CHECKACCESS Function

This function reports if the user (*principal*) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.CHECKACCESS (
  store_name      IN      VARCHAR2  DEFAULT NULL,
  path            IN      VARCHAR2,
  pathtype       IN      INTEGER,
  operation       IN      VARCHAR2,
```

```
principal    IN    VARCHAR2)
RETURN INTEGER;
```

### Parameters

**Table 49-3 CHECKACCESS Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to check for access
pathtype	Type of object path represents (see <a href="#">Table 48-4</a> )
operation	Operation to be checked (see <a href="#">Table 48-8</a> )
principal	File system user for whom the access check is made

### Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

## 49.4.2 CREATEDIRECTORY Procedure

This procedure creates a directory.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEDIRECTORY (
  store_name IN          VARCHAR2,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags IN          INTEGER,
  recurse    IN          INTEGER,
  ctx        IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 49-4 CREATEDIRECTORY Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the directory
properties	One or more properties and their values to be set, returned, or both, depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>PROP_SPC</code> (see <a href="#">Table 48-9</a> ), and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
recurse	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory

**Table 49-4 (Cont.) CREATEDIRECTORY Procedure Parameters**

Parameter	Description
ctx	Context with which to create the directory (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

### 49.4.3 CREATEFILE Procedure

This procedure creates a file.

#### Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEFILE (
  store_name  IN          VARCHAR2,
  path        IN          VARCHAR2,
  properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content     IN OUT NOCOPY BLOB,
  prop_flags  IN          INTEGER,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

#### Parameters

**Table 49-5 CREATEFILE Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the file
properties	One or more properties and their values to be set, returned or both depending, or both on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data with which to populate the file (optional)
prop_flags	Determines which properties are set, returned, or both. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
ctx	Context with which to create the file (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

### 49.4.4 CREATELINK Procedure

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the `srcPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

#### Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATELINK (
  store_name  IN          VARCHAR2,
  srcPath     IN          VARCHAR2,
```

```

dstPath      IN          VARCHAR2,
properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
prop_flags   IN          INTEGER,
ctx          IN          DBMS_DBFS_CONTENT_CONTEXT_T);

```

### Parameters

**Table 49-6 CREATELINK Procedure Parameters**

Parameter	Description
store_name	Name of store
srcPath	File system entry with which to link
dstPath	Path of the new link element to be created
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
ctx	Context with which to create the link (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.5 CREATEREFERENCE Procedure

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

### Syntax

```

DBMS_DBFS_CONTENT_SPI.CREATEREFERENCE (
  srcPath      IN          VARCHAR2,
  dstPath      IN          VARCHAR2,
  properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  prop_flags   IN          INTEGER,
  store_name   IN          VARCHAR2,
  ctx          IN          DBMS_DBFS_CONTENT_CONTEXT_T);

```

### Parameters

**Table 49-7 CREATEREFERENCE Procedure Parameters**

Parameter	Description
store_name	Name of store
srcPath	File system entry with which to link
dstPath	Path of the new link element to be created

**Table 49-7 (Cont.) CREATEREference Procedure Parameters**

Parameter	Description
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
ctx	Context with which to create the reference (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.6 DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETECONTENT (
    store_name      IN      VARCHAR2,
    contentID      IN      RAW,
    filter          IN      VARCHAR2,
    soft_delete    IN      INTEGER,
    ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 49-8 DELETECONTENT Procedure Parameters**

Parameter	Description
store_name	Name of store
contentID	Unique identifier for the file to be deleted
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations).
ctx	Context with which to delete the file (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.7 DELETEDIRECTORY Procedure

This procedure deletes a directory.

If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

**Syntax**

```

DBMS_DBFS_CONTENT_SPI.DELETEDIRECTORY (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  soft_delete IN   INTEGER,
  recurse     IN   INTEGER,
  ctx         IN   DBMS_DBFS_CONTENT_CONTEXT_T);

```

**Parameters****Table 49-9 DELETEDIRECTORY Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the directory
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations).
recurse	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
ctx	Context with which to delete the directory (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.8 DELETEFILE Procedure

This procedure deletes the specified file.

**Syntax**

```

DBMS_DBFS_CONTENT_SPI.DELETEFILE (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  soft_delete IN   BOOLEAN,
  ctx         IN   DBMS_DBFS_CONTENT_CONTEXT_T);

```

**Parameters****Table 49-10 DELETEFILE Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the file
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i> , Deletion Operations).

**Table 49-10 (Cont.) DELETEFILE Procedure Parameters**

Parameter	Description
ctx	Context with which to delete the file (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.9 GETFEATURES Function

This function returns the features of a store.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETFEATURES (
    store_name      IN      VARCHAR2)
RETURN INTEGER;
```

### Parameters

**Table 49-11 GETFEATURES Function Parameters**

Parameter	Description
store_name	Name of store

### Return Values

DBMS\_DBFS\_CONTENT.FEATURE\_\* features supported by the Store Provider

## 49.4.10 GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the `prop_data` bitmask in `prop_flags` (see [Table 48-9](#)) or by passing one or more RAW buffers.

When `forUpdate` is 0, this procedure also accepts a valid "as of" timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the `GETPATH` Procedures do not support these modes of operation.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATH (
    store_name  IN      VARCHAR2,
    path        IN      VARCHAR2,
    properties  IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content     OUT     NOCOPY BLOB,
    item_type   OUT     INTEGER,
    prop_flags  IN      INTEGER,
    forUpdate   IN      INTEGER,
    deref       IN      INTEGER,
    ctx         IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

```

DBMS_DBFS_CONTENT_SPI.GETPATH (
  store_name IN          VARCHAR2,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount     IN OUT      NUMBER,
  offset     IN          NUMBER,
  buffer     OUT NOCOPY  RAW,
  prop_flags IN          INTEGER,
  ctx       IN          DBMS_DBFS_CONTENT_CONTEXT_T);

```

```

DBMS_DBFS_CONTENT_SPI.GETPATH (
  store_name IN          VARCHAR2,
  path       IN          VARCHAR2,
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount     IN OUT      NUMBER,
  offset     IN          NUMBER,
  buffers    OUT NOCOPY  DBMS_DBFS_CONTENT_RAW_T,
  prop_flags IN          INTEGER,
  ctx       IN          DBMS_DBFS_CONTENT_CONTEXT_T);

```

## Parameters

**Table 49-12** GETPATH Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">Table 48-4</a> )
amount	On input, number of bytes to be read. On output, number of bytes read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
forUpdate	Specifies that a lock should be taken to signify exclusive write access to the path item
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.11 GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHBYSTOREID (
    store_name      IN      VARCHAR2,
    guid            IN      INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 49-13** GETPATHBYSTOREID Function Parameters

Parameter	Description
store_name	Name of store
guid	Unique ID representing the desired path item

### Return Values

Store-qualified path name represented by the GUID

### Usage Notes

If the `STD_GUID` is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

## 49.4.12 GETPATHNOWAIT Procedure

This procedure implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.

See `FEATURE_NOWAIT` in [Table 48-5](#) for more information.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHNOWAIT (
    store_name      IN      VARCHAR2,
    path            IN      VARCHAR2,
    properties      IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    content         OUT      NOCOPY BLOB,
    item_type       OUT      INTEGER,
    prop_flags      IN      INTEGER,
    deref           IN      INTEGER,
    ctx             IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

## Parameters

**Table 49-14** GETPATHNOWAIT Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">Table 48-4</a> )
prop_flags	Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.13 GETSTOREID Function

This function returns the ID of a store.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETSTOREID (
    store_name      IN      VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 49-15** GETSTOREID Function Parameters

Parameter	Description
store_name	Name of store

### Return Values

ID of the Store

### Usage Notes

A store ID identifies a provider-specific store, across registrations and mounts, but independent of changes to the store contents. For this reason, changes to the store table or tables should be reflected in the store ID, but re-initialization of the same store table or tables should preserve the store ID.

## 49.4.14 GETVERSION Function

This function returns the version associated with a store.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.GETVERSION (
    store_name      IN      VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 49-16** GETVERSION Function Parameters

Parameter	Description
store_name	Name of store

### Return Values

A "version" (either specific to a provider package, or to an individual store) based on a standard *a.b.c* naming convention (for *major*, *minor*, and *patch* components)

## 49.4.15 ISPATHLOCKED Procedure

This procedure checks if any user-level locks are applied on a given path.

### Syntax

```
DBMS_DBFS_CONTENT.ISPATHLOCKED (
    store_name      IN      VARCHAR2,
    path            IN      VARCHAR2,
    who             IN      VARCHAR2,
    lock_type       IN OUT  INTEGER,
    ctx             IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 49-17** ISPATHLOCKED Procedure Parameters

Parameter	Description
store_name	Name of store
path	Path name of items to be locked
who	Transaction identifier that has locked the path
lock_type	One of the available lock types (see <a href="#">Table 48-6</a> )
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.16 LIST Function

This function lists the contents of a directory path name.

The invoker of the subprogram has the option to investigate recursively into sub-directories, to make soft-deleted items visible, to use a flashback "as of" a specified timestamp, and to filter items within the store based on list predicates.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.LIST (
  store_name  IN    VARCHAR2,
  path        IN    VARCHAR2,
  filter      IN    VARCHAR2,
  recurse     IN    INTEGER,
  ctx         IN    DBMS_DBFS_CONTENT_CONTEXT_T)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

### Parameters

**Table 49-18 LIST Function Parameters**

Parameter	Description
store_name	Name of repository
path	Name of path to directories
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

### Return Values

Path items found that match the path, filter and criteria for executing recursively (see [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T Table Type](#))

### Usage Notes

This function returns only list items; the client is expected to explicitly use one of the [GETPATH Procedures](#) to access the properties or content associated with an item.

## 49.4.17 LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.LOCKPATH (
  store_name  IN    VARCHAR2,
  path        IN    VARCHAR2,
  who         IN    VARCHAR2,
  lock_type   IN    INTEGER,
```

```
waitForRowLock IN    INTEGER,
ctx            IN    DBMS_DBFS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 49-19 LOCKPATH Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Path name of items to be locked
who	Transaction identifier that has locked the path
lock_type	One of the available lock types (see <a href="#">Table 48-6</a> )
waitForRowLock	Determines if a row is locked by a transaction or not
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

### Usage Notes

- It is the responsibility of the store and its providers (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.
- The status of locked items is available by means of various optional properties (see `OPT_LOCK*` in [Table 48-8](#)).

## 49.4.18 PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEALL (
  store_name  IN    VARCHAR2,
  path       IN    VARCHAR2,
  filter     IN    VARCHAR2,
  ctx       IN    DBMS_DBFS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 49-20 PURGEALL Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to file items
filter	A filter, if any, to be applied based on specified criteria
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.19 PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEPATH (
  path          IN          VARCHAR2,
  filter        IN          VARCHAR2,
  store_name    IN          VARCHAR2,
  ctx           IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 49-21 PURGEPATH Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to file items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.20 PUTPATH Procedures

This procedure creates a new path item.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name    IN          VARCHAR2,
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  content       IN OUT NOCOPY BLOB,
  item_type     OUT          INTEGER,
  prop_flags    IN          INTEGER,
  ctx           IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name    IN          VARCHAR2,
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  amount       IN          NUMBER,
  offset        IN          NUMBER,
  buffer        IN          RAW,
  prop_flags    IN          INTEGER,
  ctx           IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
  store_name    IN          VARCHAR2,
  path          IN          VARCHAR2,
  properties    IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  written       OUT         NUMBER,
  offset        IN          NUMBER,
```

```

buffers      IN          DBMS_DBFS_CONTENT_RAW_T,
prop_flags  IN          INTEGER,
ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T ;

```

## Parameters

**Table 49-22 PUTPATH Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Path name of item to be put
properties	One or more properties and their values to be set depending on <code>prop_flags</code> (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see <a href="#">Table 48-4</a> )
amount	Number of bytes to be read
written	Number of bytes written
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set. Default is <code>PROP_STD</code> . Specify properties to be returned by setting <code>prop_spec</code> , and providing an instance of the <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> with properties whose values are of interest.
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## Usage Notes

- All path names allow their metadata (properties) to be read and modified. On completion of the call, the client can access specific properties using `prop_flags` (see [Table 48-9](#)).
- On completion of the call, the client can request a new BLOB locator that can be used to continue data access using the `prop_data` bitmask in `prop_flags` (see [Table 48-9](#)).
- Files can also be written without using BLOB locators, by explicitly specifying logical offsets or buffer-amounts, and a suitably sized buffer.

## 49.4.21 RENAMEPATH Procedure

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

 **Note:**

See *Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on Rename and Move operations

### Syntax

```
DBMS_DBFS_CONTENT_SPI.RENAMEPATH (
  store_name      IN          VARCHAR2,
  oldPath         IN          VARCHAR2,
  newPath         IN          VARCHAR2,
  properties      IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  ctx             IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

### Parameters

**Table 49-23 RENAMEPATH Procedure Parameters**

Parameter	Description
store_name	Name of store, must be unique
oldPath	Name of path prior to renaming
newPath	Name of path after renaming
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.22 RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREALL (
  store_name      IN          VARCHAR2,
  path            IN          VARCHAR2,
  filter          IN          VARCHAR2,
  ctx             IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

## Parameters

**Table 49-24 RESTOREALL Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to path items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.23 RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREPATH (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  ctx         IN   DBMS_DBFS_CONTENT_CONTEXT_T);
```

## Parameters

**Table 49-25 RESTOREPATH Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to path items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.24 SEARCH Function

This function searches for path items matching the given path and filter criteria.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.SEARCH (
  store_name  IN   VARCHAR2,
  path        IN   VARCHAR2,
  filter      IN   VARCHAR2,
  recurse     IN   INTEGER,
  ctx         IN   DBMS_DBFS_CONTENT_CONTEXT_T)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

## Parameters

**Table 49-26 LIST Function Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the path items
filter	A filter, if any, to be applied
recurse	If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory.
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## Return Values

Path items matching the given path and filter criteria (see [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T Table Type](#))

## 49.4.25 SETPATH Procedure

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedure that associates an existing contentID with a new path.

### Note:

See *Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on Rename and Move operations

## Syntax

```
DBMS_DBFS_CONTENT_SPI.SETPATH (
  store_name    IN          VARCHAR2,
  contentID    IN          RAW,
  path         IN          VARCHAR2,
  properties   IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  ctx         IN          DBMS_DBFS_CONTENT_CONTEXT_T);
```

## Parameters

**Table 49-27 SETPATH Procedure Parameters**

Parameter	Description
store_name	Name of the store
contentID	Unique identifier for the item to be associated
path	Name of path to path item

**Table 49-27 (Cont.) SETPATH Procedure Parameters**

Parameter	Description
properties	One or more properties and their values to be set depending on prop_flags (see <a href="#">DBMS_DBFS_CONTENT_PROPERTIES_T Table Type</a> )
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

## 49.4.26 SPACEUSAGE Procedure

This procedure queries file system space usage statistics.

Providers are expected to support this subprogram for their stores and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on.

### Syntax

```
DBMS_DBFS_CONTENT_SPI.SPACEUSAGE (
  store_name  IN      VARCHAR2,
  blksize    OUT     INTEGER,
  tbytes     OUT     INTEGER,
  fbytes     OUT     INTEGER,
  nfile      OUT     INTEGER,
  ndir       OUT     INTEGER,
  nlink      OUT     INTEGER,
  nref       OUT     INTEGER);
```

### Parameters

**Table 49-28 SPACEUSAGE Procedure Parameters**

Parameter	Description
store_name	Name of store
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store

**Usage Notes**

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, it is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

## 49.4.27 UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

**Syntax**

```
DBMS_DBFS_CONTENT_SPI.UNLOCKPATH (
  store_name      IN      VARCHAR2,
  path            IN      VARCHAR2,
  who             IN      VARCHAR2,
  waitForRowLock IN      INTEGER,
  ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

**Parameters****Table 49-29 UNLOCKPATH Procedure Parameters**

Parameter	Description
store_name	Name of store
path	Name of path to the path items
who	Transaction identifier that has locked the path
waitForRowLock	Determines if a row is locked by a transaction or not
ctx	Context with which to access the path items (see <a href="#">DBMS_DBFS_CONTENT_CONTEXT_T Object Type</a> )

**Related Topics**

- [LOCKPATH Procedure](#)  
This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

# 50

## DBMS\_DBFS\_HS

The Oracle Database File System Hierarchical Store is implemented in the `DBMS_DBFS_HS` package. This package provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Summary of DBMS\\_DBFS\\_HS Subprograms](#)

### See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide*

## 50.1 DBMS\_DBFS\_HS Overview

The `DBMS_DBFS_HS` package is a service provider underneath the `DBMS_DBFS_CONTENT` package that enables use of tape or Amazon S3 Web service as storage for data.

The data on tape or Amazon S3 Web service is part of the Oracle Database and can be accessed through all standard interfaces, but only through the database. The package allows users to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management of their content.

The package initially stores all content files in level-1 cache. As the level-1 cache fills up, content files are moved to level-2 cache and then to an external storage device using bulk writes.

## 50.2 DBMS\_DBFS\_HS Security Model

The `DBMS_DBFS_HS` package runs with invoker's rights.

## 50.3 DBMS\_DBFS\_HS Constants

The `DBMS_DBFS_HS` package uses the constants shown in the tables in this topic.

**Table 50-1 DBMS\_DBFS\_HS Constants - Used by the CREATESTORE Procedure**

Constant	Type	Value	Description
STORETYPE_TAPE	VARCHAR2(50)	'HS_TAPE'	Use tape as a storage tier
STORETYPE_AMAZO NS3	VARCHAR2(50)	'HS_S3'	Use Amazon S3 Web service as a storage tier

**Table 50-2 DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPNAME_BUCKET	VARCHAR2(50)	'BUCKET'	Specifies the AWS bucket to be used as a storage tier by the Hierarchical Store.  Restrictions on bucket name are: 1) Bucket names can only contain lowercase letters, numbers, periods (.) and dashes(-). Note that underscores (_) are invalid. 2) Bucket names must start with a number or letter. 3) Bucket names cannot be in an IP address style (192.168.5.4). 4) Bucket names must be between 3 and 63 characters long. 5) Bucket names should not end with a dash. 6) Dashes cannot appear next to periods. For example, my- .bucket .com is invalid.
PROPNAME_CACHES IZE	VARCHAR2(50)	'CACHE_SIZE'	Specifies the cumulative cache size used for the Hierarchical Store. This property is set by the <a href="#">CREATESTORE Procedure</a> and can be modified by the <a href="#">RECONFIGCACHE Procedure</a> . It cannot be modified by the <a href="#">SETSTOREPROPERTY Procedure</a> , though its value can be queried by the <a href="#">GETSTOREPROPERTY Function</a> .
PROPNAME_COMPRE SSLEVEL	VARCHAR2(50)	'COMPRESSION_ LEVEL'	Use to enable compression of files stored in the DBFS hierarchical store. It specifies the compression level to be used for compressing the files

**Table 50-2 (Cont.) DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPNAME_ENABLE CLEANUPONDELETE	VARCHAR2(50)	'ENABLE_CLEAN UP_ON_DELETE'	If this property is set to 'TRUE', whenever the user invokes the <a href="#">DELETEFILE Procedure</a> in the <a href="#">DBMS_DBFS_CONTENT</a> interface on a file residing in the <a href="#">DBMS_DBFS_HS</a> store, the <a href="#">DBMS_DBFS_HS</a> removes the file on the external storage that contains this user file, provided that the file has no other useful data. By default, the property is set to 'TRUE' for <a href="#">STORETYPE_AMAZONS3</a> and 'FALSE' for <a href="#">STORETYPE_TAPE</a> .
PROPNAME_HTTPPR OXY	VARCHAR2(50)	'HTTP_PROXY'	Specifies the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service
PROPNAME_LICENS EID	VARCHAR2(50)	'LICENSE_ID'	Specifies the license ID associated with the library <code>libosbws11.so</code> .
PROPNAME_LOBCAC HE_QUOTA	VARCHAR2(50)	'LOBCACHE_QUO TA'	Specifies fraction of the <code>cache_size</code> which is allocated for level 1 cache. The default value of this parameter is <code>NULL</code> which means that 0.8 (= 80%) of the <code>cache_size</code> is used for level 1 cache.  This property cannot be modified by the <a href="#">SETSTOREPROPERTY Procedure</a> though its value can be queried by the <a href="#">GETSTOREPROPERTY Function</a> . Its value is set by <a href="#">CREATESTORE Procedure</a> and can be modified by the <a href="#">RECONFIGCACHE Procedure</a> .
PROPNAME_MEDIAP OOL	VARCHAR2(50)	'MEDIA_POOL'	Specifies the media pool number to use for storing the content
PROPVAL_COMPLVL _NONE	VARCHAR2(50)	'NONE'	Indicates no compression
PROPVAL_COMPLVL _LOW	VARCHAR2(50)	'LOW'	Use to set the compression level to <code>LOW</code> . This is expected to have the best performance while still providing a good compression ratio.
PROPVAL_COMPLVL _MEDIUM	VARCHAR2(50)	'MEDIUM'	Use to set the compression level to <code>MEDIUM</code> . This compression level is expected to provide better compression ratio than <code>LOW</code> but the time required for compression will be higher than compression level <code>LOW</code> .

**Table 50-2 (Cont.) DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPVAL_COMPLVL_HIGH	VARCHAR2(50)	'HIGH'	Use to set the compression level to HIGH. This compression level is expected to provide the best compression ratio but compression time will in general be highest among the 3 compression levels.
PROPNAME_OPTTARBALLSIZE	VARCHAR2(50)	'OPTIMAL_TARBALL_SIZE'	Specifies <code>optimal_tarball_size</code> as the maximum possible size of an archive file.  Multiple content files are bundled together into one archive file and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation.  This property cannot be modified by the <a href="#">SETSTOREPROPERTY Procedure</a> though its value can be queried by the <a href="#">GETSTOREPROPERTY Function</a> . Its value is set by <a href="#">CREATESTORE Procedure</a> and can be modified by the <a href="#">RECONFIGCACHE Procedure</a> .
PROPNAME_READCHUNKSIZE	VARCHAR2(50)	'READ_CHUNK_SIZE'	Specifies the size used by the SBT protocol to transfer data from tape or S3. This chunk is allocated in memory per transaction for retrieval of content files from an archive store, so the value of this property should be conservative. The default size of 1MB is typically good for most users.
PROPNAME_S3HOST	VARCHAR2(50)	'S3_HOST'	Specifies the HOST name of the Amazon S3 storage service. It must be <code>s3.amazonaws.com</code> .
PROPNAME_SBT_LIBRARY	VARCHAR2(50)	'SBT_LIBRARY'	Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named <code>libosbws11.so</code> and is available in <code>rdbms/lib</code> directory.
PROPNAME_STREAMABLE	VARCHAR2(50)	'STREAMABLE'	Indicates whether buffer-based PUT or GET should be done on this store. Valid values for are TRUE and FALSE. The default value of this property is TRUE.

**Table 50-2 (Cont.) DBMS\_DBFS\_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function**

Constant	Type	Value	Description
PROPNAME_WALLET	VARCHAR2(50)	'WALLET'	<p>The value of this property should be of the form:</p> <p><i>LOCATION=file:filename</i>  <i>CREDENTIAL_ALIAS=access/secret_alias</i>  <i>PROXY_AUTH_ALIAS=proxyusername/password alias</i></p> <p>Defines the Oracle Wallet which contains the credentials of the Amazon S3 account associated with the store under consideration.</p> <p><b>LOCATION:</b> The directory path that contains the Oracle wallet. The format is <i>file:directory-path</i></p> <p>The format of <i>wallet_path</i> in Windows is, for example:  <i>file:c:\WINNT\Profiles\username\WALLETS</i></p> <p>In UNIX or Linux it is, for example:  <i>file:/home/username/wallets</i></p> <p>When the package is executed in the Oracle database server, the wallet is accessed from the database server.</p> <p><b>PASSWORD:</b> Defines the wallet password. If auto-login is enabled in wallet (this can be changed using the OWM utility), this parameter does not have to be specified. By default, the <i>mkstore</i> utility enables auto-login.</p> <p><b>CREDENTIAL_ALIAS:</b> Defines the credential alias for <i>ACCESS_KEY</i> and <i>SECRET_KEY</i></p>
PROPNAME_WRITEC HUNKSIZ	VARCHAR2(50)	'WRITE_CHUNK_ SIZE'	<p>Specifies the size used by the SBT protocol to transfer data to tape or S3.</p> <p>This chunk is allocated in memory per transaction for PUT of Content Files to an archive store so the value should be conservative.</p> <p>The default size of 1MB is typically good for most users.</p>

**Table 50-3 DBMS\_DBFS\_HS Constants - Used by the REGISTERSTORECOMMAND Function**

Constant	Type	Value	Description
BEFORE_PUT	NUMBER	'1'	Specified operation must be performed before writing a SECUREFILE to the remote store
BEFORE_GET	NUMBER	'2'	Specified operation must be performed before a retrieval operation such as reading a SECUREFILE from the remote device

**Table 50-4 DBMS\_DBFS\_HS Constants - Failure/Success/Error**

Constant	Type	Value	Description
FAIL	NUMBER	'0'	Procedure or function did not execute successfully
SUCCESS	NUMBER	'1'	Procedure or function completed successfully
ERROR	NUMBER	'2'	Procedure or function returned an error

## 50.4 DBMS\_DBFS\_HS Operational Notes

When the DBMS\_DBFS\_HS package is executed in the Oracle database server, the wallet is accessed from the database server.

## 50.5 Summary of DBMS\_DBFS\_HS Subprograms

This table lists and describes the subprograms in the DBMS\_DBFS\_HS package.

**Table 50-5 DBMS\_DBFS\_HS Package Subprograms**

Subprogram	Description
<a href="#">CLEANUPUNUSEDBACKUPFILES Procedure</a>	Removes files created on the external storage device that hold no currently used data
<a href="#">CREATEBUCKET Procedure</a>	Creates an AWS bucket, associated with a store of type STORETYPE_AMAZONS3 into which the Hierarchical Store can then move data
<a href="#">CREATESTORE Procedure</a>	Creates a new hierarchical store
<a href="#">DEREGSTORECOMMAND Function</a>	Removes a command that had been previously associated with a store through the <a href="#">RECONFIGCACHE Procedure</a>
<a href="#">DROPSTORE Procedure</a>	Deletes a previously created hierarchical store
<a href="#">FLUSHCACHE Procedure</a>	Flushes (writes out) dirty contents from the level-1 cache.
<a href="#">GETSTOREPROPERTY Function</a>	Retrieves the values of a property of a store

**Table 50-5 (Cont.) DBMS\_DBFS\_HS Package Subprograms**

Subprogram	Description
<a href="#">RECONFIGCACHE Procedure</a>	Reconfigures the parameters of the database cache used by the store
<a href="#">REGISTERSTORECOMMAND Procedure</a>	Registers commands for a store with the Hierarchical Store to be sent to the Media Manager for the external storage device associated with the store
<a href="#">SENDCOMMAND Procedures</a>	Sends a command to be executed on the external storage device's Media Manager
<a href="#">SETSTOREPROPERTY Procedure</a>	Stores properties of a store in the database
<a href="#">STOREPUSH Procedure</a>	Pushes locally staged data to the remote storage

## 50.5.1 CLEANUPUNUSEDBACKUPFILES Procedure

This procedure removes files created on the external storage device that hold no currently used data in them.

### Syntax

```
DBMS_DBFS_HS.CLEANUPUNUSEDBACKUPFILES (
    store_name    IN    VARCHAR2);
```

### Parameters

**Table 50-6 CLEANUPUNUSEDBACKUPFILES Procedure Parameters**

Parameter	Description
store_name	Name of store

### Usage Notes

- The action of removing files from external storage device can not be rolled back.
- This method can be executed periodically to clear space on the external storage device. Asynchronously deleting content from the external storage device is useful because it has minimal impact on the OLTP performance. The periodic scheduling can be accomplished using the DBMS\_SCHEDULER package.

## 50.5.2 CREATEBUCKET Procedure

This procedure creates an AWS bucket, associated with a store of type STORETYPE\_AMAZONS3 into which the Hierarchical Store can then move data.

### Syntax

```
DBMS_DBFS_HS.CREATEBUCKET (
    store_name    IN    VARCHAR2);
```

## Parameters

**Table 50-7 CREATEBUCKET Procedure Parameters**

Parameter	Description
store_name	Name of store

## Usage Notes

- The PROPNAME\_BUCKET property of the store should be set before this subprogram is called.
- Once this procedure has successfully created a bucket in Amazon S3, the bucket can only be deleted using out-of-band methods, such as logging-in to S3 and deleting data (directories, files, and other items) for the bucket.

## 50.5.3 CREATESTORE Procedure

This procedure creates a new hierarchical store `store_name` of type `STORE_TYPE` (`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`) in schema `schema_name` (defaulting to the current schema) under the ownership of the invoking session user.

## Syntax

```
DBMS_DBFS_HS.CREATESTORE (
  store_name      IN      VARCHAR2,
  store_type      IN      VARCHAR2,
  tbl_name        IN      VARCHAR2,
  tbs_name        IN      VARCHAR2,
  cache_size      IN      NUMBER,
  lob_cache_quota IN      NUMBER DEFAULT NULL,
  optimal_tarball_size IN    NUMBER DEFAULT NULL,
  schema_name     IN      VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 50-8 CREATESTORE Procedure Parameters**

Parameter	Description
store_name	Name of store
store_type	STORETYPE_TAPE or STORETYPE_AMAZONS3
tbl_name	Table for store entries
tbs_name	Tablespace for the store
cache_size	Amount of space used by the store to cache content in given tablespace
lob_cache_quota	Fraction of the cache_size which is allocated for level 1 cache. The default value of this parameter is NULL which means that 0.8 (= 80%) of the cache_size is used for level 1 cache.

**Table 50-8 (Cont.) CREATESTORE Procedure Parameters**

Parameter	Description
<code>optimal_tarball_size</code>	Maximum possible size of the archive file. Multiple content files are bundled together into one archive file, and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. The value of is set by default to 10GB for tape and to 100MB for Amazon S3.
<code>schema_name</code>	Schema for the store

**Usage Notes**

`CREATESTORE()` sets certain properties of the store to default values. The user can use the methods `SETSTOREPROPERTY()` and `RECONFIGCACHE()` to appropriately change the property values and to set other properties of the store.

- Store names must be unique for an owner. The same store names can be used for different stores owned by different owners.
- Once a table space has been specified to store the store's content in a database, it cannot be changed later.
- This subprogram will execute like a DDL statement, performing an automatic `COMMIT` before and after execution.
- Stores using `DBMS_DBFS_HS` must not use singleton mount. This means that the singleton parameter should be `FALSE` and the `store_mount` parameter should have a non-NULL value in a call to the `DBMS_DBFS_CONTENT.MOUNTSTORE` procedure.

## 50.5.4 DEREGSTORECOMMAND Function

This procedure removes a command that had been previously associated with a store through the `REGISTERSTORECOMMAND` Procedure.

**Syntax**

```
DBMS_DBFS_HS.DEREGSTORECOMMAND (
  store_name      IN      VARCHAR2,
  message         IN      VARCHAR2);
```

**Parameters****Table 50-9 DEREGSTORECOMMAND Procedure Parameters**

Parameter	Description
<code>store_name</code>	Name of store
<code>message</code>	Message to be deregistered

### Usage Notes

If this subprogram successfully executes, its actions cannot be rolled back by the user. If the user wants to restore the previous state, the user must call the [REGISTERSTORECOMMAND Procedure](#).

### Related Topics

- [REGISTERSTORECOMMAND Procedure](#)  
This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

## 50.5.5 DROPSTORE Procedure

This procedure deletes a previously created hierarchical store specified by name and owned by the invoking session user.

### Syntax

```
DBMS_DBFS_HS.DROPSTORE (
  store_name  IN  VARCHAR2,
  opt_flags   IN  INTEGER DEFAULT 0);
```

### Parameters

**Table 50-10 DROPSTORE Procedure Parameters**

Parameter	Description
store_name	Name of store owned by the invoking session user
opt_flags	User can specify optional flags. If <code>DISABLE_CLEANUPBACKUPFILES</code> is specified as one of the optional flags, the call to the <a href="#">CLEANUPUNUSEDBACKUPFILES Procedure</a> is not issued. By default, when this flag is not set, the procedure implicitly cleans-up all unused backup files.

### Usage Notes

- The procedure executes like a DDL in that it auto-commits before and after its execution.
- If `CLEANUPBACKUPFILES` is disabled during the procedure, the user must resort to out-of-band techniques to cleanup unused backup files. No further invocations of `CLEANUPBACKFILES` for a dropped store are possible through hierarchical store.
- This subprogram will un-register the store from `DBMS_DBFS_CONTENT` package. All files in the given store are deleted from the store (Tape or Amazon S3 Web service). The database table holding the store's entries in the database, is also dropped by this subprogram.

## 50.5.6 FLUSHCACHE Procedure

This procedure flushes out dirty contents from level-1 cache, which can be locked, to level-2 cache, thereby freeing-up space in level 1 cache.

### Syntax

```
DBMS_DBFS_HS.FLUSHCACHE (
    store_name    IN    VARCHAR2);
```

### Parameters

**Table 50-11 FLUSHCACHE Procedure Parameters**

Parameter	Description
store_name	Name of store

## 50.5.7 GETSTOREPROPERTY Function

This function retrieves the values of a property.

### Syntax

```
DBMS_DBFS_HS.GETSTOREPROPERTY (
    store_name    IN    VARCHAR2,
    property_name IN    VARCHAR2,
    noexcp       IN    BOOLEAN DEFAULT FALSE) RETURN VARCHAR2;
```

### Parameters

**Table 50-12 GETSTOREPROPERTY Function Parameters**

Parameter	Description
store_name	Name of store
property_name	Name of property
noexcp	If set to FALSE, raises an exception if the property does not exist in the database. If noexcp is set to TRUE, returns NULL if the property does not exist.

### Return Values

The values of a property.

### Usage Notes

The specified store must already have been created.

## 50.5.8 RECONFIGCACHE Procedure

This procedure reconfigures the parameters of the database cache being used by the store.

### Syntax

```
DBMS_DBFS_HS.RECONFIGCACHE (
  store_name          IN  VARCHAR2,
  cache_size         IN  NUMBER DEFAULT NULL,
  lobcache_quota     IN  NUMBER DEFAULT NULL,
  optimal_tarball_size IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 50-13 RECONFIGCACHE Procedure Parameters**

Parameter	Description
store_name	Name of store
cache_size	Cumulative cache size used for the Hierarchical Store
lobcache_quota	Fraction of the cache size that are assigned to level 1 cache
optimal_tarball_size	Maximum possible size of an archive file. Since creating one file for every content file in the store is a prohibitively expensive operation, multiple content files are bundled together into one archive file for transfer to tape or Amazon S3.

### Usage Notes

- The specified store must already have been created before reconfiguration.
- The Hierarchical Store uses a level 1 cache and a level 2 cache. The level 1 cache subsumes most of the working set and the level 2 cache is used to perform bulk writes to the backend device.
- If any of the last 3 parameters is NULL, its value specified during store creation is used. If the parameter was NULL when the call to the [CREATESTORE Procedure](#) was issued, the DBMS\_DBFS\_HS package assigns a default value.

The DBMS\_DBFS\_HS package optimistically tries to allocate more than 1 tarball's worth of size for level 2 cache to facilitate concurrency, though a minimum of 1 tarball size is necessary for level 2 cache.

The values for cumulative cache size and LOB cache quota decide allocation of space for the two caches. If values are not provided, a user might see an `INSUFFICIENT_CACHE` exception. In that case, it is better to revise the cache parameters in order to have a working store.

- If this subprogram successfully executes, its actions cannot be rolled back by the user. In that case, the user should call `RECONFIGCACHE` again with new or modified parameters.

## 50.5.9 REGISTERSTORECOMMAND Procedure

This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

### Syntax

```
DBMS_DBFS_HS.REGISTERSTORECOMMAND (  
    store_name    IN    VARCHAR2,  
    message      IN    VARCHAR2,  
    flags        IN    NUMBER);
```

### Parameters

**Table 50-14 REGISTERSTORECOMMAND Procedure Parameters**

Parameter	Description
store_name	Name of store
message	Message to be sent to the Media Manager of the external store
flags	Valid values: <ul style="list-style-type: none"><li>BEFORE_PUT CONSTANT NUMBER := 1;</li><li>BEFORE_GET CONSTANT NUMBER := 2;</li></ul>

### Usage Notes

- These commands are sent before the next read or write of content. When the Hierarchical Store wants to push (or get) data to (or from) the storage device, it begins a session (to communicate with the device). After beginning the session, it sends all registered commands for the to the relevant device before writing (or getting) any data.
- If this method successfully executes, its actions cannot be rolled back by the user. To restore the previous state the user must call the [DEREGSTORECOMMAND Function](#).

## 50.5.10 SENDCOMMAND Procedure

This procedure sends a command to be executed on the external storage device's Media Manager.

### Syntax

```
DBMS_DBFS_HS.SENDCOMMAND (  
    store_name    IN    VARCHAR2,  
    message      IN    VARCHAR2);
```

## Parameters

**Table 50-15 SENDCOMMAND Procedure Parameters**

Parameter	Description
store_name	Name of store
message	Message string to be executed

## 50.5.11 SETSTOREPROPERTY Procedure

This procedure stores properties of a store in the database as name-value pairs.

### Syntax

```
DBMS_DBFS_HS.SETSTOREPROPERTY (
    store_name      IN    VARCHAR2,
    property_name   IN    VARCHAR2,
    property_value  IN    VARCHAR2);
```

## Parameters

**Table 50-16 SETSTOREPROPERTY Procedure Parameters**

Parameter	Description
store_name	Name of store
property_name	For a store using Tape device, there are three properties whose values must be set by the user, and four properties that have default values. Stores of type STORETYPE_AMAZONS3 have properties with default values. The various options for both types of stores are detailed under <code>property_value</code> .

**Table 50-16 (Cont.) SETSTOREPROPERTY Procedure Parameters**

Parameter	Description
property_value	<p data-bbox="764 342 1073 367"><b>Stores using a Tape Device</b></p> <p data-bbox="764 375 1430 401">The values for the following properties must be set by the user:</p> <ul data-bbox="764 415 1455 632" style="list-style-type: none"> <li data-bbox="764 415 1455 499">• PROPNAME_SBTLIBRARY - This should point to the shared library used by RMAN to communicate with the external tape device. It is usually named libobk.so.</li> <li data-bbox="764 512 1455 564">• PROPNAME_MEDIAPool - Media pool number for storing content</li> <li data-bbox="764 577 1455 632">• PROPNAME_CACHE_SIZE - Amount of space, in bytes, used for the cache of this store</li> </ul> <p data-bbox="764 640 1430 693">The following properties, which have default values assigned to them when a store is created, benefit from tuning:</p> <ul data-bbox="764 707 1455 1268" style="list-style-type: none"> <li data-bbox="764 707 1455 852">• PROPNAME_READCHUNKSIZE and PROPNAME_WRITECHUNKSIZE - These are the sizes used by the SBT protocol to transfer data to and from the tapes. These chunks are allocated in memory per transaction, so the values should be conservative. The default size is 1MB.</li> <li data-bbox="764 865 1455 980">• PROPNAME_STREAMABLE – Indicates whether DBFS_LINKS can perform read operations (for example SELECT or DBMS_LOB.READ) directly from the store, or if the data must be copied back into the database before it can be read</li> <li data-bbox="764 993 1455 1108">• PROPNAME_ENABLECLEANUPONDELETE - Indicates if DBMS_DBFS_HS should delete unused files on the external storage. Valid values for this property are 'FALSE' for STORETYPE_TAPE.</li> <li data-bbox="764 1121 1455 1268">• PROPNAME_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.</li> </ul>

**Table 50-16 (Cont.) SETSTOREPROPERTY Procedure Parameters**

Parameter	Description
(cont) <code>property_value</code>	<p><b>Stores of type STORETYPE_AMAZONS3</b></p> <p>It is mandatory that the following properties have assigned values, and default values are provided:</p> <ul style="list-style-type: none"> <li>• <code>PROPNAME_SBTLIBRARY</code> - Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named <code>libosbws11.so</code> and is available in <code>rdbms/lib</code> directory.</li> <li>• <code>PROPNAME_S3HOST</code> - Defines the HOST name of the Amazon S3 storage service. It must be <code>s3.amazonaws.com</code>.</li> <li>• <code>PROPNAME_BUCKET</code> - Defines the AWS bucket used as a storage tier by the Hierarchical Store. Restrictions on bucket names are: <ul style="list-style-type: none"> <li>-- Bucket names can only contain lowercase letters, numbers, periods (.) and dashes (-). Use of an underscore (_) is invalid.</li> <li>-- Bucket names must start with a number or letter</li> <li>-- Bucket names cannot be in an IP address style ("192.168.5.4")</li> <li>-- Bucket names must be between 3 and 63 characters in length</li> <li>-- Bucket names should not end with a dash</li> <li>-- Dashes cannot appear next to periods. For example, "my-.bucket.com" is invalid.</li> </ul> </li> <li>• <code>PROPNAME_LICENSEID</code> - Specifies the license ID associated with the library <code>libosbws11.so</code>.</li> <li>• <code>PROPNAME_WALLET</code> - Has the form: <pre>'LOCATION=file:&lt;filename&gt; CREDENTIAL_ALIAS=&lt;access/secret_alias&gt; PROXY_AUTH_ALIAS=&lt;proxyusername/password alias&gt;'</pre> <ul style="list-style-type: none"> <li>-- <code>LOCATION</code> - Directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>. See <a href="#">Examples</a> for variations in format.</li> <li>-- <code>PASSWORD</code> - Defines the wallet password. If <code>auto-login</code> is enabled in the wallet (this can be changed using the user's own utility), and does not have to be specified. By default, the <code>mkstore</code> utility enables <code>auto-login</code>.</li> <li>-- <code>CREDENTIAL_ALIAS</code> - Defines the credential alias for <code>ACCESS_KEY</code> and <code>SECRET_KEY</code></li> <li>-- <code>PROXY_AUTH_ALIAS</code> - Defines authentication credentials for the proxy server, if applicable.</li> </ul> </li> </ul>

**Table 50-16 (Cont.) SETSTOREPROPERTY Procedure Parameters**

Parameter	Description
(property_value (contd.))	<p>The following properties are optional:</p> <ul style="list-style-type: none"> <li>• PROPNAME_HTTPPROXY - Defines the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service.</li> <li>• PROPNAME_STREAMABLE – Indicates whether buffer-based PUT or GET operation should be done on this store. Valid values for this property are TRUE (default) and FALSE.</li> <li>• PROPNAME_ENABLECLEANUPONDELETE - Indicates if DBMS_DBFS_HS should delete unused files on the external storage device. Default values for this property are FALSE for STORETYPE_TAPE and TRUE for STORETYPE_AMAZONS3.</li> <li>• PROPNAME_COMPRESSLEVEL - Describes how files written to tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.</li> </ul>

#### Usage Notes

- The specified store must already have been created.
- If this subprogram successfully executes, its actions cannot be rolled back by the user.
- The same property can be set multiple times to the same or different values using this subprogram
- Regarding PROPNAME\_ENABLECLEANUPONDELETE behavior, a job is created for each store by the DBMS\_DBFS\_HS to remove the unused files from the external storage. By default, the job is enabled for STORETYPE\_AMAZONS3 and is disabled for STORETYPE\_TAPE. If the ENABLECLEANUPONDELETE property is set to TRUE, the job is enabled; if the property is set to FALSE, the job is disabled. If enabled, the job runs at an interval of one hour by default. The DBMS\_SCHEDULER package can be used to modify the schedule. The name of the job can be obtained by querying USER\_DBFS\_HS\_FIXED\_PROPERTIES for prop\_name = 'DELJOB\_NAME'.

#### Examples

##### Format

The format of wallet\_path in Windows is, for example:

```
file:c:\WINNT\Profiles\\WALLETS
```

The format of wallet\_path in UNIX or Linux is, for example:

```
file:/home/username/wallets
```

## 50.5.12 STOREPUSH Procedure

This procedure pushes locally staged data to the remote storage.

### Syntax

```
DBMS_DBFS_HS.STOREPUSH (
    store_name  IN      VARCHAR2,
    path        IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 50-17 STOREPUSH Procedure Parameters**

Parameter	Description
store_name	Name of store whose content the client writes from local cache to the external store
path	A non-mount qualified (without mount point) path within the store. By default, its value is NULL which corresponds to the root path of the store.

### Usage Notes

- The Hierarchical Store caches the content files locally in database tables. When enough content is amassed in the cache to make it efficient to write to the external storage device (or the cache is completely filled), the Hierarchical Store creates a tarball out of the local content and writes these tarballs as files on the external device. The size of the tarball created by the Hierarchical Store is controlled by the store property `PROPNAME_OPTTARBALLSIZE`.
- When the amount of free space in the cache is such that the caching of a content file will push the space used above `cache_size`, the Hierarchical Store will internally call `STOREPUSH`. The `STOREPUSH` Procedure creates tarball(s) out of the existing dirty or modified content files in the cache and writes them out to the external device. A `STOREPUSH` call is not guaranteed to write all the dirty content from local cache to the external storage, since some files may be locked by other sessions.
- `STOREPUSH` has a built-in ability feature allowing it to automatically resume operation. If a `STOREPUSH` call is interrupted (say by a network outage) after it has transferred some tarballs to the external device, it can be restarted after the outage and will then resume transferring data from the point it was interrupted. In other words, work done before the outage is not lost. `STOREPUSH` can safely be restarted and the effect is such as if the outage never occurred.
- If this method successfully executes, its actions cannot be rolled back by the user.
- By default, when `path` is NULL, all files in the store are candidates for `STOREPUSH`. If `path` has a valid input value, all files which are under the namespace of given `path` are written from the local cache to the external store. If a given path is an existing file, it is pushed out again to the remote store.

# 51

## DBMS\_DBFS\_SFS

The `DBMS_DBFS_SFS` package provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the `DBMS_DBFS_CONTENT` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_DBFS\\_SFS Subprograms](#)

### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide*

### 51.1 DBMS\_DBFS\_SFS Overview

The `DBMS_DBFS_SFS` package is a sample implementation of a package that implements and extends the `DBMS_DBFS_CONTENT_SPI` interface. It provides a POSIX-compliant file system stored in the RDBMS.

### 51.2 DBMS\_DBFS\_SFS Security Model

The `DBMS_DBFS_SFS` package runs with `AUTHID CURRENT_USER`.

### 51.3 DBMS\_DBFS\_SFS Constants

The `DBMS_DBFS_SFS` package uses the constants shown in the following tables.

- [Table 51-1](#)
- [Table 51-2](#)
- [Table 51-3](#)
- [Table 51-4](#)

**Table 51-1 DBMS\_DBFS\_SFS Constants - Compression Levels**

Constant	Type	Value	Description
<code>COMPRESSION_DEFAU LT</code>	<code>VARCHAR2(32)</code>	<code>' '</code>	Use the default SecureFile compression level
<code>COMPRESSION_LOW</code>	<code>VARCHAR2(32)</code>	<code>'LOW'</code>	Use compression level 'LOW'

**Table 51-1 (Cont.) DBMS\_DBFS\_SFS Constants - Compression Levels**

Constant	Type	Value	Description
COMPRESSION_MEDIUM	VARCHAR2(32)	'MEDIUM'	Use compression level 'MEDIUM'
COMPRESSION_HIGH	VARCHAR2(32)	'HIGH'	Use compression level 'HIGH'

**Table 51-2 DBMS\_DBFS\_SFS Constants - Used by the encryption Parameter**

Constant	Type	Value	Description
ENCRYPTION_DEFAULT	VARCHAR2(32)	' '	Use the default SecureFile encryption algorithm
ENCRYPTION_3DES168	VARCHAR2(32)	'3DES168'	Use encryption 3DES 168 bit
ENCRYPTION_AES128	VARCHAR2(32)	'AES128'	Use encryption AES 128 bit
ENCRYPTION_AES192	VARCHAR2(32)	'AES192'	Use encryption AES 192 bit
ENCRYPTION_AES256	VARCHAR2(32)	'AES256'	Use encryption AES 256 bit

**Table 51-3 DBMS\_DBFS\_SFS Constants - Used by the npartitions Parameter**

Constant	Type	Value	Description
DEFAULT_PARTITIONS	INTEGER	16	Default to 16 partitions

**Table 51-4 DBMS\_DBFS\_SFS Constants - Used by the partition\_key Parameter**

Constant	Type	Value	Description
PARTITION_BY_ITEM	INTEGER	1	Use a hash of the item name for the partition key
PARTITION_BY_PATH	INTEGER	2	Use a hash of the path name for the partition key
PARTITION_BY_GUID	INTEGER	3	Use a hash of the GUID as the partition key

## 51.4 Summary of DBMS\_DBFS\_SFS Subprograms

This table lists and describes the DBMS\_DBFS\_SFS Package subprograms.

**Table 51-5 DBMS\_DBFS\_SFS Package Subprograms**

Subprogram	Description
<a href="#">CREATEFILESYSTEM Procedure</a>	Creates a file system store
<a href="#">CREATESTORE Procedure</a>	Creates a new DBFS SFS store
<a href="#">DROPFILESYSTEM Procedures</a>	Drops the DBFS SFS store
<a href="#">INITFS Procedure</a>	Initializes a POSIX file system store

## 51.4.1 CREATEFILESYSTEM Procedure

This procedure creates a file system store.

### Syntax

```
DBMS_DBFS_SFS.CREATEFILESYSTEM (
  store_name          IN      VARCHAR2,
  schema_name        IN      VARCHAR2  DEFAULT NULL,
  tbl_name           IN      VARCHAR2  DEFAULT NULL,
  tbl_tbs            IN      VARCHAR2  DEFAULT NULL,
  lob_tbs            IN      VARCHAR2  DEFAULT NULL,
  use_bf             IN      BOOLEAN   DEFAULT FALSE,
  properties         IN      DBMS_DBFS_CONTENT_PROPERTIES_T DEFAULT NULL,
  create_only        IN      BOOLEAN   FALSE,
  use_objects        IN      BOOLEAN   DEFAULT FALSE,
  with_grants        IN      BOOLEAN   DEFAULT FALSE,
  do_dedup           IN      BOOLEAN   DEFAULT FALSE,
  do_compress        IN      BOOLEAN   DEFAULT FALSE,
  compression        IN      VARCHAR2  DEFAULT COMPRESSION_DEFAULT,
  do_encrypt         IN      BOOLEAN   DEFAULT FALSE,
  encryption         IN      VARCHAR2  DEFAULT ENCRYPTION_DEFAULT,
  do_partition       IN      BOOLEAN   DEFAULT FALSE,
  npartitions        IN      NUMBER    DEFAULTDEFAULT_PARTITIONS,
  partition_key      IN      NUMBER    DEFAULT PARTITION_BY_ITEM,
  partition_guidi    IN      BOOLEAN   DEFAULT FALSE,
  partition_pathi    IN      BOOLEAN   DEFAULT FALSE,
  partition_prop     IN      BOOLEAN   DEFAULT TRUE);
```

### Parameters

**Table 51-6 CREATEFILESYSTEM Procedure Parameters**

Parameter	Description
store_name	Name of store
schema_name	Schema for the store, defaulting to the current schema
tbl_name	Table for store entries. If not specified, an internally generated name is used.
tbl_tb	Tablespace for the store, defaulting to the schema's default tablespace
lob_tbs	Tablespace in which to create the LOB segment. It defaults to the user's default tablespace.

**Table 51-6 (Cont.) CREATEFILESYSTEM Procedure Parameters**

Parameter	Description
use_bf	If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.
properties	Table of (name, value, typecode) tuples used to configure the store properties. Currently no such properties are defined or used.
create_only	If TRUE, the file system is created, but not registered with the current user
use_objects	If TRUE, a single base-table with an object-type column (using a nested table) is created to backup the new file system. Otherwise, a pair of (parent, child) tables is used to backup the file system. In both cases, the object type nested table or the child table is used only for user-defined properties.
with_grants	If TRUE, DML and query access permissions are granted to the DBFS_ROLE as part of creating the file system. Otherwise, explicit grants (or existing permissions) are required to access the file system.
do_dedup	If TRUE, do deduplication the underlying SecureFile column
do_compress	If TRUE, do compression the underlying SecureFile column
compression	Compression algorithm to use (see <a href="#">Table 51-1</a> )
do_encrypt	If TRUE, encrypt the underlying SecureFile column
encryption	encryption algorithm to use (see <a href="#">Table 51-2</a> )
do_partition	If TRUE, partition the table used for storage
npartitions	Number of partitions to create for the table (see <a href="#">Table 51-3</a> ).
partition_key	How to partition the table: by item name, by path name, or by GUID (see <a href="#">Table 51-4</a> ).
partition_guidi	If TRUE, build an index on GUID
partition_pathi	If TRUE, build an index on path name
partition_prop	If TRUE, partition the properties table

### Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

## 51.4.2 CREATESTORE Procedure

This procedure creates a new DBFS SFS store owned by the invoking session user.

### Syntax

```
DBMS_DBFS_SFS.CREATESTORE (
    store_name      IN      VARCHAR2,
    tbl_name        IN      VARCHAR2  DEFAULT NULL,
    tbs_name        IN      VARCHAR2  DEFAULT NULL,
```

```

use_bf      in      BOOLEAN  DEFAULT FALSE,
stgopts     in      VARCHAR2 DEFAULT '';

```

### Parameters

**Table 51-7 CREATESTORE Procedure Parameters**

Parameter	Description
store_name	Name of store
store_type	STORETYPE_TAPE or STORETYPE_AMAZONS3
tbl_name	Placeholder for the store content cached in database
tbs_name	Named tablespace
use_bf	If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.
stgopts	Currently non-operational, reserved for future use

## 51.4.3 DROPFILESYSYSTEM Procedures

This procedure drops the DBFS SFS store, purging all dictionary information associated with the store, and dropping the underlying file system table.

### Syntax

```

DBMS_DBFS_SFS.DROPFILESYSYSTEM (
  schema_name  IN      VARCHAR2 DEFAULT NULL,
  tbl_name     IN      INTEGER);

DBMS_DBFS_SFS.DROPFILESYSYSTEM (
  store_name   IN      VARCHAR2);

```

### Parameters

**Table 51-8 DROPFILESYSYSTEM Procedure Parameters**

Parameter	Description
schema_name	Name of schema
tbl_name	Name of tablespace
store_name	Name of store path

### Usage Notes

- If the specified store table is registered by the current user, it will be unregistered from the content interface described in the `DBMS_DBFS_CONTENT` package and the POSIX metadata tables.
- Subsequent to unregistration, an attempt will be made to store table(s). This operation may fail if other users are currently using this store table.
- The user attempting a drop of the tables underlying the store must actually have the privileges to complete the drop operation (either as the owner of the tables, or as a sufficiently privileged user for cross-schema operations).

- The procedure executes like a DDL in that it auto-commits before and after its execution.

## 51.4.4 INITFS Procedure

This procedure initialize a POSIX file system store. The table associated with the POSIX file system store `store_name` is truncated and reinitialized with a single "root" directory entry.

### Syntax

```
DBMS_DBFS_SFS.INITFS (  
    store_name      IN      VARCHAR2);
```

### Parameters

**Table 51-9** INITFS Procedure Parameters

Parameter	Description
<code>store_name</code>	Name of store

### Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

# 52

## DBMS\_DDL

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_DDL Subprograms](#)

### 52.1 DBMS\_DDL Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with release Oracle Database 10g:

- [ALTER\\_COMPILE Procedure](#)

### 52.2 DBMS\_DDL Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.

### 52.3 DBMS\_DDL Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

### 52.4 Summary of DBMS\_DDL Subprograms

This table lists the `DBMS_DDL` subprograms in alphabetical order and briefly describes them.

**Table 52-1** *DBMS\_DDL Package Subprograms*

Subprogram	Description
<a href="#">ALTER_COMPILE Procedure</a>	Compiles the PL/SQL object
<a href="#">ALTER_TABLE_NOT_REFERENCEABLE Procedure</a>	Reorganizes object tables

**Table 52-1 (Cont.) DBMS\_DDL Package Subprograms**

Subprogram	Description
<a href="#">ALTER_TABLE_REFERENCEABLE Procedure</a>	Reorganizes object tables
<a href="#">CREATE_WRAPPED Procedures</a>	Takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement
<a href="#">IS_TRIGGER_FIRE_ONCE Function</a>	Returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, returns FALSE
<a href="#">SET_TRIGGER_FIRING_PROPERTY Procedures</a>	Sets the specified DML or DDL trigger's firing property
<a href="#">WRAP Functions</a>	Takes as input a CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated

## 52.4.1 ALTER\_COMPILE Procedure

This procedure is equivalent to the SQL statement: ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]

### Note:

This procedure is deprecated in Oracle Database 10g Release 2 (10.2). While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

### Syntax

```
DBMS_DDL.ALTER_COMPILE (
    type          VARCHAR2,
    schema        VARCHAR2,
    name          VARCHAR2
    reuse_settings BOOLEAN := FALSE);
```

## Parameters

**Table 52-2 ALTER\_COMPILE Procedure Parameters**

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

## Exceptions

**Table 52-3 ALTER\_COMPILE Procedure Exceptions**

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

## 52.4.2 ALTER\_TABLE\_NOT\_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`.

This is equivalent to SQL:

```
ALTER TABLE [<table_schema>.<table_name>] NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

### Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
    table_name      IN          VARCHAR2,
    table_schema    IN DEFAULT  NULL,
    affected_schema IN DEFAULT  NULL);
```

## Parameters

**Table 52-4 ALTER\_TABLE\_NOT\_REFERENCEABLE Procedure Parameters**

Parameter	Description
table_name	Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.

**Table 52-4 (Cont.) ALTER\_TABLE\_NOT\_REFERENCEABLE Procedure Parameters**

Parameter	Description
table_schema	Name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
affected_schema	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

**Usage Notes**

This procedure simply reverts for the affected schema to the default table referenceable for PUBLIC; that is., it simply undoes the previous ALTER\_TABLE\_REFERENCEABLE call for this specific schema. The affected schema must a particular schema (cannot be PUBLIC).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has ALTER ANY TABLE and SELECT ANY TABLE and DROP ANY TABLE privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

## 52.4.3 ALTER\_TABLE\_REFERENCEABLE Procedure

This procedure alters the given object table table\_schema.table\_name so it becomes the referenceable table for the given schema affected\_schema.

This is equivalent to SQL:

```
ALTER TABLE [<table_schema>.<table_name>] REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

**Syntax**

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
  table_name      IN VARCHAR2,
  table_schema    IN DEFAULT NULL,
  affected_schema IN DEFAULT NULL);
```

**Parameters****Table 52-5 ALTER\_TABLE\_REFERENCEABLE Procedure Parameters**

Parameter	Description
table_name	Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.
table_schema	Name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
affected_schema	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

### Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same `E OID` as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same `E OID`; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it makes the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

## 52.4.4 CREATE\_WRAPPED Procedures

The procedure takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a `CREATE OR REPLACE` statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

 **See Also:**  
[WRAP Functions](#)

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual [WRAP Functions](#) and `DBMS_SQL.PARSE` (or `EXECUTE IMMEDIATE`) calls. The different functionality of each form of syntax is presented with the definition.

### Syntax

Is a shortcut for `EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl)`:

```
DBMS_DDL.CREATE_WRAPPED (  
    ddl      VARCHAR2);
```

Is a shortcut for `DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub))`:

```
DBMS_DDL.CREATE_WRAPPED(  
    ddl      DBMS_SQL.VARCHAR2A,  
    lb       PLS_INTEGER,  
    ub       PLS_INTEGER);
```

Is a shortcut for `DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub))`:

```
DBMS_DDL.CREATE_WRAPPED(  
    ddl      DBMS_SQL.VARCHAR2S,  
    lb       PLS_INTEGER,  
    ub       PLS_INTEGER);
```

## Parameters

**Table 52-6 CREATE\_WRAPPED Procedure Parameters**

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

## Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS\_DDL.CREATE\_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS\_DDL to avoid the possibility that the name DBMS\_DDL is captured by a locally-defined unit or by redefining the DBMS\_DDL public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a entire SQL\*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS\_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL\*Plus "/" termination character), both the [CREATE\\_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

## Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS\_DDL.MALFORMED\_WRAP\_INPUT is raised.

## Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

## 52.4.5 IS\_TRIGGER\_FIRE\_ONCE Function

This function returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, it returns FALSE.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process

- For changes made by executing one or more Streams apply errors using the EXECUTE\_ERROR or EXECUTE\_ALL\_ERRORS procedure in the DBMS\_APPLY\_ADM package
- For changes made by a Logical Standby apply process

 **Note:**

Only DML and DDL triggers can be fire once. All other types of triggers always fire.

 **See Also:**

"SET\_TRIGGER\_FIRING\_PROPERTY Procedures"

**Syntax**

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
    trig_owner      IN VARCHAR2,
    trig_name       IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

**Table 52-7 IS\_TRIGGER\_FIRE\_ONCE Function Parameters**

Parameter	Description
trig_owner	Schema of trigger
trig_name	Name of trigger

## 52.4.6 SET\_TRIGGER\_FIRING\_PROPERTY Procedures

This procedure sets the specified DML or DDL trigger's firing property whether or not the property is set for the trigger.

Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the EXECUTE\_ERROR or EXECUTE\_ALL\_ERRORS procedure in the DBMS\_APPLY\_ADM package.
- Applied by a Logical Standby apply process

**Syntax**

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
    trig_owner      IN VARCHAR2,
    trig_name       IN VARCHAR2,
    fire_once       IN BOOLEAN);

DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
    trig_owner      IN VARCHAR2,
```

```

trig_name      IN VARCHAR2,
property       IN INTEGER,
setting        IN BOOLEAN);

```

### Parameters

**Table 52-8 SET\_TRIGGER\_FIRING\_PROPERTY Procedure Parameters**

Parameter	Description
trig_owner	Schema of the trigger to set
trig_name	Name of the trigger to set
fire_once	<ul style="list-style-type: none"> <li>If TRUE, the trigger is set to fire once. By default, the fire_once parameter is set to TRUE for DML and DDL triggers.</li> <li>If FALSE, the trigger is set to always fire unless apply_server_only property is set to TRUE, which overrides fire_once property setting.</li> </ul>
property	<ul style="list-style-type: none"> <li>DBMS_DDL.fire_once to set the fire_once property of the trigger</li> <li>DBMS_DDL.apply_server_only to indicate whether trigger fires only in the context of SQL apply processes maintaining a logical standby database or Streams apply processes</li> </ul>
setting	Value of property being set

### Usage Notes

DML triggers created on a table have their fire-once property set to TRUE. In this case, the triggers only fire when the table is modified by an user process, and they are automatically disabled inside Oracle processes maintaining either a logical standby database (SQL Apply) or Oracle processes doing replication (Streams Apply) processes, and thus do not fire when a SQL Apply or a Streams Apply process modifies the table. There are two ways for a user to fire a trigger as a result of SQL Apply or a Streams Apply process making a change to a maintained table: (a) setting the fire-once property of a trigger to FALSE, which allows it fire both in the context of a user process or a SQL or Streams Apply process, or (b) by setting the apply-server-only property to TRUE and thus making the trigger fire only in the context of a SQL Apply or a Streams Apply process and not in the context of a user process.

- FIRE\_ONCE=TRUE, APPLY\_SERVER\_ONLY=FALSE

This is the default property setting for a DML trigger. The trigger only fires when user process modifies the base table.

- FIRE\_ONCE=TRUE OR FALSE, APPLY\_SERVER\_ONLY=TRUE

The trigger only fires when SQL Apply or Streams Apply process modifies the base table. The trigger does not fire when a user process modifies the base table. Thus the apply-server-only property overrides the fire-once property of a trigger.

 **Note:**

- If you dequeue an error transaction from the error queue and execute it without using the `DBMS_APPLY_ADM` package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
- Only DML and DDL triggers can be fire once. All other types of triggers always fire.

 **See Also:**

*Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

## 52.4.7 WRAP Functions

This function takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a `CREATE OR REPLACE` statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to `DBMS_SQL` or `EXECUTE IMMEDIATE`. The different functionality of each form of syntax is presented with the definition.

 **See Also:**

[CREATE\\_WRAPPED Procedures](#)

### Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP (
    ddl      VARCHAR2)
RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the [PARSE Procedures](#) in the `DBMS_SQL` package and its argument list follows the convention of `DBMS_SQL.PARSE`:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2S,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the [PARSE Procedures](#) in the [DBMS\\_SQL](#) package:

```
DBMS_DDL.WRAP(
  ddl      DBMS_SQL.VARCHAR2A,
  lb       PLS_INTEGER,
  ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2A;
```

## Parameters

**Table 52-9 WRAP Function Parameters**

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

## Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

## Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name `SYS.DBMS_DDL` to avoid the possibility that the name `DBMS_DDL` is captured by a locally-defined unit or by redefining the `DBMS_DDL` public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL\*Plus `"/` termination character), both the [CREATE\\_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

## Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

## Examples

```
DECLARE
  ddl VARCHAR2(32767);
BEGIN
  ddl := GENERATE_PACKAGE(...);
```

```
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl  
END;
```

# 53

## DBMS\_DEBUG

DBMS\_DEBUG is deprecated. Use DBMS\_DEBUG\_JDWP instead.

See [DBMS\\_DEBUG\\_JDWP](#) for more information.

DBMS\_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This package is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

### Note:

The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

- [Overview](#)
- [Constants](#)
- [Variables](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_DEBUG Subprograms](#)

### 53.1 DBMS\_DEBUG Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with DBMS\_DEBUG. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using DBMS\_DEBUG: This tells it which target session to supervise. The debug session may then call entry points in DBMS\_DEBUG to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- [SYNCHRONIZE Function](#)
- [DEBUG\\_ON Procedure](#)
- [DEBUG\\_OFF Procedure](#)

DBMS\_DEBUG does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

## 53.2 DBMS\_DEBUG Constants

A breakpoint status may have the following value: `breakpoint_status_unused`—breakpoint is not in use.

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

## 53.3 DBMS\_DEBUG Variables

The DBMS\_DEBUG uses the variables shown in the following table.

**Table 53-1 DBMS\_DEBUG Variables**

Variable	Description
<code>default_timeout</code>	The timeout value (used by both sessions). The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

## 53.4 DBMS\_DEBUG Exceptions

These values are returned by the various functions called in the debug session (`SYNCHRONIZE`, `CONTINUE`, `SET_BREAKPOINT`, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

**Table 53-2 DBMS\_DEBUG Exceptions**

Status	Description
<code>success</code>	Normal termination

Statuses returned by `GET_VALUE` and `SET_VALUE`:

**Table 53-3 DBMS\_DEBUG Exceptions Returned by GET\_VALUE and SET\_VALUE**

Status	Description
error_bogus_frame	No such entrypoint on the stack
error_no_debug_info	Program was compiled without debug symbols
error_no_such_object	No such variable or parameter
error_unknown_type	Debug information is unreadable
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided
error_illegal_index	No such element exists in the collection
error_nullcollection	Table is atomically NULL
error_nullvalue	Value is NULL

Statuses returned by SET\_VALUE:

**Table 53-4 DBMS\_DEBUG Exceptions Returned by SET\_VALUE**

Status	Description
error_illegal_value	Constraint violation
error_illegal_null	Constraint violation
error_value_malformed	Unable to decipher the given value
error_other	Some other error
error_name_incomplete	Name did not resolve to a scalar

Statuses returned by the breakpoint functions:

**Table 53-5 Statuses Returned by the Breakpoint Functions**

Status	Description
error_no_such_breakpt	No such breakpoint
error_idle_breakpt	Cannot enable or disable an unused breakpoint
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation)

General error codes (returned by many of the DBMS\_DEBUG subprograms):

**Table 53-6 DBMS\_DEBUG Subprograms Error Codes**

Status	Description
error_unimplemented	Functionality is not yet implemented
error_deferred	No program running; operation deferred

**Table 53-6 (Cont.) DBMS\_DEBUG Subprograms Error Codes**

Status	Description
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server
error_communication	Some error other than a timeout occurred
error_timeout	Timeout occurred

**Table 53-7 illegal\_init Exceptions**

Exception	Description
illegal_init	DEBUG_ON was called prior to INITIALIZE

The following exceptions are raised by procedure SELF\_CHECK:

**Table 53-8 SELF\_CHECK Procedure Exceptions**

Exception	Description
pipe_creation_failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe
pipe_datatype_mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

## 53.5 DBMS\_DEBUG Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

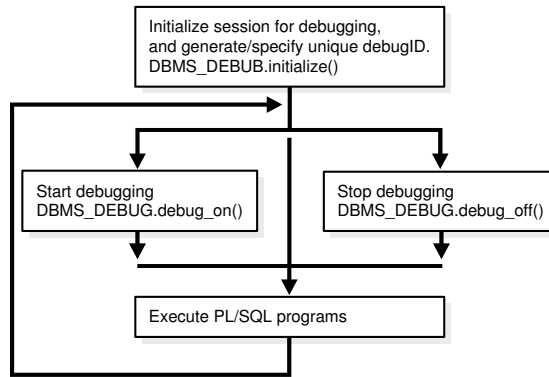

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 53-1 and Figure 53-2 illustrate the flow of operations in the session to be debugged and in the debugging session.

**Figure 53-1 Target Session**

**platform:** pc

### Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

## Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

## Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

## Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

## Common Debug Session Sections

- Common Section
- Target Session
- Debug Session Section

### Common Section

The following subprograms may be called in either the target or the debug session:

- [PROBE\\_VERSION Procedure](#)
- [SELF\\_CHECK Procedure](#)
- [SET\\_TIMEOUT Function](#)

### Target Session

The following subprograms may be called only in the target session:

- [INITIALIZE Function](#)
- [DEBUG\\_ON Procedure](#)
- [SET\\_TIMEOUT\\_BEHAVIOUR Procedure](#)
- [GET\\_TIMEOUT\\_BEHAVIOUR Function](#)

### Debug Session Section

The following subprograms should be run in the debug session only:

- [ATTACH\\_SESSION Procedure](#)
- [SYNCHRONIZE Function](#)

- SHOW\_FRAME\_SOURCE Procedure
- SHOW\_SOURCE Procedures
- GET\_MORE\_SOURCE Procedure
- PRINT\_BACKTRACE Procedure
- CONTINUE Function
- SET\_BREAKPOINT Function
- DELETE\_BREAKPOINT Function
- SET\_OER\_BREAKPOINT Function
- DELETE\_OER\_BREAKPOINT Function
- ENABLE\_BREAKPOINT Function
- DISABLE\_BREAKPOINT Function
- SHOW\_BREAKPOINTS Procedures
- SET\_VALUE Functionn
- GET\_VALUE Function
- TARGET\_PROGRAM\_RUNNING Procedure
- DETACH\_SESSION Procedure
- GET\_RUNTIME\_INFO Function
- PRINT\_INSTANTIATIONS Procedure
- PING Procedure
- GET\_LINE\_MAP Function
- GET\_RUNTIME\_INFO Function
- GET\_INDEXES Function
- EXECUTE Procedure

### OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are `exception_init`'d to the same OER, they are indistinguishable.

### Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
  - Package specifications.

- Procedures and functions that are not nested inside other packages, procedures, or functions.
  - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
  4. `Namespace_trigger` contains triggers.

### Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

- `LibunitType_cursor`
- `LibunitType_procedure`
- `LibunitType_function`
- `LibunitType_package`
- `LibunitType_package_body`
- `LibunitType_trigger`
- `LibunitType_Unknown`

### Breakflags

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
<code>break_next_line</code>	Break at next source line (step over calls)
<code>break_any_call</code>	Break at next source line (step into calls)
<code>break_any_return</code>	Break after returning from current entrypoint (skip over any entrypoints called from the current routine)
<code>break_return</code>	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running <code>Proc1</code> , which calls <code>Proc2</code> , then <code>break_return</code> stops at the end of <code>Proc2</code> .)
<code>break_exception</code>	Break when an exception is raised
<code>break_handler</code>	Break when an exception handler is executed
<code>abort_execution</code>	Stop execution and force an 'exit' event as soon as <code>DBMS_DEBUG.CONTINUE</code> is called.

### Information Flags

These are flags which may be passed as the `info_requested` parameter to `SYNCHRONIZE`, `CONTINUE`, and `GET_RUNTIME_INFO`.

Flag	Description
<code>info_getStackDepth</code>	Get the current depth of the stack
<code>info_getBreakpoint</code>	Get the breakpoint number

Flag	Description
info_getLineinfo	Get program unit information

### Reasons for Suspension

After CONTINUE is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-
reason_interpreter_starting	Interpreter is starting
reason_breakpoint	Hit a breakpoint
reason_enter	Procedure entry
reason_return	Procedure is about to return
reason_finish	Procedure is finished
reason_line	Reached a new line
reason_interrupt	An interrupt occurred
reason_exception	An exception was raised
reason_exit	Interpreter is exiting (old form)
reason_knl_exit	Kernel is exiting
reason_handler	Start exception-handler
reason_timeout	A timeout occurred
reason_instantiate	Instantiation block
reason_abort	Interpreter is aborting

## 53.6 DBMS\_DEBUG Data Structures

The DBMS\_DEBUG package defines RECORD types and TABLE types.

### RECORD Types

- [BREAKPOINT\\_INFO Record Type](#)
- [PROGRAM\\_INFO Record Type](#)
- [RUNTIME\\_INFO Record Type](#)

### TABLE Types

- [BACKTRACE\\_TABLE Table Type](#)
- [BREAKPOINT\\_TABLE Table Type](#)
- [INDEX\\_TABLE Table Type](#)
- [VC2\\_TABLE Table Type](#)

## 53.6.1 BREAKPOINT\_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

### Syntax

```
TYPE breakpoint_info IS RECORD (
  name          VARCHAR2(30),
  owner         VARCHAR2(30),
  dblink        VARCHAR2(30),
  line#         BINARY_INTEGER,
  libunittype   BINARY_INTEGER,
  status        BINARY_INTEGER);
```

### Fields

**Table 53-9** BREAKPOINT\_INFO Fields

Field	Description
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	NULL, unless this is a nested procedure or function
status	See <a href="#">Constants</a> for values of breakpoint_status_*

## 53.6.2 PROGRAM\_INFO Record Type

The PROGRAM\_INFO record type of the DBMS\_DEBUG package specifies a program location. It is a line number in a program unit.

This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

### Syntax

```
TYPE program_info IS RECORD(
  -- The following fields are used when setting a breakpoint
  namespace    BINARY_INTEGER,
  name         VARCHAR2(30),
  owner        VARCHAR2(30),
  dblink       VARCHAR2(30),
  line#        BINARY_INTEGER,
  -- Read-only fields (set by Probe when doing a stack backtrace)
  libunittype  BINARY_INTEGER,
  entrypointname VARCHAR2(30));
```

## Fields

**Table 53-10 PROGRAM\_INFO Fields**

Field	Description
namespace	See <a href="#">DBMS_DEBUG Operational Notes</a> for more information about namespaces.
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	A read-only field, NULL, unless this is a nested procedure or function
entrypointname	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See <a href="#">DBMS_DEBUG Operational Notes</a> for more information about the libunit types.

## 53.6.3 RUNTIME\_INFO Record Type

This type gives context information about the running program.

### Syntax

```
TYPE runtime_info IS RECORD(
    line#           BINARY_INTEGER,
    terminated      binary_integer,
    breakpoint      binary_integer,
    stackdepth     BINARY_INTEGER,
    interpreterdepth BINARY_INTEGER,
    reason          BINARY_INTEGER,
    program         program_info);
```

## Fields

**Table 53-11 RUNTIME\_INFO Fields**

Field	Description
line#	Duplicate of program.line#
terminated	Whether the program has terminated
breakpoint	Breakpoint number
stackdepth	Number of frames on the stack
interpreterdepth	[A reserved field]
reason	Reason for suspension
program	Source location

## 53.6.4 BACKTRACE\_TABLE Table Type

This type is used by PRINT\_BACKTRACE.

### Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

## 53.6.5 BREAKPOINT\_TABLE Table Type

This type is used by SHOW\_BREAKPOINTS.

### Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

## 53.6.6 INDEX\_TABLE Table Type

This type is used by GET\_INDEXES to return the available indexes for an indexed table.

### Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

## 53.6.7 VC2\_TABLE Table Type

This type is used by SHOW\_SOURCE.

### Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

## 53.7 Summary of DBMS\_DEBUG Subprograms

This table lists the DBMS\_DEBUG subprograms in alphabetical order and briefly describes them.

**Table 53-12 DBMS\_DEBUG Package Subprograms**

Subprogram	Description
<a href="#">ATTACH_SESSION Procedure</a>	Notifies the debug session about the target debugID
<a href="#">CONTINUE Function</a>	Continues execution of the target program
<a href="#">DEBUG_OFF Procedure</a>	Turns debug-mode off
<a href="#">DEBUG_ON Procedure</a>	Turns debug-mode on
<a href="#">DELETE_BREAKPOINT Function</a>	Deletes a breakpoint
<a href="#">DELETE_OER_BREAKPOINT Function</a>	Deletes an OER breakpoint

**Table 53-12 (Cont.) DBMS\_DEBUG Package Subprograms**

Subprogram	Description
DETACH_SESSION Procedure	Stops debugging the target program
DISABLE_BREAKPOINT Function	Disables a breakpoint
ENABLE_BREAKPOINT Function	Activates an existing breakpoint
EXECUTE Procedure	Executes SQL or PL/SQL in the target session
GET_INDEXES Function	Returns the set of indexes for an indexed table
GET_MORE_SOURCE Procedure	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
GET_LINE_MAP Function	Returns information about line numbers in a program unit
GET_RUNTIME_INFO Function	Returns information about the current program
GET_TIMEOUT_BEHAVIOUR Function	Returns the current timeout behavior
GET_VALUE Function	Gets a value from the currently-running program
INITIALIZE Function	Sets debugID in target session
PING Procedure	Pings the target session to prevent it from timing out
PRINT_BACKTRACE Procedure	Prints a stack backtrace
PRINT_INSTANTIATIONS Procedure	Prints a stack backtrace
PROBE_VERSION Procedure	Returns the version number of DBMS_DEBUG on the server
SELF_CHECK Procedure	Performs an internal consistency check
SET_BREAKPOINT Function	Sets a breakpoint in a program unit
SET_OER_BREAKPOINT Function	Sets an OER breakpoint
SET_TIMEOUT Function	Sets the timeout value
SET_TIMEOUT_BEHAVIOUR Procedure	Tells Probe what to do with the target session when a timeout occurs
SET_VALUE Function	Sets a value in the currently-running program
SHOW_BREAKPOINTS Procedures	Returns a listing of the current breakpoints
SHOW_FRAME_SOURCE Procedure	Fetches the frame source
SHOW_SOURCE Procedures	Fetches program source
SYNCHRONIZE Function	Waits for program to start running
TARGET_PROGRAM_RUNNING Procedure	Returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not

## 53.7.1 ATTACH\_SESSION Procedure

This procedure notifies the debug session about the target program.

### Syntax

```
DBMS_DEBUG.ATTACH_SESSION (
    debug_session_id IN VARCHAR2,
    diagnostics      IN BINARY_INTEGER := 0);
```

### Parameters

**Table 53-13** ATTACH\_SESSION Procedure Parameters

Parameter	Description
debug_session_id	Debug ID from a call to INITIALIZE in target session
diagnostics	Generate diagnostic output if nonzero

## 53.7.2 CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If info\_requested is not NULL, then calls GET\_RUNTIME\_INFO.

### Syntax

```
DBMS_DEBUG.CONTINUE (
    run_info      IN OUT runtime_info,
    breakflags    IN      BINARY_INTEGER,
    info_requested IN      BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 53-14** CONTINUE Function Parameters

Parameter	Description
run_info	Information about the state of the program
breakflags	Mask of events that are of interest (see the discussion about break flags under <a href="#">DBMS_DEBUG Operational Notes</a> )
info_requested	Which information should be returned in run_info when the program stops (see the discussion of information flags under <a href="#">DBMS_DEBUG Operational Notes</a> )

## Return Values

**Table 53-15** CONTINUE Function Return Values

Return	Description
success	
error_timeout	Timed out before the program started running
error_communication	Other communication error

### 53.7.3 DEBUG\_OFF Procedure

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

 **WARNING:**

There must be a debug session waiting if immediate is TRUE.

#### Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

#### Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

### 53.7.4 DEBUG\_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

#### Syntax

```
DBMS_DEBUG.DEBUG_ON (
    no_client_side_plsql_engine BOOLEAN := TRUE,
    immediate                   BOOLEAN := FALSE);
```

#### Parameters

**Table 53-16** DEBUG\_ON Procedure Parameters

Parameter	Description
no_client_side_plsql_engine	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine
immediate	If this is TRUE, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

## 53.7.5 DELETE\_BREAKPOINT Function

This function deletes a breakpoint.

### Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 53-17 DELETE\_BREAKPOINT Function Parameters**

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

### Return Values

**Table 53-18 DELETE\_BREAKPOINT Function Return Values**

Return	Description
success	
error_no_such_breakpoint	No such breakpoint exists
error_idle_breakpoint	Cannot delete an unused breakpoint
error_stale_breakpoint	The program unit was redefined since the breakpoint was set

## 53.7.6 DELETE\_OER\_BREAKPOINT Function

This function deletes an OER breakpoint.

### Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (
    oer IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 53-19 DELETE\_OER\_BREAKPOINT Function Parameters**

Parameter	Description
oer	The OER (positive 4-byte number) to delete

## 53.7.7 DETACH\_SESSION Procedure

This procedure stops debugging the target program.

This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

### Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

## 53.7.8 DISABLE\_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

### Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 53-20** DISABLE\_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

### Return Values

**Table 53-21** DISABLE\_BREAKPOINT Function Return Values

Returns	Description
success	
error_no_such_breakpt	No such breakpoint exists
error_idle_breakpt	Cannot disable an unused breakpoint

## 53.7.9 ENABLE\_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

### Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

## Parameters

**Table 53-22 ENABLE\_BREAKPOINT Function Parameters**

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

## Return Values

**Table 53-23 ENABLE\_BREAKPOINT Function Return Values**

Return	Description
success	Success
error_no_such_breakpt	No such breakpoint exists
error_idle_breakpt	Cannot enable an unused breakpoint

## 53.7.10 EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS\_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

### Syntax

```
DBMS_DEBUG.EXECUTE (
  what          IN VARCHAR2,
  frame#        IN BINARY_INTEGER,
  bind_results  IN BINARY_INTEGER,
  results       IN OUT NOCOPY dbms_debug_vc2coll,
  errm          IN OUT NOCOPY VARCHAR2);
```

## Parameters

**Table 53-24 EXECUTE Procedure Parameters**

Parameter	Description
what	SQL or PL/SQL source to execute
frame#	The context in which to execute the code. Only -1 (global context) is supported at this time.
bind_results	Whether the source wants to bind to results in order to return values from the target session: 0 = No 1 = Yes
results	Collection in which to place results, if bind_results is not 0
errm	Error message, if an error occurred; otherwise, NULL

## Examples

### Example 1

This example executes a SQL statement. It returns no results.

```

DECLARE
  coll sys.dbms_debug_vc2coll; -- results (unused)
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                    'values(''LJE'', 1, 1)',
                    -1, 0, coll, errm);
END;

```

### Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```

DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute(
    'DECLARE PRAGMA autonomous_transaction; ' ||
    'BEGIN ' ||
    '  insert into emp(ename, empno, deptno) ' ||
    '  values(''LJE'', 1, 1); ' ||
    ' COMMIT; ' ||
    'END;',
    -1, 0, coll, errm);
END;

```

### Example 3

This example executes a PL/SQL block, and it returns some results.

```

DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute(
    'DECLARE ' ||
    '  pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
    '  x PLS_INTEGER; ' ||
    '  i PLS_INTEGER := 1; ' ||
    'BEGIN ' ||
    '  SELECT COUNT(*) INTO x FROM emp; ' ||
    '  pp.EXTEND(x * 6); ' ||
    '  FOR c IN (SELECT * FROM emp) LOOP ' ||
    '    pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
    '    pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
    '    pp(i) := ''Job: '' || c.job; i := i+1; ' ||
    '    pp(i) := ''Mgr: '' || c.mgr; i := i+1; ' ||
    '    pp(i) := ''Sal: '' || c.sal; i := i+1; ' ||
    '    pp(i) := null; i := i+1; ' ||
    '  END LOOP; ' ||
    '  :1 := pp; ' ||
    'END;',

```

```

        -1, 1, coll, errm);
each := coll.FIRST;
WHILE (each IS NOT NULL) LOOP
    dosomething(coll(each));
    each := coll.NEXT(each);
END LOOP;
END;
```

## 53.7.11 GET\_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

### Syntax

```

DBMS_DEBUG.GET_INDEXES (
    varname   IN  VARCHAR2,
    frame#    IN  BINARY_INTEGER,
    handle    IN  program_info,
    entries   OUT index_table)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 53-25 GET\_INDEXES Function Parameters**

Parameter	Description
varname	Name of the variable to get index information about
frame#	Number of frame in which the variable or parameter resides; NULL for a package variable
handle	Package description, if object is a package variable
entries	1-based table of the indexes: if non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on.

### Return Values

**Table 53-26 GET\_INDEXES Function Return Values**

Return	Description
error_no_such_object	One of the following: <ul style="list-style-type: none"> <li>- The package does not exist</li> <li>- The package is not instantiated</li> <li>- The user does not have privileges to debug the package</li> <li>- The object does not exist in the package</li> </ul>

## 53.7.12 GET\_MORE\_SOURCE Procedure

When the source does not fit in the buffer provided by the SHOW\_SOURCE Procedure version which produced a formatted buffer, this procedure provides additional source.

### Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (  
    buffer          IN OUT VARCHAR2,  
    buflen         IN BINARY_INTEGER,  
    piece#         IN BINARY_INTEGER);
```

### Parameters

**Table 53-27** GET\_MORE\_SOURCE Procedure Parameters

Parameter	Description
buffer	The buffer
buflen	The length of the buffer
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the <a href="#">SHOW_SOURCE Procedures</a>

### Usage Notes

This procedure should be called only after the version of SHOW\_SOURCE that returns a formatted buffer.

### Related Topics

- [SHOW\\_SOURCE Procedures](#)  
The procedure gets the source code. There are two overloaded SHOW\_SOURCE procedures.

## 53.7.13 GET\_LINE\_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

### Syntax

```
DBMS_DEBUG.GET_LINE_MAP (  
    program          IN program_info,  
    maxline         OUT BINARY_INTEGER,  
    number_of_entry_points OUT BINARY_INTEGER,  
    linemap         OUT RAW)  
RETURN BINARY_INTEGER;
```

## Parameters

**Table 53-28 GET\_LINE\_MAP Function Parameters**

Parameter	Description
program	A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.
maxline	The largest source code line number in 'program'
number_of_entry_points	The number of subprograms in 'program'
linemap	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.

## Return Values

**Table 53-29 GET\_LINE\_MAP Function Return Values**

Return	Description
success	A successful completion
error_no_debug_info	The program unit exists, but has no debug info
error_bad_handle	No such program unit exists

## 53.7.14 GET\_RUNTIME\_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to 0.

**Note:**

This is currently only used by client-side PL/SQL.

### Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (
    info_requested IN BINARY_INTEGER,
    run_info      OUT runtime_info)
RETURN BINARY_INTEGER;
```

## Parameters

**Table 53-30 GET\_RUNTIME\_INFO Function Parameters**

Parameter	Description
info_requested	Which information should be returned in run_info when the program stops (see <a href="#">DBMS_DEBUG Operational Notes</a> for information about information flags)
run_info	Information about the state of the program

## 53.7.15 GET\_TIMEOUT\_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

### Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
RETURN BINARY_INTEGER;
```

## Parameters

**Table 53-31 GET\_TIMEOUT\_BEHAVIOUR Function Parameters**

Parameter	Description
oer	The OER (a 4-byte positive number)

## Return Values

**Table 53-32 GET\_TIMEOUT\_BEHAVIOUR Function Return Values**

Return	Description
success	A successful completion

## Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

## Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

## 53.7.16 GET\_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET\_VALUE functions.

### Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  frame#        IN BINARY_INTEGER,
  scalar_value  OUT VARCHAR2,
  format        IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 53-33 GET\_VALUE Function Parameters**

Parameter	Description
variable_name	Name of the variable or parameter
frame#	Frame in which it lives; 0 means the current procedure
scalar_value	Value
format	Optional date format to use, if meaningful

### Return Values

**Table 53-34 GET\_VALUE Function Return Values**

Return	Description
success	A successful completion
error_bogus_frame	Frame does not exist
error_no_debug_info	Entrypoint has no debug information
error_no_such_object	variable_name does not exist in frame#
error_unknown_type	The type information in the debug information is illegible
error_nullvalue	Value is NULL
error_indexed_table	The object is a table, but no index was provided

This form of GET\_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

### Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  handle        IN program_info,
  scalar_value  OUT VARCHAR2,
  format        IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

## Parameters

**Table 53-35 GET\_VALUE Function Parameters**

Parameter	Description
variable_name	Name of the variable or parameter
handle	Description of the package containing the variable
scalar_value	Value
format	Optional date format to use, if meaningful

## Return Values

**Table 53-36 GET\_VALUE Function Return Values**

Return	Description
error_no_such_object	One of the following: <ul style="list-style-type: none"> <li>- Package does not exist</li> <li>- Package is not instantiated</li> <li>- User does not have privileges to debug the package</li> <li>- Object does not exist in the package</li> </ul>
error_indexed_table	The object is a table, but no index was provided

## Examples

This example illustrates how to get the value with a given package `PACK` in schema `SCOTT`, containing variable `VAR`:

```
DECLARE
  handle    dbms_debug.program_info;
  resultbuf VARCHAR2(500);
  retval    BINARY_INTEGER;
BEGIN
  handle.Owner      := 'SCOTT';
  handle.Name       := 'PACK';
  handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
  retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

## 53.7.17 INITIALIZE Function

This function initializes the target session for debugging.

### Syntax

```
DBMS_DEBUG.INITIALIZE (
  debug_session_id IN VARCHAR2      := NULL,
  diagnostics      IN BINARY_INTEGER := 0)
RETURN VARCHAR2;
```

## Parameters

**Table 53-37 INITIALIZE Function Parameters**

Parameter	Description
<code>debug_session_id</code>	Name of session ID. If <code>NULL</code> , then a unique ID is generated.
<code>diagnostics</code>	Indicates whether to dump diagnostic output to the tracefile: 0 = (default) no diagnostics 1 = print diagnostics

## Return Values

The newly-registered debug session ID (`debugID`)

## Usage Notes

You cannot use `DBMS_DEBUG` and the JDWP-based debugging interface simultaneously. This call will either fail with an `ORA-30677` error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to `DBMS_DEBUG` will succeed only if either the caller or the specified debug role carries the `DEBUG CONNECT SESSION` privilege. Failing that, an `ORA-1031` error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The `CREATE ANY PROCEDURE` privilege does not affect the visibility of routines through the debugger. A privilege `DEBUG` for each object has been introduced with a corresponding `DEBUG ANY PROCEDURE` variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for `DEBUG CONNECT SESSION` privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or `PUBLIC` will be used to check for `DEBUG CONNECT SESSION`. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the `DEBUG` privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made (even if those roles were not available within a definer's rights environment of the call), and the debug role.

## 53.7.18 PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

### Syntax

```
DBMS_DEBUG.PING;
```

### Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

### Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`:

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call `debug_off`) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
- `abort_on_timeout` - Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;
```

```
continue_on_timeout CONSTANT BINARY_INTEGER:= 1;
```

```
nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;
```

```
abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

## 53.7.19 PRINT\_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded `PRINT_BACKTRACE` procedures.

### Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (  
    listing IN OUT VARCHAR2);
```

```
DBMS_DEBUG.PRINT_BACKTRACE (  
    backtrace OUT backtrace_table);
```

## Parameters

**Table 53-38 PRINT\_BACKTRACE Procedure Parameters**

Parameter	Description
listing	A formatted character buffer with embedded newlines
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

## 53.7.20 PRINT\_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

### Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
    pkgs   IN OUT NOCOPY backtrace_table,
    flags  IN BINARY_INTEGER);
```

## Parameters

**Table 53-39 PRINT\_INSTANTIATIONS Procedure Parameters**

Parameter	Description
pkgs	The instantiated packages
flags	Bitmask of options: <ul style="list-style-type: none"> <li>1 - show specs</li> <li>2 - show bodies</li> <li>4 - show local instantiations</li> <li>8 - show remote instantiations (NYI)</li> <li>16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.</li> </ul>

### Exceptions

no\_target\_program - target session is not currently executing

### Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: Namespace, Name, Owner, and LibunitType.

In addition, `Line#` contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

## 53.7.21 PROBE\_VERSION Procedure

This procedure returns the version number of DBMS\_DEBUG on the server.

### Syntax

```
DBMS_DEBUG.PROBE_VERSION (
    major out BINARY_INTEGER,
    minor out BINARY_INTEGER);
```

### Parameters

**Table 53-40 PROBE\_VERSION Procedure Parameters**

Parameter	Description
major	Major version number
minor	Minor version number: increments as functionality is added

## 53.7.22 SELF\_CHECK Procedure

This procedure performs an internal consistency check. SELF\_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF\_CHECK does not return successfully, then an incorrect version of DBMS\_DEBUG was probably installed on this server. The solution is to install the correct version (pblog.sql loads DBMS\_DEBUG and the other relevant packages).

### Syntax

```
DBMS_DEBUG.SELF_CHECK (
    timeout IN binary_integer := 60);
```

### Parameters

**Table 53-41 SELF\_CHECK Procedure Parameters**

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

### Exceptions

**Table 53-42 SELF\_CHECK Procedure Exceptions**

Exception	Description
OER-6516	Probe version is inconsistent
pipe_creation_failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe

**Table 53-42 (Cont.) SELF\_CHECK Procedure Exceptions**

Exception	Description
pipe_datatype_mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

### 53.7.23 SET\_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session.

Execution pauses if the target program reaches the breakpoint.

#### Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
  program      IN program_info,
  line#        IN BINARY_INTEGER,
  breakpoint#  OUT BINARY_INTEGER,
  fuzzy        IN BINARY_INTEGER := 0,
  iterations   IN BINARY_INTEGER := 0)
RETURN BINARY_INTEGER;
```

#### Parameters

**Table 53-43 SET\_BREAKPOINT Function Parameters**

Parameter	Description
program	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)
line#	Line at which the breakpoint is to be set
breakpoint#	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint
fuzzy	Only applicable if there is no executable code at the specified line: 0 means return <code>error_illegal_line</code> 1 means search forward for an adjacent line at which to place the breakpoint -1 means search backward for an adjacent line at which to place the breakpoint
iterations	Number of times to wait before signalling this breakpoint

## Return Values

 **Note:**

The `fuzzy` and `iterations` parameters are not yet implemented

**Table 53-44 SET\_BREAKPOINT Function Return Values**

Return	Description
success	A successful completion
error_illegal_line	Cannot set a breakpoint at that line
error_bad_handle	No such program unit exists

## 53.7.24 SET\_OER\_BREAKPOINT Function

This function sets an OER breakpoint.

### Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (
    oer IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 53-45 SET\_OER\_BREAKPOINT Function Parameters**

Parameter	Description
oer	The OER (positive 4-byte number) to set

### Return Values

**Table 53-46 SET\_OER\_BREAKPOINT Function Return Values**

Return	Description
success	A successful completion
error_no_such_breakpt	No such OER breakpoint exists

## 53.7.25 SET\_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

### Syntax

```
DBMS_DEBUG.SET_TIMEOUT (
    timeout BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

## Parameters

**Table 53-47 SET\_TIMEOUT Function Parameters**

Parameter	Description
timeout	The timeout to use for communication between the target and debug sessions

## 53.7.26 SET\_TIMEOUT\_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

### Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
    behaviour IN PLS_INTEGER);
```

## Parameters

**Table 53-48 SET\_TIMEOUT\_BEHAVIOUR Procedure Parameters**

Parameter	Description
behaviour - One of the following:	
retry_on_timeout	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
continue_on_timeout	Continue execution, using same event flags
nodebug_on_timeout	Turn debug-mode OFF (in other words, call <code>debug_off</code> ) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling <code>debug_on</code> .
abort_on_timeout	Continue execution, using the <code>abort_execution</code> flag, which should cause the program to terminate immediately. The session remains in debug-mode.

### Exceptions

unimplemented - the requested behavior is not recognized

### Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

## 53.7.27 SET\_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET\_VALUE functions.

### Syntax

```
DBMS_DEBUG.SET_VALUE (
    frame#           IN binary_integer,
    assignment_statement IN varchar2)
RETURN BINARY_INTEGER;
```

```
DBMS_DEBUG.SET_VALUE (
    handle           IN program_info,
    assignment_statement IN VARCHAR2)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 53-49 SET\_VALUE Function Parameters**

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

### Return Values

**Table 53-50 SET\_VALUE Function Return Values**

Return	Description
success	-
error_illegal_value	Not possible to set it to that value
error_illegal_null	Cannot set to NULL because object type specifies it as 'not NULL'
error_value_malformed	Value is not a scalar
error_name_incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	One of the following: <ul style="list-style-type: none"> <li>- Package does not exist</li> <li>- Package is not instantiated</li> <li>- User does not have privileges to debug the package</li> <li>- Object does not exist in the package</li> </ul>

## Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that modification to a package variable using SET\_VALUE might not take effect for a line or two.

## Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
  handle dbms_debug.program_info;
  retval BINARY_INTEGER;
BEGIN
  handle.Owner      := 'SCOTT';
  handle.Name       := 'PACK';
  handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
  retval            := dbms_debug.set_value(handle, 'var := 6;');
END;
```

## 53.7.28 SHOW\_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW\_BREAKPOINTS procedures.

### Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
  listing IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
  listing OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
  code_breakpoints OUT breakpoint_table,
  oer_breakpoints  OUT oer_table);
```

### Parameters

**Table 53-51 SHOW\_BREAKPOINTS Procedure Parameters**

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints.
code_breakpoints	Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER

## 53.7.29 SHOW\_FRAME\_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW\_SOURCE procedures.

### Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
  first_line IN          BINARY_INTEGER,
  last_line  IN          BINARY_INTEGER,
  source     IN OUT NOCOPY vc2_table,
  frame_num  IN          BINARY_INTEGER);
```

### Parameters

**Table 53-52 SHOW\_FRAME\_SOURCE Procedure Parameters**

Parameter	Description
first_line	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#
frame_num	1-based frame number

### Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW\_SOURCE can also be used.
- If it's a stored PL/SQL package/function/procedure then use SQL as described in the [Usage Notes to SHOW\\_SOURCE Procedures](#).

## 53.7.30 SHOW\_SOURCE Procedures

The procedure gets the source code. There are two overloaded SHOW\_SOURCE procedures.

### Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
  first_line IN  BINARY_INTEGER,
  last_line  IN  BINARY_INTEGER,
  source     OUT vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
  first_line IN  BINARY_INTEGER,
  last_line  IN  BINARY_INTEGER,
  window     IN  BINARY_INTEGER,
  print_arrow IN  BINARY_INTEGER,
```

```
buffer      IN OUT VARCHAR2,
bufllen    IN      BINARY_INTEGER,
pieces     OUT     BINARY_INTEGER);
```

## Parameters

**Table 53-53 SHOW\_SOURCE Procedure Parameters**

Parameter	Description
first_line	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#
window	'Window' of lines (the number of lines around the current source line)
print_arrow	Nonzero means to print an arrow before the current line
buffer	Buffer in which to place the source listing
bufllen	Length of buffer
pieces	Set to nonzero if not all the source could be placed into the given buffer

## Return Values

An indexed table of source-lines. The source lines are stored starting at `first_line`. If any error occurs, then the table is empty.

## Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
    -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
    -- or GET_RUNTIME_INFO to fill in 'info'
    SELECT text INTO <buffer> FROM all_source
    WHERE owner = info.Program.Owner
          AND name = info.Program.Name
          AND line = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in bufferlength (buflen), then additional pieces can be retrieved using the GET\_MORE\_SOURCE procedure (pieces returns the number of additional pieces that need to be retrieved).

### 53.7.31 SYNCHRONIZE Function

This function waits until the target program signals an event. If info\_requested is not NULL, then it calls GET\_RUNTIME\_INFO.

#### Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
    run_info      OUT  runtime_info,
    info_requested IN  BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

#### Parameters

**Table 53-54 SYNCHRONIZE Function Parameters**

Parameter	Description
run_info	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
info_requested	Optional bit-field in which to request information other than the default (which is info_getStackDepth + info_getLineInfo). 0 means that no information is requested at all (see <a href="#">DBMS_DEBUG Operational Notes</a> for more about information flags).

#### Return Values

**Table 53-55 SYNCHRONIZE Function Return Values**

Return	Description
success	A successful completion
error_timeout	Timed out before the program started execution
error_communication	Other communication error

### 53.7.32 TARGET\_PROGRAM\_RUNNING Procedure

This procedure returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not.

#### Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING
RETURN BOOLEAN;
```

## DBMS\_DEBUG\_JDWP

The `DBMS_DEBUG_JDWP` provides the interface to initiate and control the debugging of PL/SQL stored procedures and Java stored procedures over Java Debug Wire Protocol (JDWP).

This chapter contains the following topics:

- [DBMS\\_DEBUG\\_JDWP Overview](#)
- [DBMS\\_DEBUG\\_JDWP Security Model](#)
- [Summary of DBMS\\_DEBUG\\_JDWP Subprograms](#)

### 54.1 DBMS\_DEBUG\_JDWP Overview

Oracle supports the debugging of PL/SQL stored procedures and Java stored procedures over JDWP. Using the `DBMS_DEBUG_JDWP` package, you can:

- Retrieve the session ID of the current session and serial number
- Connect a database session to a debugger over JDWP
- Set the NLS parameters to change the formats in which PL/SQL program values are represented over JDWP

### 54.2 DBMS\_DEBUG\_JDWP Security Model

The debugging user invoking a `DBMS_DEBUG_JDWP` subprogram requires a privilege to connect the target database session to the debugger.

**Table 54-1 System Privileges**

System Privilege	Description
DEBUG CONNECT SESSION	Allows a user to connect his current session to a debugger
DEBUG CONNECT ANY	Allows a user to connect a session by any logon user to a debugger

In addition, the user can also be granted the following user privilege to debug another user's session.

**Table 54-2 User Privileges**

User Privilege	Description
DEBUG CONNECT ON USER <user>	Allows a user to connect any of the specified user's logon sessions to a debugger to debug another user's session or his own

## 54.3 Summary DBMS\_DEBUG\_JDWP Subprograms

This table lists the DBMS\_DEBUG\_JDWP subprograms and briefly describes them.

**Table 54-3 DBMS\_DEBUG\_JDWP Package Subprograms**

Subprogram	Description
<a href="#">CONNECT_TCP Procedure</a>	Connects the specified session to the debugger waiting at host:port
<a href="#">CURRENT_SESSION_ID Function</a>	Gets the current session's session ID
<a href="#">CURRENT_SESSION_SERIAL Function</a>	Gets the current session's session serial number
<a href="#">DISCONNECT Procedure</a>	Disconnects the specified session from any debugger with which it is connected
<a href="#">GET-NLS_PARAMETER Function</a>	Gets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP
<a href="#">PROCESS_CONNECT_STRING Procedure</a>	Connects a session to a debugger without having to directly modify an application's code
<a href="#">SET-NLS_PARAMETER Procedure</a>	Sets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP

### 54.3.1 CONNECT\_TCP Procedure

This procedure connects the specified session to the debugger waiting at host:port.

#### Syntax

```
DBMS_DEBUG_JDWP.CONNECT_TCP(
  host           IN  VARCHAR2,
  port           IN  VARCHAR2,
  session_id     IN  PLS_INTEGER := NULL,
  session_serial IN  PLS_INTEGER := NULL,
  debug_role     IN  VARCHAR2  := NULL,
  debug_role_pwd IN  VARCHAR2  := NULL,
  option_flags   IN  PLS_INTEGER := 0,
  extensions_cmd_set IN PLS_INTEGER := 128);
```

## Parameters

**Table 54-4 CONNECT\_TCP Parameters**

Parameter	Description
host	The host name the debugger is waiting at
port	The port number the debugger is waiting at
session_id	Session ID
session_serial	Session number
debug_role	Debug role
debug_role_pwd	Debug password
option_flags	Values: <ul style="list-style-type: none"> <li>1 : Does not suspend the program until the next client/server request begins. This can be used to hide the startup sequence from end users, who may only want to see their own code</li> <li>2 : Forces the connection even if the session appears to be connected to a debugger. This should best only be specified after some human-interaction confirmation step has occurred; i.e., if an attempt without this option raised ORA-30677, then if the user confirms, retry with this bit set.</li> </ul> These may be added together to select multiple option choices.
extensions_cmd_set	The ID of the Oracle JDWP extension command set

## Exceptions

**Table 54-5 CONNECT\_TCP Exceptions**

Exception	Description
ORA-00022	Invalid session ID
ORA-01031	Insufficient privilege
ORA-30677	Session is already connected to a debugger
ORA-30681	Improper value for argument EXTENSIONS_CMD_SET
ORA-30682	Improper value for argument OPTION_FLAGS
ORA-30683	Failure establishing connection to debugger

## Usage Notes

- To connect the current session to a debugger, you can pass `NULL` to both the `session_id` and `session_serial` parameters.

- To connect a different session, you need to find out its ID and serial. These are available in the `v$sql_debuggable_sessions` view. The Instance Manager option of Oracle Enterprise Manager is one example of a user interface that displays these values to users. You can also find the values of these for your own session using the [CURRENT\\_SESSION\\_ID Function](#) and [CURRENT\\_SESSION\\_SERIAL Function](#).
- The `debug_role` and `debug_role_pwd` arguments allow the user to name any role as the "debug role", which will be available to privilege checking when checking for permissions to connect the session and when checking permissions available on objects within the debugged session. Both the role and its password are passed here as strings and not as identifiers, so double quotes should not be used but case matters. If the original role name wasn't double-quoted, it should be specified here in upper case.
- An `ORA-30677` indicates that the requested session is already being debugged. It is suggested in this case that the user be asked to confirm that (s)he desires to steal the session from the existing connection, and then either an explicit disconnect call or the use of the `connect_force_connect` option bit can be used to allow the connection to succeed on a second attempt. Note that using the `connect_force_connect` bit will avoid the session being allowed to run freely if it is currently suspended through the debugger - in other words, this bit lets you steal a session from one debugger to another without actually disturbing the state of the session.

### 54.3.2 CURRENT\_SESSION\_ID Function

This function gets the current session's session ID

#### Syntax

```
DBMS_DEBUG_JDWP.CURRENT_SESSION_ID  
RETURN PLS_INTEGER;
```

### 54.3.3 CURRENT\_SESSION\_SERIAL Function

This function gets the current session's session number.

#### Syntax

```
DBMS_DEBUG_JDWP.CURRENT_SESSION_SERIAL  
RETURN PLS_INTEGER;
```

### 54.3.4 DISCONNECT Procedure

This procedure disconnects the specified session from any debugger with which it is connected.

#### Syntax

```
DBMS_DEBUG_JDWP.DISCONNECT(  
    session_id      IN PLS_INTEGER := NULL,  
    session_serial  IN PLS_INTEGER := NULL);
```

## Parameters

**Table 54-6 DISCONNECT Procedure Parameters**

Parameter	Description
session_id	Session ID
session_serial	Session number

## Usage Notes

- If the session to disconnect is the current session, the session will be allowed to run freely after disconnecting the debugger. Otherwise, the session will be terminated.
- The same rights are required for this call as for connect, except when disconnecting the current session and the effective user at the time of the call is the same as the login user of the session where no privilege is required.

## 54.3.5 GET\_NLS\_PARAMETER Function

This function gets the value of the specified NLS parameter affecting the format in which the NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings, as they are presented through JDWP.

These values are private to the current session, but further are private to the debugger mechanisms, separate from the values used to convert values within the debugged program itself.

## Syntax

```
DBMS_DEBUG_JDWP.GET_NLS_PARAMETER(
    name IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 54-7 GET\_NLS\_PARAMETER Function Parameters**

Parameter	Description
name	Specified NLS parameter

## Usage Notes

- When any variable value is read or assigned through JDWP, or when either GET\_NLS\_PARAMETER Function or SET\_NLS\_PARAMETER Procedure is first invoked in a session, the debugger mechanisms make a private copy of the then-current NLS\_LANGUAGE, NLS\_TERRITORY, NLS\_CALENDAR, NLS\_DATE\_LANGUAGE, NLS\_NUMERIC\_CHARACTERS, NLS\_TIMESTAMP\_FORMAT, NLS\_TIMESTAMP\_TZ\_FORMAT, NLS\_TIME\_FOMAT and NLS\_TIME\_TZ\_FORMAT values. These private copies may be read using this GET\_NLS\_PARAMETER Functioncall and changed using the following call to the [SET\\_NLS\\_PARAMETER Procedure](#).

- Once the debugger's private copy of the NLS parameters is established, changes made to the NLS parameters in the current session using the `ALTER SESSION` statement will have no effect on the formatting of values as seen through JDWP. To modify the NLS parameters used for JDWP, one must use the `SET-NLS_PARAMETER Procedure`. By the same token, changes made to the debugger's private copy of the NLS parameters using `SET-NLS_PARAMETER Procedure` will have no effect on the debugged program itself.
- Date values are always formatted for JDWP use using the `NLS_TIMESTAMP_FORMAT`. The default format for `DATE (NLS_DATE_FORMAT)` used in a session most often does not show the time information that is in fact present in the value, and for debugging purposes it seems beneficial to always display that information.

### 54.3.6 PROCESS\_CONNECT\_STRING Procedure

This procedure connects a session to a debugger in two ways, so that you do not have to directly modify the application code.

The two ways are:

- Using the `ORA_DEBUG_JDWP` environment variable, when running an OCI program
- Setting a web browser cookie called `OWA_DEBUG_<dad>`, when running an application through the PL/SQL Web Gateway

#### Syntax

```
DBMS_DEBUG_JDWP.PROCESS_CONNECT_STRING (
    connect_string      IN VARCHAR2,
    connect_string_type IN PLS_INTEGER);
```

#### Parameters

**Table 54-8 PROCESS\_CONNECT\_STRING Procedure Parameters**

Parameter	Description
<code>connect_string</code>	The <code>ORA_DEBUG_JDWP</code> environment variable or <code>OWA_DEBUG_&lt;dad&gt;</code> cookie value that contains the JDWP connection information such as the host and port number of the debugger to connect to
<code>connect_string_type</code>	Can have the following two values: <ul style="list-style-type: none"> <li>• 1 if the connect string value is retrieved from the <code>ORA_DEBUG_JDWP</code> environment</li> <li>• 2 if the value is from the <code>OWA_DEBUG_&lt;dad&gt;</code> cookie</li> </ul>

#### Exceptions

**Table 54-9 PROCESS\_CONNECT\_STRING Procedure Exceptions**

Exception	Description
ORA-00022	Invalid session ID
ORA-01031	Insufficient privilege

**Table 54-9 (Cont.) PROCESS\_CONNECT\_STRING Procedure Exceptions**

Exception	Description
ORA-30677	Session is already connected to a debugger
ORA-30681	Improper value for argument EXTENSIONS_CMD_SET
ORA-30682	Improper value for argument OPTION_FLAGS
ORA-30683	Failure establishing connection to debugger
ORA-30689	Improper value for environment variable ORA_DEBUG_JDWP

### 54.3.7 SET\_NLS\_PARAMETER Procedure

This function sets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP.

These values are private to the current session, but further are private to the debugger mechanisms, separate from the values used to convert values within the debugged program itself.

#### Syntax

```
DBMS_DEBUG_JDWP.SET_NLS_PARAMETER(
    name      IN VARCHAR2,
    value     IN VARCHAR2);
```

#### Parameters

**Table 54-10 SET\_NLS\_PARAMETER Procedure Parameters**

Parameter	Description
name	Specified NLS parameter
value	Value of specified NLS parameter

#### Usage Notes

- When any variable value is read or assigned through JDWP, or when either GET\_NLS\_PARAMETER Function Or SET\_NLS\_PARAMETER Procedure is first invoked in a session, the debugger mechanisms make a private copy of the then-current NLS\_LANGUAGE, NLS\_TERRITORY, NLS\_CALENDAR, NLS\_DATE\_LANGUAGE, NLS\_NUMERIC\_CHARACTERS, NLS\_TIMESTAMP\_FORMAT, NLS\_TIMESTAMP\_TZ\_FORMAT, NLS\_TIME\_FOMAT and NLS\_TIME\_TZ\_FORMAT values. These private copies may be read by calling the [GET\\_NLS\\_PARAMETER Function](#) and changed using the following call to the SET\_NLS\_PARAMETER Procedure.
- Once the debugger's private copy of the NLS parameters is established, changes made to the NLS parameters in the current session using the ALTER SESSION statement will have no effect on the formatting of values as seen through JDWP. To modify the NLS parameters used for JDWP, one must use the

`SET-NLS_PARAMETER` Procedure. By the same token, changes made to the debugger's private copy of the NLS parameters using `SET-NLS_PARAMETER` Procedure will have no effect on the debugged program itself.

- Date values are always formatted for JDWP use using the `NLS_TIMESTAMP_FORMAT`. The default format for `DATE` (`NLS_DATE_FORMAT`) used in a session most often does not show the time information that is in fact present in the value, and for debugging purposes it seems beneficial to always display that information.

# DBMS\_DEBUG\_JDWP\_CUSTOM

The `DBMS_DEBUG_JDWP_CUSTOM` package provides database users a means to perform custom handling of a debug connection request of a database session to a debugger using the Java Debug Wire Protocol (JDWP).

This chapter contains the following topics:

- [DBMS\\_DEBUG\\_JDWP\\_CUSTOM Overview](#)
- [DBMS\\_DEBUG\\_JDWP\\_CUSTOM Security Model](#)
- [Summary of DBMS\\_DEBUG\\_JDWP\\_CUSTOM Subprograms](#)

## 55.1 DBMS\_DEBUG\_JDWP\_CUSTOM Overview

`DBMS_DEBUG_JDWP_CUSTOM` package is invoked when you attempt to connect your database session to a debugger, using the Java Debug Wire Protocol (JDWP). Before connecting to the database, you must set the `ORA_DEBUG_JDWP` environment variable in your client-side OCI application. Defining this package in your schema enables you to perform custom actions before connecting your database session to the debugger.

## 55.2 DBMS\_DEBUG\_JDWP\_CUSTOM Security Model

This default implementation of the `DBMS_DEBUG_JDWP_CUSTOM` package does not perform any additional security checks and only invokes the `DBMS_DEBUG_JDWP` package for making the debug connection. When the `DBMS_DEBUG_JDWP` package is invoked, it checks for the necessary `DEBUG CONNECT` system or user privilege before making the connection.

A database user who wants to perform additional custom security checks, must perform the following steps to override this default implementation:

- Define the `DBMS_DEBUG_JDWP_CUSTOM` package in the user's own schema.
- Implement the check before invoking the `DBMS_DEBUG_JDWP` package in the user's local copy of the package.

## 55.3 Summary DBMS\_DEBUG\_JDWP\_CUSTOM Subprograms

This table summarizes the DBMS\_DEBUG\_JDWP\_CUSTOM subprograms.

**Table 55-1 DBMS\_DEBUG\_JDWP\_CUSTOM Subprograms**

Subprogram	Description
<a href="#">CONNECT_DEBUGGER Procedure</a>	This procedure is invoked to handle the debug connection request of the current database session to the debugger.

### 55.3.1 CONNECT\_DEBUGGER Procedure

This procedure is invoked to handle the debug connection request of the current database session to the debugger.

#### Syntax

```
PROCEDURE CONNECT_DEBUGGER
(
  HOST          VARCHAR2,
  PORT          VARCHAR2,
  DEBUG_ROLE    VARCHAR2 := NULL,
  DEBUG_ROLE_PWD VARCHAR2 := NULL,
  OPTION_FLAGS  PLS_INTEGER := 0,
  EXTENSIONS_CMD_SET PLS_INTEGER := 128
)
```

#### Parameters

The preceding parameters are for the default implementation of the procedure for handling the debug connection request. A user, who wants to customize the handling of the request, must override this default implementation of the DBMS\_DEBUG\_JDWP\_CUSTOM package procedure by defining the package (specification and body) with a procedure of the same name in the user's own schema. The user may customize the number and names of the arguments, but must have the same name for the package and the procedure, namely, DBMS\_DEBUG\_JDWP\_CUSTOM and CONNECT\_DEBUGGER respectively. The user's customized version of the package may contain overloaded versions of the CONNECT\_DEBUGGER procedure with different arguments. All of the arguments to the custom package procedure must either be of VARCHAR2 type or of types that PL/SQL can implicitly convert from VARCHAR2.

For example, if a user wants to disallow debugging outside business hours, while applying optional NLS settings to the program values displayed during debugging,

then the user can define a custom implementation of the package in the user's schema in the following way:

```

CREATE OR REPLACE PACKAGE DBMS_DEBUG_JDWP_CUSTOM AUTHID CURRENT_USER IS
  PROCEDURE CONNECT_DEBUGGER(HOST VARCHAR2,
                              PORT VARCHAR2,
                              NLS_LANGUAGE VARCHAR2 DEFAULT NULL,
                              NLS_TERRITORY VARCHAR2 DEFAULT NULL);
END;
/

CREATE OR REPLACE PACKAGE BODY DBMS_DEBUG_JDWP_CUSTOM IS

  PROCEDURE CONNECT_DEBUGGER(HOST VARCHAR2,
                              PORT VARCHAR2,
                              NLS_LANGUAGE VARCHAR2 DEFAULT NULL,
                              NLS_TERRITORY VARCHAR2 DEFAULT NULL) IS

  BEGIN
    SELECT EXTRACT(HOUR FROM LOCALTIMESTAMP) INTO HOUR FROM DUAL;
    IF (HOUR < 9 OR HOUR > 5) THEN
      RAISE_APPLICATION_ERROR(-20000,
        'Debug connection disallowed outside business hours');
    ELSE
      IF (NLS_LANGUAGE IS NOT NULL) THEN
        DBMS_DEBUG_JDWP.SET-NLS_PARAMETER('NLS_LANGUAGE', NLS_LANGUAGE);
      END IF;
      IF (NLS_TERRITORY IS NOT NULL) THEN
        DBMS_DEBUG_JDWP.SET-NLS_PARAMETER('NLS_TERRITORY', NLS_TERRITORY);
      END IF;
      DBMS_DEBUG_JDWP.CONNECT_TCP(HOST, PORT);
    END IF;
  END;
END;
/

```

Before executing the client application for passing arguments to the procedure parameters, the user must set the `ORA_DEBUG_JDWP` environment variable as follows :

```

> setenv ORA_DEBUG_JDWP "host=123.45.67.89;port=4000;nls_language=american"
> myapp -user hr/hr
...

```

# 56

## DBMS\_DESCRIBE

You can use the `DBMS_DESCRIBE` package to get information about a PL/SQL object. When you specify an object name, `DBMS_DESCRIBE` returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_DESCRIBE Subprograms](#)

### 56.1 DBMS\_DESCRIBE Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

#### See Also:

*Oracle Call Interface Programmer's Guide*

### 56.2 DBMS\_DESCRIBE Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

### 56.3 DBMS\_DESCRIBE Types

The `DBMS_DESCRIBE` package declares two PL/SQL table types, which are used to hold data returned by `DESCRIBE_PROCEDURE` in its `OUT` parameters.

The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
INDEX BY BINARY_INTEGER;
```

```
TYPE NUMBER_TABLE IS TABLE OF NUMBER
INDEX BY BINARY_INTEGER;
```

## 56.4 DBMS\_DESCRIBE Exceptions

DBMS\_DESCRIBE can raise application errors in the range -20000 to -20004.

**Table 56-1 DBMS\_DESCRIBE Errors**

Error	Description
ORA-20000	ORU 10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

## 56.5 DBMS\_DESCRIBE Examples

One use of the DESCRIBE\_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT\_NAME of SCOTT.ACCOUNT\_UPDATE, where ACCOUNT\_UPDATE is an overloaded function with specification:

```
TABLE account (acct_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person (person_id number(4), person_nm varchar2(10))

CREATE OR REPLACE PACKAGE ACCOUNT_PKG IS
  FUNCTION ACCOUNT_UPDATE (acct_no
    NUMBER,
                           person    person%rowtype,
                           amounts    DBMS_DESCRIBE.NUMBER_TABLE,
                           trans_date DATE)
    return account.balance%type;

  FUNCTION ACCOUNT_UPDATE (acct_no NUMBER,
    person    person%rowtype,
    amounts   DBMS_DESCRIBE.NUMBER_TABLE,
    trans_no  NUMBER)
    return account.balance%type;
END;
```

This procedure might look similar to the following output:

```
overload position argument level datatype length prec scale rad
-----
1          0          0          2      22    7    2  10
1          1  ACCNT_NO  0          2      0    0    0  0
1          2  PERSON    0      250    0    0    0  0
1          1  PERSON_ID  1          2      22    4    0  10
1          2  PERSON_NM  1          1      10    0    0  0
1          3  AMOUNTS   0      251    0    0    0  0
1          1          1          2      22    0    0  0
1          4  TRANS_DATE 0          12     0    0    0  0
2          0          0          2      22    7    2  10
```

2	1	ACCNT_NO	0	2	22	0	0	0
2	2	PERSON	0	2	22	4	0	10
2	3	AMOUNTS	0	251	22	4	0	10
2	1		1	2	0	0	0	0
2	4	TRANS_NO	0	2	0	0	0	0

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
  pvc2   IN   VARCHAR2,
  pvc    OUT  VARCHAR,
  pstr   IN OUT STRING,
  plong  IN   LONG,
  prowid IN   ROWID,
  pchara IN   CHARACTER,
  pchar  IN   CHAR,
  praw  IN   RAW,
  plraw  IN   LONG RAW,
  pbinint IN  BINARY_INTEGER,
  pplsint IN  PLS_INTEGER,
  pbool  IN   BOOLEAN,
  pnat   IN   NATURAL,
  ppos   IN   POSITIVE,
  pposn  IN   POSITIVEN,
  pnatn  IN   NATURALN,
  pnum   IN   NUMBER,
  pintgr IN   INTEGER,
  pint   IN   INT,
  psmall IN  SMALLINT,
  pdec   IN   DECIMAL,
  preal  IN   REAL,
  pfloat IN  FLOAT,
  pnumer IN  NUMERIC,
  pdp    IN   DOUBLE PRECISION,
  pdate  IN   DATE,
  pmls   IN   MLSLABEL) AS

BEGIN
  NULL;
END;
```

If you describe this procedure using the following:

```
CREATE OR REPLACE PACKAGE describe_it AS

  PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

  PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
    n INTEGER;
  BEGIN
    n := isize - LENGTHB(val);
    IF n < 0 THEN
      n := 0;
    END IF;
    DBMS_OUTPUT.PUT(val);
    FOR i in 1..n LOOP
      DBMS_OUTPUT.PUT(' ');
    END LOOP;
  END;
```

```

END LOOP;
END prt_value;

PROCEDURE desc_proc (name VARCHAR2) IS

    overload    DBMS_DESCRIBE.NUMBER_TABLE;
    position    DBMS_DESCRIBE.NUMBER_TABLE;
    c_level     DBMS_DESCRIBE.NUMBER_TABLE;
    arg_name    DBMS_DESCRIBE.VARCHAR2_TABLE;
    dty         DBMS_DESCRIBE.NUMBER_TABLE;
    def_val     DBMS_DESCRIBE.NUMBER_TABLE;
    p_mode     DBMS_DESCRIBE.NUMBER_TABLE;
    length      DBMS_DESCRIBE.NUMBER_TABLE;
    precision   DBMS_DESCRIBE.NUMBER_TABLE;
    scale       DBMS_DESCRIBE.NUMBER_TABLE;
    radix       DBMS_DESCRIBE.NUMBER_TABLE;
    spare       DBMS_DESCRIBE.NUMBER_TABLE;
    idx         INTEGER := 0;

BEGIN
    DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
        name,
        null,
        null,
        overload,
        position,
        c_level,
        arg_name,
        dty,
        def_val,
        p_mode,
        length,
        precision,
        scale,
        radix,
        spare);

    DBMS_OUTPUT.PUT_LINE('Position   Name           DTY   Mode');
    LOOP
        idx := idx + 1;
        prt_value(TO_CHAR(position(idx)), 12);
        prt_value(arg_name(idx), 12);
        prt_value(TO_CHAR(dty(idx)), 5);
        prt_value(TO_CHAR(p_mode(idx)), 5);
        DBMS_OUTPUT.NEW_LINE;
    END LOOP;
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.NEW_LINE;

END desc_proc;
END describe_it;

```

Then the results list all the numeric codes for the PL/SQL datatypes:

Position	Name	Datatype_Code	Mode
1	PVC2	1	0
2	PVC	1	1
3	PSTR	1	2
4	PLONG	8	0

5	PROWID	11	0
6	PCHARA	96	0
7	PCHAR	96	0
8	PRAW	23	0
9	PLRAW	24	0
10	PBININT	3	0
11	PPLSINT	3	0
12	PBOOL	252	0
13	PNAT	3	0
14	PPOS	3	0
15	PPOSN	3	0
16	PNATN	3	0
17	PNUM	2	0
18	PINTGR	2	0
19	PINT	2	0
20	PSMALL	2	0
21	PDEC	2	0
22	PREAL	2	0
23	PFLOAT	2	0
24	PNUMBER	2	0
25	PDP	2	0
26	PDATE	12	0
27	PMLS	106	0

## 56.6 Summary of DBMS\_DESCRIBE Subprograms

The DBMS\_DESCRIBE package includes the DESCRIBE\_PROCEDURE procedure.

**Table 56-2 DBMS\_DESCRIBE Package Subprograms**

Subprogram	Description
<a href="#">DESCRIBE_PROCEDURE Procedure</a>	Provides a brief description of a PL/SQL stored procedure

### 56.6.1 DESCRIBE\_PROCEDURE Procedure

The procedure DESCRIBE\_PROCEDURE provides a brief description of a PL/SQL stored procedure.

It takes the name of a stored procedure and returns information about each parameter of that procedure.

#### Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
    object_name          IN VARCHAR2,
    reserved1            IN VARCHAR2,
    reserved2            IN VARCHAR2,
    overload             OUT NUMBER_TABLE,
    position             OUT NUMBER_TABLE,
    level                OUT NUMBER_TABLE,
    argument_name        OUT VARCHAR2_TABLE,
    datatype             OUT NUMBER_TABLE,
    default_value        OUT NUMBER_TABLE,
    in_out               OUT NUMBER_TABLE,
    length               OUT NUMBER_TABLE,
    precision            OUT NUMBER_TABLE,
```

```

scale          OUT NUMBER_TABLE,
radix          OUT NUMBER_TABLE,
spare         OUT NUMBER_TABLE
include_string_constraints  OUT BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 56-3 DBMS\_DESCRIBE.DESCRIBE\_PROCEDURE Parameters**

Parameter	Description
object_name	<p>Name of the procedure being described.</p> <p>The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified OBJECT_NAME can result in one of the following exceptions:</p> <p>ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function.</p> <p>ORA-20001 - The procedure or function that you specified does not exist within the given package.</p> <p>ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects.</p> <p>ORA-20003 - The object that you specified is invalid and cannot be described.</p> <p>ORA-20004 - The object was specified with a syntax error.</p>
reserved1	Reserved for future use -- must be set to NULL or the empty string.
reserved2	
overload	<p>A unique number assigned to the procedure's signature.</p> <p>If a procedure is overloaded, then this field holds a different value for each version of the procedure.</p>
position	<p>Position of the argument in the parameter list.</p> <p>Position 0 returns the values for the return type of a function.</p>
level	<p>If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the <i>Oracle Call Interface Programmer's Guide</i> for a description of the ODESSP call for an example.</p>
argument_name	Name of the argument associated with the procedure that you are describing.

**Table 56-3 (Cont.) DBMS\_DESCRIBE.DESCRIBE\_PROCEDURE Parameters**

Parameter	Description
datatype	<p>Oracle datatype of the argument being described. The datatypes and their numeric type codes are:</p> <ul style="list-style-type: none"> <li>0 placeholder for procedures with no arguments</li> <li>1 VARCHAR, VARCHAR, STRING</li> <li>2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL</li> <li>3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL</li> <li>8 LONG</li> <li>11 ROWID</li> <li>12 DATE</li> <li>23 RAW</li> <li>24 LONG RAW</li> <li>58 OPAQUE TYPE</li> <li>96 CHAR (ANSI FIXED CHAR), CHARACTER</li> <li>106 MLSLABEL</li> <li>121 OBJECT</li> <li>122 NESTED TABLE</li> <li>123 VARRAY</li> <li>178 TIME</li> <li>179 TIME WITH TIME ZONE</li> <li>180 TIMESTAMP</li> <li>181 TIMESTAMP WITH TIME ZONE</li> <li>231 TIMESTAMP WITH LOCAL TIME ZONE</li> <li>250 PL/SQL RECORD</li> <li>251 PL/SQL TABLE</li> <li>252 PL/SQL BOOLEAN</li> </ul>
default_value	1 if the argument being described has a default value; otherwise, the value is 0.
in_out	<p>Describes the mode of the parameter:</p> <ul style="list-style-type: none"> <li>0 IN</li> <li>1 OUT</li> <li>2 IN OUT</li> </ul>
length	For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned. If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
precision	If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.
scale	If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number.
radix	If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number.
spare	Reserved for future functionality.
include_string_constraints	The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96

### Return Values

All values from `DESCRIBE_PROCEDURE` are returned in its `OUT` parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

# DBMS\_DG

The `DBMS_DG` package allows applications to notify the primary database or the fast-start failover target database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

This chapter contains the following topics:

- [Using DBMS\\_DG](#)
- [Security Model](#)
- [Summary of the DBMS\\_DG Subprogram](#)

## See Also:

*Oracle Data Guard Broker*

## 57.1 Using DBMS\_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the `DBMS_DG.INITIATE_FS_FAILOVER` procedure to alert either the primary or fast-start failover target standby database that the application wants a fast-start failover to occur immediately. The database on which the procedure was called then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover. If the configuration is not in a valid fast-start failover state, the `INITIATE_FS_FAILOVER` subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

## Note:

If you are working in a multitenant container database (CDB), then functions within `DBMS_DG` are only executed at the root level. Ensure you are connected at the root level, not at the individual pluggable database (PDB) level.

## 57.2 DBMS\_DG Security Model

The `DBMS_DG` package runs with invoker's rights and requires the `SYSDBA` privilege.

## 57.3 Summary of the DBMS\_DG Subprogram

The DBMS\_DG package contains one subprogram, the INITIATE\_FS\_FAILOVER procedure.

**Table 57-1 DBMS\_DG Package Subprogram**

Subprogram	Description
<a href="#">INITIATE_FS_FAILOVER Procedure</a>	Enables an application to notify either the primary or fast-start failover target standby database that a fast-start failover is necessary when the application encounters conditions that warrant a failover. This procedure can only be called while connected to a primary database or a fast-start failover standby database.

### 57.3.1 INITIATE\_FS\_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request that a fast-start failover be invoked.

#### Syntax

```
DBMS_DG.INITIATE_FS_FAILOVER (
    condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

#### Parameters

**Table 57-2 INITIATE\_FS\_FAILOVER Procedure Parameters**

Parameter	Description
condstr	Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of "Application Failover Requested" will be logged in the broker log file and in the database alert log of the database on which the procedure was called.

#### Usage Notes

- This procedure returns a binary integer.
- Query the V\$FS\_FAILOVER\_STATS view to see the time of the last fast-start failover and the reason it was performed.
- This procedure can only be called while connected to a primary database or a fast-start failover standby database.

## Errors

**Table 57-3 INITIATE\_FS\_FAILOVER Procedure Errors**

Error	Description
ORA-00000: normal, successful completion	The request to initiate a fast-start failover has been posted to the observer.
ORA-16646: fast-start failover is disabled	Either a broker configuration does not exist or fast-start failover has not been enabled.
ORA-16666: unable to initiate fast-start failover on a bystander standby database	DBMS_DG.INITIATE_FS_FAILOVER was invoked on a bystander standby database. That is, it was not invoked on the primary or on the fast-start failover target standby database.
ORA-16817: unsynchronized fast-start failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized.
ORA-16819: fast-start failover observer not started	DBMS_DG.INITIATE_FS_FAILOVER was invoked but an observer had not yet been started.
ORA-16820: fast-start failover observer is no longer observing this database	DBMS_DG.INITIATE_FS_FAILOVER was invoked but the configuration detects that the observer may not be running.
ORA-16829: lagging fast-start failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit.

## Example

In this example, the program attempts to initiate a fast-start failover when fast-start failover is disabled. To use this example, connect as user SYS with SYDDBA privileges.

```
set serveroutput on

declare
status integer;

begin
status := dbms_dg.initiate_fs_failover('Failover Requested');

dbms_output.put_line('Fast-Start Failover is disabled: Expected status =
ORA-16646');
dbms_output.put_line('                Actual Status = ORA-' || status);

end;
/
exit;
```

# DBMS\_DIMENSION

DBMS\_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

## See Also:

*Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS\_DIMENSION package

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_DIMENSION Subprograms](#)

## 58.1 DBMS\_DIMENSION Security Model

Security on this package can be controlled by granting EXECUTE to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: CREATE ANY DIMENSION, ALTER ANY DIMENSION, and DROP ANY DIMENSION.

## 58.2 Summary of DBMS\_DIMENSION Subprograms

This table lists the DBMS\_DIMENSION subprograms and briefly describes them.

**Table 58-1 DBMS\_DIMENSION Package Subprograms**

Subprogram	Description
<a href="#">DESCRIBE_DIMENSION Procedure</a>	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
<a href="#">VALIDATE_DIMENSION Procedure</a>	Verifies that the relationships specified in a dimension are correct

## 58.2.1 DESCRIBE\_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS\_OUTPUT package.

### Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (
    dimension IN VARCHAR2);
```

### Parameters

**Table 58-2 DESCRIBE\_DIMENSION Procedure Parameter**

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

## 58.2.2 VALIDATE\_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table DIMENSION\_EXCEPTIONS in the user's schema.

### Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
    dimension          IN VARCHAR2,
    incremental        IN BOOLEAN := TRUE,
    check_nulls        IN BOOLEAN := FALSE,
    statement_id        IN VARCHAR2 := NULL );
```

### Parameters

**Table 58-3 VALIDATE\_DIMENSION Procedure Parameters**

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.
incremental	If TRUE, check only the new rows for tables of this dimension. If FALSE, check all the rows.
check_nulls	If TRUE, then all level columns are verified to be non-null. If FALSE, this check is omitted. Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

# DBMS\_DISTRIBUTED\_TRUST\_ADMIN

DBMS\_DISTRIBUTED\_TRUST\_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Examples](#)
- [Summary of DBMS\\_DISTRIBUTED\\_TRUST\\_ADMIN Subprograms](#)

## 59.1 DBMS\_DISTRIBUTED\_TRUST\_ADMIN Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

## 59.2 DBMS\_DISTRIBUTED\_TRUST\_ADMIN Security Model

To execute DBMS\_DISTRIBUTED\_TRUST\_ADMIN, the EXECUTE\_CATALOG\_ROLE role must be granted to the DBA. To select from the view TRUSTED\_SERVERS, the SELECT\_CATALOG\_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW\_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the DENY\_SERVER procedure does not have any effect if

the database already does not trust any database or if that database is already untrusted.

The procedures `DENY_ALL` and `ALLOW_ALL` delete all entries (in other words, server names) that are explicitly allowed or denied using the `ALLOW_SERVER` procedure or `DENY_SERVER` procedure respectively.

## 59.3 DBMS\_DISTRIBUTED\_TRUST\_ADMIN Examples

If you have not yet used the package `DBMS_DISTRIBUTED_TRUST_ADMIN` to change the trust listing, by default you trust all databases in the same enterprise domain if that domain is listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST
NAME
-----
Trusted
All
```

Because all servers are currently trusted, you can execute the [DENY\\_SERVER Procedure](#) and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST
NAME
-----
Untrusted SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the [DENY\\_ALL Procedure](#), you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;

TRUST
NAME
-----
Untrusted
All
```

The [ALLOW\\_SERVER Procedure](#) can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST
NAME
-----
Trusted SALES.US.AMERICAS.ACME_AUTO.COM
```

## 59.4 Summary of DBMS\_DISTRIBUTED\_TRUST\_ADMIN Subprograms

This table lists and briefly describes the DBMS\_DISTRIBUTED\_TRUST\_ADMIN subprograms.

**Table 59-1 DBMS\_DISTRIBUTED\_TRUST\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">ALLOW_ALL Procedure</a>	Empties the list and inserts a row indicating that all servers should be trusted
<a href="#">ALLOW_SERVER Procedure</a>	Enables a specific server to be allowed access even though deny all is indicated in the list
<a href="#">DENY_ALL Procedure</a>	Empties the list and inserts a row indicating that all servers should be untrusted
<a href="#">DENY_SERVER Procedure</a>	Enables a specific server to be denied access even though allow all is indicated in the list

### 59.4.1 ALLOW\_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED\_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

#### Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

#### Usage Notes

ALLOW\_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

### 59.4.2 ALLOW\_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "deny all").

#### Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (
  server IN VARCHAR2);
```

## Parameters

**Table 59-2 ALLOW\_SERVER Procedure Parameters**

Parameter	Description
server	Unique, fully-qualified name of the server to be trusted.

## Usage Notes

If the Trusted Servers List contains the entry "deny all", then this procedure adds a specification indicating that a specific database (for example, DBx) is to be trusted.

If the Trusted Servers List contains the entry "allow all", and if there is no "deny DBx" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "allow all", and if there is a "deny DBx" entry in the list, then that entry is deleted.

## 59.4.3 DENY\_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view TRUSTED\_SERVERS will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

### Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

## 59.4.4 DENY\_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified allow all).

### Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (
    server IN VARCHAR2);
```

## Parameters

**Table 59-3 DENY\_SERVER Procedure Parameters**

Parameter	Description
server	Unique, fully-qualified name of the server to be untrusted.

## Usage Notes

If the Trusted Servers List contains the entry allow all, then this procedure adds an entry indicating that the specified database (for example, DBx) is not to be trusted.

If the Trusted Servers List contains the entry "deny all", and if there is no "allow DBx" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "deny all", and if there is an "allow DBx" entry, then this procedure causes that entry to be deleted.

# 60

## DBMS\_DNFS

The `DBMS_DNFS` package provides an interface to assist in creating a database using files in the backup set.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_DNFS Subprograms](#)

### See Also:

*Oracle Database Administrator's Guide*

## 60.1 DBMS\_DNFS Security Model

This package has to be executed by users with `SYSDBA` privileges.

## 60.2 Summary of DBMS\_DNFS Subprograms

The `DBMS_DNFS` package includes the `CLONEDB_RENAMEFILE` procedure.

**Table 60-1 DBMS\_DNFS Package Subprograms**

Subprogram	Description
<a href="#">CLONEDB_RENAMEFILE Procedure</a>	Renames datafiles that were pointing to the backup set to the actual file name in cloned database.

### 60.2.1 CLONEDB\_RENAMEFILE Procedure

This procedure is used to rename datafiles that were pointing to the backup set to the actual file name in cloned database.

The `srcfile` is the file name that represents the data file in the backup image copy or a read-only storage snapshot. The `destfile` destination file path must point to a NFS volume where cloneDB datafiles will be created. When the procedure is run successfully, the control file record is updated with the new datafile name.

#### Syntax

```
DBMS_DNFS.CLONEDB_RENAMEFILE (  
    srcfile      IN      VARCHAR2,  
    destfile     IN      VARCHAR2);
```

## Parameters

**Table 60-2** *CLONEDB\_RENAMEFILE Procedure Parameters*

<b>Parameter</b>	<b>Description</b>
srcfile	Source datafile name in the control file
destfile	New datafile name

# 61

## DBMS\_DST

The DBMS\_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Summary of DBMS\\_DST Subprograms](#)

### See Also:

- *Oracle Database Globalization Support Guide*
- *Oracle Database Reference*

### 61.1 DBMS\_DST Overview

The transition period during which Daylight Saving Time comes into effect, or stops being in effect, has the potential for problems, such as data loss, when handling timestamps with time zone data. The DBMS\_DST package enables working with these transitions in the context of a set of rules.

### 61.2 DBMS\_DST Security Model

The DBMS\_DST package is an invoker's rights package.

### See Also:

*Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

The execute privilege on the package is granted to the EXECUTE\_CATALOG\_ROLE role. This role is normally granted to selected users to allow EXECUTE privileges for packages and procedures in the data dictionary.

The user that invokes the package must have the following privileges:

- CREATE ANY TABLE
- ALTER ANY TABLE

- DROP ANY TABLE
- SELECT ANY TABLE
- LOCK ANY TABLE
- ALTER ANY INDEX
- ALTER ANY TRIGGER
- UPDATE ANY TABLE
- EXECUTE ANY TYPE

## 61.3 DBMS\_DST Views

The DBMS\_DST package uses views to display table information.

These views are shown in the following table. They are further described in the *Oracle Database Reference*:

**Table 61-1 Views used by DBMS\_DST**

View	Description
DBA_TSTZ_TABLES	Displays information about all tables in the database, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> datatypes or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> datatypes. Its columns are the same as those in <code>ALL_TSTZ_TABLES</code> .
USER_TSTZ_TABLES	Displays information about the tables owned by the current user, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> datatypes or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> datatypes. Its columns (except for <code>OWNER</code> ) are the same as those in <code>ALL_TSTZ_TABLES</code> .
ALL_TSTZ_TABLES	Displays information about the tables accessible to the current user, which have columns defined on <code>TIMESTAMP WITH TIME ZONE</code> datatypes or object types containing attributes of <code>TIMESTAMP WITH TIME ZONE</code> datatypes.

## 61.4 Summary of DBMS\_DST Subprograms

This table lists and describes the DBMS\_DST package subprograms.

**Table 61-2 DBMS\_DST Package Subprograms**

Subprogram	Description
<a href="#">BEGIN_PREPARE Procedure</a>	Starts a prepare window
<a href="#">BEGIN_UPGRADE Procedure</a>	Starts an upgrade window
<a href="#">CREATE_AFFECTED_TABLE Procedure</a>	Creates a table that has the schema shown in the comments for the <a href="#">FIND_AFFECTED_TABLES Procedure</a>

**Table 61-2 (Cont.) DBMS\_DST Package Subprograms**

Subprogram	Description
<a href="#">CREATE_ERROR_TABLE Procedure</a>	Creates a log error table
<a href="#">CREATE_TRIGGER_TABLE Procedure</a>	Creates a table that is used to record active triggers disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process
<a href="#">END_PREPARE Procedure</a>	Ends a prepare window
<a href="#">END_UPGRADE Procedure</a>	Ends an upgrade window
<a href="#">FIND_AFFECTED_TABLES Procedure</a>	Finds all the tables that have affected TSTZ data due to the new timezone version
<a href="#">UPGRADE_DATABASE Procedure</a>	Upgrades all tables in the database that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
<a href="#">UPGRADE_SCHEMA Procedure</a>	Upgrades tables in a specified list of schemas that has one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
<a href="#">UPGRADE_TABLE Procedure</a>	Upgrades a specified list of tables that has one or more columns defined on the TSTZ type or an ADT containing the TSTZ type

## 61.4.1 BEGIN\_PREPARE Procedure

This procedure starts a prepare window. Once a prepare window is started successfully, the database property 'DST\_UPGRADE\_STATE' is set to 'PREPARE', and the database property 'SECONDARY\_TT\_VERSION' is set to a new timezone version.

The prepare window lets a DBA investigate data affected by the upgrade, and so judge when it is optimal to perform the upgrade. The prepare window can overlap normal database operation.

### Syntax

```
DBMS_DST.BEGIN_PREPARE (
    new_version          IN BINARY_INTEGER);
```

### Parameters

**Table 61-3 BEGIN\_PREPARE Procedure Parameters**

Parameter	Description
new_version	New timezone version to which the database is to be prepared to upgrade

## 61.4.2 BEGIN\_UPGRADE Procedure

This procedure starts an upgrade window.

When an upgraded window is started successfully, the TSTZ data in the dictionary tables is upgraded to reflect the new timezone version, and the database property

'DST\_UPGRADE\_STATE' is set to 'UPGRADE'. Once BEGIN\_UPGRADE has been performed successfully, the user must re-start the database. After a successful restart, the database property 'PRIMARY\_TT\_VERSION' is the new timezone version, and 'SECONDARY\_TT\_VERSION' is the old timezone version.

The procedure operates atomically, and upgrades all or none of the dictionary tables and the database properties. It must be called in the database in OPEN MIGRATE mode.

### Syntax

```
DBMS_DST.BEGIN_UPGRADE (
    new_version          IN BINARY_INTEGER,
    error_on_overlap_time IN BOOLEAN := FALSE,
    error_on_nonexisting_time IN BOOLEAN := FALSE);
```

### Parameters

**Table 61-4 BEGIN\_UPGRADE Procedure Parameters**

Parameter	Description
new_version	New timezone version to which the database is to be upgraded
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is FALSE. For more information about boundary cases, see <i>Oracle Database SQL Language Reference</i> .
error_on_nonexisting_time	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default value is FALSE.

## 61.4.3 CREATE\_AFFECTED\_TABLE Procedure

This procedure creates a table that has the schema shown in the comments for the FIND\_AFFECTED\_TABLES Procedure.

### Syntax

```
DBMS_DST.CREATE_AFFECTED_TABLE (
    table_name          IN VARCHAR2);
```

### Parameters

**Table 61-5 CREATE\_AFFECTED\_TABLE Procedure Parameters**

Parameter	Description
table_name	Name of the table created

### Usage Notes

This procedure takes a table\_name without schema qualification, creating a table within the current user schema.

**Related Topics**

- [FIND\\_AFFECTED\\_TABLES Procedure](#)  
This procedure finds all the tables which have affected TSTZ data due to the new timezone version.

## 61.4.4 CREATE\_ERROR\_TABLE Procedure

This procedure creates a log error table.

The table has the following schema:

```
CREATE TABLE dst$error_table(
  table_owner    VARCHAR2(30),
  table_name     VARCHAR2(30),
  column_name    VARCHAR2(4000),
  rid            ROWID,
  error_number   NUMBER)
```

**Syntax**

```
DBMS_DST.CREATE_ERROR_TABLE (
  table_name     IN VARCHAR2);
```

**Parameters**

**Table 61-6 CREATE\_ERROR\_TABLE Procedure Parameters**

Parameter	Description
table_name	Name of the table created

**Usage Notes**

- This procedure takes a table\_name without schema qualification, creating a table within the current user schema.
- The error number is found when upgrading time zone file and timestamp with time zone data. For more information about error handling when upgrading time zone file and timestamp with time zone data, see Oracle Database Globalization Support Guide

## 61.4.5 CREATE\_TRIGGER\_TABLE Procedure

This procedure creates a table to record active triggers that are disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process.

The table that has the following schema.

```
CREATE TABLE dst_trigger_table (
  trigger_owner  VARCHAR2(30),
  trigger_name   VARCHAR2(30));
```

**Syntax**

```
DBMS_DST.CREATE_TRIGGER_TABLE (
  table_name     IN VARCHAR2);
```

## Parameters

**Table 61-7 CREATE\_TRIGGER\_TABLE Procedure Parameters**

Parameter	Description
table_name	Name of table to be created

## Usage Notes

This procedure takes a `table_name` without schema qualification, creating a table within the current user schema.

## 61.4.6 END\_PREPARE Procedure

This procedure ends a prepare window.

### Syntax

```
DBMS_DST.BEGIN_PREPARE;
```

## 61.4.7 END\_UPGRADE Procedure

This procedure ends an upgrade window. An upgraded window is ended if all the affected user tables have been upgraded. Otherwise, the `OUT` parameter `num_of_failures` indicates how many tables have not been converted.

### Syntax

```
DBMS_DST.END_UPGRADE (
  num_of_failures OUT BINARY_INTEGER);
```

## Parameters

**Table 61-8 END\_UPGRADE Procedure Parameters**

Parameter	Description
num_of_failures	Number of tables that fail to complete

## 61.4.8 FIND\_AFFECTED\_TABLES Procedure

This procedure finds all the tables which have affected TSTZ data due to the new timezone version.

This procedure can only be invoked during a prepare window. The tables which have affected TSTZ data are recorded into a table indicated by parameter `affected_tables`. If semantic errors must be logged, they are recorded into a table indicated by parameter `log_errors_table`.

### Syntax

```
DBMS_DST.FIND_AFFECTED_TABLES (
  affected_tables          IN VARCHAR2 := 'sys.dst$affected_tables',
```

```

log_errors          IN  BOOLEAN := FALSE,
log_errors_table    IN  VARCHAR2 := 'sys.dst$error_table',
parallel            IN  BOOLEAN := FALSE);

```

## Parameters

**Table 61-9 FIND\_AFFECTED\_TABLES Procedure Parameters**

Parameter	Description
affected_tables	<p>Name of table with the following schema:</p> <pre> CREATE TABLE dst\$affected_tables (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   row_count NUMBER,   error_count NUMBER) </pre> <p>The table can be created with the <a href="#">CREATE_AFFECTED_TABLE Procedure</a>.</p>
log_errors	<p>Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table.</p> <p>The default is FALSE.</p>
log_errors_table	<p>Table name with the following schema:</p> <pre> CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER) </pre> <p>The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a>. The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.</p>
parallel	<p>Boolean flag indicating whether to find the affected tables using parallel queries or serial queries. The default is FALSE.</p>

## 61.4.9 UPGRADE\_DATABASE Procedure

This procedure upgrades all tables in the database, which have one or more columns defined on the TSTZ type or an ADT containing the TSTZ type.

This procedure can only be invoked after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that, a base table and its materialized view log table are upgraded in an atomic transaction.

### Syntax

```

DBMS_DST.UPGRADE_DATABASE (
  num_of_failures    OUT BINARY_INTEGER,
  upgrade_data       IN  BOOLEAN := TRUE,
  parallel           IN  BOOLEAN := FALSE,

```

```

continue_after_errors    IN  BOOLEAN := TRUE,
log_errors               IN  BOOLEAN := FALSE,
log_errors_table        IN  VARCHAR2 := 'sys.dst$error_table' ,
error_on_overlap_time   IN  BOOLEAN := FALSE,
error_on_nonexisting_time IN  BOOLEAN := FALSE,
log_triggers_table      IN  VARCHAR2 := 'sys.dst$trigger_table');

```

## Parameters

**Table 61-10 UPGRADE\_DATABASE Procedure Parameters**

Parameter	Description
num_of_failures	Number of tables that fail to complete
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave it unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, errors are logged to the log_errors_table. The default is FALSE.
log_errors_table	Table name with the following schema:  <pre> CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER) </pre> The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a> . The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.
error_on_nonexisting_time	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.
log_triggers_table	Table to log triggers which are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade

## 61.4.10 UPGRADE\_SCHEMA Procedure

This procedure upgrades tables in a specified list of schemas that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

This procedure can be invoked only after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that a base table and its materialized view log table are upgraded in an atomic transaction.

### Syntax

```
DBMS_DST.UPGRADE_SCHEMA (
    num_of_failures          OUT BINARY_INTEGER,
    schema_list              IN  VARCHAR2,
    upgrade_data             IN  BOOLEAN := TRUE,
    parallel                 IN  BOOLEAN := FALSE,
    continue_after_errors   IN  BOOLEAN := TRUE,
    log_errors               IN  BOOLEAN := FALSE,
    log_errors_table        IN  VARCHAR2 := 'sys.dst$error_table' ,
    error_on_overlap_time    IN  BOOLEAN := FALSE,
    error_on_nonexisting_time IN  BOOLEAN := FALSE,
    log_triggers_table       IN  VARCHAR2 := 'sys.dst$trigger_table');
```

### Parameters

**Table 61-11 UPGRADE\_SCHEMA Procedure Parameters**

Parameter	Description
num_of_failures	Number of tables that fail to complete
schema_list	Schema name list (comma separated strings)
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE) or to leave unconverted (FALSE).The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML.The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table.The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.

**Table 61-11 (Cont.) UPGRADE\_SCHEMA Procedure Parameters**

Parameter	Description
log_errors_table	<p>Table name with the following schema:</p> <pre>CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER)</pre> <p>The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a>. The <code>rid</code> column records the rowids of the offending rows, and the <code>error_number</code> column records the corresponding error number.</p>
error_on_overlap_time	<p>Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error.</p> <p>The default is TRUE.</p>
error_on_nonexisting_time	<p>Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error.</p> <p>The default is TRUE.</p>
log_triggers_table	<p>Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade</p>

## 61.4.11 UPGRADE\_TABLE Procedure

This procedure upgrades a specified list of tables that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

### Syntax

```
DBMS_DST.UPGRADE_TABLE (
  num_of_failures      OUT BINARY_INTEGER,
  table_list           IN VARCHAR2,
  upgrade_data         IN BOOLEAN := TRUE,
  parallel             IN BOOLEAN := FALSE,
  continue_after_errors IN BOOLEAN := TRUE,
  log_errors           IN BOOLEAN := FALSE,
  log_errors_table     IN VARCHAR2 := 'sys.dst$error_table' ,
  error_on_overlap_time IN BOOLEAN := FALSE,
  error_on_nonexisting_time IN BOOLEAN := FALSE,
  log_triggers_table   IN VARCHAR2 := 'sys.dst$trigger_table',
  atomic_upgrade       IN BOOLEAN := FALSE);
```

### Parameters

**Table 61-12 UPGRADE\_TABLE Procedure Parameters**

Parameter	Description
num_of_failures	Number of tables that fail to complete
table_list	Table name list (comma separated strings)

**Table 61-12 (Cont.) UPGRADE\_TABLE Procedure Parameters**

Parameter	Description
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML), or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.
log_errors_table	Table name with the following schema:  <pre>CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER)</pre> The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a> . The rid parameter records the rowids of the offending rows and the corresponding error number.
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.
error_on_nonexisting_time	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.
log_triggers_table	Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade
atomic_upgrade	Boolean flag indicating whether to convert the listed tables atomically (in a single transaction). If FALSE, each table is converted in its own transaction. The default is FALSE.

### Usage Notes

This procedure can only be invoked after an upgrade window has been started. The table list has to satisfy the following partial ordering:

1. If a base table has a materialized view log table, the log table must be the next item in the list.

2. If the container table for a materialized view appears in the list, the materialized view's 'non-upgraded' base tables and log tables must appear in the table list and before the container table.

A base table and its materialized view log table need to be upgraded in an atomic transaction by specifying `atomic_upgrade` to `TRUE`.

# 62

## DBMS\_EDITIONS\_UTILITIES

The `DBMS_EDITIONS_UTILITIES` package provides helper functions for edition-related operations.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)
- [Summary of `DBMS\_EDITIONS\_UTILITIES` Subprograms](#)

### 62.1 `DBMS_EDITIONS_UTILITIES` Overview

The `DBMS_EDITIONS_UTILITIES` package implements an interface which provides helper functions for edition-related operations.

### 62.2 `DBMS_EDITIONS_UTILITIES` Security Model

This package is owned by `SYS` with `execute` access granted to `PUBLIC`. It runs with invoker's rights, that is, with the security profile of the caller.

### 62.3 `DBMS_EDITIONS_UTILITIES` Exceptions

The table in this topic lists exception messages created by `DBMS_EDITIONS_UTILITIES`.

**Table 62-1** `DBMS_EDITIONS_UTILITIES` Error Messages

Error	Description
ORA-38817	Insufficient privileges
ORA-942	Missing table

### 62.4 Summary of `DBMS_EDITIONS_UTILITIES` Subprograms

This table lists and describes the `DBMS_EDITIONS_UTILITIES` package subprograms.

**Table 62-2 DBMS\_EDITIONS\_UTILITIES Package Subprograms**

Subprogram	Description
<a href="#">CLEAN_UNUSABLE_EDITIONS Procedure</a>	Drops covered objects in unusable editions, and drops empty unusable editions if possible.
<a href="#">SET_EDITIONING_VIEWS_READ_ONLY Procedure</a>	Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to READ ONLY or READ/WRITE
<a href="#">SET_NULL_COLUMN_VALUES_T O_EXPR Procedure</a>	For use only during an edition-based redefinition (EBR) exercise

## 62.4.1 CLEAN\_UNUSABLE\_EDITIONS Procedure

Drops all covered objects in any unusable editions and drops empty unusable editions.

The `CLEAN_UNUSABLE_EDITIONS` procedure executes immediately and in its entirety.

### Syntax

```
DBMS_EDITIONS_UTILITIES.CLEAN_UNUSABLE_EDITIONS ( );
```

### Usage Notes

The `COMPATIBLE` parameter must be set to 12.2.0 or higher for this procedure to execute.

### See Also:

- *Oracle Database SQL Language Reference* for information about `DROP EDITION`
- *Oracle Database Development Guide* for more information about using edition-based redefinition

## 62.4.2 SET\_EDITIONING\_VIEWS\_READ\_ONLY Procedure

Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to `READ ONLY` or `READ/WRITE`.

### Syntax

```
DBMS_EDITIONS_UTILITIES.SET_EDITIONING_VIEWS_READ_ONLY (
  table_name IN VARCHAR2,
  owner      IN VARCHAR2 DEFAULT NULL,
  read_only  IN BOOLEAN   DEFAULT TRUE);
```

## Parameters

**Table 62-3 SET\_EDITIONING\_VIEWS\_READ\_ONLY Procedure Parameters**

Parameter	Description
table_name	Base table of the editioning views
owner	Base table schema. The default (or NULL) is the current schema.
read_only	TRUE to set the views to read-only; FALSE (or NULL) sets the views to READ/WRITE. Default is TRUE.

## Usage Notes

The user must have the following privileges:

- Owner of the table, or have the ALTER ANY TABLE system privileges
- USE object privilege on all the editions for which the views are defined

## 62.4.3 SET\_NULL\_COLUMN\_VALUES\_TO\_EXPR Procedure

This procedure replaces NULL values in a replacement column with the value of an expression.

The expression evaluation cost is deferred to future updates and queries. The procedure is intended for use only during an edition-based redefinition (EBR) exercise.

### See Also:

- *Oracle Database Development Guide* regarding transforming pre- to post-upgrade representation

## Syntax

```
DBMS_EDITIONS_UTILITIES.SET_NULL_COLUMN_VALUES_TO_EXPR(
  table_name  IN  VARCHAR2,
  column_name IN  VARCHAR2,
  expression  IN  VARCHAR2);
```

## Parameters

**Table 62-4 SET\_NULL\_COLUMN\_VALUES\_TO\_EXPR Procedure Parameters**

Parameter	Description
table_name	A potentially schema-qualified table name
column_name	Name of the column to be updated
expression	An expression composed of columns in the same table, constants, and SQL functions

# 63

## DBMS\_EPG

The `DBMS_EPG` package implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)
- [Data Structures](#)
  - [VARCHAR2\\_TABLE Table Type](#)
- [Subprogram Groups](#)
- [Summary of DBMS\\_EPG Subprograms](#)

### 63.1 DBMS\_EPG Overview

The `DBMS_EPG` package is a platform on which PL/SQL users develop and deploy PL/SQL Web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of `mod_plsql` in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser by way of HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

### 63.2 DBMS\_EPG Security Model

The `XDBADMIN` role is required to invoke the configuration interface. It may be invoked by the database user "XDB".

The authorization interface can be invoked by any user.

### 63.3 DBMS\_EPG Exceptions

The table in this topic lists the exceptions raised by the `DBMS_EPG` package.

**Table 63-1 DBMS\_EPG Exceptions**

Exception	Error Code	Description
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

## 63.4 DBMS\_EPG Data Structures

The DBMS\_EPG package defines a TABLE type.

### VARCHAR2\_TABLE Table Type

This type is used by the procedures GET\_ALL\_GLOBAL\_ATTRIBUTES, GET\_ALL\_DAD\_ATTRIBUTES, GET\_ALL\_DAD\_MAPPINGS, and GET\_DAD\_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

## 63.5 DBMS\_EPG Subprogram Groups

The DBMS\_EPG consists of two interfaces: configuration subprograms and authorization subprograms.

- [Configuration Subprograms](#)
- [Authorization Subprograms](#)

### 63.5.1 DBMS\_EPG Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

**Table 63-2 Configuration Subprogram Group**

Subprogram	Description
<a href="#">CREATE_DAD Procedure</a>	Creates a new DAD
<a href="#">DELETE_DAD_ATTRIBUTE Procedure</a>	Deletes a DAD attribute
<a href="#">DELETE_GLOBAL_ATTRIBUTE Procedure</a>	Deletes a global attribute
<a href="#">DROP_DAD Procedure</a>	Drops a DAD
<a href="#">GET_ALL_DAD_ATTRIBUTES Procedure</a>	Retrieves all the attributes of a DAD.
<a href="#">GET_ALL_DAD_MAPPINGS Procedure</a>	Retrieves all virtual paths to which the specified DAD is mapped.
<a href="#">GET_ALL_GLOBAL_ATTRIBUTES Procedure</a>	Retrieves all global attributes and values
<a href="#">GET_DAD_ATTRIBUTE Function</a>	Retrieves the value of a DAD attribute

**Table 63-2 (Cont.) Configuration Subprogram Group**

Subprogram	Description
<a href="#">GET_DAD_LIST Procedure</a>	Retrieves a list of all DADs for an Embedded Gateway instance.
<a href="#">GET_GLOBAL_ATTRIBUTE Function</a>	Retrieves the value of a global attribute
<a href="#">MAP_DAD Procedure</a>	Maps a DAD to the specified virtual path.
<a href="#">SET_DAD_ATTRIBUTE Procedure</a>	Sets the value for a DAD
<a href="#">SET_GLOBAL_ATTRIBUTE Procedure</a>	Sets the value of a global attribute
<a href="#">UNMAP_DAD Procedure</a>	Unmaps a DAD from the specified virtual path

## 63.5.2 DBMS\_EPG Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

**Table 63-3 Authorization Subprogram Group**

Subprogram	Description
<a href="#">AUTHORIZE_DAD Procedure</a>	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
<a href="#">DEAUTHORIZE_DAD Procedure</a>	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

## 63.6 Summary of DBMS\_EPG Subprograms

This table lists the DBMS\_ALERT subprograms and briefly describes them.

**Table 63-4 DBMS\_EPG Package Subprograms**

Subprogram	Description
<a href="#">AUTHORIZE_DAD Procedure</a>	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
<a href="#">CREATE_DAD Procedure</a>	Creates a new DAD
<a href="#">DEAUTHORIZE_DAD Procedure</a>	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
<a href="#">DELETE_DAD_ATTRIBUTE Procedure</a>	Deletes a DAD attribute
<a href="#">DELETE_GLOBAL_ATTRIBUTE Procedure</a>	Deletes a global attribute
<a href="#">DROP_DAD Procedure</a>	Drops a DAD
<a href="#">GET_ALL_DAD_ATTRIBUTES Procedure</a>	Retrieves all the attributes of a DAD.

**Table 63-4 (Cont.) DBMS\_EPG Package Subprograms**

Subprogram	Description
<a href="#">GET_ALL_DAD_MAPPINGS Procedure</a>	Retrieves all virtual paths to which the specified DAD is mapped.
<a href="#">GET_ALL_GLOBAL_ATTRIBUTES Procedure</a>	Retrieves all global attributes and values
<a href="#">GET_DAD_ATTRIBUTE Function</a>	Retrieves the value of a DAD attribute
<a href="#">GET_DAD_LIST Procedure</a>	Retrieves a list of all DADs for an Embedded Gateway instance.
<a href="#">GET_GLOBAL_ATTRIBUTE Function</a>	Retrieves the value of a global attribute
<a href="#">MAP_DAD Procedure</a>	Maps a DAD to the specified virtual path.
<a href="#">SET_DAD_ATTRIBUTE Procedure</a>	Sets the value for a DAD
<a href="#">SET_GLOBAL_ATTRIBUTE Procedure</a>	Sets the value of a global attribute
<a href="#">UNMAP_DAD Procedure</a>	Unmaps a DAD from the specified virtual path

## 63.6.1 AUTHORIZE\_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

### See Also:

[Authorization Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 63-5 AUTHORIZE\_DAD Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD to create
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

### Usage Notes

- To authorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.

- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

### Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

### Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

## 63.6.2 CREATE\_DAD Procedure

This procedure creates a new DAD.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.CREATE_DAD (
    dad_name  IN  VARCHAR2,
    path      IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 63-6 CREATE\_DAD Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

## 63.6.3 DEAUTHORIZE\_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

### See Also:

[Authorization Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_EPG.DEAUTHORIZE_DAD (
  dad_name  IN  VARCHAR2,
  path      IN  VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 63-7 DEAUTHORIZE\_DAD Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD for which to deauthorize use
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

**Usage Notes**

To deauthorize the use of another user's privileges, the invoker must have the `ALTER USER` system privilege.

**Exceptions**

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

**Examples**

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

## 63.6.4 DELETE\_DAD\_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

**See Also:**

[Configuration Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (
  dad_name      IN  VARCHAR2,
  attr_name     IN  VARCHAR2);
```

**Parameters****Table 63-8 DELETE\_DAD\_ATTRIBUTE Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

### Exceptions

Raises an error if DAD does not exist

## 63.6.5 DELETE\_GLOBAL\_ATTRIBUTE Procedure

This procedure deletes a global attribute.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (  
    attr_name    IN VARCHAR2);
```

### Parameters

**Table 63-9** DELETE\_GLOBAL\_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to delete

## 63.6.6 DROP\_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.DROP_DAD (  
    dadname    IN VARCHAR2);
```

### Parameters

**Table 63-10** DROP\_DAD Procedure Parameters

Parameter	Description
dad_name	The DAD to drop

**Exceptions**

Raises an error if the DAD does not exist.

## 63.6.7 GET\_ALL\_DAD\_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

**See Also:**

[Configuration Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
  dad_name      IN          VARCHAR2,
  attr_names    OUT NOCOPY  VARCHAR2_TABLE,
  attr_values   OUT NOCOPY  VARCHAR2_TABLE);
```

**Parameters****Table 63-11 GET\_ALL\_DAD\_ATTRIBUTES Procedure Parameters**

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

**Exceptions**

Raises an error if DAD does not exist.

**Usage Notes**

If the DAD has no attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

## 63.6.8 GET\_ALL\_DAD\_MAPPINGS Procedure

This procedure retrieves all the virtual paths to which the specified DAD is mapped.

**See Also:**

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (
  dad_name      IN      VARCHAR2,
  paths         OUT NOCOPY VARCHAR2_TABLE);
```

### Parameters

**Table 63-12** GET\_ALL\_DAD\_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which h the DAD is mapped

### Exceptions

Raises an error if DAD does not exist.

### Usage Notes

If the DAD is not mapped to any virtual path, `paths` will be set to empty arrays.

## 63.6.9 GET\_ALL\_GLOBAL\_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
  attr_names    OUT NOCOPY VARCHAR2_TABLE,
  attr_values   OUT NOCOPY VARCHAR2_TABLE);
```

### Parameters

**Table 63-13** GET\_ALL\_GLOBAL\_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

### Usage Notes

If the gateway instance has no global attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

## 63.6.10 GET\_DAD\_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 63-14** GET\_DAD\_ATTRIBUTE Function Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

### Return values

Returns the DAD attribute value. Returns `NULL` if attribute is unknown or has not been set.

### Exceptions

Raises an error if DAD does not exist.

## 63.6.11 GET\_DAD\_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_DAD_LIST (  
    dad_names     OUT NOCOPY  VARCHAR2_TABLE);
```

## Parameters

**Table 63-15** GET\_DAD\_LIST Procedure Parameters

Parameter	Description
dad_names	The list of all DADs

## Usage Notes

If no DADs exist then `dad_names` will be set to an empty array.

## 63.6.12 GET\_GLOBAL\_ATTRIBUTE Function

This function retrieves the value of a global attribute.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (  
    attr_name IN VARCHAR2)  
RETURN VARCHAR2;
```

## Parameters

**Table 63-16** GET\_GLOBAL\_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to retrieve

## Return Values

Returns the global attribute value. Returns `NULL` if attribute has not been set or is not a valid attribute.

## 63.6.13 MAP\_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_EPG.MAP_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2);
```

**Parameters****Table 63-17 MAP\_DAD Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

**Exceptions**

Raises an error if the DAD does not exist.

## 63.6.14 SET\_DAD\_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

**See Also:**

[Configuration Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
  dad_name   IN VARCHAR2,
  attr_name  IN VARCHAR2,  attr_value IN VARCHAR2);
```

**Parameters****Table 63-18 SET\_DAD\_ATTRIBUTE Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

**Table 63-19 Mapping Between mod\_plsql and Embedded PL/SQL Gateway DAD Attributes**

<b>mod_plsql DAD Attribute</b>	<b>Embedded PL/SQL Gateway DAD Attribute</b>	<b>Allows Multiple Occurrences</b>	<b>Legal Values</b>
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String

**Table 63-19 (Cont.) Mapping Between mod\_plsql and Embedded PL/SQL Gateway DAD Attributes**

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetPackageState, StatelessWithFastRestPackageState, StatelessWithPreservePackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Char, Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

### Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

### Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. `mod_plsql` users should note the following
  - The `PlsqlDatabasePassword` attribute is not needed.
  - The `PlsqlDatabaseConnectionString` attribute is not needed because the embedded gateway does not support logon to external databases.

### Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

## 63.6.15 SET\_GLOBAL\_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
  attr_name   IN VARCHAR2,
  attr_value  IN VARCHAR2);
```

## Parameters

**Table 63-20 SET\_GLOBAL\_ATTRIBUTE Procedure Parameters**

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

**Table 63-21 Mapping Between mod\_plsql and Embedded PL/SQL Gateway Global Attributes**

mod_plsql Global Attribute	Embedded PL/SQL Gateway Global Attribute	Allows Multiple Occurrences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

## Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.

## Exceptions

Raises an error if the attribute is unknown.

## Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

## 63.6.16 UNMAP\_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

### See Also:

[Configuration Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_EPG.UNMAP_DAD (  
    dad_name IN VARCHAR2,  
    path      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 63-22 UNMAP\_DAD Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD to unmap
path	The virtual path to unmap

### Usage Notes

Raises an error if the DAD does not exist.

# DBMS\_ERRLOG

The `DBMS_ERRLOG` package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_ERRLOG Subprograms](#)

## See Also:

*Oracle Database Data Warehousing Guide* for more information regarding how to use `DBMS_ERRLOG` and *Oracle Database SQL Language Reference* for `error_logging_clause` syntax

## 64.1 DBMS\_DIMENSION Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

## 64.2 Summary of DBMS\_ERRLOG Subprograms

The `DBMS_ERRORLOG` package includes the `CREATE_ERROR_LOG` procedure subprogram.

**Table 64-1 DBMS\_ERRLOG Package Subprograms**

Subprogram	Description
<a href="#">CREATE_ERROR_LOG Procedure</a>	Creates the error logging table used in DML error logging

### 64.2.1 CREATE\_ERROR\_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

`LONG`, `CLOB`, `BLOB`, `BFILE`, and `ADT` datatypes are not supported in the columns.

## Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
    dml_table_name          IN VARCHAR2,
    err_log_table_name      IN VARCHAR2 := NULL,
    err_log_table_owner     IN VARCHAR2 := NULL,
    err_log_table_space     IN VARCHAR2 := NULL,
    skip_unsupported       IN BOOLEAN := FALSE);
```

## Parameters

**Table 64-2 CREATE\_ERROR\_LOG Procedure Parameters**

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR\$_'. Examples are the following: dml_table_name: 'EMP', err_log_table_name: 'ERR\$_EMP' dml_table_name: '"Emp2"', err_log_table_name: 'ERR\$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

## Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                               Null?      Type
-----
CHANNEL_ID                          NOT NULL   CHAR(1)
CHANNEL_DESC                         NOT NULL   VARCHAR2(20)
CHANNEL_CLASS                                   VARCHAR2(20)
```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                               Null?    Type
-----
ORA_ERR_NUMBER$                    NUMBER
ORA_ERR_MESG$                      VARCHAR2(2000)
ORA_ERR_ROWID$                     ROWID
ORA_ERR_OPTYP$                    VARCHAR2(2)
ORA_ERR_TAG$                       VARCHAR2(2000)
CHANNEL_ID                         VARCHAR2(4000)
CHANNEL_DESC                       VARCHAR2(4000)
CHANNEL_CLASS                      VARCHAR2(4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

# 65

## DBMS\_FGA

The `DBMS_FGA` package provides fine-grained security functions.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_FGA Subprograms](#)

### 65.1 DBMS\_FGA Security Model

You must have the `AUDIT_ADMIN` role or the `EXECUTE` privilege on the `DBMS_FGA` package to create audit policies. `DBMS_FGA` is an invoker rights package.

To analyze and audit data, you must have the `AUDIT_VIEWER` role. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module is executed with the module owner's privilege.

### 65.2 DBMS\_FGA Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering.

For both the rule-based optimizer and the cost-based optimizer, you can query the `SQL_TEXT` and `SQL_BINDS` columns of the `UNIFIED_AUDIT_TRAIL` view to analyze the SQL text and corresponding bind variables that are issued.

### 65.3 Summary of DBMS\_FGA Subprograms

This table lists the `DBMS_FGA` subprograms and briefly describes them.

**Table 65-1** *DBMS\_FGA Package Subprograms*

Subprogram	Description
<a href="#">ADD_POLICY Procedure</a>	Creates an audit policy using the supplied predicate as the audit condition
<a href="#">DISABLE_POLICY Procedure</a>	Disables an audit policy
<a href="#">DROP_POLICY Procedure</a>	Drops an audit policy
<a href="#">ENABLE_POLICY Procedure</a>	Enables an audit policy

## 65.3.1 ADD\_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition.

### Syntax

```
DBMS_FGA.ADD_POLICY(
  object_schema      IN VARCHAR2 DEFAULT NULL,
  object_name        IN VARCHAR2,
  policy_name        IN VARCHAR2,
  audit_condition    IN VARCHAR2 DEFAULT NULL,
  audit_column       IN VARCHAR2 DEFAULT NULL,
  handler_schema     IN VARCHAR2 DEFAULT NULL,
  handler_module     IN VARCHAR2 DEFAULT NULL,
  enable             IN BOOLEAN DEFAULT TRUE,
  statement_types    IN VARCHAR2 DEFAULT SELECT,
  audit_trail        IN BINARY_INTEGER DEFAULT NULL,
  audit_column_opts  IN BINARY_INTEGER DEFAULT ANY_COLUMNS,
  policy_owner       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 65-2 ADD\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema of the object to be audited. If NULL, the current schema is assumed.
object_name	Name of the object to be audited
policy_name	Unique name of the policy. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks.
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.
audit_column	Columns to be checked for access. These can include OLS hidden columns or object type columns. The default, NULL, causes audit if any column is accessed or affected.
handler_schema	Schema that contains the event handler. The default, NULL, causes the current schema to be used.
handler_module	Function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.
enable	Enables the policy if TRUE, which is the default
statement_types	SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only
audit_trail	In an environment that has not yet migrated to unified auditing, the destination (DB or XML) of fine-grained audit records. Also specifies whether to populate the LSQLTEXT and LSQLBIND columns in the FGA_LOG\$ system table.

**Table 65-2 (Cont.) ADD\_POLICY Procedure Parameters**

Parameter	Description
<code>audit_column_opts</code>	Establishes whether a statement is audited when the query references <i>any</i> column specified in the <code>audit_column</code> parameter or only when <i>all</i> such columns are referenced
<code>policy_owner</code>	User who owns the fine-grained auditing policy. However, this setting is not a user-supplied argument. The Oracle Data Pump client uses this setting internally to recreate the fine-grained audit policies appropriately.

**Usage Notes**

- A table or view can have a maximum of 256 fine-grained audit policies applied to it.
- If `object_schema` is not specified, the current schema is assumed.
- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. The expression can also use functions, such as the `USER` or `SYS_CONTEXT` functions.

The expression must not combine conditions using operators such as `AND` and `OR`. `audit_condition` can be `NULL` (or omitted), which is interpreted as `TRUE`, but it cannot contain the following elements:

- Subqueries or sequences
- The following attributes of the `USERENV` namespace when accessed using the `SYS_CONTEXT` function:
  - \* `CURRENT_SQL`
  - \* `CURRENT_SQL_LENGTH`
  - \* `CURRENT_BIND`
- Any use of the pseudo columns `LEVEL`, `PRIOR`, or `ROWNUM`.

Specifying an audit condition of "1=1" to force auditing of all specified statements ("statement\_types") affecting the specified column ("audit\_column") is no longer needed to achieve this purpose. A `NULL` value for `audit_condition` causes audit to happen even if no rows are processed, so that all actions on a table with this policy are audited.

- The `audit_condition` is evaluated using the privileges of the user who creates the policy.

- For the `audit_condition` setting, do not include functions, which execute the `auditable` statement on the same base table, in the `audit_condition` setting. For example, suppose you create a function that executes an `INSERT` statement on the `HR.EMPLOYEES` table. The policy `audit_condition` contains this function and it is for `INSERT` statements (as set by the `statement_types` parameter). When the policy is used, the function executes recursively until the system has run out of memory. This can raise the error `ORA-1000: maximum open cursors exceeded` or `ORA-00036: maximum number of recursive SQL levels (50) exceeded`.
- Do not issue the `DBMS_FGA.ENABLE_POLICY` or `DBMS_FGA.DISABLE_POLICY` statement from a policy function in a condition.
- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

```
PROCEDURE fname ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
                 VARCHAR2 ) AS ...
```

where *fname* is the name of the procedure, *object\_schema* is the name of the schema of the table audited, *object\_name* is the name of the table to be audited, and *policy\_name* is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.

- If you have migrated to unified auditing, then omit the `audit_trail` parameter because the audit records will automatically be written to the unified audit trail.
- Be aware that sensitive data, such as credit card information, can be recorded in clear text.
- The `audit_trail` parameter, if used, specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):
  - If `audit_trail` includes `XML`, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\adump` on Windows systems.)
  - If `audit_trail` includes `DB` instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database. However, for read-only databases, Oracle Database writes the fine-grained audit records to XML files, regardless of the `audit_trail` settings.
  - If `audit_trail` includes `EXTENDED`, then the query's SQL Text and SQL Bind variable information are included in the audit trail.
  - For example:
    - \* Setting `audit_trail` to `DBMS_FGA.DB` sends the audit trail to the `SYS.FGA_LOG$` table in the database and omits SQL Text and SQL Bind.
    - \* Setting `audit_trail` to `DBMS_FGA.DB + DBMS_FGA.EXTENDED` sends the audit trail to the `SYS.FGA_LOG$` table in the database and includes SQL Text and SQL Bind.
    - \* Setting `audit_trail` to `DBMS_FGA.XML` writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.

- \* Setting `audit_trail` to `DBMS_FGA.XML + DBMS_FGA.EXTENDED` writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

The `audit_trail` parameter appears in the `ALL_AUDIT_POLICIES` view.

- You can change the operating system destination using the following command:

```
ALTER SYSTEM SET AUDIT_FILE_DEST = New Directory DEFERRED
```

- On many platforms, XML audit files are named `process_name_processId.xml`, for example, `ora_2111.xml`. Alternatively, on Windows, the XML audit files are named `process_name_ThreadId.xml` (or `process_name_ProcessId.xml` if the process is not running as a thread).
- The `audit_column_opts` parameter establishes whether a statement is audited
  - when the query references *any* column specified in the `audit_column` parameter (`audit_column_opts = DBMS_FGA.ANY_COLUMNS`), or
  - only when *all* such columns are referenced (`audit_column_opts = DBMS_FGA.ALL_COLUMNS`).

The default is `DBMS_FGA.ANY_COLUMNS`.

The `ALL_AUDIT_POLICIES` view also shows `audit_column_opts`.

- When `audit_column_opts` is set to `DBMS_FGA.ALL_COLUMNS`, a SQL statement is audited only when all the columns mentioned in `audit_column` have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

All these columns must refer to a single table/view or alias.

If a SQL statement selects the columns from different table aliases, the statement will not be audited.

- Every XML audit record contains the elements `AUDIT_TYPE` and `EXTENDED_TIMESTAMP`, with the latter printed in UTC zone (with no timezone information). Values retrieved using `V$XML_AUDIT_TRAIL` view are converted to session timezone and printed.
- For `SQL_TEXT` and `SQL_BIND` element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such `SQL_TEXT` and `SQL_BIND` values.
- For large numbers of XML audit files, querying `V$XML_AUDIT_TRAIL` is faster when they are loaded into a database table using `SQL*Loader` or a similar tool. XML audit files are larger than the equivalent written to OS files when `AUDIT_TRAIL=OS`.
- Error handling is the same as when `AUDIT_TRAIL=OS`. If any error occurs in writing an audit record to disk, including the directory identified by `AUDIT_FILE_DEST` being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.
- Do not create recursive fine-grained audit handlers. For example, suppose you create a handler that executes an `INSERT` statement on the `HR.EMPLOYEES` table. The policy that is associated with this handler is for `INSERT` statements (as set by the `statement_types` parameter). When the policy is used, the handler executes recursively until the system has run out of memory. This can raise the error `ORA-1000: maximum open cursors exceeded` or `ORA-00036: maximum number of`

recursive SQL levels (50) exceeded. See also *Oracle Database Security Guide* with regard to Creating a Fine-Grained Audit Policy.

- The fine-grained audit handler module should not have explicit COMMIT, ROLLBACK, and DDL statements mentioned in it.
- The values for the `audit_trail` parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format. A dynamic view, `V$XML_AUDIT_TRAIL`, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an `.xml` extension) in the `AUDIT_FILE_DEST` directory to be parsed and presented in relational table format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

The `DBA_COMMON_AUDIT_TRAIL` view includes the contents of the `V$XML_AUDIT_TRAIL` dynamic view for standard and fine-grained audit records.

Note that the `V$XML_AUDIT_TRAIL` view is populated only if unified auditing is not enabled. If you have enabled unified auditing, then you can query the `UNIFIED_AUDIT_TRAIL` data dictionary view for the audit trail records.

#### See Also:

*Oracle Database Security Guide* for an example of creating an email alert handler for a fine-grained audit policy

### Examples

```
DBMS_FGA.ADD_POLICY (
  object_schema      => 'scott',
  object_name        => 'emp',
  policy_name        => 'mypolicy1',
  audit_condition    => 'sal < 100',
  audit_column       => 'comm,sal',
  handler_schema     => NULL,
  handler_module     => NULL,
  enable             => TRUE,
  statement_types    => 'INSERT, UPDATE',
  audit_column_opts  => DBMS_FGA.ANY_COLUMNS,
  policy_owner       => 'sec_admin');
```

## 65.3.2 DISABLE\_POLICY Procedure

This procedure disables an audit policy.

### Syntax

```
DBMS_FGA.DISABLE_POLICY(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2);
```

## Parameters

**Table 65-3** DISABLE\_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema of the object to be audited. If NULL, the current schema is assumed.
object_name	Name of the object to be audited
policy_name	Unique name of the policy

The default value for object\_schema is NULL. If NULL, the current schema is assumed.

## Examples

```
DBMS_FGA.DISABLE_POLICY (
object_schema => 'scott',
object_name   => 'emp',
policy_name   => 'mypolicy1');
```

## 65.3.3 DROP\_POLICY Procedure

This procedure drops an audit policy.

## Syntax

```
DBMS_FGA.DROP_POLICY(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2);
```

## Parameters

**Table 65-4** DROP\_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema of the object to be audited. If NULL, the current schema is assumed.
object_name	Name of the object to be audited
policy_name	Unique name of the policy

## Usage Notes

The DBMS\_FGA procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the DBMS\_FGA procedures are part of the DDL transaction. The default value for object\_schema is NULL. If NULL, the current schema is assumed.

**Note:**

Oracle Database automatically drops the audit policy if you remove the object specified in the `object_name` parameter of the `DBMS_FGA.ADD_POLICY` procedure, or if you drop the user who created the audit policy.

**Examples**

```
DBMS_FGA.DROP_POLICY (
object_schema => 'scott',
object_name   => 'emp',
policy_name   => 'mypolicy1');
```

## 65.3.4 ENABLE\_POLICY Procedure

This procedure enables an audit policy.

**Syntax**

```
DBMS_FGA.ENABLE_POLICY(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2,
  enable       IN BOOLEAN);
```

**Parameters****Table 65-5 ENABLE\_POLICY Procedure Parameters**

Parameter	Description
<code>object_schema</code>	Schema of the object to be audited. If <code>NULL</code> , the current schema is assumed.
<code>object_name</code>	Name of the object to be audited
<code>policy_name</code>	Unique name of the policy
<code>enable</code>	Defaults to <code>TRUE</code> to enable the policy

**Examples**

```
DBMS_FGA.ENABLE_POLICY (
object_schema => 'scott',
object_name   => 'emp',
policy_name   => 'mypolicy1',
enable       => TRUE);
```

# DBMS\_FILE\_GROUP

The `DBMS_FILE_GROUP` package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. You can use this package to create and manage file group repositories.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Summary of DBMS\\_FILE\\_GROUP Subprograms](#)

## 66.1 DBMS\_FILE\_GROUP Overview

It is helpful to understand terminology before using the `DBMS_FILE_GROUP` package.

The following terms pertain to the `DBMS_FILE_GROUP` package:

### File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is `expdat.dmp`.
- The directory object that contains the file is `db_files`.
- The file type is `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

### Version

A **version** is a collection of related files. For example, a version might consist of a set of data files and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

### File Group

A **file group** is a collection of versions. A file group can logically group a set of versions. For example, a file group named `financial_quarters` can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as `Q1FY04`, `Q2FY04`, and so on.

**See Also:***Oracle Streams Concepts and Administration*

## 66.2 DBMS\_FILE\_GROUP Security Model

There are two ways to define control on the DBMS\_FILE\_GROUP package.

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

## 66.3 DBMS\_FILE\_GROUP Constants

The DBMS\_FILE\_GROUP package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS\_FILE\_GROUP.EXPORT\_DUMP\_FILE.

The following table lists the parameters and enumerated constants.

**Table 66-1 DBMS\_FILE\_GROUP Parameters with Enumerated Constants**

Parameter	Option	Type	Description
file_type	<ul style="list-style-type: none"> <li>• DATAFILE</li> </ul>	VARCHAR2(30)	DATAFILE is a datafile for a database. This constant can be specified as 'DATAFILE'.
new_file_type	<ul style="list-style-type: none"> <li>• EXPORT_DUMP_FILE</li> <li>• DATAPUMP_LOG_FILE</li> </ul>		EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'. DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.
max_versions	<ul style="list-style-type: none"> <li>• INFINITE</li> </ul>	NUMBER	INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.
retention_days			

**Table 66-1 (Cont.) DBMS\_FILE\_GROUP Parameters with Enumerated Constants**

Parameter	Option	Type	Description
privilege	System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure: <ul style="list-style-type: none"> <li>• READ_ANY_FILE_GROUP</li> <li>• MANAGE_ANY_FILE_GROUP</li> <li>• MANAGE_FILE_GROUP</li> </ul> Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure: <ul style="list-style-type: none"> <li>• READ_ON_FILE_GROUP</li> <li>• MANAGE_ON_FILE_GROUP</li> </ul>	BINARY_INTEGER	READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary.  MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema.  MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema.  READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary.  MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.

## 66.4 DBMS\_FILE\_GROUP Examples

DBMS\_FILE\_GROUP examples are in another book.

*Oracle Streams Concepts and Administration* includes an example of a business that sells books and music over the internet. The business runs weekly reports on the sales data in the `inst1.example.com` database and stores these reports in two HTML files on a computer file system. The `book_sales.htm` file contains the report for book sales, and the `music_sales.htm` file contains the report for music sales.

The business wants to store these weekly reports in a file group repository at the `inst2.example.com` remote database. Every week, the two reports are generated on the `inst1.example.com` database, transferred to the computer system running the `inst2.example.com` database, and added to the repository as a file group version. The file group repository stores all of the file group versions that contain the reports for each week.

## 66.5 Summary of DBMS\_FILE\_GROUP Subprograms

This table lists the DBMS\_FILE\_GROUP subprograms and briefly describes them.

**Table 66-2 DBMS\_FILE\_GROUP Package Subprograms**

Subprogram	Description
<a href="#">ADD_FILE Procedure</a>	Adds a file to a version of a file group
<a href="#">ALTER_FILE Procedure</a>	Alters a file in a version of a file group
<a href="#">ALTER_FILE_GROUP Procedure</a>	Alters a file group

Table 66-2 (Cont.) DBMS\_FILE\_GROUP Package Subprograms

Subprogram	Description
<a href="#">ALTER_VERSION Procedure</a>	Alters a version of a file group
<a href="#">CREATE_FILE_GROUP Procedure</a>	Creates a file group
<a href="#">CREATE_VERSION Procedure</a>	Creates a version of a file group
<a href="#">DROP_FILE_GROUP Procedure</a>	Drops a file group
<a href="#">DROP_VERSION Procedure</a>	Drops a version of a file group
<a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a>	Grants object privileges on a file group to a user
<a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a>	Grants system privileges for file group operations to a user
<a href="#">PURGE_FILE_GROUP Procedure</a>	Purges a file group using the file group's retention policy
<a href="#">REMOVE_FILE Procedure</a>	Removes a file from a version of a file group
<a href="#">REVOKE_OBJECT_PRIVILEGE Procedure</a>	Revokes object privileges on a file group from a user
<a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a>	Revokes system privileges for file group operations from a user

**Note:**

All subprograms commit unless specified otherwise.

## 66.5.1 ADD\_FILE Procedure

This procedure adds a file to a version of a file group.

**See Also:**

An example that uses this procedure for a file group repository in *Oracle Streams Concepts and Administration*

**Syntax**

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  file_type       IN VARCHAR2 DEFAULT NULL,
  file_directory IN VARCHAR2 DEFAULT NULL,
  version_name    IN VARCHAR2 DEFAULT NULL,
  comments        IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 66-3 ADD\_FILE Procedure Parameters**

Parameter	Description
<code>file_group_name</code>	The name of the file group that contains the version, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>file_name</code>	The name of the file being added to the version. Each file name in a version must be unique.
<code>file_type</code>	<p>The file type. The following are reserved file types:</p> <ul style="list-style-type: none"> <li>If the file is a datafile, then enter the following: <code>'DATAFILE'</code></li> <li>If the file is a Data Pump export dump file, then enter the following: <code>'DUMPSET'</code></li> </ul> <p>Data Pump metadata is populated when a Data Pump export dump file is imported.</p> <ul style="list-style-type: none"> <li>If the file is a Data Pump export log file, then enter the following: <code>'DATAPUMPLOG'</code></li> </ul> <p>If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify <code>NULL</code> to omit a file type description.</p> <p>See "<a href="#">Constants</a>" for more information about the reserved file types.</p>
<code>file_directory</code>	<p>The name of the directory object that corresponds to the directory containing the file.</p> <p>If <code>NULL</code>, then the procedure uses the default directory object for the version.</p> <p>If <code>NULL</code> and no default directory object exists for the version, then the procedure uses the default directory object for the file group.</p> <p>If <code>NULL</code> and no default directory object exists for the version or file group, then the procedure raises an error.</p>
<code>version_name</code>	<p>The name of the version to which the file is added.</p> <p>If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if <code>'1'</code> is specified, then the file is added to version 1 of the file group.</p> <p>If <code>NULL</code>, then the procedure uses the version with the latest creation time for the file group.</p>
<code>comments</code>	Comments about the file being added

## Usage Notes

To run this procedure with either `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or `'DUMPSET'` specified for the `file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file

- Have READ privilege on the directory object that contains the Data Pump export dump file

**See Also:**

*Oracle Database Utilities* for more information about Data Pump privileges

## 66.5.2 ALTER\_FILE Procedure

This procedure alters a file in a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  version_name     IN  VARCHAR2  DEFAULT NULL,
  new_file_name    IN  VARCHAR2  DEFAULT NULL,
  new_file_directory IN VARCHAR2  DEFAULT NULL,
  new_file_type    IN  VARCHAR2  DEFAULT NULL,
  remove_file_type IN  VARCHAR2  DEFAULT 'N',
  new_comments     IN  VARCHAR2  DEFAULT NULL,
  remove_comments IN  VARCHAR2  DEFAULT 'N');
```

### Parameters

**Table 66-4 ALTER\_FILE Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name. <b>Note:</b> When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.

**Table 66-4 (Cont.) ALTER\_FILE Procedure Parameters**

Parameter	Description
<code>new_file_directory</code>	<p>The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If NULL, then the procedure does not change the directory object name.</p> <p><b>Note:</b> When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.</p>
<code>new_file_type</code>	<p>The file type. The following are reserved file types:</p> <ul style="list-style-type: none"> <li>If the file is a datafile, then enter the following: 'DATAFILE'</li> <li>If the file is a Data Pump export dump file, then enter the following: 'DUMPSET'</li> <li>If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG'</li> </ul> <p>If the file type is not one of the reserved file types, then enter a text description of the file type.</p> <p>If NULL, then the procedure does not change the file type.</p> <p><b>See Also:</b> "<a href="#">Constants</a>" for more information about the reserved file types.</p>
<code>remove_file_type</code>	<p>If Y, then the procedure removes the file type. If Y and the <code>new_file_type</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not remove the file type.</p>
<code>new_comments</code>	<p>New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments.</p> <p>If NULL, then the procedure does not change the existing comments.</p>
<code>remove_comments</code>	<p>If Y, then the procedure removes the comments for the file. If Y and the <code>new_comments</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not change the existing comments.</p>

### Usage Notes

If the file type is changed to `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `new_file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file

- Have READ privilege on the directory object that contains the Data Pump export dump file

**See Also:**

*Oracle Database Utilities* for more information about Data Pump privileges

## 66.5.3 ALTER\_FILE\_GROUP Procedure

This procedure alters a file group.

### Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP(
  file_group_name      IN  VARCHAR2,
  keep_files           IN  VARCHAR2  DEFAULT NULL,
  min_versions         IN  NUMBER     DEFAULT NULL,
  max_versions         IN  NUMBER     DEFAULT NULL,
  retention_days       IN  NUMBER     DEFAULT NULL,
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN  VARCHAR2  DEFAULT 'N',
  new_comments         IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

### Parameters

**Table 66-5 ALTER\_FILE\_GROUP Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group being altered, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged.  If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged.  If NULL, then this parameter is not changed.  <b>Note:</b> If the file group is dropped because of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.  If NULL, then the procedure does not change the <i>min_versions</i> setting for the file group.

**Table 66-5 (Cont.) ALTER\_FILE\_GROUP Procedure Parameters**

Parameter	Description
max_versions	<p>The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged.</p> <p>Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.</p> <p>If NULL, then the procedure does not change the max_versions setting for the file group.</p>
retention_days	<p>The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time.</p> <p>A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours.</p> <p>Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.</p> <p>If NULL, then the procedure does not change the retention_days setting for the file group.</p>
new_default_directory	<p>The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.</p> <p>If NULL, then the procedure does not change the default directory.</p>
remove_default_directory	<p>If Y, then the procedure removes the default directory for the file group. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error.</p> <p>If N, then the procedure does not remove the default directory for the file group.</p>
new_comments	<p>Comments about the file group. If non-NULL, then the new comments replace the existing comments for the file group.</p> <p>If NULL, then the procedure does not change the existing comments.</p>
remove_comments	<p>If Y, then the comments for the file group are removed. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error.</p> <p>If N, then the procedure does not change the comments for the file group.</p>

**Usage Notes**

If min\_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the

existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

## 66.5.4 ALTER\_VERSION Procedure

This procedure alters a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
    file_group_name      IN  VARCHAR2,
    version_name         IN  VARCHAR2  DEFAULT NULL,
    new_version_name     IN  VARCHAR2  DEFAULT NULL,
    remove_version_name  IN  VARCHAR2  DEFAULT 'N',
    new_default_directory IN  VARCHAR2  DEFAULT NULL,
    remove_default_directory IN VARCHAR2  DEFAULT 'N',
    new_comments         IN  VARCHAR2  DEFAULT NULL,
    remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

### Parameters

**Table 66-6 ALTER\_VERSION Procedure Parameters**

Parameter	Description
<code>file_group_name</code>	The name of the file group that contains the version, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>version_name</code>	The name of the version being altered.  If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered.  If '*' is specified, then the procedure alters all versions, and the <code>new_version_name</code> parameter must be <code>NULL</code> .  If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group.
<code>new_version_name</code>	The new name of the version. Do not specify a schema.  The specified version name cannot be a positive integer or an asterisk ('*').  If <code>NULL</code> , then the procedure does not change the version name.
<code>remove_version_name</code>	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the <code>new_version_name</code> parameter is set to a non- <code>NULL</code> value, then the procedure raises an error.  If N, then the procedure does not remove the version name.

**Table 66-6 (Cont.) ALTER\_VERSION Procedure Parameters**

Parameter	Description
<code>new_default_directory</code>	The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.
<code>remove_default_directory</code>	If Y, then the procedure removes the default directory. If Y and the <code>new_default_directory</code> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.
<code>new_comments</code>	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
<code>remove_comments</code>	If Y, then the procedure removes the comments for the version. If Y and the <code>new_comments</code> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

## 66.5.5 CREATE\_FILE\_GROUP Procedure

This procedure creates a file group.

### See Also:

An example that uses this procedure for a file group repository in *Oracle Streams Concepts and Administration*

### Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP(
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER     DEFAULT 2,
  max_versions       IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory  IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

Table 66-7 CREATE\_FILE\_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
keep_files	If <code>Y</code> , then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged.  If <code>N</code> , then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged.  <b>Note:</b> If the file group is dropped because of a <code>DROP USER CASCADE</code> statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <code>min_versions</code> . When the number of versions exceeds the specified <code>max_versions</code> , the oldest version is purged.  Specify <code>DBMS_FILE_GROUP.INFINITE</code> for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <code>retention_days</code> and there are more versions than the number specified in <code>min_versions</code> , the version is purged. The age of a version is calculated by subtracting the creation time from the current time.  A decimal value can specify a fraction of a day. For example, <code>1.25</code> specifies one day and six hours.  Specify <code>DBMS_FILE_GROUP.INFINITE</code> for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.
comments	Comments about the file group being created.

## Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

## 66.5.6 CREATE\_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the `PURGE_FILE_GROUP` procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the `OUT` parameter `version_out`, and the other does not.

### See Also:

- [PURGE\\_FILE\\_GROUP Procedure](#)
- An example that uses this procedure for a file group repository in *Oracle Streams Concepts and Administration*

### Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL,
  version_out      OUT VARCHAR2);
```

### Parameters

**Table 66-8 CREATE\_VERSION Procedure Parameters**

Parameter	Description
<code>file_group_name</code>	The name of the file group to which the new version is added, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>version_name</code>	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk ( <code>'*' </code> ).
<code>default_directory</code>	The default directory object used when files are added to a version if no directory is specified when the files are added.
<code>comments</code>	Comments about the version being created

**Table 66-8 (Cont.) CREATE\_VERSION Procedure Parameters**

Parameter	Description
version_out	If the version_name parameter is set to a non-NULL value, then this parameter contains the specified version name.  If the version_name parameter is set to NULL, then this parameter contains the generated version number.

## 66.5.7 DROP\_FILE\_GROUP Procedure

This procedure drops a file group.

### Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(
  file_group_name IN VARCHAR2,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 66-9 DROP\_FILE\_GROUP Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group being dropped, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the procedure retains the files in the file group on hard disk. If N, then the procedure deletes the files in the file group from hard disk. If NULL, then the procedure uses the default keep files property of the file group.

### Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

## 66.5.8 DROP\_VERSION Procedure

This procedure drops a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 66-10 DROP\_VERSION Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped.  If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if <code>'1'</code> is specified, then version 1 of the file group is dropped.  If <code>NULL</code> , then the procedure uses the version with the oldest creation time for the file group.  If <code>'*'</code> , then the procedure drops all versions.
keep_files	If <code>Y</code> , then the procedure retains the files in the version on hard disk.  If <code>N</code> , then the procedure deletes the files in the version from hard disk.  If <code>NULL</code> , then the procedure uses the default keep files property of the file group.

## Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

## 66.5.9 GRANT\_OBJECT\_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

### Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  grantee      IN  VARCHAR2,
  grant_option IN  BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 66-11 GRANT\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
object_name	The name of the file group on which the privilege is granted, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.

**Table 66-11 (Cont.) GRANT\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The constant that specifies the privilege. See " <a href="#">Constants</a> " for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

**Usage Notes**

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

## 66.5.10 GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

**Note:**

When you grant a privilege on "ANY" object (for example, ALTER\_ANY\_RULE), and the initialization parameter O7\_DICTIONARY\_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7\_DICTIONARY\_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7\_DICTIONARY\_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object allows access to any schema, including SYS. Set the O7\_DICTIONARY\_ACCESSIBILITY initialization parameter with caution.

**Syntax**

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 66-12 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The constant that specifies the privilege. See "Constants" for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

## 66.5.11 PURGE\_FILE\_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group unless purging a version would cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

### Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
    file_group_name IN VARCHAR2);
```

### Parameter

**Table 66-13 PURGE\_FILE\_GROUP Procedure Parameter**

Parameter	Description
file_group_name	The name of the file group, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.  If NULL and this procedure is run by SYS user, then the procedure purges all file groups.

### Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

## 66.5.12 REMOVE\_FILE Procedure

This procedure removes a file from a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_file       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 66-14 REMOVE\_FILE Procedure Parameters**

Parameter	Description
<code>file_group_name</code>	The name of the file group that contains the version, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>file_name</code>	The name of the file being removed from the version
<code>version_name</code>	The name of the version from which the file is removed. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if <code>'1'</code> is specified, then the file is removed from version 1 of the file group. If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group. If <code>'*'</code> , then the procedure removes the file from all versions.
<code>keep_file</code>	If <code>Y</code> , then the procedure retains the file on hard disk. If <code>N</code> , then the procedure deletes the file from hard disk. If <code>NULL</code> , then the procedure uses the default keep files property of the file group.

### Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

## 66.5.13 REVOKE\_OBJECT\_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

### Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
  object_name IN VARCHAR2,
  privilege   IN BINARY_INTEGER,
  revokee    IN VARCHAR2);
```

### Parameters

**Table 66-15 REVOKE\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
object_name	The name of the file group on which the privilege is revoked, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
privilege	The constant that specifies the privilege. See " <a href="#">Constants</a> " for valid privileges.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

## 66.5.14 REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

### Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(
  privilege IN BINARY_INTEGER,
  revokee  IN VARCHAR2);
```

### Parameters

**Table 66-16 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The constant that specifies the privilege. See " <a href="#">Constants</a> " for valid privileges.
revokee	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

# DBMS\_FILE\_TRANSFER

The `DBMS_FILE_TRANSFER` package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operating Notes](#)
- [Summary of DBMS\\_FILE\\_TRANSFER Subprograms](#)

## See Also:

- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

## 67.1 DBMS\_FILE\_TRANSFER Overview

The `DBMS_FILE_TRANSFER` package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

The destination database converts each block when it receives a file from a platform with different endianness. Datafiles can be imported after they are moved to the destination database as part of a transportable operation without RMAN conversion. Both `GET` and `PUT` operations will converted the file across platform difference at the destination. However, `COPY` is a local operation and therefore no conversion is required.

## 67.2 DBMS\_FILE\_TRANSFER Security Model

The `DBMS_FILE_TRANSFER` package must be created under `SYS` (`CONNECT INTERNAL`). Operations provided by this package are performed under the current calling user, not the package owner (`SYS`).

To use this interface the following users must have the following privileges:

- The current user at the local database must have `READ` privilege on the directory object specified in the `source_directory_object` parameter.
- The connected user at the destination database must have `WRITE` privilege to the directory object specified in the `destination_directory_object` parameter.

## 67.3 DBMS\_FILE\_TRANSFER Operational Notes

DBMS\_FILE\_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use DBMS\_FILE\_TRANSFER for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

## 67.4 Summary of DBMS\_FILE\_TRANSFER Subprograms

This table lists the DBMS\_FILE\_TRANSFER subprograms and briefly describes them.

**Table 67-1 DBMS\_FILE\_TRANSFER Package Subprograms**

Subprogram	Description
<a href="#">COPY_FILE Procedure</a>	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
<a href="#">GET_FILE Procedure</a>	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
<a href="#">PUT_FILE Procedure</a>	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

### 67.4.1 COPY\_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

#### Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE(
  source_directory_object    IN  VARCHAR2,
  source_file_name           IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name      IN  VARCHAR2);
```

## Parameters

**Table 67-2 COPY\_FILE Procedure Parameters**

Parameter	Description
source_directory_object	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the CREATE DIRECTORY command).
source_file_name	The name of the file to copy. This file must exist in the source directory.
destination_directory_object	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, +diskgroup1) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: +diskgroup1/dbs/control).
destination_file_name	The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM: <ul style="list-style-type: none"> <li>The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type)</li> <li>The file type tag assigned to the file is COPY_FILE</li> <li>The value of the destination_file_name argument becomes the file's alias name in the designated destination directory</li> </ul> The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.

## Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- READ privilege on the directory object specified in the source\_directory\_object parameter
- WRITE privilege on directory object specified in the destination\_directory\_object parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

The source\_file\_name parameter must specify a file that is in the directory specified by the source\_directory\_object parameter before running the procedure, and the

`destination_file_name` parameter must specify the new name of the file in the new location specified in the `destination_directory_object` parameter. Relative paths and symbolic links are not allowed in the directory objects for the `source_directory_object` and `destination_directory_object` parameters.

Transferring the file is not transactional. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

### See Also:

*Oracle Automatic Storage Management Administrator's Guide* for instructions about using file transfer

## Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';
```

Directory created.

```
SQL> BEGIN
  2   DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR','t_xdbtmp.f', 'DGROUP',
                                't_xdbtmp.f');
  3 END;
  4 /
```

PL/SQL procedure successfully completed.

```
SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

## 67.4.2 GET\_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

### Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
  source_directory_object      IN  VARCHAR2,
  source_file_name             IN  VARCHAR2,
  source_database              IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name        IN  VARCHAR2);
```

## Parameters

**Table 67-3 GET\_FILE Procedure Parameters**

Parameter	Description
source_directory_object	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
source_database	The name of a database link to the remote database where the file is located.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
destination_file_name	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

## Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The current user at the local database must have write privilege on the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the `V$SESSION_LONGOPS` dynamic performance view.

## Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS '^t_work^';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- assumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
```

```

-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/

```

## 67.4.3 PUT\_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system.

The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

### Syntax

```

DBMS_FILE_TRANSFER.PUT_FILE(
  source_directory_object      IN  VARCHAR2,
  source_file_name             IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name        IN  VARCHAR2,
  destination_database         IN  VARCHAR2);

```

### Parameters

**Table 67-4** PUT\_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

### Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the `V$SESSION_LONGOPS` dynamic performance view.

### Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password: password

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
  DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                                'dbs2' ) ;
END ;
```

# DBMS\_FLASHBACK

Using `DBMS_FLASHBACK`, you can flash back to a version of the database at a specified time or a specified system change number (SCN).

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of DBMS\\_FLASHBACK Subprograms](#)

## See Also:

For detailed information about `DBMS_FLASHBACK`:

- *Oracle Database Development Guide*
- *Oracle Database SQL Language Reference*.

## 68.1 DBMS\_FLASHBACK Overview

`DBMS_FLASHBACK` provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction back out features that allow for selective removal of the effects of individual transactions. This is different from a flashback database which moves the database back in time.

When `DBMS_FLASHBACK` is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use `DBMS_FLASHBACK` for the following reasons:

- **Self-service repair:** If you accidentally delete rows from a table, you can recover the deleted rows.
- **Packaged applications such as email and voicemail:** You can use Flashback to restore deleted email by re-inserting the deleted message into the current message box.
- **Decision support system (DSS) and online analytical processing (OLAP) applications:** You can perform data analysis or data modeling to track seasonal demand.

## 68.2 DBMS\_FLASHBACK Security Model

To use the `DBMS_FLASHBACK` package, you must have the `EXECUTE` privilege on it.

## 68.3 DBMS\_FLASHBACK Types

The following table describes the types used by `DBMS_FLASHBACK`.

**Table 68-1 DBMS\_FLASHBACK**

Type	Description
<code>TXNAME_ARRAY</code>	Creates a <code>VARRAY</code> for holding Transaction Names or Identifiers (XIDs)

## 68.4 DBMS\_FLASHBACK Exceptions

`DBMS_FLASHBACK` creates the following error messages.

**Table 68-2 DBMS\_FLASHBACK Error Messages**

Error	Description
<code>ORA-08180</code>	Time specified is too old
<code>ORA-08181</code>	Invalid system change number specified
<code>ORA-08182</code>	User cannot begin read-only or serializable transactions in Flashback mode
<code>ORA-08183</code>	User cannot enable Flashback within an uncommitted transaction
<code>ORA-08184</code>	User cannot enable Flashback within another Flashback session
<code>ORA-08185</code>	<code>SYS</code> cannot enable Flashback mode

## 68.5 DBMS\_FLASHBACK Operational Notes

`DBMS_FLASHBACK` is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need. If you need to perform a Flashback over a 24-hour period, the DBA must set the `undo_retention` parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the `RETENTION GUARANTEE` clause for the undo tablespace to ensure that unexpired undo is not discarded. `UNDO_RETENTION` is not in itself a guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, `RETENTION GUARANTEE` prevents this. For more information, see the *Oracle Database Administrator's Guide*.

In a Flashback-enabled session, `SYSDATE` is not affected; it continues to provide the current time.

`DBMS_FLASHBACK` can be used within logon triggers to enable Flashback without changing the application code.

## 68.6 DBMS\_FLASHBACK Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```
DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
  employee_no  number(5) PRIMARY KEY,
  employee_name varchar2(20),
  employee_mgr  number(5)
  CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
  salary       number,
  hiredate     date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20 seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
```

```
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;

REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Flashback to see Scott's organization
DECLARE
    restore_scn number;
BEGIN
    SELECT scn INTO restore_scn FROM keep_scn;
    DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (restore_scn);
END;
/

REM -- Show Scott's org.
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no =
    (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger')
ORDER BY LEVEL;

REM -- Restore scott's organization.
DECLARE
    scotts_emp NUMBER;
    scotts_mgr NUMBER;
    CURSOR c1 IS
        SELECT employee_no, employee_name, employee_mgr, salary, hiredate
        FROM employee
        CONNECT BY PRIOR employee_no = employee_mgr
        START WITH employee_no =
            (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger');
    c1_rec c1 % ROWTYPE;
BEGIN
    SELECT employee_no, employee_mgr INTO scotts_emp, scotts_mgr FROM employee
    WHERE employee_name = 'Scott Tiger';
    /* Open c1 in flashback mode */
    OPEN c1;
    /* Disable Flashback */
    DBMS_FLASHBACK.DISABLE;
    LOOP
        FETCH c1 INTO c1_rec;
        EXIT WHEN c1%NOTFOUND;
        /*
        Note that all the DML operations inside the loop are performed
        with Flashback disabled
        */
```

```

*/
IF (cl_rec.employee_mgr = scotts_emp) then
  INSERT INTO employee VALUES (cl_rec.employee_no,
    cl_rec.employee_name,
    scotts_mgr,
    cl_rec.salary,
    cl_rec.hiredate);
ELSE
IF (cl_rec.employee_no != scotts_emp) THEN
  INSERT INTO employee VALUES (cl_rec.employee_no,
    cl_rec.employee_name,
    cl_rec.employee_mgr,
    cl_rec.salary,
    cl_rec.hiredate);
  END IF;
END IF;
END LOOP;
END;
/

REM -- Show the restored organization.
select lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

```

## 68.7 Summary of DBMS\_FLASHBACK Subprograms

This table lists the DBMS\_FLASHBACK subprograms and briefly describes them.

**Table 68-3 DBMS\_FLASHBACK Package Subprograms**

Subprogram	Description
<a href="#">DISABLE Procedure</a>	Disables the Flashback mode for the entire session
<a href="#">ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure</a>	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN
<a href="#">ENABLE_AT_TIME Procedure</a>	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in <code>query_time</code>
<a href="#">GET_SYSTEM_CHANGE_NUMBER Function</a>	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
<a href="#">TRANSACTION_BACKOUT Procedures</a>	Provides the mechanism to back out a transaction

### 68.7.1 DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

#### Syntax

```
DBMS_FLASHBACK.DISABLE;
```

## Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;
```

## 68.7.2 ENABLE\_AT\_SYSTEM\_CHANGE\_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number.

In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

### Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
    query_scn IN NUMBER);
```

### Parameters

**Table 68-4 ENABLE\_AT\_SYSTEM\_CHANGE\_NUMBER Procedure Parameters**

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

## 68.7.3 ENABLE\_AT\_TIME Procedure

This procedure enables Flashback for the entire session.

The snapshot time is set to the SCN that most closely matches the time specified in query\_time. It enables Flashback for the entire session.

### Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
    query_time IN TIMESTAMP);
```

## Parameters

**Table 68-5 ENABLE\_AT\_TIME Procedure Parameters**

Parameter	Description
query_time	<p>This is an input parameter of type <code>TIMESTAMP</code>. A time stamp can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Using the <code>TIMESTAMP</code> constructor           <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00');</pre> <p>Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</p> </li> <li>Using the <code>TO_TIMESTAMP</code> function:           <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))</pre> <p>You provide the format you want to use. This example shows the <code>TO_TIMESTAMP</code> function for February 12, 2001, 2:35 PM.</p> </li> </ul> <ul style="list-style-type: none"> <li>If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M.</li> <li>Note that if the query time contains a time zone, the time zone information is truncated.</li> </ul>

### 68.7.4 GET\_SYSTEM\_CHANGE\_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

#### Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
RETURN NUMBER;
```

### 68.7.5 TRANSACTION\_BACKOUT Procedures

This procedure provides a mechanism to back out a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (`XIDS`).

The procedure analyzes the transactional dependencies, perform DMLs and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DMLs performed as part of transaction back out. However it holds all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent you must explicitly commit the transaction.

A report is generated in the system tables `DBA_FLASHBACK_TRANSACTION_STATE` and `DBA_FLASHBACK_TRANSACTION_REPORT`.

## Syntax

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
    numtxns          NUMBER,
    xids              XID_ARRAY,
    options           NUMBER default NOCASCADE,
    timeHint         TIMESTAMP default MINTIME);
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
    numtxns          NUMBER,
    xids              XID_ARRAY,
    options           NUMBER default NOCASCADE,
    scnHint          TIMESTAMP default 0  );
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
    numtxns          NUMBER,
    txnnames         TXNAME_ARRAY,
    options           NUMBER default NOCASCADE,
    timehint         TIMESTAMP MINTIME );
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
    numtxns          NUMBER,
    txnNames         TXNAME_ARRAY,
    options           NUMBER default NOCASCADE,
    scnHint          NUMBER 0);
```

## Parameters

**Table 68-6 TRANSACTION\_BACKOUT Procedure Parameters**

Parameter	Description
numtxns	Number of transactions passed as input
xids	List of transaction IDs in the form of an array
txnnames	List of transaction names in the form of an array
options	Back out dependent transactions: <ul style="list-style-type: none"> <li>• NOCASCADE - No dependency is expected. If a dependency is found, this raises an error, with the first dependent transaction provided in the report.</li> <li>• NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK.</li> <li>• NONCONFLICT_ONLY - This option lets the user back out the changes to the nonconflicting rows of the given transactions. Note that a transaction dependency can happen due to a row conflict through either WAW or primary/unique key constraints. If the user chooses to back out only the nonconflicting rows, this does not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data.</li> <li>• CASCADE - This completely removes the given transactions including their dependents in a post order fashion (reverse order of commit times).</li> </ul>

**Table 68-6 (Cont.) TRANSACTION\_BACKOUT Procedure Parameters**

Parameter	Description
timehint	Time hint on the start of the transaction
scnhint	SCN hint on the start of the transaction

**Usage Notes** **Note:**

For information about restrictions in using `TRANSACTION_BACKOUT`, see "Using Flashback Transaction" in the *Oracle Database Development Guide*.

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this raises an error and terminates. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.

# DBMS\_FLASHBACK\_ARCHIVE

The `DBMS_FLASHBACK_ARCHIVE` package contains procedures for performing various flashback tasks.

These include:

- Disassociation and reassociation of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA
- Tamper-proofing the tables of an application
- Importing of user history

### **Caution:**

Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

- Enabling and disabling of session-level support for valid-time

### **See Also:**

*Oracle Database Development Guide* for more information about "Using Flashback Data Archive (Oracle Temporal)"

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_FLASHBACK\\_ARCHIVE Subprograms](#)

## 69.1 DBMS\_FLASHBACK\_ARCHIVE Overview

Flashback Data Archive (FDA) provides strict protection on the internal history tables that it creates and maintains for users.

The read-only semantics prohibit users, including a DBA, from doing updates, deletes, and inserts on the Flashback Data Archive internal history tables. Users are also prevented from issuing any DDL statements on these tables. This strict security enforcement helps meet the requirements of applications in regulatory / compliance environments. Flashback Data Archive supports most common DDL statements, including those that alter the table definition or incur data movement. However, some

DDL statements are not supported on Flashback Data Archive-enabled tables. Since most application schemas are modified during application software upgrades, the ability to perform DDL operations on tracked tables is critical.

To support schema evolution during application upgrades and other table maintenance tasks that require use of DDL statements not supported by Flashback Data Archive, the `DBMS_FLASHBACK_ARCHIVE` package provides a set of simple-to-use PL/SQL procedures:

- To disassociate a Flashback Data Archive enabled base table from the underlying FDA
- To reassociate a temporarily disassociated base table with its underlying FDA

After a user has disassociated the base table from its FDA, it's possible to issue any DDL statements on the base table or the history tables in the FDA. Having finished with the schema changes, the user can then reassociate the base table with its FDA so that Flashback Data Archive protection is in operation and automatic tracking and archiving is resumed.

## 69.2 DBMS\_FLASHBACK\_ARCHIVE Security Model

Users need the `FLASHBACK_ARCHIVE_ADMINISTER` privilege to import user-generated history, to set context level, and to tamper-proof tables. After a table is disassociated, users can perform DDL and DML statements on the table if they have the necessary privileges. Enabling and disabling session-level Valid Time Temporal flashback needs no additional privileges.

## 69.3 DBMS\_FLASHBACK\_ARCHIVE Constants

The `DBMS_FLASHBACK_ARCHIVE` package uses the constants shown in the following table.

**Table 69-1 DBMS\_FLASHBACK\_ARCHIVE Constants**

Constant	Type	Value	Description
NODROP	BINARY_INTEGER	1	Do not drop temporary history table
NOCOMMIT	BINARY_INTEGER	2	Do not commit transaction
NODELETE	BINARY_INTEGER	4	Do not delete data in history table

## 69.4 Summary of DBMS\_FLASHBACK\_ARCHIVE Subprograms

This table lists the `DBMS_FLASHBACK_ARCHIVE` subprograms and briefly describes them.

**Table 69-2 DBMS\_FLASHBACK\_ARCHIVE Package Subprograms**

Subprogram	Description
<a href="#">ADD_TABLE_TO_APPLICATION Procedure</a>	Takes an application name and adds a table to the application as a security table

**Table 69-2 (Cont.) DBMS\_FLASHBACK\_ARCHIVE Package Subprograms**

Subprogram	Description
<a href="#">CREATE_TEMP_HISTORY_TABLE Procedure</a>	Creates a table called <code>TEMP_HISTORY</code> with the correct definition in schema
<a href="#">DISABLE_APPLICATION Procedure</a>	Takes an application name and marks a table in it as a security table
<a href="#">DISABLE_ASOF_VALID_TIME Procedure</a>	Disables session level valid-time flashback
<a href="#">DISASSOCIATE_FBA Procedure</a>	Disassociates the given table from the flashback data archive
<a href="#">DROP_APPLICATION Procedure</a>	Takes an application name and removes it from the list of applications
<a href="#">ENABLE_APPLICATION Procedure</a>	Takes an application name and enables Flashback Data Archive on all the security tables for this application
<a href="#">ENABLE_AT_VALID_TIME Procedure</a>	Enables session level valid time flashback
<a href="#">EXTEND_MAPPINGS Procedure</a>	Extends time mappings to times in the past
<a href="#">GET_SYS_CONTEXT Function</a>	Gets the context previously selected by the <a href="#">SET_CONTEXT_LEVEL Procedure</a>
<a href="#">IMPORT_HISTORY Procedure</a>	Imports history from a table called <code>TEMP_HISTORY</code> in the given schema.
<a href="#">LOCK_DOWN_APPLICATION Procedure</a>	Takes an application name and makes all the security tables read-only. The group called <code>SYSTEM</code> cannot be locked
<a href="#">PURGE_CONTEXT Procedure</a>	Purges the context to be saved selected by the <a href="#">SET_CONTEXT_LEVEL Procedure</a>
<a href="#">REASSOCIATE_FBA Procedure</a>	Reassociates the given table with the flashback data archive
<a href="#">REGISTER_APPLICATION Procedure</a>	Takes an application name and optionally a Flashback Data Archive, and registers an application for database hardening
<a href="#">REMOVE_TABLE_FROM_APPLICATION Procedure</a>	Takes an application name and marks a table in it as no longer being a security table
<a href="#">SET_CONTEXT_LEVEL Procedure</a>	Defines how much of the user context is to be saved

## 69.4.1 ADD\_TABLE\_TO\_APPLICATION Procedure

This procedure takes an application name and adds a table to the application as a security table. If the application is enabled for Flashback Data Archive, then this table will also be enabled for Flashback Data Archive.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.ADD_TABLE_TO_APPLICATION (
    application_name      IN   VARCHAR2,
    table_name            IN   VARCHAR2,
    schema_name           IN   VARCHAR2 := NULL);
```

**Parameters****Table 69-3 ADD\_TABLE\_TO\_APPLICATION Procedure Parameters**

Parameter	Description
application_name	Name of the application for which a table has been added as a security table
table_name	Name of the table to add as a security table for the given application
schema_name	Name of the schema containing the desired table. If no schema name is specified, the current schema is used.

## 69.4.2 CREATE\_TEMP\_HISTORY\_TABLE Procedure

This procedure creates a table called `TEMP_HISTORY` with the correct definition in schema.

**Syntax**

```
DBMS_FLASHBACK_ARCHIVE.CREATE_TEMP_HISTORY_TABLE (
    owner_name1    IN    VARCHAR2,
    table_name1    IN    VARCHAR2);
```

**Parameters****Table 69-4 CREATE\_TEMP\_HISTORY\_TABLE Procedure Parameters**

Parameter	Description
owner_name1	Schema of the Flashback Data Archive-enabled table
table_name1	Name of the Flashback Data Archive-enabled table

## 69.4.3 DISABLE\_APPLICATION Procedure

This procedure takes an application name and disables Flashback Data Archive on all of its security tables.

**Syntax**

```
DBMS_FLASHBACK_ARCHIVE.DISABLE_APPLICATION (
    application_name    IN    VARCHAR2);
```

**Parameters****Table 69-5 DISABLE\_APPLICATION Procedure Parameters**

Parameter	Description
application_name	Name of the application whose security tables will be disabled for Flashback Data Archive

## 69.4.4 DISABLE\_ASOF\_VALID\_TIME Procedure

This procedure disables session level valid-time flashback.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISABLE_ASOF_VALID_TIME;
```

## 69.4.5 DISASSOCIATE\_FBA Procedure

This procedure disassociates the given table from the flashback data archive.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA (
  owner_name    IN    VARCHAR2,
  table_name    IN    VARCHAR2);
```

### Parameters

**Table 69-6 DISASSOCIATE\_FBA Procedure Parameters**

Parameter	Description
owner_name	Schema of the Flashback Data Archive enabled base table
table_name	Name of the Flashback Data Archive enabled base table

### Exceptions

**Table 69-7 DISASSOCIATE\_FBA Procedure Exceptions**

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55634	Cannot acquire the lock on the table for disassociation

## 69.4.6 DROP\_APPLICATION Procedure

This procedure takes an application name and removes it from the list of applications. As part of this procedure, Flashback Data Archive will be disabled on all security-enabled tables and all history data will be lost. The group called `SYSTEM` cannot be dropped.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.DROP_APPLICATION (
  application_name    IN    VARCHAR2);
```

## Parameters

**Table 69-8 DROP\_APPLICATION Procedure Parameters**

Parameter	Description
application_name	Name of the application for which a table has been added as a security table

## 69.4.7 ENABLE\_APPLICATION Procedure

This procedure takes an application name and enables Flashback Data Archive on all the security tables for this application. Once an application is enabled, every change to an FDA enabled table will be tracked.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.ENABLE_APPLICATION (
    application_name          IN  VARCHAR2);
```

## Parameters

**Table 69-9 ENABLE\_APPLICATION Procedure Parameters**

Parameter	Description
application_name	Name of the application for which to enable Flashback Data Archive on all its security tables

## 69.4.8 ENABLE\_AT\_VALID\_TIME Procedure

This procedure enables session level valid time flashback.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.ENABLE_AT_VALID_TIME (
    level          IN  VARCHAR2,
    query_time     IN  TIMESTAMP DEFAULT SYSTIMESTAMP);
```

## Parameters

**Table 69-10 ENABLE\_AT\_VALID\_TIME Procedure Parameters**

Parameter	Description
level	Options: <ul style="list-style-type: none"> <li>All - Sets the visibility of temporal data to the full table, which is the default temporal table visibility</li> <li>CURRENT - Sets the visibility of temporal data to currently valid data within the valid time period at the session level</li> <li>ASOF - Sets the visibility of temporal data to data valid as of the given time as defined by the timestamp</li> </ul>

**Table 69-10 (Cont.) ENABLE\_AT\_VALID\_TIME Procedure Parameters**

Parameter	Description
query_time	Used only if level is ASOF. Data which is valid at this query_time will only be shown.

## 69.4.9 EXTEND\_MAPPINGS Procedure

This procedure extends time mappings to times in the past.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.EXTEND_MAPPINGS;
```

## 69.4.10 GET\_SYS\_CONTEXT Function

This function gets the context previously selected by the SET\_CONTEXT\_LEVEL Procedure.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.GET_SYS_CONTEXT (
    xid          IN RAW,
    namespace    IN VARCHAR2,
    parameter    IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 69-11 GET\_SYS\_CONTEXT Function Parameters**

Parameter	Description
xid	Transaction identifier is an opaque handle to a transaction obtained from the versions query
namespace	Namespace
parameter	If undefined, the subprogram returns NULL

### Related Topics

- [SET\\_CONTEXT\\_LEVEL Procedure](#)  
This procedure defines how much of the user context is to be saved.

## 69.4.11 IMPORT\_HISTORY Procedure

This procedure is called after invoking the `CREATE_TEMP_HISTORY_TABLE` procedure, and after the `TEMP_HISTORY` table is populated with user-generated history data

### ▲ Caution:

Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.IMPORT_HISTORY (
  owner_name1      IN   VARCHAR2,
  table_name1      IN   VARCHAR2,
  temp_history_name IN   VARCHAR2 DEFAULT 'TEMP_HISTORY',
  options          IN   BINARY_INTEGER DEFAULT 0);
```

### Parameters

**Table 69-12** IMPORT\_HISTORY Procedure Parameters

Parameter	Description
<code>owner_name1</code>	Schema of the Flashback Data Archive-enabled table
<code>table_name1</code>	Name of the Flashback Data Archive-enabled table
<code>temp_history_name</code>	Optional temporary history table from which we import history data
<code>options</code>	One (or a combination) of constants ( <code>NODROP</code> , <code>NOCOMMIT</code> , and <code>NODELETE</code> ) to specify if we want to drop, commit changes of, or truncate the temporary history table

### Usage Notes

The database function `TIMESTAMP_TO_SCN` can be used to convert times to SCN when populating the temporary history table.

### Related Topics

- [CREATE\\_TEMP\\_HISTORY\\_TABLE Procedure](#)  
This procedure creates a table called `TEMP_HISTORY` with the correct definition in schema.

## 69.4.12 LOCK\_DOWN\_APPLICATION Procedure

This procedure takes an application name and makes all the security tables read-only. The group called `SYSTEM` cannot be locked.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.LOCK_DOWN_APPLICATION (
    application_name          IN   VARCHAR2);
```

### Parameters

**Table 69-13 LOCK\_DOWN\_APPLICATION Procedure Parameters**

Parameter	Description
<code>application_name</code>	Name of the application for which a table has been added as a security table

## 69.4.13 PURGE\_CONTEXT Procedure

This procedure purges the context to be saved selected by the `SET_CONTEXT_LEVEL` Procedure.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.PURGE_CONTEXT;
```

### Related Topics

- [SET\\_CONTEXT\\_LEVEL Procedure](#)  
This procedure defines how much of the user context is to be saved.

## 69.4.14 REASSOCIATE\_FBA Procedure

This procedure reassociates the given table with the flashback data archive.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA (
    owner_name      VARCHAR2,
    table_name      VARCHAR2);
```

### Parameters

**Table 69-14 REASSOCIATE\_FBA Procedure Parameters**

Parameter	Description
<code>owner_name</code>	Schema of the Flashback Data Archive enabled base table
<code>table_name</code>	Name of the Flashback Data Archive enabled base table

## Exceptions

**Table 69-15 REASSOCIATE\_FBA Procedure Exceptions**

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55636	Table definition validation failed

## Usage Notes

- The procedure will signal an error if the base table and the history table do not have identical data definitions. For example, when columns are added or table is split, the resulting base table and history table need to have the same schema.
- The FDA internal history table schema has some row versions metadata columns. The procedure will signal an error if any metadata column is dropped by users.

## 69.4.15 REGISTER\_APPLICATION Procedure

This procedure takes an application name and optionally a Flashback Data Archive, and registers an application for database hardening.

When database hardening is enabled, then all the security tables for that application are enabled for Flashback Data Archive using the given Flashback Data Archive. If no Flashback Data Archive is specified, the default Flashback Data Archive is used.

### See Also:

Using Flashback Data Archive in *Oracle Database Development Guide* regarding database hardening

## Syntax

```
DBMS_FLASHBACK_ARCHIVE.REGISTER_APPLICATION (
    application_name          IN   VARCHAR2,
    flashback_archive_name    IN   VARCHAR2 := NULL);
```

## Parameters

**Table 69-16 REGISTER\_APPLICATION Procedure Parameters**

Parameter	Description
application_name	Name of the application which is being registered. The application SYSTEM is already registered when the package is created and is populated with list of tables needed for database hardening.
flashback_archive_name	Name of the Flashback Data Archive in which the historical data for the security tables for given application is stored. If no Flashback Data Archive is specified, the default Flashback Data Archive is used.

## 69.4.16 REMOVE\_TABLE\_FROM\_APPLICATION Procedure

This procedure takes an application name and marks a table in it as no longer being a security table.

If the application is already enabled for Flashback Data Archive, Flashback Data Archive will be disabled for this table.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.REMOVE_TABLE_TO_APPLICATION (
  application_name      IN   VARCHAR2,
  table_name            IN   VARCHAR2,
  schema_name          IN   VARCHAR2 := NULL);
```

### Parameters

**Table 69-17 REMOVE\_TABLE\_FROM\_APPLICATION Procedure Parameters**

Parameter	Description
application_name	Name of the application for which a table is being removed from the list of security tables
table_name	Name of the table to mark as being no longer a security table for the given application
schema_name	Name of the schema containing the desired table. If no schema name is specified, the current schema is used.

## 69.4.17 SET\_CONTEXT\_LEVEL Procedure

This procedure defines how much of the user context is to be saved.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.SET_CONTEXT_LEVEL (
  level      VARCHAR2);
```

### Parameters

**Table 69-18 SET\_CONTEXT\_LEVEL Procedure Parameters**

Parameter	Description
level	Depending on how much of the user context needs to be saved: <ul style="list-style-type: none"> <li>• ALL - the entire SYS_CONTEXT</li> <li>• TYPICAL - the user ID, global user ID and the hostname</li> <li>• NONE - nothing</li> </ul>

# 70

## DBMS\_FREQUENT\_ITEMSET

The DBMS\_FREQUENT\_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- [Summary of DBMS\\_FREQUENT\\_ITEMSET Subprograms](#)

### 70.1 Summary of DBMS\_FREQUENT\_ITEMSET Subprograms

The DBMS\_FREQUENT\_ITEMSET package includes the FI\_HORIZONTAL function and FI\_TRANSACTIONAL function subprograms.

**Table 70-1 DBMS\_FREQUENT\_ITEMSET Package Subprograms**

Subprogram	Description
<a href="#">FI_HORIZONTAL Function</a>	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
<a href="#">FI_TRANSACTIONAL Function</a>	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

#### 70.1.1 FI\_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

#### Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(  
  tranx_cursor      IN  SYSREFCURSOR,  
  support_threshold IN  NUMBER,  
  itemset_length_min IN  NUMBER,  
  itemset_length_max IN  NUMBER,
```

```

including_items      IN      SYS_REFCURSOR DEFAULT NULL,
excluding_items      IN      SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
    itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
    support          NUMBER,
    length           NUMBER,
    total_tranx     NUMBER);

```

## Parameters

**Table 70-2 FI\_HORIZONTAL Function Parameters**

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns. Each column of cursor represents an item. All columns of the cursor must be of the same datatype. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned. The default is NULL.

## Return Values

**Table 70-3 FI\_HORIZONTAL Return Values**

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

## Example

Suppose you have a table `horiz_table_in`.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in `horiz_table_in` looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
    CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
    FROM horiz_table_in),
    0.3,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT
    ('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

## 70.1.2 FI\_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

### Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
    tranx_cursor      IN      SYSREFCURSOR,
    support_threshold IN      NUMBER,
    itemset_length_min IN     NUMBER,
    itemset_length_max IN     NUMBER,
    including_items   IN      SYS_REFCURSOR DEFAULT NULL,
    excluding_items   IN      SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
    itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
    support      NUMBER,
    length       NUMBER,
    total_tranx  NUMBER);
```

## Parameters

**Table 70-4** *FI\_TRANSACTIONAL Function Parameters*

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

## Return Values

**Table 70-5** *FI\_TRANSACTIONAL Return Values*

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

## Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

## Examples

Suppose that the input table `tranx_table_in` looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of `VARCHAR2(30)`, you must create a nested table of `VARCHAR2(30)`:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in),
    0.6,
    2,
    5,
    NULL,
    NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    CURSOR(SELECT tid, iid FROM tranx_table_in),
    0.6,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT
        ('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```
SELECT
    bt.setid, nt.*
FROM
    (SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
    FROM table(
        DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
            CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
            NULL, NULL))) bt,
    table(bt.itemset) nt;
```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the NESTED\_TABLE\_FAST\_INSERT hint for performance:

```
CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */ INTO fq_nt
  SELECT cast(itemset as FI_VARCHAR_NT)
  FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
    NULL, NULL));
```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```
CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP
    FETCH freqC INTO coll_nt;
    EXIT WHEN freqC%NOTFOUND;
    num_rows := num_rows + 1;
    num_itms := num_itms + coll_nt.count;
  END LOOP;
  CLOSE freqC;
  DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
```

# 71

## DBMS\_FS

The `DBMS_FS` package for performing operations on an Oracle file system (make, mount, unmount and destroy operations) in an Oracle database.

This chapter contains the following topics:

- [DBMS\\_FS Overview](#)
- [DBMS\\_FS Security Model](#)
- [Summary of DBMS\\_FS Subprograms](#)

### 71.1 DBMS\_FS Overview

The `DBMS_FS` package contains Oracle file system (OFS) procedures that you can use to create, mount, unmount, and destroy an Oracle file system.

The `DBMS_FS` package enables applications to access database objects from a universal client such as an NFS server. This feature interfaces with Oracle SecureFiles to provide the file system access.

#### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for a detailed description of managing an NFS server in Oracle Database

### 71.2 DBMS\_FS Security Model

You must have the `SYSDBA` administrative privilege to use the `DBMS_FS` package.

The operations that you perform using the `DBMS_FS` package are equivalent to the file system operations that are performed in an operating system by the root user. Access to the individual file system that is created and mounted by this package is enforced using Access Control Lists (ACLs) and the permissions on the mounted directories to the operating system user.

### 71.3 Summary of DBMS\_FS Subprograms

This table lists the `DBMS_FS` subprograms and briefly describes them.

**Table 71-1 DBMS\_FS Subprograms**

Subprogram	Description
<a href="#">DESTROY_ORACLE_FS Procedure</a>	Destroys an Oracle file system, using the <code>fstype</code> and of name <code>fsname</code>
<a href="#">MAKE_ORACLE_FS Procedure</a>	Creates a file system of type specified by <code>fstype</code> and of name <code>fsname</code>
<a href="#">MOUNT_ORACLE_FS Procedure</a>	Mounts an Oracle file system on the specified mount point
<a href="#">UNMOUNT_ORACLE_FS Procedure</a>	Unmounts an Oracle file system on the specified mount point

### 71.3.1 DESTROY\_ORACLE\_FS Procedure

This procedure destroys an Oracle file system and then frees the resources that were associated with it.

#### Syntax

```
DBMS_FS.DESTROY_ORACLE_FS (
    fstype      IN VARCHAR2,
    fsname      IN VARCHAR2);
```

#### Parameters

**Table 71-2 DBMS\_FS Parameters**

Parameter	Description
<code>fstype</code>	File system type. Valid options are: <ul style="list-style-type: none"> <li>DBFS (database file system)</li> <li>OFS (Oracle file system)</li> </ul>
<code>fsname</code>	Name of the file system

#### Usage Notes

- You can find information about the currently mounted file systems by querying the `V$OFSMOUNT` dynamic view.
- For more information about the file system types, see the `fstype` description in [MAKE\\_ORACLE\\_FS Procedure](#).
- Before you run the `DBMS_FS.DESTROY_ORACLE_FS` procedure, you must unmount the file system by using the `DBMS_FS.UNMOUNT_ORACLE_FS` procedure.
- After you run `DBMS_FS.DESTROY_ORACLE_FS`, Oracle Database destroys the file system and frees the associated resources.

#### Example

This example shows how to destroy an OFS file system:

```
BEGIN
    DBMS_FS.DESTROY_ORACLE_FS (
```

```

fstype      => 'ofs',
fsname      => 'dbfs_fs1');
END;
/

```

## 71.3.2 MAKE\_ORACLE\_FS Procedure

This procedure creates a new file system of type `OFs`, on top of an existing Oracle tablespace or other database object.

### Syntax

```

DBMS_FS.MAKE_ORACLE_FS (
  fstype      IN VARCHAR2,
  fsname      IN VARCHAR2,
  fsoptions   IN VARCHAR2);

```

### Parameters

**Table 71-3 DBMS\_FS Parameters**

Parameter	Description
<code>fstype</code>	File system type. Enter <code>ofs</code> to create an Oracle file system.
<code>fsname</code>	Name of the file system. Enter a string no longer than 256 characters, using alpha numeric characters.
<code>fsoptions</code>	Specify an existing tablespace to use for the Oracle file system, using the following format:  "tablespace=tablespace_name"

### Usage Notes

- If you want to create a database file system (DBFS), then you must run the `dbfs_create_filesystem.sql` script, which in turn calls the `dbfs_create_filesystem_advanced.sql` script. By default, this script is in the `$ORACLE_HOME/rdbms/admin` directory. When you run this script, provide the name of an existing tablespace and a name for the file system that will be stored in the database. The size of the file system will be the same as the table size. For example, to create a file system in the `dbfs_ts` tablespace, in the file system `dbfs_tab`:

```
@/$ORACLE_HOME/rdbms/admin/dbfs_create_filesystem.sql dbfs_ts dbfs_tab
```

After you run this script, you can use the other procedures in the `DBMS_FS` package to mount, unmount, and destroy the file system.

- Running the `DBMS_FS.MAKE_ORACLE_FS` procedure on the database instance is equivalent to running the `mkfs` command by root in an operating system.
- The tablespace that you specified in the `fsoptions` parameter must already exist before you execute the `DBMS_FS.MAKE_ORACLE_FS` procedure. To find existing tablespaces, query the `DBA_TABLESPACES` data dictionary view.
- The size of the file system is the same size as this tablespace.

### Example

This example shows how to create an OFS file system:

```
BEGIN
  DBMS_FS.MAKE_ORACLE_FS (
    fstype          => 'ofs',
    fsname          => 'ofs_fsl',
    mount_options   => 'TABLESPACE=ofs_fsl_tbsp');
END;
/
```

## 71.3.3 MOUNT\_ORACLE\_FS Procedure

This procedure mounts an Oracle file system on the specified mount point.

### Syntax

```
DBMS_FS.MOUNT_ORACLE_FS (
  fstype          IN VARCHAR2,
  fsname          IN VARCHAR2,
  mount_point     IN VARCHAR2,
  mount_options   IN VARCHAR2);
```

### Parameters

**Table 71-4 MOUNT\_ORACLE\_FS Procedure Parameters**

Parameter	Description
fstype	File system type. Valid options are: <ul style="list-style-type: none"> <li>DBFS (database file system)</li> <li>OFS (Oracle file system)</li> </ul>
fsname	Name of the file system. Enter a string no longer than 256 characters, using alpha numeric characters.
mount_point	Local directory where the file system should be mounted. This directory must already exist. Enter an absolute path. The maximum number of mount points that you can create is 64.
mount_options	Comma-separated mount options, listed in <a href="#">Table 71-5</a> .

### Usage Notes

**Table 71-5 Supported Mount Options for the MOUNT\_ORACLE\_FS procedure**

Mount Option	Usage Description
default_permissions	Enables permission check and restrict access based on file mode. This option is useful with the <code>allow_other</code> mount option.

**Table 71-5 (Cont.) Supported Mount Options for the MOUNT\_ORACLE\_FS procedure**

Mount Option	Usage Description
allow_other	Allows other users apart from the operating system user that did the mount can access the files. This will be used in conjunction with permission checks in determining the file access. This option requires setting the <code>user_allow_other</code> parameter in the <code>/etc/fuse.conf</code> configuration file on Linux.
max_read	Maximum size of the read operation. No maximum size is set by default.
max_write	Maximum write size in a single request. The default is 128K.
direct_io	Indicates to the operating system kernel not use file system cache.
nopersist	Does not store the mount options for use in next instance startup.
persist	Stores the mount entry persistently so that on subsequent instance startup it will be automatically mounted again.
ro	Mounts the file system in read-only mode. Files cannot be modified.
rw	Mounts the file system as read-write. This is the default.
nosuid	Specifies that the file system cannot contain set userid files.
suid	Specifies that the file system can contain set userid files. This is the default.

### Usage Notes

- This procedure makes the files system visible in the local database instance.
- For more information about the file system types, see the `fstype` description in [MAKE\\_ORACLE\\_FS Procedure](#).
- You can find information about currently mounted file systems by querying the `V$OFSMOUNT` dynamic view.
- Run the `DBMS_FS.MOUNT_ORACLE_FS` procedure on a file system that has already been created with `DBMS_FS.MAKE_ORACLE_FS` in the local computer node where the Oracle database instance is running. You cannot run this procedure on file systems that were created outside of Oracle Database.

### Example

```
BEGIN
  DBMS_FS.MOUNT_ORACLE_FS (
    fstype      => 'dbfs',
    fsname     => 'dbfs_fs1',
    mount_point => '/oracle/dbfs/testfs',
    mount_options => 'default_permissions, allow_other, persist');
END;
```

## 71.3.4 UNMOUNT\_ORACLE\_FS Procedure

This procedure unmounts an Oracle file system on the specified mount point.

### Syntax

```
DBMS_FS.UNMOUNT_ORACLE_FS (
  fsname           IN VARCHAR2,
  mount_point      IN VARCHAR2,
  unmount_options  IN VARCHAR2);
```

**Table 71-6 UNMOUNT\_ORACLE\_FS Procedure Parameters**

Parameter	Description
fsname	Name of the file system
mount_point	Local directory where the file system had been mounted. Enter an absolute path.
unmount_options	Optionally, enter <i>force</i> to unmount the file system forcibly. This setting prevents new requests from being sent to the file system. All pending requests on the file system are either completed or cancelled.  If you omit this setting, then attempts to unmount a busy file system cause an <i>EBUSY</i> error.

### Usage Notes

- Before you unmount the file system, ensure that all applications that use this file system are shut down. Also ensure that no processes reference the mounting file system.
- You can find information about the currently mounted file systems by querying the `V$OFSMOUNT` dynamic view.
- For more information about the file system types, see the `fstype` description in [MAKE\\_ORACLE\\_FS Procedure](#).
- When an Oracle instance is shut down in normal immediate mode, then all the mounted file systems are automatically unmounted.
- If a file system is mounted from the operating system level with the `persist` option of the `mount` command, it is automatically mounted again when the database instance starts. If this file system is unmounted by executing `DBMS_FS.UNMOUNT_ORACLE_FS`, then it is not automatically mounted when the database instance starts.
- If you perform a `SHUTDOWN ABORT`, then the file system may still show as mounted but not accessible. In this case, you must unmount the system manually by calling `unmount` command at the operating system level or `fusermount` procedure on Linux systems.
- You can export the local mount point of an Oracle file system to point to the remote system, and then NFS mount the file system from the remote system by using the operating system `mount` command. The `DBMS_FS.MOUNT_ORACLE_FS` procedure is similar to `mount` commands that are used for other local file systems.

- For better security, Oracle recommends that you use access control lists (ACLs) and Kerberos to control access to sensitive data.
- Do not attempt to unmount the file system from the operating system level. Doing so can leave the Oracle Database-created file system internal tables in an inconsistent state.

### Example

```
BEGIN
  DBMS_FS.UNMOUNT_ORACLE_FS (
    fsname          => 'dbfs_fs1',
    mount_point     => '/oracle/dbfs/testfs',
    mount_options   => 'force');
END;
```

# DBMS\_GOLDENGATE\_ADM

The `DBMS_GOLDENGATE_ADM` package provides subprograms to configure and manage Oracle GoldenGate conflict detection and resolution.

This chapter contains the following topics:

- [Using DBMS\\_GOLDENGATE\\_ADM](#)
- [Summary of DBMS\\_GOLDENGATE\\_ADM Subprograms](#)

## 72.1 Using DBMS\_GOLDENGATE\_ADM

This section contains topics which relate to using the `DBMS_GOLDENGATE_ADM` package.

- [DBMS\\_GOLDENGATE\\_ADM Overview](#)
- [DBMS\\_GOLDENGATE\\_ADM Security Model](#)

### 72.1.1 DBMS\_GOLDENGATE\_ADM Overview

The `DBMS_GOLDENGATE_ADM` package provides interfaces to configure automatic conflict detection and resolution in an Oracle GoldenGate configuration that replicates tables between Oracle databases.

When more than one replica of a table allows changes to the table, a conflict can occur when a change is made to the same row in two different databases at nearly the same time. Oracle GoldenGate replicates changes using row logical change records (LCRs). It detects a conflict by comparing the old values in the row LCR with the current values of the corresponding table row identified by the key columns. If any column value does not match, then there is a conflict. After a conflict is detected, Oracle GoldenGate can resolve the conflict by overwriting values in the row with some values from the row LCR, ignoring the values in the row LCR, or computing a delta to update the row values.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

 **Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product.

 **See Also:**

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

## 72.1.2 DBMS\_GOLDENGATE\_ADM Security Model

Security on this package can be controlled either by granting `EXECUTE` on this package to selected users or roles or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

An Oracle GoldenGate administrator must be configured at each Oracle database in the table's replication environment, and Oracle GoldenGate must be configured to replicate the table at each Oracle database. You can configure an Oracle GoldenGate administrator using the `GRANT_ADMIN_PRIVILEGE` procedure in the `DBMS_GOLDENGATE_ADM` package.

 **See Also:**

The Oracle GoldenGate documentation for more information about Oracle GoldenGate replication and configuring an Oracle GoldenGate administrator

## 72.2 Summary of DBMS\_GOLDENGATE\_ADM Subprograms

**Table 72-1 DBMS\_GOLDENGATE\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_AUTO_CDR Procedure</a>	Configures Oracle GoldenGate automatic conflict detection and resolution for a table
<a href="#">ADD_AUTO_CDR_COLUMN_GROUP Procedure</a>	Adds a column group and configures Oracle GoldenGate automatic conflict detection and resolution for the column group
<a href="#">ADD_AUTO_CDR_DELTA_RES Procedure</a>	Configures Oracle GoldenGate automatic conflict detection and delta resolution for the column
<a href="#">ALTER_AUTO_CDR Procedure</a>	Alters the Oracle GoldenGate automatic conflict detection and resolution for a table
<a href="#">ALTER_AUTO_CDR_COLUMN_GROUP Procedure</a>	Alters a column group for Oracle GoldenGate automatic conflict detection and resolution
<a href="#">DELETE_PROCREP_EXCLUSION_OBJ Procedure</a>	Deletes a database object from the exclusion list for Oracle GoldenGate procedural replication

**Table 72-1 (Cont.) DBMS\_GOLDENGATE\_ADM Package Subprograms**

Subprogram	Description
<a href="#">GG_PROCEDURE_REPLICATION_ON Function</a>	Returns 1 if Oracle GoldenGate procedural replication is enabled and returns 0 if it is disabled
<a href="#">INSERT_PROCREP_EXCLUSION_OBJ Procedure</a>	Inserts a database object into the exclusion list for Oracle GoldenGate procedural replication
<a href="#">PURGE_TOMBSTONES Procedure</a>	Purges rows that were deleted before the specified timestamp from the tombstone table
<a href="#">REMOVE_AUTO_CDR Procedure</a>	Removes Oracle GoldenGate automatic conflict detection and resolution for a table
<a href="#">REMOVE_AUTO_CDR_COLUMN_GROUP Procedure</a>	Removes a column group that was configured for Oracle GoldenGate automatic conflict detection and resolution
<a href="#">REMOVE_AUTO_CDR_DELTA_RES Procedure</a>	Removes Oracle GoldenGate automatic conflict detection and delta resolution for the column

**Note:**

All procedures commit unless specified otherwise.

## 72.2.1 ADD\_AUTO\_CDR Procedure

This procedure configures Oracle GoldenGate automatic conflict detection and resolution for a table.

The conflict detection and resolution configured by this procedure is based on the timestamp of the changes. The procedure adds one or more hidden columns of `TIMESTAMP` type to the table, and each hidden column is counted against the limit of 1,000 columns for each table.

The procedure automatically places the columns in the table into a default column group and into an unconditional supplemental log group, excluding nonscalar columns. To create column groups that include a subset of the columns in the table, use the `ADD_AUTO_CDR_COLUMN_GROUP` procedure in this package.

### Syntax

```
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR(
  schema_name          IN VARCHAR2,
  table_name           IN VARCHAR2,
  resolution_granularity IN VARCHAR2 DEFAULT 'ROW',
  existing_data_timestamp IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  tombstone_deletes    IN BOOLEAN DEFAULT TRUE,
  fetchcols            IN BOOLEAN DEFAULT TRUE,
  record_conflicts     IN BOOLEAN DEFAULT FALSE,
  use_custom_handlers  IN BINARY_INTEGER DEFAULT 0);
```

## Parameters

**Table 72-2 ADD\_AUTO\_CDR Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.
resolution_granularity	ROW, the default, adds one hidden <code>TIMESTAMP</code> column for the row and one hidden <code>TIMESTAMP</code> column for each LOB column.  COLUMN adds one hidden <code>TIMESTAMP</code> column for each column in the table.
existing_data_timestamp	Timestamp to assign to existing rows.  If <code>NULL</code> , then the current system timestamp is used. If a time is specified, and the operating system time zone is not a valid Oracle time zone, then Oracle uses UTC as the default value.
tombstone_deletes	<code>TRUE</code> , the default, tracks deleted rows in a tombstone table. Tracking deleted rows might be required to detect and resolve some conflicts, but tracking deleted rows requires additional database resources.  <code>FALSE</code> does not track deleted rows in a tombstone table.
fetchcols	<code>TRUE</code> , the default, fetches the value of LOBs during conflict detection and resolution. Fetching LOBs can be an expensive operation.  <code>FALSE</code> does not fetch the value of LOBs during conflict detection and resolution.
record_conflicts	<code>TRUE</code> records the conflict in the <code>DBA_APPLY_ERROR</code> and <code>DBA_APPLY_ERROR_MESSAGES</code> views.  <code>FALSE</code> , the default, does not record the conflict.
use_custom_handlers	0, the default, indicates that automatic conflict handlers are used.  1 indicates that automatic conflict handlers are not used and that a custom error handler must be specified using the <code>SET_DML_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package.

### 72.2.2 ADD\_AUTO\_CDR\_COLUMN\_GROUP Procedure

This procedure adds a column group to a table that is configured for Oracle GoldenGate automatic conflict detection and resolution.

For a table that has been configured for timestamp conflict detection and resolution, this procedure adds a column group that includes a specified subset of columns in the table. Any columns in the table that are not part of a column group remain in the default column group for the table.

When you add a column group to a table, conflict detection and resolution is performed on the columns in the column group separately from the other columns in

the table. Column groups enable different databases to update different columns in the same row at nearly the same time without causing a conflict.

For example, a replicated table that contains employee information might have a salary column and a bonus column as well as other columns that identify the employee and a location column for the employees office number. Assume that one department in the company updates its database to change the employee's salary while another department updates its database to change the employee's location. If the salary and bonus columns are in a column group, these changes are applied to the replicated table in each database without requiring conflict resolution.

The procedure automatically places the columns in the column group into an unconditional supplemental log group, excluding nonscalar columns.

Before this procedure can be run on a table, the DBMS\_GOLDENGATE\_ADM.ADD\_AUTO\_CDR procedure must be run in the table with ROW specified for the resolution\_granularity parameter.

### Syntax

```
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR_COLUMN_GROUP(
  schema_name          IN VARCHAR2,
  table_name           IN VARCHAR2,
  column_list          IN VARCHAR2,
  column_group_name    IN VARCHAR2 DEFAULT NULL,
  existing_data_timestamp IN TIMESTAMP WITH TIME ZONE DEFAULT NULL);
```

### Parameters

**Table 72-3 ADD\_AUTO\_CDR\_COLUMN\_GROUP Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.
column_list	Group of columns for which the conflict detection and resolution is configured. Specify the columns in a comma-separated list. The same column cannot be in more than one column group. Also, the same column cannot be in a column group and specified in a delta resolution.
column_group_name	The name of the column group. If NULL, the column group name is system generated.
existing_data_timestamp	The time value for the added TIMESTAMP columns for existing table data.

## 72.2.3 ADD\_AUTO\_CDR\_DELTA\_RES Procedure

This procedure configures Oracle GoldenGate automatic conflict detection and delta resolution for the column.

The resolution method does not depend on a timestamp or an extra resolution column. With delta conflict resolution, the conflict is resolved by adding the difference between the new and old values in the LCR to the value in the table. For example, if a bank balance is updated at two sites concurrently, then the converged value accounts for all

debits and credits. This resolution method is generally used for financial data such as an account balance.

The procedure automatically places the column into an unconditional supplemental log group.

Before this procedure can be run on a table, the DBMS\_GOLDENGATE\_ADM.ADD\_AUTO\_CDR procedure must be run in the table with ROW specified for the resolution\_granularity parameter.

### Syntax

```
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR_DELTA_RES(
    schema_name IN VARCHAR2,
    table_name  IN VARCHAR2,
    column_name IN VARCHAR2);
```

### Parameters

**Table 72-4 ADD\_AUTO\_CDR\_DELTA\_RES Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.
column_name	The name of the column. The specified column must be a NUMBER or FLOAT data type column. The same column cannot be in a column group.

## 72.2.4 ALTER\_AUTO\_CDR Procedure

This procedure alters the Oracle GoldenGate automatic conflict detection and resolution for a table.

### Syntax

```
DBMS_GOLDENGATE_ADM.ALTER_AUTO_CDR(
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    tombstone_deletes IN BOOLEAN DEFAULT NULL,
    fetchcols        IN BOOLEAN DEFAULT NULL,
    record_conflicts  IN BOOLEAN DEFAULT NULL,
    use_custom_handlers IN BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 72-5 ALTER\_AUTO\_CDR Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.

**Table 72-5 (Cont.) ALTER\_AUTO\_CDR Procedure Parameters**

Parameter	Description
tombstone_deletes	TRUE tracks deleted rows in a tombstone table. Tracking deleted rows might be required to detect and resolve some conflicts, but tracking deleted rows requires additional database resources.  FALSE does not track deleted rows in a tombstone table.  NULL retains the current setting for the parameter.
fetchcols	TRUE fetches the value of nonscalar columns during conflict detection and resolution.  FALSE does not fetch the value of nonscalar columns during conflict detection and resolution.  NULL retains the current setting for the parameter.
record_conflicts	TRUE records the conflict.  FALSE does not record the conflict.  NULL retains the current setting for the parameter.
use_custom_handlers	0 indicates that automatic conflict handlers are used.  1 indicates that automatic conflict handlers are not used and that a custom error handler must be specified using the SET_DML_HANDLER procedure in the DBMS_APPLY_ADM package.  NULL, the default, retains the current setting for the parameter.

## 72.2.5 ALTER\_AUTO\_CDR\_COLUMN\_GROUP Procedure

This procedure alters a column group for Oracle GoldenGate automatic conflict detection and resolution.

### Syntax

```
DBMS_GOLDENGATE_ADM.ALTER_AUTO_CDR_COLUMN_GROUP(
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    column_group_name IN VARCHAR2,
    add_column_list  IN VARCHAR2,
    remove_column_list IN VARCHAR2);
```

### Parameters

**Table 72-6 ALTER\_AUTO\_CDR\_COLUMN\_GROUP Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.
column_group_name	The name of the column group.

**Table 72-6 (Cont.) ALTER\_AUTO\_CDR\_COLUMN\_GROUP Procedure Parameters**

Parameter	Description
add_column_list	A comma-separated list of columns to add to the column group.
remove_column_list	A comma-separated list of columns to remove from the column group.

## 72.2.6 DELETE\_PROCREP\_EXCLUSION\_OBJ Procedure

This procedure deletes a database object from the exclusion list for Oracle GoldenGate procedural replication.

When a database object is on the exclusion list for Oracle GoldenGate procedural replication, execution of subprogram in the package is not replicated if the subprogram operates on the excluded object. For example, if `hr.employees` is an excluded database object for the `DBMS_REDEFINITION` package, then an execution of the `DBMS_REDEFINITION.START_REDEF_TABLE` procedure on the `hr.employees` table is not replicated.

### Caution:

Run the `DELETE_PROCREP_EXCLUSION_OBJ` procedure only under the direction of Oracle Support.

### Syntax

```
DBMS_GOLDENGATE_ADM.DELETE_PROCREP_EXCLUSION_OBJ(
  package_owner    IN VARCHAR2 DEFAULT NULL,
  package_name     IN VARCHAR2 DEFAULT NULL,
  object_owner     IN VARCHAR2 DEFAULT NULL,
  object_name      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 72-7 DELETE\_PROCREP\_EXCLUSION\_OBJ Procedure Parameters**

Parameter	Description
package_owner	The owner of the package.
package_name	The name of the package.
object_owner	The owner of the object.
object_name	The name of the object.

## 72.2.7 GG\_PROCEDURE\_REPLICATION\_ON Function

This function returns 1 if Oracle GoldenGate procedural replication is enabled and returns 0 if it is disabled.

### Syntax

```
DBMS_STREAMS.GG_PROCEDURE_REPLICATION_ON
RETURN NUMBER;
```

## 72.2.8 INSERT\_PROCREP\_EXCLUSION\_OBJ Procedure

This procedure inserts a database object into the exclusion list for Oracle GoldenGate procedural replication.

When a database object is on the exclusion list for Oracle GoldenGate procedural replication, execution of subprogram in the package is not replicated if the subprogram operates on the excluded object. For example, if `hr.employees` is an excluded database object for the `DBMS_REDEFINITION` package, then an execution of the `DBMS_REDEFINITION.START_REDEF_TABLE` procedure on the `hr.employees` table is not replicated.

### Caution:

Run the `INSERT_PROCREP_EXCLUSION_OBJ` procedure only under the direction of Oracle Support.

### Syntax

```
DBMS_GOLDENGATE_ADM.INSERT_PROCREP_EXCLUSION_OBJ(
  package_owner  IN VARCHAR2 DEFAULT NULL,
  package_name   IN VARCHAR2 DEFAULT NULL,
  object_owner   IN VARCHAR2 DEFAULT NULL,
  object_name    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 72-8** INSERT\_PROCREP\_EXCLUSION\_OBJ Procedure Parameters

Parameter	Description
<code>package_owner</code>	The owner of the package.
<code>package_name</code>	The name of the package.
<code>object_owner</code>	The owner of the object.
<code>object_name</code>	The name of the object.

## 72.2.9 PURGE\_TOMBSTONES Procedure

This procedure purges rows that were deleted before the specified timestamp from the tombstone table.

### Syntax

```
DBMS_GOLDENGATE_ADM.PURGE_TOMBSTONES(
    purge_timestamp IN TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 72-9 PURGE\_TOMBSTONES Procedure Parameters**

Parameter	Description
purge_timestamp	The timestamp before which records are purged.

## 72.2.10 REMOVE\_AUTO\_CDR Procedure

This procedure removes Oracle GoldenGate automatic conflict detection and resolution for a table.

### Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR(
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2);
```

### Parameters

**Table 72-10 REMOVE\_AUTO\_CDR Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.

## 72.2.11 REMOVE\_AUTO\_CDR\_COLUMN\_GROUP Procedure

This procedure removes a column group that was configured for Oracle GoldenGate automatic conflict detection and resolution.

### Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR_COLUMN_GROUP(
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    column_group_name IN VARCHAR2);
```

## Parameters

**Table 72-11 REMOVE\_AUTO\_CDR\_COLUMN\_GROUP Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.
column_group_name	The name of the column group.

## 72.2.12 REMOVE\_AUTO\_CDR\_DELTA\_RES Procedure

This procedure removes Oracle GoldenGate automatic conflict detection and delta resolution for the column.

### Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR_DELTA_RES(  
    schema_name IN VARCHAR2,  
    table_name  IN VARCHAR2,  
    column_name IN VARCHAR2);
```

## Parameters

**Table 72-12 REMOVE\_AUTO\_CDR\_DELTA\_RES Procedure Parameters**

Parameter	Description
schema_name	The name of the table's schema.
table_name	The name of the table.
column_name	The name of the column.

# 73

## DBMS\_GOLDENGATE\_AUTH

The `DBMS_GOLDENGATE_AUTH` package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_GOLDENGATE\\_AUTH Subprograms](#)

### See Also:

[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) in the `DBMS_XSTREAM_AUTH` package

### 73.1 DBMS\_GOLDENGATE\_AUTH Overview

This package provides subprograms for granting privileges to GoldenGate administrators and revoking privileges from GoldenGate administrators. A GoldenGate administrator manages an integrated GoldenGate and XStream Out configuration.

GoldenGate administrators can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

### See Also:

- [GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) in the `DBMS_XSTREAM_AUTH` package
- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

## 73.2 DBMS\_GOLDENGATE\_AUTH Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `DBMS_GOLDENGATE_AUTH` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

## 73.3 Summary of DBMS\_GOLDENGATE\_AUTH Subprograms

The `DBMS_XSTREAM_AUTH` package includes the `GRANT_ADMIN_PRIVILEGE` procedure and `REVOKE_ADMIN_PRIVILEGE` procedure subprograms.

**Table 73-1 DBMS\_GOLDENGATE\_AUTH Package Subprograms**

Subprogram	Description
<a href="#">GRANT_ADMIN_PRIVILEGE Procedure</a>	Either grants the privileges needed by a user to be a GoldenGate administrator directly, or generates a script that grants these privileges
<a href="#">REVOKE_ADMIN_PRIVILEGE Procedure</a>	Either revokes GoldenGate administrator privileges from a user directly, or generates a script that revokes these privileges

**Note:**

All subprograms commit unless specified otherwise.

## 73.3.1 GRANT\_ADMIN\_PRIVILEGE Procedure

This procedure grants the privileges needed by a user to be a GoldenGate administrator.

### See Also:

[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) in the [DBMS\\_XSTREAM\\_AUTH](#) package

### Syntax

```
DBMS_GOLDENGATE_AUTH.GRANT_ADMIN_PRIVILEGE (
  grantee                IN  VARCHAR2,
  privilege_type         IN  VARCHAR2  DEFAULT '*',
  grant_select_privileges IN  BOOLEAN   DEFAULT TRUE,
  do_grants              IN  BOOLEAN   DEFAULT TRUE,
  file_name              IN  VARCHAR2  DEFAULT NULL,
  directory_name        IN  VARCHAR2  DEFAULT NULL,
  grant_optional_privileges IN  VARCHAR2  DEFAULT NULL,
  container              IN  VARCHAR2  DEFAULT 'CURRENT');
```

### Parameters

**Table 73-2 GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
grantee	The user to whom privileges are granted
privilege_type	Specify one of the following values: <ul style="list-style-type: none"> <li>• CAPTURE               <p>Specifying CAPTURE grants the minimum privileges required by the user to administer Oracle GoldenGate integrated extract.</p> </li> <li>• APPLY               <p>Specifying APPLY grants the minimum privileges required by the user to administer Oracle GoldenGate integrated replicat.</p> </li> <li>• *               <p>Specifying * grants the minimum privileges required by the user to administer Oracle GoldenGate integrated extract and Oracle GoldenGate integrated replicat.</p> </li> </ul>
grant_select_privileges	If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user. This setting is recommended for GoldenGate administrators.  If FALSE, then the procedure does not grant the set of privileges to the user.  SELECT_CATALOG_ROLE enables the user to select from the data dictionary.

**Table 73-2 (Cont.) GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
do_grants	<p>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_GOLDENGATE_PRIVILEGES data dictionary view. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fails, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_GOLDENGATE_PRIVILEGES data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.</p> <p>Note: It is recommended that do_grants be set to TRUE because many APIs check for the presence of a user in the DBA_GOLDENGATE_PRIVILEGES view, which will not be populated if do_grants is set to FALSE.</p>
file_name	<p>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file.</p> <p>If NULL, then the procedure does not generate a file.</p>
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>
grant_optional_privileges	<p>A comma-separated list of optional privileges to grant to the grantee. You can specify the following roles and privileges:</p> <ul style="list-style-type: none"> <li>• XDBADMIN</li> <li>• DV_XSTREAM_ADMIN</li> <li>• DV_GOLDENGATE_ADMIN</li> <li>• EXEMPT_ACCESS_POLICY</li> <li>• EXEMPT_REDACTION_POLICY</li> </ul>

**Table 73-2 (Cont.) GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
container	<p>If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root by a common user.</p> <p>If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p>

### Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege
- EXECUTE on the following packages:
  - DBMS\_APPLY\_ADM
  - DBMS\_AQ
  - DBMS\_AQADM
  - DBMS\_AQIN
  - DBMS\_AQELM
  - DBMS\_CAPTURE\_ADM
  - DBMS\_FLASHBACK
  - DBMS\_LOCK
  - DBMS\_PROPAGATION\_ADM
  - DBMS\_RULE\_ADM
  - DBMS\_STREAMS\_ADM
  - DBMS\_STREAMS\_ADVISOR\_ADM
  - DBMS\_STREAMS\_HANDLER\_ADM
  - DBMS\_STREAMS\_MESSAGING
  - DBMS\_TRANSFORM
  - DBMS\_XSTREAM\_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue

- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT\_CATALOG\_ROLE
- SELECT or READ privilege on data dictionary views related to GoldenGate and Oracle Streams
- The ability to allow a remote GoldenGate administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the GRANT\_REMOTE\_ADMIN\_ACCESS procedure in this package.

 **Note:**

This procedure grants only the privileges necessary to configure and administer a GoldenGate environment. You can grant additional privileges to the grantee if necessary.

 **See Also:**

[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) in the [DBMS\\_XSTREAM\\_AUTH](#) package

## 73.3.2 REVOKE\_ADMIN\_PRIVILEGE Procedure

This procedure revokes GoldenGate administrator privileges from a user.

### Syntax

```
DBMS_GOLDENGATE_AUTH.REVOKE_ADMIN_PRIVILEGE(
  grantee           IN  VARCHAR2,
  privilege_type    IN  VARCHAR2  DEFAULT '*',
  revoke_select_privileges  IN  BOOLEAN  DEFAULT FALSE,
  do_revokes        IN  BOOLEAN  DEFAULT TRUE,
  file_name         IN  VARCHAR2  DEFAULT NULL,
  directory_name    IN  VARCHAR2  DEFAULT NULL,
  revoke_optional_privileges IN  VARCHAR2  DEFAULT NULL,
  container         IN  VARCHAR2  DEFAULT 'CURRENT');
```

## Parameters

**Table 73-3 REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
grantee	The user from whom privileges are revoked
privilege_type	Specify one of the following values: <ul style="list-style-type: none"> <li>CAPTURE Specifying CAPTURE revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated extract.</li> <li>APPLY Specifying APPLY revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated replicat.</li> <li>* Specifying * revokes the minimum privileges required by the user to administer Oracle GoldenGate integrated extract and Oracle GoldenGate integrated replicat.</li> </ul>
revoke_select_privileges	If TRUE, then the procedure revokes SELECT_CATALOG_ROLE from the user.  If FALSE, then the procedure does not revoke SELECT_CATALOG_ROLE to the user.  SELECT_CATALOG_ROLE enables the user to select from the data dictionary.
do_revokes	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked.  If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view.  You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file.  If NULL, then the procedure does not generate a file.

**Table 73-3 (Cont.) REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters**

Parameter	Description
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have the <code>WRITE</code> privilege on the directory object.</p> <p>If the <code>file_name</code> parameter is <code>NULL</code>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <code>NULL</code> and the <code>file_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p>
revoke_optional_privileges	<p>A comma-separated list of optional privileges to revoke from the grantee, such as the <code>DV_XSTREAM_ADMIN</code> and <code>DV_GOLDENGATE_ADMIN</code> privileges</p>
container	<p>If <code>CURRENT</code>, then revokes privileges from the grantee only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then revokes privileges from the grantee in all containers in the CDB. To specify <code>ALL</code>, the procedure must be invoked in the root.</p> <p>If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p>

### Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the `GRANT_ADMIN_PRIVILEGE` procedure in this package.

# DBMS\_HADOOP

The `DBMS_HADOOP` package provides a PL/SQL procedure called `CREATE_EXTDDL_FOR_HIVE()`, that creates an Oracle external table for a given hive table.

Big Data SQL needs to be correctly set up for `DBMS_HADOOP` to work.

This chapter contains the following topics:

- [DBMS\\_HADOOP Overview](#)
- [DBMS\\_HADOOP Security Model](#)
- [Summary of DBMS\\_HADOOP Subprograms](#)

## 74.1 DBMS\_HADOOP Overview

The `DBMS_HADOOP` package provides two procedures for creating an Oracle external table and for synchronizing the Oracle external table partitions.

These procedures are:

- `CREATE_EXTDDL_FOR_HIVE()` — creates an Oracle external table for a given hive table
- `SYNCHRONIZE_PARTITIONS_FOR_HIVE()` — helps to synchronize the Oracle external table partitions with those in the corresponding hive table

## 74.2 DBMS\_HADOOP Security Model

Users must have `ALTER` privileges on the table for modifying external table parameters. In addition the `ALTER` privileges, users must have `READ` privileges for the directory object that contains the external data source and `WRITE` privileges for the directory objects containing bad, log, and discard files.

Similar privileges are applicable to the partitioned external tables.

## 74.3 Summary of DBMS\_HADOOP Subprograms

`DBMS_HADOOP` includes the `CREATE_EXTDDL_FOR_HIVE` procedure and `SYNC_PARTITIONS_FOR_HIVE` procedure subprograms.

**Table 74-1 DBMS\_HADOOP Subprograms**

Subprogram	Description
<a href="#">CREATE_EXTDDL_FOR_HIVE Procedure</a>	Given a hive table name, creates a text of DDL that can be executed to create an external table corresponding to the hive table

**Table 74-1 (Cont.) DBMS\_HADOOP Subprograms**

Subprogram	Description
<a href="#">SYNC_PARTITIONS_FOR_HIVE Procedure</a>	Synchronizes the existing partitioning definition of a hive table in Oracle catalog

### 74.3.1 CREATE\_EXTDDL\_FOR\_HIVE Procedure

This procedure creates an Oracle external table for a given hive table.

#### Syntax

```
DBMS_HADOOP.CREATE_EXTDDL_FOR_HIVE (
  cluster_id      IN VARCHAR2,
  db_name         IN VARCHAR2 := NULL,
  hive_table_name IN VARCHAR2,
  hive_partition  IN BOOLEAN,
  table_name      IN VARCHAR2 := NULL,
  perform_DDL     IN BOOLEAN := FALSE,
  text_of_DDL     OUT CLOB);
```

#### Parameters

**Table 74-2 CREATE\_EXTDDL\_FOR\_HIVE Procedure Parameters**

Parameter	Description
cluster_id	Hadoop cluster ID
hive_db_name	Database where the hive table is located
hive_table_name	Name of the hive table
hive_partition	If this argument is TRUE and if the original hive table is partitioned, the corresponding Oracle external table will also be partitioned using the same partition key(s). If the original hive table is not partitioned, hive_partition=TRUE has no effect. If hive_partition=FALSE, the corresponding Oracle external table will not be partitioned even if the original hive table is partitioned.
table_name	Name of the Oracle external table
perform_DDL	If this argument is TRUE, the external table will be automatically created. Otherwise, only the textual representation of the DDL statement will be generated and returned in text_of_DDL .
text_of_DDL	If the argument perform_DDL is FALSE, only the textual representation of the DDL statement will be generated and returned in text_of_DDL .

## 74.3.2 SYNCHRONIZE\_PARTITIONS\_FOR\_HIVE Procedure

This procedure synchronizes the Oracle external table partitions with those in the corresponding hive table.

### Syntax

```
DBMS_HADOOP.SYNCHRONIZE_PARTITIONS_FOR_HIVE (  
    table_name    IN  VARCHAR2,  
    table_owner   IN  VARCHAR2);
```

### Parameters

**Table 74-3 SYNCHRONIZE\_PARTITIONS\_FOR\_HIVE Procedure Parameters**

Parameter	Description
table_name	Oracle external table
table_owner	Schema name

# DBMS\_HANG\_MANAGER

The DBMS\_HANG\_MANAGER package provides a method of changing some Hang Manager configuration parameters.

This chapter contains the following topics:

- [DBMS\\_HANG\\_MANAGER Overview](#)
- [DBMS\\_HANG\\_MANAGER Security Model](#)
- [DBMS\\_HANG\\_MANAGER Constants](#)
- [DBMS\\_HANG\\_MANAGER Exceptions](#)
- [Summary of DBMS\\_HANG\\_MANAGER Subprograms](#)

## 75.1 DBMS\_HANG\_MANAGER Overview

The DBMS\_HANG\_MANAGER package provides a method of changing some Hang Manager configuration parameters.

Hang Manager is always enabled on all databases, Automatic Storage Management (ASM) disk groups, and single instance systems (when not using Oracle RAC). Hang resolution is enabled on all instances by default except for single instance systems (when not using Oracle RAC) where it is disabled and cannot be enabled at this time.

### Note:

The DBMS\_HANG\_MANAGER package is intended for use by database administrators (DBA) only. It is not intended for use by application developers.

## 75.2 DBMS\_HANG\_MANAGER Security Model

DBMS\_HANG\_MANAGER can only be run as the SYS user.

## 75.3 DBMS\_HANG\_MANAGER Constants

The table in this topic lists DBMS\_HANG\_MANAGER package constants.

**Table 75-1 DBMS\_HANG\_MANAGER Constants**

Name	Type	Value	Description
RESOLUTION_SCOPE	VARCHAR2	resolution scope	Resolution scope parameter name

**Table 75-1 (Cont.) DBMS\_HANG\_MANAGER Constants**

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
SENSITIVITY	VARCHAR2	sensitivity	Sensitivity parameter name
BASE_FILE_SIZE_LIMIT	VARCHAR2	base file size limit	Base file size limit parameter name. The default value of this parameter is 100 MB.
BASE_FILE_SET_COUNT	VARCHAR2	base file set count	Base file set count parameter name. The default value is 5 trace files in the circular trace file set.
LWS_FILE_SIZE_LIMIT	VARCHAR2	long waiting session file size limit	Long waiting session file size limit parameter name. The default value of this parameter is 100 MB.
LWS_FILE_SET_COUNT	VARCHAR2	long waiting session set count	Long waiting session set count parameter name. The default value is 5 trace files in the circular trace file set.
RESOLUTION_SCOPE_PROCESS	VARCHAR2	PROCESS	Enables only session and/or process termination
RESOLUTION_SCOPE_INSTANCE	VARCHAR2	INSTANCE	Enables session, process, and instance termination. The latter is used in specific scenarios. The default value is INSTANCE.
SENSITIVITY_NORMAL	VARCHAR2	NORMAL	Sets various Hang Manager intervals to their default values. The default value is NORMAL.
SENSITIVITY_HIGH	VARCHAR2	HIGH	Sets the various Hang Manager intervals to half of their default values

## 75.4 DBMS\_HANG\_MANAGER Exceptions

The table in this topic lists the exceptions raised by the DBMS\_HANG\_MANAGER package.

**Table 75-2 DBMS\_HANG\_MANAGER Package Exceptions**

Exception	Error Code	Description
ERRNUM_INPUT_ERROR	-32706	Invalid user input
ERRNUM_INTERNAL_ERROR	-32707	Database experienced an error setting a parameter
ERRNUM_UNSUPPORTED_ERROR	-32708	Operation is not supported on this instance type

## 75.5 Summary of DBMS\_HANG\_MANAGER Subprograms

The DBMS\_HANG\_MANAGER package includes the SET procedure subprogram.

**Table 75-3 DBMS\_HANG\_MANAGER Package Subprograms**

Subprogram	Description
<a href="#">SET Procedure</a>	Sets the specified parameter to the specified value

### 75.5.1 SET Procedure

This procedure sets the specified parameters to specified values.

#### Syntax

```
DBMS_HANG_MANAGER.SET (
  pname  IN VARCHAR2,
  pvalue IN VARCHAR2);
```

#### Parameters

**Table 75-4 SET Procedure Parameters**

Parameter	Description
pname	Contains the parameter name that needs to be modified
pvalue	Contains the new value for the parameter name specified in pname

# DBMS\_HEAT\_MAP

The `DBMS_HEAT_MAP` package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace. A second set of subprograms externalize the heatmaps materialized by the background for top N tablespaces.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_HEAT\\_MAP Subprograms](#)

## See Also:

- Heat Map in *Oracle Database VLDB and Partitioning Guide*
- [DBMS\\_ILM](#)
- [DBMS\\_ILM\\_ADMIN](#)

## 76.1 DBMS\_HEAT\_MAP Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database.

The Heat Map tracks modification times at the block level, and multiple access statistics at the segment level. Objects in the `SYSTEM` and `SYSAUX` tablespaces are not tracked. `DBMS_HEAT_MAP` gives you access to the Heat Map statistics at various levels - block, extent, segment, object, and tablespace.

## 76.2 DBMS\_HEAT\_MAP Security Model

The execution privilege is granted to `PUBLIC`. Procedures in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

## 76.3 Summary of DBMS\_HEAT\_MAP Subprograms

This table lists and briefly describes the `DBMS_HEAT_MAP` package subprograms.

**Table 76-1 DBMS\_HEAT\_MAP Package Subprograms**

Subprogram	Description
<a href="#">BLOCK_HEAT_MAP Function</a>	Returns last modification time for each block in a table segment
<a href="#">EXTENT_HEAT_MAP Function</a>	Returns the extent level Heat Map statistics for a table segment
<a href="#">OBJECT_HEAT_MAP Function</a>	Returns the minimum, maximum and average access times for all the segments belonging to the object
<a href="#">SEGMENT_HEAT_MAP Procedure</a>	Returns the heatmap attributes for the given segment
<a href="#">TABLESPACE_HEAT_MAP Function</a>	Returns the minimum, maximum and average access times for all the segments in the tablespace

### 76.3.1 BLOCK\_HEAT\_MAP Function

This table function returns the last modification time for each block in a table segment. It returns no information for segment types that are not data.

#### Syntax

```
DBMS_HEAT_MAP.BLOCK_HEAT_MAP (
    owner          IN VARCHAR2,
    segment_name   IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL,
    sort_columnid  IN NUMBER DEFAULT NULL,
    sort_order     IN VARCHAR2 DEFAULT NULL)
RETURN hm_bls_row PIPELINED;
```

#### Parameters

**Table 76-2 BLOCK\_HEAT\_MAP Function Parameters**

Parameter	Description
owner	Owner of the segment
segment_name	Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table.
partition_name	Defaults to NULL. For a partitioned table, specify the partition or subpartition segment name.
sort_columnid	ID of the column on which to sort the output. Valid values 1..9. Invalid values are ignored.
sort_order	Defaults to NULL. Possible values: ASC, DESC

## Return Values

**Table 76-3** *BLOCK\_HEAT\_MAP Function Return Values (Output Parameters)*

Parameter	Description
owner	Owner of the segment
segment_name	Segment name of the non-partitioned table
partition_name	Partition or subpartition name
tablespace_name	Tablespace containing the segment
file_id	Absolute file number of the block in the segment
relative_fno	Relative file number of the block in the segment
block_id	Block number of the block
write time	Last modification time of the block

## 76.3.2 EXTENT\_HEAT\_MAP Function

This table function returns the extent level Heat Map statistics for a table segment. It returns no information for segment types that are not data. Aggregates at extent level, including minimum modification time and maximum modification time, are included.

### Syntax

```
DBMS_HEAT_MAP.EXTENT_HEAT_MAP (
  owner          IN VARCHAR2,
  segment_name   IN VARCHAR2,
  partition_name IN VARCHAR2 DEFAULT NULL,
  RETURN hm_els_row PIPELINED;
```

### Parameters

**Table 76-4** *EXTENT\_HEAT\_MAP Function Parameters*

Parameter	Description
owner	Owner of the segment
segment_name	Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table.
partition_name	Defaults to NULL. For a partitioned table, specify the partition or subpartition segment name.

### Return Values

**Table 76-5** *EXTENT\_HEAT\_MAP Function Return Values (Output Parameters)*

Parameter	Description
owner	Owner of the segment

**Table 76-5 (Cont.) EXTENT\_HEAT\_MAP Function Return Values (Output Parameters)**

Parameter	Description
segment_name	Segment name of the non-partitioned table
partition_name	Partition or subpartition name
tablespace_name	Tablespace containing the segment
file_id	Absolute file number of the block in the segment
relative_fno	Relative file number of the block in the segment
block_id	Block number of the block
blocks	Number of blocks in the extent
bytes	Number of bytes in the extent
min_writetime	Minimum of last modification time of the block
max_writetime	Maximum of last modification time of the block
avg_writetime	Average of last modification time of the block

### 76.3.3 OBJECT\_HEAT\_MAP Function

This table function returns the minimum, maximum and average access times for all the segments belonging to the object.

The object must be a table. The table function raises an error if called on object tables other than table.

#### Syntax

```
DBMS_HEAT_MAP.OBJECT_HEAT_MAP (
    object_owner      IN VARCHAR2,
    object_name       IN VARCHAR2)
RETURN hm_object_table PIPELINED;
```

#### Parameters

**Table 76-6 OBJECT\_HEAT\_MAP Function Parameters**

Parameter	Description
object_owner	Tablespace containing the segment
object_name	Segment header relative file number

#### Return Values

**Table 76-7 OBJECT\_HEAT\_MAP Function Return Values (Output Parameters)**

Parameter	Description
segment_name	Name of the top level segment

**Table 76-7 (Cont.) OBJECT\_HEAT\_MAP Function Return Values (Output Parameters)**

Parameter	Description
partition_name	Name of the partition
tablespace_name	Name of the tablespace
segment_type	Type of segment as in DBA_SEGMENTS.SEGMENT_TYPE
segment_size	Segment size in bytes
min_writetime	Oldest write time for the segment
max_writetime	Latest write time for the segment
avg_writetime	Average write time for the segment
min_readtime	Oldest read time for the segment
max_readtime	Latest read time for the segment
avg_writetime	Average write time for the segment
min_lookuptime	Oldest index lookup time for the segment
max_lookuptime	Latest index lookup time for the segment
avg_lookuptime	Average index lookup time for the segment
min_ftstime	Oldest full table scan time for the segment
max_ftstime	Latest full table scan time for the segment
avg_ftstime	Average full table scan time for the segment

## 76.3.4 SEGMENT\_HEAT\_MAP Procedure

This procedure returns the heatmap attributes for the given segment.

### Syntax

```
DBMS_HEAT_MAP.SEGMENT_HEAT_MAP (
  tablespace_id      IN NUMBER,
  header_file        IN NUMBER,
  header_block       IN NUMBER,
  segment_objd       IN NUMBER,
  min_writetime      OUT DATE,
  max_writetime      OUT DATE,
  avg_writetime      OUT DATE,
  min_readtime       OUT DATE,
  max_readtime       OUT DATE,
  avg_readtime       OUT DATE,
  min_lookuptime     OUT DATE,
  max_lookuptime     OUT DATE,
  avg_lookuptime     OUT DATE,
  min_ftstime        OUT DATE,
  max_ftstime        OUT DATE,
  avg_ftstime        OUT DATE);
```

## Parameters

**Table 76-8** *SEGMENT\_HEAT\_MAP Procedure Parameters*

Parameter	Description
tablespace_id	Tablespace containing the segment
header_file	Segment header relative file number
header_block	Segment header block number
segment_objid	DATAOBJ of the segment

## Return Values

**Table 76-9** *SEGMENT\_HEAT\_MAP Procedure Return Values (Output Parameters)*

Parameter	Description
min_writetime	Oldest write time for the segment
max_writetime	Latest write time for the segment
avg_writetime	Average write time for the segment
min_readtime	Oldest read time for the segment
max_readtime	Latest read time for the segment
avg_writetime	Average write time for the segment
min_lookuptime	Oldest index lookup time for the segment
max_lookuptime	Latest index lookup time for the segment
avg_lookuptime	Average index lookup time for the segment
min_ftstime	Oldest full table scan time for the segment
max_ftstime	Latest full table scan time for the segment
avg_ftstime	Average full table scan time for the segment

## 76.3.5 TABLESPACE\_HEAT\_MAP Function

This table function returns the minimum, maximum and average access times for all the segments in the tablespace.

### Syntax

```
DBMS_HEAT_MAP.TABLESPACE_HEAT_MAP (
    tablespace_name      IN VARCHAR2)
RETURN hm_tablespace_table PIPELINED;
```

## Parameters

**Table 76-10** *TABLESPACE\_HEAT\_MAP Procedure Parameters*

Parameter	Description
tablespace_name	Name of the tablespace

## Return Values

**Table 76-11** *TABLESPACE\_HEAT\_MAP Procedure Return Values (Output Parameters)*

Parameter	Description
segment_count	Total number of segments in the tablespace
allocated_bytes	Space used by the segments in the tablespace
min_writetime	Oldest write time for the segment
max_writetime	Latest write time for the segment
avg_writetime	Average write time for the segment
min_readtime	Oldest read time for the segment
max_readtime	Latest read time for the segment
avg_writetime	Average write time for the segment
min_lookuptime	Oldest index lookup time for the segment
max_lookuptime	Latest index lookup time for the segment
avg_lookuptime	Average index lookup time for the segment
min_ftstime	Oldest full table scan time for the segment
max_ftstime	Latest full table scan time for the segment
avg_ftstime	Average full table scan time for the segment

# DBMS\_HIERARCHY

DBMS\_HIERARCHY contains subprograms for validating the data in tables used by hierarchies and analytic views.

This chapter contains the following topics:

- [DBMS\\_HIERARCHY Overview](#)
- [DBMS\\_HIERARCHY Security Model](#)
- [Summary of DBMS\\_HIERARCHY Subprograms](#)

## 77.1 DBMS\_HIERARCHY Overview

The DBMS\_HIERARCHY package contains functions for validating that the contents of a database table are suitable for use by an analytic view or a hierarchy, a function for verifying the success of the validation, and a procedure for creating a table for logging validation operations.

 **Note:**

Names specified by parameters of the DBMS\_HIERARCHY subprograms are case-sensitive.

For information about using analytic views, see *Oracle Database Data Warehousing Guide*.

## 77.2 DBMS\_HIERARCHY Security Model

Summarizes security considerations for the validation of analytic view and hierarchy objects.

All procedures in this package validate that the current user has the necessary privileges on the specified objects and return an error if those privileges are not found.

 **Note:**

To ensure that the user has enough tablespace to log validation operations, do one of the following:

- `GRANT UNLIMITED TABLESPACE TO username ;`
- `ALTER USERNAME username QUOTA size ON tablespace_name ;`

The following system privileges are required to use this package:

**To validate objects in the user's own schema:**

- CREATE TABLE privilege for CREATE\_VALIDATE\_LOG\_TABLE or to have VALIDATE\_ANALYTIC\_VIEW or VALIDATE\_HIERARCHY automatically create a table
- SELECT privilege on the tables or views used by the analytic view or hierarchy
- INSERT privilege on the tables used by the attribute dimensions of the hierarchy or the fact table used by the analytic view

**To validate objects in different schemas:**

- CREATE ANY TABLE privilege for CREATE\_VALIDATE\_LOG\_TABLE or to have the VALIDATE\_ANALYTIC\_VIEW or VALIDATE\_HIERARCHY automatically create a table
- INSERT ANY TABLE privilege on the tables used by the attribute dimensions of the hierarchy or the fact table used by the analytic view

## 77.3 Summary of DBMS\_HIERARCHY Subprograms

This table lists the DBMS\_HIERARCHY subprograms and briefly describes them.

Subprogram	Description
<a href="#">CREATE_VALIDATE_LOG_TABLE Procedure</a>	Creates a table that you can use for logging messages generated by the VALIDATE_HIERARCHY and VALIDATE_ANALYTIC_VIEW functions.
<a href="#">VALIDATE_ANALYTIC_VIEW Function</a>	Validates that the data in a table is suitable for use by an analytic view.
<a href="#">VALIDATE_CHECK_SUCCESS Function</a>	Indicates whether a prior call to VALIDATE_HIERARCHY or VALIDATE_ANALYTIC_VIEW was successful or produced validation errors.
<a href="#">VALIDATE_HIERARCHY Function</a>	Validates that the data in a table is suitable for use by a hierarchy.

### 77.3.1 CREATE\_VALIDATE\_LOG\_TABLE Procedure

This procedure creates a table that you can use for logging messages generated by the VALIDATE\_ANALYTIC\_VIEW or VALIDATE\_HIERARCHY function, which validate data used by an analytic view or hierarchy.

The table that this procedure creates has the following structure.

NAME	NULL?	DATATYPE
LOG_NUMBER	NOT NULL	NUMBER
ACTION_ORDER	NOT NULL	NUMBER
OBJECT_OWNER	NOT NULL	VARCHAR2(128 BYTE)
OBJECT_NAME	NOT NULL	VARCHAR2(128 BYTE)
ACTION	NOT NULL	VARCHAR2(10 BYTE)
TIME	NOT NULL	TIMESTAMP(6)

```
ERROR_NUMBER          NUMBER
ERROR_MESSAGE         VARCHAR2(4000)
```

### Syntax

```
DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
    table_name          IN VARCHAR2,
    owner_name          IN VARCHAR2          DEFAULT NULL
    IGNORE_IF_EXISTS    IN PL/SQL BOOLEAN    DEFAULT FALSE);
```

### Parameters

Parameter	Description
table_name	The name of the table to create.
owner_name	The name of the schema in which to create the table. If owner_name is NULL, then the table is created in the current user's schema.
IGNORE_IF_EXISTS	A Boolean that indicates whether to create the table if a table by the same name exists. If you specify a table, it must have the same structure as the table that this procedure creates.

### Examples

#### Example 77-1 Creating a Validation Log Table

```
BEGIN
    DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
        'VAL_AV_HIERARCHY_LOG',
        'AV_USER',
        FALSE
    );
END;
/
```

## 77.3.2 VALIDATE\_ANALYTIC\_VIEW Function

This function validates that the data in a table or view conforms to the logical constraints inherent in the definition of an analytic view.

### Syntax

```
DBMS_HIERARCHY.VALIDATE_ANALYTIC_VIEW (
    analytic_view_name      IN VARCHAR2          DEFAULT NULL,
    analytic_view_owner_name IN VARCHAR2          DEFAULT NULL,
    log_table_name          IN VARCHAR2          DEFAULT NULL,
    log_table_owner_name    IN VARCHAR2          DEFAULT NULL)
RETURN NUMBER;
```

## Parameters

Parameter	Description
<code>analytic_view_name</code>	The name of the analytic view to validate.
<code>analytic_view_owner_name</code>	The name of the owner of the schema that contains the analytic view.
<code>log_table_name</code>	The name of the validation log table in which to put the results of the validation operation.
<code>log_table_owner_name</code>	The name of the owner of the schema in which the validation log table exists or in which to create the table.

## Returns

The number of the entry in the validation log table for the validation results.

## Usage Notes

If the `log_table_name` parameter is `NULL`, then the `VALIDATE_ANALYTIC_VIEW` function creates a validation log table. The name of the table it creates is `DBMS_HIERARCHY_LOG`.

When the validation operation begins, a row is inserted into the log table with the action of `START`. When the operation completes, a row is inserted into the log table with the action of `END`. When an error is detected, a row is inserted into the log table with the action of `ERROR`, and the associated `error_number` and `error_message` columns are populated. All rows inserted into the validation log table include a log number and the time of the insert.

The `VALIDATE_ANALYTIC_VIEW` function verifies that the following conditions are true for each attribute dimension the analytic view is dimensioned by:

- The key values found in the fact table for the attribute dimension must exist in the star schema dimension table for that attribute dimension.
- The referenced attribute values for the attribute dimension must be unique across all rows of the star schema dimension table for that dimension.

Also, for every hierarchy in the analytic view, the function verifies that the following conditions are true:

- The primary key of a level determines a unique value for each attribute of the level.
- For each row of the table or view used by the attribute dimension of the hierarchy, the value for every level key column (including alternate keys) of a `NOT NULL` level is `non-NULL`.
- For each row of the table or view, either all level key columns and alternate key columns of a `SKIP WHEN NULL` level must be `NULL` or they must all be `non-NULL`. This verifies that the alternate level key is determined by the level key.
- For each group of rows that have the same alternate key column values for a level, the key column values must have the same column values. This verifies that the level key is determined by the alternate level key, which is required for an alternate key.

## Examples

### Example 77-2 Validating an Analytic View

```

DECLARE
  log_num NUMBER;
  obj_name VARCHAR2(8) := 'SALES_AV';
BEGIN
  log_num := DBMS_HIERARCHY.VALIDATE_ANALYTIC_VIEW(obj_name);
END;
/

```

## 77.3.3 VALIDATE\_CHECK\_SUCCESS Function

This function indicates whether a prior call to `VALIDATE_HIERARCHY` or `VALIDATE_ANALYTIC_VIEW` was successful or produced validation errors.

### Syntax

```

DBMS_HIERARCHY.VALIDATE_CHECK_SUCCESS (
  TOPOBJ_NAME          IN VARCHAR2,
  TOPOBJ_OWNER        IN VARCHAR2,
  LOG_NUMBER           IN VARCHAR2,
  LOG_TABLE_NAME       IN VARCHAR2,
  LOG_TABLE_OWNER_NAME IN VARCHAR2 )
RETURN VARCHAR2;

```

### Parameters

Parameter	Description
TOPOBJ_NAME	The name of the hierarchy or analytic view.
TOPOBJ_OWNER	The owner of the hierarchy or analytic view.
LOG_NUMBER	The number of the log entry.
LOG_TABLE_NAME	The name of the log table.
LOG_TABLE_OWNER_NAME	The name of the schema in which the table exists.

### Returns

A `VARCHAR2` that is `SUCCESS` if no errors occurred or `ERROR` if errors did occur.

## Examples

### Example 77-3 Using VALIDATE\_CHECK\_SUCCESS

This example finds out whether the prior call to `VALIDATE_ANALYTIC_VIEW` encountered errors.

```

DECLARE
  log_num NUMBER;
  succ VARCHAR2(7);

```

```

obj_name VARCHAR2(8) := 'SALES_AV';
BEGIN
  log_num := dbms_hierarchy.validate_analytic_view(obj_name);
  succ := dbms_hierarchy.validate_check_success(
    topobj_name => obj_name, log_number => log_num);
  IF (succ != 'SUCCESS') THEN
    RAISE_APPLICATION_ERROR(
      num => -20000,
      msg => 'Validate failed!');
  END IF;
END;
/

```

## 77.3.4 VALIDATE\_HIERARCHY Function

This function validates that the data in a table or view conforms to the logical constraints inherent in the definitions of an attribute dimension that uses the table or view and a hierarchy that uses the attribute dimension.

### Syntax

```

DBMS_HIERARCHY.VALIDATE_HIERARCHY (
  hier_name           IN VARCHAR2,
  hier_owner_name     IN VARCHAR2  DEFAULT NULL,
  log_table_name      IN VARCHAR2  DEFAULT NULL,
  log_table_owner_name IN VARCHAR2  DEFAULT NULL)
RETURN NUMBER;

```

### Parameters

Parameter	Description
hier_name	The name of the hierarchy to validate.
hier_owner_name	The name of the owner of the schema that contains the hierarchy.
log_table_name	The name of the validation log table in which to put the results of the validation operation.
log_table_owner_name	The name of the owner of the schema in which the validation log table exists or in which to create the table.

### Returns

The number of the entry in the validation log table for the validation results.

### Usage Notes

If the `log_table_name` parameter is `NULL`, then the `VALIDATE_HIERARCHY` function creates a validation log table. The name of the table it creates is `DBMS_HIERARCHY_LOG`.

When the validation operation begins, a row is inserted into the log table with the action of `START`. When the operation completes, a row is inserted into the log table with the action of `END`. When an error is detected, a row is inserted into the log table with the action of `ERROR`, and the associated `error_number` and `error_message` columns are

populated. All rows inserted into the validation log table include a log number and the time of the insert.

The `VALIDATE_HIERARCHY` function verifies that the following conditions are true for the hierarchy:

- The primary key of a level determines a unique value for each attribute of the level.
- For each row of the table or view used by the attribute dimension of the hierarchy, the value for every level key column (including alternate keys) of a `NOT NULL` level is `non-NULL`.
- For each row of the table or view, either all level key columns and alternate key columns of a `SKIP WHEN NULL` level must be `NULL` or they must all be `non-NULL`. This verifies that the alternate level key is determined by the level key.
- For each group of rows that have the same alternate key column values for a level, the key column values must have the same column values. This verifies that the level key is determined by the alternate level key, which is required for an alternate key.

### Examples

#### Example 77-4 Validating a Hierarchy and Specifying a Table Name

This example validates the `PRODUCT_HIER` hierarchy and specifies that the results be inserted in the table named `VAL_AV_HIERARCHY_LOG`. The owner of the hierarchy and of the schema that contains the table is `AV_USER`.

```
-- Create a log table.
BEGIN
  DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
    'VAL_AV_HIERARCHY_LOG',
    'AV_USER',
    FALSE
  );
END;
/
-- Validate the hierarchy.
DECLARE
  log_num NUMBER;
  obj_name VARCHAR2(12) := 'PRODUCT_HIER';
  table_name VARCHAR2(28) := 'VAL_AV_HIERARCHY_LOG';
BEGIN
  log_num := DBMS_HIERARCHY.VALIDATE_HIERARCHY(obj_name, 'AV_USER',
table_name);
END;
/
```

Query the log table.

```
SELECT LOG_NUMBER, ACTION, OBJECT_NAME, ERROR_NUMBER, ERROR_MESSAGE
FROM AV_USER.VAL_AV_HIERARCHY_LOG;
WHERE OBJECT_NAME = 'PRODUCT_HIER';
```

LOG_NUMBER	ACTION	OBJECT_NAME	ERROR_NUMBER	ERROR_MESSAGE
------------	--------	-------------	--------------	---------------

```
-----
1 START      PRODUCT_HIER
1 END        PRODUCT_HIER
```

**Example 77-5 Validating a Hierarchy Without Specifying a Table Name**

This example shows that if you do not specify a validation log table, then the VALIDATE\_HIERARCHY function creates one named DBMS\_HIERARCHY\_LOG.

```
DECLARE
  log_num NUMBER;
  obj_name VARCHAR2(12) := 'PRODUCT_HIER';
BEGIN
  log_num := DBMS_HIERARCHY.VALIDATE_HIERARCHY(obj_name);
END;
```

Query the log table.

```
SELECT LOG_NUMBER, ACTION, OBJECT_NAME, ERROR_NUMBER, ERROR_MESSAGE
FROM DBMS_HIERARCHY_LOG
WHERE OBJECT_NAME = 'PRODUCT_HIER';
```

LOG_NUMBER	ACTION	OBJECT_NAME	ERROR_NUMBER	ERROR_MESSAGE
1	START	PRODUCT_HIER		
1	END	PRODUCT_HIER		

# 78

## DBMS\_HM

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through `DBMS_HM` package

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_HM Subprograms](#)

### See Also:

*Oracle Database Administrator's Guide* for more information about "Health Monitor"

## 78.1 DBMS\_HM Security Model

Users must have `EXECUTE` privilege to run the procedures of `DBMS_HM` package.

## 78.2 Summary of DBMS\_HM Subprograms

This table lists the `DBMS_CONNECTION_POOL` subprograms and briefly describes them.

**Table 78-1 DBMS\_HM Package Subprograms**

Subprogram	Description
<a href="#">GET_RUN_REPORT Function</a>	Returns the report for the specified checker run
<a href="#">RUN_CHECK Procedure</a>	Runs the specified checker with the given arguments

### 78.2.1 GET\_RUN\_REPORT Function

This function returns the report for the specified checker run.

#### Syntax

```
DBMS_HM.GET_RUN_REPORT (  
    run_name      IN VARCHAR2,  
    type          IN VARCHAR2 := 'TEXT',  
    level         IN VARCHAR2 := 'BASIC',)  
RETURN CLOB;
```

## Parameters

**Table 78-2 GET\_RUN\_REPORT Function Parameters**

Parameter	Description
run_name	Name of the check's run
type	Report format type. Possible values are 'HTML', 'XML' and 'TEXT'. Default report type is 'TEXT'.
level	Details of report, possible value are 'BASIC' and 'DETAIL'. Caution: Currently only 'BASIC' level is supported.

## 78.2.2 RUN\_CHECK Procedure

This procedure runs the specified checker with the specified arguments.

You can specify a name for the run, the inputs needed and maximum time-out for the run. The run report will be maintained persistently in the database.

### Syntax

```
DBMS_HM.RUN_CHECK (
    check_name    IN  VARCHAR2,
    run_name      IN  VARCHAR2 := NULL,
    timeout       IN  NUMBER := NULL,
    input_params  IN  VARCHAR2 := NULL);
```

## Parameters

**Table 78-3 RUN\_CHECK Procedure Parameters**

Parameter	Description
check_name	Name of the check to be invoked. Check names and their parameters can be accessed from the V\$HM_CHECK and V\$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: SELECT name FROM V\$HM_CHECK WHERE INTERNAL_CHECK = 'N' retrieves the list of checks that can be run manually by users.
run_name	Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run.
timeout	Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run.

**Table 78-3 (Cont.) RUN\_CHECK Procedure Parameters**

Parameter	Description
input_params	<p>Input string: which consists of name, value pairs de-limited by a special character ';'.            Example ('Data Block Integrity Check' invocation may take following type of input parameters.            'BLC_DF_NUM=1;BLC_BL_NUM=23456'</p> <p>Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively.</p> <p>Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V\$HM_CHECK_PARAM view.</p> <p>Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check'</p> <pre>SELECT a.* FROM v\$hm_check_param a, v\$hm_check b WHERE a.check_id = b.id AND b.name = 'Data Block Integrity Check';</pre>

# DBMS\_HPROF

The `DBMS_HPROF` package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

This chapter contains the following topic:

- [Summary of DBMS\\_HPROF Subprograms](#)

## See Also:

*Oracle Database Development Guide* for more information about the "PL/SQL Hierarchical Profiler"

## 79.1 Summary of DBMS\_HPROF Subprograms

This table lists and briefly describes the `DBMS_HPROF` package subprograms.

**Table 79-1 DBMS\_HPROF Package Subprograms**

Subprogram	Description
<a href="#">ANALYZE Function</a>	Analyzes the raw profiler output and produces hierarchical profiler information in database tables.
<a href="#">CREATE_TABLES Procedure</a>	Creates the hierarchical profiler database tables and data structures in the user's session.
<a href="#">START_PROFILING Procedure</a>	Starts hierarchical profiler data collection in the user's session.
<a href="#">STOP_PROFILING Procedure</a>	Stops profiler data collection in the user's session.

### 79.1.1 ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables or generates out-of-the-box HTML reports.

#### Syntax

```
DBMS_HPROF.ANALYZE (
  trace_id           IN NUMBER,
  summary_mode      IN BOOLEAN DEFAULT FALSE,
  trace             IN VARCHAR2 DEFAULT NULL,
  skip              IN PLS_INTEGER DEFAULT 0,
  collect           IN PLS_INTEGER DEFAULT NULL,
  run_comment       IN VARCHAR2 DEFAULT NULL)
```

```

RETURN NUMBER;

DBMS_HPROF.ANALYZE (
  trace_id      IN NUMBER,
  report_clob   OUT CLOB,
  trace        IN VARCHAR2 DEFAULT NULL,
  skip         IN PLS_INTEGER DEFAULT 0,
  collect      IN PLS_INTEGER DEFAULT NULL);

```

## Parameters

**Table 79-2 ANALYZE Function Parameters**

Parameter	Description
trace_id	The trace_id of the raw profiler data entry in the raw profiler data table (dbmsHP_trace_data).
summary_mode	By default (that is, when summary_mode is FALSE), a detailed analysis is done. When summary_mode is TRUE, only top-level summary information is generated into the database table.
report_clob	The analyzed HTML report.
trace	Analyzes only the subtrees rooted at the specified trace entry. By default (when trace is NULL), the analysis/reporting is generated for the entire run. The trace entry must be specified in a special quoted qualified format. For example, "HR"."PKG"."FOO" or "".""."__plsSql_vm". If multiple overloads exist for the specified name, all of them will be analyzed.
skip	Used only when trace is specified. Analyze only the subtrees rooted at the specified trace, but ignore the first skip invocations to trace. The default value for skip is 0.
collect	Used only when trace is specified. Analyze collect number of invocations of traces (starting from skip+1'th invocation). By default, only 1 invocation is collected.
run_comment	User-provided comment for this run.

## Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

## Usage Notes

- Use the DBMS\_HPROF.CREATE\_TABLES subprogram to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Calling the DBMS\_HPROF.CREATE\_TABLES with default value (FALSE) will raise error if table already exists.

- Use `DBMS_HPROF.CREATE_TABLES(TRUE)` to drop any previously created hierarchical profiler tables.
- Use the `DBMS_HPROF.CREATE_TABLES` to drop any previously created hierarchical profiler tables. By default, `force_it` is `FALSE`; therefore, to drop any previously created hierarchical profiler tables you must set the value of `force_it` to `TRUE`.
- If `trace_id` entry is `NULL`, error is raised.
- If `trace_id` entry in the raw profiler data table does not exist, error is raised.
- If raw data of the `trace_id` entry in the raw profiler data table is `NULL` or is zero size, error is raised.

### Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```
connect HR/HR;
```

The following example analyzes and generates HTML CLOB report from a raw profiler data table.

```
DECLARE
    reportclob clob;
    trace_id number;
BEGIN
    -- create raw profiler data and analysis tables
    -- force_it =>TRUE will dropped the tables if table exists
    DBMS_HPROF.CREATE_TABLES(force_it =>TRUE);

    -- Start profiling
    -- Write raw profiler data in raw profiler data table
    trace_id := DBMS_HPROF.START_PROFILING;

    -- Run procedure to be profiled
    test;

    -- Stop profiling
    DBMS_HPROF.STOP_PROFILING;

    -- analyzes trace_id entry in raw profiler data table and produce
    -- analyzed HTML report in reportclob
    DBMS_HPROF.ANALYZE(trace_id , reportclob);
END;
/
```

## 79.1.2 CREATE\_TABLES Procedure

Creates the hierarchical profiler database tables and data structures in the user's session.

### Syntax

```
DBMS_HPROF.CREATE_TABLES (
    force_it          IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 79-3 CREATE\_TABLES Procedure Parameters**

Parameter	Description
force_it	If FALSE and DBMS_HPROF tables are present, then an HPROF error is raised.  If TRUE, then the procedure creates tables. If the tables already exist, then they are dropped and new tables are created.

 **Note:**

Users need not use the dbmshptab.sql script located in the rdbms/admin directory to create the hierarchical profiler database tables and data structures anymore.

The dbmshptab.sql script is deprecated starting in Oracle Database 18c.

## 79.1.3 START\_PROFILING Procedure

This procedure starts hierarchical profiler data collection in the user's session.

### Syntax

```
DBMS_HPROF.START_PROFILING(
    max_depth      IN PLS_INTEGER DEFAULT NULL,
    sqlmonitor     IN BOOLEAN DEFAULT TRUE,
    run_comment    IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

### Parameters

**Table 79-4 START\_PROFILING Procedure Parameters**

Parameter	Description
max_depth	By default (that is, when max_depth value is NULL) profile information is gathered for all functions irrespective of their call depth. When a non-NULL value is specified for max_depth, the profiler collects data only for functions up to a call depth level of max_depth.
sqlmonitor	Generates a real-time monitoring report for a profiler run when the profiler run ends.  The default value is TRUE.
run_comment	User provided comment for the profiler data collection run.

### Return Values

Unique run identifier for this profiler run. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

### Usage Notes

- Even though the profiler does not individually track functions at depth greater than `max_depth`, the time spent in such functions is charged to the ancestor function at depth `max_depth`.
- Raw profiler data is generated in the raw profiler data table with a unique `trace_id`.
- The unique `trace_id` is used to manage the raw profiler output stored in the raw profiler data table.

## 79.1.4 STOP\_PROFILING Procedure

This procedure stops profiler data collection in the user's session. This subprogram also has the side effect of flushing data collected so far in the session, and it signals the end of a run. When the `STOP_PROFILING` procedure returns CLOB, it contains the Real-Time Monitoring report for the profiler run.

### Syntax

```
DBMS_HPROF.STOP_PROFILING;
```

```
DBMS_HPROF.STOP_PROFILING  
RETURN CLOB;
```

### Examples

#### Profiling with raw profiler data table

```
DECLARE  
    analyze_runid number;  
    trace_id number;  
BEGIN  
    -- create raw profiler data and analysis tables  
    -- call create_tables with force_it =>FALSE (default) when  
    -- raw profiler data and analysis tables do not exist already  
    DBMS_HPROF.CREATE_TABLES;  
    -- Start profiling  
    -- Write raw profiler data in raw profiler data table  
    trace_id := DBMS_HPROF.START_PROFILING;  
    -- Run the procedure to be profiled  
    test;  
    -- Stop profiling  
    DBMS_HPROF.STOP_PROFILING;  
    -- analyzes trace_id entry in raw profiler data table and writes  
    -- hierarchical profiler information in hprof's analysis tables  
    analyze_runid := DBMS_HPROF.ANALYZE(trace_id);  
END;  
/
```

# DBMS\_HS\_PARALLEL

The `DBMS_HS_PARALLEL` PL/SQL package enables parallel processing for heterogeneous targets access. This package is designed to improve performance when retrieving data from a large foreign table.

This chapter discusses the following topics:

- [Using DBMS\\_HS\\_PARALLEL](#)
- [Summary of DBMS\\_HS\\_PARALLEL Subprograms](#)

## 80.1 Using the DBMS\_HS\_PARALLEL Subprogram

`DBMS_HS_PARALLEL` is compiled with the authorization ID of `CURRENT_USER`, which uses invoker's rights. In other words, all procedures in this package are executed with the privileges of the calling user.

## 80.2 Summary of DBMS\_HS\_PARALLEL Subprograms

This table lists the `DBMS_HS_PARALLEL` subprograms in alphabetic order and briefly describes them.

**Table 80-1 DBMS\_HS\_PARALLEL Package Subprograms**

Subprogram	Description
<a href="#">CREATE_OR_REPLACE_VIEW</a>	Creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.
<a href="#">CREATE_TABLE_TEMPLATE</a>	Writes out a <code>CREATE TABLE</code> template based on information gathered from the remote table. You can use the information to add any optimal Oracle <code>CREATE TABLE</code> clauses.
<a href="#">DROP_VIEW</a>	Drops the view and internal objects created by the <code>CREATE_OR_REPLACE_VIEW</code> procedure. If the view has not already been created by the <code>CREATE_OR_REPLACE_VIEW</code> procedure, an error message is returned.
<a href="#">LOAD_TABLE</a>	Loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

## 80.2.1 CREATE\_OR\_REPLACE\_VIEW Procedure

This procedure creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.

### Syntax

```
CREATE_OR_REPLACE_VIEW (remote_table, database_link, oracle_view, parallel_degree)
```

### Parameters

**Table 80-2 CREATE\_OR\_REPLACE\_VIEW Procedure Parameters**

Parameters	Description
remote_table	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_view	The name of the Oracle view. It is specified as [schema_name.]oracle_view_name. The default schema name is the current user. If the oracle_view parameter is not specified, the remote table name will be used as the view name.
parallel_degree	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.

### Usage Notes

- The specified Oracle view is created and future reference of this view utilizes internal database objects for parallel retrieval of remote non-Oracle table data. If the Oracle view already exists, the following Oracle error message is raised:  
ORA-00955: name is already used by an existing object
- This view is created as a read-only view. If you attempt to insert and update the view, the following Oracle error message is raised:  
ORA-01733: virtual column not allowed here
- If the remote table or the database link does not exist, one of the following Oracle error messages is raised:  
ORA-00942: table or view does not exist  
or  
ORA-02019: connection description for remote database not found
- You need the CREATE VIEW, CREATE TABLE, CREATE TYPE, CREATE PACKAGE, and CREATE FUNCTION privileges to execute the CREATE\_OR\_REPLACE\_VIEW procedure.
- If you encounter either of the following Oracle error messages, increase the PROCESSES and SESSIONS parameter in the Oracle initialization parameter file:

```
ORA-12801: error signaled in parallel query server P003
or
ORA-00018: maximum number of session exceeded
```

- Because the `CREATE_OR_REPLACE_VIEW` procedure creates some internal objects, use the `DROP_VIEW` procedure to drop the view and the internal objects. The SQL `DROP VIEW` statement only drops the view and not the internal objects.

## 80.2.2 CREATE\_TABLE\_TEMPLATE Procedure

This procedure writes out a `CREATE TABLE` template based on information gathered from the remote table. You can use the information to add any optimal Oracle `CREATE TABLE` clauses.

### Syntax

```
CREATE_TABLE_TEMPLATE (remote_table, database_link, oracle_table,
create_table_template_string)
```

### Parameters

**Table 80-3 CREATE\_TABLE\_TEMPLATE Procedure Parameters**

Parameter	Description
<code>remote_table</code>	The name of the remote database table. It is specified as <code>[remote_schema_name.]remote_table_name</code> .
<code>database_link</code>	The remote database link name. The call can only be applied to a heterogeneous services database link.
<code>oracle_table</code>	The name of the local Oracle table the data will be loaded into. It is specified as <code>[schema_name.]oracle_table_name</code> . The default schema name is the current user. If the <code>oracle_table</code> parameter is not specified, the remote table name will be used as the local Oracle name.
<code>create_table_template_string</code>	Contains the Oracle <code>CREATE TABLE</code> SQL template when the procedure is returned.

## 80.2.3 DROP\_VIEW Procedure

This procedure drops the view and internal objects created by the `CREATE_OR_REPLACE_VIEW` procedure. If the view has not already been created by the `CREATE_OR_REPLACE_VIEW` procedure, an error message is returned.

### Syntax

```
DROP_VIEW (oracle_view)
```

## Parameters

**Table 80-4 DROP\_VIEW Procedure Parameter**

Parameter	Description
oracle_view	The name of the Oracle view created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not been created by the CREATE_OR_REPLACE_VIEW procedure, an error is returned.

## 80.2.4 LOAD\_TABLE Procedure

This procedure loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

### Syntax

```
LOAD_TABLE (remote_table, database_link, oracle_table, truncate, parallel_degree,
row_count)
```

### Parameters

**Table 80-5 LOAD\_TABLE Procedure Parameters**

Parameter	Description
remote_table	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name
database_link	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
truncate	Determines whether the Oracle table is truncated before the data is loaded. The value is either TRUE or FALSE. The default value is TRUE which means the Oracle table is truncated first. When set to FALSE, the Oracle table will not be truncated before the data is loaded.
parallel_degree	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.
row_count	Contains the number of rows just added with the load table operation.

### Usage Notes

- This procedure only loads the remote table data into Oracle local table. It does not create a key, index, constraints or any other dependencies such as triggers. It is recommended that you create these dependencies after the table data is loaded as performance will improve greatly. You will need to decide whether to create the dependencies before or after the data is loaded based on your knowledge of the remote table data and dependencies.
- If the local table does not exist, the `LOAD_TABLE` procedure creates a simple (non-partitioned) local table based on the exact column matching of the remote table after which the data is inserted into the local table.
- If the remote table or the database link does not exist, an error message is returned.
- If the local table is incompatible with the remote table, an error message is returned.
- You need the `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `LOAD_TABLE` procedure.
- If you encounter either of the following Oracle error messages, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file:  

```
ORA-12801: error signaled in parallel query server P003  
or  
ORA-00018: maximum number of session exceeded
```
- One of the following is required for parallel processing:
  - The remote table is range partitioned.
  - Histogram information for a numeric column is available.
  - There is a numeric index or primary key.
- To drop the local table, use the `DROP TABLE` SQL statement.

# 81

## DBMS\_HS\_PASSTHROUGH

The `DBMS_HS_PASSTHROUGH` PL/SQL package allows you to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows operations in statements for which there is no equivalent in Oracle.

This chapter discusses the following topics:

- [DBMS\\_HS\\_PASSTHROUGH Overview](#)
- [DBMS\\_HS\\_PASSTHROUGH Operational Notes](#)
- [Summary of DBMS\\_HS\\_PASSTHROUGH Subprograms](#)

### See Also:

*Oracle Database Heterogeneous Connectivity User's Guide* for more information about this package

### 81.1 DBMS\_HS\_PASSTHROUGH Overview

You can execute passthrough SQL statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is executed in the same transaction as standard SQL statements.

### See Also:

*Oracle Database Heterogeneous Connectivity User's Guide* for information about this package

### 81.2 DBMS\_HS\_PASSTHROUGH Operational Notes

The `DBMS_HS_PASSTHROUGH` package is a virtual package. It conceptually resides at the non-Oracle system. In reality, however, calls to this package are intercepted by Heterogeneous Services and mapped to one or more Heterogeneous Services calls. The driver, in turn, maps these Heterogeneous Services calls to the API of the non-Oracle system. The client application should invoke the procedures in the package through a database link in exactly the same way as it would invoke a non-Oracle system stored procedure. The special processing done by Heterogeneous Services is transparent to the user.

## 81.3 Summary of DBMS\_HS\_PASSTHROUGH Subprograms

This table lists the DBMS\_HS\_PASSTHROUGH subprograms and briefly describes them.

**Table 81-1 DBMS\_HS\_PASSTHROUGH Package Subprograms**

Subprogram	Description
<a href="#">BIND_INOUT_VARIABLE Procedure</a>	Binds IN OUT bind variables
<a href="#">BIND_INOUT_VARIABLE_RAW Procedure</a>	Binds IN OUT bind variables of datatype RAW
<a href="#">BIND_OUT_VARIABLE Procedure</a>	Binds an OUT variable with a PL/SQL program variable
<a href="#">BIND_OUT_VARIABLE_RAW Procedure</a>	Binds an OUT variable of datatype RAW with a PL/SQL program variable
<a href="#">BIND_VARIABLE Procedure</a>	Binds an IN variable positionally with a PL/SQL program variable
<a href="#">BIND_VARIABLE_RAW Procedure</a>	Binds IN variables of type RAW
<a href="#">CLOSE_CURSOR Procedure</a>	Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system
<a href="#">EXECUTE_IMMEDIATE Procedure</a>	Runs a (non-SELECT) SQL statement immediately, without bind variables
<a href="#">EXECUTE_NON_QUERY Function</a>	Runs a (non-SELECT) SQL statement
<a href="#">FETCH_ROW Function</a>	Fetches rows from a query
<a href="#">GET_VALUE Procedure</a>	Retrieves column value from SELECT statement, or retrieves OUT bind parameters
<a href="#">GET_VALUE_RAW Procedure</a>	Similar to GET_VALUE, but for datatype RAW
<a href="#">OPEN_CURSOR Function</a>	Opens a cursor for running a passthrough SQL statement at the non-Oracle system
<a href="#">PARSE Procedure</a>	Parses SQL statement at non-Oracle system

### 81.3.1 BIND\_INOUT\_VARIABLE Procedure

This procedure binds IN OUT bind variables.

#### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dt>,
  n      IN  VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

 **See Also:**

For binding OUT variables of datatype RAW, see [BIND\\_OUT\\_VARIABLE\\_RAW Procedure](#).

**Pragmas**

Purity level defined : WNDS, RNDS

**Parameters**

**Table 81-2 BIND\_INOUT\_VARIABLE Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name of the bind variable.  For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

**Exceptions**

**Table 81-3 BIND\_INOUT\_VARIABLE Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.2 BIND\_INOUT\_VARIABLE\_RAW Procedure

This procedure binds IN OUT bind variables of datatype RAW.

**Syntax**

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
```

```
v      IN OUT RAW,
n      IN   VARCHAR2);
```

### Pragmas

Purity level defined : WNDS, RNDS

### Parameters

**Table 81-4 BIND\_INOUT\_VARIABLE\_RAW Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name the bind variable.  For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 81-5 BIND\_INOUT\_VARIABLE\_RAW Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.3 BIND\_OUT\_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dt>,
  n      IN  VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

 **See Also:**

For binding OUT variables of datatype RAW, see [BIND\\_OUT\\_VARIABLE\\_RAW Procedure](#).

### Pragmas

Purity level defined : WNDS, RNDS

### Parameters

**Table 81-6 BIND\_OUT\_VARIABLE Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 81-7 BIND\_OUT\_VARIABLE Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.4 BIND\_OUT\_VARIABLE\_RAW Procedure

This procedure binds an `OUT` variable of datatype `RAW` with a PL/SQL program variable.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      OUT RAW,
  n      IN VARCHAR2);
```

### Pragmas

Purity level defined : WNDS, RNDS

### Parameters

**Table 81-8 BIND\_OUT\_VARIABLE\_RAW Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the <code>OUT</code> bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use <code>GET_VALUE</code> to retrieve the value of the <code>OUT</code> parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using <code>BIND_OUT_VARIABLE_RAW</code> .
n	(Optional) Name of the bind variable. For example, in <code>SELECT * FROM emp WHERE ename=:ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 81-9 BIND\_OUT\_VARIABLE\_RAW Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

## 81.3.5 BIND\_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      IN <dt>,
  n      IN VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

### See Also:

To bind RAW variables use [BIND\\_VARIABLE\\_RAW Procedure](#).

### Pragmas

Purity level defined: WNDS, RNDS

### Parameters

**Table 81-10 BIND\_VARIABLE Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable name.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 81-11 BIND\_VARIABLE Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.

**Table 81-11 (Cont.) BIND\_VARIABLE Procedure Exceptions**

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### 81.3.6 BIND\_VARIABLE\_RAW Procedure

This procedure binds IN variables of type RAW.

#### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
  c   IN BINARY_INTEGER NOT NULL,
  p   IN BINARY_INTEGER NOT NULL,
  v   IN RAW,
  n   IN VARCHAR2);
```

#### Pragmas

Purity level defined : WNDS, RNDS

#### Parameters

**Table 81-12 BIND\_VARIABLE\_RAW Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

#### Exceptions

**Table 81-13 BIND\_VARIABLE\_RAW Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.7 CLOSE\_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

### Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (
    c IN BINARY_INTEGER NOT NULL);
```

### Pragmas

Purity level defined : WNDS, RNDS

### Parameters

**Table 81-14 CLOSE\_CURSOR Procedure Parameters**

Parameter	Description
c	Cursor to be released.

### Exceptions

**Table 81-15 CLOSE\_CURSOR Procedure Exceptions**

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.8 EXECUTE\_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately.

The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN\_CURSOR, PARSE, EXECUTE\_NON\_QUERY, CLOSE\_CURSOR.

### Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
    s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 81-16 EXECUTE\_IMMEDIATE Procedure Parameters**

Parameter	Description
s	VARCHAR2 variable with the statement to be executed immediately.

**Return Values**

The number of rows affected by the execution of the SQL statement.

**Exceptions****Table 81-17 EXECUTE\_IMMEDIATE Procedure Exceptions**

Exception	Description
ORA-28551	SQL statement is invalid.
ORA-28554	Max open cursors.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.9 EXECUTE\_NON\_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a `SELECT` statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

**Syntax**

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (
    c IN BINARY_INTEGER NOT NULL)
RETURN BINARY_INTEGER;
```

**Parameters****Table 81-18 EXECUTE\_NON\_QUERY Function Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.

**Return Values**

The number of rows affected by the SQL statement in the non-Oracle system

**Exceptions****Table 81-19 EXECUTE\_NON\_QUERY Function Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.10 FETCH\_ROW Function

This function fetches rows from a result set.

The result set is defined with a SQL `SELECT` statement. When there are no more rows to be fetched, the exception `NO_DATA_FOUND` is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

### Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
  c   IN BINARY_INTEGER NOT NULL,
  f   IN BOOLEAN)
RETURN BINARY_INTEGER;
```

### Pragmas

Purity level defined : WNDS

### Parameters

**Table 81-20** FETCH\_ROW Function Parameters

Parameter	Description
<code>c</code>	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
<code>first</code>	(Optional) Reexecutes <code>SELECT</code> statement. Possible values: <ul style="list-style-type: none"> <li>- <code>TRUE</code>: reexecute <code>SELECT</code> statement.</li> <li>- <code>FALSE</code>: fetch the next row, or if run for the first time, then execute and fetch rows (default).</li> </ul>

### Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

### Exceptions

**Table 81-21** FETCH\_ROW Function Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

## 81.3.11 GET\_VALUE Procedure

This procedure has two purposes: it retrieves the select list items of `SELECT` statements after a row has been fetched, and it retrieves the `OUT` bind values, after the `SQL` statement has been run.

### Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      OUT <dt>);
```

<dt> is either `DATE`, `NUMBER`, or `VARCHAR2`.

### See Also:

For retrieving values of datatype `RAW`, see [GET\\_VALUE\\_RAW Procedure](#).

### Pragmas

Purity level defined : `WNDS`

### Parameters

**Table 81-22 GET\_VALUE Procedure Parameters**

Parameter	Description
<code>c</code>	Cursor associated with the passthrough <code>SQL</code> statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
<code>p</code>	Position of the bind variable or select list item in the <code>SQL</code> statement: Starts at 1.
<code>v</code>	Variable in which the <code>OUT</code> bind variable or select list item stores its value.

### Exceptions

**Table 81-23 GET\_VALUE Procedure Exceptions**

Exception	Description
<code>ORA-1403</code>	Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0").
<code>ORA-28550</code>	The cursor passed is invalid.
<code>ORA-28552</code>	Procedure is not run in right order. (Did you first open the cursor and parse the <code>SQL</code> statement?)
<code>ORA-28553</code>	The position of the bind variable is out of range.

**Table 81-23 (Cont.) GET\_VALUE Procedure Exceptions**

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## 81.3.12 GET\_VALUE\_RAW Procedure

This procedure is similar to GET\_VALUE, but for datatype RAW.

### Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
  c    IN  BINARY_INTEGER NOT NULL,
  p    IN  BINARY_INTEGER NOT NULL,
  v    OUT RAW);
```

### Pragmas

Purity level defined : WNDS

### Parameters

**Table 81-24 GET\_VALUE\_RAW Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable or select list item stores its value.

### Exceptions

**Table 81-25 GET\_VALUE\_RAW Procedure Exceptions**

Exception	Description
ORA-1403	Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### 81.3.13 OPEN\_CURSOR Function

This function opens a cursor for running a passthrough SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure `CLOSE_CURSOR`.

#### Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
  RETURN BINARY_INTEGER;
```

#### Pragmas

Purity level defined : WNDS, RNDS

#### Return Values

The cursor to be used on subsequent procedure and function calls.

#### Exceptions

**Table 81-26 OPEN\_CURSOR Function Exceptions**

Exception	Description
ORA-28554	Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' <code>OPEN_CURSORS</code> initialization parameter.

### 81.3.14 PARSE Procedure

This procedure parses an SQL statement at a non-Oracle system.

#### Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
  c          IN BINARY_INTEGER NOT NULL,
  stmt      IN VARCHAR2 NOT NULL);
```

#### Pragmas

Purity level defined : WNDS, RNDS

#### Parameters

**Table 81-27 PARSE Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened using function <code>OPEN_CURSOR</code> .
stmt	Statement to be parsed.

## Exceptions

**Table 81-28 PARSE Procedure Exceptions**

<b>Exception</b>	<b>Description</b>
ORA-28550	The cursor passed is invalid.
ORA-28551	SQL statement is illegal.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

# DBMS\_ILM

The `DBMS_ILM` package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Summary of DBMS\\_ILM Subprograms](#)

## See Also:

- *Oracle Database VLDB and Partitioning Guide* for information about managing Automatic Data Optimization (ADO) with this package
- [DBMS\\_ILM\\_ADMIN](#)
- [DBMS\\_HEAT\\_MAP](#)

## 82.1 DBMS\_ILM Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database. The `DBMS_ILM` package supports immediate evaluation or execution of ADO related tasks. The

package supports the following two ways for scheduling ADO actions.

- A database user schedules immediate ADO policy execution on a set of objects.
- A database user views the results of evaluation of ADO policies on a set of objects. The user then adds or deletes objects to this set and reviews the results of ADO policy evaluation again. The user repeats this step to determine the set of objects for ADO execution. The user can then schedule ADO actions for immediate execution on this set of objects.

The following procedures support the two usage modes. Before describing the procedures, we introduce the notion of an ADO task as an entity that helps to track a particular evaluation or (an evaluation and execution) of ADO policies. A particular ADO task could be in one of the following states.

- Inactive
- Active

- Completed

## 82.2 DBMS\_ILM Security Model

The DBMS\_ILM package runs under invoker's rights.

## 82.3 DBMS\_ILM Constants

The table in this topic lists the constants used by the DBMS\_ILM package.

**Table 82-1 DBMS\_ILM Constants**

Constant	Value	Type	Description
ILM_ALL_POLICIES	'ALL POLICIES'	VARCHAR2(20)	Selects all ADO policies on an object
ILM_EXECUTION_OF FLINE	1	NUMBER	Specifies that the object may be offline while ADO action is performed
ILM_EXECUTION_ON LINE	2	NUMBER	Specifies that the object should be online while ADO action is performed
SCOPE_DATABASE	1	NUMBER	Selects all ADO policies in the database
SCOPE_SCHEMA	2	NUMBER	Selects all ADO policies in the current schema
SCHEDULE_IMMEDIA TE	1	NUMBER	Schedules ADO task for immediate execution
ARCHIVE_STATE_AC TIVE	'0'	VARCHAR2(1)	Represents the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table that would make the row active
ARCHIVE_STATE_AR CHIVED	'1'	VARCHAR2(1)	Represents the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table that would make the row inactive

## 82.4 DBMS\_ILM Exceptions

The table in this topic lists the exceptions raised by the DBMS\_ILM package.

**Table 82-2 DBMS\_ILM Exceptions**

Exception	Error Code	Description
INVALID_ARGUMENT_VALUE	38327	Invalid argument value
INVALID_ILM_DICTIONARY	38328	Inconsistent dictionary state
INTERNAL_ILM_ERROR	38329	Internal error
INSUFFICIENT_PRIVILEGES	38330	Insufficient privileges

## 82.5 Summary of DBMS\_ILM Subprograms

This table lists and describes the DBMS\_ILM package subprograms.

**Table 82-3 DBMS\_ILM Package Subprograms**

Subprogram	Description
<a href="#">ADD_TO_ILM Procedure</a>	Adds the object specified through the argument to a particular ADO task and evaluates the ADO policies on this object
<a href="#">ARCHIVESTATENAME Function</a>	Returns the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table
<a href="#">EXECUTE_ILM Procedure</a>	Executes an ADO task.
<a href="#">EXECUTE_ILM_TASK Procedure</a>	Executes an ADO task that has been evaluated previously
<a href="#">PREVIEW_ILM Procedure</a>	Evaluates all ADO policies in the scope specified by means of an argument
<a href="#">REMOVE_FROM_ILM Procedure</a>	Removes the object specified through the argument from a particular ADO task
<a href="#">STOP_ILM Procedure</a>	Stops ADO-related jobs created for a particular ADO task

### 82.5.1 ADD\_TO\_ILM Procedure

This procedure adds the object specified through the argument to a particular ADO task and evaluates the ADO policies on this object.

The procedure can only be executed on an ADO task in an inactive state. The results of the ADO policy evaluation on this object can be viewed using the appropriate views depending on role and access (USER\_ILMTASKS or DBA\_ILMTASKS, USER\_ILMEVALUATIONDETAILS or DBA\_ILMEVALUATIONDETAILS, USER\_ILMRESULTS or DBA\_ILMRESULTS).

#### Syntax

```
DBMS_ILM.ADD_TO_ILM (
  task_id          IN    NUMBER,
  owner            IN    VARCHAR2,
  object_name     IN    VARCHAR2,
  subobject_name  IN    VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 82-4 ADD\_TO\_ILM Procedure Parameters**

Parameter	Description
task_id	Identifies a particular ADO task
owner	Owner of the object
object_name	Name of the object
subobject_name	Name of the subobject (partition name in the case of partitioned tables)

## 82.5.2 ARCHIVESTATENAME Function

This function returns the value of the `ORA_ARCHIVE_STATE` column of a row-archival enabled table.

### Syntax

```
DBMS_ILM.ARCHIVESTATENAME (
    value      IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 82-5** *ARCHIVESTATENAME Function Parameters*

Parameter	Description
value	Value for which the archive state name is to be returned

### Usage Notes

Returns `ARCHIVE_STATE_ACTIVE` for 0, `ARCHIVE_STATE_ARCHIVED` for others

"Using In-Database Archiving" in *Oracle Database VLDB and Partitioning Guide*

## 82.5.3 EXECUTE\_ILM Procedure

This procedure executes an ADO task.

There are two overloads to this procedure. The first overload executes an ADO task for a set of objects without having evaluated them previously. The second overload executes ADO policies for a specific object.

### Syntax

```
DBMS_ILM.EXECUTE_ILM (
    task_id          OUT    NUMBER,
    ilm_scope        IN     NUMBER DEFAULT SCOPE_SCHEMA,
    execution_mode   IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```

```
DBMS_ILM.EXECUTE_ILM (
    owner            IN     VARCHAR2,
    object_name      IN     VARCHAR2,
    task_id          OUT    NUMBER,
    subobject_name   IN     VARCHAR2 DEFAULT NULL,
    policy_name      IN     VARCHAR2 DEFAULT ILM_ALL_POLICIES,
    execution_mode   IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```

## Parameters

**Table 82-6 EXECUTE\_ILM Procedure Parameters**

Parameter	Description
task_id	Identifies a particular ADO task
ilm_scope	Determines the set of objects considered for ADO execution. The default is to consider only the objects in the schema.
execution_mode	Whether the ADO task be executed online (ILM_EXECUTION_ONLINE) or offline (ILM_EXECUTION_OFFLINE)
owner	Owner of the object
object_name	Name of the object
subobject_name	Name of the subobject (partition name in the case of partitioned tables)
policy_name	Name of the ADO policy to be evaluated on the object. The package constant ILM_ALL_POLICIES should be used if all ADO policies on an object should be evaluated.

## Usage Notes

- The EXECUTE\_ILM procedure can be used by users who want more control of when ADO is performed, and who do not want to wait until the next maintenance window.
- The procedure executes like a DDL in that it auto commits before and after the ADO task and related jobs are created.

## 82.5.4 EXECUTE\_ILM\_TASK Procedure

This procedure executes an ADO task that has been evaluated previously and moves it to an active state.

### Syntax

```
DBMS_ILM.EXECUTE_ILM_TASK (
    task_id          IN      NUMBER,
    execution_mode   IN      NUMBER DEFAULT ILM_EXECUTION_ONLINE);
    execution_schedule IN    NUMBER DEFAULT SCHEDULE_IMMEDIATE);
```

## Parameters

**Table 82-7 EXECUTE\_ILM\_TASK Procedure Parameters**

Parameter	Description
task_id	Identifies a particular ADO task
execution_mode	Whether the ADO task be executed online (ILM_EXECUTION_ONLINE) or offline (ILM_EXECUTION_OFFLINE)

**Table 82-7 (Cont.) EXECUTE\_ILM\_TASK Procedure Parameters**

Parameter	Description
execution_schedule	Identifies when the ADO task should be executed. Currently, the only choice available is immediate scheduling of ADO jobs

## 82.5.5 PREVIEW\_ILM Procedure

This procedure evaluates the ADO policies on the objects specified using the `ILM_SCOPE` argument.

It returns a number as `task_id` which identifies a particular ADO task. This can be used to view the results of the policy evaluation in the appropriate views depending on role and access (`USER_ILMTASKS` or `DBA_ILMTASKS`, `USER_ILMEVALUATIONDETAILS` or `DBA_ILMEVALUATIONDETAILS`, `USER_ILMRESULTS` or `DBA_ILMRESULTS`).

The `PREVIEW_ILM` procedure leaves the ADO task in an inactive state. Once you have previewed the results, you can add or delete objects to this task.

### Syntax

```
DBMS_ILM.PREVIEW_ILM (
    task_id          OUT    NUMBER,
    ilm_scope        IN     NUMBER DEFAULT SCOPE_SCHEMA);
```

### Parameters

**Table 82-8 PREVIEW\_ILM Procedure Parameters**

Parameter	Description
task_id	Identifies a particular ADO task
ilm_scope	Identifies the scope of execution. Should be either <code>SCOPE_DATABASE</code> or <code>SCOPE_SCHEMA</code> as described in <a href="#">Constants</a>

## 82.5.6 REMOVE\_FROM\_ILM Procedure

This procedure removes the object specified through the argument from a particular ADO task.

The procedure can only be executed on an ADO task in an inactive state.

### Syntax

```
DBMS_ILM.REMOVE_FROM_ILM (
    task_id          IN     NUMBER,
    owner            IN     VARCHAR2,
    object_name      IN     VARCHAR2,
    subobject_name   IN     VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 82-9** *REMOVE\_FROM\_ILM Procedure Parameters*

Parameter	Description
task_id	Identifies a particular ADO task
owner	Owner of the object
object_name	Name of the object
subobject_name	Name of the subobject (partition name in the case of partitioned tables)

## 82.5.7 STOP\_ILM Procedure

This procedure terminates ILM ADO jobs associated to a particular task Id or job name.

### Syntax

```
DBMS_ILM.STOP_ILM (
    task_id          IN          NUMBER,
    p_drop_running_jobs IN      BOOLEAN DEFAULT FALSE),
    p_jobname        IN          VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 82-10** *STOP\_ILM Procedure Parameters*

Parameter	Description
task_id	Number that uniquely identifies a particular ADO task
p_drop_running_jobs	Determines whether running jobs are dropped
p_jobname	Name of job to be terminated

# DBMS\_ILM\_ADMIN

The `DBMS_ILM_ADMIN` package provides an interface to customize Automatic Data Optimization (ADO) policy execution. In combination with partitioning and compression, ADO policies can be used to help implement an Information Lifecycle Management (ILM) strategy.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_ILM\\_ADMIN Subprograms](#)

## See Also:

- *Oracle Database VLDB and Partitioning Guide* for information about managing Automatic Data Optimization (ADO) with this package
- [DBMS\\_ILM](#)
- [DBMS\\_HEAT\\_MAP](#)

## 83.1 DBMS\_ILM\_ADMIN Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database.

## 83.2 DBMS\_ILM\_ADMIN Security Model

This package runs under definer's rights. The user requires DBA privileges.

## 83.3 DBMS\_ILM\_ADMIN Constants

The table in this topic describes constants used by the `DBMS_ILM_ADMIN` package.

The value column refers to the numeric or character value that the constants resolve to.

**Table 83-1 DBMS\_ILM\_ADMIN Constants**

Constant	Value	Type	Description
ABS_JOBLIMIT	12	NUMBER	Specifies the absolute number of concurrent ILM ADO jobs.
EXECUTION_INTERVAL	1	NUMBER	Determines the frequency with which ADO background evaluation occurs. Specified in minutes.
RETENTION_TIME	2	NUMBER	Controls the amount of time ADO history should be maintained. Specified in days.
EXECUTION_MODE	4	NUMBER	Controls whether ADO execution is online, offline. The value for this parameter should either be DBMS_ILM_ADMIN.ILM_EXECUTION_OFFLINE or DBMS_ILM_ADMIN.ILM_EXECUTION_ONLINE.
JOBLIMIT	5	NUMBER	Controls the upper limit on number of ILM ADO jobs at any time. The maximum number of concurrent ADO jobs is JOBLIMIT*(number of instances)*(number of CPUs per instance).
JOB_SIZELIMIT	13	NUMBER	Specifies the size (in megabytes) of the data that is processed by a single ILM ADO row level compression job.
ENABLED	7	NUMBER	Provides a way to turn background ADO off or on
TBS_PERCENT_USED	8	NUMBER	Decides when a tablespace is considered full. Specified as a percentage of tablespace quota.
TBS_PERCENT_FREE	9	NUMBER	Decides the targeted tablespace storage through ADO actions as a percentage of tablespace quota.
DEG_PARALLEL	10	NUMBER	Decides the degree of parallelism to be used for ADO jobs
POLICY_TIME	11	NUMBER	Decides if ADO policies are treated as though they are specified in seconds rather than days. Can take value ILM_POLICY_IN_SECONDS (treat policy time in seconds) or ILM_POLICY_IN_DAYS (treat policy time in days - default).
HEAT_MAP_SEG_READ	1	NUMBER	Segment read done
HEAT_MAP_SEG_WRITE	2	NUMBER	Segment write done
HEAT_MAP_SEG_SCAN	4	NUMBER	Full table scan done
HEAT_MAP_SEG_LOOKUP	8	NUMBER	Index scan done

The DBMS\_ILM\_ADMIN package uses the constants as parameter values shown in [Table 83-2](#).

**Table 83-2 DBMS\_ILM\_ADMIN Constants Used as Parameter Values**

Constant	Value	Type	Description
ILM_EXECUTION_OFFLINE	1	NUMBER	Specifies that the object may be offline while ADO action is performed.
ILM_EXECUTION_ONLINE	2	NUMBER	Specifies that the object should be online while ADO action is performed
ILM_ENABLED	1	NUMBER	Indicates automatic ADO policy evaluation and execution is enabled
ILM_DISABLED	2	NUMBER	Indicates automatic ADO policy evaluation and execution is disabled
ILM_POLICY_IN_DAYS	0	NUMBER	Indicates policy is specified in days. This is the default.
ILM_POLICY_IN_SECONDS	1	NUMBER	Indicates policy is specified in seconds (rather than days). This could be used to test ADO policy evaluation quickly instead of waiting for the policy duration.

## 83.4 Summary of DBMS\_ILM\_ADMIN Subprograms

This table lists and briefly describes the DBMS\_ILM\_ADMIN package subprograms.

**Table 83-3 DBMS\_ILM\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">CLEAR_HEAT_MAP_ALL Procedure</a>	Deletes all rows except the dummy row
<a href="#">CLEAR_HEAT_MAP_TABLE Procedure</a>	Clears all or some statistics for the heat map table, deleting rows for a given table or segment which match a given pattern, or all such rows
<a href="#">CUSTOMIZE_ILM Procedure</a>	Customizes environment for ILM execution by specifying the values for ILM execution related parameters
<a href="#">DISABLE_ILM Procedure</a>	Turns off all background ILM scheduling
<a href="#">ENABLE_ILM Procedure</a>	Turns on all background ILM scheduling
<a href="#">SET_HEAT_MAP_ALL Procedure</a>	Updates or inserts heat map rows for all tables
<a href="#">SET_HEAT_MAP_START Procedure</a>	Sets the start date for collecting heat map data
<a href="#">SET_HEAT_MAP_TABLE Procedure</a>	Updates or inserts a row for the specified table or segment

## 83.4.1 CLEAR\_HEAT\_MAP\_ALL Procedure

This procedure deletes all rows in HEAT\_MAP\_STAT\$ except the dummy row.

### Syntax

```
DBMS_ILM_ADMIN.CLEAR_HEAT_MAP_ALL;
```

## 83.4.2 CLEAR\_HEAT\_MAP\_TABLE Procedure

This procedure clears all or some statistics for the heat map table, deleting rows for a given table or segment which match a given pattern, or all such rows.

### Syntax

```
DBMS_ILM_ADMIN.CLEAR_HEAT_MAP_TABLE (
  owner          IN VARCHAR2,
  tablename      IN VARCHAR2,
  partition      IN VARCHAR2 default '',
  access_date    IN DATE DEFAULT NULL,
  segment_access_summary IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 83-4** CLEAR\_HEAT\_MAP\_TABLE Procedure Parameters

Parameter	Description
owner	Table owner
tablename	Table name
partition	Name of the subobject, defaults to NULL
access_date	Date for the entry in HEAT_MAP_STAT\$ to be removed
segment_access_summary	Summary of segment access constants indicating access operations performed on the segment

## 83.4.3 CUSTOMIZE\_ILM Procedure

This procedure customizes environment for ILM execution by specifying the values for ILM execution related parameters. These values take effect for the next background scheduling.

### Syntax

```
DBMS_ILM_ADMIN.CUSTOMIZE_ILM (
  parameter      IN NUMBER,
  value          IN NUMBER);
```

## Parameters

**Table 83-5** *CUSTOMIZE\_ILM Procedure Parameters*

Parameter	Description
parameter	One of the parameter constants defined in DBMS_ILM_ADMIN package
value	Value of parameter

### 83.4.4 DISABLE\_ILM Procedure

This procedure turns off all background ILM scheduling.

#### Syntax

```
DBMS_ILM_ADMIN.DISABLE_ILM;
```

### 83.4.5 ENABLE\_ILM Procedure

This procedure turns on all background ILM scheduling.

#### Syntax

```
DBMS_ILM_ADMIN.ENABLE_ILM;
```

### 83.4.6 SET\_HEAT\_MAP\_ALL Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

#### Syntax

```
DBMS_ILM_ADMIN.SET_HEAT_MAP_ALL (
    access_date           IN DATE,
    segment_access_summary IN NUMBER);
```

## Parameters

**Table 83-6** *SET\_HEAT\_MAP\_ALL Procedure Parameters*

Parameter	Description
access_date	Date for the entry in HEAT_MAP_STAT\$ to be added
segment_access_summary	Summary of segment access constants indicating access operations performed on the segment

## 83.4.7 SET\_HEAT\_MAP\_START Procedure

This procedure sets the start date for collecting heat map data.

### Syntax

```
DBMS_ILM_ADMIN.SET_HEAT_MAP_START (
    start_date IN DATE);
```

### Parameters

**Table 83-7** SET\_HEAT\_MAP\_START Procedure Parameters

Parameter	Description
start_date	Indicates the new date from which all statistics are valid

## 83.4.8 SET\_HEAT\_MAP\_TABLE Procedure

This procedure updates or inserts a row for the specified table or segment.

### Syntax

```
DBMS_ILM_ADMIN.SET_HEAT_MAP_TABLE (
    owner          IN VARCHAR2,
    tablename      IN VARCHAR2,
    partition      IN VARCHAR2 DEFAULT '',
    access_date    IN DATE DEFAULT NULL,
    segment_access_summary IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 83-8** SET\_HEAT\_MAP\_TABLE Procedure Parameters

Parameter	Description
owner	Table owner
tablename	Table name
partition	Name of the subobject, defaults to NULL
access_date	Date for the entry in HEAT_MAP_STAT\$ to be added
segment_access_summary	Summary of segment access constants indicating access operations performed on the segment

# DBMS\_INMEMORY

The `DBMS_INMEMORY` package provides an interface for In-Memory Column Store (IM column store) functionality.

This chapter contains the following topics:

- [DBMS\\_INMEMORY Overview](#)
- [DBMS\\_INMEMORY Security Model](#)
- [Summary of DBMS\\_INMEMORY Subprograms](#)

## 84.1 DBMS\_INMEMORY Overview

This package contains procedures for populating and repopulating the IM column store, and for dropping IM expressions from a specified table.

### IM Population and Repopulation

In-Memory population (population) occurs when the database reads existing row-format data from disk, transforms it into columnar format, and then stores it in the IM column store. Only objects with the `INMEMORY` attribute are eligible for population.

Population, which transforms existing data on disk into columnar format, is different from repopulation, which loads new data into the IM column store. Repopulation occurs automatically after their columnar data undergo significant DML activity.

When an object has the `INMEMORY` attribute and a priority other than `NONE`, the database gradually populates the object in the IM column store according to an internal priority queue. Objects with priority of `NONE` are populated only when they undergo a full scan. The `DBMS_INMEMORY.POPULATE` procedure forces immediate population of an object. Similarly, `DBMS_INMEMORY.REPOPULATE` procedure forces immediate repopulation of an object.

#### See Also:

*Oracle Database In-Memory Guide* to learn more about IM population

### IM Expressions

IM expressions populate frequently evaluated query expressions in the IM column store for subsequent reuse. An IM expression is materialized as a hidden virtual column, prefixed with the string `SYS_IME`, and is accessed in the same way as a non-virtual column.

When you use `DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS`, the database adds the 20 hottest expressions to their respective tables as `SYS_IME` columns and applies the default `INMEMORY` column compression clause. If any `SYS_IME` columns that were

added during a previous invocation are no longer in the latest expression list, then the database changes their attribute to `NO INMEMORY`.

The maximum number of `SYS_IME` columns for a table, regardless of whether the attribute is `INMEMORY` or `NO INMEMORY`, is 50. After the 50 expression limit is reached for a table, the database will not add new `SYS_IME` columns. To make space for new expressions, you must manually drop `SYS_IME` columns with the `DBMS_INMEMORY.IME_DROP_EXPRESSIONS` or `DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS` procedures.

#### See Also:

*Oracle Database In-Memory Guide* to learn more about IM expressions

## 84.2 DBMS\_INMEMORY Security Model

The `DBMS_INMEMORY` package subprograms execute with invoker's rights.

The `POPULATE` and `REPOPULATE` procedures require the invoking user to have `SELECT` privileges on the specified object. For `IME_DROP_EXPRESSIONS`, the invoking user must have `ALTER TABLE` privileges on the specified table.

## 84.3 Summary of DBMS\_INMEMORY Subprograms

This table lists and briefly describes the `DBMS_INMEMORY` package subprograms.

**Table 84-1 DBMS\_INMEMORY Package Subprograms**

Subprogram	Description
<a href="#">IME_DROP_EXPRESSIONS Procedure</a>	Drops a specified set of <code>SYS_IME</code> virtual columns from a table
<a href="#">POPULATE Procedure</a>	Forces population of the specified table
<a href="#">REPOPULATE Procedure</a>	Forces repopulation of the specified table
<a href="#">SEGMENT_DEALLOCATE_VERSIONS Procedure</a>	Deallocates non-current IMCUs in the IM column store

### 84.3.1 IME\_DROP\_EXPRESSIONS Procedure

This procedure drops a specified set of `SYS_IME` virtual columns from a table.

#### Syntax

```
DBMS_INMEMORY.IME_DROP_EXPRESSIONS(
  schema_name  IN  VARCHAR2,
  table_name   IN  VARCHAR2,
  column_name  IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 84-2** IME\_DROP\_EXPRESSIONS Procedure Parameters

Parameter	Description
schema_name	The name of the schema that contains the In-Memory table
table_name	The name of the In-Memory table that contains the SYS_IME columns
column_name	The name of the SYS_IME column. By default this value is null, which specifies all SYS_IME columns in this table.

## Usage Notes

Typical reasons for dropping SYS\_IME columns are space and performance. The maximum number of SYS\_IME columns for a table, regardless of whether the attribute is INMEMORY or NO INMEMORY, is 50. After the 50-expression limit is reached for a table, the database will not add new SYS\_IME columns. To make space for new expressions, you must manually drop SYS\_IME columns with the DBMS\_INMEMORY.IME\_DROP\_EXPRESSIONS or DBMS\_INMEMORY\_ADMIN.IME\_DROP\_ALL\_EXPRESSIONS procedures.

To drop a specified SYS\_IME column or all SYS\_IME columns in the requested table, use DBMS\_INMEMORY.IME\_DROP\_EXPRESSIONS . To populate these segments again, either invoke the DBMS\_INMEMORY.POPULATE procedure, or perform a full table scan.

## 84.3.2 POPULATE Procedure

This procedure forces population of the specified table, partition, or subpartition into the IM column store.

### Syntax

```
DBMS_INMEMORY.POPULATE(
  schema_name      IN   VARCHAR2,
  table_name       IN   VARCHAR2,
  subobject_name   IN   VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 84-3** POPULATE Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
subobject_name	Partition or subpartition

### 84.3.3 REPOPULATE Procedure

This procedure forces repopulation of a table, partition, or subpartition that is currently populated in the IM column store.

#### Syntax

```
DBMS_INMEMORY.REPOPULATE(
  schema_name      IN  VARCHAR2,
  table_name       IN  VARCHAR2,
  subobject_name   IN  VARCHAR2 DEFAULT NULL,
  force            IN  BOOLEAN DEFAULT FALSE);
```

#### Parameters

**Table 84-4 REPOPULATE Procedure Parameters**

Parameter	Description
schema_name	Name of the schema that owns the object.
table_name	Name of the table requiring repopulation.
subobject_name	Name of the partition or subpartition. If null, then repopulate the entire table.
force	<p>Whether to repopulate all IMCUs in the segment, just as in initial population.</p> <p>The following values are possible for the <i>force</i> parameter:</p> <ul style="list-style-type: none"> <li><b>FALSE</b> — The database repopulates only IMCUs containing modified rows. This is the default.</li> <li><b>TRUE</b> — The database drops the segment, and then rebuilds it. The database increments the statistics and performs all other tasks related to initial population.</li> </ul> <p>For example, IMCU 1 contains rows 1 to 500,000, and IMCU 2 contains rows 500,001 to 1,000,000. A statement modifies row 600,000. When <i>force</i> is <b>FALSE</b>, the database only repopulates IMCU 2. When <i>force</i> is <b>TRUE</b>, the database repopulates both IMCUs.</p> <p>Consider further that the <code>INMEMORY_VIRTUAL_COLUMNS</code> initialization parameter is set to <code>ENABLE</code>, and an application creates a new virtual column. When <i>force</i> is <b>FALSE</b>, the database only repopulates IMCU 2 with the new column. When <i>force</i> is <b>TRUE</b>, the database repopulates both IMCUs with the new column.</p>

### 84.3.4 SEGMENT\_DEALLOCATE\_VERSIONS Procedure

This procedure deallocates non-current IMCUs in the IM column store.

#### Syntax

```
DBMS_INMEMORY.SEGMENT_DEALLOCATE_VERSIONS(
  SCHEMA_NAME      IN  VARCHAR2,
  TABLE_NAME      IN  VARCHAR2,
```

```
PARTITION_NAME IN VARCHAR2 DEFAULT NULL,
SPCPRESSURE   IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 84-5 SEGMENT\_DEALLOCATE\_VERSIONS Procedure Parameters**

Parameter	Description
schema_name	Name of the schema that owns the object.
table_name	Name of the table requiring repopulation.
partition_name	Name of the partition or subpartition. If null, then repopulate the entire table.
sppressure	Whether to force deallocation of non-current IMCUs ( <code>TRUE</code> ), or wait for the database to deallocate them automatically. By default, the database deallocates non-current IMCUs every two minutes.

## Usage Notes

During repopulation, the IM column store maintains both the current IMCU and non-current IMCU. This mechanism, which is called *double buffering*, ensures that queries do not decrease performance because an IMCU is unavailable during repopulation. After repopulation completes, the IM column store retains the non-current IMCU for a short time (2 minutes by default) to optimize queries with older SCNs. Typically, the default behavior is sufficient. However, you can force deallocation of non-current IMCUs by using the `SEGMENT_DEALLOCATE_VERSIONS` procedure.

## Example

The following program forces deallocation of non-current IMCUs for the `products` table:

```
BEGIN
  DBMS_INMEMORY.SEGMENT_DEALLOCATE_VERSIONS(
    schema_name => 'SH'
  , table_name  => 'PRODUCTS'
  , sppressure => TRUE );
END;
```

### See Also:

*Oracle Database In-Memory Guide* to learn more about double buffering in the IM column store

# DBMS\_INMEMORY\_ADMIN

DBMS\_INMEMORY\_ADMIN provides interfaces for managing an In-Memory FastStart (IM FastStart) area and In-Memory Expressions (IM expressions).

This chapter contains the following topics:

- [DBMS\\_INMEMORY\\_ADMIN Overview](#)
- [DBMS\\_INMEMORY\\_ADMIN Security Model](#)
- [DBMS\\_INMEMORY\\_ADMIN Operational Notes](#)
- [Summary of DBMS\\_INMEMORY\\_ADMIN Subprograms](#)

 **See Also:**

*Oracle Database In-Memory Guide* to learn more about Oracle Database In-Memory features

## 85.1 DBMS\_INMEMORY\_ADMIN Overview

This package provides interfaces for managing In-Memory Expressions (IM expressions) and the In-Memory FastStart (IM FastStart) area.

### IM Expressions

Analytic queries often contain complex expressions or calculations that consume significant CPU and memory during execution. Use `IME_CAPTURE_EXPRESSIONS` to identify these frequently used (“hot”) expressions and `IME_POPULATE_EXPRESSIONS` to populate them in the IM column store. By using IM expressions, the database avoids repeated computations and improves performance.

The database represents IM expressions as system-generated virtual columns. The name of an IM virtual column begins with `SYS_IME`. You can also use `DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS` and `DBMS_INMEMORY.IME_DROP_EXPRESSIONS` to remove existing `SYS_IME` columns.

The `DBA_IM_EXPRESSIONS` view shows the `SYS_IME` columns that have the `INMEMORY` attribute. After using the `IME_CAPTURE_EXPRESSIONS` procedure, you can query this view to see the hot expressions added to different tables in the database.

 **See Also:**

*Oracle Database In-Memory Guide* to learn more about IM expressions

### IM FastStart Area

The IM FastStart area stores data that optimizes the population of the IM column store when the database restarts. Because the database reads columnar data directly from persistent storage without needing to compress or format it, population is faster when a database instance restarts.

When you enable IM FastStart for the IM column store, you must specify an ASSM tablespace for the IM FastStart area. The tablespace stores the data in a SecureFiles LOB named `SYSDBIMFS_LOGSEG$`. The `SYSAUX` tablespace stores the metadata. When data is populated or repopulated in the IM column store, the database automatically writes the data to the IM FastStart area. You cannot manually force a write. If you specify an object as `NO INMEMORY`, then the database removes it from the IM FastStart area.

When the IM FastStart area is under space pressure, the database automatically drops the oldest 15% of segments and continues saving columnar data. If space is unavailable, then the database stops writing to the IM FastStart area.

#### See Also:

*Oracle Database In-Memory Guide* to learn more about IM expressions

### Automatic In-Memory

Automatic In-Memory uses access tracking, column statistics, and other relevant statistics to manage objects in the IM column store. If the IM column store is full, and if other more frequently accessed segments would benefit from population in the IM column store, then the IM column store evicts inactive segments. If the IM column store is configured to hold all `INMEMORY` segments, however, then Automatic In-Memory takes no action.

By default, Automatic In-Memory checks usage statistics for the past 31 days. You can change the current setting by supplying the `AIM_STATWINDOW_DAYS` parameter to `DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER`.

#### See Also:

*Oracle Database In-Memory Guide* to learn more about Automatic In-Memory

## 85.2 DBMS\_INMEMORY\_ADMIN Security Model

This package requires administrator privileges. Package subprograms execute with invoker's rights.

## 85.3 DBMS\_INMEMORY\_ADMIN Operational Notes

It is possible for a DBMS\_INMEMORY\_ADMIN FastStart operation to fail or be interrupted.

In a failure or interruption scenario, the following rules determine which subprograms you can use:

- If FASTSTART\_ENABLE does not succeed, then the only permitted operation is re-executing FASTSTART\_ENABLE.
- If FASTSTART\_MIGRATE\_STORAGE does not succeed, then the only permitted operation is re-executing FASTSTART\_MIGRATE\_STORAGE.
- If FASTSTART\_DISABLE does not succeed, then all DBMS\_INMEMORY\_ADMIN operations are permitted.

## 85.4 Summary of DBMS\_INMEMORY\_ADMIN Subprograms

This table lists the DBMS\_INMEMORY\_ADMIN subprograms and briefly describes them.

**Table 85-1 DBMS\_INMEMORY\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">AIM_GET_PARAMETER Procedure</a>	This procedure obtains the current values for parameters that control Automatic In-Memory.
<a href="#">AIM_SET_PARAMETER Procedure</a>	The procedure customizes the execution environment of Automatic In-Memory
<a href="#">FASTSTART_DISABLE Procedure</a>	This procedure disables the In-Memory FastStart (IM FastStart) feature.
<a href="#">FASTSTART_ENABLE Procedure</a>	This procedure enables IM FastStart and assigns a tablespace.
<a href="#">FASTSTART_MIGRATE_STORAGE Procedure</a>	This procedure moves all IM FastStart data and metadata from the existing tablespace to the specified new tablespace.
<a href="#">GET_FASTSTART_TABLESPACE Function</a>	This function returns the name of the tablespace that is currently designated for IM FastStart.
<a href="#">IME_CAPTURE_EXPRESSIONS Procedure</a>	This procedure captures the 20 most frequently accessed (“hottest”) expressions in the database in the specified time interval.
<a href="#">IME_CLOSE_CAPTURE_WINDOW Procedure</a>	This procedure signals the end of the current expression capture window.
<a href="#">IME_DROP_ALL_EXPRESSIONS Procedure</a>	This procedure drops all SYS_IME expression virtual columns in the database.
<a href="#">IME_GET_CAPTURE_STATE Procedure</a>	This procedure returns the current capture state of the expression capture window and the timestamp of the most recent modification.
<a href="#">IME_OPEN_CAPTURE_WINDOW Procedure</a>	This procedure signals the beginning of an expression capture window.

**Table 85-1 (Cont.) DBMS\_INMEMORY\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">IME_POPULATE_EXPRESSIONS Procedure</a>	This procedure forces the population of expressions captured in the latest invocation of DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS.

## 85.4.1 AIM\_GET\_PARAMETER Procedure

This procedure obtains the current values for parameters that control Automatic In-Memory.

### Syntax

```
DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(
    parameter IN NUMBER,
    value     OUT NUMBER);
```

### Parameters

Parameter	Description
parameter	Specifies a predefined constant that controls Automatic In-Memory. The only valid constant is AIM_STATWINDOW_DAYS, which specifies the number of days in the sliding statistics window. Automatic In-Memory uses this duration to filter statistics for INMEMORY objects as part of its algorithms. For example, if the duration is set to 7 days, then Automatic In-Memory considers only statistics of the past 7 days for its algorithms. The default is 31.
value	Specifies the value assigned to AIM_STATWINDOW_DAYS.

### Example 85-1 Getting the Number of Days in the Statistics Window

The following code prints the number of days in the statistics window to the screen:

```
VARIABLE b_statwin NUMBER

BEGIN

DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DAYS, :b_statwin);
END;
/

PRINT b_statwin
```

Sample output appears below:

```
B_STATWIN
-----
          14
```

**See Also:**

*Oracle Database In-Memory Guide* to learn how to use AIM\_GET\_PARAMETER

## 85.4.2 AIM\_SET\_PARAMETER Procedure

The procedure customizes the execution environment of Automatic In-Memory.

### Syntax

```
DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER(
  parameter IN NUMBER,
  value     IN NUMBER);
```

### Parameters

Parameter	Description
parameter	Specifies a predefined constant that controls Automatic In-Memory. The only valid constant is AIM_STATWINDOW_DAYS, which specifies the number of days in the sliding statistics window. The default is 31.
value	Assigns the value assigned to AIM_STATWINDOW_DAYS.

### Example 85-2 Setting the Number of Days in the Statistics Window

The following example gets the current number of days in the window, sets it to 14, and then prints the value to the screen:

```
VARIABLE b_statwin NUMBER

BEGIN

DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DA
YS, :b_statwin);
END;
/

PRINT b_statwin

BEGIN

DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DA
YS, 14);
END;
```

```
/
BEGIN

DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DAYS, :b_statwin);
END;
/

PRINT b_statwin
```

Sample output appears below:

```
B_STATWIN
-----
          31

B_STATWIN
-----
          14
```

#### See Also:

*Oracle Database In-Memory Guide* to learn how to use AIM\_GET\_PARAMETER

## 85.4.3 FASTSTART\_DISABLE Procedure

This procedure disables the In-Memory FastStart (IM FastStart) feature.

### Syntax

```
DBMS_INMEMORY_ADMIN.FASTSTART_DISABLE( );
```

### Security Model

Administrator privileges are required to execute this procedure.

### Usage Notes

When you execute the procedure, the database executes the following actions:

1. Waits until all IM FastStart operations complete
2. Disables the IM FastStart feature, and performs the following operations:
  - Cleans the IM FastStart area
  - Deletes IM FastStart metadata stored in the `SYSAUX` tablespace
  - Releases the IM FastStart tablespace (but does not delete it)

This procedure does not interrupt or affect any concurrent IM column store operations.

## Examples

The following PL/SQL program disables the IM FastStart feature:

```
EXEC DBMS_INMEMORY_ADMIN.FASTSTART_DISABLE;
```

The following query shows that the LOB for the IM FastStart tablespace has been deleted (sample output included):

```
COL OWNER FORMAT a5
COL SEGMENT_NAME FORMAT a20
SELECT  l.OWNER, l.SEGMENT_NAME, SUM(s.BYTES)/1024/1024 MB
FROM    DBA_LOBS l, DBA_SEGMENTS s
WHERE   l.SEGMENT_NAME = s.SEGMENT_NAME
AND     l.TABLESPACE_NAME = 'FS_TBS'
GROUP BY l.OWNER, l.SEGMENT_NAME;

no rows selected
```

## 85.4.4 FASTSTART\_ENABLE Procedure

This procedure enables In-Memory FastStart (IM FastStart), and designates a tablespace for the IM FastStart (FastStart) area.

### Syntax

```
DBMS_INMEMORY_ADMIN.FASTSTART_ENABLE(
    tbs_name    IN    VARCHAR2,
    nologging  IN    BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 85-2 FASTSTART\_ENABLE Procedure Parameters**

Parameter	Description
tbs_name	The name of the ASSM tablespace for the FastStart area.
nologging	The logging mode of the LOB created for the FastStart area. If the nologging parameter is set to FALSE, then the database creates the FastStart LOB with the LOGGING option. If set to TRUE (default), then the database creates the LOB with the NOLOGGING option.

### Security Model

Administrator privileges are required to execute this procedure.

### Usage Notes

To enable IM FastStart, the ASSM tablespace specified in FASTSTART\_ENABLE must exist, and the SYSAUX tablespace must be online. Only one FastStart tablespace can exist for every PDB or non-CDB. The specified tablespace must have enough space to store data for the IM column store, and it must not contain any other data before it is

designated for the FastStart area. Oracle recommends sizing the tablespace at least twice of the size of the `INMEMORY_SIZE` initialization parameter.

The database does not create the FastStart area on disk until the IM column store is populated. After population, the data periodically saves the columnar data (but not metadata such as the transaction journal) to the FastStart area, which is represented on disk as the `SYSDBIMFS_LOBSEG$` segment. The database stores the FastStart metadata in the `SYSAUX` tablespace. In an Oracle Real Application Clusters (Oracle RAC) environment, IM FastStart data is shared across all nodes.

#### Note:

IM FastStart is not supported in a standby database instance.

Whereas the initial loading of IMCUs into memory is expensive and CPU-bound, an IM FastStart tablespace requires intermittent I/O. The database periodically writes columnar data to the IM FastStart area. If a database instance must restart, then Oracle Database reads the columnar data directly from the IM FastStart area rather than reconstructing the IMCUs from scratch. No compression or formatting of the columnar data is required.

### Examples

This example creates `fs_tbs` as an ASSM tablespace, and then uses `FASTSTART_ENABLE` to specify this tablespace as the IM FastStart area:

```
CREATE TABLESPACE fs_tbs
  DATAFILE 'fs_tbs.dbf' SIZE 500M
  EXTENT MANAGEMENT LOCAL
  SEGMENT SPACE MANAGEMENT AUTO;

EXEC DBMS_INMEMORY_ADMIN.FASTSTART_ENABLE('fs_tbs');
```

The following query shows that the IM FastStart LOB was created (sample output included):

```
COL OWNER FORMAT a5
COL SEGMENT_NAME FORMAT a20
SELECT  l.OWNER, l.SEGMENT_NAME, SUM(s.BYTES)/1024/1024 MB
FROM    DBA_LOBS l, DBA_SEGMENTS s
WHERE   l.SEGMENT_NAME = s.SEGMENT_NAME
AND     l.TABLESPACE_NAME = 'FS_TBS'
GROUP BY l.OWNER, l.SEGMENT_NAME;
```

OWNER	SEGMENT_NAME	MB
SYS	SYSDBIMFS_LOBSEG\$	.125

## 85.4.5 FASTSTART\_MIGRATE\_STORAGE Procedure

This procedure moves the In-Memory FastStart (IM FastStart) data and catalogs from the current tablespace to a new tablespace.

### Syntax

```
DBMS_INMEMORY_ADMIN.FASTSTART_MIGRATE_STORAGE (
    tbs_name    IN    VARCHAR2 );
```

### Parameters

**Table 85-3 FASTSTART\_MIGRATE\_STORAGE Procedure Parameters**

Parameter	Description
tbs_name	The name of the new ASSM tablespace for the IM FastStart area.

### Security Model

DBA privileges are required to execute this procedure.

### Usage Notes

When you execute the procedure, the database executes the following actions:

1. Waits until all IM FastStart operations complete
2. Disables the IM FastStart feature
3. Copies IM FastStart data and metadata to the new tablespace, leaving the old tablespace intact
4. Re-enables IM FastStart the feature

### Examples

The following program obtains the name of the IM FastStart tablespace, if one exists, and prints the result (sample output included):

```
VARIABLE b_fstbs VARCHAR2(20)
BEGIN
    :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----
FS_TBS
```

The following statements create a new tablespace named `fs_tbs2`, and then migrate the IM FastStart area to this tablespace:

```
CREATE TABLESPACE fs_tbs2
  DATAFILE 'fs_tbs2.dbf' SIZE 500M
  EXTENT MANAGEMENT LOCAL
  SEGMENT SPACE MANAGEMENT AUTO;

EXEC DBMS_INMEMORY_ADMIN.FASTSTART_MIGRATE_STORAGE('fs_tbs2');
```

The following program prints the name of the current IM FastStart tablespace (sample output included):

```
BEGIN
  :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----
FS_TBS2
```

## 85.4.6 GET\_FASTSTART\_TABLESPACE Function

This function returns the tablespace assigned to In-Memory FastStart (IM FastStart). If the feature is disabled, then the function returns `NOT ENABLED`.

### Syntax

```
DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE();
```

### Security Model

DBA privileges are required to execute this function.

### Examples

This program obtains the name of the IM FastStart tablespace, if one exists, and prints the result:

```
VARIABLE b_fstbs VARCHAR2(20)
BEGIN
  :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----
NOT ENABLED
```

## 85.4.7 IME\_CAPTURE\_EXPRESSIONS Procedure

This procedure captures the 20 most frequently accessed (“hottest”) expressions in the database in the specified time interval.

### Syntax

```
DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS(
    snapshot    IN    VARCHAR2);
```

### Parameters

**Table 85-4 IME\_CAPTURE\_EXPRESSIONS Procedure Parameters**

Parameter	Description
snapshot	<p>Specifies a snapshot that defines the time interval in which expression statistics are considered.</p> <p>You can specify any of the following values:</p> <ul style="list-style-type: none"> <li> <b>CUMULATIVE</b>                      The database considers all expression statistics since the creation of the database.                 </li> <li> <b>CURRENT</b>                      The database considers only expression statistics from the past 24 hours.                 </li> <li> <b>WINDOW</b>                      The database considers statistics for expressions tracked in the most recent expression capture window.                      The database adds hidden virtual columns for expressions tracked in the most recent window. If the capture window is currently open, then the database considers all expressions tracked in the current window up until this point, and then materializes the hottest expressions. To list the expressions that have been tracked in the current window, query <code>DBA_EXPRESSION_STATISTICS</code> with <code>SNAPSHOT= 'WINDOW'</code>.                 </li> </ul>

### Usage Notes

When you invoke this procedure, the database queries the Expression Statistics Store (ESS), and considers only expressions on tables that are at least partially populated in the IM column store. The database adds the 20 hottest expressions to their respective tables as hidden virtual columns, prefixed with the string `SYS_IME`, and applies the default `INMEMORY` column compression clause. If any `SYS_IME` columns added during a previous invocation are no longer in the latest top 20 list, then the database marks them as `NO INMEMORY`.

#### Note:

Executing the `IME_CAPTURE_EXPRESSIONS` procedure on a standby database has no effect.

The maximum number of SYS\_IME columns for a table, regardless of whether the attribute is INMEMORY or NO INMEMORY, is 50. After the limit is reached for a table, the database will not add new SYS\_IME columns. To make space for new expressions, you must manually drop SYS\_IME columns with the [IME\\_DROP\\_ALL\\_EXPRESSIONS Procedure](#) or [IME\\_DROP\\_EXPRESSIONS Procedure](#).

The 50-expression limit for each table, which includes both INMEMORY and NO INMEMORY expressions, is different from the 20-expression limit for the database, which includes only INMEMORY expressions. For example, if 20 tables are populated in the IM column store, then each table might each have 1 SYS\_IME column with the INMEMORY attribute, and 49 SYS\_IME columns with the NO INMEMORY attribute.

IM expressions and virtual columns are stored in In-Memory structured called In-Memory Expression Units (IMEUs). Every IMEU is linked to a parent In-Memory Compression Unit (IMCU) from which it inherits compression characteristics.

ESS information is stored in the data dictionary and exposed in the DBA\_EXPRESSION\_STATISTICS view. This view shows the metadata that the optimizer has collected in the ESS. IM expressions are exposed as system-generated virtual columns, prefixed by the string SYS\_IME, in the DBA\_IM\_EXPRESSIONS view.

### Example 85-3 Capturing Expressions in a User-Defined Window

This example demonstrates use of the WINDOW capture mode. Your goal is to open and close an expression capture window, and then capture all expressions that the database tracked during this window. You perform the following steps:

1. Open an expression capture window, generate expressions, and then close the window:

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
-- Generate expressions for the database to track
EXEC DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
```

2. Query DBA\_EXPRESSION\_STATISTICS (sample output included):

```
COL OWNER FORMAT A6
COL TABLE_NAME FORMAT A9
COL COUNT FORMAT 99999
COL CREATED FORMAT A10
COL EXPRESSION_TEXT FORMAT A29

SELECT OWNER, TABLE_NAME, EVALUATION_COUNT AS COUNT,
       CREATED, EXPRESSION_TEXT
FROM   DBA_EXPRESSION_STATISTICS
WHERE  SNAPSHOT = 'WINDOW'
AND    OWNER = 'SH';
```

OWNER	TABLE_NAM	COUNT	CREATED	EXPRESSION_TEXT
SH	SALES	4702	09-OCT-17	"QUANTITY_SOLD"
SH	SALES	4702	09-OCT-17	"QUANTITY_SOLD" * "AMOUNT_SOLD"
SH	SALES	4702	09-OCT-17	"PROD_ID"
SH	SALES	4702	09-OCT-17	"CUST_ID"
SH	SALES	4702	09-OCT-17	"CHANNEL_ID"
SH	SALES	4702	09-OCT-17	"AMOUNT_SOLD"

The preceding query shows both the columns tracked in the ESS and the expressions captured during the window for queries in the `sh` schema. During the most recent window, the database captured one expression:  
`QUANTITY_SOLD*AMOUNT_SOLD`.

3. Use `IME_CAPTURE_EXPRESSIONS` to make the database consider all expressions in the current window for materialization:

```
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('WINDOW');
```

4. Query `DBA_IM_EXPRESSIONS` (sample output included):

```
COL OWNER FORMAT a6
COL TABLE_NAME FORMAT a9
COL COLUMN_NAME FORMAT a25
SET LONG 50
SET LINESIZE 150

SELECT OWNER, TABLE_NAME, COLUMN_NAME, SQL_EXPRESSION
FROM   DBA_IM_EXPRESSIONS;

OWNER  TABLE_NAM COLUMN_NAME          SQL_EXPRESSION
-----
SH     SALES      SYS_IME000100000025201B  "QUANTITY_SOLD" * "AMOUNT_SOLD"
```

The preceding output shows all virtual columns that were added to the table and marked `INMEMORY` as part of the latest `IME_CAPTURE_EXPRESSIONS` invocation. The database gradually populates the captured expressions into the IM column store when it repopulates different IMCUs of the table.

5. Execute the following procedure to explicitly force a population of all captured IM expressions:

```
EXEC DBMS_INMEMORY_ADMIN.IME_POPULATE_EXPRESSIONS();
```

Note that you can populate IM expressions from a specific table by executing the `DBMS_INMEMORY.REPOPULATE` procedure with the `force` parameter set to `TRUE`.

#### Example 85-4 Capturing Expressions for the Past Day

The following program captures expressions tracked during the last 24 hours:

```
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('CURRENT');
```

## 85.4.8 IME\_CLOSE\_CAPTURE\_WINDOW Procedure

This procedure signals the end of the current expression capture window.

### Syntax

```
DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
```

### Usage Notes

On invocation of this procedure, the optimizer saves all gathered statistics to disk, and essentially freezes the expressions tracked in the window. The database preserves the statistics captured in this window until a new expression capture window is opened, at which point the database purges the statistics captured in the previous window.

### Example 85-5 Example

This example opens an expression capture window, and then issues `IME_CAPTURE_EXPRESSIONS('WINDOW')` so that the database considers all expressions in the current window for materialization. Finally, the example closes the window.

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();  
-- Generate expressions so that the database can track them  
EXEC DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();  
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('WINDOW');
```

## 85.4.9 IME\_DROP\_ALL\_EXPRESSIONS Procedure

This procedure drops all `SYS_IME` expression virtual columns in the database.

### Syntax

```
DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS();
```

### Usage Notes

The `IME_DROP_ALL_EXPRESSIONS` procedure drops all `SYS_IME` columns from all tables, regardless of whether they have the `INMEMORY` attribute. In effect, the procedure acts as a database-wide reset button.

Using `IME_DROP_ALL_EXPRESSIONS` triggers a drop of all `IMEUs` and `IMCUs` for segments that have `SYS_IME` columns. For example, if 50 populated tables have one `SYS_IME` column each, then `IME_DROP_ALL_EXPRESSIONS` removes all 50 tables from the IM column store. To populate these segments again, you must use the `DBMS_INMEMORY.POPULATE` procedure or perform a full table scan.

## 85.4.10 IME\_GET\_CAPTURE\_STATE Procedure

This procedure returns the current capture state of the expression capture window and the timestamp of the most recent modification.

### Syntax

```
DBMS_INMEMORY_ADMIN.IME_GET_CAPTURE_STATE(  
    p_capture_state OUT VARCHAR2,  
    p_last_modified OUT TIMESTAMP);
```

### Parameters

Parameter	Description
p_capture_state	Describes the current state of the expression capture window. The following states are possible: <ul style="list-style-type: none"> <li>• OPEN — Indicates that the window is open.</li> <li>• CLOSED — Indicates that the window is closed.</li> <li>• DEFAULT — Indicates that the window has not been used. It is equivalent to the CLOSED state.</li> </ul>
p_last_modified	Indicates the timestamp of the most recent action.

### Usage Notes

This procedure is useful for avoiding conflicting calls for [IME\\_OPEN\\_CAPTURE\\_WINDOW Procedure](#) and [IME\\_CLOSE\\_CAPTURE\\_WINDOW Procedure](#). For example, if the current expression capture window state is OPEN, then you cannot open another window, and if the window state is CLOSED, then you cannot close a window.

#### Example 85-6 Determining the State of an Expression Capture Window

This example opens an expression capture window, and then determines its capture state.

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW( );

VARIABLE b_state VARCHAR2(25)
VARIABLE b_time  VARCHAR2(10)
EXECUTE DBMS_INMEMORY_ADMIN.IME_GET_CAPTURE_STATE(:b_state, :b_time)
PRINT b_state b_time
```

The following sample output indicates that an expression capture window is currently open:

```
B_STATE
-----
OPEN

B_TIME
-----
09-OCT-17
```

## 85.4.11 IME\_OPEN\_CAPTURE\_WINDOW Procedure

This procedure signals the beginning of an expression capture window.

### Syntax

```
DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW( );
```

### Security Model

Administrator privileges are required to execute this procedure.

### Usage Notes

On invocation of this procedure, the optimizer begins a new window snapshot and starts tracking expressions that occur within this window. An expression capture window is global across all instances in an Oracle RAC database.

Conflicting actions are not permitted. For example, in an Oracle RAC database, opening expression capture window on instance 1 at time t0 and attempting to open another expression capture window on instance 2 at time t1 before closing the first window is a conflicting action. To obtain the current capture state and reduce the potential for conflicting procedure invocations, use the [IME\\_GET\\_CAPTURE\\_STATE Procedure](#).

### Example

This following program opens an expression capture window:

```
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW( );
```

## 85.4.12 IME\_POPULATE\_EXPRESSIONS Procedure

This procedure forces the population of expressions captured in the latest invocation of DBMS\_INMEMORY\_ADMIN.IME\_CAPTURE\_EXPRESSIONS.

### Syntax

```
DBMS_INMEMORY_ADMIN.IME_POPULATE_EXPRESSIONS( );
```

### Usage Notes

If you do not invoke this procedure, then the database gradually repopulates SYS\_IME columns when their parent IMCUs are repopulated. If a table is not repopulated, then any new SYS\_IME columns captured by the IME\_CAPTURE\_EXPRESSIONS procedure are not populated. IME\_POPULATE\_EXPRESSIONS solves this problem by forcing population.

Internally, the procedure invokes DBMS\_INMEMORY.REPOPULATE for all tables that have SYS\_IME columns with the INMEMORY attribute. To populate SYS\_IME columns in a specified subset of tables, use DBMS\_INMEMORY.REPOPULATE instead of IME\_POPULATE\_EXPRESSIONS.

# DBMS\_IOT

The `DBMS_IOT` package creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command. `DBMS_IOT` can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the `enable_constraint` operation.

`DBMS_IOT` is not loaded during database installation. To install `DBMS_IOT`, run `dbmsiotc.sql`, available in the `ADMIN` directory.

This chapter contains the following topics:

- [Summary of DBMS\\_IOT Subprograms](#)

## Note:

With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

## 86.1 Summary of DBMS\_IOT Subprograms

This table lists and briefly describes the `DBMS_IOT` subprograms.

**Table 86-1** *DBMS\_IOT Package Subprograms*

Subprogram	Description
<a href="#">BUILD_CHAIN_ROWS_TABLE Procedure</a>	Creates a table into which references to the chained rows for an index-organized table can be placed using the <code>ANALYZE</code> command
<a href="#">BUILD_EXCEPTIONS_TABLE Procedure</a>	Creates an exception table into which rows of an index-organized table that violate a constraint can be placed

### 86.1.1 BUILD\_CHAIN\_ROWS\_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command.

#### Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

## Parameters

**Table 86-2 BUILD\_CHAIN\_ROWS\_TABLE Procedure Parameters**

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
chainrow_table_name	Intended name for the chained-rows table.

## Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

## Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS','L','LC');
```

A chained-row table is created with the following columns:

Column Name	Null?	Type
OWNER_NAME		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CLUSTER_NAME		VARCHAR2(30)
PARTITION_NAME		VARCHAR2(30)
SUBPARTITION_NAME		VARCHAR2(30)
HEAD_ROWID		ROWID
TIMESTAMP		DATE
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

## 86.1.2 BUILD\_EXCEPTIONS\_TABLE Procedure

This procedure creates an exception table.

Rows of an index-organized table that violate a constraint can be placed into this table during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

## Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

## Parameters

**Table 86-3 BUILD\_EXCEPTIONS\_TABLE Procedure Parameters**

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
exceptions_table_name	Intended name for exception-table.

## Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

## Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS', 'L', 'LE');
```

An exception table for the preceding index-organized table with the following columns:

Column Name	Null?	Type
ROW_ID		VARCHAR2(30)
OWNER		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CONSTRAINT		VARCHAR2(30)
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

## DBMS\_JAVA

The DBMS\_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

For a complete description of this package within the context of DBMS\_JAVA, see DBMS\_JAVA in the *Oracle Database Java Developer's Guide*.

# DBMS\_JOB

The `DBMS_JOB` package schedules and manages jobs in the job queue.

 **Note:**

The `DBMS_JOB` package has been superseded by the `DBMS_SCHEDULER` package, and support for `DBMS_JOB` might be removed in future releases of Oracle Database. In particular, if you are administering jobs to manage system load, you are encouraged to disable `DBMS_JOB` by revoking the package execution privilege for users.

For more information, see [DBMS\\_SCHEDULER](#) and "Moving from `DBMS_JOB` to `DBMS_SCHEDULER`" in the *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_JOB Subprograms](#)

## 88.1 DBMS\_JOB Security Model

No specific system privileges are required to use `DBMS_JOB`. No system privileges are available to manage `DBMS_JOB`. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted `EXECUTE`. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

## 88.2 DBMS\_JOB Operational Notes

These notes describe stopping a job, and working with Oracle Real Application Clusters.

### Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.

## Working with Oracle Real Application Clusters

DBMS\_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the [DBMS\\_SCHEDULER](#) package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

- DBMS\_JOB.SUBMIT
- DBMS\_JOB.INSTANCE
- DBMS\_JOB.CHANGE
- DBMS\_JOB.RUN

### DBMS\_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(  
  job      OUT      BINARY_INTEGER,  
  what     IN       VARCHAR2,  
  next_date IN      DATE DEFAULT SYSDATE,  
  interval IN      VARCHAR2 DEFAULT 'NULL',  
  no_parse IN      BOOLEAN DEFAULT FALSE,  
  instance IN      BINARY_INTEGER DEFAULT ANY_INSTANCE,  
  force    IN      BOOLEAN DEFAULT FALSE);
```

Use the parameters `instance` and `force` to control job and instance affinity. The default value of `instance` is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the `instance` value. Oracle displays error ORA-23319 if the `instance` value is a negative number or NULL.

The `force` parameter defaults to `false`. If `force` is `TRUE`, any positive integer is acceptable as the job instance. If `force` is `FALSE`, the specified instance must be running, or Oracle displays error number ORA-23428.

### DBMS\_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE(  JOB IN BINARY_INTEGER,  
  instance          IN BINARY_INTEGER,  
  force             IN BOOLEAN DEFAULT FALSE);
```

The `FORCE` parameter in this example defaults to `FALSE`. If the `instance` value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of `force`. If the `INSTANCE` value is positive and the `FORCE` parameter is `FALSE`, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the `force` parameter is `TRUE`, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the `instance` value is negative or NULL.

## DBMS\_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE( JOB IN BINARY_INTEGER,
  what           IN VARCHAR2 DEFAULT NULL,
  next_date      IN DATE DEFAULT NULL,
  interval       IN VARCHAR2 DEFAULT NULL,
  instance       IN BINARY_INTEGER DEFAULT NULL,
  force          IN BOOLEAN DEFAULT FALSE );
```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is null indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the `instance` number is negative.

## DBMS\_JOB.RUN

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If `force` is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if `force` is `FALSE` and the connected instance is the incorrect instance.

```
DBMS_JOB.RUN(
  job    IN BINARY_INTEGER,
  force  IN BOOLEAN DEFAULT FALSE);
```

# 88.3 Summary of DBMS\_JOB Subprograms

This table lists the `DBMS_JOB` subprograms and briefly describes them.

**Table 88-1 DBMS\_JOB Package Subprograms**

Subprogram	Description
<a href="#">BROKEN Procedure</a>	Disables job execution
<a href="#">CHANGE Procedure</a>	Alters any of the user-definable parameters associated with a job
<a href="#">INSTANCE Procedure</a>	Assigns a job to be run by a instance
<a href="#">INTERVAL Procedure</a>	Alters the interval between executions for a specified job
<a href="#">NEXT_DATE Procedure</a>	Alters the next execution time for a specified job
<a href="#">REMOVE Procedure</a>	Removes specified job from the job queue
<a href="#">RUN Procedure</a>	Forces a specified job to run
<a href="#">SUBMIT Procedure</a>	Submits a new job to the job queue
<a href="#">USER_EXPORT Procedures</a>	Re-creates a given job for export, or re-creates a given job for export with instance affinity
<a href="#">WHAT Procedure</a>	Alters the job description for a specified job

## 88.3.1 BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

### Syntax

```
DBMS_JOB.BROKEN (  
  job      IN  BINARY_INTEGER,  
  broken   IN  BOOLEAN,  
  next_date IN DATE DEFAULT SYSDATE);
```

### Parameters

**Table 88-2 BROKEN Procedure Parameters**

Parameter	Description
job	System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.
broken	Sets the job as broken or not broken. TRUE sets it as broken; FALSE sets it as not broken.
next_date	Next date when the job will be run.

### Note:

If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

### Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- If a job fails 16 times in a row, Oracle automatically sets it as broken and then stops trying to run it.

## 88.3.2 CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

### Syntax

```
DBMS_JOB.CHANGE (  
  job      IN  BINARY_INTEGER,  
  what     IN  VARCHAR2,  
  next_date IN DATE,  
  interval IN  VARCHAR2,  
  instance IN  BINARY_INTEGER DEFAULT NULL,  
  force    IN  BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 88-3 CHANGE Procedure Parameters**

Parameter	Description
job	System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.
what	PL/SQL procedure to run.
next_date	Next date when the job will be run.
interval	Date function; evaluated immediately before the job starts running.
instance	When a job is submitted, specifies which instance can run the job. This defaults to NULL, which indicates that instance affinity is not changed.
force	If this is FALSE, then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception.  If this is TRUE, then any positive integer is acceptable as the job instance.

## Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters `what`, `next_date`, or `interval` are NULL, then leave that value as it is.

## Example

```
BEGIN
  DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
  COMMIT;
END;
```

## 88.3.3 INSTANCE Procedure

This procedure changes job instance affinity.

### Syntax

```
DBMS_JOB.INSTANCE (
  job          IN BINARY_INTEGER,
  instance     IN BINARY_INTEGER,
  force        IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 88-4 INSTANCE Procedure Parameters**

Parameter	Description
job	System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.
instance	When a job is submitted, a user can specify which instance can run the job.
force	If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.

## Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

## 88.3.4 INTERVAL Procedure

This procedure changes how often a job runs.

## Syntax

```
DBMS_JOB.INTERVAL (
    job      IN BINARY_INTEGER,
    interval IN VARCHAR2);
```

## Parameters

**Table 88-5 INTERVAL Procedure Parameters**

Parameter	Description
job	System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.
interval	Date function, evaluated immediately before the job starts running.

## Usage Notes

- If the job completes successfully, then this new date is placed in next\_date. interval is evaluated by plugging it into the statement select interval into next\_date from dual;
- The interval parameter must evaluate to a time in the future. Legal intervals include:

Interval	Description
'sysdate + 7'	Run once a week.
'next_day(sysdate, 'TUESDAY')'	Run once every Tuesday.

Interval	Description
'null'	Run only once.

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- Your job will not be available for processing by the job queue in the background until it is committed.

## 88.3.5 NEXT\_DATE Procedure

This procedure changes when an existing job next runs.

### Syntax

```
DBMS_JOB.NEXT_DATE (
    job          IN BINARY_INTEGER,
    next_date    IN DATE);
```

### Parameters

**Table 88-6** NEXT\_DATE Procedure Parameters

Parameter	Description
<code>job</code>	System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view.
<code>next_date</code>	Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.

### Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

## 88.3.6 REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

### Syntax

```
DBMS_JOB.REMOVE (
    job          IN BINARY_INTEGER );
```

### Parameters

**Table 88-7** REMOVE Procedure Parameters

Parameter	Description
<code>job</code>	System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view.

## Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

## Example

```
BEGIN
  DBMS_JOB.REMOVE(14144);
  COMMIT;
END;
```

## 88.3.7 RUN Procedure

This procedure runs job `JOB` now. It runs it even if it is broken.

Running the job recomputes `next_date`. See data dictionary view `USER_JOBS` or `DBA_JOBS`.

## Syntax

```
DBMS_JOB.RUN (
  job      IN BINARY_INTEGER,
  force    IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 88-8 RUN Procedure Parameters**

Parameter	Description
<code>job</code>	System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view.
<code>force</code>	If this is <code>TRUE</code> , then instance affinity is irrelevant for running jobs in the foreground process. If this is <code>FALSE</code> , then the job can be run in the foreground only in the specified instance.

## Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

### WARNING:

This re-initializes the current session's packages.

## Exceptions

An exception is raised if `force` is `FALSE`, and if the connected instance is the wrong one.

## 88.3.8 SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

### Syntax

```
DBMS_JOB.SUBMIT (
    job          OUT BINARY_INTEGER,
    what         IN  VARCHAR2,
    next_date   IN  DATE DEFAULT SYSDATE,
    interval    IN  VARCHAR2 DEFAULT 'null',
    no_parse    IN  BOOLEAN DEFAULT FALSE,
    instance    IN  BINARY_INTEGER DEFAULT any_instance,
    force       IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 88-9 SUBMIT Procedure Parameters**

Parameter	Description
job	System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view
what	<p>PL/SQL text o the job to be run. This must be a valid PL/SQL statement or block of code. For example, to run a stored procedure P, you could pass the string P; (with the semi-colon) to this routine. The SQL that you submit in the what parameter is wrapped in the following PL/SQL block:</p> <pre>DECLARE     job BINARY_INTEGER := :job;     next_date DATE := :mydate;     broken BOOLEAN := FALSE; BEGIN     WHAT     :mydate := next_date;     IF broken THEN :b := 1; ELSE :b := 0; END IF; END;</pre> <p>Ensure that you include the ; semi-colon with the statement.</p>
next_date	Next date when the job will be run.
interval	Date function that calculates the next time to run the job. The default is NULL. This must evaluate to a either a future point in time or NULL.
no_parse	<p>A flag. The default is FALSE. If this is set to FALSE, then Oracle parses the procedure associated with the job. If this is set to TRUE, then Oracle parses the procedure associated with the job the first time that the job is run.</p> <p>For example, if you want to submit a job before you have created the tables associated with the job, then set this to TRUE.</p>
instance	When a job is submitted, specifies which instance can run the job.

**Table 88-9 (Cont.) SUBMIT Procedure Parameters**

Parameter	Description
force	If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.

**Usage Notes**

- Your job will not be available for processing by the job queue in the background until it is committed.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

**Example**

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT(:jobno,
    'dbms_ddl.analyze_object(''TABLE'',
    ''DQUON'', ''ACCOUNTS'',
    ''ESTIMATE'', NULL, 50);'
    SYSDATE, 'SYSDATE + 1');
  COMMIT;
END;
/
Statement processed.
print jobno
JOBNO
-----
14144
```

## 88.3.9 USER\_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (8i and after) and preserves the compatibility.

**Syntax**

```
DBMS_JOB.USER_EXPORT (
  job      IN      BINARY_INTEGER,
  mycall   IN OUT  VARCHAR2);

DBMS_JOB.USER_EXPORT (
  job      IN      BINARY_INTEGER,
  mycall   IN OUT  VARCHAR2,
  myinst   IN OUT  VARCHAR2);
```

## Parameters

**Table 88-10 USER\_EXPORT Procedure Parameter**

Parameter	Description
job	System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.
mycall	Text of a call to re-create the given job.
myinst	Text of a call to alter instance affinity.

## 88.3.10 WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

### Syntax

```
DBMS_JOB.WHAT (  
    job      IN BINARY_INTEGER,  
    what     IN VARCHAR2);
```

### Parameters

**Table 88-11 WHAT Procedure Parameters**

Parameter	Description
job	System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.
what	PL/SQL procedure to run.

### Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- Some legal values of `what` (assuming the routines exist) are:
  - `'myproc(''10-JAN-82'', next_date, broken);'`
  - `'scott.emppackage.give_raise(''JENKINS'', 30000.00);'`
  - `'dbms_job.remove(job);'`

# DBMS\_JSON

The `DBMS_JSON` package provides an interface for data-guide operations.

This chapter contains the following topics:

- [DBMS\\_JSON Overview](#)
- [DBMS\\_JSON Security Model](#)
- [DBMS\\_JSON Constants](#)
- [Summary of DBMS\\_JSON Subprograms](#)

## 89.1 DBMS\_JSON Overview

Package `DBMS_JSON` provides subprograms for manipulating JavaScript Object Notation (JSON) data that is stored in Oracle Database.

## 89.2 DBMS\_JSON Security Model

`PUBLIC` is granted the `EXECUTE` privilege on package `DBMS_JSON`. Its subprograms execute with invoker's rights privileges.

## 89.3 DBMS\_JSON Constants

The `DBMS_JSON` package uses these constants to define the JSON schema types and data-guide formatting options.

**Table 89-1 DBMS\_JSON Constants Defined for JSON Data-Guide Formatting**

Name	Value	Description
<code>FORMAT_FLAT</code>	2	Display flat format
<code>FORMAT_HIERARCHICAL</code>	1	Display hierarchical format
<code>PRETTY</code>	1	Use appropriate indentation to improve readability

**Table 89-2 DBMS\_JSON Constants for JSON Schema Types**

Name	Type	Value	Description
<code>TYPE_ARRAY</code>	<code>NUMBER(2)</code>	6	A JSON array
<code>TYPE_BOOLEAN</code>	<code>NUMBER(2)</code>	2	A JSON boolean
<code>TYPE_OBJECT</code>	<code>NUMBER(2)</code>	5	A JSON object
<code>TYPE_NULL</code>	<code>NUMBER(2)</code>	1	The JSON NULL value
<code>TYPE_NUMBER</code>	<code>NUMBER(2)</code>	3	A JSON number
<code>TYPE_STRING</code>	<code>NUMBER(2)</code>	4	A JSON string

## 89.4 Summary of DBMS\_JSON Subprograms

This table lists the DBMS\_JSON subprograms and briefly describes them.

### DBMS\_JSON Package Subprograms

Subprogram	Description
<a href="#">ADD_VIRTUAL_COLUMNS Procedure</a>	Add virtual columns based on data-guide information. This has no effect when running on the shard catalog server — no virtual column is added.
<a href="#">CREATE_VIEW Procedure</a>	Create a view with relational columns and scalar JSON fields as specified in a data guide.
<a href="#">CREATE_VIEW_ON_PATH Procedure</a>	Create a view based on data-guide information, with relational columns, top-level scalar types, and fully expanded sub-tree under a given path. When running on the shard catalog server this raises an error stating that the data guide is empty.
<a href="#">DROP_VIRTUAL_COLUMNS Procedure</a>	Drop virtual columns created by procedure <code>add_virtual_columns</code> . This has no effect when running on the shard catalog server.
<a href="#">GET_INDEX_DATAGUIDE Function</a>	Get JSON data guide from a data guide-enabled JSON search index. When running on the shard catalog server this returns a single empty row as result.
<a href="#">RENAME_COLUMN Procedure</a>	Set the preferred name for a view column or a virtual column creating using a data guide. This has no effect when running on the shard catalog server.

#### Note:

In the context of sharding, each individual shard maintains its own data-guide information, which is obtained from the JSON documents stored in that shard. When running on individual shard, procedures in this package that use data-guide information use only the information that is maintained for that shard.

### 89.4.1 ADD\_VIRTUAL\_COLUMNS Procedure

This procedure adds virtual columns based on the data guide.

The virtual column name is the value of `o:preferred_vc_name` in the data guide. The procedure ignores JSON objects, arrays, and fields under arrays in the data guide.

Before it adds virtual columns, procedure `add_virtual_columns` first drops any existing virtual columns that were projected from fields in the same JSON column by a previous invocation of `add_virtual_columns` or by data-guide change-trigger procedure `add_vc` (in effect, it does what procedure `DBMS_JSON.drop_virtual_columns` does).

 **See Also:**

- [DROP\\_VIRTUAL\\_COLUMNS Procedure](#)
- *Oracle Database JSON Developer's Guide*

### Syntax

```
DBMS_JSON.ADD_VIRTUAL_COLUMNS (
    tablename IN VARCHAR2,
    jcolname  IN VARCHAR2,
    dataguide IN CLOB);
```

For the following signature you must have a data guide-enabled search index on the JSON column. (This is not needed for the previous signature.)

```
DBMS_JSON.ADD_VIRTUAL_COLUMNS (
    tablename IN VARCHAR2,
    jcolname  IN VARCHAR2,
    frequency NUMBER   DEFAULT 0,
    hidden    BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 89-3 ADD\_VIRTUAL\_COLUMNS Procedure Parameters**

Parameter	Description
<code>tablename</code>	Name of the table containing JSON column <code>jcolname</code> .
<code>jcolname</code>	Name of the JSON column in table <code>tablename</code> that contains the data from which to create the virtual column.
<code>frequency</code>	Sets the minimum frequency threshold to display JSON columns. A frequency of 0 means display all JSON columns. Also, all JSON columns are displayed if statistics have not been collected, effectively overriding any value set by this parameter.
<code>hidden</code>	TRUE means the added virtual column is hidden; FALSE means it is not. The default is FALSE.
<code>dataguide</code>	The data guide. When <code>o:hidden</code> in the data guide for a particular JSON field is set to TRUE, the corresponding virtual column is added as a hidden column. The default value of <code>o:hidden</code> is FALSE.

### Usage Notes

Procedure `DBMS_STATS.GATHER_STATS` collects statistics in the data guide. If the frequency statistic has not been collected, frequency is NULL. Setting the frequency to

a value greater than zero means do not include columns for which there are no frequency statistics collected (statistic is `NULL`), unless `DBMS_STATS.GATHER_STATS` has never been executed. In that case, the frequency parameter is ignored and all columns are displayed in the view.

## 89.4.2 CREATE\_VIEW Procedure

This procedure creates a view with relational columns, using scalar JSON fields as specified in the data guide. A data guide-enabled JSON search index is not required for this procedure; the data guide is passed to the procedure.

### See Also:

*Oracle Database JSON Developer's Guide*

### Syntax

(Optional) Enter syntax information here.

```
PROCEDURE CREATE_VIEW (
    viewname VARCHAR2,
    tablename VARCHAR2,
    jcolname VARCHAR2,
    dataguide CLOB);
```

### Parameters

**Table 89-4 DBMS\_JSON.CREATE\_VIEW Procedure Parameters**

Parameter	Description
viewname	Name of the view.
tablename	Name of the table containing JSON column jcolname.
jcolname	Name of the JSON column in table tablename that is used to create the view.
dataguide	The data guide.

## 89.4.3 CREATE\_VIEW\_ON\_PATH Procedure

This procedure creates a view with relational columns, using top-level scalar values and the scalar values in the expanded sub-tree under a given path. The JSON column must have a data guide-enabled search index.

### See Also:

*Oracle Database JSON Developer's Guide*

## Syntax

```
PROCEDURE CREATE_VIEW_ON_PATH(
    viewname VARCHAR2,
    tablename VARCHAR2,
    jcolname VARCHAR2,
    path VARCHAR2,
    frequency NUMBER DEFAULT 0);
```

## Parameters

**Table 89-5 CREATE\_VIEW\_ON\_PATH Procedure Parameters**

Parameter	Description
viewname	Name of the view.
tablename	Name of the table containing JSON column jcolname.
jcolname	Name of the JSON column in table tablename that is used to create the view. The column must have a data guide-enabled JSON search index, or else an error is raised.
path	The path of the JSON field to be expanded. It uses JSON path-expression syntax. It expands the descendants under the specified path, and creates view columns for each scalar value in the resulting sub-tree. The path \$ creates a view starting from the JSON document root.
frequency	The minimum frequency threshold for displaying the JSON columns. A frequency of 0 means display all JSON columns. All JSON columns are also displayed if statistics have not been collected, effectively overriding any value set by this parameter. The view only displays JSON fields with frequency greater than the given frequency. It does not display JSON fields added after collecting statistics if the given frequency is greater than 0, if their statistic columns are NULL.

## 89.4.4 DROP\_VIRTUAL\_COLUMNS Procedure

Drop all virtual columns that were added using PL/SQL procedure `DBMS_JSON.add_virtual_columns` or using data-guide change-trigger procedure `add_vc`.

### See Also:

- [ADD\\_VIRTUAL\\_COLUMNS Procedure](#)
- *Oracle Database JSON Developer's Guide*

## Syntax

```
PROCEDURE DROP_VIRTUAL_COLUMNS(
    tablename VARCHAR2,
    jcolname VARCHAR2);
```

## Parameters

**Table 89-6 DBMS\_JSON.DROP\_VIRTUAL\_COLUMNS Procedure Parameters**

Parameter	Description
tablename	Name of the table containing JSON column jcolname.
jcolname	Name of the JSON column in table tablename.

## 89.4.5 GET\_INDEX\_DATAGUIDE Function

GET\_INDEX\_DATAGUIDE gets JSON data guide from data guide-enabled JSON search index.

### See Also:

*Oracle Database JSON Developer's Guide*

## Syntax

```
FUNCTION GET_INDEX_DATAGUIDE(
    tablename VARCHAR2,
    jcolname VARCHAR2,
    format NUMBER,
    pretty NUMBER DEFAULT 0)
RETURN CLOB;
```

## Parameters

**Table 89-7 DBMS\_JSON.GET\_INDEX\_DATAGUIDE Procedure Parameters**

Parameter	Description
tablename	Name of the table containing JSON column jcolname.
jcolname	Name of the JSON column in table tablename that has a data guide-enabled JSON search index.
format	The data-guide format: <ul style="list-style-type: none"> <li>FORMAT_HIERARCHICAL — hierarchical format</li> <li>FORMAT_FLAT — flat format</li> </ul>
pretty	A value of DBMS_JSON.PRETTY means pretty-print the data guide, using indentation to improve readability.

### Example 89-1 Example Get Data Guide in Hierarchical Pretty Format

This example returns the data guide in hierarchical format.

```
SELECT DBMS_JSON.GET_INDEX_DATAGUIDE('T1', 'PO',
DBMS_JSON.FORMAT_HIERARCHICAL, DBMS_JSON.PRETTY)
FROM DUAL;
```

## 89.4.6 RENAME\_COLUMN Procedure

This procedure sets the preferred name for a JSON column, to be used by the create view, or add virtual columns procedure.

### See Also:

*Oracle Database JSON Developer's Guide*

### Syntax

```
PROCEDURE RENAME_COLUMN(
  tablename VARCHAR2,
  jcolname VARCHAR2,
  path VARCHAR2,
  type NUMBER,
  preferred_name VARCHAR2);
```

### Parameters

**Table 89-8 RENAME\_COLUMN Procedure Parameters**

Parameter	Description
tablename	Name of the table containing JSON column jcolname.
jcolname	Name of the JSON column in table tablename. It must have a data guide-enabled JSON search index, or else an error is raised.
path	Path to the JSON field on which to set the preferred column name.
type	The type of the JSON field targeted by path. Two JSON fields can have the same path if they are of different types. Possible values: <ul style="list-style-type: none"> <li>TYPE_NULL</li> <li>TYPE_STRING</li> <li>TYPE_NUMBER</li> <li>TYPE_BOOLEAN</li> <li>TYPE_OBJECT</li> <li>TYPE_ARRAY</li> </ul>
preferred_name	Preferred name for the JSON field specified by path. If there is a name conflict, a system generated name is used instead.

### Example 89-2 Example Renaming a Column

This example renames a field to item\_name.

```
EXEC DBMS_JSON.RENAME_COLUMN('T1', 'PO', '$.purchaseOrder.items.name',
DBMS_JSON.TYPE_STRING, 'item_name');
```

## DBMS\_LDAP

The DBMS\_LDAP package lets you access data from LDAP servers.

For a complete description of this package within the context of Oracle Internet Directory, see DBMS\_LDAP in the *Application Developer's Guide for Oracle Identity Management*

## DBMS\_LDAP\_UTL

The DBMS\_LDAP\_UTL package contains the Oracle Extension utility functions.

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP_UTL` in the *Application Developer's Guide for Oracle Identity Management*

# DBMS\_LIBCACHE

The `DBMS_LIBCACHE` package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_LIBCACHE Subprograms](#)

## 92.1 DBMS\_LIBCACHE Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements.

The open and parse functions are executed in advance for PL/SQL and DML. For PL/SQL, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

## 92.2 DBMS\_LIBCACHE Security Model

To execute `DBMS_LIBCACHE` you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, `DBMS_LIBCACHE` should be called for each.

Alternatively, `DBMS_LIBCACHE` may be called with the generic user `PARSER`. However, this user cannot parse the SQL that uses objects with access granted through roles. This is a standard PL/SQL security limitation.

## 92.3 Summary of DBMS\_LIBCACHE Subprograms

The `DBMS_LIBCACHE` package includes the `COMPILE_FROM_REMOTE` procedure subprogram.

**Table 92-1** *DBMS\_LIBCACHE Package Subprograms*

Subprogram	Description
<a href="#">COMPILE_FROM_REMOTE Procedure</a>	Extracts SQL in batch from the source instance and compiles the SQL at the target instance

## 92.3.1 COMPILE\_FROM\_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

### Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
  p_db_link          IN      dbms_libcache$def.db_link$type,
  p_username         IN      VARCHAR2 default null,
  p_threshold_executions IN  NATURAL  default 3,
  p_threshold_sharable_mem IN NATURAL  default 1000,
  p_parallel_degree  IN      NATURAL  default 1);
```

### Parameters

**Table 92-2 COMPILE\_FROM\_REMOTE Procedure Parameters**

Parameter	Description
p_db_link	Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role SELECT_ON_CATALOG at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with <code>dbms_libcache\$def.ACCESS_METHOD = DB_LINK_METHOD</code>
p_instance_name	(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.
p_username	Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single <code>user_id</code> , for example APPS, APPS is the parsing <code>user_id</code> that is recorded in the shared pool. To select only SQL statements parsed by APPS, enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example GL. If the username is supplied, it must be valid. The name is not case sensitive.
p_threshold_executions	The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

**Table 92-2 (Cont.) COMPILE\_FROM\_REMOTE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>p_threshold_sharable_mem</code>	The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.
<code>p_parallel_degree</code>	The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.

# DBMS\_LOB

The `DBMS_LOB` package provides subprograms to operate on `BLOBs`, `CLOBs`, `NCLOBs`, `BFILEs`, and temporary `LOBs`. You can use `DBMS_LOB` to access and manipulate specific parts of a `LOB` or complete `LOBs`.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Datatypes](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Summary of DBMS\\_LOB Subprograms](#)

## See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide*

## 93.1 DBMS\_LOB Overview

`DBMS_LOB` can read and modify `BLOBs`, `CLOBs`, and `NCLOBs`; it provides read-only operations for `BFILEs`. The bulk of the `LOB` operations are provided by this package.

## 93.2 DBMS\_LOB Deprecated Subprograms

The `DBMS_LOB.LOADFROMFILE` program is deprecated from the `DBMS_LOB` package in Oracle Database 12c release 12.2

## Note:

Oracle recommends that do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Use `DBMS_LOB.LoadClobFromFile` or `DBMS_LOB.LoadBlobFromFile` instead.

## 93.3 DBMS\_LOB Security Model

This package must be created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

Any `DBMS_LOB` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_LOB` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the `AUTHID` to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE procl AUTHID DEFINER ...
```

or

```
CREATE PROCEDURE procl AUTHID CURRENT_USER ...
```

### See Also:

For more information on `AUTHID` and privileges, see *Oracle Database PL/SQL Language Reference*

You can provide secure access to `BFILE`s using the `DIRECTORY` feature discussed in `BFILENAME` function in the *Oracle Database SecureFiles and Large Objects Developer's Guide* and the *Oracle Database SQL Language Reference*.

For information about the security model pertaining to temporary LOBs, see [Operational Notes](#).

## 93.4 DBMS\_LOB Constants

This topic describes the constants used by the `DBMS_LOB` package

These are shown in following tables:

- [Table 93-1](#)
- [Table 93-2](#)
- [Table 93-3](#)
- [Table 93-4](#)
- [Table 93-5](#)
- [Table 93-6](#)

**Table 93-1 DBMS\_LOB Constants - Basic**

Constant	Type	Value	Description
<code>CALL</code>	<code>PLS_INTEGER</code>	12	Create the <code>TEMP LOB</code> with call duration

**Table 93-1 (Cont.) DBMS\_LOB Constants - Basic**

Constant	Type	Value	Description
FILE_READONLY	BINARY_INTEGER	0	Open the specified BFILE read-only
LOB_READONLY	BINARY_INTEGER	0	Open the specified LOB read-only
LOB_READWRITE	BINARY_INTEGER	1	Open the specified LOB read-write
LOBMAXSIZE	INTEGER	18446744073709551615	Maximum size of a LOB in bytes
SESSION	PLS_INTEGER	10	Create the TEMP LOB with session duration

**Table 93-2 DBMS\_LOB Constants - Option Types**

Constant	Definition	Value	Description
OPT_COMPRESS	BINARY_INTEGER	1	Set/Get the SECUREFILE compress option value
OPT_DEDUPLICATE	BINARY_INTEGER	4	Set/Get the SECUREFILE Deduplicate option value
OPT_ENCRYPT	BINARY_INTEGER	2	Get the SECUREFILE encrypt option value

**Table 93-3 DBMS\_LOB Constants - Option Values**

Constant	Definition	Value	Description
COMPRESS_OFF	BINARY_INTEGER	0	For <a href="#">SETOPTIONS Procedures</a> , set compress off; for <a href="#">GETOPTIONS Functions</a> , compress is off
COMPRESS_ON	BINARY_INTEGER	1	For <a href="#">SETOPTIONS Procedures</a> , set compress on; for <a href="#">GETOPTIONS Functions</a> , compress is on
DEDUPLICATE_OFF	BINARY_INTEGER	0	For <a href="#">SETOPTIONS Procedures</a> , set deduplicate is off; for <a href="#">GETOPTIONS Functions</a> , deduplicate is off
DEDUPLICATE_ON	BINARY_INTEGER	4	For <a href="#">SETOPTIONS Procedures</a> , set deduplicate is on; for <a href="#">GETOPTIONS Functions</a> , deduplicate is on
ENCRYPT_OFF	BINARY_INTEGER	0	For <a href="#">GETOPTIONS Functions</a> , encrypt is off
ENCRYPT_ON	BINARY_INTEGER	2	For <a href="#">GETOPTIONS Functions</a> , encrypt is on

**Table 93-4 DBMS\_LOB Constants - DBFS State Value Types**

Constant	Definition	Value	Description
DBFS_LINK_NEVER	PLS_INTEGER	0	LOB has never been archived
DBFS_LINK_NO	PLS_INTEGER	2	LOB was archived, but as been read back in to the RDBMS
DBFS_LINK_YES	PLS_INTEGER	1	LOB is currently archived

**Table 93-5 DBMS\_LOB Constants - DBFS Cache Flags**

Constant	Definition	Value	Description
DBFS_LINK_CACHE	PLS_INTEGER	1	Put the LOB data to the archive, but keep the data in the RDBMS as a cached version
DBFS_LINK_NOCACHE	PLS_INTEGER	0	Put the LOB data to the archive, and remove the data from the RDBMS.

**Table 93-6 DBMS\_LOB Constants - Miscellaneous**

Constant	Definition	Value	Description
CONTENTTYPE_MAX_SIZE	PLS_INTEGER	128	Maximum number of bytes allowed in the content type string
DBFS_LINK_PATH_MAX_SIZE	PLS_INTEGER	1024	The maximum length of DBFS pathnames

## 93.5 DBMS\_LOB Datatypes

The table in this topic describes the datatypes used by DBMS\_LOB.

**Table 93-7 Datatypes Used by DBMS\_LOB**

Type	Description
BLOB	Source or destination binary LOB.
RAW	Source or destination RAW buffer (used with BLOB).
CLOB	Source or destination character LOB (including NCLOB).
VARCHAR2	Source or destination character buffer (used with CLOB and NCLOB).
INTEGER	Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.
BFILE	Large, binary object stored outside the database.

The DBMS\_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause `ANY_CS` in the specification of `DBMS_LOB` subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

## 93.6 DBMS\_LOB Operational Notes

All `DBMS_LOB` subprograms work based on LOB locators. For the successful completion of `DBMS_LOB` subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system.

See also Chapter 1 of *Oracle Database SecureFiles and Large Objects Developer's Guide*

Starting from 12.2 release, you can select a persistent LOB locator from a remote table into a local variable. The remote column can be of type BLOB, CLOB, or NCLOB. You cannot select `BFILE` from a remote table. The LOB variable that refers to the LOB value in a remote table is called a remote locator.

All the `DBMS_LOB` APIs other than the ones that are meant for BFILES will now accept and support operations on remote LOB locators. All the APIs that take in two locators must have both LOBs collocated at one database.

### See Also:

*Distributed LOBs* chapter in *Oracle Database SecureFiles and Large Objects Developer's Guide*.

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- Internal LOBs
- External LOBs
- Temporary LOBs

### Internal LOBs

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

### External LOBs

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a `DIRECTORY` object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the `DIRECTORY` object and the filename of the external LOB you are adding to the `BFILENAME` function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the specified LOB locator.

After the LOBs are defined and created, you can then `SELECT` from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to `DBMS_LOB` for access to the LOB value.

For details on the different ways to do this, See *Oracle Database SecureFiles and Large Objects Developer's Guide*

### Temporary LOBs

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either `BLOBs`, `CLOBs`, or `NCLOBs`.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as `CACHE/ NOCACHE`. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and roll backs are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-`REF` semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB

data. The PL/SQL `DBMS_LOB` package, `PRO*C/C++`, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the `EMPTY_BLOB` or `EMPTY_CLOB` functions that are supported for permanent LOBs. The `EMPTY_BLOB` function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the `DBMS_LOB` package by using the appropriate `FREETEMPORARY` or `OCIDurationEnd` statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and `DBMS_LOB` statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or `DBMS_LOB COPY` command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a `v$` view called `V$TEMPORARY_LOBS`, which contains information about how many temporary LOBs exist for each session. `v$` views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using `V$TEMPORARY_LOBS` in conjunction with `DBA_SEGMENTS`, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in `DBMS_LOB` return `NULL` if any of the input parameters are `NULL`. All procedures in `DBMS_LOB` raise an exception if the LOB locator is input as `NULL`.
2. Operations based on `CLOBs` do not verify if the character set IDs of the parameters (`CLOB` parameters, `VARCHAR2` buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.

## 93.7 DBMS\_LOB Rules and Limits

This topic describes general DBMS\_LOB rules and limits, rules and limits specific to external files (BFILES), and maximum LOB and buffer sizes.

### General Rules and Limits

- Oracle Database does not support constraints on columns or attributes whose type is a LOB, with the following exception: NOT NULL constraints are supported for a LOB column or attribute.
- The following rules apply in the specification of subprograms in this package:
  - `newlen`, `offset`, and `amount` parameters for subprograms operating on BLOBs and BFILES must be specified in terms of *bytes*.
  - `newlen`, `offset`, and `amount` parameters for subprograms operating on CLOBs must be specified in terms of *characters*.

In multi-byte character sets, it is not possible to interpret these offsets correctly. As a result, SUBSTR raises the following error: ORA-22998: CLOB or NCLOB in multibyte character set not supported.

- A subprogram raises an INVALID\_ARGVAL exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
  1. Only positive, absolute offsets from the beginning of LOB data are permitted: Negative offsets from the tail of the LOB are not permitted.
  2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as `amount`, `offset`, `newlen`, `nth`, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
  3. The value of `offset`, `amount`, `newlen`, `nth` must not exceed the value `lobmaxsize 18446744073709551615 (264)` in any DBMS\_LOB subprogram.
  4. For CLOBs consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed `(lobmaxsize/character_width_in_bytes)` characters.

For example, if the CLOB consists of 2-byte characters, such as:

```
JA16SJISFIXED
```

Then, the maximum `amount` value should not exceed:

```
18446744073709551615/2 = 9223372036854775807
```

- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for RAW and VARCHAR2 parameters used in DBMS\_LOB subprograms. For example, if you declare a variable to be:

```
charbuf VARCHAR2(3000)
```

Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for DBMS\_LOB subprograms for CLOBs and NCLOBs.

- The %CHARSET clause indicates that the form of the parameter with %CHARSET must match the form of the ANY\_CS parameter to which it refers.

For example, in DBMS\_LOB subprograms that take a VARCHAR2 buffer parameter, the form of the VARCHAR2 buffer must match the form of the CLOB parameter. If the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS\_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

- If the value of `amount` plus the `offset` exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

Under these input conditions, read subprograms, such as `READ`, `COMPARE`, `INSTR`, and `SUBSTR`, read until End of Lob/File is reached. For example, for a `READ` operation on a BLOB or BFILE, if the user specifies offset value of 3 GB and an amount value of 2 GB on a LOB that is 4GB in size, then `READ` returns only 1GB (4GB-3GB) bytes.

- Functions with `NULL` or invalid input values for parameters return a `NULL`. Procedures with `NULL` values for destination LOB parameters raise exceptions.
- Operations involving patterns as parameters, such as `COMPARE`, `INSTR`, and `SUBSTR` do not support regular expressions or special matching characters (such as `%` in the `LIKE` operator in SQL) in the `pattern` parameter or substrings.
- The End of LOB condition is indicated by the `READ` procedure using a `NO_DATA_FOUND` exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The `READ` buffer for the last read contains 0 bytes.
- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.
- Unless otherwise stated, the default value for an `offset` parameter is 1, which indicates the first byte in the BLOB or BFILE data, and the first character in the CLOB or NCLOB value. No default values are specified for the `amount` parameter — you must input the values explicitly.
- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as `APPEND`, `COPY`, `ERASE`, `TRIM`, or `WRITE`. These subprograms do not implicitly lock the row containing the LOB.

### Rules and Limits Specific to External Files (BFILES)

- The subprograms `COMPARE`, `INSTR`, `READ`, `SUBSTR`, `FILECLOSE`, `FILECLOSEALL` and `LOADFROMFILE` operate only on an *opened* BFILE locator; that is, a successful `FILEOPEN` call must precede a call to any of these subprograms.
- For the functions `FILEEXISTS`, `FILEGETNAME` and `GETLENGTH`, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the `DIRECTORY` object and the file.
- DBMS\_LOB does not support any concurrency control mechanism for BFILE operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the `FILECLOSEALL` subprogram to close all files opened in the session and resume file operations from the beginning.

- If you are the creator of a DIRECTORY, or if you have system privileges, then use the CREATE OR REPLACE, DROP, and REVOKE statements in SQL with extreme caution.

If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to invoke a program or anonymous block that calls FILECLOSEALL, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the BFILE.

In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than SESSION\_MAX\_OPEN\_FILES.

In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the BFILE variable in its most current state.

After the exception transfers program control outside the PL/SQL program block, all references to the open BFILES are lost. The result is a larger open file count which may or may not exceed the SESSION\_MAX\_OPEN\_FILES value.

For example, consider a READ operation past the end of the BFILE value, which generates a NO\_DATA\_FOUND exception:

```
-- This assumes a directory 'DDD' whose path is already known
DECLARE
    fil BFILE:= bfilename('DDD', 'filename.foo');
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: ' ||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
END;

ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
```

```

dbms_lob.open(fil, dbms_lob.lob_readonly);
amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
dbms_lob.read(fil, amt, pos, buf);
dbms_output.put_line('Read F1 past EOF: '||
    utl_raw.cast_to_varchar2(buf));
dbms_lob.close(fil);
exception
WHEN no_data_found
THEN
    BEGIN
        dbms_output.put_line('End of File reached. Closing file');
        dbms_lob.fileclose(fil);
        -- or dbms_lob.filecloseall if appropriate
    END;
END;
/

Statement processed.
End of File reached. Closing file

```

In general, you should ensure that files opened in a PL/SQL block using DBMS\_LOB are closed before normal or abnormal termination of the block.

### Maximum LOB Size

The maximum size for LOBs supported by the database is equal to the value of the blocksize of the tablespace the LOB column resides in times the value  $2^{32}-1$  (4294967295). This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

### Maximum Buffer Size

The maximum buffer size, 32767 bytes.

For BLOBs, where buffer size is expressed in bytes, the number of bytes cannot exceed 32767.

For CLOBs or NCLOBs, where buffer size is expressed in characters, the number of characters cannot result in a buffer larger than 32767 bytes. For example, if you are using fixed-width, two-byte characters, then specifying 20000 characters is an error ( $20000*2 = 40000$ , which is greater than 32767).

## 93.8 DBMS\_LOB Exceptions

The table in the topic describes the exceptions for DBMS\_LOB.

**Table 93-8 DBMS\_LOB Exceptions**

Exception	Code	Description
ACCESS_ERROR	22925	You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes.
BUFFERING_ENABLED	22279	Cannot perform operation with LOB buffering enabled

**Table 93-8 (Cont.) DBMS\_LOB Exceptions**

Exception	Code	Description
CONTENTTYPE_TOOLONG	43859	The length of the contenttype string exceeds the defined maximum. Modify the length of the contenttype string and retry the operation.
CONTENTTYPEBUF_WRONG	43862	The length of the contenttype buffer is less than defined constant. Modify the length of the contenttype buffer and retry the operation.
INVALID_ARGVAL	21560	The argument is expecting a non-NULL, valid value but the argument value passed in is NULL, invalid, or out of range.
INVALID_DIRECTORY	22287	The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access.
NO_DATA_FOUND	1403	ENDOFLOB indicator for looping read operations. This is not a hard error.
NOEXIST_DIRECTORY	22285	The directory leading to the file does not exist.
NOPRIV_DIRECTORY	22286	The user does not have the necessary access privileges on the directory or the file for the operation.
OPEN_TOOMANY	22290	The number of open files has reached the maximum limit.
OPERATION_FAILED	22288	The operation attempted on the file failed.
QUERY_WRITE	14553	Cannot perform a LOB write inside a query or PDML parallel execution server
SECUREFILE_BADLOB	43856	A non-SECUREFILE LOB type was used in a SECUREFILE only call
SECUREFILE_BADPARAM	43857	An invalid argument was passed to a SECUREFILE subprogram
SECUREFILE_MARKERASE D	43861	The mark provided to a FRAGMENT_* operation has been deleted
SECUREFILE_OUTOFBOUN DS	43883	Attempted to perform a FRAGMENT_* operation past the LOB end
UNOPENED_FILE	22289	The file is not open for the required operation to be performed.
VALUE_ERROR	6502	PL/SQL error for invalid values to subprogram's parameters.

## 93.9 Summary of DBMS\_LOB Subprograms

This table lists the DBMS\_LOB subprograms and briefly describes them.

**Table 93-9 DBMS\_LOB Package Subprograms**

Subprogram	Description
<a href="#">APPEND Procedures</a>	Appends the contents of the source LOB to the destination LOB

**Table 93-9 (Cont.) DBMS\_LOB Package Subprograms**

Subprogram	Description
<a href="#">CLOB2FILE Procedure</a>	Writes the content of a CLOB into a file.
<a href="#">CLOSE Procedure</a>	Closes a previously opened internal or external LOB
<a href="#">COMPARE Functions</a>	Compares two entire LOBs or parts of two LOBs
<a href="#">CONVERTTOBLOB Procedure</a>	Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets
<a href="#">CONVERTTOCLOB Procedure</a>	Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets
<a href="#">COPY Procedures</a>	Copies all, or part, of the source LOB to the destination LOB
<a href="#">COPY_DBFS_LINK Procedures</a>	Copies the DBFS Link in the source LOB to the destination LOB
<a href="#">COPY_FROM_DBFS_LINK</a>	Retrieves the data for the LOB from the DBFS store
<a href="#">CREATETEMPORARY Procedures</a>	Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace
<a href="#">DBFS_LINK_GENERATE_PATH Functions</a>	Returns a unique file path name for use in creating a DBFS Link
<a href="#">ERASE Procedures</a>	Erases all or part of a LOB
<a href="#">FILECLOSE Procedure</a>	Closes the file
<a href="#">FILECLOSEALL Procedure</a>	Closes all previously opened files
<a href="#">FILEEXISTS Function</a>	Checks if the file exists on the server
<a href="#">FILEGETNAME Procedure</a>	Gets the directory object name and file name
<a href="#">FILEISOPEN Function</a>	Checks if the file was opened using the input BFILE locators
<a href="#">FILEOPEN Procedure</a>	Opens a file
<a href="#">FRAGMENT_DELETE Procedure</a>	Deletes the data at the specified offset for the specified length from the LOB
<a href="#">FRAGMENT_INSERT Procedures</a>	Inserts the specified data (limited to 32K) into the LOB at the specified offset
<a href="#">FRAGMENT_MOVE Procedure</a>	Moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified
<a href="#">FRAGMENT_REPLACE Procedures</a>	Replaces the data at the specified offset with the specified data (not to exceed 32k)
<a href="#">FREETEMPORARY Procedures</a>	Frees the temporary BLOB or CLOB in the default temporary tablespace
<a href="#">GET_DBFS_LINK Functions</a>	Returns the DBFS Link path associated with the specified SecureFile
<a href="#">GET_DBFS_LINK_STATE Procedures</a>	Retrieves the current DBFS Link state of the specified SecureFile
<a href="#">GETCHUNKSIZE Functions</a>	Returns the amount of space used in the LOB chunk to store the LOB value

**Table 93-9 (Cont.) DBMS\_LOB Package Subprograms**

Subprogram	Description
<a href="#">GETCONTENTTYPE Functions</a>	Returns the content ID string previously set by means of the <a href="#">SETCONTENTTYPE Procedure</a>
<a href="#">GETLENGTH Functions</a>	Gets the length of the LOB value
<a href="#">GETOPTIONS Functions</a>	Obtains settings corresponding to the <code>option_type</code> field for a particular LOB
<a href="#">GET_STORAGE_LIMIT Function</a>	Returns the storage limit for LOBs in your database configuration
<a href="#">INSTR Functions</a>	Returns the matching position of the <i>n</i> th occurrence of the pattern in the LOB
<a href="#">ISOPEN Functions</a>	Checks to see if the LOB was already opened using the input locator
<a href="#">ISREMOTE Function</a>	Checks to see if the LOB is local to the database or if it belongs to a remote database.
<a href="#">ISSECUREFILE Function</a>	Returns TRUE if the LOB locator passed to is for a SecureFiles LOB, otherwise, returns FALSE
<a href="#">ISTEMPORARY Functions</a>	Checks if the locator is pointing to a temporary LOB
<a href="#">LOADBLOBFROMFILE Procedure</a>	Loads BFILE data into an internal BLOB
<a href="#">LOADCLOBFROMFILE Procedure</a>	Loads BFILE data into an internal CLOB
<a href="#">LOADFROMFILE Procedure</a>	Loads BFILE data into an internal LOB. This procedure has been deprecated starting with Oracle Database 12c release 12.2.
<a href="#">MOVE_TO_DBFS_LINK Procedures</a>	Writes the specified SecureFile data to the DBFS store
<a href="#">OPEN Procedures</a>	Opens a LOB (internal, external, or temporary) in the indicated mode
<a href="#">READ Procedures</a>	Reads data from the LOB starting at the specified offset
<a href="#">SET_DBFS_LINK Procedures</a>	Links the specified SecureFile to the specified path name. It does not copy the data to the path
<a href="#">SETCONTENTTYPE Procedure</a>	Sets the content type string for the data in the LOB
<a href="#">SETOPTIONS Procedures</a>	Enables CSCE features on a per-LOB basis, overriding the default LOB column settings
<a href="#">SUBSTR Functions</a>	Returns part of the LOB value starting at the specified offset
<a href="#">TRIM Procedures</a>	Trims the LOB value to the specified shorter length
<a href="#">WRITE Procedures</a>	Writes data to the LOB from a specified offset
<a href="#">WRITEAPPEND Procedures</a>	Writes a buffer to the end of a LOB

## 93.9.1 APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

### Syntax

```
DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY BLOB,
  src_lob  IN          BLOB);

DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob  IN          CLOB CHARACTER SET dest_lob%CHARSET);
```

### Parameters

**Table 93-10 APPEND Procedure Parameters**

Parameter	Description
dest_lob	Locator for the internal LOB to which the data is to be appended.
src_lob	Locator for the internal LOB from which the data is to be read.

### Exceptions

**Table 93-11 APPEND Procedure Exceptions**

Exception	Description
VALUE_ERROR	Either the source or the destination LOB is NULL.
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML parallel execution server
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

### Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.  
  
If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- If APPEND is called on a LOB that has been archived, it implicitly gets the LOB before the first byte is written
- If APPEND is called on a SecureFiles LOB that is a DBFS Link, an exception is thrown.

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.2 CLOB2FILE Procedure

This procedure writes the content of a CLOB into a bfile. This procedure gets called from the deprecated `dbms_xslprocessor.clob2file` internally.

### Syntax

```
DBMS_LOB.CLOB2FILE(
  src_cl      IN CLOB,
  file_loc    IN VARCHAR2,
  file_name   IN VARCHAR2,
  csid        IN NUMBER := 0,
  open_mode   IN VARCHAR2 := 'wb');
```

### Parameters

**Table 93-12 CLOB2FILE Procedure Parameters**

Parameter	Description
<code>src_cl</code>	Source CLOB locator to write into a file
<code>file_loc</code>	Directory object name where the file is located
<code>file_name</code>	File name
<code>csid</code>	Character set id of the CLOB locator <ul style="list-style-type: none"> <li>Must be a valid Oracle id; otherwise returns an error</li> <li>If the value is 0, then the content of the output file will be in the database character set</li> </ul>
<code>open_mode</code>	The mode to open the output file in. <ul style="list-style-type: none"> <li><code>wb</code> — write byte mode, overwrites the file</li> </ul> The default value is <code>wb</code> .

## 93.9.3 CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

### Syntax

```
DBMS_LOB.CLOSE (
  lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
  lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
  file_loc   IN OUT NOCOPY BFILE);
```

## Parameters

**Table 93-13** CLOSE Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

## Exceptions

No error is returned if the `BFILE` exists but is not opened. An error is returned if the LOB is not open.

## Usage Notes

`CLOSE` requires a round-trip to the server for both internal and external LOBs. For internal LOBs, `CLOSE` triggers other code that relies on the close call, and for external LOBs (`BFILES`), `CLOSE` actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.4 COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

### Syntax

```
DBMS_LOB.COMPARE (
  lob_1          IN BLOB,
  lob_2          IN BLOB,
  amount        IN INTEGER := DBMS_LOB.LOBMAXSIZE,
  offset_1      IN INTEGER := 1,
  offset_2      IN INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.COMPARE (
  lob_1          IN CLOB CHARACTER SET ANY_CS,
  lob_2          IN CLOB CHARACTER SET lob_1%CHARSET,
```

```

amount          IN INTEGER := DBMS_LOB.LOBMAXSIZE,
offset_1        IN INTEGER := 1,
offset_2        IN INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.COMPARE (
lob_1           IN BFILE,
lob_2           IN BFILE,
amount         IN INTEGER,
offset_1        IN INTEGER := 1,
offset_2        IN INTEGER := 1)
RETURN INTEGER;

```

## Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

## Parameters

**Table 93-14 COMPARE Function Parameters**

Parameter	Description
lob_1	LOB locator of first target for comparison.
lob_2	LOB locator of second target for comparison.
amount	Number of bytes (for BLOBs) or characters (for CLOBs/NCLOBs) to compare.
offset_1	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.
offset_2	Offset in bytes or characters on the second LOB (origin: 1) for the comparison.

## Return Values

- `INTEGER`: 0 if the comparison succeeds, nonzero if not.
- `NULL`, if any of `amount`, `offset_1` or `offset_2` is not a valid LOB offset value. A valid offset is within the range of 1 to `LOBMAXSIZE` inclusive.

## Usage Notes

- You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful `FILEOPEN` operation for this operation to succeed.
- `COMPARE` returns 0 if the data exactly matches over the range specified by the `offset` and `amount` parameters. `COMPARE` returns -1 if the first CLOB is less than the second, and 1 if it is greater.
- For fixed-width  $n$ -byte CLOBs, if the input `amount` for `COMPARE` is specified to be greater than  $(\text{DBMS\_LOB.LOBMAXSIZE}/n)$ , then `COMPARE` matches characters in a range of size  $(\text{DBMS\_LOB.LOBMAXSIZE}/n)$ , or  $\text{Max}(\text{length}(\text{clob1}), \text{length}(\text{clob2}))$ , whichever is lesser.
- If `COMPARE` is called on any LOB that has been archived, it implicitly gets the LOB before the compare begins.

- If `COMPARE()` is called on a SecureFiles LOB that is a DBFS Link, the linked LOB is streamed from DBFS, if possible, otherwise an exception is thrown.

### Exceptions

**Table 93-15 COMPARE Function Exceptions for BFILE operations**

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

#### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.5 CONVERTTOBLOB Procedure

This procedure reads character data from a source `CLOB` or `NCLOB` instance, converts the character data to the character set you specify, writes the converted data to a destination `BLOB` instance in binary format, and returns the new offsets.

You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

### Syntax

```
DBMS_LOB.CONVERTTOBLOB(
  dest_lob      IN OUT      NOCOPY BLOB,
  src_clob      IN          CLOB CHARACTER SET ANY_CS,
  amount        IN          INTEGER,
  dest_offset   IN OUT      INTEGER,
  src_offset    IN OUT      INTEGER,
  blob_csid     IN          NUMBER,
  lang_context  IN OUT      INTEGER,
  warning       OUT         INTEGER);
```

### Parameters

**Table 93-16 CONVERTTOBLOB Procedure Parameters**

Parameter	Description
<code>dest_lob</code>	LOB locator of the destination LOB instance.

**Table 93-16 (Cont.) CONVERTTLOB Procedure Parameters**

Parameter	Description
src_clob	LOB locator of the source LOB instance.
amount	Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB.
dest_offset	( IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. ( OUT) The new offset in bytes after the end of the write.
src_offset	( IN) Offset in characters in the source LOB for the start of the read. ( OUT) Offset in characters in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	( IN) Language context, such as shift status, for the current conversion. ( OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.
warning	( OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.

### Usage Notes

#### Preconditions

Before calling the CONVERTTLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

#### Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 93-17 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column

describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

**Table 93-17 DBMS\_LOB.CONVERTTOBLOB Typical Values**

Parameter	Value	Description
<code>amount</code>	<code>LOBMAXSIZE (IN)</code>	convert the entire file
<code>dest_offset</code>	<code>1 (IN)</code>	start from the beginning
<code>src_offset</code>	<code>1 (IN)</code>	start from the beginning
<code>blob_csid</code>	<code>DEFAULT_CSID (IN)</code>	default CSID, use same CSID as source LOB
<code>lang_context</code>	<code>DEFAULT_LANG_CTX (IN)</code>	default language context
<code>warning</code>	<code>NO_WARNING (OUT)</code> <code>WARN_INCONVERTIBLE_CHAR (OUT)</code>	no warning message, success character in source cannot be properly converted

#### General Notes

- You must specify the desired character set for the destination LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the source LOB character set.
- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The `amount` and `src_offset` values are in characters and the `dest_offset` is in bytes. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.
- `CONVERTTOBLOB` gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

#### Exceptions

[Table 93-18](#) gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

**Table 93-18 CONVERTTOBLOB Procedure Exceptions**

Exception	Description
<code>VALUE_ERROR</code>	Any of the input parameters are <code>NULL</code> or <code>INVALID</code> .
<code>INVALID_ARGVAL</code>	One or more of the following: <ul style="list-style-type: none"> <li>- <code>src_offset</code> or <code>dest_offset</code> &lt; 1.</li> <li>- <code>src_offset</code> or <code>dest_offset</code> &gt; <code>LOBMAXSIZE</code>.</li> <li>- <code>amount</code> &lt; 1.</li> <li>- <code>amount</code> &gt; <code>LOBMAXSIZE</code>.</li> </ul>

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

## 93.9.6 CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets.

You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

### Syntax

```
DBMS_LOB.CONVERTTOCLOB(
  dest_lob      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_blob      IN             BLOB,
  amount        IN             INTEGER,
  dest_offset   IN OUT        INTEGER,
  src_offset    IN OUT        INTEGER,
  blob_csid     IN             NUMBER,
  lang_context  IN OUT        INTEGER,
  warning       OUT           INTEGER);
```

### Parameters

**Table 93-19** CONVERTTOCLOB Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of bytes to convert from the source LOB. If you want to copy the entire BLOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the BLOB.
dest_offset	( IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. ( OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write.
src_offset	( IN) Offset in bytes in the source LOB for the start of the read. ( OUT) Offset in bytes in the source LOB right after the end of the read.
blob_csid	The character set ID of the source data

**Table 93-19 (Cont.) CONVERTTOCLOB Procedure Parameters**

Parameter	Description
lang_context	<p>( IN ) Language context, such as shift status, for the current conversion.</p> <p>( OUT ) The language context at the time when the current conversion is done.</p> <p>This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.</p>
warning	<p>Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message.</p> <p>Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.</p>

### Usage Notes

#### Preconditions

Before calling the `CONVERTTOCLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the `CONVERTTOCLOB` procedure. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

#### Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 93-20](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

**Table 93-20 DBMS\_LOB.CONVERTTOCLOB Typical Values**

Parameter	Value	Description
amount	LOBMAXSIZE ( IN )	convert the entire file
dest_offset	1 ( IN )	start from the beginning
src_offset	1 ( IN )	start from the beginning
csid	DEFAULT_CSID ( IN )	default CSID, use destination CSID

**Table 93-20 (Cont.) DBMS\_LOB.CONVERTTOCLOB Typical Values**

Parameter	Value	Description
lang_context	DEFAULT_LANG_CTX (IN)	default language context
warning	NO_WARNING (OUT) WARN_INCONVERTIBLE_CHAR (OUT)	no warning message, success character in source cannot be properly converted

**General Notes**

- You must specify the desired character set for the source LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the destination LOB character set.
- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The `amount` and `src_offset` values are in bytes and the `dest_offset` is in characters. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.
- `CONVERTTOCLOB` gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

**Exceptions**

**Table 93-21 CONVERTTOCLOB Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: - <code>src_offset</code> or <code>dest_offset</code> < 1. - <code>src_offset</code> or <code>dest_offset</code> > <code>LOBMAXSIZE</code> . - <code>amount</code> < 1. - <code>amount</code> > <code>LOBMAXSIZE</code> .

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

## 93.9.7 COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

### Syntax

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY BLOB,
  src_lob    IN           BLOB,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);
```

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob    IN           CLOB CHARACTER SET dest_lob%CHARSET,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);
```

### Parameters

**Table 93-22 COPY Procedure Parameters**

Parameter	Description
dest_lob	LOB locator of the copy target.
src_lob	LOB locator of source for the copy.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to copy.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.
src_offset	Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.

### Exceptions

**Table 93-23 COPY Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or invalid.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- src_offset or dest_offset &lt; 1</li> <li>- src_offset or dest_offset &gt; LOBMAXSIZE</li> <li>- amount &lt; 1</li> <li>- amount &gt; LOBMAXSIZE</li> </ul>
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML parallel execution server

**Table 93-23 (Cont.) COPY Procedure Exceptions**

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

**Usage Notes**

- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the `src_offset` to the end of the source LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- Prior to copy, the source and destination LOBs are retrieved, if they are currently archived. For a complete over-write, the destination LOB is not retrieved.
- If the source LOB is a DBFS Link, the data is streamed from DBFS, if possible, otherwise an exception is thrown. If the destination LOB is a DBFS Link, an exception is thrown.

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.8 COPY\_DBFS\_LINK Procedures

This procedure copies the DBFS Link in the source LOB to the destination LOB.

**Syntax**

```
DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst   IN OUT BLOB,
  lob_loc_src   IN   BLOB,
  flags         IN   PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

```
DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst   IN OUT CLOB CHARACTER SET ANY_CS,
```

```
lob_loc_src  IN  CLOB CHARACTER SET ANY_CS,
flags       IN  PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

### Parameters

**Table 93-24 COPY\_DBFS\_LINK Procedure Parameters**

Parameter	Description
lob_loc_dst	LOB to be made to reference the same storage data as lob_loc_src
lob_loc_src	LOB from which to copy the reference
flags	Options to COPY_DBFS_LINK: <ul style="list-style-type: none"> <li>DBFS_LINK_NOCACHE specifies to only copy the DBFS Link</li> <li>DBFS_LINK_CACHE specifies to copy the DBFS Link and read the data into the database LOB specified by lob_loc_dst so that the data is cached</li> </ul>

### Exceptions

**Table 93-25 COPY\_DBFS\_LINK Procedure Exceptions**

Exception	Description
SECUREFILE_BADLOB	Either lob_loc_src or lob_loc_dst is not a SECUREFILE
INVALID_ARGVAL	lob_loc_src LOB has not been archived
ORA-01555	If the source LOB has been retrieved, never archived, or if the LOB has been migrated in and out (modified or not) since the locator was gotten.

## 93.9.9 COPY\_FROM\_DBFS\_LINK

This procedure retrieves the archived SecureFiles LOB data from the DBFS HSM store and to the database.

### Syntax

```
DBMS_LOB.COPY_FROM_DBFS_LINK (
lob_loc      IN OUT BLOB);

DBMS_LOB.COPY_FROM_DBFS_LINK (
lob_loc      IN OUT CLOB CHARACTER SET ANY_CS);
```

### Parameters

**Table 93-26 COPY\_FROM\_DBFS\_LINK Procedure Parameters**

Parameter	Description
lob_loc	LOB to be retrieved from the archive

### Usage Note

COPY\_FROM\_DBFS\_LINK does not remove the underlying DBFS file.

If the LOB is successfully retrieved, COPY\_FROM\_DBFS\_LINK silently returns success.

### Exceptions

**Table 93-27 COPY\_FROM\_DBFS\_LINK Procedure Exceptions**

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE
ORA-01555	If the LOB has already been retrieved and has been modified since retrieval, if the LOB has been migrated in and out (modified or not) since the locator was retrieved

## 93.9.10 CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

### Syntax

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := DBMS_LOB.SESSION);
```

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := 10);
```

### Parameters

**Table 93-28 CREATETEMPORARY Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
cache	Specifies if LOB should be read into buffer cache or not.
dur	1 of 2 predefined duration values (SESSION or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session or call. If dur is omitted, then the session duration is used.

#### See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure
- *Oracle Database PL/SQL Language Reference* for more information about NOCOPY and passing temporary lob as parameters

## 93.9.11 DBFS\_LINK\_GENERATE\_PATH Functions

This subprogram returns a unique file path name for use in creating a DBFS Link.

### Syntax

```
DBMS_LOB.DBFS_LINK_GENERATE_PATH (
    lob_loc      IN BLOB,
    storage_dir  IN VARCHAR2)
RETURN VARCHAR2;

DBMS_LOB.DBFS_LINK_GENERATE_PATH (
    lob_loc      IN CLOB CHARACTER SET ANY_CS,
    storage_dir  IN VARCHAR2)
RETURN VARCHAR2;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(dbfs_link_generate_path,
    WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-29 DBFS\_LINK\_GENERATE\_PATH Function Parameters**

Parameter	Description
lob_loc	LOB to be retrieved from DBFS
storage_dir	DBFS directory that will be the parent directory of the file

### Exceptions

**Table 93-30 DBFS\_LINK\_GENERATE\_PATH Function Exceptions**

Exception	Description
SECUREFILE_WRONGTYPE	lob_loc is not a SECUREFILE

### Usage Notes

Returns a globally unique file pathname that can be used for archiving. This is guaranteed to be globally unique across all calls to this function for different LOBs and versions of that LOB. It is always the same for the same LOB and version.

## 93.9.12 ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

### Syntax

```
DBMS_LOB.ERASE (
    lob_loc      IN OUT NOCOPY BLOB,
    amount      IN OUT NOCOPY INTEGER,
    offset      IN              INTEGER := 1);
```

```
DBMS_LOB.ERASE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN OUT NOCOPY INTEGER,
  offset       IN           INTEGER := 1);
```

## Parameters

**Table 93-31 ERASE Procedure Parameters**

Parameter	Description
lob_loc	Locator for the LOB to be erased. For more information, see <a href="#">Operational Notes</a> .
amount	Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.
offset	Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).

## Usage Notes

- When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.
- The actual number of bytes or characters erased can differ from the number you specified in the `amount` parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the `amount` parameter.
- `ERASE` gets the LOB if it is archived, unless the erase covers the entire LOB.
- If the LOB to be erased is a DBFS Link, an exception is thrown.

### Note:

The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "[TRIM Procedures](#)".

## Exceptions

**Table 93-32 ERASE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any input parameter is NULL.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- amount &lt; 1 or amount &gt; LOBMAXSIZE</li> <li>- offset &lt; 1 or offset &gt; LOBMAXSIZE</li> </ul>
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML parallel execution server
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

### See Also:

- ["TRIM Procedures"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.13 FILECLOSE Procedure

This procedure closes a `BFILE` that has already been opened through the input locator.

### Note:

The database has only read-only access to `BFILEs`. This means that `BFILEs` cannot be written through the database.

## Syntax

```
DBMS_LOB.FILECLOSE (  
    file_loc IN OUT NOCOPY BFILE);
```

## Parameters

**Table 93-33 FILECLOSE Procedure Parameters**

Parameter	Description
<code>file_loc</code>	Locator for the <code>BFILE</code> to be closed.

## Exceptions

**Table 93-34 FILECLOSE Procedure Exceptions**

Exception	Description
VALUE_ERROR	NULL input value for <code>file_loc</code> .
UNOPENED_FILE	File was not opened with the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

 **See Also:**

- ["FILEOPEN Procedure"](#)
- ["FILECLOSEALL Procedure"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.14 FILECLOSEALL Procedure

This procedure closes all `BFILE`s opened in the session.

### Syntax

```
DBMS_LOB.FILECLOSEALL;
```

### Exceptions

**Table 93-35 FILECLOSEALL Procedure Exception**

Exception	Description
UNOPENED_FILE	No file has been opened in the session.

 **See Also:**

- ["FILEOPEN Procedure"](#)
- ["FILECLOSE Procedure"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.15 FILEEXISTS Function

This function finds out if a specified BFILE locator points to a file that actually exists on the server's file system.

### Syntax

```
DBMS_LOB.FILEEXISTS (
    file_loc    IN    BFILE)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-36 FILEEXISTS Function Parameter**

Parameter	Description
file_loc	Locator for the BFILE.

### Return Values

**Table 93-37 FILEEXISTS Function Return Values**

Return	Description
0	Physical file does not exist.
1	Physical file exists.

### Exceptions

**Table 93-38 FILEEXISTS Function Exceptions**

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

#### See Also:

- ["FILEISOPEN Function"](#).
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.16 FILEGETNAME Procedure

This procedure determines the directory object and filename, given a `BFILE` locator.

This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the `dir_alias` buffer is 30, and for the entire path name, it is 2000.

### Syntax

```
DBMS_LOB.FILEGETNAME (
    file_loc   IN   BFILE,
    dir_alias  OUT  VARCHAR2,
    filename   OUT  VARCHAR2);
```

### Parameters

**Table 93-39 FILEGETNAME Procedure Parameters**

Parameter	Description
<code>file_loc</code>	Locator for the <code>BFILE</code>
<code>dir_alias</code>	Directory object name
<code>filename</code>	Name of the <code>BFILE</code>

### Exceptions

**Table 93-40 FILEGETNAME Procedure Exceptions**

Exception	Description
<code>VALUE_ERROR</code>	Any of the input parameters are <code>NULL</code> or <code>INVALID</code> .
<code>INVALID_ARGVAL</code>	<code>dir_alias</code> or <code>filename</code> are <code>NULL</code> .

### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.17 FILEISOPEN Function

This function finds out whether a `BFILE` was opened with the specified `FILE` locator.

### Syntax

```
DBMS_LOB.FILEISOPEN (
    file_loc IN BFILE)
RETURN INTEGER;
```

## Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 93-41 FILEISOPEN Function Parameter**

Parameter	Description
file_loc	Locator for the BFILE.

## Return Values

INTEGER: 0 = file is not open, 1 = file is open

## Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

## Exceptions

**Table 93-42 FILEISOPEN Function Exceptions**

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

### See Also:

- ["FILEEXISTS Function"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.18 FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

### Syntax

```
DBMS_LOB.FILEOPEN (
  file_loc  IN OUT NOCOPY  BFILE,
  open_mode IN              BINARY_INTEGER := file_readonly);
```

## Parameters

**Table 93-43 FILEOPEN Procedure Parameters**

Parameter	Description
file_loc	Locator for the BFILE.
open_mode	File access is read-only.

## Exceptions

**Table 93-44 FILEOPEN Procedure Exceptions**

Exception	Description
VALUE_ERROR	file_loc or open_mode is NULL.
INVALID_ARGVAL	open_mode is not equal to FILE_READONLY.
OPEN_TOOMANY	Number of open files in the session exceeds session_max_open_files.
NOEXIST_DIRECTORY	Directory associated with file_loc does not exist.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

### See Also:

- ["FILECLOSE Procedure"](#)
- ["FILECLOSEALL Procedure"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.19 FRAGMENT\_DELETE Procedure

This procedure deletes the data at the specified offset for the specified length from the LOB without having to rewrite all the data in the LOB following the specified offset.

### Syntax

```
DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  offset       IN           INTEGER);

DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  offset       IN           INTEGER);
```

## Parameters

**Table 93-45 FRAGMENT\_DELETE Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be removed from the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the deletion

## Exceptions

**Table 93-46 FRAGMENT\_DELETE Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

## 93.9.20 FRAGMENT\_INSERT Procedures

This procedure inserts the specified data (limited to 32K) into the LOB at the specified offset.

### Syntax

```
DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN             INTEGER,
  offset       IN             INTEGER,
  buffer       IN             RAW);

DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN             INTEGER,
  offset       IN             INTEGER,
  buffer       IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

## Parameters

**Table 93-47 FRAGMENT\_INSERT Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

**Table 93-47 (Cont.) FRAGMENT\_INSERT Procedure Parameters**

Parameter	Description
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be inserted into the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the insertion
buffer	Data to insert into the LOB

**Exceptions**

**Table 93-48 FRAGMENT\_INSERT Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

**Usage Notes**

FRAGMENT\_INSERT gets the LOB, if necessary, before performing operations on the LOB.

## 93.9.21 FRAGMENT\_MOVE Procedure

This procedure moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified.

**Syntax**

```
DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  src_offset   IN           INTEGER,
  dest_offset  IN           INTEGER);

DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  src_offset   IN           INTEGER,
  dest_offset  IN           INTEGER);
```

## Parameters

**Table 93-49 FRAGMENT\_MOVE Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be moved in the LOB
src_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
dest_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to remove the data

## Exceptions

**Table 93-50 FRAGMENT\_MOVE Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

## Usage Notes

- All offsets are pre-move offsets.
- Offsets of more than 1 past the end of the LOB are not permitted.
- FRAGMENT\_MOVE gets the LOB, if necessary, before performing operations on the LOB.

## 93.9.22 FRAGMENT\_REPLACE Procedures

This procedure replaces the data at the specified offset with the specified data (not to exceed 32k).

### Syntax

```

DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY BLOB,
  old_amount  IN          INTEGER,
  new_amount  IN          INTEGER,
  offset      IN          INTEGER,
  buffer      IN          RAW);

DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  old_amount  IN          INTEGER,

```

```

new_amount IN          INTEGER,
offset     IN          INTEGER,
buffer     IN          VARCHAR2 CHARACTER SET lob_loc%CHARSET);

```

### Parameters

**Table 93-51** FRAGMENT\_REPLACE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
old_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be replaced in the LOB
new_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be written to the LOB
offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
buffer	Data to insert into the LOB

### Exceptions

**Table 93-52** FRAGMENT\_REPLACE Procedure Exceptions

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

### Usage Notes

- Invoking this procedure is equivalent to deleting the old amount of bytes/characters at offset and then inserting the new amount of bytes/characters at offset.
- FRAGMENT\_REPLACE gets the LOB, if necessary, before performing operations on the LOB.

## 93.9.23 FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in the default temporary tablespace.

### Syntax

```

DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB);

DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

```

## Parameters

**Table 93-53** FREETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

## Usage Notes

- When a new temporary LOB is created, and there is currently no temporary LOB in use with the same duration (session, call), a new temporary LOB segment is created. When the temporary LOB is freed, the space it consumed is released to the temporary segment. If there are no other temporary LOBs for the same duration, the temporary segment is also freed.
- After the call to `FREETEMPORARY`, the LOB locator that was freed is marked as invalid.
- If an invalid LOB locator is assigned to another LOB locator using `OCILOBLocatorAssign` in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.24 GET\_DBFS\_LINK Functions

This function returns the DBFS path name for the specified SecureFile LOB.

### Syntax

```
DBMS_LOB.GET_DBFS_LINK (
  lob_loc          IN      BLOB,
  storage_path     OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  lob_length       OUT NUMBER);
```

```
DBMS_LOB.GET_DBFS_LINK (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  storage_path     OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  lob_length       OUT NUMBER);
```

### Parameters

**Table 93-54** GET\_DBFS\_LINK Function Parameters

Parameter	Description
lob_loc	LOB to be retrieved from DBFS
storage_path	Path where the LOB is stored in DBFS

**Table 93-54 (Cont.) GET\_DBFS\_LINK Function Parameters**

Parameter	Description
lob_length	LOB length at the time of write to DBFS

**Return Values**

The Archive ID

**Exceptions**

**Table 93-55 GET\_DBFS\_LINK Function Exceptions**

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE
ORA-01555	The LOB has already been retrieved and has been modified since retrieval or the LOB has been migrated in and out (modified or not) since the locator was retrieved

## 93.9.25 GET\_DBFS\_LINK\_STATE Procedures

GET\_DBFS\_LINK\_STATE retrieves the current link state of the specified SecureFile.

**Syntax**

```
DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc      IN BLOB,
  storage_path OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  state        OUT NUMBER,
  cached       OUT BOOLEAN);
```

```
DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc      IN CLOB CHARACTER SET ANY_CS,
  storage_path OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
  state        OUT NUMBER,
  cached       OUT BOOLEAN);
```

**Parameters**

**Table 93-56 GET\_DBFS\_LINK\_STATE Procedure Parameters**

Parameter	Description
lob_loc	LOB to be retrieved from the archive
storage_path	Path where the LOB is stored in the DBFS HSM store
state	One of DBFS_LINK_NEVER, DBFS_LINK_NO or DBFS_LINK_YES
cached	If the LOB is archived and the data was specified to be cached on put

## Exceptions

**Table 93-57 GET\_DBFS\_LINK\_STATE Procedure Exceptions**

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

## Usage Notes

- If the LOB has never been archived, state is set to DBMS\_LOB.DBFS\_LINK\_NEVER. If the LOB has been archived, state is set to DBMS\_LOB.DBFS\_LINK\_YES. If the LOB has been previously retrieved from the archive, state is set to DBFS\_LINK\_NO.
- If the LOB was archived, but the data was left in the RDBMS, cached is set to TRUE. If the data was removed after the link was created, cached is set to FALSE, and NULL if state is DBMS\_LOB.DBFS\_LINK\_NEVER.

## 93.9.26 GETCONTENTTYPE Functions

This procedure returns the content type string previously set by means of the SETCONTENTTYPE Procedure.

### Syntax

```
DBMS_LOB.GETCONTENTTYPE (
    lob_loc IN BLOB)
RETURN VARCHAR2;

DBMS_LOB.GETCONTENTTYPE (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(getcontenttype, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-58 GETCONTENTTYPE Function Parameters**

Parameter	Description
lob_loc	LOB whose content type is to be retrieved

### Return Values

The returned content type.

If the SecureFiles LOB does not have a contenttype associated with it, GETCONTENTTYPE( ) returns NULL.

## Exceptions

**Table 93-59 GETCONTENTTYPE Function Exceptions**

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

## Related Topics

- [SETCONTENTTYPE Procedure](#)  
This procedure sets the content type string for the data in the LOB.

## 93.9.27 GET\_STORAGE\_LIMIT Function

This function returns the LOB storage limit for the specified LOB.

### Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

```
DBMS_LOB.GET_STORAGE_LIMIT (
    lob_loc IN BLOB)
RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(get_storage_limit, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-60 GET\_STORAGE\_LIMIT Function Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Return Value

The value returned from this function is the maximum allowable size for specified LOB locator. For BLOBS, the return value depends on the block size of the tablespace the LOB resides in and is calculated as  $(2^{32})-1$  (4294967295) times the block size of the tablespace. For CLOBS/NCLOBS, the value returned is the  $(2^{32})-1$  (4294967295) times the block size of the tablespace divided by the character width of the CLOB/NCLOB.

### Usage

#### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for details on LOB storage limits

## 93.9.28 GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, a multiple of tablespace blocks in bytes. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value. This function returns the amount of space used in the LOB chunk to store the LOB value.

### Syntax

```
DBMS_LOB.GETCHUNKSIZE (  
    lob_loc IN BLOB)  
    RETURN INTEGER;  
  
DBMS_LOB.GETCHUNKSIZE (  
    lob_loc IN CLOB CHARACTER SET ANY_CS)  
    RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksize, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-61 GETCHUNKSIZE Function Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Return Values

The return value is a usable chunk size in bytes.

### Usage Notes

- With regard to basic LOB files, performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the `WRITE` until you have enough for a chunk, instead of issuing several `WRITE` calls for the same chunk.

These tactics of performance improvement do not apply to SecureFiles.

- Note that chunk size is independent of LOB type (`BLOB`, `CLOB`, `NCLOB`, Unicode or other character set).

#### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## Exceptions

**Table 93-62 GETCHUNKSIZE Procedure Exceptions**

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## 93.9.29 GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

### Syntax

```
DBMS_LOB.GETLENGTH (
  lob_loc   IN BLOB)
RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (
  lob_loc   IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (
  file_loc  IN BFILE)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

### Parameters

**Table 93-63 GETLENGTH Function Parameter**

Parameter	Description
file_loc	The file locator for the LOB whose length is to be returned.

### Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob\_loc is NULL. An error is returned in the following cases for BFILES:

- lob\_loc does not have the necessary directory and operating system privileges
- lob\_loc cannot be read because of an operating system read error

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

**Exceptions**

**Table 93-64 GETLENGTH Procedure Exceptions**

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

### 93.9.30 GETOPTIONS Functions

This function obtains compression, deduplication, and encryption settings corresponding to the `option_type` field for a particular LOB.

**Syntax**

```
DBMS_LOB.GETOPTIONS (
  lob_loc          IN      BLOB,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;

DBMS_LOB.GETOPTIONS (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;
```

**Parameters**

**Table 93-65 GETOPTIONS Function Parameter**

Parameter	Description
<code>lob_loc</code>	Locator for the LOB to be examined. For more information, see <a href="#">Operational Notes</a> .
<code>option_type</code>	See <a href="#">Table 93-2</a>

**Return Values**

The return values are a combination of `COMPRESS_ON`, `ENCRYPT_ON` and `DEDUPLICATE_ON` (see [Table 93-3](#)) depending on which option types (see [Table 93-2](#)) are passed in.

**Exceptions**

**Table 93-66 GETOPTIONS Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	A parameter value was invalid

**Table 93-66 (Cont.) GETOPTIONS Procedure Exceptions**

Exception	Description
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call

**Usage Notes**

You cannot turn compression or deduplication on or off for a SecureFile column that does not have those features on. The GetOptions Functions and [SETOPTIONS Procedures](#) work on individual SecureFiles. You can turn off a feature on a particular SecureFile and turn on a feature that has already been turned off by SetOptions, but you cannot turn on an option that has not been given to the SecureFile when the table was created.

## 93.9.31 INSTR Functions

This function returns the matching position of the *n*th occurrence of the pattern in the LOB, starting from the offset you specify.

**Syntax**

```
DBMS_LOB.INSTR (
  lob_loc   IN   BLOB,
  pattern   IN   RAW,
  offset    IN   INTEGER := 1,
  nth       IN   INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  lob_loc   IN   CLOB          CHARACTER SET ANY_CS,
  pattern   IN   VARCHAR2     CHARACTER SET lob_loc%CHARSET,
  offset    IN   INTEGER := 1,
  nth       IN   INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  file_loc  IN   BFILE,
  pattern   IN   RAW,
  offset    IN   INTEGER := 1,
  nth       IN   INTEGER := 1)
RETURN INTEGER;
```

**Pragmas**

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

## Parameters

**Table 93-67 INSTR Function Parameters**

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see <a href="#">Operational Notes</a> .
file_loc	The file locator for the LOB to be examined.
pattern	Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs. The maximum size of the pattern is 16383 bytes.
offset	Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)
nth	Occurrence number, starting at 1.

## Return Values

**Table 93-68 INSTR Function Return Values**

Return	Description
INTEGER	Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.
NULL	Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE.

## Usage Notes

The form of the VARCHAR2 buffer (the `pattern` parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILES, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

## Exceptions

**Table 93-69 INSTR Function Exceptions for BFILES**

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.

**Table 93-69 (Cont.) INSTR Function Exceptions for BFILES**

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

 **See Also:**

## 93.9.32 ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

### Syntax

```
DBMS_LOB.ISOPEN (
    lob_loc IN BLOB)
    RETURN INTEGER;

DBMS_LOB.ISOPEN (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
    RETURN INTEGER;

DBMS_LOB.ISOPEN (
    file_loc IN BFILE)
    RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-70 ISOPEN Function Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
file_loc	File locator.

### Return Values

The return value is 1 if the LOB is open, 0 otherwise.

### Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (BFILEs), ISOPEN also requires a round-trip, because that's where the state is kept.

#### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.33 ISREMOTE Function

This function checks to see if the LOB is local to the database or if it belongs to a remote database.

### Syntax

```

DBMS_LOB.ISREMOTE (
    lob_loc IN BLOB)
    RETURN BOOLEAN;

DBMS_LOB.ISREMOTE (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
    RETURN BOOLEAN;

```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(isremote, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-71 ISREMOTE Function Parameter**

Parameter	Description
lob_loc	Locator for the LOB.

## Return Values

BOOLEAN: TRUE for remote LOBs obtained over a database link; FALSE for LOBs obtained from local database

### See Also:

- *Distributed LOBs* chapter in Database SecureFiles and Large Objects Developer's Guide for more details on the usage of this procedure.

## 93.9.34 ISSECUREFILE Function

This function returns TRUE if the LOB locator passed to it is for a SecureFile LOB. It returns FALSE otherwise.

### Syntax

```
DBMS_LOB ISSECUREFILE(
    lob_loc    IN    BLOB)
RETURN BOOLEAN;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(issecurefile, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 93-72 ISSECUREFILE Function Parameter**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Return Values

This function returns TRUE if the LOB locator passed to it is for a SecureFile LOB. It returns FALSE otherwise.

## 93.9.35 ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

### Syntax

```
DBMS_LOB.ISTEMPORARY (
    lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

## Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 93-73 ISTEMPORARY Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

## Return Values

The return value is 1 if the LOB is temporary and exists; 0 if the LOB is not temporary or does not exist; NULL if the given locator is NULL.

## Usage Notes

When you free a Temporary LOB with `FREETEMPORARY`, the LOB locator is not set to NULL. Consequently, `ISTEMPORARY` will return 0 for a locator that has been freed but not explicitly reset to NULL.

### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.36 LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as `LOADFROMFILE`, and returns the new offsets.

## Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
  dest_lob   IN OUT NOCOPY BLOB,
  src_bfile  IN           BFILE,
  amount     IN           INTEGER,
  dest_offset IN OUT      INTEGER,
  src_offset IN OUT      INTEGER);
```

## Parameters

**Table 93-74 LOADBLOBFROMFILE Procedure Parameters**

Parameter	Description
dest_lob	BLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.

**Table 93-74 (Cont.) LOADBLOBFROMFILE Procedure Parameters**

Parameter	Description
amount	Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.

**Usage Notes**

- You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in bytes for BLOBs.
- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- LOADFROMFILE gets the destination LOB prior to the load unless the load covers the entire LOB.

**Constants and Defaults**

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

**Table 93-75 Suggested Values of the Parameter**

Parameter	Default Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Constants defined in DBMSLOB.SQL

```
lobmaxsize          CONSTANT INTEGER          := DBMS_LOB.LOBMAXSIZE;
```

### Exceptions

**Table 93-76 LOADBLOBFROMFILE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the BLOB

#### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.37 LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

### Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
  dest_lob          IN OUT NOCOPY  NOCOPY CLOB CHARACTER SET ANY_CS,
  src_bfile         IN             BFILE,
  amount           IN             INTEGER,
  dest_offset      IN OUT         INTEGER,
  src_offset       IN OUT         INTEGER,
  bfile_csid       IN             NUMBER,
  lang_context     IN OUT         INTEGER,
  warning          OUT            INTEGER);
```

## Parameters

**Table 93-77 LOADCLOBFROMFILE Procedure Parameters**

Parameter	Description
<code>dest_lob</code>	CLOB/NCLOB locator of the target for the load.
<code>src_bfile</code>	BFILE locator of the source for the load.
<code>amount</code>	Number of bytes to load from the BFILE. Use <code>DBMS_LOB.LOBMAXSIZE</code> of load until the end of the BFILE.
<code>dest_offset</code>	(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.
<code>src_offset</code>	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.
<code>bfile_csid</code>	Character set id of the source (BFILE) file.
<code>lang_context</code>	(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call
<code>warning</code>	(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined the constant value <code>DBMS_LOB.WARN_INCONVERTIBLE_CHAR</code> .

## Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the `BFILE` (unless the amount specified is `LOBMAXSIZE` which you can specify to continue loading until the end of the `BFILE` is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of `CLOB` and national character set in the case of `NCLOB`.
- `csid=0` indicates the default behavior that uses database `csid` for `CLOB` and national `csid` for `NCLOB` in the place of source `csid`. Conversion is still necessary if it is of varying width
- It is not mandatory that you wrap the LOB operation inside the `OPEN/CLOSE` operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the `OPEN/CLOSE`, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

The source `BFILE` can contain data in the Unicode character set. The Unicode standard defines many encoding schemes that provide mappings from Unicode characters to sequences of bytes. [Table 93-78](#) lists Unicode encodings schemes supported by this subprogram.

**Table 93-78 Supported Unicode Encoding Schemes**

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-8	AL32UTF8	873
UTF-16BE	AL16UTF16	2000
UTF-16LE	AL16UTF16LE	2002
CESU-8	UTF8	871
UTF-EBCDIC	UTFE	872
UTF-16	UTF16	1000

All three UTF-16 encoding schemes encode Unicode characters as 2-byte unsigned integers. Integers can be stored in big-endian or in little-endian byte order. The UTF-16BE encoding scheme defines big-endian data. The UTF-16LE scheme defines little-endian data. The UTF-16 scheme requires that the source `BFILE` contains the Byte Order Mark (BOM) character in the first two bytes to define the byte order. The BOM code is `0xFEFF`. If the code is stored as `{0xFE, 0xFF}`, the data is interpreted as big-endian. If it is stored as `{0xFF, 0xFE}`, the data is interpreted as little-endian.

In UTF-8 and in CESU-8 encodings the Byte Order Mark is stored as `{0xEF, 0xBB, 0xBF}`. With any of the Unicode encodings, the corresponding BOM sequence at the beginning of the file is recognized and not loaded into the destination LOB.

## Constants

Here is a summary of the constants and the suggested values that can be used.

**Table 93-79 Suggested Values of the LOADCLOBFROMFILE Parameter**

Parameter	Suggested Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	0 (IN)	default csid, use destination csid
lang_context	0 (IN)	default language context
warning	0 (OUT)	no warning message, everything is ok

Constants defined in DBMSLOB.SQL

```
lobmaxsize          CONSTANT INTEGER      := 18446744073709551615;
warn_inconvertible_char CONSTANT INTEGER      := 1;
default_csid        CONSTANT INTEGER      := 0;
default_lang_ctx    CONSTANT INTEGER      := 0;
no_warning          CONSTANT INTEGER      := 0;
```

## Exceptions

**Table 93-80 LOADCLOBFROMFILE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the CLOB

### See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.38 LOADFROMFILE Procedure

This deprecated procedure copies all, or a part of, a source external LOB (`BFILE`) to a destination internal LOB.

### Note:

This procedure has been deprecated starting in Oracle Database 12c release 12.2.

### Syntax

```
DBMS_LOB.LOADFROMFILE (
  dest_lob   IN OUT NOCOPY BLOB,
  src_file   IN           BFILE,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);
```

### Parameters

**Table 93-81** LOADFROMFILE Procedure Parameters

Parameter	Description
<code>dest_lob</code>	LOB locator of the target for the load.
<code>src_file</code>	<code>BFILE</code> locator of the source for the load.
<code>amount</code>	Number of bytes to load from the <code>BFILE</code> .
<code>dest_offset</code>	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.
<code>src_offset</code>	Offset in bytes in the source <code>BFILE</code> (origin: 1) for the start of the load.

### Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source `BFILE`. The `amount` and `src_offset`, because they refer to the `BFILE`, are in terms of bytes, and the `dest_offset` is either in bytes or characters for `BLOBs` and `CLOBs` respectively.

### Note:

The input `BFILE` must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary `BFILE` data is loaded into a `CLOB`. The `BFILE` data must already be in the same character set as the `CLOB` in the database. No error checking is performed to verify this.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

 **Note:**

If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using `DBMS_LOB.LOADFROMFILE`, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use `sql*loader` instead of `LOADFROMFILE` to load data into a CLOB or NCLOB because `sql*loader` provides the necessary character set conversions.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

**Exceptions**

**Table 93-82 LOADFROMFILE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- <code>src_offset</code> or <code>dest_offset</code> &lt; 1.</li> <li>- <code>src_offset</code> or <code>dest_offset</code> &gt; LOBMAXSIZE.</li> <li>- <code>amount</code> &lt; 1.</li> <li>- <code>amount</code> &gt; LOBMAXSIZE.</li> </ul>

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.39 MOVE\_TO\_DBFS\_LINK Procedures

This procedure archives the specified LOB data (from the database) into the DBFS HSM Store.

### Syntax

```
DBMS_LOB.MOVE_TO_DBFS_LINK (
    lob_loc      IN OUT BLOB,
    storage_path IN      VARCHAR2(dbfs_link_path_max_size),
    flags        IN      BINARY_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

```
DBMS_LOB.MOVE_TO_DBFS_LINK (
    lob_loc      IN OUT CLOB CHARACTER SET ANY_CS,
    storage_path IN      VARCHAR2(dbfs_link_path_max_size),
    flags        IN      BINARY_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

### Parameters

**Table 93-83 MOVE\_TO\_DBFS\_LINK Procedure Parameters**

Parameter	Description
lob_loc	LOB to be archived
storage_path	Path where the LOB will be stored
flags	Either DBFS_LINK_CACHE or DBFS_LINK_NOCACHE. If DBFS_LINK_CACHE is specified, the LOB data continues to be stored in the RDBMS as well as being written to the DBFS store. DBFS_LINK_NOCACHE specifies that the LOB data should be deleted from the RDBMS once written to the DBFS.

### Exceptions

**Table 93-84 MOVE\_TO\_DBFS\_LINK Procedure Exceptions**

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

### Usage Notes

- If the LOB is already archived, the procedure silently returns as if the put was successful. In that case, if DBFS\_LINK\_NOCACHE is specified, or flags is defaulted, the LOB data is removed from the RDBMS.
- Calling this procedure multiple times on the same LOB with the same flags has no effect.
- Calling the procedure on a LOB that is already archived causes the LOB to be cached (DBFS\_LINK\_CACHE) or removed (DBFS\_LINK\_NOCACHE) according to the flag setting.

## 93.9.40 OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

### Syntax

```
DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY BLOB,
  open_mode IN           BINARY_INTEGER);

DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  open_mode IN           BINARY_INTEGER);

DBMS_LOB.OPEN (
  file_loc IN OUT NOCOPY BFILE,
  open_mode IN           BINARY_INTEGER := file_readonly);
```

### Parameters

**Table 93-85 OPEN Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
open_mode	Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.

### Usage Notes

#### Note:

If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILES), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain

and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.41 READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the `buffer` parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the `amount` parameter. If the input `offset` points past the End of LOB, then `amount` is set to 0, and a `NO_DATA_FOUND` exception is raised.

### Syntax

```
DBMS_LOB.READ (
  lob_loc   IN          BLOB,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          RAW);

DBMS_LOB.READ (
  lob_loc   IN          CLOB CHARACTER SET ANY_CS,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          VARCHAR2 CHARACTER SET lob_loc%CHARSET);

DBMS_LOB.READ (
  file_loc  IN          BFILE,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          RAW);
```

### Parameters

**Table 93-86 READ Procedure Parameters**

Parameter	Description
<code>lob_loc</code>	Locator for the LOB to be read. For more information, see <a href="#">Operational Notes</a> .
<code>file_loc</code>	The file locator for the LOB to be examined.
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).
<code>buffer</code>	Output buffer for the read operation.

## Exceptions

Table 93-87 lists exceptions that apply to any LOB instance. Table 93-88 lists exceptions that apply only to BFILES.

**Table 93-87 READ Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- <code>amount &lt; 1</code></li> <li>- <code>amount &gt; 32767</code> bytes (or the character equivalent)</li> <li>- <code>offset &lt; 1</code></li> <li>- <code>offset &gt; LOBMAXSIZE</code></li> <li>- <code>amount</code> is greater, in bytes or characters, than the capacity of buffer.</li> </ul>
NO_DATA_FOUND	End of the LOB is reached, and there are no more bytes or characters to read from the LOB: <code>amount</code> has a value of 0.

**Table 93-88 READ Procedure Exceptions for BFILES**

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## Usage Notes

- The form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.
- When calling `DBMS_LOB.READ` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- `READ` gets the LOB, if necessary, before the read.
- If the LOB is a DBFS LINK, data is streamed from DBFS, if possible, otherwise an exception is thrown.

 **See Also:**

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.42 SET\_DBFS\_LINK Procedures

This function links the specified SecureFile to the specified path name. It does not copy the data to the path.

### Syntax

```

DBMS_LOB.SET_DBFS_LINK (
  lob_loc      IN OUT BLOB,
  archive_id   IN      RAW(1024));

DBMS_LOB.SET_DBFS_LINK(
  lob_loc_dst  IN OUT CLOB CHARACTER SET ANY_CS,
  archive_id   IN      RAW(1024));

```

### Parameters

**Table 93-89** SET\_DBFS\_LINK Procedure Parameters

Parameter	Description
lob_loc	LOB for which to store the reference value
archive_id	Archive ID as returned by calling either of the <a href="#">GET_DBFS_LINK Functions</a>

### Exceptions

**Table 93-90** SET\_DBFS\_LINK Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

## 93.9.43 SETCONTENTTYPE Procedure

This procedure sets the content type string for the data in the LOB.

### Syntax

```

DBMS_LOB.SETCONTENTTYPE (
  lob_loc      IN OUT NOCOPY BLOB,
  contenttype  IN      VARCHAR2);

DBMS_LOB.SETCONTENTTYPE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  contenttype  IN      VARCHAR2);

```

## Parameters

**Table 93-91 SETCONTENTTYPE Procedure Parameters**

Parameter	Description
lob_loc	LOB to be assigned the content type
contenttype	String to be assigned

## Exceptions

**Table 93-92 SETCONTENTTYPE Procedure Exceptions**

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

## Usage Notes

To clear an existing content type associated with a SECUREFILE, invoke SETCONTENTTYPE with contenttype set to empty string.

## 93.9.44 SETOPTIONS Procedures

This procedure enables/disables compression and deduplication on a per-LOB basis, overriding the default LOB column settings.

### Syntax

```
DBMS_LOB.SETOPTIONS (
    lob_loc          IN      BLOB,
    option_types     IN      PLS_INTEGER,
    options          IN      PLS_INTEGER);

DBMS_LOB.SETOPTIONS (
    lob_loc          IN      CLOB CHARACTER SET ANY_CS,
    option_types     IN      PLS_INTEGER,
    options          IN      PLS_INTEGER);
```

## Parameters

**Table 93-93 SETOPTIONS Procedure Parameter**

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see <a href="#">Operational Notes</a> .
option_type	See <a href="#">Table 93-2</a>
options	See <a href="#">Table 93-3</a>

## Exceptions

**Table 93-94** SETOPTIONS Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled

## Usage Notes

- DBMS\_LOB.SETOPTIONS cannot be used to enable or disable encryption on individual LOBs.
- You cannot turn the compression or deduplication features on or off for a SecureFile column if they were not turned when the table was created.

The [GETOPTIONS Functions](#) and SETOPTIONS Procedures work on individual SecureFiles. You can turn off compression or deduplication on a particular SecureFiles LOB and turn them on, *if* they have already been turned off by SETOPTIONS.

- This call incurs a round-trip to the server to make the changes persistent.

## 93.9.45 SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width *n*-byte CLOBs, if the input amount for SUBSTR is greater than  $(32767/n)$ , then SUBSTR returns a character buffer of length  $(32767/n)$ , or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, *n* is the maximum byte-width used for characters in the CLOB.

### Syntax

```
DBMS_LOB.SUBSTR (
  lob_loc      IN      BLOB,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;
```

```
DBMS_LOB.SUBSTR (
  lob_loc      IN      CLOB CHARACTER SET ANY_CS,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;
```

```
DBMS_LOB.SUBSTR (
  file_loc     IN      BFILE,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;
```

## Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

## Parameters

**Table 93-95 SUBSTR Function Parameters**

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see <a href="#">Operational Notes</a> .
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to be read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).

## Return Values

**Table 93-96 SUBSTR Function Return Values**

Return	Description
RAW	Function overloading that has a BLOB or BFILE in parameter.
VARCHAR2	CLOB version.
NULL	Either: <ul style="list-style-type: none"> <li>- any input parameter is NULL</li> <li>- amount &lt; 1</li> <li>- amount &gt; 32767</li> <li>- offset &lt; 1</li> <li>- offset &gt; LOBMAXSIZE</li> </ul>

## Exceptions

**Table 93-97 SUBSTR Function Exceptions for BFILE operations**

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

### Usage Notes

- The form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.
- When calling `DBMS_LOB.SUBSTR` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- `DBMS_LOB.SUBSTR` will return 8191 or more characters based on the characters stored in the LOBs. If all characters are not returned as a consequence of the character byte size exceeding the available buffer, the user should either call `DBMS_LOB.SUBSTR` with a new offset to read the remaining characters, or call the subprogram on loop until all the data is extracted.
- `SUBSTR` gets the LOB, if necessary, before read.
- If the LOB is a DBFS Link, the data is streamed from DBFS, if possible, otherwise, an exception is thrown.

#### See Also:

- ["READ Procedures"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.46 TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the `newLen` parameter.

Specify the length in bytes for `BLOBs`, and specify the length in characters for `CLOBs`.

#### Note:

The `TRIM` procedure decreases the length of the LOB to the value specified in the `newLen` parameter.

If you attempt to `TRIM` an empty LOB, then nothing occurs, and `TRIM` returns no error. If the new length that you specify in `newLen` is greater than the size of the LOB, then an exception is raised.

### Syntax

```
DBMS_LOB.TRIM (  
    lob_loc          IN OUT NOCOPY BLOB,
```

```

newlen          IN          INTEGER);
DBMS_LOB.TRIM (
lob_loc         IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
newlen         IN          INTEGER);

```

### Parameters

**Table 93-98 TRIM Procedure Parameters**

Parameter	Description
lob_loc	Locator for the internal LOB whose length is to be trimmed. For more information, see <a href="#">Operational Notes</a> .
newlen	New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.

### Exceptions

**Table 93-99 TRIM Procedure Exceptions**

Exception	Description
VALUE_ERROR	lob_loc is NULL.
INVALID_ARGVAL	Either: - new_len < 0 - new_len > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML parallel execution server
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

### Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- TRIM gets the LOB, if necessary, before altering the length of the LOB, unless the new length specified is '0'

 **See Also:**

- ["ERASE Procedures"](#)
- ["WRITEAPPEND Procedures"](#)
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.47 WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the `buffer` parameter.

`WRITE` replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

### Syntax

```
DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY BLOB,
  amount   IN           INTEGER,
  offset   IN           INTEGER,
  buffer   IN           RAW);
```

```
DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount   IN           INTEGER,
  offset   IN           INTEGER,
  buffer   IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

### Parameters

**Table 93-100** WRITE Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see <a href="#">Operational Notes</a>
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.
<code>buffer</code>	Input buffer for the write

## Exceptions

**Table 93-101 WRITE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - <code>amount &lt; 1</code> - <code>amount &gt; 32767</code> bytes (or the character equivalent) - <code>offset &lt; 1</code> - <code>offset &gt; LOBMAXSIZE</code>
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML parallel execution server
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB
SECUREFILE_OUTOFBOUNDS	Attempted to perform a write operation past the end of a LOB having <code>FRAGMENT_*</code> on it

## Usage Notes

- There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.
- The form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.
- When calling `DBMS_LOB.WRITE` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.
- It is not mandatory that you wrap the LOB operation inside the `Open/Close` interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the `Open/Close` API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- `WRITE` gets the LOB, if necessary, before writing the LOB, unless the write is specified to overwrite the entire LOB.

 **See Also:**

- "APPEND Procedures"
- "COPY Procedures"
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## 93.9.48 WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the `buffer` parameter.

### Syntax

```
DBMS_LOB.WRITEAPPEND (
    lob_loc IN OUT NOCOPY BLOB,
    amount IN             INTEGER,
    buffer IN             RAW);

DBMS_LOB.WRITEAPPEND (
    lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    amount IN             INTEGER,
    buffer IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

### Parameters

**Table 93-102** WRITEAPPEND Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see <a href="#">Operational Notes</a>
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write
<code>buffer</code>	Input buffer for the write

### Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

### Exceptions

**Table 93-103** WRITEAPPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.

**Table 93-103 (Cont.) WRITEAPPEND Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	Either: - amount < 1 - amount > 32767 bytes (or the character equivalent)
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML parallel execution server
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

### Usage Notes

- The form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.
- When calling `DBMS_LOB.WRITEAPPEND` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.
- It is not mandatory that you wrap the LOB operation inside the `Open/Close` interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the `Open/Close` API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- `WRITEAPPEND` gets the LOB, if necessary, before appending to the LOB.

# DBMS\_LOCK

The `DBMS_LOCK` package provides an interface to Oracle Lock Management services.

You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Summary of DBMS\\_LOCK Subprograms](#)

## See Also:

For more information, and an example of how to use the `DBMS_LOCK` package, see *Oracle Database Development Guide*.

## 94.1 DBMS\_LOCK Overview

The `DBMS_LOCK` package has many beneficial uses.

These uses include the following:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

## 94.2 DBMS\_LOCK Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

## 94.3 DBMS\_LOCK Constants

The DBMS\_LOCK package includes several constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 94-1 DBMS\_LOCK Constants**

Name	Alternate Name(s)	Type	Value	OEM Abbreviation	Description
NL_MODE	NuLl	INTEGER	1	-	-
SS_MODE	Sub Shared	INTEGER	2	ULRS	This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.
SX_MODE	<ul style="list-style-type: none"> <li>Sub eXclusive</li> <li>Row Exclusive Mode</li> </ul>	INTEGER	3	ULRX	This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.
S_MODE	<ul style="list-style-type: none"> <li>Shared</li> <li>Row Exclusive Mode</li> <li>Intended Exclusive</li> </ul>	INTEGER	4	ULRSX	-
SSX_MODE	<ul style="list-style-type: none"> <li>Shared Sub eXclusive</li> <li>Share Row Exclusive Mode</li> </ul>	INTEGER	5	-	This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.
X_MODE	Exclusive	INTEGER	6	ULX	-

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

## 94.4 DBMS\_LOCK. Rules and Limits

When another process holds "held", an attempt to get "get" succeeds or fails, based on the held mode and type of get.

The following table describes the results:

**Table 94-2 Lock Compatibility**

HELD MODE	GET NL	GET SS	GET SX	GET S	GET SSX	GET X
NL	Success	Success	Success	Success	Success	Success
SS	Success	Success	Success	Success	Success	Fail

**Table 94-2 (Cont.) Lock Compatibility**

HELD MODE	GET NL	GET SS	GET SX	GET S	GET SSX	GET X
SX	Success	Success	Success	Fail	Fail	Fail
S	Success	Success	Fail	Success	Fail	Fail
SSX	Success	Success	Fail	Fail	Fail	Fail
X	Success	Fail	Fail	Fail	Fail	Fail

```
maxwait constant integer := 32767;
```

The constant `maxwait` waits forever.

## 94.5 DBMS\_LOCK Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views.

User locks are automatically released when a session terminates. The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

`DBMS_LOCK` is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

## 94.6 Summary of DBMS\_LOCK Subprograms

This table lists the `DBMS_LOCK` subprograms and briefly describes them.

**Table 94-3 DBMS\_LOCK Package Subprograms**

Subprogram	Description
<a href="#">ALLOCATE_UNIQUE Procedure</a>	Allocates a unique lock ID to a named lock
<a href="#">CONVERT Function</a>	Converts a lock from one mode to another
<a href="#">RELEASE Function</a>	Releases a lock
<a href="#">REQUEST Function</a>	Requests a lock of a specific mode.

### 94.6.1 ALLOCATE\_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) a specified lock name. Lock identifiers are used to enable applications to

coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

### Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
    lockname          IN  VARCHAR2,
    lockhandle        OUT VARCHAR2,
    expiration_secs   IN  INTEGER  DEFAULT 864000);
```

### Parameters

**Table 94-4 ALLOCATE\_UNIQUE Procedure Parameters**

Parameter	Description
lockname	Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA\$; these are reserved for products supplied by Oracle.
lockhandle	Returns the handle to the lock ID generated by ALLOCATE_UNIQUE. You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE. A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.
expiration_secs	Number of seconds to wait after the last ALLOCATE_UNIQUE has been performed on a specified lock, before permitting that lock to be deleted from the DBMS_LOCK_ALLOCATED table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to ALLOCATE_UNIQUE may delete expired locks to recover space.

### Usage Notes

If you choose to identify locks by name, you can use ALLOCATE\_UNIQUE to generate a unique lock identification number for these named locks.

The first session to call ALLOCATE\_UNIQUE with a new lock name causes a unique lock ID to be generated and stored in the dbms\_lock\_allocated table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least expiration\_secs (defaults to 10 days) past the last call to ALLOCATE\_UNIQUE with the specified lock name. After this time, the row in the dbms\_lock\_allocated table for this lock name may be deleted in order to recover space. ALLOCATE\_UNIQUE performs a commit.

**⚠ WARNING:**

Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a specified name.

**Exceptions**

ORA-20000, ORU-10003: Unable to find or insert lock <lockname> into catalog dbms\_lock\_allocated.

## 94.6.2 CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE\_UNIQUE procedure.

**Syntax**

```
DBMS_LOCK.CONVERT(
  id          IN INTEGER ||
  lockhandle  IN VARCHAR2,
  lockmode   IN INTEGER,
  timeout     IN NUMBER DEFAULT MAXWAIT)
RETURN INTEGER;
```

**Parameters**

**Table 94-5 CONVERT Function Parameters**

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change
lockmode	New mode that you want to assign to the specified lock. For the available modes and their associated integer identifiers, see <a href="#">Constants</a> .
timeout	Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).

**Return Values**

**Table 94-6 CONVERT Function Return Values**

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error

**Table 94-6 (Cont.) CONVERT Function Return Values**

Return Value	Description
4	Don't own lock specified by id or lockhandle
5	Illegal lock handle

## 94.6.3 RELEASE Function

This function explicitly releases a lock previously acquired using the `REQUEST` function.

Locks are automatically released at the end of a session. `RELEASE` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

### Syntax

```
DBMS_LOCK.RELEASE (
    id          IN INTEGER)
RETURN INTEGER;
```

```
DBMS_LOCK.RELEASE (
    lockhandle IN VARCHAR2)
RETURN INTEGER;
```

### Parameters

**Table 94-7 RELEASE Function Parameter**

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change

### Return Values

**Table 94-8 RELEASE Function Return Values**

Return Value	Description
0	Success
3	Parameter error
4	Do not own lock specified by id or lockhandle
5	Illegal lock handle

## 94.6.4 REQUEST Function

This function requests a lock with a specified mode.

`REQUEST` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

## Syntax

```

DBMS_LOCK.REQUEST(
  id          IN  INTEGER ||
  lockhandle  IN  VARCHAR2,
  lockmode    IN  INTEGER DEFAULT X_MODE,
  timeout     IN  INTEGER DEFAULT MAXWAIT,
  release_on_commit IN  BOOLEAN DEFAULT FALSE)
RETURN INTEGER;

```

The current default values, such as `X_MODE` and `MAXWAIT`, are defined in the `DBMS_LOCK` package specification.

## Parameters

**Table 94-9** REQUEST Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change
lockmode	Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see <a href="#">Constants</a> .
timeout	Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 (timeout).
release_on_commit	Set this parameter to <code>TRUE</code> to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session.

## Return Values

**Table 94-10** REQUEST Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Already own lock specified by id or lockhandle
5	Illegal lock handle

# DBMS\_LOGMNR

The `DBMS_LOGMNR` package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS\\_LOGMNR Subprograms](#)

## See Also:

*Oracle Database Utilities* for information regarding LogMiner.

## 95.1 DBMS\_LOGMNR Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

**See Also:**

[DBMS\\_LOGMNR\\_D](#) for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

## 95.2 DBMS\_LOGMNR Security Model

You must have the `EXECUTE_CATALOG_ROLE` role to use the `DBMS_LOGMNR` package.

## 95.3 DBMS\_LOGMNR Constants

The `DBMS_LOGMNR` package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, `DBMS_LOGMNR.NEW`.

The following table describes the constants for the `ADD_LOGFILE` options flag in the `DBMS_LOGMNR` package.

**Table 95-1 Constants for ADD\_LOGFILE Options Flag**

Constant	Description
<code>NEW</code>	Implicitly calls the <code>DBMS_LOGMNR.END_LOGMNR</code> procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.
<code>ADDFILE</code>	Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception ( <code>ORA-01289</code> ). This is the default if no options flag is specified.

[Table 95-2](#) describes the constants for the `START_LOGMNR` options flag in the `DBMS_LOGMNR` package.

**Table 95-2 Constants for START\_LOGMNR Options Flag**

Constant	Description
<code>COMMITTED_DATA_ONLY</code>	<p>If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on).</p> <p>If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).</p>

**Table 95-2 (Cont.) Constants for START\_LOGMNR Options Flag**

Constant	Description
SKIP_CORRUPTION	Directs a select operation on the V\$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V\$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.
DDL_DICT_TRACKING	If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open.  This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9i.
DICT_FROM_ONLINE_CATALOG	Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed.  This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files. Expect to see a value of 2 in the STATUS column of the V\$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.
DICT_FROM_REDO_LOGS	If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.
NO_SQL_DELIMITER	If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.
NO_ROWID_IN_STMT	If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled.  When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.
PRINT_PRETTY_SQL	If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.

**Table 95-2 (Cont.) Constants for START\_LOGMNR Options Flag**

Constant	Description
CONTINUOUS_MINE	Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled.
STRING_LITERALS_IN_ST MT	If set, SQL_REDO and SQL_UNDO use literals for numbers and datetime and interval column types.

 **Note:**

As of Oracle Database 12c Release 2 (12.2.0.1), the LogMiner CONTINUOUS\_MINE option is deprecated. It is still supported for backward compatibility reasons, but Oracle recommends that you discontinue using it. There is no replacement functionality.

To specify more than one option, use a plus sign (+) between them. For example:

```
EXECUTE DBMS_LOGMNR.START_LOGMNR(OPTIONS => -
    DBMS_LOGMNR.DDL_DICT_TRACKING + DBMS_LOGMNR.DICT_FROM_REDO_LOGS);
```

## 95.4 DBMS\_LOGMNR Views

The DBMS\_LOGMNR package uses the views listed under *Accessing Logminer Operational Information In Views in Oracle Database Utilities*.

 **See Also:**

*Oracle Database Utilities*

## 95.5 DBMS\_LOGMNR Operational Notes

A **LogMiner session** begins with a call to DBMS\_LOGMNR.ADD\_LOGFILE or DBMS\_LOGMNR.START\_LOGMNR (the former if you plan to specify log files explicitly; the

latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`.

Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue SQL `SELECT` statements against the `V$logmnr_contents` view to retrieve the data of interest.

## 95.6 Summary of DBMS\_LOGMNR Subprograms

This table lists the `DBMS_LOGMNR` subprograms and briefly describes them.

In a multitenant container database (CDB) some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

**Table 95-3 DBMS\_LOGMNR Package Subprograms**

Subprogram	Description
<a href="#">ADD_LOGFILE Procedure</a>	Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session
<a href="#">COLUMN_PRESENT Function</a>	Call this function for any row returned from the <code>V\$logmnr_contents</code> view to determine if undo or redo column values exist for the column specified by the <code>column_name</code> input parameter to this function
<a href="#">END_LOGMNR Procedure</a>	Finishes a LogMiner session
<a href="#">MINE_VALUE Function</a>	Call this function for any row returned from the <code>V\$logmnr_contents</code> view to retrieve the undo or redo column value of the column specified by the <code>column_name</code> input parameter to this function
<a href="#">REMOVE_LOGFILE Procedure</a>	Removes a redo log file from the list of redo log files for LogMiner to process
<a href="#">START_LOGMNR Procedure</a>	Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to <code>DBMS_LOGMNR.ADD_LOGFILE</code> )

### 95.6.1 ADD\_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

In a CDB, the `ADD_LOGFILE` procedure must be called from the root database. You must have the `LOGMINING` administrative privilege to use this procedure.

#### Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
  LogFileName      IN VARCHAR2,
  options          IN BINARY_INTEGER default ADDFILE );
```

## Parameters

**Table 95-4 ADD\_LOGFILE Procedure Parameters**

Parameter	Description
LogFileName	Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.
options	Does one of the following: <ul style="list-style-type: none"> <li>Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW)</li> <li>Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE)</li> </ul> See <a href="#">Table 95-1</a> .

## Exceptions

**Table 95-5 ADD\_LOGFILE Procedure Exceptions**

Exception	Description
ORA-01284	Specified file cannot be opened.
ORA-01287	Specified file is from a different database incarnation.
ORA-01289	Specified file has already been added to the list. Duplicate redo log files cannot be added.
ORA-01290	Specified file is not in the current list and therefore cannot be removed from the list.
ORA-01324	Specified file cannot be added to the list because there is a DB_ID mismatch.

## Usage Notes

- Before querying the V\$LOGMNR\_CONTENTS view, you must make a successful call to the DBMS\_LOGMNR.START\_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS\_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD\_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS\_MINE option and you want to analyze more than one redo log file, you must call the ADD\_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.
- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)

- To analyze the redo log files from a different database (or a database incarnation with a different database `RESETLOGS SCN`) than that with which the current list of redo log files is associated, use the `END_LOGMNR` procedure to end the current LogMiner session, and then build a new list using the `ADD_LOGFILE` procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

## 95.6.2 COLUMN\_PRESENT Function

This function is designed to be used in conjunction with the `MINE_VALUE` function.

If the `MINE_VALUE` function returns a `NULL` value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a `NULL` value.

To distinguish between these two cases, use the `COLUMN_PRESENT` function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

### Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN NUMBER;
```

### Parameters

**Table 95-6 COLUMN\_PRESENT Function Parameters**

Parameter	Description
<code>sql_redo_undo</code>	Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V\$logmnr_contents</code> view from which to extract data values. See the Usage Notes for more information.
<code>column_name</code>	Specifies the fully qualified name ( <code>schema.table.column</code> ) of the column for which this function will return information.  In a CDB, the column name is specified as follows: <code>container_name: schema.table.column</code>

### Return Values

[Table 95-7](#) describes the return values for the `COLUMN_PRESENT` function. The `COLUMN_PRESENT` function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of `NULL` values returned by the `DBMS_LOGMNR.MINE_VALUE` function.

**Table 95-7 Return Values for COLUMN\_PRESENT Function**

Return	Description
0	Specified column is not present in this row of V\$LOGMNR_CONTENTS.
1	Column is present in this row of V\$LOGMNR_CONTENTS.

**Exceptions****Table 95-8 COLUMN\_PRESENT Function Exceptions**

Exception	Description
ORA-01323	Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Value specified for the <code>column_name</code> parameter is not a fully qualified column name.

**Usage Notes**

- To use the `COLUMN_PRESENT` function, you must have successfully started LogMiner.
- The `COLUMN_PRESENT` function must be invoked in the context of a select operation on the `V$LOGMNR_CONTENTS` view.
- The `COLUMN_PRESENT` function does not support `LONG`, `LOB`, `ADT`, or `COLLECTION` datatypes.
- The value for the `sql_redo_undo` parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify `UNDO_VALUE`.
  - If an update operation was performed and you want to know what the value is after the update operation, specify `REDO_VALUE`.
  - If an insert operation was performed, typically you would specify `REDO_VALUE` (because the value of a column prior to an insert operation will always be `NULL`).
  - If a delete operation was performed, typically you would specify `UNDO_VALUE` (because the value of a column after a delete operation will always be `NULL`).

### 95.6.3 END\_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a

database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

### Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

### Exceptions

**Table 95-9 END\_LOGMNR Procedure Exception**

Exception	Description
ORA-01307	No LogMiner session is currently active. The <code>END_LOGMNR</code> procedure was called without adding any log files or before the <code>START_LOGMNR</code> procedure was called

## 95.6.4 MINE\_VALUE Function

This function facilitates queries based on a column's data value.

This function takes two arguments. The first one specifies whether to mine the redo (`REDO_VALUE`) or undo (`UNDO_VALUE`) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The `MINE_VALUE` function always returns a string that can be converted back to the original datatype.

### Syntax

```
DBMS_LOGMNR.MINE_VALUE (
    sql_redo_undo    IN RAW,
    column_name      IN VARCHAR2 default '') RETURN VARCHAR2;
```

### Parameters

**Table 95-10 MINE\_VALUE Function Parameters**

Parameter	Description
<code>sql_redo_undo</code>	Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V\$logmnr_contents</code> view from which to extract data values. See the Usage Notes for more information.
<code>column_name</code>	Specifies the fully qualified name ( <code>schema.table.column</code> ) of the column for which this function will return information. In a CDB, the column name is specified as follows: <code>container_name:schema.table.column</code>

## Return Values

**Table 95-11 Return Values for MINE\_VALUE Function**

Return	Description
NULL	The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.
NON-NULL	The column is contained within the self-describing record; the value is returned in string format.

## Exceptions

**Table 95-12 MINE\_VALUE Function Exceptions**

Exception	Description
ORA-01323	Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Invalid identifier. The value specified for the <code>column_name</code> parameter was not a fully qualified column name.

## Usage Notes

- To use the MINE\_VALUE function, you must have successfully started LogMiner.
- The MINE\_VALUE function must be invoked in the context of a select operation from the V\$LOGMNR\_CONTENTS view.
- The MINE\_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the `sql_redo_undo` parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO\_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO\_VALUE.
  - If an insert operation was performed, typically you would specify REDO\_VALUE (because the value of a column prior to an insert operation will always be null).
  - If a delete operation was performed, typically you would specify UNDO\_VALUE (because the value of a column after a delete operation will always be null).
- If the DBMS\_LOGMNR.MINE\_VALUE function is used to get an NCHAR value that includes characters not found in the database character set, then those characters are returned as the replacement character (for example, an inverted question mark) of the database character set.

## 95.6.5 REMOVE\_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

In a CDB, the `REMOVE_LOGFILE` procedure must be called from the root database. You must have the `LOGMINING` administrative privilege to use this procedure.

### Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (  
    LogFileName      IN VARCHAR2);
```

### Parameters

**Table 95-13 REMOVE\_LOGFILE Procedure Parameters**

Parameter	Description
LogFileName	Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.

### Exceptions

**Table 95-14 REMOVE\_LOGFILE Procedure Exception**

Exception	Description
ORA-01290	Cannot remove unlisted log file

### Usage Notes

- Before querying the `V$LOGMNR_CONTENTS` view, you must make a successful call to the `DBMS_LOGMNR.START_LOGMNR` procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the `END_LOGMNR` procedure to end the current LogMiner session, and then build a new list using the `ADD_LOGFILE` procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the `ADD_LOGFILE` procedure must match the database ID and `RESETLOGS SCN` of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database `RESETLOGS SCN`) than that with which the current list of redo log files is associated, use the `END_LOGMNR` procedure to end the current LogMiner session, and then build a new list using the `ADD_LOGFILE` procedure.

## 95.6.6 START\_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

In a CDB, the `START_LOGMNR` procedure must be called from the root database. You must have the `LOGMINING` administrative privilege to use this procedure.

### Syntax

```
DBMS_LOGMNR.START_LOGMNR (
  startScn          IN NUMBER default 0,
  endScn            IN NUMBER default 0,
  startTime         IN DATE default '01-jan-1988',
  endTime           IN DATE default '31-dec-2110',
  DictFileName     IN VARCHAR2 default '',
  Options           IN BINARY_INTEGER default 0 );
```

### Parameters

**Table 95-15 START\_LOGMNR Procedure Parameters**

Parameter	Description
<code>startScn</code>	Directs LogMiner to return only redo records with an SCN greater than or equal to the <code>startScn</code> specified. This fails if there is no redo log file containing the specified <code>startScn</code> value. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
<code>endScn</code>	Directs LogMiner to return only redo records with an SCN less than or equal to the <code>endScn</code> specified. If you specify an <code>endScn</code> value that is beyond the value in any redo log file, then LogMiner uses the greatest <code>endScn</code> value in the redo log file that contains the most recent changes. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
<code>startTime</code>	Directs LogMiner to return only redo records with a timestamp greater than or equal to the <code>startTime</code> specified. This fails if there is no redo log file containing the specified <code>startTime</code> value. (You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.)  This parameter is ignored if <code>startScn</code> is specified. See the Usage Notes for additional information.

**Table 95-15 (Cont.) START\_LOGMNR Procedure Parameters**

Parameter	Description
endTime	Directs LogMiner to return only redo records with a timestamp less than or equal to the endTime specified. If you specify an endTime value that is beyond the value in any redo log file, then LogMiner will use the greatest endTime in the redo log file that contains the most recent changes. You can query the FILENAME, LOW_TIME, and HIGH_TIME columns in the V\$LOGMNR_LOGS view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if endScn is specified. See the Usage Notes for additional information.
DictFileName	Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct SQL_REDO and SQL_UNDO columns in V\$LOGMNR_CONTENTS, as well as to fully translate SEG_NAME, SEG_OWNER, SEG_TYPE_NAME, TABLE_NAME, and TABLE_SPACE columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the DBMS_LOGMNR_D.BUILD procedure.) You need to specify this parameter only if neither DICT_FROM_REDO_LOGS nor DICT_FROM_ONLINE_CATALOG is specified.
options	See <a href="#">Table 95-2</a> .

**Exceptions****Table 95-16 START\_LOGMNR Procedure Exceptions**

Exception	Description
ORA-01280	Internal error encountered.
ORA-01281	startScn or endScn parameter value is not a valid SCN, or endScn is less than startScn.
ORA-01282	value for the startTime parameter was greater than the value specified for the endTime parameter, or there was no redo log file that was compatible with the date range specified with the startTime and endTime parameters.
ORA-01283	Options parameter specified is invalid.
ORA-01284	LogMiner dictionary file specified in the DictFileName parameter has a full path length greater than 256 characters, or the file cannot be opened.
ORA-01285	Error reading specified file.
ORA-01291	Redo log files that are needed to satisfy the user's requested SCN or time range are missing.
ORA-01292	No log file has been specified for the current LogMiner session.
ORA-01293	Mounted database required for specified LogMiner options.
ORA-01294	Error occurred while processing information in the specified dictionary file, possible corruption.

**Table 95-16 (Cont.) START\_LOGMNR Procedure Exceptions**

Exception	Description
ORA-01295	Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.
ORA-01296	Character set mismatch between specified LogMiner dictionary and log files.
ORA-01297	Redo version mismatch between LogMiner dictionary and log files.
ORA-01299	Specified LogMiner dictionary corresponds to a different database incarnation.
ORA-01300	Writable database required for specified LogMiner options.

**Usage Notes**

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system.
- After executing the `START_LOGMNR` procedure, you can query the following views:
  - `V$LOGMNR_CONTENTS` - contains history of information in redo log files
  - `V$LOGMNR_DICTIONARY` - contains current information about the LogMiner dictionary file extracted to a flat file
  - `V$LOGMNR_PARAMETERS` - contains information about the LogMiner session

(You can query the `V$LOGMNR_LOGS` view after a redo log file list has been added to the list of files that LogMiner is to mine.)
- Parameters and options are not persistent across calls to `DBMS_LOGMNR.START_LOGMNR`. You must specify all desired parameters and options (including SCN and time ranges) each time you call `DBMS_LOGMNR.START_LOGMNR`.
- Be aware that specifying redo log files using a timestamp is not precise.
- The `CONTINUOUS_MINE` option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the `CONTINUOUS_MINE` option:
  - The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the `V$ARCHIVED_LOGS` view to determine which redo log file entries will be found by LogMiner.
 

Even if an entry is listed in the database control file (and the `V$ARCHIVED_LOGS` view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be available.
  - If you specify the `CONTINUOUS_MINE` option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the `V$LOGMNR_CONTENTS` view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will

automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.

- LogMiner can mine online redo logs. However, if the `CONTINUOUS_MINE` option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.
- Keep the following in mind regarding starting and ending times or SCN ranges:
  - If you specify neither a `startTime` nor a `startScn` parameter, LogMiner will set the `startScn` parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
  - If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
  - If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
  - If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` without the `CONTINUOUS_MINE` option, and you specify:
    - \* 0 for the `startTime` or `startScn` value, then the lowest SCN in the LogMiner redo log file list will be used as the `startScn`
    - \* A nonzero number for the `startTime` or `startScn` value, then an error is returned
    - \* 0 or a nonzero number for the `endTime` or `endScn` value, then the highest SCN in the LogMiner redo log file list will be used as the `endScn`
  - If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` with the `CONTINUOUS_MINE` option, and you specify:
    - \* 0 for the `startTime` or `startScn` value, then an error is returned.
    - \* A `startTime` or `startScn` value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the `V$LOGMNR_CONTENTS` view.
    - \* An `endTime` or `endScn` parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
    - \* 0 for the `endTime` or `endScn` parameter value, then LogMiner includes the online redo log files when it mines. When you query the

V\$logmnr\_contents view, rows will be returned from this view as changes are made to the database, and will not stop until you enter CTL+C or you terminate the PL/SQL cursor.

## DBMS\_LOGMNR\_D

The `DBMS_LOGMNR_D` package, one of a set of LogMiner packages, contains two subprograms: the `BUILD` procedure and the `SET_TABLESPACE` procedure.

- The `BUILD` procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The `SET_TABLESPACE` procedure re-creates all LogMiner tables in an alternate tablespace.

The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_LOGMNR\\_D Subprograms](#)

### See Also:

*Oracle Database Utilities* for information regarding LogMiner.

## 96.1 DBMS\_LOGMNR\_D Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you.

LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

**See Also:**

[DBMS\\_LOGMNR](#) for information on the package subprograms used in running a LogMiner session.

## 96.2 DBMS\_LOGMNR\_D Security Model

You must have the `EXECUTE_CATALOG_ROLE` role to use the `DBMS_LOGMNR_D` package.

## 96.3 Summary of DBMS\_LOGMNR\_D Subprograms

This table lists and briefly describes the `DBMS_LOGMNR_D` subprograms.

In a multitenant container database (CDB), some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

**Table 96-1 DBMS\_LOGMNR\_D Package Subprograms**

Subprogram	Description
<a href="#">BUILD Procedure</a>	Extracts the LogMiner dictionary to either a flat file or one or more redo log files
<a href="#">SET_TABLESPACE Procedure</a>	Re-creates all LogMiner tables in an alternate tablespace

### 96.3.1 BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

The following considerations apply to a multitenant container database (CDB) environment.

- In a CDB environment, when you extract to the redo log files, the `BUILD` procedure must be called from the root database. The LogMiner data dictionary for the entire CDB is extracted to the redo log files.
- In a CDB environment, when you extract to flat files, you can mine only one pluggable database (PDB) at a time. You must first explicitly build the flat file dictionary for that specific PDB by running the `BUILD` procedure from it. The LogMiner data dictionary for each PDB for which the `BUILD` procedure is run is extracted to a flat file.
- You cannot add or remove PDBs from a CDB while this procedure is executing.

#### Syntax

```
DBMS_LOGMNR_D.BUILD (
    dictionary_filename IN VARCHAR2,
    dictionary_location IN VARCHAR2,
    options             IN NUMBER);
```

## Parameters

**Table 96-2 BUILD Procedure Parameters**

Parameter	Description
dictionary_filename	Specifies the name of the LogMiner dictionary file.
dictionary_location	Specifies the directory object for the LogMiner dictionary file.
options	Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).

## Exceptions

**Table 96-3 BUILD Procedure Exceptions**

Exception	Description
ORA-01302	<p>Dictionary build options are missing or incorrect. This error is returned under the following conditions:</p> <ul style="list-style-type: none"> <li>• If the value of the OPTIONS parameter is not one of the supported values (STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified</li> <li>• If the STORE_IN_REDO_LOGS option is not specified and neither the dictionary_filename nor the dictionary_location parameter is specified</li> <li>• If the STORE_IN_REDO_LOGS option is specified and either the dictionary_filename or the dictionary_location parameter is specified</li> </ul>
ORA-01308	Initialization parameter UTL_FILE_DIR is not set.

 **Note:**

In prior releases, you used the UTL\_FILE\_DIR initialization parameter to specify a directory location. However, as of Oracle Database 18c, the UTL\_FILE\_DIR initialization parameter is desupported. It is still supported for backward compatibility, but Oracle recommends that you instead use directory objects.

ORA-01336	<p>Specified dictionary file cannot be opened. This error is returned under the following conditions:</p> <ul style="list-style-type: none"> <li>• The dictionary file is read-only.</li> </ul>
-----------	---

**Table 96-3 (Cont.) BUILD Procedure Exceptions**

Exception	Description
ORA-01308	<p>Dictionary directory is not set.</p> <p>This error is returned under the following conditions:</p> <ul style="list-style-type: none"> <li>The specified value for the <code>dictionary_location</code> is not a directory object.</li> <li>The specified value for the <code>dictionary_location</code> is a directory object that is defined to be a file path that cannot be accessed</li> </ul>

**Usage Notes**

- To extract the LogMiner dictionary to a flat file, you must supply a filename and location. The location must be specified as a database directory object. (See `CREATE DIRECTORY` in the Oracle Database SQL Language Reference.)
 

To extract the LogMiner dictionary to the redo log files, specify only the `STORE_IN_REDO_LOGS` option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

  - If you do not specify any parameters, an error is returned.
  - If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
  - If you specify a filename and location, as well as the `STORE_IN_FLAT_FILE` option, the LogMiner dictionary is extracted to a flat file with the specified name.
  - If you do not specify a filename and location, but do specify the `STORE_IN_REDO_LOGS` option, the LogMiner dictionary is extracted to the redo log files.
  - If you specify a filename and location, as well as the `STORE_IN_REDO_LOGS` option, an error is returned.
  - If you do not specify a filename and location, but do specify the `STORE_IN_FLAT_FILE` option, an error is returned.
- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9i release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- The database must be open when you run the `DBMS_LOGMNR_D.BUILD` procedure.
- When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:

- You must specify a directory for use by the PL/SQL procedure. To do so, first create an Oracle directory object with a pathname that specifies where the dictionary file is to be generated. For example:

```
create directory my_dictionary_dir as '/oracle/dictionary';
```

Be aware that the `DDL_DICT_TRACKING` option to the `DBMS_LOGMNR.START_LOGMNR` procedure is not supported for flat file dictionaries created prior to Oracle9i. If you attempt to use the `DDL_DICT_TRACKING` option with a LogMiner database extracted to a flat file prior to Oracle9i, the ORA-01330 error (problem loading a required build table) is returned.

- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:
  - The `DBMS_LOGMNR_D.BUILD` procedure must be run on a system that is running Oracle9i or later.
  - Archivelog mode must be enabled in order to generate usable redo log files.
  - The `COMPATIBLE` parameter in the initialization parameter file must be set to 9.2.0 or higher.
  - The database to which LogMiner is attached must be Oracle9i or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers.

### Examples

#### Example 1: Extracting the LogMiner Dictionary to a Flat File

The following example extracts the LogMiner dictionary file to a flat file named `dictionary.ora` in a specified path (`/oracle/database`).

```
SQL> create directory my_dictionary_dir as '/oracle/database';
SQL> EXECUTE dbms_logmnr_d.build(dictionary_location=>my_dictionary_dir, -
                                dictionary_filename=>'dictionary.ora', -
                                options => dbms_logmnr_d.store_in_flat_file);
```

#### Example 2: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -
                                options => dbms_logmnr_d.store_in_redo_logs);
```

## 96.3.2 SET\_TABLESPACE Procedure

This procedure moves LogMiner tables from the default `SYSAUX` tablespace to an alternate tablespace.

By default, all LogMiner tables are created to use the `SYSAUX` tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to this alternate tablespace

In a CDB, only the LogMiner metadata in the local container is moved to the requested tablespace.

## Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (  
    new_tablespace      IN VARCHAR2);
```

## Parameters

**Table 96-4 SET\_TABLESPACE Parameter**

Parameter	Description
new_tablespace	A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.

## Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the `SYSTEM` tablespace. Oracle encourages such users to consider using the `SET_TABLESPACE` procedure to move the tables to the `SYSAUX` tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

## Example: Using the DBMS\_LOGMNR\_D.SET\_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the `DBMS_LOGMNR_D.SET_TABLESPACE` procedure.

```
SQL> CREATE TABLESPACE logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'  
      SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;
```

```
SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

# DBMS\_LOGSTDBY

The `DBMS_LOGSTDBY` package provides subprograms for configuring and managing the logical standby database environment.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_LOGSTDBY Subprograms](#)

## See Also:

*Oracle Data Guard Concepts and Administration*

## 97.1 DBMS\_LOGSTDBY Overview

The `DBMS_LOGSTDBY` package helps you manage the SQL Apply (logical standby database) environment.

The subprograms in the `DBMS_LOGSTDBY` package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.  
For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

## 97.2 DBMS\_LOGSTDBY Security Model

You must have the `DBA` role to use the `DBMS_LOGSTDBY` package.

A prototype role, `LOGSTDBY_ADMINISTRATOR`, is created by default with `RESOURCE` and `EXECUTE` privileges on `DBMS_LOGSTDBY`. If you choose to use this role, consider granting

ALTER DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard.

The procedures associated with skipping transactions (SKIP and UNSKIP, SKIP\_ERROR and UNSKIP\_ERROR, and SKIP\_TRANSACTION and UNSKIP\_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

The procedures associated with EDS-based replication require the EXECUTE privilege on the DBMS\_LOGSTDBY package. They also require the CREATE TABLE and DROP TABLE system privileges to create (and drop) shadow tables in the target schema. If materialized views are used, then the CREATE MATERIALIZED VIEW and DROP ANY MATERIALIZED VIEW system privileges are also required.

#### Note:

As of Oracle Database 12c Release 2 (12.2.0.2), Extended Datatype Support (EDS) is deprecated. All EDS-supported Oracle data types are now supported natively by logical standbys or Oracle GoldenGate.

## 97.3 DBMS\_LOGSTDBY Constants

The DBMS\_LOGSTDBY package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS\_LOGSTDBY.SKIP\_ACTION\_SKIP.

The following table describes the constants for the `proc_name` parameter in the DBMS\_LOGSTDBY.SKIP procedure.

**Table 97-1 Constants for SKIP Options Flag**

Constant	Description
MAX_EVENTS	Maximum number of events to log in the DBA_LOGSTDBY_EVENTS view. See the DBMS_LOGSTDBY APPLY_SET Procedure.
SKIP_ACTION_APPLY	Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to apply the DDL or PL/SQL statement.
SKIP_ACTION_ERROR	Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to error out.
SKIP_ACTION_REPLACE	Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to apply the replacement DDL. (This constant should not be used while handling an Oracle Supplied PL/SQL procedure call).

**Table 97-1 (Cont.) Constants for SKIP Options Flag**

Constant	Description
SKIP_ACTION_SKIP	Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to skip the associated DDL or Oracle supplied PL/SQL procedure call.

## 97.4 Summary of DBMS\_LOGSTDBY Subprograms

This table describes each subprogram of the DBMS\_LOGSTDBY procedure, including a reference to the section where each procedure is described in more detail.

In a multitenant container database (CDB), some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

### Note:

As of Oracle Database 12c Release 2 (12.2.0.2), DBMS\_LOGSTDBY subprograms related to Extended Datatype Support (EDS) are deprecated. All EDS-supported Oracle data types are now supported natively by logical standbys or Oracle GoldenGate.

**Table 97-2 DBMS\_LOGSTDBY Package Subprograms**

Subprogram	Description
<a href="#">APPLY_SET Procedure</a>	Sets the values of various parameters that configure and maintain SQL Apply.
<a href="#">APPLY_UNSET Procedure</a>	Restores the default values of various parameters that configure and maintain SQL Apply.
<a href="#">BUILD Procedure</a>	Ensures supplemental logging is enabled properly and builds the LogMiner dictionary.
<a href="#">EDS_ADD_TABLE</a>	Adds EDS-based replication for the table. It should be invoked on the primary database first and then on the standby database.
<a href="#">EDS_EVOLVE_AUTOMATIC</a>	Enables or disables automatic DDL handling for EDS tables.
<a href="#">EDS_EVOLVE_MANUAL</a>	Allows you to evolve EDS tables manually (that is, manually take compensating actions based on DDLs on the base tables with EDS-replication).
<a href="#">EDS_REMOVE_TABLE</a>	Removes EDS-based replication for the specified table. It also drops the shadow table and triggers.
<a href="#">INSTANTIATE_TABLE Procedure</a>	Creates and populates a table in the standby database from a corresponding table in the primary database.

Table 97-2 (Cont.) DBMS\_LOGSTDBY Package Subprograms

Subprogram	Description
<a href="#">IS_APPLY_SERVER Function</a>	This function returns TRUE if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the <code>fire_once</code> parameter in the <code>DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY</code> subprogram set to FALSE (the default is TRUE). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.
<a href="#">MAP_PRIMARY_SCN Function</a>	Maps an SCN relevant to the primary database to a corresponding SCN at the logical standby database. The mapped SCN is conservative in nature, and can thus be used to flash back the logical standby database to compensate for a flashback database operation performed at the primary database.
<a href="#">PREPARE_FOR_NEW_PRIMARY Procedure</a>	Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency
<a href="#">PURGE_SESSION Procedure</a>	Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply
<a href="#">REBUILD Procedure</a>	Records relevant metadata (including the LogMiner dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process
<a href="#">SET_TABLESPACE Procedure</a>	Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the <code>SYSAUX</code> tablespace.
<a href="#">SKIP Procedure</a>	Specifies rules that control database operations that should not be applied to the logical standby database
<a href="#">SKIP_ERROR Procedure</a>	Specifies rules regarding what action to take upon encountering errors.
<a href="#">SKIP_TRANSACTION Procedure</a>	Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.
<a href="#">UNSKIP Procedure</a>	Deletes rules specified by the <code>SKIP</code> procedure.
<a href="#">UNSKIP_ERROR Procedure</a>	Deletes rules specified by the <code>SKIP_ERROR</code> procedure.
<a href="#">UNSKIP_TRANSACTION Procedure</a>	Deletes rules specified by the <code>SKIP_TRANSACTION</code> procedure.

## 97.4.1 APPLY\_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. All parameters, except for `PRESERVE_COMMIT_ORDER`, can be changed without having to stop SQL Apply.

In a CDB, the `APPLY_SET` procedure must be called from the root database.

### Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
    inname      IN VARCHAR,
    value       IN VARCHAR);
```

### Parameters

**Table 97-3 APPLY\_SET Procedure Parameters**

Parameter	Description
<code>APPLY_SERVERS</code>	Controls the number of <code>APPLIER</code> processes used to apply changes. The maximum number allowed is 1024, provided the <code>MAX_SERVERS</code> parameter is set to accommodate this.
<code>EVENT_LOG_DEST</code>	<p>Controls where SQL Apply records the occurrence of an interesting event. It takes the following values:</p> <ul style="list-style-type: none"> <li><code>DEST_ALL</code> - All events will be recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view and in the alert log.</li> <li><code>DEST_EVENTS_TABLE</code> - All events that contain information about user data will be recorded only in the <code>DBA_LOGSTDBY_EVENTS</code> view. This is the default value.</li> </ul> <p>For example, if SQL Apply receives an <code>ORA-1403</code> error, the whole event is recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view. Whereas, the alert log records only that SQL Apply stopped because of <code>ORA-1403</code>. No information regarding the user table or offending statement is logged in the alert log. However, if you stop the SQL Apply engine, it gets recorded in both the <code>DBA_LOGSTDBY_EVENTS</code> view and in the alert log. Note that this parameter affects the behavior of the following parameters: <code>RECORD_APPLIED_DDL</code>, <code>RECORD_SKIP_DDL</code>, <code>RECORD_SKIP_ERRORS</code>, and <code>RECORD_UNSUPPORTED_OPERATIONS</code>. For example, if <code>RECORD_APPLIED_DDL</code> is set to <code>TRUE</code>, but <code>EVENT_LOG_DEST</code> is set to <code>DEST_EVENTS_TABLE</code>, then the applied DDL string will only be recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view.</p>
<code>LOG_AUTO_DEL_RETENTION_TARGET</code>	<p>This parameter setting is only meaningful if <code>LOG_AUTO_DELETE</code> has been set to <code>TRUE</code>. The value you supply for this parameter controls how long (in minutes) a remote archived log that is received from the primary database will be retained at the logical standby database once all redo records contained in the log have been applied at the logical standby database. The default value is 1440 minutes.</p>

**Table 97-3 (Cont.) APPLY\_SET Procedure Parameters**

Parameter	Description
LOG_AUTO_DELETE	Automatically deletes foreign archived redo log files as soon as they have been applied on the logical standby database. By default, a foreign archived redo log file is not deleted until 24 hours (the default value of LOG_AUTO_DEL_RETENTION_TARGET parameter) after it has been applied at the logical standby database. Set to TRUE to enable automatic deletion of archived redo log files. Set to FALSE to disable automatic deletion. The default value is TRUE.
MAX_EVENTS_RECORDED	Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value. The default value is 10,000.
MAX_SERVERS	Number of processes that SQL Apply uses to read and apply redo. The default value is 9. The maximum number allowed is 2048.
MAX_SGA	Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower. The maximum size allowed is 4095 megabytes.
PREPARE_SERVERS	Controls the number of PREPARER processes used to prepare changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.
PRESERVE_COMMIT_ORDER	TRUE: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting. FALSE: Transactions containing non-overlapping sets of rows may be committed in a different order than they were committed on the primary database. Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened on the primary database. See the Usage Notes for details and recommendations. You cannot modify this parameter while SQL Apply is running.
RECORD_APPLIED_DDL	Controls whether DDL statements that have been applied to the logical standby database are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.

**Table 97-3 (Cont.) APPLY\_SET Procedure Parameters**

Parameter	Description
RECORD_SKIP_DDL	Controls whether skipped DDL statements are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_SKIP_ERRORS	Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_UNSUPPORTED_OPERATIONS	Captures information about transactions running on the primary database that will not be supported by a logical standby database. This procedure records its information as events in the DBA_LOGSTDBY_EVENTS table. Specify one of the following values: TRUE: The information is captured and recorded as events in the DBA_LOGSTDBY_EVENTS table. FALSE: The information is not captured. This is the default.

If a parameter is changed while SQL Apply is running, the change will take effect at some point in the future. In such a case, an informational row is inserted into the DBA\_LOGSTDBY\_EVENTS view at the time the parameter change takes effect.

Additionally, if you are modifying a parameter while SQL Apply is running on an Oracle RAC configuration, you must be connected to the same instance where SQL Apply is running.

### Exceptions

**Table 97-4 APPLY\_SET Procedure Exceptions**

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

### Usage Notes

- Use the APPLY\_UNSET procedure to restore the default settings of a parameter.

- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

### Examples

To record DDLs in the `DBA_LOGSTDBY_EVENTS` view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

## 97.4.2 APPLY\_UNSET Procedure

Use the `APPLY_UNSET` procedure to restore the default values of the parameters that you changed with the `APPLY_SET` procedure.

In a CDB, the `APPLY_UNSET` procedure must be called from the root database.

### Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
    inname          IN VARCHAR);
```

### Parameters

The parameter information for the `APPLY_UNSET` procedure is the same as that described for the `APPLY_SET` procedure. See [Table 97-3](#) for complete parameter information.

### Exceptions

**Table 97-5** APPLY\_UNSET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

### Usage Notes

- Use the `APPLY_SET` procedure to specify a nondefault value for a parameter.

### Examples

If you previously specified that applied DDLs show up in the `DBA_LOGSTDBY_EVENTS` view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

## 97.4.3 BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply.

This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

In a CDB, the `BUILD` procedure must be called from the root database on the primary. Additionally, you cannot add or remove PDBs from a CDB while this procedure is executing.

 **Note:**

In databases created using Oracle Database 11g release 2 (11.2) or later, supplemental logging information is automatically propagated to any existing physical standby databases. However, for databases in earlier releases, or if the database was created using an earlier release and then upgraded to 11.2, you must check whether supplemental logging is enabled at the physical standby(s) if it is also enabled at the primary database. If it is not enabled at the physical standby(s), then before performing a switchover or failover, you must enable supplemental logging on all existing physical standby databases. To do so, issue the following SQL command on each physical standby:

```
SQL> ALTER DATABASE ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY, UNIQUE INDEX)
      COLUMNS;
```

If you do not do this, then any logical standby that is also in the same Data Guard configuration will be unusable if a switchover or failover is performed to one of the physical standby databases. If a switchover or failover has already occurred and supplemental logging was not enabled, then you must recreate all logical standby databases.

### Syntax

```
DBMS_LOGSTDBY.BUILD;
```

### Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- `DBMS_LOGSTDBY.BUILD` should be run only once for each logical standby database you want to create. You do not need to use `DBMS_LOGSTDBY.BUILD` for each Oracle RAC instance.
- `DBMS_LOGSTDBY.BUILD` waits for all transactions (including distributed transactions) that are active at the time of the procedure invocation to complete before returning. See *Oracle Database Administrator's Guide* for information about how to handle in-doubt transactions.

## Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

## 97.4.4 EDS\_ADD\_TABLE

This procedure adds EDS-based replication for the table. It should be invoked on the primary database first and then on the standby database.

### Syntax

```
DBMS_LOGSTDBY.EDS_ADD_TABLE (
    table_owner      IN VARCHAR2,
    table_name       IN VARCHAR2,
    p_dblink         IN VARCHAR2);
```

### Parameters

**Table 97-6 EDS\_ADD\_TABLE Procedure Parameters**

Parameter	Description
table_owner	Owner of the table to be created or re-created in the standby database
table_name	Name of the table to be created or re-created in the standby database
p_dblink	A database link to the primary database

### Exceptions

**Table 97-7 EDS\_ADD\_TABLE Procedure Exceptions**

Exception	Description
ORA-942	Table or view does not exist
ORA-16103	SQL Apply must be stopped to allow this operation
ORA-16130	Supplemental log information is missing from log stream
ORA-16236	Logical standby metadata operation in progress
ORA-16276	Specified database link does not correspond to primary database
ORA-16278	Specified table has a multi-object skip rule defined
ORA-16279	Specified database link does not have the necessary roles for operation
ORA-16302	Extended datatype support is not supported for specified table
ORA-16303	Specified table already has EDS on this database
ORA-16304	Procedure must first be called at the primary database

**Table 97-7 (Cont.) EDS\_ADD\_TABLE Procedure Exceptions**

Exception	Description
ORA-16306	Specified table does not have a primary key

**Usage Notes**

- When this procedure is invoked on the primary, the definition of the local table is used to compose the shadow table and both the base and shadow table triggers.
- When this procedure is invoked on the standby, a database link to the primary (p\_dblink) must be provided so that the definition of the table on the primary can be used to compose the shadow table and its trigger on the standby. After the shadow table and its trigger are composed on the standby, the DBMS\_LOGSTDBY.INSTANTIATE\_TABLE procedure is called on the base table, using the provided database link to the primary. The p\_dblink parameter is ignored when called on the primary and it defaults to NULL.
- Error checking is done up front. Generally, if the table contains a datatype that this procedure does not support, then an error is raised.  
  
If the table is already supported by SQL Apply, then an exception is raised. To determine whether a table is a candidate for extended datatype support (EDS), query the DBA\_LOGSTDBY\_EDS\_SUPPORTED view on the primary.
- This procedure must be executed on the primary before it is executed on the standby; otherwise an error is raised.
- For role changes to a logical standby it is essential that EDS be added to both the primary and the standby prior to the role change. If it is added only on the primary, then it must be removed after the role change because the EDS context would then be invalid.
- For rolling upgrades the procedure only needs to be called on the primary.
- This procedure is not replicated to a logical standby and therefore must be executed on both the primary and the standby databases. It is replicated to a physical standby so when it is used for rolling upgrades it should only be called on the primary.
- When this procedure is executed on the standby, it requires that SQL Apply be stopped and the database guard set to either STANDBY or NONE. When the procedure is complete, the table is protected by the database guard.

**Examples**

To add EDS for the table OE.CUSTOMERS, issue the following commands, first on the primary and then on the standby.

On the primary database, issue the following command:

```
execute dbms_logstdby.eds_add_table('OE','CUSTOMERS');
```

On the standby database, issue the following commands:

```
alter database stop logical standby apply;
execute dbms_logstdby.eds_add_table('OE','CUSTOMERS','dblink-to-primary');
alter database start logical standby apply immediate;
```

## 97.4.5 EDS\_EVOLVE\_AUTOMATIC

This procedure either enables or disables automatic DDL handling for EDS tables.

### Syntax

```
DBMS_LOGSTDBY.EDS_EVOLVE_AUTOMATIC (
    options          IN VARCHAR2);
```

### Parameters

**Table 97-8 EDS\_EVOLVE\_AUTOMATIC Parameter Descriptions**

Parameter	Description
options	Specify <code>ENABLE</code> to enable automatic DDL handling for EDS. Specify <code>DISABLE</code> to disable automatic DDL handling for EDS.

### Exceptions

**Table 97-9 EDS\_EVOLVE\_AUTOMATIC Exception Descriptions**

Exception	Description
ORA-16104	The specified parameter is not valid
ORA-16305	Procedure not supported on a logical standby

### Usage Notes

- For transparent handling of DDLs on all EDS-enabled tables, this procedure must be called at the primary database once (with the `ENABLE` option) prior to the first call to `EDS_ADD_TABLE`.
- If an EDS-specific DDL trigger is enabled, it fires after every DDL to determine whether the DDL affects the viability of EDS-replication of any of the tables presently enabled for EDS. If it does, then a separate `EVOLVING` trigger is generated on the table that ensures no DMLs are allowed on the affected base table until the compensating actions are taken to repair the EDS-specific metadata.
- If the SQL statements `ALTER TABLE` or `CREATE UNIQUE INDEX` are executed on an EDS-maintained table, then an evolve operation is started if automatic evolve has been enabled.
- This procedure can be called on a primary database only and is replicated via SQL Apply to a logical standby database.
- When the procedure is executed on the standby it succeeds regardless of the database guard setting and whether or not apply is running.

### Examples

To enable automatic evolution of all EDS- maintained tables, issue the following statement:

```
execute dbms_logstdby.eds_evolve_automatic('ENABLE');
```

After automatic evolve has been enabled, there is no need to issue eds\_evolve commands. They will be done automatically for you upon completion of a DDL command issued against an EDS table.

To disable automatic evolution of all EDS- maintained tables, issue the following statement:

```
execute dbms_logstdby.eds_evolve_automatic('DISABLE');
```

## 97.4.6 EDS\_EVOLVE\_MANUAL

This procedure allows you to evolve EDS tables manually (that is, manually take compensating actions based on DDLs on the base tables with EDS-replication).

### Syntax

```
DBMS_LOGSTDBY.EDS_EVOLVE_MANUAL (
    options          IN VARCHAR2,
    table_owner     IN VARCHAR2,
    table_name      IN VARCHAR2);
```

### Parameters

**Table 97-10 EDS\_EVOLVE\_MANUAL Parameter Descriptions**

Parameter	Description
options	Valid options are: <ul style="list-style-type: none"> <li>START - start an evolve operation, prior to performing the DDL</li> <li>FINISH - finish an evolve operation after performing the DDL</li> <li>CANCEL - cancel a started evolve operation</li> </ul>
table_owner	Owner of the table to be created or re-created in the standby database
table_name	Name of the table to be created or re-created in the standby database

### Exceptions

**Table 97-11 EDS\_EVOLVE\_MANUAL Exception Descriptions**

Exception	Description
ORA-16302	Extended datatype support is not supported for specified table
ORA-16305	Procedure not supported on a logical standby
ORA-16306	Specified table does not have a primary key
ORA-16307	Table not prepared for extended datatype support operation

### Usage Notes

- To perform a manual evolve operation, you must call EDS\_EVOLVE\_MANUAL before and after any DDL that may affect the base table being replicated with EDS. The following is the prescribed method for evolving manually:

1. Call `EDS_EVOLVE_MANUAL` with the `START` option.
2. Perform the DDL.
3. Call `EDS_EVOLVE_MANUAL` with the `FINISH` option.

Deviation from this order could lead to data loss. An error is returned if the procedure is called with the `FINISH` option before it is called with `START` for the specified table. When the procedure is called with the `START` option, DML on the table is blocked by an evolve trigger.

- This procedure can only be invoked on a primary database.
- When this procedure is executed on the standby, SQL Apply must be stopped and the database guard set to either `STANDBY` or `NONE`. When the procedure is complete, the table is protected by the database guard.

### Examples

To manually evolve an EDS table, issue the following commands on the primary database:

```
execute dbms_logstdby.eds_evolve_manual('START','OE','CUSTOMERS');
alter table oe.customers some_DDL_construct;
execute dbms_logstdby.eds_evolve_manual('FINISH','OE','CUSTOMERS');
```

## 97.4.7 EDS\_REMOVE\_TABLE

This procedure removes EDS-based replication for the specified table. It also drops the shadow table and triggers.

### Syntax

```
DBMS_LOGSTDBY.EDS_REMOVE_TABLE (
    table_owner      IN VARCHAR2,
    table_name       IN VARCHAR2,
```

### Parameters

**Table 97-12 EDS\_REMOVE\_TABLE Parameter Descriptions**

Parameter	Description
<code>table_owner</code>	Owner of the table to be created or re-created in the standby database
<code>table_name</code>	Name of the table to be created or re-created in the standby database

### Exceptions

**Table 97-13 EDS\_REMOVE\_TABLE Exception Descriptions**

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation

## Usage Notes

- When this procedure is called on the standby, the shadow table and both triggers are dropped locally but not on the primary.

When this procedure is called on the primary, the shadow table and both triggers are dropped and the procedure is re-executed on the standby by the apply engine. Therefore, the supporting shadow table and triggers are also dropped at the logical standby. Using this approach, a single call made on the primary can remove EDS from the entire configuration for a table.

- In a multi-standby configuration, you can remove support on a single standby by calling this procedure on that standby.
- This procedure takes out an exclusive table lock to ensure isolation in the presence of ongoing user writes on the same table. Thus the procedure will block until existing write-transactions that have outstanding row locks on the table are completed.
- When this procedure is executed on the standby, SQL Apply must be stopped and the database guard set to either `STANDBY` or `NONE`. When the procedure is complete, the table is protected by the database guard.

## Examples

To remove EDS for the table `OE.CUSTOMERS`, issue the following command on the primary database:

```
execute dbms_logstdby.eds_remove_table('OE','CUSTOMERS');
```

## 97.4.8 INSTANTIATE\_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database.

The table requires the name of the database link (`dblink`) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the `INSTANTIATE_TABLE` procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

In a CDB, the `INSTANTIATE_TABLE` procedure must be called from within the container in which the table to be instantiated resides. Additionally, the database link that is provided to the primary database must point to the corresponding container on the primary.

## Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  dblink           IN VARCHAR2);
```

## Parameters

**Table 97-14 INSTANTIATE\_TABLE Procedure Parameters**

Parameter	Description
schema_name	Name of the schema
table_name	Name of the table to be created or re-created in the standby database
dblink	Name of the database link account that has privileges to read and lock the table in the primary database, as well as the SELECT_CATALOG_ROLE on the primary database

## Exceptions

**Table 97-15 INSTANTIATE\_TABLE Procedure Exceptions**

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress
ORA-16276	Specified database link does not correspond to primary database
ORA-16277	Specified table is not supported by logical standby database
ORA-16278	Specified table has a multi-object skip rule defined

## Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until SQL Apply encounters redo that occurred after the table was instantiated from the primary. The SCN at which the table was instantiated from the primary database is available in the DBA\_LOGSTDBY\_EVENTS view.
- The specified table must be a table that is supported by logical standby (that is, it does not appear in the DBA\_LOGSTDBY\_UNSUPPORTED\_TABLES view on the primary database).
- If there are any skip rules that specifically name this table (without any wildcards), those skip rules will be dropped as part of INSTANTIATE\_TABLE, so that the table will be properly maintained by SQL Apply in the future. If there are skip rules that indirectly reference this table (match a skip rule with a wildcard in the schema\_name or table\_name, and have a TABLE, DML, or SCHEMA\_DDL statement type), INSTANTIATE\_TABLE will fail with an ORA-16278 error. Any multi-object skip rules that pertain to the table must be dropped or changed before re-attempting the INSTANTIATE\_TABLE call.

## Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-
    SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -
    DBLINK => 'INSTANTIATE_TBL_LINK');
```

## 97.4.9 IS\_APPLY\_SERVER Function

This function returns `TRUE` if it is executed from PL/SQL in the context of a logical standby apply server process.

This function is used in conjunction with triggers that have the `fire_once` parameter in the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram set to `FALSE` (the default is `TRUE`). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.

### Syntax

```
DBMS_LOGSTDBY.IS_APPLY_SERVER
RETURN BOOLEAN;
```

### Parameters

None

## 97.4.10 MAP\_PRIMARY\_SCN Function

This function returns an SCN on the standby that predates the supplied SCN from the primary database by at least 5 minutes.

It can be used to determine a safe SCN to use in a compensating flashback database operation at the logical standby database, following a flashback database operation or a point-in-time recovery operation at the primary database.

### Syntax

```
DBMS_LOGSTDBY.MAP_PRIMARY_SCN(primary_scn NUMBER) RETURN NUMBER;
```

### Exceptions

**Table 97-16** MAP\_PRIMARY\_SCN Function Exceptions

Exception	Description
ORA-20001	Primary SCN is before mapped range
ORA-20002	SCN mapping requires <code>PRESERVE_COMMIT_ORDER</code> to be <code>TRUE</code>

### Usage Notes

Use this function to get a conservative SCN at the logical standby database that corresponds to an SCN at the primary database. This function is useful in the context of doing compensating flashback database operations at the logical standby following a flashback database or a point-in-time recovery operation done at the primary database.

## 97.4.11 PREPARE\_FOR\_NEW\_PRIMARY Procedure

The `PREPARE_FOR_NEW_PRIMARY` procedure must be invoked at a logical standby database following a failover, if that standby database was not the target of the failover operation.

Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the `alert.log`. These logs must be copied to the logical standby and registered using the `ALTER DATABASE REGISTER LOGICAL LOGFILE` statement.

In a CDB, the `PREPARE_FOR_NEW_PRIMARY` procedure must be called from the root database.

### Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
    FORMER_STANDBY_TYPE    IN VARCHAR2,
    DBLINK                 IN VARCHAR2);
```

### Parameters

**Table 97-17** PREPARE\_FOR\_NEW\_PRIMARY Procedure Parameters

Parameter	Description
FORMER_STANDBY_TYPE	The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.
DBLINK	The name of a database link to the new primary database

### Exceptions

**Table 97-18** PREPARE\_FOR\_NEW\_PRIMARY Procedure Exceptions

Exception	Description
ORA-16104	Invalid Logical Standby option.
ORA-16109	Failed to apply log data from previous primary.

### Usage Notes

- This routine is intended only for logical standby systems. This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully. Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally. Upon manual registration of the terminal logs, users should complete the process by calling either `START LOGICAL STANDBY APPLY` if the new primary database was formerly a physical standby database or `START LOGICAL STANDBY APPLY NEW PRIMARY` if the

new primary database was formerly a logical standby database. See the alert log for more details regarding the reasons for any exception.

### Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY ( -
        FORMER_STANDBY_TYPE => 'LOGICAL', -
        DBLINK => 'dblink_to_newprimary');
```

## 97.4.12 PURGE\_SESSION Procedure

PURGE\_SESSION identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply.

Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

In a CDB, the PURGE\_SESSION procedure must be called from the root database.

### Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

### Exceptions

**Table 97-19 PURGE\_SESSION Procedure Exceptions**

Exception	Description
ORA-01309	Invalid session

### Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the DBA\_LOGMNR\_PURGED\_LOG view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10g Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the LOG\_AUTO\_DELETE parameter described in the DBMS\_LOGSTDBY.APPLY\_SET procedure described.

### Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the DBA\_LOGMNR\_PURGED\_LOG view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;
```

```
FILE_NAME
-----
/boston/arc_dest/arc_1_40_509538672.log
```

```
/boston/arc_dest/arc_1_41_509538672.log
/boston/arc_dest/arc_1_42_509538672.log
/boston/arc_dest/arc_1_43_509538672.log
/boston/arc_dest/arc_1_44_509538672.log
/boston/arc_dest/arc_1_45_509538672.log
/boston/arc_dest/arc_1_46_509538672.log
/boston/arc_dest/arc_1_47_509538672.log
```

3. Use operating system-specific commands to delete archived redo log files from the file system.

## 97.4.13 REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner dictionary) in the redo stream required for other logical standby databases.

In a CDB, the `REBUILD` procedure must be called from the root database.

### Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

### Usage Notes

- LogMiner dictionary information is logged in the redo log files. The standby redo log files (if present) are archived.

### Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

## 97.4.14 SET\_TABLESPACE Procedure

This procedure moves metadata tables required by SQL Apply to the user-specified tablespace.

By default, the metadata tables are created in the `SYSAUX` tablespace. SQL Apply cannot be running when you invoke this procedure.

In a CDB, the `SET_TABLESPACE` procedure must be called from the root database.

### Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE(
    NEW_TABLESPACE IN VARCHAR2)
```

### Parameters

**Table 97-20 SET\_TABLE SPACE Procedure Parameters**

Parameter	Description
<code>NEW_TABLESPACE</code>	Name of the new tablespace where metadata tables will reside.

## Exceptions

**Table 97-21 SET\_TABLESPACE Procedure Exceptions**

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress

## Examples

To move metadata tables to a new tablespace named LOGSTDBY\_TBS, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

## 97.4.15 SKIP Procedure

The `SKIP` procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database.

For example, the `SKIP` procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

### Note:

For information about skipping containers, see "[Skipping Containers](#)."

## Syntax

```
DBMS_LOGSTDBY.SKIP (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL,
    proc_name           IN VARCHAR2 DEFAULT NULL,
    use_like            IN BOOLEAN DEFAULT TRUE,
    esc                 IN CHAR1 DEFAULT NULL);
```

## Parameters

**Table 97-22 SKIP Procedure Parameters**

Parameter	Description
<code>stmt</code>	<p>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. <a href="#">Table 97-23</a> shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter. The keyword <code>PL/SQL</code> is used for the execution of Oracle-supplied packages which are supported for replication.</p>
<code>schema_name</code>	<p>The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code>.</p>
<code>object_name</code>	<p>The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code>. If not applicable, this value must be set to <code>NULL</code>.</p>
<code>proc_name</code>	<p>Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>'schema.package.procedure'</pre> <p>This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.</p> <p>The procedures to be invoked in the case of DDL or PL/SQL take no arguments. You can access the various information needed inside the procedure by accessing the context associated with the <code>namespace.LSBY_APPLY_CONTEXT</code>.</p> <p>For a full list of parameters that are accessible in the context of the skip procedure, see the <code>DBMS_LOGSTDBY_CONTEXT</code> package.</p> <p>The parameters of interest in the case of DDLs are: <code>STATEMENT</code>, <code>STATEMENT_TYPE</code>, <code>SCHEMA</code>, <code>NAME</code>, <code>CURRENT_SCHEMA</code>, <code>XIDUSN</code>, <code>XIDSLT</code>, <code>XIDSQN</code> and <code>SKIP_ACTION</code>.</p> <p>The parameters of interest in the case of PL/SQL are: <code>STATEMENT</code>, <code>PACKAGE_SCHEMA</code>, <code>PACKAGE_NAME</code>, <code>PROCEDURE_NAME</code>, <code>CURRENT_SCHEMA</code>, <code>XIDUSN</code>, <code>XIDSLT</code>, <code>XIDSQN</code>, <code>EXIT_STATUS</code>, and <code>SKIP_ACTION</code>.</p> <p><b>Note 1:</b> The <code>DBMS_LOGSTDBY.SKIP_ACTION_REPLACE</code> constant is not supported for PL/SQL.</p> <p><b>Note 2:</b> SQL Apply calls the skip handler when the procedure's exit is processed.</p> <p><b>Note 3:</b> The <code>use_like</code> parameter must be set to <code>FALSE</code> for PL/SQL since wildcarding PL/SQL is not supported.</p>

**Table 97-22 (Cont.) SKIP Procedure Parameters**

Parameter	Description
proc_name (cont.)	<p>A sample conditional skip rule on DBMS_RLS.DROP_POLICY is as follows:</p> <pre> create or replace procedure sec_mgr.skip_drop_policy is   l_stmt CLOB;   l_pkgown varchar2(30);   l_pkgnam varchar2(30);   l_procnm varchar2(30);   l_cur_schema varchar2(30);   l_xidusn number;   l_xidslt number;   l_xidsqn number;   l_exit_status number;   l_skip_action number; Begin   -- read all relevant info   dbms_logstdby_context.get_context(name =&gt; 'STATEMENT', value =&gt;   l_stmt);   dbms_logstdby_context.get_context(name =&gt; 'PACKAGE_SCHEMA', value =&gt;   l_pkgown);   dbms_logstdby_context.get_context(name =&gt; 'PACKAGE_NAME', value =&gt;   l_pkgnam);   dbms_logstdby_context.get_context(name =&gt; 'PROCEDURE_NAME', value =&gt;   l_procnm);   dbms_logstdby_context.get_context(name =&gt; 'CURRENT_SCHEMA', value =&gt;   l_cur_schema);   dbms_logstdby_context.get_context(name =&gt; 'XIDUSN', value =&gt; l_xidusn);   dbms_logstdby_context.get_context(name =&gt; 'XIDSLT', value =&gt; l_xidslt);   dbms_logstdby_context.get_context(name =&gt; 'XIDSQN', value =&gt; l_xidsqn);   dbms_logstdby_context.get_context(name =&gt; 'EXIT_STATUS', value =&gt;   l_ext_status);    if 0 == l_ext_status then   Insert Into sec_mgr.logit Values     ('Success: '  l_pkgown  '.'  l_pkgnm  '.'  l_procnm  ' by '     l_current_user);    If l_current_user != 'TESTSCHEMA' Then     l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY;   Else     l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP;   End If;   End If;    dbms_logstdby_context.set_context(name=&gt;'SKIP_ACTION',   value =&gt; l_skip_action);    End skip_drop_policy;  EXECUTE DBMS_LOGSTDBY.SKIP( -   stmt =&gt; 'PL/SQL', -   schema_name =&gt; 'SYS', -   object_name =&gt; 'DBMS_RLS.DROP_POLICY', -   proc_name =&gt; 'SEC_MGR.SKIP_DROP_POLICY' -   use_like=&gt; FALSE); </pre>

**Table 97-22 (Cont.) SKIP Procedure Parameters**

Parameter	Description
use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in <i>Oracle Database SQL Language Reference</i> .
esc	Identifies an escape character (such as the character "/") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Language Reference</i> for more information about pattern matching.

**Usage Notes**

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104: invalid Logical Standby option requested error:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'DML', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'DML_HANDLER');
```

Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the SCHEMA\_DDL event for the HR.EMPLOYEES table, and a rule for the ALTER TABLE event for the HR.EMPLOYEES table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'SCHEMA_DDL', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'TABLE_ALTER_HANDLER');
```

On encountering an ALTER TABLE statement, the schema\_ddl\_handler procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement. Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the empddl\_handler procedure being invoked upon encountering the ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'ALTER TABLE', -
```

```

        schema_name => 'HR', -
        object_name => 'EMP%', -
        proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
        stmt => 'ALTER TABLE', -
        schema_name => 'HR', -
        object_name => 'EMPLOYEES', -
        proc_name => 'EMPLOYEE_DDL_HANDLER');

```

- Use the SKIP procedure with caution, particularly when skipping DDL statements. If a CREATE TABLE statement is skipped, for example, you must also specify other DDL statements that refer to that table in the SKIP procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the SKIP procedure, SQL Apply must be halted. Do this by issuing an ALTER DATABASE STOP LOGICAL STANDBY APPLY statement. Once all desired filters have been specified, issue an ALTER DATABASE START LOGICAL STANDBY APPLY IMMEDIATE statement to start SQL Apply using the new filter settings.
- See the UNSKIP procedure for information about reversing (undoing) the settings of the SKIP procedure.
- For USER statements, the SCHEMA\_NAME parameter will be the user and specify '%' for the OBJECT\_NAME parameter.
- If the PROC\_NAME parameter is supplied, it must already exist in DBA\_PROCEDURES and it must execute with DEFINER rights. If the procedure is declared with INVOKER rights, the ORA-1031: insufficient privileges message will be returned.
- If the procedure returns a REPLACEMENT statement, the REPLACEMENT statement will be executed using the SYSTEM and OBJECT privileges of the owner of the procedure.
- The PL/SQL block of a SKIP procedure cannot contain transaction control statements (for example, COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction.

#### Skip Statement Options

Table 97-23 lists the supported values for the stmt parameter of the SKIP procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. In addition, any of the SQL statements listed in the sys.audit\_actions table (shown in the right column of Table 97-23) are also valid values. Note that keywords are generally defined by database object.

**Table 97-23 Supported Values for the stmt Parameter**

Keyword	Associated SQL Statements
There is no keyword for this group of SQL statements.	GRANT REVOKE ANALYZE TABLE ANALYZE INDEX ANALYZE CLUSTER

**Table 97-23 (Cont.) Supported Values for the stmt Parameter**

Keyword	Associated SQL Statements
CLUSTER	AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER
CONTAINER	See " <a href="#">Skipping Containers</a> "
CONTEXT	CREATE CONTEXT DROP CONTEXT
DATABASE LINK	CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK
DIMENSION	ALTER DIMENSION CREATE DIMENSION DROP DIMENSION
DIRECTORY <sup>1</sup>	CREATE DIRECTORY DROP DIRECTORY
DML	Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE)
INDEX	ALTER INDEX CREATE INDEX DROP INDEX
NON_SCHEMA_DDL	<i>All DDL that does not pertain to a particular schema</i> <b>Note:</b> SCHEMA_NAME and OBJECT_NAME must be null
PL/SQL <sup>2</sup>	Execute Oracle-supplied package.
PROCEDURE <sup>3</sup>	ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE

**Table 97-23 (Cont.) Supported Values for the `stmt` Parameter**

<b>Keyword</b>	<b>Associated SQL Statements</b>
PROFILE	ALTER PROFILE CREATE PROFILE DROP PROFILE
ROLE	ALTER ROLE CREATE ROLE DROP ROLE SET ROLE
ROLLBACK STATEMENT	ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT
SCHEMA_DDL	<i>All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)</i> <b>Note:</b> SCHEMA_NAME and OBJECT_NAME must not be null
SEQUENCE	ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE
SYNONYM	CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM
SYSTEM AUDIT	AUDIT <i>SQL_statements</i> NOAUDIT <i>SQL_statements</i>
TABLE	CREATE TABLE ALTER TABLE DROP TABLE TRUNCATE TABLE
TABLESPACE	CREATE TABLESPACE DROP TABLESPACE ALTER TABLESPACE
TRIGGER	ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER

**Table 97-23 (Cont.) Supported Values for the `stmt` Parameter**

Keyword	Associated SQL Statements
TYPE	ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY
USER	ALTER USER CREATE USER DROP USER
VIEW	CREATE VIEW DROP VIEW
VIEW	CREATE VIEW DROP VIEW

<sup>1</sup> All directory objects are owned by SYS, but for the purpose of filtering them with a skip directive the schema should be specified as "%".

<sup>2</sup> See *Oracle Data Guard Concepts and Administration* for information about supported packages.

<sup>3</sup> Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

### Exceptions

**Table 97-24 DBMS\_LOGSTDBY.SKIP Procedure Exceptions**

Exception	Description
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> <li>Procedure used INVOKER rights</li> <li>Procedure needs DBA privileges</li> </ul>
ORA-16103	Logical standby apply must be stopped to allow this operation.
ORA-16104	Invalid logical standby option requested.
ORA-16203	"Unable to interpret SKIP procedure return values." Indicates that a SKIP procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the DBA_LOGSTDBY_EVENTS view.
ORA-16236	Logical standby metadata operation in progress.

## Examples

### Example 1. Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA_DDL', -
      schema_name => 'HR', -
      object_name => '%', -
      proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -
      schema_name => 'HR', -
      object_name => '%', -
      proc_name => null);

```

### Example 2. Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a `SKIP` procedure to handle DDL statements with file specifications transparently. The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

#### 1. Create the `SKIP` procedure to handle tablespace DDL statements:

```

CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl
IS
  l_old_stmt varchar2(4000);
  l_stmt_typ varchar2(40);
  l_schema  varchar2(30);
  l_name    varchar2(30);
  l_xidusn  number;
  l_xidslt  number;
  l_xidsqn  number;
  l_skip_action number;
  l_new_stmt varchar2(4000);

  -- read all information
  dbms_logstdby_context.get_context(name=>'STATEMENT',value=>l_old_stmt);
  dbms_logstdby_context.get_context(name=>'STATEMENT_TYPE',value=>l_stmt_type);
  dbms_logstdby_context.get_context(name=>'OWNER',value=>l_schema);
  dbms_logstdby_context.get_context(name=>'NAME',value=>l_name);
  dbms_logstdby_context.get_context(name=>'XIDUSN',value=>l_xidusn);
  dbms_logstdby_context.get_context(name=>'XIDSLT',value=>l_xidslt);
  dbms_logstdby_context.get_context(name=>'XIDSQN',value=>l_xidsqn);
  dbms_logstdby_context.get_context(name=>'CONTAINER_NAME',value=>l_conname);

  --
  -- All primary file specification that contains a directory
  -- /usr/orcl/primary/dbs
  -- should go to /usr/orcl/standby directory specification

  BEGIN
    l_new_stmt := replace (l_old_stmt, '/usr/orcl/primary/dbs', '/usr/orcl/standby');
    l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;
  EXCEPTION
    WHEN OTHERS THEN
      l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;

```

```

    l_new_stmt := NULL;
END;

dbms_logstdby_context.set_context(name=>new_statement, value => l_new_stmt);
dbms_logstdby_context.set_context(name=>'SKIP_ACTION', value => l_skip_action);
END handle_tbs_ddl;

```

## 2. Register the SKIP procedure with SQL Apply:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
    proc_name => 'SYS.HANDLE_TBS_DDL');

```

## Skipping Containers

To skip a container (either a PDB or the root), use the `CONTAINER` keyword. All SQL statements executed on the container, as well as any other actions taken on the container, are skipped.

You can skip a particular PDB within a CDB. For example, the following command skips the PDB named `PDB1`. The command must be executed at the root level:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP(stmt => 'CONTAINER', object_name => 'PDB1');

```

As shown in the following example, you could also skip only the root of the CDB, but not any of the PDBs that exist under the root. The command must be executed at the root level:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP(stmt => 'CONTAINER', object_name => 'CDB$ROOT');

```

### Note:

To create other skip rules for a container, create the rules from within the container. The container to which the rules will apply is automatically derived from the container in which the rules are created.

## 97.4.16 SKIP\_ERROR Procedure

The `SKIP_ERROR` procedure specifies the action to take when a logical standby database detects an error.

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine a course of action. The default action when a match is found is to skip the error and continue with applying changes. However, if a procedure is supplied, then `SKIP_ERROR` can take other actions depending on the situation. It can do nothing, which causes SQL Apply to stop, or it can change the error message text and stop SQL Apply, or it can actually skip the error.

### Syntax

```

DBMS_LOGSTDBY.SKIP_ERROR (
    stmt                IN VARCHAR2,
    schema_name        IN VARCHAR2 DEFAULT NULL,
    object_name        IN VARCHAR2 DEFAULT NULL,
    proc_name          IN VARCHAR2 DEFAULT NULL,
    use_like            IN BOOLEAN  DEFAULT NULL,
    esc                IN CHAR1    DEFAULT NULL);

```

## Parameters

**Table 97-25 SKIP\_ERROR Procedure Parameters**

Parameter	Description
stmt	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. <a href="#">Table 97-23</a> shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
schema_name	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> .
object_name	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> .
proc_name	<p>Name of a stored procedure to call when SQL Apply encounters an error and determines a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>' "schema" . "package" . "procedure" '</pre> <p>This procedure returns an error message that directs SQL Apply to perform one of the following actions:</p> <ul style="list-style-type: none"> <li>• Silently skip the error and continue with SQL Apply</li> <li>• Replace the error message that would have been created with a custom one, and stop SQL Apply</li> <li>• Do nothing, causing SQL Apply to stop and the original error message to be logged</li> </ul> <p>The procedure registered with SQL Apply does not take any parameters. The context associated with <code>LSBY_APPLY_CONTEXT</code> can be used to retrieve all relevant information related to the error. See the <code>DBMS_LOGSTDBY_CONTEXT</code> package for a list of all parameters associated with <code>LSBY_APPLY_CONTEXT</code>.</p> <p>The parameters of interest for procedures registered with <code>SKIP_ERROR</code> are <code>CONTAINER_NAME</code>, <code>STATEMENT</code>, <code>STATEMENT_TYPE</code>, <code>SCHEMA</code>, <code>NAME</code>, <code>XIDUSN</code>, <code>XIDSLT</code>, <code>XIDSQN</code>, <code>ERROR</code> and <code>NEW_ERROR</code>.</p>
use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The <code>use_like</code> parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in <i>Oracle Database SQL Language Reference</i> .
esc	Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character.

## Usage Notes

- A stored procedure provided to the `SKIP_ERROR` procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the `STATUS` column of the `DBA_LOGSTDBY_EVENTS` table. The `STATUS_CODE` column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the `NEW_ERROR` is written to the events table. To truly have no effect, set `NEW_ERROR` to `ERROR` in the procedure.
- If the stored procedure requires that a shutdown be avoided, then you must set `NEW_ERROR` to `NULL`.
- This procedure requires `DBA` privileges to execute.
- For `USER` statements, the `SCHEMA_NAME` parameter will be the user and you should specify `'%'` for the `OBJECT_NAME` parameter.
- If the `PROC_NAME` parameter is specified, it must already exist in `DBA_PROCEDURES` and it must execute with `DEFINERS` rights. If the procedure is declared with `INVOKERS` rights, the `ORA-1031: insufficient privileges` message will be returned.
- The PL/SQL block of a `SKIP_ERROR` procedure cannot contain transaction control statements (for example: `COMMIT`, `ROLLBACK`, `SAVEPOINT`, and `SET CONSTRAINT`) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

## Exceptions

**Table 97-26 SKIP\_ERROR Procedure Exceptions**

Exception	Description
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> <li>• Procedure used <code>INVOKER</code> rights</li> <li>• Procedure needs <code>DBA</code> privileges</li> </ul>
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

### Example 1

The following example shows how to specify rules so that SQL Apply will skip any error raised from any `GRANT DDL` command.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR('GRANT')
```

### Example 2

To skip errors on `GRANT` statements on `SYS` or `HR` schemas, define a procedure `handle_error_ddl` and register it. In the following example, assume that `handle_error_ddl` is a free-standing procedure in the `SYS` schema.

**1. Create the error-handler procedure:**

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl
is
l_stmt      VARCHAR2(4000);
l_stmt_type VARCHAR2(40);
l_schema    VARCHAR2(30);
l_name      VARCHAR2(30);
l_xidusn    NUMBER;
l_xidslt    NUMBER;
l_xidsqn    NUMBER;
l_error     VARCHAR2(4000);
l_conname   VARCHAR2(30);
l_newerr    VARCHAR2(4000);

BEGIN
  dbms_logstdby_context.get_context(name=>'STATEMENT',value=>l_stmt);
  dbms_logstdby_context.get_context(name=>'STATEMENT_TYPE',value=>l_stmt_type);
  dbms_logstdby_context.get_context(name=>'SCHEMA',value=>l_schema);
  dbms_logstdby_context.get_context(name=>'NAME',value=>l_name);
  dbms_logstdby_context.get_context(name=>'XIDUSN',value=>l_xidusn);
  dbms_logstdby_context.get_context(name=>'XIDSLT',value=>l_xidslt);
  dbms_logstdby_context.get_context(name=>'XIDSQN',value=>l_xidsqn);
  dbms_logstdby_context.get_context(name=>'ERROR',value=>l_error);
  dbms_logstdby_context.get_context(name=>'CONTAINER_NAME',value=>l_conname);

  -- default error to what we already have
  l_new_error := l_error;

  -- Ignore any GRANT errors on SYS or HR schemas

  IF INSTR(UPPER(l_stmt), 'GRANT') > 0
  THEN
  IF l_schema is NULL
  OR (l_schema is NOT NULL AND
  (UPPER(l_schema) = 'SYS' OR
  UPPER(l_schema) = 'HR'))
  THEN
  l_new_error := NULL;
  -- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
  -- code not shown here
  END IF;
  END IF;

  dbms_logstdby_context.set_context(name => 'NEW_ERROR', value => l_new_error);

END handle_error_ddl;
/
```

**2. Register the error handler with SQL Apply:**

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
  statement => 'NON_SCHEMA_DDL', -
  schema_name => NULL, -
  object_name => NULL, -
  proc_name => 'SYS.HANDLE_ERROR_DDL');
```

## 97.4.17 SKIP\_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

### Syntax

```
DBMS_LOGSTDBY.SKIP_TRANSACTION (
    xidusn          IN NUMBER,
    xidslt          IN NUMBER,
    xidsqn          IN NUMBER);
```

### Parameters

**Table 97-27** SKIP\_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN NUMBER	Transaction ID undo segment number of the transaction being skipped
XIDSLT NUMBER	Transaction ID slot number of the transaction being skipped
XIDSQN NUMBER	Transaction ID sequence number of the transaction being skipped

### Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

#### WARNING:

**SKIP\_TRANSACTION** is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the **V\$logmnr\_contents** view and have taken compensating actions at the logical standby database. **SKIP\_TRANSACTION** is not the appropriate procedure to invoke to skip DML changes to a table.

To skip a DML failure, use a **SKIP** procedure, such as **SKIP('DML','MySchema','MyFailed Table')**. Using the **SKIP\_TRANSACTION** procedure for DML transactions may skip changes for other tables, thus logically corrupting them.

- This procedure requires DBA privileges to execute.
- Use the **DBA\_LOGSTDBY\_SKIP\_TRANSACTION** view to list the transactions that are going to be skipped by SQL Apply.

## Exceptions

**Table 97-28 SKIP\_TRANSACTION Procedure Exceptions**

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

## Examples

To skip a DDL transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-
      XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

## 97.4.18 UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure.

The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

The container\_name argument is valid only in a CDB.

## Syntax

```
DBMS_LOGSTDBY.UNSKIP (
  stmt                IN VARCHAR2,
  schema_name         IN VARCHAR2 DEFAULT NULL,
  object_name         IN VARCHAR2 DEFAULT NULL,
  container_name      IN VARCHAR2 DEFAULT NULL);
```

## Parameters

The parameter information for the UNSKIP procedure is the same as that described for the SKIP procedure. See [Table 97-22](#) for complete parameter information.

## Exceptions

**Table 97-29 UNSKIP Procedure Exceptions**

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

## Usage Notes

### ⚠ WARNING:

If DML changes for a table have been skipped and not compensated for, you must follow the call to the `UNSKIP` procedure with a call to the `INSTANTIATE_TABLE` procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the `schema_name` or the `object_name` parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the `UNSKIP` procedure, and you will need a distinct `UNSKIP` procedure call to delete each rule that was previously specified.

For example, assume you have specified the following two rules to skip applying DML statements to the `HR.EMPLOYEE` and `HR.EMPTEMP` tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => null);
```

In the following example, the wildcard in the `TABLE_NAME` parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```

In fact, this `UNSKIP` procedure matches neither of the rules, because the wildcard character in the `TABLE_NAME` parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding `SKIP` rule.

## 97.4.19 UNSKIP\_ERROR Procedure

Use the `UNSKIP_ERROR` procedure to delete rules specified earlier with the `SKIP_ERROR` procedure.

The parameters specified in the `UNSKIP_ERROR` procedure must match exactly for the procedure to delete an already-specified rule.

The `container_name` argument is valid only in a CDB.

### Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
```

```
object_name          IN VARCHAR2 DEFAULT NULL,
container_name      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

The parameter information for the UNSKIP\_ERROR procedure is the same as that described for the SKIP\_ERROR procedure. See [Table 97-25](#) for complete parameter information.

### Exceptions

**Table 97-30 UNSKIP\_ERROR Procedure Exceptions**

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

### Usage Notes

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema\_name or the object\_name parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the UNSKIP\_ERROR procedure, and you need a distinct UNSKIP\_ERROR procedure call to delete each rule that you previously specified.

For example, assume you have specified the following two rules to handle the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => 'hr_employee_handler');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => 'hr_tempemp_handler');
```

In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT\_NAME parameter will not be expanded.

### Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -
    statement => 'NON_SCHEMA_DDL', -
```

```

schema_name => NULL, -
object_name => NULL);

```

## 97.4.20 UNSKIP\_TRANSACTION Procedure

Use the `UNSKIP_TRANSACTION` procedure to delete rules specified earlier with the `SKIP_TRANSACTION` procedure.

The parameters specified in the `UNSKIP_TRANSACTION` procedure must match exactly for the procedure to delete an already-specified rule.

### Syntax

```

DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
    xidusn_p          IN NUMBER,
    xidslt_p          IN NUMBER,
    xidsqn_p          IN NUMBER);

```

### Parameters

**Table 97-31 UNSKIP\_TRANSACTION Procedure Parameters**

Parameter	Description
XIDUSN	Transaction ID undo segment number of the transaction being skipped
XIDSLT	Transaction ID slot number of the transaction being skipped
XIDSQN	Transaction ID sequence number of the transaction being skipped

### Exceptions

**Table 97-32 UNSKIP\_TRANSACTION Procedure Exceptions**

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

### Usage Notes

- This procedure requires DBA privileges to execute.
- Query the `DBA_LOGSTDBY_SKIP_TRANSACTION` view to list the transactions that are going to be skipped by SQL Apply.

### Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

# DBMS\_LOGSTDBY\_CONTEXT

As of Oracle Database 12c release 1 (12.1), SQL Apply processes have access to a context namespace called `LSBY_APPLY_CONTEXT`. You can use the procedures provided in the `DBMS_LOGSTDBY_CONTEXT` package to set and retrieve various parameters associated with `LSBY_APPLY_CONTEXT`. This is useful when writing skip procedures that are registered with SQL Apply using the `DBMS_LOGSTDBY.SKIP` and `DBMS_LOGSTDBY.SKIP_ERROR` procedures.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_LOGSTDBY\\_CONTEXT Subprograms](#)

## See Also:

*Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

## 98.1 DBMS\_LOGSTDBY\_CONTEXT Overview

SQL Apply processes have access to a context namespace called `LSBY_APPLY_CONTEXT`.

The following table lists the predefined parameters associated with `LSBY_APPLY_CONTEXT` that you can set and retrieve by using the procedures provided in the `DBMS_LOGSTDBY_CONTEXT` package. The ability to set and retrieve the parameters in this way is useful when writing skip procedures that are registered with SQL Apply using the `DBMS_LOGSTDBY.SKIP` and `DBMS_LOGSTDBY.SKIP_ERROR` procedures.

**Table 98-1** Predefined Parameters of Namespace `LSBY_APPLY_CONTEXT`

Parameter	Description
<code>STATEMENT</code>	First 4000 bytes of the statement that the Apply process is processing.
<code>STATEMENT_TYPE</code>	See <a href="#">Table 97-23</a> for a list of various statement types.
<code>PACKAGE_SCHEMA</code>	Schema that owns the PL/SQL package being processed (if applicable).
<code>PACKAGE_NAME</code>	Name of the PL/SQL package being processed (if applicable).
<code>PROCEDURE_NAME</code>	Name of the PL/SQL procedure being processed (if applicable).
<code>CURRENT_SCHEMA</code>	Current schema in effect when the DDL or PL/SQL procedure was executed at the primary.

**Table 98-1 (Cont.) Predefined Parameters of Namespace  
LSBY\_APPLY\_CONTEXT**

Parameter	Description
XIDUSN	XIDUSN of the transaction at the primary database.
XIDSLT	XIDSLT of the transaction at the primary database.
XIDSQN	XIDSQN of the transaction at the primary database.
SCHEMA	Schema that owns the object being processed by SQL Apply (in the case of DML or DDL operations).
NAME	Object name being processed by SQL Apply (in case of DML or DDL operations).
CONTAINER_NAME	Container where the target object or the PL/SQL procedure resides (in the case of a multitenant container database (CDB)).
ERROR	Text of the original error encountered by the SQL Apply process (if applicable).
NEW_ERROR	Text of the new error to be raised by the SQL Apply process (if applicable, See the DBMS_LOGSTDBY <a href="#">SKIP_ERROR Procedure</a> ).
NEW_STMT	Text of the replacement statement that SQL Apply must execute (If applicable, See the DBMS_LOGSTDBY <a href="#">SKIP Procedure</a> ).
SKIP_ACTION	The skip action to be performed by SQL Apply (See the DBMS_LOGSTDBY <a href="#">SKIP Procedure</a> ).

## 98.2 DBMS\_LOGSTDBY\_CONTEXT Security Model

The security model for the DBMS\_LOGSTDBY\_CONTEXT package is the same as for the DBMS\_LOGSTDBY package.

**See Also:**

[DBMS\\_LOGSTDBY](#)

## 98.3 Summary of DBMS\_LOGSTDBY\_CONTEXT Subprograms

This table lists and briefly describes the DBMS\_LOGSTDBY\_CONTEXT package subprograms.

**Table 98-2 DBMS\_LOGSTDBY\_CONTEXT Package Subprograms**

Subprogram	Description
<a href="#">CLEAR_ALL_CONTEXT Procedure</a>	Clears all parameters contained within namespace LSBY_APPLY_CONTEXT.

**Table 98-2 (Cont.) DBMS\_LOGSTDBY\_CONTEXT Package Subprograms**

Subprogram	Description
<a href="#">CLEAR_CONTEXT Procedure</a>	Clears the specific parameter.
<a href="#">GET_CONTEXT Procedure</a>	Retrieves the value for the specified parameter.
<a href="#">SET_CONTEXT Procedure</a>	Sets the named parameter with the specified value.

### 98.3.1 CLEAR\_ALL\_CONTEXT Procedure

This procedure clears all parameters contained within namespace `LSBY_APPLY_CONTEXT`.

#### Syntax

```
DBMS_LOGSTDBY_CONTEXT.CLEAR_ALL_CONTEXT;
```

#### Parameters

None

### 98.3.2 CLEAR\_CONTEXT Procedure

This procedure clears the specific parameter.

#### Syntax

```
DBMS_LOGSTDBY_CONTEXT.CLEAR_CONTEXT (
    name          IN VARCHAR2);
```

#### Parameters

**Table 98-3 CLEAR\_CONTEXT Procedure Parameters**

Parameter	Description
name	Name of the parameter to be cleared.

### 98.3.3 GET\_CONTEXT Procedure

This procedure retrieves the value for the specified parameter.

#### Syntax

```
DBMS_LOGSTDBY_CONTEXT.GET_CONTEXT (
    name          IN VARCHAR2,
    value         OUT VARCHAR2);
```

## Parameters

**Table 98-4** *GET\_CONTEXT Procedure Parameters*

Parameter	Description
name	Name of the parameter.
value	The value retrieved for the parameter.

## 98.3.4 SET\_CONTEXT Procedure

This procedure sets the named parameter with the specified value.

### Syntax

```
DBMS_LOGSTDBY_CONTEXT.SET_CONTEXT (
    name          IN VARCHAR2
    value         IN VARCHAR2);
```

## Parameters

**Table 98-5** *SET\_CONTEXT Procedure Parameters*

Parameter	Description
name	Name of the parameter to be set.
value	Value to be assigned to the parameter being set.

# DBMS\_MEMOPTIMIZE

The `DBMS_MEMOPTIMIZE` package provides an interface for managing data in the memoptimize pool.

This chapter contains the following topics:

- [DBMS\\_MEMOPTIMIZE Overview](#)
- [Summary of DBMS\\_MEMOPTIMIZE Subprograms](#)

## 99.1 DBMS\_MEMOPTIMIZE Overview

The `DBMS_MEMOPTIMIZE` package provides an interface for managing data in the memoptimize pool. The memoptimize pool is a memory area in the system global area (SGA) that stores table data and hash index related to Memoptimized Rowstore.

The `DBMS_MEMOPTIMIZE` package provides the following functionality:

- Populate the Memoptimized Rowstore hash index with the data related to a specific table.
- Remove the data from the Memoptimized Rowstore hash index related to a specific table.

## 99.2 Summary of DBMS\_MEMOPTIMIZE Subprograms

This table lists the `DBMS_MEMOPTIMIZE` subprograms and briefly describes them.

**Table 99-1 DBMS\_MEMOPTIMIZE Package Subprograms**

Procedure	Description
<a href="#">DROP_OBJECT Procedure</a>	Removes the in-memory hash index related to a table.
<a href="#">POPULATE Procedure</a>	Populates the in-memory hash index with a table data.

### 99.2.1 DROP\_OBJECT Procedure

This procedure removes the in-memory hash index for a table.

#### Syntax

```
DBMS_MEMOPTIMIZE.DROP_OBJECT (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  partition_name   IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 99-2 DROP\_OBJECT Procedure Parameters**

Parameter	Description
schema_name	Name of the schema.
table_name	Name of the table whose data is to be removed from the in-memory hash index.
partition_name	Name of the table partition whose data is to be removed from the in-memory hash index. This is an optional parameter and its default value is NULL.

## 99.2.2 POPULATE Procedure

This procedure populates the in-memory hash index for a table.

### Syntax

```
DBMS_MEMOPTIMIZE.POPULATE (  
    schema_name      IN VARCHAR2,  
    table_name       IN VARCHAR2,  
    partition_name   IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 99-3 POPULATE Procedure Parameters**

Parameter	Description
schema_name	Name of the schema.
table_name	Name of the table from which the data is to be stored into the in-memory hash index.
partition_name	Name of the table partition from which the data is to be stored into the in-memory hash index. This is an optional parameter and its default value is NULL.

# DBMS\_METADATA

The `DBMS_METADATA` package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

 **See Also:**

*Oracle Database Utilities* for more information and for examples of using the `DBMS_METADATA` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Data Structures - Object and Table Types](#)
- [Subprogram Groupings](#)
  - [Subprograms for Retrieving Multiple Objects From the Database](#)
  - [Subprograms for Submitting XML to the Database](#)
- [Summary of All DBMS\\_METADATA Subprograms](#)

## 100.1 DBMS\_METADATA Overview

You can use the `DBMS_METADATA` package to retrieve metadata and to submit XML.

### Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

`DBMS_METADATA` provides the following retrieval interfaces:

- For programmatic use: OPEN, SET\_FILTER, SET\_COUNT, GET\_QUERY, SET\_PARSE\_ITEM, ADD\_TRANSFORM, SET\_TRANSFORM\_PARAM, SET\_REMAP\_PARAM, FETCH\_XXX, and CLOSE retrieve multiple objects.
- For use in SQL queries and for browsing: GET\_XML, GET\_DDL and GET\_SXML return metadata for a single named object. The GET\_DEPENDENT\_XML, GET\_DEPENDENT\_DDL, GET\_GRANTED\_XML, and GET\_GRANTED\_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

### Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS\_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD\_TRANSFORM, SET\_TRANSFORM\_PARAM, SET\_REMAP\_PARAM, SET\_PARSE\_ITEM, CONVERT, PUT, and CLOSE.

## 100.2 DBMS\_METADATA Security Model

The DBMS\_METADATA package considers a privileged user to be one who is connected as user SYS or who has the SELECT\_CATALOG\_ROLE role.

The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to PUBLIC.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as SELECT\_CATALOG\_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT\_CATALOG\_ROLE), you must make the program invokers-rights.
- For all objects that have passwords, except database links (for example, users and roles), the following rules apply:
  - A user who has the SELECT\_CATALOG\_ROLE can see all metadata for an object except the passwords for that object.

- The SYS user, users who have the EXP\_FULL\_DATABASE role, and users who own an object can see all metadata for that object, including passwords.
- For database links the password is never displayed. For security reasons Oracle restricts visibility of the password value to SYS users who query the link\$.passwordx column directly. Instead of the password, DBMS\_METADATA returns the following invalid syntax:

```
IDENTIFIED BY VALUES ':1'
```

A user who knows the password of the database link can manually replace the :1 with the password.

## 100.3 Rules and Limits

In an Oracle Shared Server (OSS) environment, the DBMS\_METADATA package must disable session migration and connection pooling.

This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the MAX\_SHARED\_SERVERS initialization parameter.

## 100.4 DBMS\_METADATA Data Structures - Object and Table Types

The DBMS\_METADATA package defines, in the SYS schema, the OBJECT and TABLE types shown in this code.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (
  item          VARCHAR2(30),
  value         VARCHAR2(4000),
  object_row    NUMBER )
/

CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;

CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item
/

CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;

CREATE TYPE sys.ku$_ddl AS OBJECT (
  ddlText      CLOB,
  parsedItems  sys.ku$_parsed_items )
/

CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;

CREATE TYPE sys.ku$_dcls IS TABLE OF sys.ku$_ddl
/

CREATE PUBLIC SYNONYM ku$_dcls FOR sys.ku$_dcls;

CREATE TYPE sys.ku$_multi_ddl AS OBJECT (
  object_row   NUMBER,
```

```

    ddls          sys.ku$_ddl )
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;

CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR
    sys.ku$_multi_ddls;

CREATE TYPE sys.ku$_ErrorLine IS OBJECT (
    errorNumber    NUMBER,
    errorText      VARCHAR2(2000) )
/

CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;

CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine
/
CREATE PUBLIC SYNONYM ku$_ErrorLines FOR sys.ku$_ErrorLines;

CREATE TYPE sys.ku$_SubmitResult AS OBJECT (
    ddl            sys.ku$_ddl,
    errorLines     sys.ku$_ErrorLines );
/

CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult
/

CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;

```

**Note:**

The maximum size of the VARCHAR2, NVARCHAR2, and RAW datatypes has been increased to 32 KB when the COMPATIBLE initialization parameter is set to 12.0 and the MAX\_STRING\_SIZE initialization parameter is set to EXTENDED. The DBMS\_METADATA package supports this increased size unless the version of the metadata is earlier than Oracle Database 12c Release 1 (12.1).

## 100.5 DBMS\_METADATA Subprogram Groupings

The DBMS\_METADATA subprograms retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- [Table 100-1](#) provides a summary, in alphabetical order, of DBMS\_METADATA subprograms used to retrieve multiple objects from a database.
- [Table 100-2](#) provides a summary, in alphabetical order, of DBMS\_METADATA subprograms used to submit XML metadata to a database.

## 100.5.1 DBMS\_METADATA Subprograms for Retrieving Multiple Objects From the Database

DBMS\_METADATA uses these subprograms used for retrieving multiple objects from the database.

**Table 100-1 DBMS\_METADATA Subprograms for Retrieving Multiple Objects**

Subprogram	Description
<a href="#">ADD_TRANSFORM Function</a>	Specifies a transform that <code>FETCH_xxx</code> applies to the XML representation of the retrieved objects
<a href="#">CLOSE Procedure</a>	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
<a href="#">FETCH_xxx Functions and Procedures</a>	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
<a href="#">GET_QUERY Function</a>	Returns the text of the queries that are used by <code>FETCH_xxx</code>
<a href="#">GET_xxx Functions</a>	Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call
<a href="#">OPEN Function</a>	Specifies the type of object to be retrieved, the version of its metadata, and the object model
<a href="#">SET_COUNT Procedure</a>	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_xxx</code> call
<a href="#">SET_FILTER Procedure</a>	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
<a href="#">SET_PARSE_ITEM Procedure</a>	Enables output parsing by specifying an object attribute to be parsed and returned
<a href="#">SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures</a>	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

## 100.5.2 DBMS\_METADATA Subprograms for Submitting XML to the Database

DBMS\_METADATA uses these subprograms for submitting XML to the database.

**Table 100-2 DBMS\_METADATA Subprograms for Submitting XML**

Subprogram	Description
<a href="#">ADD_TRANSFORM Function</a>	Specifies a transform for the XML documents
<a href="#">CLOSE Procedure</a>	Closes the context opened with <code>OPENW</code>
<a href="#">CONVERT Functions and Procedures</a>	Converts an XML document to DDL
<a href="#">OPENW Function</a>	Opens a write context
<a href="#">PUT Function</a>	Submits an XML document to the database

**Table 100-2 (Cont.) DBMS\_METADATA Subprograms for Submitting XML**

Subprogram	Description
<a href="#">SET_PARSE_ITEM Procedure</a>	Specifies an object attribute to be parsed
<a href="#">SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures</a>	SET_TRANSFORM_PARAM specifies a parameter to a transform SET_REMAP_PARAM specifies a remapping for a transform

## 100.6 Summary of All DBMS\_METADATA Subprograms

This table lists the DBMS\_METADATA subprograms and briefly describes them.

**Table 100-3 DBMS\_METADATA Package Subprograms**

Subprogram	Description
<a href="#">ADD_TRANSFORM Function</a>	Specifies a transform that <code>FETCH_xxx</code> applies to the XML representation of the retrieved objects
<a href="#">CLOSE Procedure</a>	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
<a href="#">CONVERT Functions and Procedures</a>	Converts an XML document to DDL
<a href="#">FETCH_xxx Functions and Procedures</a>	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
<a href="#">GET_xxx Functions</a>	Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call
<a href="#">GET_QUERY Function</a>	Returns the text of the queries that are used by <code>FETCH_xxx</code>
<a href="#">OPEN Function</a>	Specifies the type of object to be retrieved, the version of its metadata, and the object model
<a href="#">OPENW Function</a>	Opens a write context
<a href="#">PUT Function</a>	Submits an XML document to the database
<a href="#">SET_COUNT Procedure</a>	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_xxx</code> call
<a href="#">SET_FILTER Procedure</a>	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
<a href="#">SET_PARSE_ITEM Procedure</a>	Enables output parsing by specifying an object attribute to be parsed and returned
<a href="#">SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures</a>	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

### 100.6.1 ADD\_TRANSFORM Function

The `DBMS_METADATA.ADD_TRANSFORM` function is used for both retrieval and submission.

- When this procedure is used to retrieve objects, it specifies a transform that `FETCH_xxx` applies to the XML representation of the retrieved objects.

- When used to submit objects, it specifies a transform that `CONVERT` or `PUT` applies to the XML representation of the submitted objects. It is possible to add more than one transform.

### See Also:

- [Subprograms for Retrieving Multiple Objects From the Database](#)
- [Subprograms for Submitting XML to the Database](#)
- ["SET\\_TRANSFORM\\_PARAM and SET\\_REMAP\\_PARAM Procedures"](#) for information about how to modify and customize transform output

### Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    encoding    IN VARCHAR2 DEFAULT NULL,
    object_type IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

### Parameters

**Table 100-4 ADD\_TRANSFORM Function Parameters**

Parameters	Description
handle	The handle returned from <code>OPEN</code> when this transform is used to retrieve objects. Or the handle returned from <code>OPENW</code> when this transform is used in the submission of XML metadata.
name	The name of the transform. The name can be an internal keyword like <code>DDL</code> to use internally stored stylesheets. If the name contains a colon, it is interpreted as <code>directory_object_name:file_name</code> of a user-supplied Extensible Stylesheet Language Transformation (XSLT) script. Otherwise, name designates a transform implemented by <code>DBMS_METADATA</code> . See <a href="#">Table 100-5</a> for descriptions of available transforms.
encoding	The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left <code>NULL</code> and the URL is external to the database, UTF-8 encoding is assumed. If left <code>NULL</code> and the URL is internal to the database (that is, it begins with <code>/oradb/</code> ), then the encoding is assumed to be the database character set.

**Table 100-4 (Cont.) ADD\_TRANSFORM Function Parameters**

Parameters	Description
object_type	<p>The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata.</p> <ol style="list-style-type: none"> <li>When you use ADD_TRANSFORM to retrieve objects, the following definition of object_type applies: Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur: <ul style="list-style-type: none"> <li>if object_type is omitted, the transform applies to all object types within the heterogeneous collection</li> <li>if object_type is specified, the transform only applies to that specific object type within the collection</li> </ul> <p>If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type.</p> </li> <li>When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.</li> </ol>

The following table describes the transforms available on the ADD\_TRANSFORM function.

Because new transforms are occasionally added, you might want to query the DBMS\_METADATA\_TRANSFORMS view to see all valid Oracle-supplied transforms for specific object types.

**Table 100-5 Transforms Available on ADD\_TRANSFORM Function**

Object Type	Transform Name	Input Doc Type	Output Doc Type	Description
All	DDL	XML	DDL	Convert XML to SQL to create the object
All	MODIFY	XML	XML	Modify XML document according to transform parameters
Subset	SXML	XML	SXML	Convert XML to SXML
Subset	MODIFYSXML	SXML	SXML	Modify SXML document according to transform parameters
Subset	SXMLDDL	SXML	DDL	Convert SXML to DDL

Table 100-5 (Cont.) Transforms Available on ADD\_TRANSFORM Function

Object Type	Transform Name	Input Doc Type	Output Doc Type	Description
Subset	ALTERXML	SXML difference document	ALTER_XML	<p>Generate ALTER_XML from SXML difference document. (See the DBMS_METADATA_DIFF PL/SQL package for more information about SXML difference format.)</p> <p>The following parameters are valid for the ALTERXML transform:</p> <ul style="list-style-type: none"> <li>• XPATH - The XPATH of the object being altered</li> <li>• NAME - Name of the object being altered</li> <li>• ALTERABLE - Affirms that the object can be altered. If the object cannot be altered, a NOT_ALTERABLE element is inserted whose value indicates the reason.</li> <li>• CLAUSE_TYPE - The type of clause (for example, ADD_COLUMN)</li> <li>• COLUMN_ATTRIBUTE - The attribute being modified</li> <li>• CONSTRAINT_TYPE - The type of constraint (for example, UNIQUE or PRIMARY)</li> </ul>
Subset	ALTERDDL	ALTER_XML	ALTER_DDL	Convert ALTER_XML to ALTER_DDL

### Return Values

The opaque handle that is returned is used as input to SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

### Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD\_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD\_TRANSFORM more than once to apply multiple transforms to XML documents. The transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of a DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.
- Each transform expects a certain format XML document as input. If the input document is unspecified, metadata XML format is assumed.

- When the ALTERXML transform is used, parse items are returned in a PARSE\_LIST element of the ALTER\_XML document. Each PARSE\_LIST\_ITEM element contains an ITEM and a VALUE. For example:

```
<PARSE_LIST>
  <PARSE_LIST_ITEM>
    <ITEM>XPATH</ITEM>
    <VALUE>/sxml:TABLE/sxml:RELATIONAL_TABLE/sxml:COL_LIST/sxml:COL_LIST_ITEM[14]</
VALUE>
  </PARSE_LIST_ITEM>
  <PARSE_LIST_ITEM>
    <ITEM>NAME</ITEM>
    <VALUE>Z1</VALUE>
  </PARSE_LIST_ITEM>
  <PARSE_LIST_ITEM>
    <ITEM>CLAUSE_TYPE</ITEM>
    <VALUE>ADD_COLUMN</VALUE>
  </PARSE_LIST_ITEM>
  <PARSE_LIST_ITEM>
    <ITEM>COLUMN_ATTRIBUTE</ITEM>
    <VALUE>NOT_NULL</VALUE>
  </PARSE_LIST_ITEM>
</PARSE_LIST>
```

### Exceptions

- INVALID\_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID\_OPERATION. ADD\_TRANSFORM was called after the first call to FETCH\_XXX for the OPEN context. After the first call to FETCH\_XXX is made, no further calls to ADD\_TRANSFORM for the current OPEN context are permitted.
- INCONSISTENT\_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:
  - encoding is specified even though name is not a URL.
  - object\_type is not part of the collection designated by handle.

## 100.6.2 CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by OPEN (or OPENW) and cleans up the associated state.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)
- [Subprograms for Submitting XML to the Database](#)

### Syntax

```
DBMS_METADATA.CLOSE (
  handle IN NUMBER);
```

## Parameters

**Table 100-6** CLOSE Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).

## Usage Notes

 **Note:**

The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by OPEN or (OPENW).

- If a call to FETCH\_XXX returns NULL, indicating no more objects, a call to CLOSE is made transparently. In this case, you can still call CLOSE on the handle and not get an exception. (The call to CLOSE is not required.)
- If you know that only one specific object will be returned, you should explicitly call CLOSE after the single FETCH\_XXX call to free resources held by the handle.

## Exceptions

- INVALID\_ARGVAL. The value for the handle parameter is NULL or invalid.

## 100.6.3 CONVERT Functions and Procedures

The DBMS\_METADATA.CONVERT functions and procedures transform input XML documents.

The CONVERT functions return creation DDL. The CONVERT procedures return either XML or DDL, depending on the specified transforms.

 **See Also:**

- [Subprograms for Submitting XML to the Database](#)

## Syntax

The CONVERT functions are as follows:

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN sys.XMLType)
RETURN sys.ku$_multi_ddls;
```

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
```

```
document IN CLOB)
RETURN sys.ku$_multi_ddls;
```

The CONVERT procedures are as follows:

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN sys.XMLType,
  result   IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB,
  result   IN OUT NOCOPY CLOB);
```

## Parameters

**Table 100-7 CONVERT Subprogram Parameters**

Parameter	Description
handle	The handle returned from OPENW
document	The XML document containing object metadata of the type of the OPENW handle
result	The converted document

## Return Values

Either XML or DDL, depending on the specified transforms.

## Usage Notes

You can think of CONVERT as the second half of FETCH\_XXX, either FETCH\_DDL (for the function variants) or FETCH\_CLOB (for the procedure variants). There are two differences:

- FETCH\_XXX gets its XML document from the database, but CONVERT gets its XML document from the caller
- FETCH\_DDL returns its results in a sys.ku\$\_ddls nested table, but CONVERT returns a sys.ku\$\_multi\_ddls nested table

The transforms specified with ADD\_TRANSFORM are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the parsedItems column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

## Exceptions

- INVALID\_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT\_OPERATION. No transform was specified. The DDL transform was not specified (function variants only).

- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

## 100.6.4 FETCH\_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by `OPEN`, `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on.

See "[Usage Notes](#)" for the variants.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

### Syntax

The `FETCH` functions are as follows:

```
DBMS_METADATA.FETCH_XML (
    handle IN NUMBER)
RETURN sys.XMLType;

DBMS_METADATA.FETCH_DDL (
    handle IN NUMBER)
RETURN sys.ku$_ddl;

DBMS_METADATA.FETCH_CLOB (
    handle          IN NUMBER,
    cache_lob       IN BOOLEAN DEFAULT TRUE,
    lob_duration    IN PLS_INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The `FETCH` procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB);

DBMS_METADATA.FETCH_XML_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB,
    parsed_items OUT sys.ku$_parsed_items,
    object_type_path OUT VARCHAR2);
```

### Parameters

**Table 100-8** `FETCH_xxx` Function Parameters

Parameters	Description
<code>handle</code>	The handle returned from <code>OPEN</code> .
<code>cache_lob</code>	<code>TRUE</code> =read LOB into buffer cache

**Table 100-8 (Cont.) FETCH\_xxx Function Parameters**

Parameters	Description
lob_duration	The duration for the temporary LOB created by <code>FETCH_CLOB</code> , either <code>DBMS_LOB.SESSION</code> (the default) or <code>DBMS_LOB.CALL</code> .
doc	The metadata for the objects, or <code>NULL</code> if all objects have been returned.
parsed_items	A nested table containing the items specified by <code>SET_PARSE_ITEM</code> . If <code>SET_PARSE_ITEM</code> was not called, a <code>NULL</code> is returned.
object_type_path	For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to <code>FETCH_xxx</code> . If <code>handle</code> designates a homogeneous object type, a <code>NULL</code> is returned.

### Return Values

The metadata for the objects or `NULL` if all objects have been returned.

### Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to `OPEN` that returned the handle, and subsequent calls to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on. Each call to `FETCH_xxx` returns the number of objects specified by `SET_COUNT` (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to `FETCH_xxx` return `NULL` and cause the stream created by `OPEN` to be transparently closed.

There are several different `FETCH_xxx` functions and procedures:

- The `FETCH_XML` function returns the XML metadata for an object as an `XMLType`. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The `FETCH_DDL` function returns the DDL (to create the object) in a `sys.ku$_ddls` nested table. It assumes that the DDL transform has been specified. Each row of the `sys.ku$_ddls` nested table contains a single DDL statement in the `ddlText` column; if requested, parsed items for the DDL statement will be returned in the `parsedItems` column. Multiple DDL statements may be returned under the following circumstances:
  - When you call `SET_COUNT` to specify a count greater than 1
  - When an object is transformed into multiple DDL statements. For example, A `TYPE` object that has a DDL transform applied to it can be transformed into both `CREATE TYPE` and `CREATE TYPE BODY` statements. A `TABLE` object can be transformed into a `CREATE TABLE`, and one or more `ALTER TABLE` statements
- The `FETCH_CLOB` function simply returns the object, transformed or not, as a `CLOB`. By default, the `CLOB` is read into the buffer cache and has session duration, but these defaults can be overridden with the `cache_lob` and `lob_duration` parameters.

- The `FETCH_CLOB` procedure returns the objects by reference in an `IN OUT NOCOPY` parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The `FETCH_XML_CLOB` procedure returns the XML metadata for the objects as a CLOB in an `IN OUT NOCOPY` parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.
- All LOBs returned by `FETCH_xxx` are temporary LOBs. You must free the LOB. If the LOB is supplied as an `IN OUT NOCOPY` parameter, you must also create the LOB.
- If `SET_PARSE_ITEM` was called, `FETCH_DDL` and `FETCH_XML_CLOB` return attributes of the object's metadata (or the DDL statement) in a `sys.ku$_parsed_items` nested table. For `FETCH_XML_CLOB`, the nested table is an `OUT` parameter. For `FETCH_DDL`, it is a column in the returned `sys.ku$_dcls` nested table. Each row of the nested table corresponds to an item specified by `SET_PARSE_ITEM` and contains the following columns:
  - `item`—the name of the attribute as specified in the `name` parameter to `SET_PARSE_ITEM`.
  - `value`—the attribute value, or `NULL` if the attribute is not present in the DDL statement.
  - `object_row`—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by `FETCH_xxx`, (because `SET_COUNT` specified a count greater than 1) then `object_row=1` for all items for the first object, 2 for the second, and so on.
- The rows of the `sys.ku$_parsed_items` nested table are ordered by ascending `object_row`, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on `item`.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be `NULL`.
- If `SET_PARSE_ITEM` was not called, `NULL` is returned as the value of the parsed items nested table.
- It is expected that the same variant of `FETCH_xxx` will be called for all objects selected by `OPEN`. That is, programs will not intermix calls to `FETCH_XML`, `FETCH_DDL`, `FETCH_CLOB`, and so on using the same `OPEN` handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the `FETCH_xxx` calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

## Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. Either `FETCH_XML` was called when the DDL transform had been specified, or `FETCH_DDL` was called when the DDL transform had *not* been specified.

## 100.6.5 GET\_xxx Functions

`GET_xxx` functions let you fetch metadata for objects with a single call.

These `GET_xxx` functions are:

- `GET_XML`
- `GET_DDL`
- `GET_SXML`
- `GET_DEPENDENT_XML`
- `GET_DEPENDENT_DDL`
- `GET_GRANTED_XML`
- `GET_GRANTED_DDL`

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

## Syntax

```
DBMS_METADATA.GET_XML (  
  object_type      IN VARCHAR2,  
  name             IN VARCHAR2,  
  schema           IN VARCHAR2 DEFAULT NULL,  
  version          IN VARCHAR2 DEFAULT 'COMPATIBLE',  
  model            IN VARCHAR2 DEFAULT 'ORACLE',  
  transform        IN VARCHAR2 DEFAULT NULL)  
RETURN CLOB;
```

```
DBMS_METADATA.GET_DDL (  
  object_type      IN VARCHAR2,  
  name             IN VARCHAR2,  
  schema           IN VARCHAR2 DEFAULT NULL,  
  version          IN VARCHAR2 DEFAULT 'COMPATIBLE',  
  model            IN VARCHAR2 DEFAULT 'ORACLE',  
  transform        IN VARCHAR2 DEFAULT 'DDL')  
RETURN CLOB;
```

```

DBMS_METADATA.GET_SXML (
  object_type      IN VARCHAR2,
  name             IN VARCHAR2 DEFAULT NULL,
  schema          IN VARCHAR2 DEFAULT NULL,
  version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model           IN VARCHAR2 DEFAULT 'ORACLE',
  transform       IN VARCHAR2 DEFAULT 'SXML')
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_XML (
  object_type      IN VARCHAR2,
  base_object_name IN VARCHAR2,
  base_object_schema IN VARCHAR2 DEFAULT NULL,
  version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model           IN VARCHAR2 DEFAULT 'ORACLE',
  transform       IN VARCHAR2 DEFAULT NULL,
  object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_DDL (
  object_type      IN VARCHAR2,
  base_object_name IN VARCHAR2,
  base_object_schema IN VARCHAR2 DEFAULT NULL,
  version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model           IN VARCHAR2 DEFAULT 'ORACLE',
  transform       IN VARCHAR2 DEFAULT 'DDL',
  object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_XML (
  object_type      IN VARCHAR2,
  grantee         IN VARCHAR2 DEFAULT NULL,
  version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model           IN VARCHAR2 DEFAULT 'ORACLE',
  transform       IN VARCHAR2 DEFAULT NULL,
  object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_DDL (
  object_type      IN VARCHAR2,
  grantee         IN VARCHAR2 DEFAULT NULL,
  version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model           IN VARCHAR2 DEFAULT 'ORACLE',
  transform       IN VARCHAR2 DEFAULT 'DDL',
  object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

## Parameters

**Table 100-9** GET\_xxx Function Parameters

Parameter	Description
object_type	The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.

**Table 100-9 (Cont.) GET\_xxx Function Parameters**

Parameter	Description
name	The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified. See <a href="#">Table 100-18</a> for a list of filters.
schema	The object schema. It is used internally in a SCHEMA filter. The default is the current user.
version	The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.
model	The object model to use. This parameter takes the same values as the OPEN model parameter.
transform	The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.
base_object_name	The base object name. It is used internally in a BASE_OBJECT_NAME filter.
base_object_schema	The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.
grantee	The grantee. It is used internally in a GRANTEE filter. The default is the current user.
object_count	The maximum number of objects to return. See <a href="#">SET_COUNT Procedure</a> .

### Return Values

The metadata for the specified object as XML or DDL.

### Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET\_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML, SXML, or DDL.
  - GET\_xxxx is used to fetch named objects, especially schema objects (tables, views).
  - GET\_DEPENDENT\_xxx is used to fetch dependent objects (audits, object grants).
  - GET\_GRANTED\_xxx is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET\_xxx to fetch an index by name, or GET\_DEPENDENT\_xxx to fetch the same index by specifying the table on which it is defined.
- GET\_xxx only returns a single named object.
- For GET\_DEPENDENT\_xxx and GET\_GRANTED\_xxx, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)

- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL\*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

### Exceptions

- INVALID\_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT\_NOT\_FOUND. The specified object was not found in the database.

### Examples

#### Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE','EMP','SCOTT')
FROM DUAL;
```

#### Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses SET\_TRANSFORM\_PARAM (with the handle value = DBMS\_METADATA.SESSION\_TRANSFORM meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
EXECUTE
DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM,'STORAGE',false);
SELECT DBMS_METADATA.GET_DDL('TABLE',u.table_name)
      FROM USER_ALL_TABLES u
      WHERE u.nested='NO'
      AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM,'DEFAULT');
```

#### Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
      'EMPLOYEES','HR') FROM DUAL;
```

#### Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT','SCOTT')
      FROM DUAL;
```

## 100.6.6 GET\_QUERY Function

This function returns the text of the queries that are used by `FETCH_XXX`. This function assists in debugging.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

### Syntax

```
DBMS_METADATA.GET_QUERY (  
    handle IN NUMBER)  
RETURN VARCHAR2;
```

### Parameters

**Table 100-10** GET\_QUERY Function Parameters

Parameter	Description
handle	The handle returned from <code>OPEN</code> . It cannot be the handle for a heterogeneous object type.

### Return Values

The text of the queries that will be used by `FETCH_XXX`.

### Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for the `handle` parameter.

## 100.6.7 OPEN Function

The `DBMS_METADATA.OPEN` function specifies the type of object to be retrieved, the version of its metadata, and the object model.

The return value is an opaque context handle for the set of objects to be used in subsequent calls.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

## Syntax

```
DBMS_METADATA.OPEN (
  object_type IN VARCHAR2,
  version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model       IN VARCHAR2 DEFAULT 'ORACLE',
  network_link IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

## Parameters

**Table 100-11 Open Function Parameters**

Parameter	Description
object_type	<p>The type of object to be retrieved. <a href="#">Table 100-12</a> lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see <a href="#">model</a> in this table).</p> <p>The Attributes column in <a href="#">Table 100-12</a> specifies some object type attributes:</p> <ul style="list-style-type: none"> <li>• Schema objects, such as tables, belong to schemas.</li> <li>• Named objects have unique names (if they are schema objects, the name is unique to the schema).</li> <li>• Dependent objects, such as indexes, are defined with reference to a base schema object.</li> <li>• Granted objects are granted or assigned to a user or role and therefore have a named grantee.</li> <li>• Heterogeneous object types denote a collection of related objects of different types. See <a href="#">Table 100-13</a> for a listing of object types returned for the heterogeneous object type.</li> </ul> <p>These attributes are relevant when choosing object selection criteria. See "<a href="#">SET_FILTER Procedure</a>" for more information.</p>
version	<p>The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <p>COMPATIBLE (default)—the version of the metadata corresponds to the database compatibility level.</p> <p>LATEST—the version of the metadata corresponds to the database version.</p> <p>A specific database version. The value cannot be lower than 9.2.0.</p>
model	<p>Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported.</p>
network_link	<p>The name of a database link to the database whose metadata is to be retrieved. If NULL (the default), metadata is retrieved from the database on which the caller is running</p>

[Table 100-12](#) provides the name, meaning, attributes, and notes for the DBMS\_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

**Table 100-12 DBMS\_METADATA: Object Types**

Type Name	Meaning	Attributes	Notes
AQ_QUEUE	queues	SND	Dependent on table
AQ_QUEUE_TABLE	additional metadata for queue tables	ND	Dependent on table
AQ_TRANSFORM	transforms	SN	None
ASSOCIATION	associate statistics	D	None
AUDIT	audits of SQL statements	DG	Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited.
AUDIT_OBJ	audits of schema objects	D	None
CLUSTER	clusters	SN	None
COMMENT	comments	D	None
CONSTRAINT	constraints	SND	Does not include: <ul style="list-style-type: none"> <li>primary key constraint for IOT</li> <li>column NOT NULL constraints</li> <li>certain REF SCOPE and WITH ROWID constraints for tables with REF columns</li> </ul>
CONTEXT	application contexts	N	None
DATABASE_EXPORT	all metadata objects in a database	H	Corresponds to a full database export
DB_LINK	database links	SN	Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner.
DEFAULT_ROLE	default roles	G	Granted to a user by ALTER USER
DIMENSION	dimensions	SN	None
DIRECTORY	directories	N	None
FGA_POLICY	fine-grained audit policies	D	Not modeled as named object because policy names are not unique.
FUNCTION	stored functions	SN	None
INDEX_STATISTICS	precomputed statistics on indexes	D	The base object is the index's table.
INDEX	indexes	SND	None
INDEXTYPE	indextypes	SN	None
JAVA_SOURCE	Java sources	SN	None
JOB	jobs	S	None
LIBRARY	external procedure libraries	SN	None
MATERIALIZED_VIEW	materialized views	SN	None

**Table 100-12 (Cont.) DBMS\_METADATA: Object Types**

Type Name	Meaning	Attributes	Notes
MATERIALIZED_VIEW_LOG	materialized view logs	D	None
OBJECT_GRANT	object grants	DG	None
OPERATOR	operators	SN	None
PACKAGE	stored packages	SN	By default, both package specification and package body are retrieved. See <a href="#">"SET_FILTER Procedure"</a> .
PACKAGE_SPEC	package specifications	SN	None
PACKAGE_BODY	package bodies	SN	None
PROCEDURE	stored procedures	SN	None
PROFILE	profiles	N	None
PROXY	proxy authentications	G	Granted to a user by ALTER USER
REF_CONSTRAINT	referential constraint	SND	None
REFRESH_GROUP	refresh groups	SN	None
RESOURCE_COST	resource cost info		None
RLS_CONTEXT	driving contexts for enforcement of fine-grained access-control policies	D	Corresponds to the DBMS_RLS.ADD_POLICY_CONTENT procedure
RLS_GROUP	fine-grained access-control policy groups	D	Corresponds to the DBMS_RLS.CREATE_GROUP procedure
RLS_POLICY	fine-grained access-control policies	D	Corresponds to DBMS_RLS.ADD_GROUPED_POLICY. Not modeled as named objects because policy names are not unique.
RMGR_CONSUMER_GROUP	resource consumer groups	SN	Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects.
RMGR_INITIAL_CONSUMER_GROUP	assign initial consumer groups to users	G	None
RMGR_PLAN	resource plans	SN	None
RMGR_PLAN_DIRECTIVE	resource plan directives	D	Dependent on resource plan
ROLE	roles	N	None
ROLE_GRANT	role grants	G	None
ROLLBACK_SEGMENT	rollback segments	N	None
SCHEMA_EXPORT	all metadata objects in a schema	H	Corresponds to user-mode export.
SEQUENCE	sequences	SN	None

**Table 100-12 (Cont.) DBMS\_METADATA: Object Types**

Type Name	Meaning	Attributes	Notes
SYNONYM	synonyms	See notes	Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in <code>CREATE PUBLIC SYNONYM FOO FOR BAR</code> , the resultant object is considered to have name FOO and schema PUBLIC.
SYSTEM_GRANT	system privilege grants	G	None
TABLE	tables	SN	None
TABLE_DATA	metadata describing row data for a table, nested table, or partition	SND	For partitions, the object name is the partition name. For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table ( <i>not</i> the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself.
TABLE_EXPORT	metadata for a table and its associated objects	H	Corresponds to table-mode export
TABLE_STATISTICS	precomputed statistics on tables	D	None
TABLESPACE	tablespaces	N	None
TABLESPACE_QUOTA	tablespace quotas	G	Granted with ALTER USER
TRANSPORTABLE_EXPORT	metadata for objects in a transportable tablespace set	H	Corresponds to transportable tablespace export
TRIGGER	triggers	SND	None
TRUSTED_DB_LINK	trusted links	N	None
TYPE	user-defined types	SN	By default, both type and type body are retrieved. See " <a href="#">SET_FILTER Procedure</a> ".
TYPE_SPEC	type specifications	SN	None
TYPE_BODY	type bodies	SN	None
USER	users	N	None
VIEW	views	SN	None
XMLSCHEMA	XML schema	SN	The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it.
XS_USER	Real Application Security (RAS) user	N	Corresponds to RAS users
XS_ROLE	Real Application Security (RAS) role	N	Corresponds to RAS roles

**Table 100-12 (Cont.) DBMS\_METADATA: Object Types**

Type Name	Meaning	Attributes	Notes
XS_ROLESET	Real Application Security (RAS) rolesets	N	Corresponds to RAS rolesets
XS_ROLE_GRANT	Real Application Security (RAS) role grants	N	Corresponds to RAS role grants
XS_SECURITY_CLASS	Real Application Security (RAS) security class	SN	Corresponds to RAS security classes
XS_DATA_SECURITY	Real Application Security (RAS) data security policy	SN	Corresponds to RAS data security policies
XS_ACL	Real Application Security (RAS) ACL	SN	Corresponds to RAS access control lists (ACLs) and associated access control entries (ACEs)
XS_ACL_PARAM	Real Application Security (RAS) ACL parameter	N	Corresponds to RAS access control lists (ACL) parameters
XS_NAMESPACE	Real Application Security (RAS) namespace	N	Corresponds to RAS namespaces.

Table 100-13 lists the types of objects returned for the major heterogeneous object types. For SCHEMA\_EXPORT, certain object types are only returned if the INCLUDE\_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE\_USER.

**Table 100-13 Object Types Returned for the Heterogeneous Object Type**

Object Type	DATABASE_EXPORT	SCHEMA_EXPORT	TABLE_EXPORT	TRANSPORTABLE_EXPORT

Object Type	DATABASE_EXPORT	SCHEMA_EXPORT	TABLE_EXPORT	TRANSPORTABLE_EXPORT
TYPE	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
TYPE_SPEC	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
TYPE_BODY	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
USER	Yes	INCLUDE_USER	No	No
VIEW	Yes	Yes	No	No
XMLSCHEMA	Yes	Yes	No	No

### Return Values

An opaque handle to the class of objects. This handle is used as input to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, `GET_QUERY`, `SET_PARSE_ITEM`, `FETCH_xxx`, and `CLOSE`.

### Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `version` or `model` parameter was not valid for the `object_type`.

## 100.6.8 OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

### See Also:

For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#)

### Syntax

```
DBMS_METADATA.OPENW
(object_type IN VARCHAR2,
version      IN VARCHAR2 DEFAULT 'COMPATIBLE',
model       IN VARCHAR2 DEFAULT 'ORACLE')
RETURN NUMBER;
```

## Parameters

**Table 100-14 OPENW Function Parameters**

Parameter	Description
object_type	The type of object to be submitted. Valid types names and their meanings are listed in <a href="#">Table 100-12</a> . The type cannot be a heterogeneous object type.
version	The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: <ul style="list-style-type: none"> <li>COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher.</li> <li>LATEST - The version of the DDL corresponds to the database version.</li> <li>A specific database version. The value cannot be lower than 9.2.0.</li> </ul>
model	Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.

## Return Values

An opaque handle to write context. This handle is used as input to the ADD\_TRANSFORM, CONVERT, PUT, and CLOSE procedures.

## Exceptions

- INVALID\_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID\_OBJECT\_PARAM. The model parameter was not valid for the object\_type.

## 100.6.9 PUT Function

This function submits an XML document containing object metadata to the database to create the object.

### See Also:

For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#)

## Syntax

```
DBMS_METADATA.PUT (
    handle      IN          NUMBER,
    document    IN          sys.XMLType,
    flags       IN          NUMBER,
    results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

```

DBMS_METADATA.PUT (
  handle      IN          NUMBER,
  document    IN          CLOB,
  flags       IN          NUMBER,
  results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;

```

## Parameters

**Table 100-15** PUT Function Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata for the type of the OPENW handle.
flags	Reserved for future use
results	Detailed results of the operation.

## Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

## Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the sys.ku\$\_SubmitResults nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

## Exceptions

- INVALID\_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT\_OPERATION. The DDL transform was not specified.
- INCOMPATIBLE\_DOCUMENT. The version of the XML document is not compatible with this version of the software.

## 100.6.10 SET\_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single FETCH\_XXX call.

By default, each call to FETCH\_XXX returns one object. You can use the SET\_COUNT procedure to override this default. If FETCH\_XXX is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single `FETCH_xxx` operation only returns objects of a single object type.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

### Syntax

```
DBMS_METADATA.SET_COUNT (
    handle          IN NUMBER,
    value           IN NUMBER,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 100-16 SET\_COUNT Procedure Parameters**

Parameter	Description
handle	The handle returned from <code>OPEN</code> .
value	The maximum number of objects to retrieve.
object_type_path	A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> <li>• If <code>object_type_path</code> is omitted, then the count applies to all object types within the heterogeneous collection.</li> <li>• If <code>object_type_path</code> is specified, then the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection.</li> </ul>

### Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_COUNT` was called after the first call to `FETCH_xxx` for the `OPEN` context. After the first call to `FETCH_xxx` is made, no further calls to `SET_COUNT` for the current `OPEN` context are permitted.
- `INCONSISTENT_ARGS`. `object_type` parameter is not consistent with handle.

## 100.6.11 SET\_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)

### Syntax

```
DBMS_METADATA.SET_FILTER (  
    handle          IN NUMBER,  
    name            IN VARCHAR2,  
    value           IN VARCHAR2,  
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (  
    handle          IN NUMBER,  
    name            IN VARCHAR2,  
    value           IN BOOLEAN DEFAULT TRUE,  
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (  
    handle          IN NUMBER,  
    name            IN VARCHAR2,  
    value           IN NUMBER,  
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 100-17 SET\_FILTER Procedure Parameters**

Parameter	Description
handle	The handle returned from OPEN.

**Table 100-17 (Cont.) SET\_FILTER Procedure Parameters**

Parameter	Description
name	<p>The name of the filter. For each filter, <a href="#">Table 100-18</a> lists the <code>object_type</code> it applies to, its name, its datatype (text or Boolean), and its meaning or effect (including its default value, if any).</p> <p>The Datatype column of <a href="#">Table 100-18</a> also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.)) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (<i>not</i> a double quote) are needed to represent an apostrophe. For example, an example of a <code>NAME_EXPR</code> filter in PL/SQL is as follows:</p> <pre>' IN ( 'DEPT' , 'EMP' ) '</pre> <p>The filter value is combined with a particular object attribute to produce a <code>WHERE</code> condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.</p>
value	The value of the filter. Text, Boolean, and Numeric filters are supported.
object_type_path	A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See <a href="#">Table 100-19</a> for a listing of some of the values for this parameter.

[Table 100-18](#) describes the object type, name, datatype, and meaning of the filters available with the `SET_FILTER` procedure.

**Table 100-18 SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
Named objects	NAME	Text	Objects with this exact name are selected.
Named objects	NAME_EXPR	Text expression	<p>The filter value is combined with the object attribute corresponding to the object name to produce a <code>WHERE</code> condition in the query that fetches the objects.</p> <p>By default, all named objects of <code>object_type</code> are selected.</p>
Named objects	EXCLUDE_NAME_EXPR	Text expression	<p>The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched.</p> <p>By default, all named objects of the object type are selected.</p>

**Table 100-18 (Cont.) SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	EXCLUDE_TABLES	Boolean	If TRUE, all paths associated with tables are excluded from the set of objects fetched. If FALSE (the default), all paths associated with tables are fetched.
Schema objects	SCHEMA	Text	Objects in this schema are selected. If the object type is SYNONYM, then specify PUBLIC to select public synonyms.
Schema objects	SCHEMA_EXPR	Text expression	The filter value is combined with the attribute corresponding to the object's schema. The default is determined as follows: - if BASE_OBJECT_SCHEMA is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected.
PACKAGE, TYPE	SPECIFICATION	Boolean	If TRUE, retrieve the package or type specification. Defaults to TRUE.
PACKAGE, TYPE	BODY	Boolean	If TRUE, retrieve the package or type body. Defaults to TRUE.
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE	Text	Objects in this tablespace (or having a partition in this tablespace) are selected.
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE_EXPR	Text expression	The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected.
TABLE, objects dependent on tables	PRIMARY	Boolean	If TRUE, retrieve primary tables (that is, tables for which the secondary object bit in obj\$ is clear. Defaults to TRUE.
TABLE, objects dependent on tables	SECONDARY	Boolean	If TRUE, retrieve secondary tables (that is, tables for which the secondary object bit in obj\$ is set). Defaults to TRUE.
Dependent Objects	BASE_OBJECT_NAME	Text	Objects are selected that are defined or granted on objects with this name. Specify SCHEMA for triggers on schemas. Specify DATABASE for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column.

**Table 100-18 (Cont.) SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
Dependent Objects	BASE_OBJECT _SCHEMA	Text	Objects are selected that are defined or granted on objects in this schema. If BASE_OBJECT_NAME is specified with a value other than SCHEMA or DATABASE, this defaults to the current schema.
Dependent Objects	BASE_OBJECT _NAME_EXPR	Text expression	The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers.
Dependent Objects	EXCLUDE_BAS E_OBJECT_NA ME_EXPR	Text expression	The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers.
Dependent Objects	BASE_OBJECT _SCHEMA_EXP R	Text expression	The filter value is combined with the attribute corresponding to the schema of the base object.
Dependent Objects	BASE_OBJECT _TYPE	Text	The object type of the base object.
Dependent Objects	BASE_OBJECT _TYPE_EXPR	Text expression	The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type.
Dependent Objects	BASE_OBJECT _TABLESPACE	Text	The tablespace of the base object.
Dependent Objects	BASE_OBJECT _TABLESPACE _EXPR	Text expression	The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace.
INDEX, TRIGGER	SYSTEM_GENE RATED	Boolean	If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE.
Granted Objects	GRANTEE	Text	Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC.
Granted Objects	PRIVNAME	Text	The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified.
Granted Objects	GRANTEE_EXP R	Text expression	The filter value is combined with the attribute corresponding to the grantee name.
Granted Objects	EXCLUDE_GRA NTEE_EXPR	Text expression	The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched.
OBJECT_GRANT	GRANTOR	Text	Object grants are selected that are granted by this user.

**Table 100-18 (Cont.) SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
SYNONYM, JAVA_SOURCE, XMLSCHEMA	LONGNAME	Text	A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used.
SYNONYM, JAVA_SOURCE, XMLSCHEMA	LONGNAME_EXPR	Text	The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object.
All objects	CUSTOM_FILTER	Text	The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used.  The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exists for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed.
All objects	EDITION	Text	The edition filter is accepted for any object type, but affects only objects that support editions. The filter is only accepted for local objects (that is, the network_link parameter is not specified in the OPEN call). The edition name must be a valid edition name. If an edition is not specified, the edition of the active session is used.
SCHEMA_EXPORT	SCHEMA	Text	The schema whose objects are selected.
SCHEMA_EXPORT	SCHEMA_EXPR	Text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects. By default the current user's objects are selected.
SCHEMA_EXPORT	INCLUDE_USER	Boolean	If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA. Defaults to FALSE.
TABLE_EXPORT	SCHEMA	Text	Objects (tables and their dependent objects) in this schema are selected.

**Table 100-18 (Cont.) SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	SCHEMA_EXPR	Text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects. By default the current user's objects are selected.
TABLE_EXPORT	NAME	Text	The table with this exact name is selected along with its dependent objects.
TABLE_EXPORT	NAME_EXPR	Text expression	The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects.
Heterogeneous objects	BEGIN_WITH	Text	The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.
Heterogeneous objects	BEGIN_AFTER	Text	The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.
Heterogeneous objects	END_BEFORE	Text	The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.
Heterogeneous objects	END_WITH	Text	The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.

Table 100-18 (Cont.) SET\_FILTER: Filters

Object Type	Name	Datatype	Meaning
Heterogeneous objects	INCLUDE_PAT H_EXPR, EXCLUDE_PAT H_EXPR	Text expression	<p>For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 100-19 for valid path names that can be used with these filters.</p> <p>BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.</p>

### Usage Notes

- Each call to SET\_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are concatenated with the AND keyword so that you can use multiple SET\_FILTER calls to refine the set of objects to be returned. For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle, 'SCHEMA', 'SCOTT');
SET_FILTER(handle, 'NAME', 'EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle, 'NAME_EXPR', '>=' 'FELIX' '');
SET_FILTER(handle, 'NAME_EXPR', '<=' 'OSCAR' '');
```

- With SET\_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has the SELECT\_CATALOG\_ROLE role, then any object can be retrieved; otherwise, only the following can be retrieved:
  - Schema objects owned by the current user
  - Public synonyms
  - System privileges granted to the current user or to PUBLIC
  - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
  - SCHEMA\_EXPORT where the name is the current user
  - TABLE\_EXPORT where SCHEMA is the current user

If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.

- For heterogeneous object types, the `BEGIN_WITH` and `BEGIN_AFTER` filters allow restart on an object type boundary. Appropriate filter values are returned by the `FETCH_XML_CLOB` procedure.

Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for `SCHEMA_EXPORT` the `NAME` filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a `NAME_EXPR` filter explicitly for the `TABLE` object type path. [Table 100-19](#) lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: `DATABASE_EXPORT_OBJECTS`, `SCHEMA_EXPORT_OBJECTS`, and `TABLE_EXPORT_OBJECTS`.) See [Table 100-18](#) for filters defined for each path name. These path names are valid in the `INCLUDE_PATH_EXPR` and `EXCLUDE_PATH_EXPR` filters. Path names marked with an asterisk (\*) are *only* valid in those filters; they cannot be used as values of the `SET_FILTER object_type_path` parameter.

**Table 100-19 Object Type Path Names for Heterogeneous Object Types**

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	AUDIT_OBJ	Object audits on the selected tables
TABLE_EXPORT	COMMENT	Table and column comments for the selected tables
TABLE_EXPORT	CONSTRAINT	Constraints (including referential constraints) on the selected tables
TABLE_EXPORT	*GRANT	Object grants on the selected tables
TABLE_EXPORT	INDEX	Indexes (including domain indexes) on the selected tables
TABLE_EXPORT	OBJECT_GRANT	Object grants on the selected tables
TABLE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on the selected tables
TABLE_EXPORT	STATISTICS	Statistics on the selected tables
TABLE_EXPORT	TABLE_DATA	Row data for the selected tables
TABLE_EXPORT	TRIGGER	Triggers on the selected tables
SCHEMA_EXPORT	ASSOCIATION	Statistics type associations for objects in the selected schemas
SCHEMA_EXPORT	AUDIT_OBJ	Audits on all objects in the selected schemas
SCHEMA_EXPORT	CLUSTER	Clusters in the selected schemas and their indexes
SCHEMA_EXPORT	COMMENT	Comments on all objects in the selected schemas

**Table 100-19 (Cont.) Object Type Path Names for Heterogeneous Object Types**

<b>Heterogeneous Type</b>	<b>Path Name (*=valid only in xxx_PATH_EXPR)</b>	<b>Scope</b>
SCHEMA_EXPORT	CONSTRAINT	Constraints (including referential constraints) on all objects in the selected schemas
SCHEMA_EXPORT	DB_LINK	Private database links in the selected schemas
SCHEMA_EXPORT	DEFAULT_ROLE	Default roles granted to users associated with the selected schemas
SCHEMA_EXPORT	DIMENSION	Dimensions in the selected schemas
SCHEMA_EXPORT	FUNCTION	Functions in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	*GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters in the selected schemas
SCHEMA_EXPORT	INDEXTYPE	Indextypes in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JAVA_SOURCE	Java sources in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JOB	Jobs in the selected schemas
SCHEMA_EXPORT	LIBRARY	External procedure libraries in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW	Materialized views in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs on tables in the selected schemas
SCHEMA_EXPORT	OBJECT_GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	OPERATOR	Operators in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE	Packages (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE_BODY	Package bodies in the selected schemas
SCHEMA_EXPORT	PACKAGE_SPEC	Package specifications in the selected schemas
SCHEMA_EXPORT	PASSWORD_HISTORY	The password history for users associated with the selected schemas
SCHEMA_EXPORT	PROCEDURE	Procedures in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the selected schemas
SCHEMA_EXPORT	REFRESH_GROUP	Refresh groups in the selected schemas
SCHEMA_EXPORT	SEQUENCE	Sequences in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	STATISTICS	Statistics on tables and indexes in the selected schemas
SCHEMA_EXPORT	SYNONYM	Private synonyms in the selected schemas

**Table 100-19 (Cont.) Object Type Path Names for Heterogeneous Object Types**

<b>Heterogeneous Type</b>	<b>Path Name (*=valid only in xxx_PATH_EXPR)</b>	<b>Scope</b>
SCHEMA_EXPORT	TABLE	Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
SCHEMA_EXPORT	TABLE_DATA	Row data for tables in the selected schemas
SCHEMA_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users associated with the selected schemas
SCHEMA_EXPORT	TRIGGER	Triggers on tables in the selected schemas
SCHEMA_EXPORT	XS_SECURITY_CLASSES	Oracle Real Application Security (RAS) security classes
SCHEMA_EXPORT	XS_DATA_SECURITY	Oracle Real Application Security (RAS) data security policies
SCHEMA_EXPORT	XS_ACL	Oracle Real Application Security (RAS) access control lists (ACLs)
SCHEMA_EXPORT	TYPE	Types (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	TYPE_BODY	Type bodies in the selected schemas
SCHEMA_EXPORT	TYPE_SPEC	Type specifications in the selected schemas
SCHEMA_EXPORT	USER	User definitions for users associated with the selected schemas
SCHEMA_EXPORT	VIEW	Views in the selected schemas and their dependent objects (grants, constraints, comments, audits)
DATABASE_EXPORT	ASSOCIATION	Statistics type associations for objects in the database
DATABASE_EXPORT	AUDIT	Audits of SQL statements
DATABASE_EXPORT	AUDIT_OBJ	Audits on all objects in the database
DATABASE_EXPORT	CLUSTER	Clusters and their indexes
DATABASE_EXPORT	COMMENT	Comments on all objects
DATABASE_EXPORT	CONSTRAINT	Constraints (including referential constraints)
DATABASE_EXPORT	CONTEXT	Application contexts
DATABASE_EXPORT	DB_LINK	Private and public database links
DATABASE_EXPORT	DEFAULT_ROLE	Default roles granted to users in the database
DATABASE_EXPORT	DIMENSION	Dimensions in the database
DATABASE_EXPORT	DIRECTORY	Directory objects in the database
DATABASE_EXPORT	FGA_POLICY	Fine-grained audit policies
DATABASE_EXPORT	FUNCTION	Functions
DATABASE_EXPORT	* GRANT	Object and system grants
DATABASE_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters
DATABASE_EXPORT	INDEXTYPE	Indextypes and their dependent grants and audits
DATABASE_EXPORT	JAVA_SOURCE	Java sources and their dependent grants and audits
DATABASE_EXPORT	JOB	Jobs

**Table 100-19 (Cont.) Object Type Path Names for Heterogeneous Object Types**

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	LIBRARY	External procedure libraries
DATABASE_EXPORT	MATERIALIZED_VIEW	Materialized views
DATABASE_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs
DATABASE_EXPORT	OBJECT_GRANT	All object grants in the database
DATABASE_EXPORT	OPERATOR	Operators and their dependent grants and audits
DATABASE_EXPORT	PACKAGE	Packages (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	PACKAGE_BODY	Package bodies
DATABASE_EXPORT	PACKAGE_SPEC	Package specifications
DATABASE_EXPORT	PASSWORD_HISTORY	Password histories for database users
DATABASE_EXPORT	*PASSWORD_VERIFY_FUNCTION	The password complexity verification function
DATABASE_EXPORT	PROCEDURE	Procedures and their dependent grants and objects
DATABASE_EXPORT	PROFILE	Profiles
DATABASE_EXPORT	PROXY	Proxy authentications
DATABASE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the database
DATABASE_EXPORT	REFRESH_GROUP	Refresh groups
DATABASE_EXPORT	*RESOURCE_COST	Resource cost information
DATABASE_EXPORT	RLS_CONTEXT	Fine-grained access-control driving contexts
DATABASE_EXPORT	RLS_GROUP	Fine-grained access-control policy groups
DATABASE_EXPORT	RLS_POLICY	Fine-grained access-control policies
DATABASE_EXPORT	ROLE	Roles
DATABASE_EXPORT	ROLE_GRANT	Role grants to users in the database
DATABASE_EXPORT	ROLLBACK_SEGMENT	Rollback segments
DATABASE_EXPORT	*SCHEMA (named object)	Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched.
DATABASE_EXPORT	SEQUENCE	Sequences
DATABASE_EXPORT	STATISTICS	Statistics on tables and indexes
DATABASE_EXPORT	SYNONYM	Public and private synonyms
DATABASE_EXPORT	SYSTEM_GRANT	System privilege grants

**Table 100-19 (Cont.) Object Type Path Names for Heterogeneous Object Types**

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	TABLE	Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
DATABASE_EXPORT	TABLE_DATA	Row data for all tables
DATABASE_EXPORT	TABLESPACE	Tablespace definitions
DATABASE_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users in the database
DATABASE_EXPORT	TRIGGER	Triggers on the database, on schemas, and on schema objects
DATABASE_EXPORT	XS_USER	Oracle Real Application Security (RAS) users
DATABASE_EXPORT	XS_ROLE	Oracle Real Application Security (RAS) roles
DATABASE_EXPORT	XS_SECURITY_CLASSES	Oracle Real Application Security (RAS) security classes
DATABASE_EXPORT	XS_DATA_SECURITY	Oracle Real Application Security (RAS) data security policies
DATABASE_EXPORT	XS_ACL	Oracle Real Application Security (RAS) access control lists (ACLs)
DATABASE_EXPORT	XS_NAMESPACE	Oracle Real Application Security (RAS) namespaces
DATABASE_EXPORT	TRUSTED_DB_LINK	Trusted links
DATABASE_EXPORT	TYPE	Types (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	TYPE_BODY	Type bodies
DATABASE_EXPORT	TYPE_SPEC	Type specifications
DATABASE_EXPORT	USER	User definitions
DATABASE_EXPORT	VIEW	Views

### Exceptions

- **INVALID\_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID\_OPERATION.** SET\_FILTER was called after the first call to FETCH\_xxx for the OPEN context. After the first call to FETCH\_xxx is made, no further calls to SET\_FILTER are permitted.
- **INCONSISTENT\_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
  - The filter name is not valid for the object type associated with the OPEN context.
  - The filter name is not valid for the object\_type\_path.
  - The object\_type\_path is not part of the collection designated by handle .
  - The filter value is the wrong datatype.

## 100.6.12 SET\_PARSE\_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)
- [Subprograms for Submitting XML to the Database](#)

### Syntax

The following syntax applies when `SET_PARSE_ITEM` is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

The following syntax applies when `SET_PARSE_ITEM` is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
  handle      IN NUMBER,
  name        IN VARCHAR2);
```

### Parameters

**Table 100-20 SET\_PARSE\_ITEM Procedure Parameters**

Parameter	Description
handle	The handle returned from <code>OPEN</code> (or <code>OPENW</code> ).
name	The name of the object attribute to be parsed and returned. See <a href="#">Table 100-21</a> for the attribute object type, name, and meaning.
object_type	Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> <li>• If <code>object_type</code> is omitted, then the parse item applies to all object types within the heterogeneous collection</li> <li>• If <code>object_type</code> is specified, then the parse item only applies to that specific object type within the collection</li> </ul> This parameter only applies when <code>SET_PARSE_ITEM</code> is used for object retrieval.

[Table 100-21](#) describes the object type, name, and meaning of the items available in the `SET_PARSE_ITEM` procedure.

Because new items are occasionally added, you can query the `DBMS_METADATA_PARSE_ITEMS` view to see a complete list of valid parse items or to find valid parse items for a specific object type.

**Table 100-21 SET\_PARSE\_ITEM: Parse Items**

Object Type	Name	Meaning
All objects	VERB	If <code>FETCH_XML_CLOB</code> is called, no value is returned.  If <code>FETCH_DDL</code> is called, then for every row in the <code>sys.ku\$_ddl\$</code> nested table returned by <code>FETCH_DDL</code> the verb in the corresponding <code>ddlText</code> is returned. If the <code>ddlText</code> is a SQL DDL statement, then the SQL verb (for example, <code>CREATE</code> , <code>GRANT</code> , <code>AUDIT</code> ) is returned. If the <code>ddlText</code> is a procedure call (for example, <code>DBMS_AQADM.CREATE_QUEUE_TABLE( )</code> ) then the <code>package.procedure-name</code> is returned.
All objects	OBJECT_TYPE	If <code>FETCH_XML_CLOB</code> is called, an object type name from <a href="#">Table 100-12</a> is returned.  If <code>FETCH_DDL</code> is called and the <code>ddlText</code> is a SQL DDL statement whose verb is <code>CREATE</code> or <code>ALTER</code> , the object type as used in the DDL statement is returned (for example, <code>TABLE</code> , <code>PACKAGE_BODY</code> , and so on). Otherwise, an object type name from <a href="#">Table 100-12</a> is returned.
Schema objects	SCHEMA	The object schema is returned. If the object is not a schema object, no value is returned.
Named objects	NAME	The object name is returned. If the object is not a named object, no value is returned.
TABLE, TABLE_DATA, INDEX	TABLESPACE	The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a <code>TABLE_DATA</code> object, this is always the tablespace where the rows are stored.
TRIGGER	ENABLE	If the trigger is enabled, <code>ENABLE</code> is returned. If the trigger is disabled, <code>DISABLE</code> is returned.
OBJECT_GRANT, TABLESPACE_QUOTA	GRANTOR	The grantor is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_NAME	The name of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_SCHEMA	The schema of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_TYPE	The object type of the base object is returned. If the object is not a dependent object, no value is returned.
Granted objects	GRANTEE	The grantee is returned. If the object is not a granted object, no value is returned.

## Usage Notes

These notes apply when using `SET_PARSE_ITEM` to retrieve objects.

By default, the `FETCH_xxx` routines return an object's metadata as XML or creation DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

You can call `SET_PARSE_ITEM` multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the `sys.ku$_parsed_items` nested table.

For `TABLE_DATA` objects, the following parse item return values are of interest:

If Object Is	NAME, SCHEMA	BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA
nonpartitioned table	table name, schema	table name, schema
table partition	partition name, schema	table name, schema
nested table	storage table name, schema	name and schema of top-level table ( <i>not</i> the parent nested table)

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the `BASE_OBJECT_NAME`, `BASE_OBJECT_SCHEMA` and `BASE_OBJECT_TYPE` parse items for secondary `TABLE` objects return the name, schema, and type of the domain index.

### See Also:

- ["FETCH\\_xxx Functions and Procedures"](#)
- *Oracle Database Utilities* for more information about using the metadata APIs.

By default, the `CONVERT` and `PUT` procedures simply transform an object's XML metadata to DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

## Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_PARSE_ITEM` was called after the first call to `FETCH_xxx` for the `OPEN` context. After the first call to `FETCH_xxx` is made, no further calls to `SET_PARSE_ITEM` are permitted.
- `INCONSISTENT_ARGS`. The attribute `name` is not valid for the object type associated with the `OPEN` context.

## 100.6.13 SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM Procedures

These procedures are used for both retrieval and submission. SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM specify parameters to the XSLT stylesheet identified by transform\_handle.

Use them to modify or customize the output of the transform.

### See Also:

For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#)
- [Subprograms for Submitting XML to the Database](#)

### Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  value             IN VARCHAR2,
  object_type       IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  value             IN BOOLEAN DEFAULT TRUE,
  object_type       IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  value             IN NUMBER,
  object_type       IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_REMAP_PARAM (
  transform_handle  IN NUMBER,
  name              IN VARCHAR2,
  old_value         IN VARCHAR2,
  new_value         IN VARCHAR2,
  object_type       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

[Table 100-22](#) describes the parameters for the SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM procedures.

Because new parameters are occasionally added, you might want to query the DBMS\_METADATA\_TRANSFORM\_PARAMS view to see all the valid transform parameters for each transform or to find valid transform parameters for specific object types.

**Table 100-22 SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM Parameters**

Parameters	Description
transform_handle	<p>Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session.</p> <p>Note that the handle returned by OPEN is not a valid transform handle.</p> <p>For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.</p>
name	<p>The name of the transform parameter.</p> <p>For descriptions of the parameters available for each transform on the SET_TRANSFORM_PARAM procedure, see the following:</p> <ul style="list-style-type: none"> <li><a href="#">Table 100-23</a> - DDL transform</li> <li><a href="#">Table 100-24</a> - MODIFY transform</li> <li><a href="#">Table 100-26</a> - SXML transform</li> <li><a href="#">Table 100-27</a> - MODIFYSXML transform</li> <li><a href="#">Table 100-28</a> - SXMLDDL transform</li> </ul> <p>For descriptions of the parameters available for the MODIFY transform on the SET_REMAP_PARAM procedure, see <a href="#">Table 100-25</a>.</p> <p>For descriptions of the parameters available for the ALTERXML transform, see <a href="#">Table 100-4</a>.</p>
value	The value of the transform. This parameter is valid only for SET_TRANSFORM_PARAM.
old_value	The old value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
new_value	The new value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
object_type	<p>Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply:</p> <ul style="list-style-type: none"> <li>• If object_type is omitted, the parameter applies to all applicable object types within the heterogeneous collection.</li> <li>• If object_type is specified, the parameter only applies to that object type.</li> </ul> <p>This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.</p>

[Table 100-23](#) describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the SET\_TRANSFORM\_PARAM procedure.

**Table 100-23 SET\_TRANSFORM\_PARAM: Transform Parameters for the DDL Transform**

Object Type	Name	Datatype	Meaning
USER, TABLE, CLUSTER, VIEW, MATERIALIZED_VIEW PROCEDURE, FUNCTION, PACKAGE, TYPE, TRIGGER	COLLATION_CLAUSE	Text	There are three possible values: <ul style="list-style-type: none"> <li>NEVER — Collation clauses are never generated.</li> <li>ALWAYS — Collation clauses are always generated.</li> <li>NON_DEFAULT — Collation clauses other than USING_NLS_COMP are generated.</li> </ul>
All objects	PRETTY	BOOLEAN	If TRUE, format the output with indentation and line feeds. Defaults to TRUE.
All objects	SQLTERMINATOR	BOOLEAN	If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE.
TABLE	CONSTRAINTS	BOOLEAN	If TRUE, include all non-referential table constraints in the DDL. If FALSE, omit them. Defaults to TRUE.
TABLE	REF_CONSTRAINTS	BOOLEAN	If TRUE, include all referential constraints (foreign keys) in the DDL. If FALSE, omit them. Defaults to TRUE.
TABLE	CONSTRAINTS_AS_ALTER	BOOLEAN	If TRUE, include table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.
TABLE, TYPE	OID	BOOLEAN	If TRUE, include the Object ID (OID) clause in the DDL. If FALSE, omit it. Defaults to FALSE.
TABLE	SIZE_BYTE_KEYWORD	BOOLEAN	If TRUE, include the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.
TABLE, INDEX	PARTITIONING	BOOLEAN	If TRUE, include partitioning clauses in the DDL. If FALSE, omit them. Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_SEGMENT, CLUSTER, TABLE, TABLESPACE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the DDL. If FALSE, omit them. Defaults to TRUE.

**Table 100-23 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the DDL Transform**

Object Type	Name	Datatype	Meaning
INDEX, CONSTRAINT, ROLLBACK_SEGMENTS, CLUSTER, TABLE	STORAGE	BOOLEAN	If TRUE, include storage clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_SEGMENTS, CLUSTER, TABLE	TABLESPACE	BOOLEAN	If TRUE, include tablespace clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TYPE, PACKAGE	SPECIFICATION	BOOLEAN	If TRUE, include the type or package specification in the DDL. If FALSE, omit it. Defaults to TRUE.
TYPE, PACKAGE	BODY	BOOLEAN	If TRUE, include the type body or package body in the DDL. If FALSE, omit it. Defaults to TRUE.
VIEW	FORCE	BOOLEAN	If TRUE, use the FORCE keyword in the CREATE VIEW statement. If FALSE, do not use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE.
OUTLINE	INSERT	BOOLEAN	If TRUE, include the INSERT statements into the OL\$ dictionary tables that will create the outline and its hints. If FALSE, omit a CREATE OUTLINE statement. Defaults to FALSE.  Note: This object type is being deprecated.
All objects	DEFAULT	BOOLEAN	Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default.
All objects	INHERIT	BOOLEAN	If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle.

**Table 100-23 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the DDL Transform**

Object Type	Name	Datatype	Meaning
ROLE	REVOKE_FROM	Text	<p>The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is included in the DDL after the CREATE ROLE statement.</p> <p>Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant.</p> <p>Defaults to null string.</p>
TABLESPACE	REUSE	BOOLEAN	<p>If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. If FALSE, omit the REUSE parameter.</p> <p>Defaults to FALSE.</p>
CLUSTER, INDEX, ROLLBACK_SEGMENTS, TABLE, TABLESPACE	PCTSPACE	NUMBER	<p>A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundredths of the current allocation. For example, 100 means 100%.</p> <p>If the object type is TABLESPACE, the following size values are affected:</p> <ul style="list-style-type: none"> <li>- in file specifications, the value of SIZE</li> <li>- MINIMUM EXTENT</li> <li>- EXTENT MANAGEMENT LOCAL UNIFORM SIZE</li> </ul> <p>For other object types, INITIAL and NEXT are affected.</p>
TABLE	LOB_STORAGE	Text	<p>Specifies the storage type to use for LOB segments. The options are as follows:</p> <ul style="list-style-type: none"> <li>• SECUREFILE - LOB storage is returned as SECUREFILE</li> <li>• BASICFILE - LOB storage is returned as BASICFILE</li> <li>• DEFAULT - The keyword (SECUREFILE or BASICFILE) is omitted in the LOB STORE AS clause.</li> <li>• NO_CHANGE - LOB segments are created with the same storage they had in the source database. This is the default.</li> </ul> <p>Specifying this transform changes the LOB storage for all tables in the job, including tables that provide storage for materialized views.</p>

**Table 100-23 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the DDL Transform**

Object Type	Name	Datatype	Meaning
TABLE	TABLE_COMPRESSION_CLAUSE	Text	<p>Specifies a table compression clause (for example, COMPRESS BASIC) to use when the table is created.</p> <p>Specify NONE to omit the table compression clause. The table will have the default compression for the tablespace.</p> <p>Specifying this transform changes the compression type for all tables in the job, including tables that provide storage for materialized views.</p>

Table 100-24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET\_TRANSFORM\_PARAM procedure.

**Table 100-24 SET\_TRANSFORM\_PARAM: Transform Parameters for the MODIFY Transform**

Object Type	Name	Datatype	Meaning
All objects	OBJECT_ROW	NUMBER	<p>A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document.</p> <p>This parameter is additive.</p> <p>By default, all objects are copied to the output document.</p>

Table 100-25 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET\_REMAP\_PARAM procedure.

**Table 100-25 SET\_REMAP\_PARAM: Transform Parameters for the MODIFY Transform**

Object Type	Name	Datatype	Meaning
LIBRARY, TABLESPACE, DIRECTORY	REMAP_DATAFILE	Text	<p>Objects in the document will have their filespecs renamed as follows: any filespec matching old_value will be changed to new_value. Filespecs should <i>not</i> be enclosed in quotes.</p> <p>This parameter is additive.</p> <p>By default, filespecs are not renamed.</p>
Named objects and all objects dependent on named objects	REMAP_NAME	Text	<p>Any named object in the document whose name matches old_value will have its name changed to new_value.</p> <p>Any dependent object whose base object name matches old_value will have its base schema name changed to new_value.</p> <p>This parameter is additive.</p> <p>By default, names are not remapped.</p> <p>(Use REMAP_TABLESPACE to remap the name of a TABLESPACE object.)</p>

**Table 100-25 (Cont.) SET\_REMAP\_PARAM: Transform Parameters for the MODIFY Transform**

Object Type	Name	Datatype	Meaning
Schema Objects, Dependent Objects, Granted Objects, USER	REMAP_SCHEMA	Text	<p>Any schema object in the document whose name matches <code>old_value</code> will have its schema name changed to <code>new_value</code>.</p> <p>Any dependent object whose base object schema name matches <code>old_value</code> will have its base object schema name changed to <code>new_value</code>.</p> <p>Any granted object whose grantee name matches <code>old_value</code> will have its grantee name changed to <code>new_value</code>.</p> <p>Any user whose name matches <code>old_value</code> will have its name changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, schemas are not remapped.</p> <p>NOTE: The mapping may not be 100 percent complete because there are certain schema references that Import is not capable of finding. For example, Import will not find schema references embedded within the body of definitions of triggers, types, views, procedures, and packages.</p>
TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, TABLESPACE_QUOTA	REMAP_TABLESPACE	Text	<p>Objects in the document will have their tablespaces renamed as follows: any tablespace name matching <code>old_value</code> will be changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, tablespaces are not remapped.</p>

**Table 100-26 SET\_TRANSFORM\_PARAM: Transform Parameters for the SXML Transform**

Object type	Name	Datatype	Meaning
USER, TABLE, CLUSTER, VIEW, MATERIALIZED_VIEW PROCEDURE, FUNCTION, PACKAGE, TYPE, TRIGGER	COLLATION_CLAUSE	Text	<p>There are three possible values:</p> <ul style="list-style-type: none"> <li>• NEVER — Collation clauses are never generated.</li> <li>• ALWAYS — Collation clauses are always generated.</li> <li>• NON_DEFAULT — Collation clauses other than USING_NLS_COMP are generated.</li> </ul>
TABLE, TYPE	OID	Boolean	<p>If TRUE, include the Oracle Internet Directory (OID) clause in the SXML. If FALSE, omit it. Defaults to FALSE.</p>

**Table 100-26 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the SXML Transform**

Object type	Name	Datatype	Meaning
TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG.	STORAGE	Boolean	If TRUE, include storage clauses in the SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG.	TABLESPACE	Boolean	If TRUE, include tablespace clauses in the SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	REF_CONSTRAINTS	Boolean	If TRUE, include all referential constraints (foreign keys) in the SXML. If FALSE, omit them. Defaults to TRUE.
TABLE, INDEX, MATERIALIZED_VIEW	PHYSICAL_PROPERTIES	Boolean	If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the SXML. If FALSE, omit them. Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_SEGMENT, CLUSTER, TABLE, TABLESPACE	SEGMENT_ATTRIBUTES	Boolean	If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the SXML. If FALSE, omit them. Defaults to TRUE.
TABLE, INDEX	PARTITIONING	Boolean	If TRUE, include partitioning clauses in the SXML. If FALSE, omit them. Defaults to TRUE.
TABLE	CONSTRAINTS	Boolean	If TRUE, include all non-referential table constraints in the SXML. If FALSE, omit them. Defaults to TRUE.

**Table 100-27 SET\_TRANSFORM\_PARAM: Transform Parameters for the MODIFYXML Transform**

Object type	Name	Datatype	Meaning
TABLE, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG	STORAGE	Boolean	If TRUE, include storage clauses in the output SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.

**Table 100-27 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the MODIFYXML Transform**

Object type	Name	Datatype	Meaning
TABLE, INDEX, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG	TABLESPACE	Boolean	If TRUE, include tablespace clauses in the output SXML. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	REF_CONSTRAINTS	Boolean	If TRUE, include all referential constraints (foreign keys) in the output SXML. If FALSE, omit them. Defaults to TRUE.
TABLE, INDEX, VIEW, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG	REMAP_NAME	Text	Any NAME element in the document that matches old_value will be changed to new_value. This does not apply to column names. (See REMAP_COLUMN_NAME).
TABLE, INDEX, VIEW, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG	REMAP_SCHEMA	Text	Any SCHEMA element in the document matching old_value will be changed to new_value.
TABLE, INDEX, VIEW, MATERIALIZED_VIEW, IEW	REMAP_COLUMN_NAME	Text	Any column in the document whose name matches old_value will have its name changed to new_value.
TABLE, INDEX, MATERIALIZED_VIEW, IEW, MATERIALIZED_VIEW, IEW_LOG	SEGMENT_ATTRIBUTES	Boolean	If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the output SXML. If FALSE, omit them. Defaults to TRUE.
TABLE	CONSTRAINTS	Boolean	If TRUE, include all non-referential table constraints in the output SXML. If FALSE, omit them. Defaults to TRUE.

**Table 100-28 SET\_TRANSFORM\_PARAM: Transform Parameters for the SXMLDDL Transform**

Object type	Name	Datatype	Meaning
USER, TABLE, CLUSTER, VIEW, MATERIALIZED_VIEW, PROCEDURE, FUNCTION, PACKAGE, TYPE, TRIGGER	COLLATION_CLAUSE	Text	There are three possible values: <ul style="list-style-type: none"> <li>NEVER — Collation clauses are never generated.</li> <li>ALWAYS — Collation clauses are always generated.</li> <li>NON_DEFAULT — Collation clauses other than USING_NLS_COMP are generated.</li> </ul>

**Table 100-28 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the SXMLDDL Transform**

Object type	Name	Datatype	Meaning
TABLE	OID	Boolean	If TRUE, include OIDs in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG.	TABLESPACE	Boolean	If TRUE, include tablespace clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG	STORAGE	Boolean	If TRUE, include storage clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	REF_CONSTRAINTS	Boolean	If TRUE, include all referential constraints (foreign keys) in the DDL. If FALSE, omit them. Defaults to TRUE.
INDEX	PRESERVE_LOCAL	Boolean	If PARTITIONING is FALSE and PRESERVE_LOCAL is TRUE and the index is a locally partitioned index, include the LOCAL keyword in the DDL. Defaults to FALSE.
TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG	SEGMENT_ATTRIBUTES	Boolean	If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the DDL. If FALSE, omit them. Defaults to TRUE.
TABLESPACE	REUSE	Boolean	If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. If FALSE, omit the REUSE parameter. Defaults to FALSE.
TABLE, INDEX	PARTITIONING	Boolean	If TRUE, include partitioning clauses in the DDL. If FALSE, omit them. Defaults to TRUE.
TABLE	CONSTRAINTS	Boolean	If TRUE, include all non-referential table constraints in the output SXML. If FALSE, omit them. Defaults to TRUE.

### Exceptions

- **INVALID\_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID\_OPERATION.** Either SET\_TRANSFORM\_PARAM or SET\_REMAP\_PARAM was called after the first call to FETCH\_XXX for the OPEN context. After the first call to FETCH\_XXX

is made, no further calls to `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` are permitted.

- `INCONSISTENT_ARGS`. The arguments are inconsistent. This can mean the following:
  - The transform parameter `name` is not valid for the object type associated with the `OPEN` context or for the transform associated with the transform handle.
  - The transform applies to all object types in a heterogeneous collection, but `object_type` is not part of the collection.

### Usage Notes

XSLT allows parameters to be passed to stylesheets. You call `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` to specify the value of a parameter to be passed to the stylesheet identified by `transform_handle`.

Normally, if you call `SET_TRANSFORM_PARAMETER` multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the `STORAGE` transform parameter to `TRUE`.

```
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', false);
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the `OBJECT_ROW` parameter to the `MODIFY` transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 5);
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 8);
```

The `REMAP_TABLESPACE` parameter is also additive. If you specify the following, then tablespaces `TBS1` and `TBS3` are changed to `TBS2` and `TBS4`, respectively.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS3', 'TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS2', 'TBS3');
```

#### Note:

The number of remap parameters that can be specified for a `MODIFY` transform is limited to ten. That is, you can specify up to ten `REMAP_DATAFILE` parameters, up to ten `REMAP_SCHEMA` parameters and so on. Additional instances are ignored. To work around this, you can perform another `DBMS_METADATA.ADD_TRANSFORM` and specify additional remap parameters.

The `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant `SESSION_TRANSFORM` as the handle of the DDL transform at the session level. You can call `SET_TRANSFORM_PARAM`

using `DBMS_METADATA.SESSION_TRANSFORM` as the transform handle to set transform parameters for the whole session. `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` inherit these parameters when they invoke the DDL transform.

 **Note:**

The enumerated constant must be prefixed with the package name `DBMS_METADATA.SESSION_TRANSFORM`.

# DBMS\_METADATA\_DIFF

The `DBMS_METADATA_DIFF` package contains the interfaces for comparing two metadata documents in SXML format.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Browsing APIs for Fetching and Comparing Objects](#)
- [Summary of DBMS\\_METADATA\\_DIFF Subprograms](#)

 **See Also:**

*Oracle Database Utilities* for more information and for examples of using the `DBMS_METADATA_DIFF` package.

## 101.1 DBMS\_METADATA\_DIFF Overview

You can use the interfaces contained in the `DBMS_METADATA_DIFF` package to compare two metadata documents in SXML format.

The result of the comparison is an SXML difference document. This document can be converted to other formats using the `DBMS_METADATA` `submit` interface and the `CONVERT` API.

## 101.2 DBMS\_METADATA\_DIFF Security Model

The browsing interface of the `DBMS_METADATA_DIFF` package actually uses the `DBMS_METADATA` package to fetch the metadata to be compared. Therefore, the security model used for `DBMS_METADATA` also applies to `DBMS_METADATA_DIFF`. (Note, however, that `DBMS_METADATA_DIFF` does not support all object types.)

 **See Also:**

[DBMS\\_METADATA](#) for information about the `DBMS_METADATA` security model

## 101.3 DBMS\_METADATA\_DIFF — Browsing APIs for Fetching and Comparing Objects

These functions allow you to compare the metadata for two objects with a single call.

### Syntax

```
DBMS_METADATA_DIFF.COMPARE_SXML(
object_type   IN VARCHAR2,
name1        IN VARCHAR2,
name2        IN VARCHAR2,
schema1      IN VARCHAR2 DEFAULT NULL,
schema2      IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.COMPARE_ALTER(
object_type   IN VARCHAR2,
name1        IN VARCHAR2,
name2        IN VARCHAR2,
schema1      IN VARCHAR2 DEFAULT NULL,
schema2      IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.COMPARE_ALTER_XML(
object_type   IN VARCHAR2,
name1        IN VARCHAR2,
name2        IN VARCHAR2,
schema1      IN VARCHAR2 DEFAULT NULL,
schema2      IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 101-1 COMPARE\_xxx Function Parameters**

Parameters	Description
object_type	The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW.
name1	The name of the first object in the comparison.
name2	The name of the second object in the comparison.
schema1	The schema of the first object in the comparison. The default is the current user.

**Table 101-1 (Cont.) COMPARE\_xxx Function Parameters**

Parameters	Description
schema2	The schema of the second object in the comparison. The default is the value of schema1.
network_link1	The name of a database link to the database on which the first object resides. If NULL (the default), then the object is assumed to be in the database on which the caller is running.
network_link2	The name of a database link to the database on which the second object resides. The default is the value of network_link1.

### Return Values

DBMS\_METADATA\_DIFF.COMPARE\_xxx returns the differences between two objects.

### Exceptions

- `INVALID_ARGVAL`  
A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `OBJECT_NOT_FOUND`  
The specified object was not found in the database.

### Usage Notes

These functions encapsulate calls to both `DBMS_METADATA` and `DBMS_METADATA_DIFF` functions and procedures to fetch the metadata for each of the two objects and compare them.

Which function you use depends on the comparison format you want:

- `COMPARE_SXML` returns an SXML difference document.
- `COMPARE_ALTER` returns a set of ALTER statements for making the first object like the second object.
- `COMPARE_ALTER_XML` returns an ALTER\_XML document.

## 101.4 Summary of DBMS\_METADATA\_DIFF Subprograms

The `DBMS_METADATA_DIFF` subprograms provide comparison functionality for different object types.

These subprograms are used to:

- Specify the type of objects to be compared
- Specify the SXML documents to be compared
- Show the differences between the compared documents
- Clean up after the comparison

Table 101-2 provides a summary of `DBMS_METADATA_DIFF` subprograms.

**Table 101-2 DBMS\_METADATA\_DIFF Package Subprograms**

Subprogram	Description
<a href="#">OPENC Function</a>	Specifies the type of objects to be compared
<a href="#">ADD_DOCUMENT Procedure</a>	Specifies an SXML document to be compared
<a href="#">FETCH_CLOB Functions and Procedures</a>	Returns a CLOB showing the differences between the two documents specified by <code>ADD_DOCUMENT</code>
<a href="#">CLOSE Procedure</a>	Invalidates the handle returned by <code>OPENC</code> and cleans up associated state

## 101.4.1 OPENC Function

This function specifies the type of objects to be compared. The return value is an opaque context handle.

### Syntax

```
DBMS_METADATA_DIFF.OPENC (
  object_type IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 101-3 OPENC Function Parameters**

Parameters	Description
<code>object_type</code>	The type of object to be compared. Valid type names are <code>CLUSTER</code> , <code>CONTEXT</code> , <code>DB_LINK</code> , <code>FGA_POLICY</code> , <code>INDEX</code> , <code>MATERIALIZED_VIEW</code> , <code>MATERIALIZED_VIEW_LOG</code> , <code>QUEUE</code> , <code>QUEUE_TABLE</code> , <code>RLS_CONTEXT</code> , <code>RLS_GROUP</code> , <code>RLS_POLICY</code> , <code>ROLE</code> , <code>SEQUENCE</code> , <code>SYNONYM</code> , <code>TABLE</code> , <code>TABLESPACE</code> , <code>TRIGGER</code> , <code>TYPE</code> , <code>TYPE_SPEC</code> , <code>TYPE_BODY</code> , <code>USER</code> , and <code>VIEW</code> .

### Return Values

The opaque handle that is returned is used as input to `ADD_DOCUMENT`, `FETCH_xxx` and `CLOSE`.

### Exceptions

- `INVALID_ARGVAL`

A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.

## 101.4.2 ADD\_DOCUMENT Procedure

This procedure specifies an SXML document that is to be compared.

### Syntax

```
DBMS_METADATA_DIFF.ADD_DOCUMENT(  
handle IN NUMBER, document IN sys.XMLType);
```

```
DBMS_METADATA_DIFF.ADD_DOCUMENT(  
handle IN NUMBER, document IN CLOB);
```

### Parameters

**Table 101-4 ADD\_DOCUMENT Procedure Parameters**

Parameter	Description
handle	The handle returned from OPENC
document	A document to be compared. The document must be of the type specified in OPENC.

### Usage Notes

Because the comparison interface allows you to compare exactly two SXML documents, a program must call ADD\_DOCUMENT exactly twice for each OPENC handle. In the comparison result, the document specified by the first call is document 1, and the document specified by the second call is document 2.

### Exceptions

- INVALID\_ARGVAL

A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

## 101.4.3 FETCH\_CLOB Functions and Procedures

The FETCH\_CLOB functions and procedures return a CLOB showing the differences between the two documents specified by ADD\_DOCUMENT.

### Syntax

```
DBMS_METADATA_DIFF.FETCH_CLOB(  
handle IN NUMBER)  
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.FETCH_CLOB(  
  
handle IN NUMBER,  
doc IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA_DIFF.FETCH_CLOB(  
handle IN NUMBER,  
doc IN OUT NOCOPY CLOB  
diffs OUT BOOLEAN);
```

## Parameters

**Table 101-5 FETCH\_CLOB Subprogram Parameters**

Parameter	Description
handle	The handle returned from OPENC.
doc	A CLOB containing the differences between documents 1 and 2.
diffs	TRUE if the documents are different or FALSE if they are identical.

## Return Values

The differences between documents 1 and 2.

## Exceptions

- INVALID\_ARGVAL  
A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

## 101.4.4 CLOSE Procedure

This procedure invalidates the handle returned by OPENC and cleans up associated state.

## Syntax

```
DBMS_METADATA_DIFF.CLOSE(  
handle IN NUMBER);
```

## Parameters

**Table 101-6 CLOSE Function Parameters**

Parameters	Description
handle	The handle returned from OPENC

## Exceptions

- INVALID\_ARGVAL  
A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

# DBMS\_MGD\_ID\_UTL

The `DBMS_MGD_ID_UTL` package contains various utility functions and procedures.

These consist of the following utility subprograms:

- A logging utility that sets and gets Java and PL/SQL logging levels.
- A proxy utility consisting of two procedures used to set and unset the host and port of the proxy server.
- A metadata utility consisting of functions and procedures used for managing metadata.

 **See Also:**

*Oracle Database Development Guide* for more information.

This chapter describes each of these utility subprograms and contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Summary of DBMS\\_MGD\\_ID\\_UTL Subprograms](#)

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by password;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

## 102.1 DBMS\_MGD\_ID\_UTL Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and Identity Code Package schema objects in the `MGDSYS` schema.

`DBMS_MGD_ID_UTL` is a `MGDSYS`-owned package. Any `DBMS_MGD_ID_UTL` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted `connect` and `resource` roles to use the `DBMS_MGD_ID_UTL` package and its subprograms.

EXECUTE privilege is granted to PUBLIC for these ADTs: MGD\_ID, MGD\_ID\_COMPONENT, MGD\_ID\_COMPONENT\_VARRAY, and for this package DBMS\_MGD\_ID\_UTL.

SELECT or READ privilege is granted to PUBLIC for these read-only views: MGD\_ID\_CATEGORY and MGD\_ID\_SCHEME and for these metadata views: USER\_MGD\_ID\_CATEGORY and USER\_MGD\_ID\_SCHEME, and for table MGD\_ID\_XML\_VALIDATOR, and for sequence MGD\$SEQUENCE\_CATEGORY.

INSERT, UPDATE and DELETE privilege is granted to PUBLIC for these metadata views: USER\_MGD\_ID\_CATEGORY and USER\_MGD\_ID\_SCHEME.

Public synonyms, by the same name, are created for these ADTs: MGD\_ID, MGD\_ID\_COMPONENT, MGD\_ID\_COMPONENT\_VARRAY and for this package DBMS\_MGD\_ID\_UTL, as well as for these read-only views: MGD\_ID\_CATEGORY and MGD\_ID\_SCHEME and for these metadata views: USER\_MGD\_ID\_CATEGORY and USER\_MGD\_ID\_SCHEME, and for table MGD\_ID\_XML\_VALIDATOR.

## 102.2 DBMS\_MGD\_ID\_UTL Constants

The DBMS\_MGD\_ID\_UTL package defines several constants for specifying parameter values.

These constants are shown in the following tables.

**Table 102-1 DBMS\_MGD\_ID\_UTL Constants — Installed Category IDs and Names**

Name	Value
EPC_ENCODING_CATEGORY_ID	1
EPC_ENCODING_CATEGORY_NAME	EPC

**Table 102-2 DBMS\_MGD\_ID\_UTL Constants — Logging Levels**

Name	Value
LOGGING_LEVEL_ 0	OFF
LOGGING_LEVEL_ 1	SEVERE
LOGGING_LEVEL_ 2	WARNING
LOGGING_LEVEL_ 3	INFO
LOGGING_LEVEL_ 4	FINE
LOGGING_LEVEL_ 5	FINER
LOGGING_LEVEL_ 6	FINEST

**Table 102-2 (Cont.) DBMS\_MGD\_ID\_UTL Constants — Logging Levels**

Name	Value
LOGGING_LEVEL_	7
ALL	

## 102.3 DBMS\_MGD\_ID\_UTL Exceptions

The table in this topic lists the DBMS\_MGD\_ID\_UTL exceptions.

**Table 102-3 Exceptions Raised by DBMS\_MGD\_ID\_UTL Package**

Name	Error Code	Description
TDTJavaException	-55200	During the tag data translation, a Java exception was raised.
TDTCategoryNotFound	-55201	The specified category was not found.
TDTSchemeNotFound	-55202	During the tag data translation, the specified scheme was not found.
TDTLevelNotFound	-55203	During the tag data translation, the specified level was not found.
TDTOptionNotFound	-55204	During the tag data translation, the specified option was not found.
TDTFieldValidationException	-55205	During the tag data translation, the validation operation failed on a field.
TDTUndefinedField	-55206	During the tag data translation, an undefined field was detected.
TDTRuleEvaluationFailed	-55207	During the tag data translation, the rule evaluation operation failed.
TDTTooManyMatchingLevels	-55208	During the tag data translation, too many matching levels were found.

## 102.4 Summary of DBMS\_MGD\_ID\_UTL Subprograms

This table describes the utility subprograms in the DBMS\_MGD\_ID\_UTL package.

All the values and names passed to the procedures defined in the DBMS\_MGD\_ID\_UTL package are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

**Table 102-4 DBMS\_MGD\_ID\_UTL Package Subprograms**

Subprogram	Description
<a href="#">ADD_SCHEME Procedure</a>	Adds a tag data translation scheme to an existing category
<a href="#">CREATE_CATEGORY Function</a>	Creates a new category or a new version of a category
<a href="#">EPC_TO_ORACLE_SCHEME Function</a>	Converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML

**Table 102-4 (Cont.) DBMS\_MGD\_ID\_UTL Package Subprograms**

Subprogram	Description
<a href="#">GET_CATEGORY_ID Function</a>	Returns the category ID given the category name and the category version
<a href="#">GET_COMPONENTS Function</a>	Returns all relevant separated component names separated by semicolon (;) for the specified scheme
<a href="#">GET_ENCODINGS Function</a>	Returns a list of semicolon (;) separated encodings (formats) for the specified scheme
<a href="#">GET_JAVA_LOGGING_LEVEL Function</a>	Returns an integer representing the current Java trace logging level
<a href="#">GET_PLSQL_LOGGING_LEVEL Function</a>	Returns an integer representing the current PL/SQL trace logging level
<a href="#">GET_SCHEME_NAMES Function</a>	Returns a list of semicolon (;) separated scheme names for the specified category
<a href="#">GET_TDT_XML Function</a>	Returns the Oracle tag data translation XML for the specified scheme
<a href="#">GET_VALIDATOR Function</a>	Returns the Oracle Database tag data translation schema
<a href="#">REFRESH_CATEGORY Function</a>	Refreshes the metadata information on the Java stack for the specified category
<a href="#">REMOVE_CATEGORY Procedure</a>	Removes a category including all the related TDT XML if the value of <code>category_version</code> parameter is NULL
<a href="#">REMOVE_PROXY Procedure</a>	Unsets the host and port of the proxy server
<a href="#">REMOVE_SCHEME Procedure</a>	Removes a tag data translation scheme from a category
<a href="#">SET_JAVA_LOGGING_LEVEL Procedure</a>	Sets the Java logging level
<a href="#">SET_PLSQL_LOGGING_LEVEL Procedure</a>	Sets the PL/SQL tracing logging level
<a href="#">SET_PROXY Procedure</a>	Sets the host and port of the proxy server for Internet access
<a href="#">VALIDATE_SCHEME Function</a>	Validates the input tag data translation XML against the Oracle tag data translation schema

## 102.4.1 ADD\_SCHEME Procedure

This procedure adds a tag data translation scheme to an existing category.

### Syntax

```
DBMS_MGD_ID_UTL.ADD_SCHEME (
    category_id IN VARCHAR2,
    tdt_xml     IN CLOB);
```

### Parameters

**Table 102-5 ADD\_SCHEME Procedure Parameters**

Parameter	Description
<code>category_id</code>	Category ID
<code>tdt_xml</code>	Tag data translation XML

## Examples

This example performs the following actions:

1. Creates a category.
2. Adds a contractor scheme and an employee scheme to the MGD\_SAMPLE\_CATEGORY category.
3. Validates the MGD\_SAMPLE\_CATEGORY scheme.
4. Tests the tag translation of the contractor scheme and the employee scheme.
5. Removes the contractor scheme.
6. Tests the tag translation of the contractor scheme and this returns the expected exception for the removed contractor scheme.
7. Tests the tag translation of the employee scheme and this returns the expected values.
8. Removes the MGD\_SAMPLE\_CATEGORY category.

```
--contents of add_scheme2.sql
SET LINESIZE 160
-----
---CREATE CATEGORY, ADD_SCHEME, REMOVE_SCHEME, REMOVE_CATEGORY-----
-----
DECLARE
    amt          NUMBER;
    buf          VARCHAR2(32767);
    pos          NUMBER;
    tdt_xml      CLOB;
    validate_tdtxml VARCHAR2(1042);
    category_id  VARCHAR2(256);
BEGIN
    -- remove the testing category if already existed
    DBMS_MGD_ID_UTL.remove_category('MGD_SAMPLE_CATEGORY', '1.0');
    -- Step 1. Create the testing category 'MGD_SAMPLE_CATEGORY', version 1.0.
    category_id := DBMS_MGD_ID_UTL.CREATE_CATEGORY('MGD_SAMPLE_CATEGORY', '1.0', 'Oracle',
'http://www.example.com/mgd/sample');
    -- Step 2. Add contractor scheme to the category.
    DBMS_LOB.CREATETEMPORARY(tdt_xml, true);
    DBMS_LOB.OPEN(tdt_xml, DBMS_LOB.LOB_READWRITE);

## 102.4.2 CREATE\_CATEGORY Function

This function creates a new category or a new version of a category.

### Syntax

```
DBMS_MGD_ID_UTL.CREATE_CATEGORY (
    category_name    IN  VARCHAR2,
    category_version IN  VARCHAR2,
    agency           IN  VARCHAR2,
    URI              IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 102-6 CREATE\_CATEGORY Function Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version
agency	Organization that owns the category. For example, EPCglobal owns the category EPC.
URI	URI that provides additional information about the category

### Usage Notes

The return value is the category ID.

### Examples

See the [ADD\\_SCHEME Procedure](#) for an example of creating the MGD\_SAMPLE\_CATEGORY category.

## 102.4.3 EPC\_TO\_ORACLE\_SCHEME Function

This function converts the EPCglobal tag data translation (TDT) XML to Oracle Database tag data translation XML.

### Syntax

```
DBMS_MGD_ID_UTL.EPC_TO_ORACLE_SCHEME (
    xml_scheme IN CLOB)
RETURN CLOB;
```

## Parameters

**Table 102-7 EPC\_TO\_ORACLE\_SCHEME Function Parameters**

Parameter	Description
xml_scheme	Name of EPC tag scheme to be converted

## Usage Notes

The return value is the contents of the CLOB containing the Oracle Database tag data translation XML.

## Examples

The following example converts standard EPCglobal Tag Data Translation (TDT) files into Oracle Database TDT files:

```
--Contents of MGD_ID_DOC2.sql
-----
-- EPC_TO_ORACLE_SCHEME --
-----
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');

BEGIN
  DBMS_JAVA.set_output(1000000);
  DBMS_OUTPUT.ENABLE(1000000);
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_SEVERE);
END;
/

## 102.4.4 GET\_CATEGORY\_ID Function

This function returns the category ID for a given category name and category version.

### Syntax

```

DBMS_MGD_ID_UTL.GET_CATEGORY_ID (
    category name      IN  VARCHAR2,
    category_version  IN  VARCHAR2)
RETURN VARCHAR2;

```

## Parameters

**Table 102-8 GET\_CATEGORY\_ID Function Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version

## Usage Notes

- If the value of `category_version` is NULL, then the ID of the latest version of the specified category is returned.
- The return value is the category ID for the specified category name.

## Examples

The following example returns a category ID given a category name and its version:

```
-- Contents of get_category1.sql file
SELECT DBMS_MGD_ID_UTL.get_category_id('EPC', NULL) FROM DUAL;

SQL> @get_category1.sql
.
.
.
DBMS_MGD_ID_UTL.GET_CATEGORY_ID('EPC',NULL)-----1
-----1
.
.
.
```

## 102.4.5 GET\_COMPONENTS Function

This function returns all relevant separated component names separated by semicolon (;) for the specified scheme.

### Syntax

```
DBMS_MGD_ID_UTL.GET_COMPONENTS (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 102-9 GET\_COMPONENTS Function Parameters**

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

## Usage Notes

The return value contains the component names separated by a semicolon (;) for the specified scheme.

## Examples

The following example gets the components:

```
--Contents of get_components.sql
DECLARE
  id          mgd_id;
  getcomps    VARCHAR2(1000);
  getencodings VARCHAR2(1000);
  getschemenames VARCHAR2(1000);
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  getcomps := DBMS_MGD_ID_UTL.get_components(1, 'SGTIN-64');
  dbms_output.put_line('Component names are: ' || getcomps);
  getencodings := DBMS_MGD_ID_UTL.get_encodings(1, 'SGTIN-64');
  dbms_output.put_line('Encodings are: ' || getencodings);
  getschemenames := DBMS_MGD_ID_UTL.get_scheme_names(1);
  dbms_output.put_line('Scheme names are: ' || getschemenames);
END;
/
SHOW ERRORS;

SQL> @get_components.sql
.
.
.
Component names are:
filter,gtin,companyprefixlength,companyprefix,companyprefixindex,itemref,serial
Encodings are: ONS_HOSTNAME,LEGACY,TAG_ENCODING,PURE_IDENTITY,BINARY
Scheme names are:
GIAI-64,GIAI-96,GID-96,GRAI-64,GRAI-96,SGLN-64,SGLN-96,SGTIN-64,SGTIN-96,SSCC-64

PL/SQL procedure successfully completed.
.
.
.
```

## 102.4.6 GET\_ENCODING Function

This function returns a list of semicolon (;) separated encodings (formats) for the specified scheme.

### Syntax

```
DBMS_MGD_ID_UTL.GET_ENCODINGS (
  category_id IN VARCHAR2,
  scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 102-10** GET\_ENCODINGS Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

## Usage Notes

The return value contains the encodings separated by a semicolon (;) for the specified scheme.

## Examples

See the [GET\\_COMPONENTS Function](#) for an example.

## 102.4.7 GET\_JAVA\_LOGGING\_LEVEL Function

This function returns an integer representing the current trace logging level.

## Syntax

```
DBMS_MGD_ID_UTL.GET_JAVA_LOGGING_LEVEL
RETURN INTEGER;
```

## Usage Notes

The return value is the integer value denoting the current Java logging level.

## Examples

The following example gets the Java logging level.

```
--Contents of getjavalogginglevel.sql
DECLARE
    loglevel    NUMBER;
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    loglevel := DBMS_MGD_ID_UTL.get_java_logging_level();
    dbms_output.put_line('Java logging level = ' || loglevel);
END;
/
SHOW ERRORS;

SQL> @getjavalogginglevel.sql
.
.
.
Java logging level = 0
PL/SQL procedure successfully completed.
.
.
.
```

## 102.4.8 GET\_PLSQL\_LOGGING\_LEVEL Function

This function returns an integer representing the current PL/SQL trace logging level.

### Syntax

```
DBMS_MGD_ID_UTL.GET_PLSQL_LOGGING_LEVEL
RETURN INTEGER;

PRAGMA restrict_references(get_plsql_logging_level, WNDS);
```

### Usage Notes

The return value is the integer value denoting the current PL/SQL logging level.

### Examples

The following example gets the PL/SQL logging level.

```
--Contents of getplsqllogginglevel.sql
DECLARE
    loglevel    NUMBER;
BEGIN
    DBMS_MGD_ID_UTL.set_plsql_logging_level(0);
    loglevel := DBMS_MGD_ID_UTL.get_plsql_logging_level();
    dbms_output.put_line('PL/SQL logging level = ' || loglevel);
END;
/
SHOW ERRORS;

SQL> @getplsqllogginglevel.sql
.
.
.
PL/SQL logging level = 0
PL/SQL procedure successfully completed.
.
.
.
```

## 102.4.9 GET\_SCHEME\_NAMES Function

This function returns a list of semicolon (;) separated scheme names for the specified category.

### Syntax

```
DBMS_MGD_ID_UTL.GET_SCHEME_NAMES (
    category_id IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 102-11** GET\_SCHEME\_NAMES Function Parameters

Parameter	Description
category_id	Category ID

## Usage Notes

The return value contains the scheme names for the specified category ID.

## Examples

See the [GET\\_COMPONENTS Function](#) for an example.

## 102.4.10 GET\_TDT\_XML Function

This function returns the Oracle Database tag data translation XML for the specified scheme.

## Syntax

```
DBMS_MGD_ID_UTL.GET_TDT_XML (
    category_id  IN VARCHAR2,
    scheme_name  IN VARCHAR2)
RETURN CLOB;
```

## Parameters

**Table 102-12** GET\_TDT\_XML Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

## Usage Notes

The return value contains the Oracle Database tag data translation XML for the specified scheme.

## Examples

The following example gets the Oracle Database TDT XML for the specified scheme:

```
--Contents of get_tdtxml.sql
DECLARE
    gettdtxml    CLOB;

BEGIN
    gettdtxml := DBMS_MGD_ID_UTL.get_tdt_xml(1, 'SGTIN-64');
    dbms_output.put_line('Length of tdt XML is ' || DBMS_LOB.GETLENGTH(gettdtxml));
    dbms_output.put_line(DBMS_LOB.SUBSTR(gettdtxml, DBMS_LOB.GETLENGTH(gettdtxml), 1));
END;
/
```

## 102.4.11 GET\_VALIDATOR Function

This function returns the Oracle Database tag data translation schema.

### Syntax

```

DBMS_MGD_ID_UTL.GET_VALIDATOR
RETURN CLOB;

```

### Usage Notes

The return value contains the Oracle Database tag data translation schema.

### Examples

This example returns the Oracle Database TDT schema.

```
--Contents of get_validator.sql

## 102.4.12 REFRESH\_CATEGORY Function

This function refreshes the metadata information on the Java stack for the specified category.

This function must be called before using MGD\_ID functions.

### Syntax

```
DBMS_MGD_ID_UTL.REFRESH_CATEGORY (
  category_id IN VARCHAR2);
```

### Parameters

**Table 102-13 REFRESH\_CATEGORY Function Parameters**

Parameter	Description
category_id	Category ID

## Examples

The following example refreshes the metadata information for the EPC category ID.

```
--Contents of tostring3.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('..Testing to_string');
  DBMS_OUTPUT.PUT_LINE('test to_string');
  id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970',
'scheme=GID-96');
  DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
  DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @tostring3.sql
..Testing to_string
test to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970

PL/SQL procedure successfully completed.
```

## 102.4.13 REMOVE\_CATEGORY Procedure

This procedure removes a category including all the related TDT XML.

This procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Removes a category based on the specified category ID.

```
DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
  category_id IN VARCHAR2);
```

Removes a category based on the specified category name and category version.

```
DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
  category_name IN VARCHAR2,
  category_version IN VARCHAR2);
```

### Parameters

**Table 102-14 REMOVE\_CATEGORY Procedure Parameters**

Parameter	Description
category_id	Category ID

**Table 102-14 (Cont.) REMOVE\_CATEGORY Procedure Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version

**Usage Notes**

If the value of `category_version` is NULL, all versions for the specified category will be removed.

**Examples**

See the [ADD\\_SCHEME Procedure](#) for an example of removing a category.

## 102.4.14 REMOVE\_PROXY Procedure

This procedure unsets the host and port of the proxy server.

**Syntax**

```
DBMS_MGD_ID_UTL.REMOVE_PROXY;
```

**Examples**

See the [REFRESH\\_CATEGORY Function](#) for an example.

## 102.4.15 REMOVE\_SCHEME Procedure

This procedure removes a tag data translation scheme from a category.

**Syntax**

```
DBMS_MGD_ID_UTL.REMOVE_SCHEME (
  category_id IN VARCHAR2,
  scheme_name IN VARCHAR2);
```

**Parameters****Table 102-15 REMOVE\_SCHEME Procedure Parameters**

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

**Examples**

See the [ADD\\_SCHEME Procedure](#) for an example of removing a scheme.

## 102.4.16 SET\_JAVA\_LOGGING\_LEVEL Procedure

This procedure sets the Java trace logging level.

### Syntax

```
DBMS_MGD_ID_UTL.SET_JAVA_LOGGING_LEVEL (
    logginglevel IN INTEGER);
```

### Parameters

**Table 102-16 SET\_JAVA\_LOGGING\_LEVEL Procedure Parameters**

Parameter	Description
logginglevel	<p>Logging level. The Java logging level can be one of the following values in descending order:</p> <ul style="list-style-type: none"> <li>• LOGGING_LEVEL_OFF CONSTANT INTEGER := 0</li> <li>• LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1</li> <li>• LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2</li> <li>• LOGGING_LEVEL_INFO CONSTANT INTEGER := 3</li> <li>• LOGGING_LEVEL_FINE CONSTANT INTEGER := 4</li> <li>• LOGGING_LEVEL_FINER CONSTANT INTEGER := 5</li> <li>• LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6</li> <li>• LOGGING_LEVEL_ALL CONSTANT INTEGER := 7</li> </ul>

### Examples

See the [GET\\_JAVA\\_LOGGING\\_LEVEL Function](#) for an example.

## 102.4.17 SET\_PLSQL\_LOGGING\_LEVEL Procedure

This procedure sets the PL/SQL trace logging level.

### Syntax

```
DBMS_MGD_ID_UTL.SET_PLSQL_LOGGING_LEVEL (
    level IN INTEGER);

PRAGMA restrict_references(set_plsql_logging_level, WNDS);
```

## Parameters

**Table 102-17 SET\_PLSQL\_LOGGING\_LEVEL Procedure Parameters**

Parameter	Description
level	Logging level. The PL/SQL logging level can be one of the following values in descending order: <ul style="list-style-type: none"> <li>LOGGING_LEVEL_OFF CONSTANT INTEGER := 0</li> <li>LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1</li> <li>LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2</li> <li>LOGGING_LEVEL_INFO CONSTANT INTEGER := 3</li> <li>LOGGING_LEVEL_FINE CONSTANT INTEGER := 4</li> <li>LOGGING_LEVEL_FINER CONSTANT INTEGER := 5</li> <li>LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6</li> <li>LOGGING_LEVEL_ALL CONSTANT INTEGER := 7</li> </ul>

## Examples

See the [GET\\_PLSQL\\_LOGGING\\_LEVEL Function](#) for an example.

## 102.4.18 SET\_PROXY Procedure

This procedure sets the host and port of the proxy server for Internet access.

This procedure must be called if the database server accesses the Internet using a proxy server. Internet access is necessary because some rules need to look up the Object Naming Service (ONS) table to get the company prefix index.

You do not need to call this procedure if you are only using schemes that do not contain any rules requiring Internet access.

## Syntax

```
DBMS_MGD_ID_UTL.SET_PROXY (
  proxt_host  IN  VARCHAR2,
  proxy_port  IN  VARCHAR2);
```

## Parameters

**Table 102-18 SET\_PROXY Procedure Parameters**

Parameter	Description
proxy_host	Name of host
proxy_port	Host port number

## Examples

See the [REFRESH\\_CATEGORY Function](#) for an example.

## 102.4.19 VALIDATE\_SCHEME Function

This function validates the input tag data translation XML against the Oracle Database tag data translation schema.

### Syntax

```
DBMS_MGD_ID_UTL.VALIDATE_SCHEME (  
    xml_scheme IN CLOB)  
RETURN VARCHAR2;
```

### Parameters

**Table 102-19** VALIDATE\_SCHEME Function Parameters

Parameter	Description
xml_scheme	Scheme to be validated.

### Usage Notes

The return value contains the components names for the specified scheme.

### Examples

See the [ADD\\_SCHEME Procedure](#) or the [EPC\\_TO\\_ORACLE\\_SCHEME Function](#) for an example.

# DBMS\_MGWADM

DBMS\_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

 **Note:**

You must run the `catmgw.sql` script to load the Messaging Gateway packages and types into the database.

 **See Also:**

*Oracle Database Advanced Queuing User's Guide* contains information on loading database objects and using DBMS\_MGWADM

This chapter contains the following topics:

- [Security Model](#)
- [Deprecated Subprograms](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS\\_MGWADM Subprograms](#)

## 103.1 DBMS\_MGWADM Security Model

A user with administrative privilege can run all procedures in DBMS\_MGWADM.

## 103.2 DBMS\_MGWADM Deprecated Subprograms

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g Release 1 having been superseded by improved technology:

- [ADD\\_SUBSCRIBER Procedure](#) - use instead [CREATE\\_JOB Procedure](#)
- [ALTER\\_PROPAGATION\\_SCHEDULE Procedure](#) - use instead [ALTER\\_JOB Procedure](#)
- [ALTER\\_SUBSCRIBER Procedure](#) - use instead [ALTER\\_JOB Procedure](#)
- [DB\\_CONNECT\\_INFO Procedure](#) - use instead [ALTER\\_AGENT Procedures](#)

- [DISABLE\\_PROPAGATION\\_SCHEDULE Procedure](#) - use instead [DISABLE\\_JOB Procedure](#)
- [ENABLE\\_PROPAGATION\\_SCHEDULE Procedure](#) - use instead [ENABLE\\_JOB Procedure](#)
- [REMOVE\\_SUBSCRIBER Procedure](#) - use instead [REMOVE\\_JOB Procedure](#)
- [RESET\\_SUBSCRIBER Procedure](#) - use instead [RESET\\_JOB Procedure](#)
- [SCHEDULE\\_PROPAGATION Procedure](#) - use instead [CREATE\\_JOB Procedure](#)
- [UNSCHEDULE\\_PROPAGATION Procedure](#) - use instead [REMOVE\\_JOB Procedure](#)

## 103.3 DBMS\_MGWADM Constants

The DBMS\_MGWADM package defines various constants for specifying parameter values.

- [Table 103-1](#)
- [Table 103-2](#)
- [Table 103-3](#)
- [Table 103-4](#)
- [Table 103-5](#)
- [Table 103-6](#)
- [Table 103-7](#)
- [Table 103-8](#)
- [Table 103-9](#)
- [Table 103-10](#)
- [Table 103-11](#)

**Table 103-1 DBMS\_MGWADM Constants—Cleanup Actions**

Name	Type	Description
CLEAN_STARTUP_STATE	CONSTANT BINARY_INTEGER	Sets the Messaging Gateway agent to a known state so that it can be started
CLEAN_LOG_QUEUES	CONSTANT BINARY_INTEGER	Messaging Gateway agent will clean log queues for all configured messaging system links
RESET_SUB_MISSING_LOG_RECORD	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record
RESET_SUB_MISSING_MESSAGE	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message

**Table 103-2 DBMS\_MGWADM Constants—Force Values**

Name	Type	Description
FORCE	CONSTANT BINARY_INTEGER	Represents a forced action
NO_FORCE	CONSTANT BINARY_INTEGER	Represents a normal, nonforced action

**Table 103-3 DBMS\_MGWADM Constants—Logging Levels**

Name	Type	Description
BASIC_LOGGING	CONSTANT BINARY_INTEGER	The standard (the least) information written to the log file
TRACE_DEBUG_LOGGING	CONSTANT BINARY_INTEGER	The greatest information written to the log file
TRACE_HIGH_LOGGING	CONSTANT BINARY_INTEGER	The third level of detail of logging information written to the log file
TRACE_LITE_LOGGING	CONSTANT BINARY_INTEGER	The second level detail of logging information written to the log file

**Table 103-4 DBMS\_MGWADM Constants—Named Property Constants**

Name	Type	Description
MGWPROP_PREFIX	CONSTANT VARCHAR2	A constant (MGWPROP\$_) for the reserved property name prefix
MGWPROP_REMOVE	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE) for the reserved property name used to remove an existing property
MGWPROP_REMOVE_ALL	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE_ALL) for the reserved property name used to remove all properties

**Table 103-5 DBMS\_MGWADM Constants—Other Constants**

Name	Type	Description
JMS_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model
JMS_QUEUE_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS queue connections will be used to access JMS destinations
JMS_TOPIC_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS topic connections will be used to access JMS destinations
NO_CHANGE	CONSTANT VARCHAR2	Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged.

**Table 103-5 (Cont.) DBMS\_MGWADM Constants—Other Constants**

Name	Type	Description
DEFAULT_AGENT	CONSTANT VARCHAR2	Name of the Messaging Gateway default agent

**Table 103-6 DBMS\_MGWADM Constants—Propagation Types**

Name	Type	Description
INBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for non-Oracle to Oracle Database Advanced Queuing propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Database Advanced Queuing queue.
OUTBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for Oracle Database Advanced Queuing to non-Oracle propagation. The propagation source is a local Oracle Database Advanced Queuing queue and the destination is a queue in a foreign (non-Oracle) messaging system.

**Table 103-7 DBMS\_MGWADM Constants—Queue Domain Types**

Name	Type	Description
DOMAIN_QUEUE	CONSTANT BINARY_INTEGER	Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue.
DOMAIN_TOPIC	CONSTANT BINARY_INTEGER	Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic.

**Table 103-8 DBMS\_MGWADM Constants—Shutdown Modes**

Name	Type	Description
SHUTDOWN_IMMEDIATE	CONSTANT BINARY_INTEGER	Represents the immediate shutdown mode
SHUTDOWN_NORMAL	CONSTANT BINARY_INTEGER	Represents the normal shutdown mode

**Table 103-9 DBMS\_MGWADM Constants—WebSphere MQ Interface Types**

Name	Type	Description
MQSERIES_BASE_JAVA_INTER FACE	CONSTANT BINARY_INTEGER	Represents the Base Java interface for the WebSphere MQ messaging system

**Table 103-10 DBMS\_MGWADM Constants—target\_type Argument of SET\_OPTION and REMOVE\_OPTION Procedures**

Name	Type	Description
AGENT_JAVA_PROP	CONSTANT PLS_INTEGER	Used for an agent option used to set a Java System property
MSGLINK_OPTION	CONSTANT PLS_INTEGER	Used for a messaging system link option
JOB_OPTION	CONSTANT PLS_INTEGER	Used for a propagation job option

**Table 103-11 DBMS\_MGWADM Constants—conntype Argument of CREATE\_AGENT and ALTER\_AGENT Procedures**

Name	Type	Description
JDBC_OCI	CONSTANT VARCHAR2	Used to specify the JDBC OCI driver
JDBC_THIN	CONSTANT VARCHAR2	Used to specify the JDBC Thin driver

## 103.4 DBMS\_MGWADM Data Structures

The DBMS\_MGWADM package defines several OBJECT types.

### DBMS\_MGWADM Object Types

- [SYS.MGW\\_MQSERIES\\_PROPERTIES Object Type](#)
- [SYS.MGW\\_PROPERTIES Object Type](#)
- [SYS.MGW\\_PROPERTY Object Type](#)
- [SYS.MGW\\_TIBRV\\_PROPERTIES Object Type](#)

### 103.4.1 DBMS\_MGWADM SYS.MGW\_MQSERIES\_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

#### Syntax

```
TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
  queue_manager      VARCHAR2(64),
  hostname           VARCHAR2(64),
  port               INTEGER,
  channel            VARCHAR2(64),
  interface_type     INTEGER,
  max_connections    INTEGER,
  username           VARCHAR2(64),
  password           VARCHAR2(64),
  inbound_log_queue  VARCHAR2(64),
  outbound_log_queue VARCHAR2(64),

  -- Methods
  STATIC FUNCTION construct
  RETURN SYS.MGW_MQSERIES_PROPERTIES,
```

```

STATIC FUNCTION alter_construct
RETURN SYS.MGW_MQSERIES_PROPERTIES );

```

## Attributes

**Table 103-12 SYS.MGW\_MQSERIES\_PROPERTIES Attributes**

Attribute	Description
queue_manager	The name of the WebSphere MQ queue manager
hostname	The host on which the WebSphere MQ messaging system resides. If hostname is <code>NULL</code> , then a WebSphere MQ bindings connection is used. If not <code>NULL</code> , then a client connection is used and requires that a port and channel be specified.
port	The port number. This is used only for client connections; that is, when hostname is not <code>NULL</code> .
channel	The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not <code>NULL</code> .
interface_type	The type of messaging interface to use. Values: <ul style="list-style-type: none"> <li>• <code>DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE</code> if the WebSphere MQ Base Java interface should be used.</li> <li>• <code>DBMS_MGWADM.JMS_CONNECTION</code> if the link is to be used to access JMS destinations in a unified, domain-independent manner.</li> <li>• <code>DBMS_MGWADM.JMS_QUEUE_CONNECTION</code> if the link is to be used for accessing JMS queues</li> <li>• <code>DBMS_MGWADM.JMS_TOPIC_CONNECTION</code> if the link is to be used for accessing JMS topics.</li> </ul>
max_connections	The maximum number of messaging connections to the WebSphere MQ messaging system
username	The username used for authentication to the WebSphere MQ messaging system
password	The password used for authentication to the WebSphere MQ messaging system
inbound_log_queue	The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source: <ul style="list-style-type: none"> <li>• For <code>MQSERIES_BASE_JAVA_INTERFACE</code>, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>• For the <code>JMS_CONNECTION</code> interface and the <code>JMS_QUEUE_CONNECTION</code> interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>• For <code>JMS_TOPIC_CONNECTION</code> interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is <code>SYSTEM.JMS.D.SUBSCRIBER.QUEUE</code>.</li> </ul>

**Table 103-12 (Cont.) SYS.MGW\_MQSERIES\_PROPERTIES Attributes**

Attribute	Description
outbound_log_queue	<p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination:</p> <ul style="list-style-type: none"> <li>For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.</li> </ul>

**Methods****Table 103-13 SYS.MGW\_MQSERIES\_PROPERTIES Methods**

Method	Description
construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL.
alter_construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 datatype are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other datatypes are assigned a value of NULL.

## 103.4.2 DBMS\_MGWADM SYS.MGW\_PROPERTIES Object Type

This type specifies an array of properties.

**Syntax**

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

**Attributes****Table 103-14 SYS.MGW\_PROPERTIES Attributes**

Attribute	Description
name	Property name
value	Property value

## Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the `MGWPROP$_` prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

```
MGW_PROPERTY.NAME = property_name
MGW_PROPERTY.VALUE = property_value
```

If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
MGW_PROPERTY.VALUE = name_of_property_to_remove
```

No action is taken if the property name does not exist in the original list.

- Remove all properties

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
MGW_PROPERTY.VALUE = not used
```

### See Also:

"The `DBMS_MGWADM` package defines constants to represent the reserved property names on [Table 103-4](#)

## 103.4.3 DBMS\_MGWADM SYS.MGW\_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

### Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
  name VARCHAR2(500),
```

```

value VARCHAR2(4000),

-- Methods
STATIC FUNCTION construct --- (1)
RETURN SYS.MGW_PROPERTY,

STATIC FUNCTION construct( --- (2)
    p_name IN VARCHAR2,
    p_value IN VARCHAR2)
RETURN SYS.MGW_PROPERTY );

```

### Attributes

**Table 103-15 SYS.MGW\_PROPERTY Attributes**

Attribute	Description
name	Property name
value	Property value

### Methods

**Table 103-16 SYS.MGW\_PROPERTY Methods**

Method	Description
construct --- (1)	Constructs a new MGW_PROPERTY instance. All attributes are assigned a value of NULL
construct --- (2)	Constructs a new MGW_PROPERTY instance initialized using the given parameters

#### See Also:

"The DBMS\_MGWADM package defines constants to represent the reserved property names on [Table 103-4](#)

## 103.4.4 SYS.MGW\_TIBRV\_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

### Syntax

```

TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
    service VARCHAR2(128),
    daemon VARCHAR2(128),
    network VARCHAR2(256),
    cm_name VARCHAR2(256),
    cm_ledger VARCHAR2(256),

-- Methods
STATIC FUNCTION construct

```

```
RETURN SYS.MGW_TIBRV_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_TIBRV_PROPERTIES );
```

### Attributes

**Table 103-17 SYS.MGW\_TIBRV\_PROPERTIES Attributes**

Attribute	Description
service	The service parameter for the rvd transport
daemon	The daemon parameter for the rvd transport
network	The network parameter for the rvd transport
cm_name	The CM correspondent name. Reserved for future use.
cm_ledger	The CM ledger file name. Reserved for future use.

### Methods

**Table 103-18 SYS.MGW\_TIBRV\_PROPERTIES Methods**

Method	Description
construct	Constructs a new SYS.MGW_TIBRV_PROPERTIES instance. All attributes will be assigned a value of NULL.
alter_construct	Constructs a new SYS.MGW_TIBRV_PROPERTIES instance. This function is useful for altering the properties of an existing messaging link. All attributes having a VARCHAR2 datatype will be assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other datatypes will be assigned a value of NULL.

## 103.5 Summary of DBMS\_MGWADM Subprograms

This table lists the DBMS\_MGWADM subprograms and briefly describes them.

**Table 103-19 DBMS\_MGWADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_SUBSCRIBER Procedure</a>	Adds a subscriber used to consume messages from a source queue for propagation to a destination
<a href="#">ALTER_AGENT Procedures</a>	Alters Messaging Gateway agent parameters
<a href="#">ALTER_JOB Procedure</a>	Alters the properties of a propagation job
<a href="#">ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous</a>	Alters the properties of a TIB/Rendezvous messaging system link
<a href="#">ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ</a>	Alters the properties of a WebSphere MQ messaging system link
<a href="#">ALTER_PROPAGATION_SCHEDULE Procedure</a>	Alters a propagation schedule

**Table 103-19 (Cont.) DBMS\_MGWADM Package Subprograms**

Subprogram	Description
<a href="#">ALTER_SUBSCRIBER Procedure</a>	Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination
<a href="#">CLEANUP_GATEWAY Procedures</a>	Cleans up Messaging Gateway

## 103.5.1 ADD\_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

### Note:

This subprogram has been deprecated as a result of improved technology (see [CREATE\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER(
    subscriber_id      IN VARCHAR2,
    propagation_type  IN BINARY_INTEGER,
    queue_name        IN VARCHAR2,
    destination       IN VARCHAR2,
    rule              IN VARCHAR2 DEFAULT NULL,
    transformation    IN VARCHAR2 DEFAULT NULL,
    exception_queue   IN VARCHAR2 DEFAULT NULL
    options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

### Parameters

**Table 103-20 ADD\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_id	Specifies a user-defined name that identifies this subscriber
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Database Advanced Queuing to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Database Advanced Queuing propagation
queue_name	Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.

**Table 103-20 (Cont.) ADD\_SUBSCRIBER Procedure Parameters**

Parameter	Description
transformation	Specifies the transformation needed to convert between the Oracle Database Advanced Queuing payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> .  If <code>NULL</code> , then the Oracle Database Advanced Queuing payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If <code>NULL</code> , then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .  The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. <code>NULL</code> if there are none. Typically these are lesser used configuration properties supported by the messaging system.

### Usage Notes

#### See Also:

"Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Database Advanced Queuing User's Guide* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Database Advanced Queuing queues. Otherwise the native Oracle Database Advanced Queuing interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `NULL`.

#### See Also:

For additional information regarding subscriber options

- "WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide*
- "TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide*

OUTBOUND\_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- `queue_name` specifies the local Oracle Database Advanced Queuing queue that is the propagation source. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Database Advanced Queuing subscriber rule if the native Oracle Database Advanced Queuing interface is used, or a JMS selector if the Oracle JMS interface is used. If `NULL`, then no rule or selector is used.
- `transformation` specifies the transformation used to convert the Oracle Database Advanced Queuing payload to an ADT defined by Messaging Gateway.

Messaging Gateway propagation dequeues messages from the Oracle Database Advanced Queuing queue using the transformation to convert the Oracle Database Advanced Queuing payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Database Advanced Queuing queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Database Advanced Queuing interface is used, then a subscriber will be added to the Oracle Database Advanced Queuing queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_subscriber_id', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_subscriber_id`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Database Advanced Queuing queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Database Advanced Queuing queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

#### INBOUND\_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Database Advanced Queuing queue to which messages are propagated. This must have a syntax of `schema.queue`.

- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Database Advanced Queuing payload type.

Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Database Advanced Queuing payload type when the message is enqueued to the Oracle Database Advanced Queuing queue.

- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

## 103.5.2 ALTER\_AGENT Procedures

This procedure configures Messaging Gateway agent parameters.

### Syntax

```
DBMS_MGWADM.ALTER_AGENT (
    max_connections  IN  BINARY_INTEGER DEFAULT NULL,
    max_memory       IN  BINARY_INTEGER DEFAULT NULL,
    max_threads      IN  BINARY_INTEGER DEFAULT NULL,
    service          IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );

DBMS_MGWADM.ALTER_AGENT (
    agent_name      IN  VARCHAR2,
    username        IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    password        IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    database        IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    conntype        IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    max_memory      IN  PLS_INTEGER DEFAULT NULL,
    max_threads     IN  PLS_INTEGER DEFAULT NULL,
    service         IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    initfile        IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    comment         IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

## Parameters

**Table 103-21 ALTER\_AGENT Procedure Parameters**

Parameter	Description
max_connections	The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged. <b>Caution: This parameter has been deprecated.</b>
max_memory	The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.
max_threads	The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged. The maximum value of max_threads is limited to 128.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will run on only those database instances that are assigned to the service. If NULL, the job class used by this agent will be altered to belong to the default service which is mapped to every instance. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.
username	Specifies the username used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. If a username is specified then a password must also be specified.
password	Specifies the password used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. Oracle strongly recommends that a connect string, rather than NULL, be specified. Usually it will be a net service name from tnsnames.ora.
comntype	Specifies the type of connection to the Oracle Database, DBMS_MGWADM.JDBC_OCI or DBMS_MGWADM.JDBC_THIN. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
comment	Optional comments for this agent. NULL if a comment is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.

 **Note:**

The `max_connections` parameter included in previous versions of this subprogram has been deprecated and is non-operational

**Usage Notes**

- Default values for these configuration parameters are set when the Messaging Gateway agent is installed.
- Changes to the `max_memory` and `max_threads` parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.
- The `service` parameter is used to set an Oracle Scheduler job class attribute. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is NULL, the job class will belong to an internal service that is mapped to all instances.
- The `max_connections` parameter is being deprecated as of the Oracle RDBMS 11g release. The number of messaging connections used by the Messaging Gateway Agent is based on the value of the `max_threads` parameter.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the user and grant it the role `MGW_AGENT_ROLE`.

## 103.5.3 ALTER\_JOB Procedure

This procedure alters the properties of a propagation job.

**Syntax**

```
DBMS_MGWADM.ALTER_JOB (
  job_name          IN  VARCHAR2,
  rule              IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation    IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue   IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  poll_interval     IN  PLS_INTEGER DEFAULT 0,
  options           IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

**Parameters****Table 103-22 ALTER\_JOB Procedure Parameters**

Parameter	Description
<code>job_name</code>	Identifies the propagation job

**Table 103-22 (Cont.) ALTER\_JOB Procedure Parameters**

Parameter	Description
rule	Specifies an optional subscription rule used to dequeue messages from the propagation source. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> .  A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. In cases in which no exception queue is associated with the job, propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the propagation type.  A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.  Values: NULL, 0, or value > 0: <ul style="list-style-type: none"> <li>• If zero (default), the current value will not be changed.</li> <li>• If NULL, the current value will be reset and the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.</li> </ul>
options	Optional job properties. If NULL, no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of job options.
comments	An optional comment for this agent, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, the current value will not be changed.

### Usage Notes

- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- The subscriber rule cannot be altered when propagating from a JMS source. Instead, the propagation job must be dropped and re-created with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).
- The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner; add a new property, replace an existing property, remove an existing property or remove all properties.

 **Note:**

- [SYS.MGW\\_PROPERTY Object Type](#) for more information about the options parameter
- [OUTBOUND\\_PROPAGATION Jobs](#) for outbound propagation parameter interpretation
- [INBOUND\\_PROPAGATION Jobs](#) for inbound propagation parameter interpretation

## 103.5.4 ALTER\_MSGSYSTEM\_LINK Procedure for TIB/Rendezvous

This procedure alters the properties of a TIB/Rendezvous messaging system link.

### Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

### Parameters

**Table 103-23 ALTER\_MSGSYSTEM\_LINK Procedure Parameters for TIB/Rendezvous**

Parameters	Description
linkname	The messaging system link name
properties	Basic properties for a TIB/Rendezvous messaging system link. If NULL, then no link properties will be changed.
options	Optional link properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	A user-specified description, or NULL if one is not desired. If <code>DBMS_MGWADM.NO_CHANGE</code> , then the current value will not be changed.

## Usage Notes

To retain an existing value for a messaging link property with a `VARCHAR2` datatype, specify `DBMS_MGWADM.NO_CHANGE` for that particular property. To preserve an existing value for a property of another datatype, specify `NULL` for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

### See Also:

[SYS.MGW\\_PROPERTIES Object Type](#)

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

### See Also:

"TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

## 103.5.5 ALTER\_MSGSYSTEM\_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

### Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
    linkname    IN  VARCHAR2,
    properties  IN  SYS.MGW_MQSERIES_PROPERTIES,
    options     IN  SYS.MGW_PROPERTIES DEFAULT NULL,
    comment     IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

### Parameters

**Table 103-24 ALTER\_MSGSYSTEM\_LINK Procedure Parameters for WebSphere MQ**

Parameters	Description
<code>linkname</code>	The messaging system link name
<code>properties</code>	Basic properties for a WebSphere MQ messaging system link. If it is <code>NULL</code> , then no link properties are changed.

**Table 103-24 (Cont.) ALTER\_MSGSYSTEM\_LINK Procedure Parameters for WebSphere MQ**

Parameters	Description
options	Optional link properties. NULL if no options are changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	An optional description or NULL if not desired. If DBMS_MGWADM.NO_CHANGE is specified, then the current value is not changed.

### Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 datatype, specify DBMS\_MGWADM.NO\_CHANGE for that particular property. To preserve an existing value for a property of another datatype, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

#### See Also:

[SYS.MGW\\_PROPERTIES Object Type](#)

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

#### See Also:

"WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

## 103.5.6 ALTER\_PROPAGATION\_SCHEDULE Procedure

This procedure alters a propagation schedule.

### Note:

This subprogram has been deprecated as a result of improved technology (see [ALTER\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
  schedule_id  IN VARCHAR2,
  duration     IN NUMBER DEFAULT NULL,
  next_time   IN VARCHAR2 DEFAULT NULL,
  latency      IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 103-25 ALTER\_PROPAGATION\_SCHEDULE Procedure Parameters**

Parameter	Description
schedule_id	Identifies the propagation schedule to be altered
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.  Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.

### Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

## 103.5.7 ALTER\_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

### Note:

This subprogram has been deprecated as a result of improved technology (see [ALTER\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
  subscriber_id   IN VARCHAR2,
  rule            IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  options        IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

### Parameters

**Table 103-26 ALTER\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_id	Identifies the subscriber to be altered
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type.  A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Database Advanced Queuing payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type.  A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.

**Table 103-26 (Cont.) ALTER\_SUBSCRIBER Procedure Parameters**

Parameter	Description
<code>exception_queue</code>	<p>Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type.</p> <p>A <code>NULL</code> value indicates that no exception queue is used. If <code>DBMS_MGWADM.NO_CHANGE</code>, then the current value is unchanged.</p> <p>The source queue and exception queue cannot be the same queue.</p>
<code>options</code>	<p>Optional subscriber properties. If <code>NULL</code>, then no options will be changed. If not <code>NULL</code>, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.</p>

### Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Database Advanced Queuing queues. Otherwise the native Oracle Database Advanced Queuing interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

 **See Also:**

- [SYS.MGW\\_PROPERTIES Object Type](#) for more information on the options parameter
- "WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about WebSphere MQ subscriber options
- "TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about TIB/Rendezvous subscriber options

## 103.5.8 CLEANUP\_GATEWAY Procedures

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The `MGW_GATEWAY` view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

### Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY(
    action      IN    BINARY_INTEGER,
    sarg        IN    VARCHAR2 DEFAULT NULL);
```

```
DBMS_MGWADM.CLEANUP_GATEWAY(
    agent_name  IN    VARCHAR2,   action      IN    BINARY_INTEGER,   sarg
    IN    VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 103-27 CLEANUP\_GATEWAY Procedure Parameters**

Parameter	Description
action	The cleanup action to be performed. Values: <ul style="list-style-type: none"> <li>• <code>DBMS_MGWADM.CLEAN_STARTUP_STATE</code> for Messaging Gateway start up state recovery</li> <li>• <code>DBMS_MGWADM.CLEAN_LOG_QUEUES</code> for log queue cleanup</li> <li>• <code>DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC</code> for propagation job recovery due to missing log record</li> <li>• <code>DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE</code> for propagation job recovery due to missing message</li> </ul>
sarg	Optional argument whose meaning depends on the value specified for <code>action</code> . This should be <code>NULL</code> if it is not used for the specified action.

**Table 103-27 (Cont.) CLEANUP\_GATEWAY Procedure Parameters**

Parameter	Description
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

### Usage Notes

#### CLEAN\_STARTUP\_STATE

sarg is not used and must be NULL.

The CLEAN\_STARTUP\_STATE action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The CLEAN\_STARTUP\_STATE action may be needed when the MGW\_GATEWAY view shows that the AGENT\_STATUS value is something other than NOT\_STARTED or START\_SCHEDULED, and the AGENT\_PING value is UNREACHABLE for an extended period of time.

If the AGENT\_STATUS value is BROKEN, then the Messaging Gateway agent cannot be started until the problem has been resolved and the CLEAN\_STARTUP\_STATE action used to reset the agent status. A BROKEN status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the Scheduler job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to NOT\_STARTED.

Execution of this command fails if:

- The agent status is NOT\_STARTED or START\_SCHEDULED.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is STARTING.
- The Messaging Gateway agent is successfully contacted.

The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

 **Note:**

Terminate any Messaging Gateway agent process that may still be running after a `CLEAN_STARTUP_STATE` action has been successfully performed. This should be done before calling `DBMS_MGWADM.STARTUP` to start Messaging Gateway. The process is usually named `extprocmgwextproc`.

### CLEAN\_LOG\_QUEUES

`sarg` is not used and must be `NULL`.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

 **Note:**

The `CLEAN_LOG_QUEUES` action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

### RESET\_SUB\_MISSING\_LOG\_REC

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

 **Note:**

If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

### RESET\_SUB\_MISSING\_MESSAGE

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that propagation job. The procedure will fail if the Messaging Gateway agent is not running.

## 103.5.9 CREATE\_AGENT Procedure

This procedure creates a Messaging Gateway agent that will be used to process propagation jobs.

### Syntax

```
DBMS_MGWADM.CREATE_AGENT (
  agent_name      IN   VARCHAR2,
  username        IN   VARCHAR2 DEFAULT NULL,
  password        IN   VARCHAR2 DEFAULT NULL,
  database        IN   VARCHAR2 DEFAULT NULL,
  conntype        IN   VARCHAR2 DEFAULT DBMS_MGWADM.JDBC_OCI,
  max_memory      IN   PLS_INTEGER DEFAULT 64,
  max_threads     IN   PLS_INTEGER DEFAULT 1,
  service         IN   VARCHAR2 DEFAULT NULL,
  initfile        IN   VARCHAR2 DEFAULT NULL,
  comment         IN   VARCHAR2  DEFAULT NULL );
```

### Parameters

**Table 103-28 CREATE\_AGENT Procedure Parameters**

Parameter	Description
agent_name	A name used to identify the agent
username	Specifies the username used for connections to the Oracle Database
password	Specifies the password used for connections to the Oracle Database. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. A value can be specified only if username is specified. Oracle strongly recommends that a connect string, rather than NULL be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database. Values: DBMS_MGWADM.JDBC_OCI, DBMS_MGWADM.JDBC_THIN
max_memory	Specifies the maximum heap size, in MB, used by the Messaging Gateway agent
max_threads	Specifies the number of messaging threads that the Messaging Gateway agent creates. This determines the number of propagation jobs that the agent can concurrently process. The maximum value of max_threads is limited to 128.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will only run on those database instances that are assigned to the service. If NULL, then the job class will belong to the default service which is mapped to every instance.
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file.

**Table 103-28 (Cont.) CREATE\_AGENT Procedure Parameters**

Parameter	Description
comment	An optional comment for this agent. NULL if one is not desired.

**Usage Notes**

- The Messaging Gateway automatically configures a default agent when Messaging Gateway is installed. The name of the default agent is `DEFAULT_AGENT`. This procedure can be used to create additional agents.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the database user and grant it the role `MGW_AGENT_ROLE`. It is not mandatory that the connection information be specified when this procedure is called but it must be set before the agent can be started.
- The `service` parameter is used to create an Oracle Scheduler job class. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is `NULL`, the job class will belong to an internal service that is mapped to all instances.

## 103.5.10 CREATE\_JOB Procedure

This procedure creates a job used to propagate message from a source to a destination.

**Syntax**

```
DBMS_MGWADM.CREATE_JOB (
  job_name          IN  VARCHAR2,
  propagation_type  IN  PLS_INTEGER,
  source            IN  VARCHAR2,
  destination       IN  VARCHAR2,
  rule              IN  VARCHAR2 DEFAULT NULL,
  transformation    IN  VARCHAR2 DEFAULT NULL,
  exception_queue   IN  VARCHAR2 DEFAULT NULL,
  poll_interval     IN  PLS_INTEGER DEFAULT NULL,
  options           IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  enabled           IN  BOOLEAN DEFAULT TRUE,
  comments          IN  VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 103-29 CREATE\_JOB Procedure Parameters**

Parameter	Description
job_name	A user defined name to identify the propagation job
propagation_type	Specifies the type of message propagation. <ul style="list-style-type: none"> <li>• <code>DBMS_MGWADM.OUTBOUND_PROPAGATION</code> for Oracle Streams AQ to non-Oracle propagation.</li> <li>• <code>DBMS_MGWADM.INBOUND_PROPAGATION</code> for non-Oracle to Oracle Streams AQ propagation.</li> </ul>

**Table 103-29 (Cont.) CREATE\_JOB Procedure Parameters**

Parameter	Description
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
rule	Specifies an optional subscription rule used to dequeue messages from the source queue. This should be <code>NULL</code> if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> . If no transformation is specified the Oracle Streams AQ payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If <code>NULL</code> , an exception queue will not be used and propagation will stop if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> . The source queue and exception queue cannot be the same queue.
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: <code>NULL</code> or value > 0. If <code>NULL</code> , then the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.
options	Optional job properties, <code>NULL</code> if there are none. Typically these are lesser used configuration properties supported by the messaging system.
enabled	Specifies whether this propagation job is enabled after creation. Values: <code>TRUE</code> , <code>FALSE</code> . <ul style="list-style-type: none"> <li>• If <code>TRUE</code> (default), the job will be enabled after it is created.</li> <li>• If <code>FALSE</code>, the job will be disabled after it is created. A propagation job must be enabled and the Messaging Gateway agent running before messages can be propagated.</li> </ul>
comments	An optional comment for this job. <code>NULL</code> if one is not desired.

## Usage Notes

- The job must be enabled and Messaging Gateway agent started in order for messages to be propagated.
- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `NULL`.

## OUTBOUND\_PROPAGATION Jobs

The parameters for an outbound propagation job are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue that is the propagation source. This must have syntax of `schema.queue`. This can be either a multiple consumer queue or a single consumer queue.
- `destination` specifies the non-Oracle queue to which messages are propagated. This must have syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Stream AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If `NULL`, then no rule or selector is used. This parameter must be `NULL` if the native Oracle Stream AQ interface is used and the propagation source is a single consumer queue.
- `transformation` specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. The full transformation name (`schema.name`) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the non-Oracle messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. The syntax must be `schema.queue`.

If the native Oracle Streams AQ interface is used and the source is a multiple consumer queue, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not the Messaging Gateway agent is running. The local subscriber will be of the form `sys.aq$_agent('MGW_job_name', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_job_name`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following conditions:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source queue and exception queue must match.

- The exception queue must be created as a queue type of DBMS\_AQADM.NORMAL\_QUEUE. Enqueue restrictions prevent Messaging Gateway from using an Oracle Streams AQ queue of type DBMS\_AQADM.EXCEPTION\_QUEUE as a Messaging Gateway exception queue.

#### INBOUND\_PROPAGATION Jobs

The parameters for an inbound propagation job are interpreted as follows:

- `source` specifies the non-Oracle queue that is the propagation source. The syntax must be `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. The syntax must be `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the non-Oracle messaging system. This should be `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type. The full transformation name (`schema.name`) should be used if one is specified

Messaging Gateway propagation dequeues messages from the non-Oracle messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a registered non-Oracle queue to which messages are moved if an exception occurs. The syntax must be `registered_queue@message_link`.

Whether or not a subscriber is needed for the source queue depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then the Messaging Gateway agent will create it. If the agent is not running when this procedure is called, then the subscriber will be created on the non-Oracle messaging system the next time the agent starts.

The exception queue has the following conditions:

- The exception queue must be a registered non-Oracle queue.
- The source queue and exception queue must use the same messaging system link.

## 103.5.11 CREATE\_MSGSYSTEM\_LINK Procedures for TIB/Rendezvous

This procedure creates a link to a TIB/Rendezvous messaging system.

#### Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
    linkname      IN  VARCHAR2,
    properties    IN  SYS.MGW_TIBRV_PROPERTIES,
    options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
    comment       IN  VARCHAR2 DEFAULT NULL );
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
    linkname      IN  VARCHAR2,
```

```

agent_name  IN  VARCHAR2,
properties  IN  SYS.MGW_TIBRV_PROPERTIES,
options     IN  SYS.MGW_PROPERTIES DEFAULT NULL,
comment     IN  VARCHAR2 DEFAULT NULL );

```

## Parameters

**Table 103-30 CREATE\_MSGSYSTEM\_LINK Procedure Parameters for TIB/Rendezvous**

Parameter	Description
linkname	A user-defined name to identify this messaging system link
properties	Basic properties of a TIB/Rendezvous messaging system link.
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system
comment	A user-specified description. NULL if one is not desired.
agent_name	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

## Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

### See Also:

"TIB/Rendezvous System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

## 103.5.12 CREATE\_MSGSYSTEM\_LINK Procedures for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

### Syntax

```

DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname  IN  VARCHAR2,
  properties IN  SYS.MGW_MQSERIES_PROPERTIES,
  options   IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment   IN  VARCHAR2 DEFAULT NULL);

```

```

DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname  IN  VARCHAR2,
  agent_name IN  VARCHAR2,
  properties IN  SYS.MGW_MQSERIES_PROPERTIES,

```

```
options      IN SYS.MGW_PROPERTIES DEFAULT NULL,
comment     IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 103-31 CREATE\_MSGSYSTEM\_LINK Procedure Parameters for WebSphere MQ**

Parameter	Description
linkname	A user-defined name to identify the messaging system link
properties	Basic properties of a WebSphere MQ messaging system link
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system.
comment	A user-specified description. NULL if one is not desired
agent_name	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

## Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

### See Also:

"WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide* for more information about the messaging system properties and options

## 103.5.13 DB\_CONNECT\_INFO Procedure

This deprecated procedure configures connection information used by the Messaging Gateway default agent for connections to Oracle Database.

### Note:

This subprogram has been deprecated as a result of improved technology (see [ALTER\\_AGENT Procedures](#)), and is retained only for reasons of backward compatibility.

## Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
  username      IN VARCHAR2,
  password     IN VARCHAR2,
  database     IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 103-32 DB\_CONNECT\_INFO Procedure Parameters**

Parameter	Description
username	The username used for connections to Oracle Database. NULL is not allowed
password	The password used for connections to Oracle Database. NULL is not allowed
database	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from <code>tnsnames.ora</code> .

## Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role `MGW_AGENT_ROLE`, and then call this procedure to configure Messaging Gateway. Role `MGW_AGENT_ROLE` is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Database Advanced Queuing queues, and perform certain Oracle Database Advanced Queuing administration tasks.

## 103.5.14 DISABLE\_JOB Procedure

This procedure disables a propagation job.

### Syntax

```
DBMS_MGWADM.DISABLE_JOB (
    job_name IN VARCHAR2);
```

### Parameters

**Table 103-33 DISABLE\_JOB Procedure Parameters**

Parameter	Description
job_name	Identifies the propagation job

## 103.5.15 DISABLE\_PROPAGATION\_SCHEDULE Procedure

This **deprecated procedure** disables a propagation schedule.

### Note:

This subprogram has been deprecated as a result of improved technology (see [DISABLE\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2);
```

### Parameters

**Table 103-34** DISABLE\_PROPAGATION\_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be disabled

## 103.5.16 ENABLE\_JOB Procedure

This procedure enables a propagation job.

### Syntax

```
DBMS_MGWADM.ENABLE_JOB (  
    job_name IN VARCHAR2 );
```

### Parameters

**Table 103-35** ENABLE\_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job

## 103.5.17 ENABLE\_PROPAGATION\_SCHEDULE Procedure

This deprecated procedure enables a propagation schedule.

### Note:

This subprogram has been deprecated as a result of improved technology (see [ENABLE\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (
    schedule_id IN VARCHAR2 );
```

### Parameters

**Table 103-36** ENABLE\_PROPAGATION\_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be enabled

## 103.5.18 REGISTER\_FOREIGN\_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

### Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE(
    name           IN VARCHAR2,
    linkname       IN VARCHAR2,
    provider_queue IN VARCHAR2 DEFAULT NULL,
    domain         IN INTEGER DEFAULT NULL,
    options        IN SYS.MGW_PROPERTIES DEFAULT NULL,
    comment        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 103-37** REGISTER\_FOREIGN\_QUEUE Procedure Parameters

Parameters	Description
name	The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.
linkname	The link name for the messaging system on which this queue exists
provider_queue	The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name.

**Table 103-37 (Cont.) REGISTER\_FOREIGN\_QUEUE Procedure Parameters**

Parameters	Description
domain	The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DBMS_MGWADM.DOMAIN_QUEUE is for a queue (point-to-point model). DBMS_MGWADM.DOMAIN_TOPIC is for a topic (publish-subscribe model).
options	Optional queue properties
comment	A user-specified description. Can be NULL.

### Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

#### See Also:

For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Database Advanced Queuing User's Guide*.

## 103.5.19 REMOVE\_AGENT Procedure

This procedure removes a Messaging Gateway agent.

### Syntax

```
DBMS_MGWADM.REMOVE_AGENT(
    agent_name IN VARCHAR2 );
```

### Parameters

**Table 103-38 REMOVE\_AGENT Procedure Parameters**

Parameters	Description
agent_name	Identifies the Messaging Gateway agent

### Usage Notes

All messaging system links associated with this Messaging Gateway agent must be removed and the agent must be stopped before it can be removed. The Messaging Gateway default agent cannot be removed.

## 103.5.20 REMOVE\_JOB Procedure

This procedure removes a propagation job.

### Syntax

```
DBMS_MGWADM.REMOVE_JOB(
    job_name IN VARCHAR2, force IN PLS_INTEGER DEFAULT
    DBMS_MGWADM.NO_FORCE);
```

### Parameters

**Table 103-39 REMOVE\_JOB Procedure Parameters**

Parameters	Description
job_name	Identifies the propagation job
force	Specifies whether the procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this propagation job. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE <ul style="list-style-type: none"> <li>NO_FORCE (default) means the job is not removed if Messaging Gateway is unable to clean up successfully</li> <li>FORCE means the job is removed even though all cleanup actions may not be done</li> </ul>

### Usage Notes

- The Messaging Gateway agent uses various resources of the Oracle Database and the non-Oracle messaging system for its propagation work. These resources need to be released when the job is removed. For example, Messaging Gateway may create a durable subscriber on the source queue that should be removed when the job is removed. Therefore, this procedure should normally be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this job.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue when the propagation source is a multiple consumer queue.

## 103.5.21 REMOVE\_MSGSYSTEM\_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

### Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(
    linkname IN VARCHAR2);
```

## Parameters

**Table 103-40 REMOVE\_MSGSYSTEM\_LINK Procedure Parameters**

Parameters	Description
linkname	The messaging system link name

## Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

## 103.5.22 REMOVE\_OPTION Procedure

This procedure removes a Messaging Gateway configuration option. It can be used to remove an agent option, a messaging link option, or a propagation job option.

## Syntax

```
DBMS_MGWADM.REMOVE_OPTION (
    target_type  IN  PLS_INTEGER,
    target_name  IN  VARCHAR2,
    option_name  IN  VARCHAR2);
```

## Parameters

**Table 103-41 REMOVE\_OPTION Procedure Parameters**

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> <li>DBMS_MGWADM.AGENT_JAVA_PROP to remove a Java System property for a Messaging Gateway agent</li> <li>DBMS_MGWADM.MSGLINK_OPTION to remove a messaging link option</li> <li>DBMS_MGWADM.JOB_OPTION to remove a propagation job option</li> </ul>
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.

### See Also:

[Table 103-10](#) regarding options for the option\_type parameter

## Usage Notes

DBMS\_MGWADM.AGENT\_JAVA\_PROP Target

The procedure removes an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- `target_name` specifies the name of the Messaging Gateway agent. `DBMS_MGWADM.DEFAULT_AGENT` can be used for the default agent.
- `option_name` specifies the Java System property
- `encrypted` can be either `TRUE` or `FALSE`

**DBMS\_MGWADM.MSGLINK\_OPTION Target**

The procedure removes a single option for a Messaging Gateway messaging system link. This is equivalent to calling `DBMS_MGWADM.ALTER_MSGSYSTEM_LINK` and using the `options` parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

**DBMS\_MGWADM.JOB\_OPTION Target**

The procedure removes a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the `options` parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

## 103.5.23 REMOVE\_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

### Note:

This subprogram has been deprecated as a result of improved technology (see [REMOVE\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (  
  subscriber_id  IN VARCHAR2,  
  force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

## Parameters

**Table 103-42 REMOVE\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_id	Identifies the subscriber to be removed
force	Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber.  Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE <ul style="list-style-type: none"> <li>NO_FORCE means the subscriber is not removed if Messaging Gateway is unable to clean up successfully (default)</li> <li>FORCE means the subscriber is removed even though all cleanup actions may not be done</li> </ul>

## Usage Notes

- The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.
- For outbound propagation, a local subscriber is removed from the Oracle Database Advanced Queuing queue.

## 103.5.24 RESET\_JOB Procedure

This procedure resets the propagation error state for a propagation job.

### Syntax

```
DBMS_MGWADM.RESET_JOB (
    job_name IN VARCHAR2);
```

## Parameters

**Table 103-43 RESET\_JOB Procedure Parameters**

Parameter	Description
job_name	Identifies the propagation job

## Usage Notes

This procedure can be used to reset a propagation job that has been set to a failed state and propagation activities have been stopped. The administrator should correct the problem and then call this procedure to allow the agent to retry the propagation job. The STATUS field of the MGW\_JOBS view indicates the job status.

## 103.5.25 RESET\_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

### Note:

This subprogram has been deprecated as a result of improved technology (see [RESET\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (
    subscriber_id IN VARCHAR2 );
```

### Parameters

**Table 103-44** RESET\_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber

## 103.5.26 SCHEDULE\_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination.

The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

### Note:

This subprogram has been deprecated as a result of improved technology (see [CREATE\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
    schedule_id      IN VARCHAR2,
    propagation_type IN BINARY_INTEGER,
    source           IN VARCHAR2,
    destination      IN VARCHAR2,
    start_time       IN DATE DEFAULT SYSDATE,
    duration         IN NUMBER DEFAULT NULL,
    next_time        IN VARCHAR2 DEFAULT NULL,
    latency          IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 103-45 SCHEDULE\_PROPAGATION Procedure Parameters**

Parameter	Description
<code>schedule_id</code>	Specifies a user-defined name that identifies the schedule
<code>propagation_type</code>	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Database Advanced Queuing to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Database Advanced Queuing propagation.
<code>source</code>	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
<code>destination</code>	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
<code>start_time</code>	Reserved for future use
<code>duration</code>	Reserved for future use
<code>next_time</code>	Reserved for future use
<code>latency</code>	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.  Values: NULL or value > 0. If <code>latency</code> is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.

## Usage Notes

For outbound propagation, parameters are interpreted as follows:

- `source` specifies the local Oracle Database Advanced Queuing queue from which messages are propagated. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Database Advanced Queuing queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

## 103.5.27 SET\_LOG\_LEVEL Procedures

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

### Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (
    log_level    IN    BINARY_INTEGER);

DBMS_MGWADM.SET_LOG_LEVEL (
    agent_name   IN    VARCHAR2,
    log_level    IN    BINARY_INTEGER);
```

### Parameters

**Table 103-46 SET\_LOG\_LEVEL Procedure Parameters**

Parameter	Description
log_level	Level at which the Messaging Gateway agent logs information. DBMS_MGWADM.BASIC_LOGGING generates the least information while DBMS_MGWADM.TRACE_DEBUG_LOGGING generates the most information.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

### See Also:

[Table 103-3](#) for details on the log\_level parameter

## 103.5.28 SET\_OPTION Procedure

This procedure sets a Messaging Gateway configuration option. It can be used to set an agent option, a messaging link option, or a propagation job option.

### Syntax

```
DBMS_MGWADM.SET_OPTION (
    target_type  IN    PLS_INTEGER,
    target_name  IN    VARCHAR2,
    option_name  IN    VARCHAR2,
    option_value IN    VARCHAR2,
    encrypted   IN    BOOLEAN DEFAULT FALSE );
```

## Parameters

**Table 103-47 SET\_OPTION Procedure Parameters**

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> <li>DBMS_MGWADM.AGENT_JAVA_PROP to set a Java System property for a Messaging Gateway agent</li> <li>DBMS_MGWADM.MSGLINK_OPTION to set a messaging link option</li> <li>DBMS_MGWADM.JOB_OPTION to set a propagation job option</li> </ul>
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.
option_value	Option value
encrypted	Indicates whether the value should be stored as encrypted: <ul style="list-style-type: none"> <li>TRUE if the value should be stored in an encrypted form</li> <li>FALSE if the value should be stored in a cleartext form</li> </ul>

**See Also:**

[Table 103-10](#) regarding options for the option\_type parameter

### Usage Notes

#### DBMS\_MGWADM.AGENT\_JAVA\_PROP Target

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target\_name specifies the name of the Messaging Gateway agent. DBMS\_MGWADM.DEFAULT\_AGENT can be used for the default agent.
- option\_name specifies the Java System property
- encrypted can be either TRUE or FALSE

#### DBMS\_MGWADM.MSGLINK\_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS\_MGWADM.ALTER\_MSGSYSTEM\_LINK and using the options parameter to set an option.

The parameters are interpreted as follows:

- target\_name specifies the name of the message system link
- option\_name specifies the option to set

- encrypted must be FALSE

#### DBMS\_MGWADM.JOB\_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the options parameter to set an option.

The parameters are interpreted as follows:

- target\_name specifies the name of the propagation job
- option\_name specifies the option to set
- encrypted must be FALSE

## 103.5.29 SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

### Syntax

```
DBMS_MGWADM.SHUTDOWN (
    sdmode          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

```
DBMS_MGWADM.SHUTDOWN (
    agent_name     IN VARCHAR2);
```

### Parameters

**Table 103-48 SHUTDOWN Procedure Parameters**

Parameter	Description
sdmode	The shutdown mode. The only value currently supported is <code>DBMS_MGWADM.SHUTDOWN_NORMAL</code> for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.
agent_name	Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.

### Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

## 103.5.30 STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

### Syntax

```
DBMS_MGWADM.STARTUP(
    instance      IN BINARY_INTEGER DEFAULT 0,
    force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

```
DBMS_MGWADM.STARTUP(
    agent_name    IN  VARCHAR2);
```

### Parameters

**Table 103-49 STARTUP Procedure Parameters**

Parameter	Description
instance	Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance.  <b>Caution: This parameter has been deprecated.</b>
force	If this is DBMS_MGWADM.FORCE, then any positive integer is acceptable as the job instance. If this is DBMS_MGWADM.NO_FORCE (the default), then the specified instance must be running; otherwise the routine raises an exception.  <b>Caution: This parameter has been deprecated.</b>
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

### Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The force and instance parameters are no longer used and will be ignored. If the instance affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the DBMS\_MGWADM.ALTER\_AGENT procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the DBMS\_MGWADM.CREATE\_AGENT or DBMS\_MGWADM.ALTER\_AGENT subprograms.

## 103.5.31 UNREGISTER\_FOREIGN\_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

### Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE(
    name          IN  VARCHAR2,
    linkname     IN  VARCHAR2);
```

### Parameters

**Table 103-50 UNREGISTER\_FOREIGN\_QUEUE Procedure Parameters**

Parameter	Description
name	The queue name

**Table 103-50 (Cont.) UNREGISTER\_FOREIGN\_QUEUE Procedure Parameters**

Parameter	Description
linkname	The link name for the messaging system on which the queue exists

**Usage Notes**

- This procedure does not remove the physical queue in the non-Oracle messaging system.
- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

## 103.5.32 UNSCHEDULE\_PROPAGATION Procedure

This deprecated procedure removes a propagation schedule.

 **Note:**

This subprogram has been deprecated as a result of improved technology (see [REMOVE\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

**Syntax**

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (
    schedule_id IN VARCHAR2 );
```

**Parameters**

**Table 103-51 UNSCHEDULE\_PROPAGATION Procedure Parameters**

Parameter	Description
schedule_id	Identifies the propagation schedule to be removed

# DBMS\_MGWMSG

DBMS\_MGWMSG provides object types used by the canonical message types to convert message bodies, and methods, constants, and subprograms for working with Messaging Gateway message types.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Summary of DBMS\\_MGWMSG Subprograms](#)

## See Also:

[DBMS\\_MGWADM](#) which describes the Messaging Gateway administrative interface, [DBMS\\_MGWADM](#)

## 104.1 DBMS\_MGWMSG Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS\_MGWMSG package as well as the canonical types. The DBMS\_MGWMSG packages and object types are owned by SYS.

## Note:

You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Database Advanced Queuing User's Guide* for information on loading database objects and using DBMS\_MGWMSG.

## 104.2 DBMS\_MGWMSG Constants

The DBMS\_MGWMSG package defines constants for specifying various parameter values.

**Table 104-1 DBMS\_MGWMSG Constants: Value Types and Constants**  
Representing the Type of Value for a SYS.MGW\_NAME\_VALUE\_T Object

Value	Constant
TEXT_VALUE	CONSTANT BINARY_INTEGER := 1

**Table 104-1 (Cont.) DBMS\_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW\_NAME\_VALUE\_T Object**

Value	Constant
RAW_VALUE	CONSTANT BINARY_INTEGER := 2
BOOLEAN_VALUE	CONSTANT BINARY_INTEGER := 3
BYTE_VALUE	CONSTANT BINARY_INTEGER := 4
SHORT_VALUE	CONSTANT BINARY_INTEGER := 5
INTEGER_VALUE	CONSTANT BINARY_INTEGER := 6
LONG_VALUE	CONSTANT BINARY_INTEGER := 7
FLOAT_VALUE	CONSTANT BINARY_INTEGER := 8
DOUBLE_VALUE	CONSTANT BINARY_INTEGER := 9
DATE_VALUE	CONSTANT BINARY_INTEGER := 10

**Table 104-2 DBMS\_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value**

Value	Constant
BOOLEAN_FALSE	CONSTANT BINARY_INTEGER := 0
BOOLEAN_TRUE	CONSTANT BINARY_INTEGER := 1

**Table 104-3 DBMS\_MGWMSG Constants: Case Comparisons**

Value	Constant
CASE_SENSITIVE	CONSTANT BINARY_INTEGER := 0
CASE_INSENSITIVE	CONSTANT BINARY_INTEGER := 1

**Table 104-4 Constants for the TIB/Rendezvous field type**

Value	Constant
TIBRVMSG_BOOL	CONSTANT INTEGER := 1
TIBRVMSG_F32	CONSTANT INTEGER := 2
TIBRVMSG_F64	CONSTANT INTEGER := 3
TIBRVMSG_I8	CONSTANT INTEGER := 4
TIBRVMSG_I16	CONSTANT INTEGER := 5
TIBRVMSG_I32	CONSTANT INTEGER := 6
TIBRVMSG_I64	CONSTANT INTEGER := 7
TIBRVMSG_IPADDR32	CONSTANT INTEGER := 8
TIBRVMSG_IPPORT16	CONSTANT INTEGER := 9
TIBRVMSG_DATETIME	CONSTANT INTEGER := 10

**Table 104-4 (Cont.) Constants for the TIB/Rendezvous field type**

Value	Constant
TIBRVMSG_F32ARRAY	CONSTANT INTEGER := 11
TIBRVMSG_F64ARRAY	CONSTANT INTEGER := 12
TIBRVMSG_I8ARRAY	CONSTANT INTEGER := 13
TIBRVMSG_I16ARRAY	CONSTANT INTEGER := 14
TIBRVMSG_I32ARRAY	CONSTANT INTEGER := 15
TIBRVMSG_I64ARRAY	CONSTANT INTEGER := 16
TIBRVMSG_OPAQUE	CONSTANT INTEGER := 17
TIBRVMSG_STRING	CONSTANT INTEGER := 18
TIBRVMSG_XML	CONSTANT INTEGER := 19

## 104.3 DBMS\_MGWMSG Types

DBMS\_MGWMSG uses types to specify certain information.

- [SYS.MGW\\_NAME\\_VALUE\\_T Type](#)
- [SYS.MGW\\_NAME\\_VALUE\\_T Type-Attribute Mapping](#)
- [SYS.MGW\\_NAME\\_TYPE\\_ARRAY\\_T Type](#)
- [SYS.MGW\\_TEXT\\_VALUE\\_T Type](#)
- [SYS.MGW\\_RAW\\_VALUE\\_T Type](#)
- [SYS.MGW\\_BASIC\\_MSG\\_T Type](#)
- [SYS.MGW\\_NUMBER\\_ARRAY\\_T Type](#)
- [SYS.MGW\\_TIBRV\\_FIELD\\_T Type](#)
- [SYS.MGW\\_TIBRV\\_MSG\\_T Type](#)

### 104.3.1 DBMS\_MGWMSG SYS.MGW\_NAME\_VALUE\_T Type

This type specifies a named value.

The name attribute, type attribute, and one of the <>\_value attributes are typically not NULL.

#### Syntax

```
TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
  name          VARCHAR2(250),
  type          INTEGER,
  integer_value INTEGER,
  number_value  NUMBER,
  text_value    VARCHAR2(4000),
  raw_value     RAW(2000),
  date_value    DATE,
```

```
-- Methods
```

```

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BOOLEAN (
    name    IN VARCHAR2,
    value   IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BYTE (
    name    IN VARCHAR2,
    value   IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_SHORT (
    name    IN VARCHAR2,
    value   IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_INTEGER (
    name    IN VARCHAR2,
    value   IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_LONG (
    name    IN VARCHAR2,
    value   IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
    name    IN VARCHAR2,
    value   IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
    name    IN VARCHAR2,
    value   IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
    name    IN VARCHAR2,
    value   IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
    name    IN VARCHAR2,
    value   IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
    name    IN VARCHAR2,
    value   IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );

```

## Attributes

**Table 104-5 SYS.MGW\_NAME\_VALUE\_T Attributes**

Attribute	Description
name	Name associated with the value

**Table 104-5 (Cont.) SYS.MGW\_NAME\_VALUE\_T Attributes**

Attribute	Description
type	Value type. Refer to the DBMS_MGWMSG.<>_VALUE constants in <a href="#">Table 104-1</a> . This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.
integer_value	Stores a numeric integer value
number_value	Stores a numeric float or large integer value
text_value	Stores a text value
raw_value	Stores a RAW (bytes) value
date_value	Stores a date value

**SYS.MGW\_NAME\_VALUE\_T Type-Attribute Mapping**

[Table 104-6](#) shows the mapping between the value type and the attribute used to store the value.

**Table 104-6 SYS.MGW\_NAME\_VALUE\_T Type Attribute Mapping**

Type	Value Stored in Attribute
DBMS_MGWMSG.TEXT_VALUE	text_value
DBMS_MGWMSG.RAW_VALUE	raw_value
DBMS_MGWMSG.BOOLEAN_VALUE	integer_value
DBMS_MGWMSG.BYTE_VALUE	integer_value
DBMS_MGWMSG.SHORT_VALUE	integer_value
DBMS_MGWMSG.INTEGER_VALUE	integer_value
DBMS_MGWMSG.LONG_VALUE	number_value
DBMS_MGWMSG.FLOAT_VALUE	number_value
DBMS_MGWMSG.DOUBLE_VALUE	number_value
DBMS_MGWMSG.DATE_VALUE	date_value

**CONSTRUCT Method**

This method constructs a new SYS.MGW\_NAME\_VALUE\_T instance. All attributes are assigned a value of NULL.

**Syntax**

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

**CONSTRUCT\_TYPE Methods**

These methods construct a new SYS.MGW\_NAME\_VALUE\_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>\_value attributes, as shown in the mappings in [Table 104-6](#).

**Syntax**

```

STATIC FUNCTION CONSTRUCT_<> (
    name    IN VARCHAR2,
    value   IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;

```

**Usage Notes**

The `construct_boolean` method sets the value to either `DBMS_MGWMSG.BOOLEAN_TRUE` or `DBMS_MGWMSG.BOOLEAN_FALSE`.

## 104.3.2 DBMS\_MGWMSG SYS.MGW\_NAME\_TYPE\_ARRAY\_T Type

This type specifies an array of name-value pairs. An object of `SYS.MGW_NAME_VALUE_ARRAY_T` type can have up to 1024 elements.

**Syntax**

```

TYPE SYS.MGW_NAME_VALUE_ARRAY_T
AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;

```

## 104.3.3 DBMS\_MGWMSG SYS.MGW\_TEXT\_VALUE\_T Type

This type specifies a `TEXT` value. It can store a large value as a `CLOB` or a smaller value (size  $\leq 4000$ ) as `VARCHAR2`. Only one of the `<` `>` value attributes should be set.

**Syntax**

```

TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
    small_value VARCHAR2(4000),
    large_value CLOB,

    -- Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_TEXT_VALUE_T);

```

**Attributes****Table 104-7 SYS.MGW\_TEXT\_VALUE\_T Attributes**

Attribute	Description
<code>small_value</code>	Small <code>TEXT</code> value. Used for values $\leq 4000$ .
<code>large_value</code>	Large <code>TEXT</code> value. Used when the value is too large for the <code>small_value</code> attribute.

**CONSTRUCT Method**

This method constructs a new `SYS.MGW_TEXT_VALUE_T` instance. All attributes are assigned a value of `NULL`.

**Syntax**

```

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;

```

## 104.3.4 DBMS\_MGWMSG SYS.MGW\_RAW\_VALUE\_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >\_value attributes.

### Syntax

```
TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
    small_value RAW(2000),
    large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);
```

### Attributes

**Table 104-8** SYS.MGW\_RAW\_VALUE\_T Attributes

Attribute	Description
small_value	Small RAW (bytes) value <= 2000
large_value	Large RAW value. Used when the value is too large for the small_value attribute.

### CONSTRUCT Method

This method constructs a new SYS.MGW\_RAW\_VALUE\_T instance. All attributes are assigned a value of NULL.

### Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T;
```

## 104.3.5 DBMS\_MGWMSG SYS.MGW\_BASIC\_MSG\_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

### Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
    header      SYS.MGW_NAME_VALUE_ARRAY_T,
    text_body   SYS.MGW_TEXT_VALUE_T,
    raw_body    SYS.MGW_RAW_VALUE_T,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T);
```

## Attributes

**Table 104-9** SYS.MGW\_BASIC\_MSG\_T Attributes

Attribute	Description
header	Message header information as an array of name-value pairs
text_body	Message body for a TEXT message
raw_body	Message body for a RAW (bytes) message

## CONSTRUCT Method

This method constructs a new SYS.MGW\_BASIC\_MSG\_T instance. All attributes are assigned a value of NULL.

### Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

## 104.3.6 DBMS\_MGWMSG SYS.MGW\_NUMBER\_ARRAY\_T Type

A type that specifies an array of numbers.

### Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

## 104.3.7 DBMS\_MGWMSG SYS.MGW\_TIBRV\_FIELD\_T Type

This type represents a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW\_TIBRV\_MSG\_T instance.

### Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
  field_name      VARCHAR2(256),
  field_id        INTEGER,
  field_type      INTEGER,
  number_value    NUMBER,
  number_array_value SYS.MGW_NUMBER_ARRAY_T,
  text_value      VARCHAR2(4000),
  raw_value       RAW(2000),
  date_value      DATE,
  clob_value      CLOB,
  blob_value      BLOB);
```

## Attributes

**Table 104-10** SYS.MGW\_TIBRV\_FIELD\_T Attributes

Attribute	Description
field_name	Field name. This will be NULL if the field has no name.

**Table 104-10 (Cont.) SYS.MGW\_TIBRV\_FIELD\_T Attributes**

Attribute	Description
field_id	Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.
field_type	Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.
number_value	Used to store a numeric value
number_array_value	Used to store a numeric array value
text_value	Used to store a small text value
raw_value	Used to store a small raw value
date_value	Used to store a date value
clob_value	Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.
blob_value	Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.

**SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping**

[Table 104-11](#) describes the mapping in type SYS.MGW\_TIBRV\_FIELD\_T between the field type and attribute used to store the value.

**Table 104-11 SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping**

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_BOOL	number_value
TIBRVMSG_F32	number_value
TIBRVMSG_F64	number_value
TIBRVMSG_I8	number_value
TIBRVMSG_I16	number_value
TIBRVMSG_I32	number_value
TIBRVMSG_I64	number_value
TIBRVMSG_IPADDR32	text_value
TIBRVMSG_IPPORT16	number_value
TIBRVMSG_DATETIME	date_value
TIBRVMSG_F32ARRAY	number_array_value
TIBRVMSG_F64ARRAY	number_array_value
TIBRVMSG_I8ARRAY	number_array_value
TIBRVMSG_I16ARRAY	number_array_value

**Table 104-11 (Cont.) SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping**

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_I32ARRAY	number_array_value
TIBRVMSG_I64ARRAY	number_array_value
TIBRVMSG_OPAQUE	raw_value or blob_value
TIBRVMSG_STRING	text_value or clob_value
TIBRVMSG_XML	raw_value or blob_value

### 104.3.8 DBMS\_MGWMSG SYS.MGW\_TIBRV\_MSG\_T Type

This type represents a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

#### Syntax

```

TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
  send_subject  VARCHAR2(256),
  reply_subject VARCHAR2(256),
  cm_time_limit NUMBER,
  cm_sender_name VARCHAR2(256),
  cm_sequence_num NUMBER,
  fields        SYS.MGW_TIBRV_IFIELDS_T,
  clob_data1    CLOB,
  clob_data2    CLOB,
  clob_data3    CLOB,
  blob_data1    BLOB,
  blob_data2    BLOB,
  blob_data3    BLOB,

  STATIC FUNCTION construct

RETURN INTEGER
);

```

### Attributes

**Table 104-12** SYS.MGW\_TIBRV\_MSG\_T Type Attributes

Attribute	Description
send_subject	Send subject name
reply_subject	Reply subject name
cm_time_limit	Time limit for a certified message
cm_sender_name	Sender name of a certified message
cm_sequence_num	Sequence number of a certified message
fields	Collection of message fields
clob_data1	Used to store a large text value
clob_data2	Used to store a large text value
clob_data3	Used to store a large text value
blob_data1	Used to store a large raw value
blob_data2	Used to store a large raw value
blob_data3	Used to store a large raw value

### Construct Method

Constructs a new SYS.MGW\_TIBRV\_MSG\_T instance. All attributes are set to NULL.

#### Syntax

```

STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;

```

### ADD\_<> Methods

Adds a new field to the message.

## Syntax

```
MEMBER PROCEDURE ADD_<> (
    name IN VARCHAR2,
    id   IN INTEGER,
    value IN datatype );
```

## Parameters

**Table 104-13** SYS.MGW\_TIBRV\_MSG\_T ADD\_<> Method Parameters

Parameter	Description
name	Field name
id	Field identifier
value	Field data

[Table 104-14](#) shows, for each add method, the field type that will be assigned and valid values for the field data.

**Table 104-14** MGW\_TIBRV\_MSG\_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_bool	TIBRVMSG_BOOL	Valid values: 0 (false), 1 (true)
add_f32	TIBRVMSG_F32	n/a
add_f64	TIBRVMSG_F64	n/a
add_i8	TIBRVMSG_I8	Valid range: -128...127
add_i16	TIBRVMSG_I16	Valid range: -32768...32767
add_i32	TIBRVMSG_I32	Valid range: -2147483648... 2147483647
add_i64	TIBRVMSG_I64	n/a
add_ipaddr32	TIBRVMSG_IPADDR32	n/a
add_ipport16	TIBRVMSG_IPPORT16	n/a
add_datetime	TIBRVMSG_DATETIME	n/a
add_f32array	TIBRVMSG_F32ARRAY	n/a
add_f64array	TIBRVMSG_F64ARRAY	n/a
add_i8array	TIBRVMSG_I8ARRAY	Valid range: -128...127
add_i16array	TIBRVMSG_I16ARRAY	Valid range: -32768...32767
add_i32array	TIBRVMSG_I32ARRAY	Valid range: -2147483648... 2147483647
add_i64array	TIBRVMSG_I64ARRAY	n/a
add_opaque	TIBRVMSG_OPAQUE	Value stored as RAW if size < 2000; otherwise value stored in BLOB
add_string	TIBRVMSG_STRING	Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB

**Table 104-14 (Cont.) MGW\_TIBRV\_MSG\_T Add Method Field Types**

Method Name	Field Type Assigned	Comment
add_xml	TIBRVMSG_XML	Value stored as RAW if size < 2000; otherwise value stored in BLOB

**SET\_<> Methods**

Accessor methods to set an instance attribute to a specific value.

**Syntax**

```
MEMBER PROCEDURE SET_<> (
    value IN datatype );
```

**Parameters****Table 104-15 SYS.MGW\_TIBRV\_MSG\_T SET\_<> Method Parameters**

Parameter	Description
value	Value to be assigned

**GET\_<> Methods**

Accessor methods to retrieve the value for an instance attribute.

**Syntax**

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

**Parameters**

None

**Return Values**

Returns the attribute value.

**GET\_FIELD\_COUNT Function**

Gets the number of message fields.

**Syntax**

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

**Parameters**

None

**Return Values**

Returns the number of fields, or zero (0) if there are none.

## GET\_FIELD Function

Retrieves field information for the field having a given field collection index. This method should only be called if the `GET_FIELD_COUNT` Function returns a nonzero value and `idx` must specify a valid collection index; that is, `1<=idx<=get_field_count()`.

### Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

### Parameters

**Table 104-16** SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD Function Parameters

Parameter	Description
<code>idx</code>	Specifies the 1-based field collection index of the field to retrieve

**Note:**

A 1-based index begins at one (1) instead of zero (0).

### Return Values

Returns the field information.

## GET\_FIELD\_BY\_NAME Function

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

### Syntax

```
MEMBER PROCEDURE get_field_by_name (
    name IN VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

### Parameters

**Table 104-17** SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD\_BY\_NAME Function Parameters

Parameter	Description
<code>name</code>	Specifies the field name to search for. This can be <code>NULL</code> to find the first field that does not have a field name.

### Return Values

Returns the field information, or `NULL` if no match was found.

### GET\_FIELD\_BY\_ID Function

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

#### Syntax

```
MEMBER PROCEDURE get_field_by_id (
    id IN INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

#### Parameters

**Table 104-18** SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD\_BY\_ID Function Parameters

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.

#### Return Values

Returns the field information, or NULL if no match was found.

### FIND\_FIELD\_NAME Function

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

#### Syntax

```
MEMBER PROCEDURE find_field_name (
    name IN VARCHAR2,
    start_idx IN INTEGER )
RETURN INTEGER;
```

#### Parameters

**Table 104-19** SYS.MGW\_TIBRV\_MSG\_T FIND\_FIELD\_NAME Function Parameters

Parameter	Description
name	Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.
start_idx	Specifies the 1-based field collection index from which the search should start.

#### Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

### FIND\_FIELD\_ID Function

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

#### Syntax

```
MEMBER PROCEDURE find_field_id (
    id          IN INTEGER,
    start_idx  IN INTEGER )
RETURN        INTEGER;
```

#### Parameters

**Table 104-20 SYS.MGW\_TIBRV\_MSG\_T FIND\_FIELD\_ID Function Parameters**

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find a field that does not have an identifier.
start_idx	Specifies the 1-based field collection index from which the search should start.

#### Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

## 104.4 Summary of DBMS\_MGWMSG Subprograms

This table lists the DBMS\_MGWMSG subprograms and briefly describes them.

**Table 104-21 DBMS\_MGWMSG Package Subprograms**

Subprogram	Description
<a href="#">LCR_TO_XML Function</a>	Converts a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD) to a SYS.XMLTYPE object
<a href="#">NVARARRAY_ADD Procedure</a>	Appends a name-value element to the end of a name-value array
<a href="#">NVARARRAY_FIND_NAME Function</a>	Searches a name-value array for the element with the name you specify in p_name
<a href="#">NVARARRAY_FIND_NAME_TYPE Function</a>	Searches a name-value array for an element with the name and value type you specify
<a href="#">NVARARRAY_GET Function</a>	Gets the name-value element of the name you specify in p_name from a name-value array
<a href="#">NVARARRAY_GET_BOOLEAN Function</a>	Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type
<a href="#">NVARARRAY_GET_BYTE Function</a>	Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type
<a href="#">NVARARRAY_GET_DATE Function</a>	Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type

**Table 104-21 (Cont.) DBMS\_MGWMSG Package Subprograms**

Subprogram	Description
<a href="#">NVARRAY_GET_DOUBLE Function</a>	Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>DOUBLE_VALUE</code> value type
<a href="#">NVARRAY_GET_FLOAT Function</a>	Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>FLOAT_VALUE</code> value type
<a href="#">NVARRAY_GET_INTEGER Function</a>	Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>INTEGER_VALUE</code> value type
<a href="#">NVARRAY_GET_LONG Function</a>	Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>LONG_VALUE</code> value type
<a href="#">NVARRAY_GET_RAW Function</a>	Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>RAW_VALUE</code> value type
<a href="#">NVARRAY_GET_SHORT Function</a>	Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>SHORT_VALUE</code> value type
<a href="#">NVARRAY_GET_TEXT Function</a>	Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>TEXT_VALUE</code> value type
<a href="#">XML_TO_LCR Function</a>	Converts a <code>SYS.XMLTYPE</code> object to a <code>SYS.ANYDATA</code> object encapsulating a row LCR ( <code>LCR\$_ROW_RECORD</code> ) or a DDL LCR ( <code>LCR\$_DDL_RECORD</code> )

## 104.4.1 LCR\_TO\_XML Function

This function converts a `SYS.ANYDATA` object encapsulating a row LCR (Logical Change Record, in this case a `LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`) to a `SYS.XMLTYPE` object.

### See Also:

[XML\\_TO\\_LCR Function](#)

### Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
    p_anydata IN SYS.ANYDATA )
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 104-22 LCR\_TO\_XML Function Parameters**

Parameter	Description
<code>p_anydata</code>	An <code>ANYDATA</code> object to be converted

### Return Values

Returns a `SYS.XMLTYPE` object.

### Usage Notes

An exception is raised if the encapsulated type `p_anydata` is not an LCR.

## 104.4.2 NVARRAY\_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

### Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (
  p_array IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,
  p_value IN      SYS.MGW_NAME_VALUE_T );
```

### Parameters

**Table 104-23 NVARRAY\_ADD Procedure Parameters**

Parameter	Description
<code>p_array</code>	On input, the name-value array instance to modify. If <code>NULL</code> , then a new array is created. On output, the modified name-value array instance.
<code>p_value</code>	The value to add. If <code>NULL</code> , then <code>p_array</code> is not changed.

## 104.4.3 NVARRAY\_FIND\_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

### Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (
  p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

### Parameters

**Table 104-24 NVARRAY\_FIND\_NAME Function Parameters**

Parameters	Description
<code>p_array</code>	The name-value array to search
<code>p_name</code>	The name to find
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.

## 104.4.4 NVARRAY\_FIND\_NAME\_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

### Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_type    IN BINARY_INTEGER
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

### Parameters

**Table 104-25 NVARRAY\_FIND\_NAME\_TYPE Function Parameters**

Parameter	Description
p_array	The name-value array to search
p_name	The name to find
p_type	The value type. Refer to the value type constants in <a href="#">Table 104-1</a> .
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

### Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

## 104.4.5 NVARRAY\_GET Function

This function gets the name-value element of the name you specify in p\_name from a name-value array.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN SYS.MGW_NAME_VALUE_T;
```

### Parameters

**Table 104-26 NVARRAY\_GET Function Parameters**

Parameter	Description
p_array	The name-value array
p_name	The value name

**Table 104-26 (Cont.) NVARRAY\_GET Function Parameters**

Parameter	Description
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

**Return Values**

Returns the matching element, or NULL if the specified name is not found.

## 104.4.6 NVARRAY\_GET\_BOOLEAN Function

This function gets the value of the name-value array element that you specify in p\_name and with the BOOLEAN\_VALUE value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

**Parameters****Table 104-27 NVARRAY\_GET\_BOOLEAN Function Parameters**

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 104.4.7 NVARRAY\_GET\_BYTE Function

This function gets the value of the name-value array element that you specify in p\_name and with the BYTE\_VALUE value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

## Parameters

**Table 104-28** NVARRAY\_GET\_BYTE Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

## Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 104.4.8 NVARRAY\_GET\_DATE Function

This function gets the value of the name-value array element that you specify in p\_name and with the DATE\_VALUE value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

## Parameters

**Table 104-29** NVARRAY\_GET\_DATE Function Parameters

Parameters	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

## Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 104.4.9 NVARRAY\_GET\_DOUBLE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DOUBLE_VALUE` value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

### Parameters

**Table 104-30 NVARRAY\_GET\_DOUBLE Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## 104.4.10 NVARRAY\_GET\_FLOAT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `FLOAT_VALUE` value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

### Parameters

**Table 104-31 NVARRAY\_GET\_FLOAT Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

**Return Values**

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## 104.4.11 NVARRAY\_GET\_INTEGER Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `INTEGER_VALUE` value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

**Parameters****Table 104-32 NVARRAY\_GET\_INTEGER Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

**Return Values**

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## 104.4.12 NVARRAY\_GET\_LONG Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `LONG_VALUE` value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

**Parameters****Table 104-33 NVARRAY\_GET\_LONG Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array

**Table 104-33 (Cont.) NVARRAY\_GET\_LONG Function Parameters**

Parameter	Description
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

### 104.4.13 NVARRAY\_GET\_RAW Function

This function gets the value of the name-value array element that you specify in p\_name and with the RAW\_VALUE value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

**Parameters**

**Table 104-34 NVARRAY\_GET\_RAW Function Parameters**

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

### 104.4.14 NVARRAY\_GET\_SHORT Function

This function gets the value of the name-value array element that you specify in p\_name and with the SHORT\_VALUE value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
```

```

    p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;

```

### Parameters

**Table 104-35** NVARRAY\_GET\_SHORT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 104.4.15 NVARRAY\_GET\_TEXT Function

This function gets the value of the name-value array element that you specify in p\_name and with the TEXT\_VALUE value type.

### Syntax

```

DBMS_MGWMSG.NVARRAY_GET_TEXT (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN VARCHAR2;

```

### Parameters

**Table 104-36** NVARRAY\_GET\_TEXT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 104.4.16 XML\_TO\_LCR Function

This function converts a `SYS.XMLTYPE` object to a `SYS.ANYDATA` object encapsulating a row LCR (`LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`).

**See Also:**

[LCR\\_TO\\_XML Function](#)

### Syntax

```
DBMS_MGWMSG.XML_TO_LCR (
    p_xmldata IN SYS.XMLTYPE )
RETURN SYS.ANYDATA;
```

### Parameters

**Table 104-37 XML\_TO\_LCR Function Parameters**

Parameter	Description
<code>p_xmldata</code>	An <code>XMLTYPE</code> object representing an LCR

### Return Values

Returns a `SYS.ANYDATA` object.

### Usage Notes

An exception is raised if `p_xmldata` cannot be converted to an LCR.

# DBMS\_MONITOR

The `DBMS_MONITOR` package enables you to use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- [Summary of DBMS\\_MONITOR Subprograms](#)

## 105.1 Summary of DBMS\_MONITOR Subprograms

This table lists the `DBMS_MONITOR` subprograms and briefly describes them.

**Table 105-1 DBMS\_MONITOR Package Subprograms**

Subprogram	Description
<a href="#">CLIENT_ID_STAT_DISABLE Procedure</a>	Disables statistic gathering previously enabled for a given Client Identifier
<a href="#">CLIENT_ID_STAT_ENABLE Procedure</a>	Enables statistic gathering for a given Client Identifier
<a href="#">CLIENT_ID_TRACE_DISABLE Procedure</a>	Disables the trace previously enabled for a given Client Identifier globally for the database
<a href="#">CLIENT_ID_TRACE_ENABLE Procedure</a>	Enables the trace for a given Client Identifier globally for the database
<a href="#">DATABASE_TRACE_DISABLE Procedure</a>	Disables SQL trace for the whole database or a specific instance
<a href="#">DATABASE_TRACE_ENABLE Procedure</a>	Enables SQL trace for the whole database or a specific instance
<a href="#">SERV_MOD_ACT_STAT_DISABLE Procedure</a>	Disables statistic gathering enabled for a given combination of Service Name, MODULE and ACTION
<a href="#">SERV_MOD_ACT_STAT_ENABLE Procedure</a>	Enables statistic gathering for a given combination of Service Name, MODULE and ACTION
<a href="#">SERV_MOD_ACT_TRACE_DISABLE Procedure</a>	Disables the trace for ALL enabled instances for a or a given combination of Service Name, MODULE and ACTION name globally
<a href="#">SERV_MOD_ACT_TRACE_ENABLE Procedure</a>	Enables SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified
<a href="#">SESSION_TRACE_DISABLE Procedure</a>	Disables the previously enabled trace for a given database session identifier (SID) on the local instance
<a href="#">SESSION_TRACE_ENABLE Procedure</a>	Enables the trace for a given database session identifier (SID) on the local instance

## 105.1.1 CLIENT\_ID\_STAT\_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V\$CLIENT\_STATS view enabled by the CLIENT\_ID\_STAT\_ENABLE Procedure.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(  
    client_id          IN  VARCHAR2);
```

### Parameters

**Table 105-2** CLIENT\_ID\_STAT\_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is disabled

### Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

## 105.1.2 CLIENT\_ID\_STAT\_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier.

Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V\$CLIENT\_STATS views.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(  
    client_id          IN  VARCHAR2);
```

### Parameters

**Table 105-3** CLIENT\_ID\_STAT\_ENABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is enabled

### Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

## 105.1.3 CLIENT\_ID\_TRACE\_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT\_ID\_TRACE\_ENABLE Procedure.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
  client_id  IN  VARCHAR2);
```

### Parameters

**Table 105-4 CLIENT\_ID\_TRACE\_DISABLE Procedure Parameters**

Parameter	Description
client_id	Client Identifier for which SQL tracing is disabled

### Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

## 105.1.4 CLIENT\_ID\_TRACE\_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(
  client_id  IN  VARCHAR2,
  waits     IN  BOOLEAN DEFAULT TRUE,
  binds     IN  BOOLEAN DEFAULT FALSE,
  plan_stat IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 105-5 CLIENT\_ID\_TRACE\_ENABLE Procedure Parameters**

Parameter	Description
client_id	Database Session Identifier for which SQL tracing is enabled
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

### Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

### Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,
FALSE);
```

## 105.1.5 DATABASE\_TRACE\_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

### Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(
instance_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 105-6 DATABASE\_TRACE\_DISABLE Procedure Parameters**

Parameter	Description
instance_name	Disables tracing for the named instance

## 105.1.6 DATABASE\_TRACE\_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

### Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(
waits          IN BOOLEAN DEFAULT TRUE,
binds          IN BOOLEAN DEFAULT FALSE,
instance_name IN VARCHAR2 DEFAULT NULL,
plan_stat     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 105-7 DATABASE\_TRACE\_ENABLE Procedure Parameters**

Parameter	Description
waits	If TRUE, wait information will be present in the trace
binds	If TRUE, bind information will be present in the trace
instance_name	If set, restricts tracing to the named instance
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

## 105.1.7 SERV\_MOD\_ACT\_STAT\_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V\$SERV\_MOD\_ACT\_STATS view.

Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus `dblinks` that have been activated as a result of the enable).

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
  service_name  IN VARCHAR2,
  module_name   IN VARCHAR2,
  action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

### Parameters

**Table 105-8 SERV\_MOD\_ACT\_STAT\_DISABLE Procedure Parameters**

Parameter	Description
<code>service_name</code>	Name of the service for which statistic aggregation is disabled
<code>module_name</code>	Name of the <code>MODULE</code> . An additional qualifier for the service. It is a required parameter.
<code>action_name</code>	Name of the <code>ACTION</code> . An additional qualifier for the Service and <code>MODULE</code> name. Omitting the parameter (or supplying <code>ALL_ACTIONS</code> constant) means enabling aggregation for all Actions for a given Service/ <code>MODULE</code> combination. In this case, statistics are aggregated on the module level.

### Usage Notes

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

## 105.1.8 SERV\_MOD\_ACT\_STAT\_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, `MODULE` and `ACTION`.

Calling this procedure enables statistic gathering for a hierarchical combination of Service name, `MODULE` name, and `ACTION` name on all instances for the same database. Statistics are accessible by means of the V\$SERV\_MOD\_ACT\_STATS view.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE(
  service_name  IN VARCHAR2,
  module_name   IN VARCHAR2,
  action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

## Parameters

**Table 105-9 SERV\_MOD\_ACT\_STAT\_ENABLE Procedure Parameters**

Parameter	Description
service_name	Name of the service for which statistic aggregation is enabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level.

## Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL\_ACTIONS for an action specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

## Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE  
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'GLEDGER', 'DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the PAYROLL Module.
- For the DEBIT\_ENTRY Action within the GLEDGER Module.

## 105.1.9 SERV\_MOD\_ACT\_TRACE\_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
  service_name  IN  VARCHAR2,
  module_name   IN  VARCHAR2,
  action_name   IN  VARCHAR2 DEFAULT ALL_ACTIONS,
  instance_name IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 105-10 SERV\_MOD\_ACT\_TRACE\_DISABLE Procedure Parameters**

Parameter	Description
service_name	Name of the service for which tracing is disabled.
module_name	Name of the MODULE. An additional qualifier for the service
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name.
instance_name	If set, this restricts tracing to the named instance_name

### Usage Notes

Specifying NULL for the module\_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

### Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
  DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
  FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
  DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1', 'PAYROLL');
```

## 105.1.10 SERV\_MOD\_ACT\_TRACE\_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance\_name is specified.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
    service_name      IN VARCHAR2,
    module_name       IN VARCHAR2 DEFAULT ANY_MODULE,
    action_name       IN VARCHAR2 DEFAULT ANY_ACTION,
    waits             IN BOOLEAN DEFAULT TRUE,
    binds             IN BOOLEAN DEFAULT FALSE,
    instance_name     IN VARCHAR2 DEFAULT NULL,
    plan_stat         IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 105-11 SERV\_MOD\_ACT\_TRACE\_ENABLE Procedure Parameters**

Parameter	Description
service_name	Name of the service for which SQL trace is enabled
module_name	Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled for all modules and actions in a given service.
action_name	Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
instance_name	If set, this restricts tracing to the named instance_name
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

### Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL\_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance\_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.

- Specifying NULL for the `module_name` parameter means that statistics will be accumulated for the sessions which do not set the `MODULE` attribute.

### Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
                                               DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS,TRUE,
                                               FALSE,NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
                                               DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

## 105.1.11 SESSION\_TRACE\_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

### Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
  session_id      IN      BINARY_INTEGER DEFAULT NULL,
  serial_num      IN      BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 105-12** SESSION\_TRACE\_DISABLE Procedure Parameters

Parameter	Description
<code>session_id</code>	Database Session Identifier for which SQL trace is disabled
<code>serial_num</code>	Serial number for this session

### Usage Notes

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is no longer traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

### Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

## 105.1.12 SESSION\_TRACE\_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

### Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE(
  session_id  IN  BINARY_INTEGER DEFAULT NULL,
  serial_num  IN  BINARY_INTEGER DEFAULT NULL,
  waits       IN  BOOLEAN DEFAULT TRUE,
  binds       IN  BOOLEAN DEFAULT FALSE,
  plan_stat   IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 105-13** SESSION\_TRACE\_ENABLE Procedure Parameters

Parameter	Description
session_id	Client Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed.
serial_num	Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

### Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

### Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

# DBMS\_MVIEW

DBMS\_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

 **Note:**

DBMS\_MVIEW is a synonym for DBMS\_SNAPSHOT.

 **See Also:**

*Oracle Database Data Warehousing Guide* for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:

- [Operational Notes](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Summary of DBMS\\_MVIEW Subprograms](#)

## 106.1 DBMS\_MVIEW Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL\*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN..END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

## 106.2 DBMS\_MVIEW Security Model

The DBMS\_MVIEW package consists of a number of materialized view-related subprograms, each of which has different functionality and privilege requirements.

The privilege model is generally based on the invoker's right. Each package subprogram is executed by first checking the privileges against the invoker. If all the required privileges are met, the subprogram will be executed. Otherwise, an insufficient privileges error will be thrown.

## 106.3 DBMS\_MVIEW Rules and Limits

The `DBMS_MVIEW.EXPLAIN_REWRITE` procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the `DBMS_MVIEW.EXPLAIN_MVIEW` procedure.

## 106.4 Summary of DBMS\_MVIEW Subprograms

This table lists the `DBMS_MVIEW` subprograms and briefly describes them.

**Table 106-1 DBMS\_MVIEW Package Subprograms**

Subprogram	Description
<code>BEGIN_TABLE_REORGANIZATION Procedure</code>	Performs a process to preserve materialized view data needed for refresh
<code>END_TABLE_REORGANIZATION Procedure</code>	Ensures that the materialized view data for the master table is valid and that the master table is in the proper state
<code>ESTIMATE_MVIEW_SIZE Procedure</code>	Estimates the size of a materialized view that you might create, in bytes and rows
<code>EXPLAIN_MVIEW Procedure</code>	Explains what is possible with a materialized view or potential materialized view
<code>EXPLAIN_REWRITE Procedure</code>	Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views
<code>I_AM_A_REFRESH Function</code>	Returns the value of the <code>I_AM_REFRESH</code> package state
<code>PMARKER Function</code>	Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)
<code>PURGE_DIRECT_LOAD_LOG Procedure</code>	Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)
<code>PURGE_LOG Procedure</code>	Purges rows from the materialized view log
<code>PURGE_MVIEW_FROM_LOG Procedure</code>	Purges rows from the materialized view log
<code>REFRESH Procedures</code>	Refreshes one or more materialized views that are not members of the same refresh group
<code>REFRESH_ALL_MVIEWS Procedure</code>	Refreshes all materialized views that do not reflect changes to their master table or master materialized view
<code>REFRESH_DEPENDENT Procedures</code>	Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views
<code>REGISTER_MVIEW Procedure</code>	Enables the administration of individual materialized views
<code>UNREGISTER_MVIEW Procedure</code>	Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view

## 106.4.1 BEGIN\_TABLE\_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

### Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
  tabowner   IN   VARCHAR2,
  tabname    IN   VARCHAR2);
```

### Parameters

**Table 106-2 BEGIN\_TABLE\_REORGANIZATION Procedure Parameters**

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

## 106.4.2 END\_TABLE\_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

### Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (
  tabowner   IN   VARCHAR2,
  tabname    IN   VARCHAR2);
```

### Parameters

**Table 106-3 END\_TABLE\_REORGANIZATION Procedure Parameters**

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

## 106.4.3 ESTIMATE\_MVIEW\_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

### Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (
  stmt_id      IN   VARCHAR2,
  select_clause IN VARCHAR2,
  num_rows     OUT  NUMBER,
  num_bytes    OUT  NUMBER);
```

## Parameters

**Table 106-4 ESTIMATE\_MVIEW\_SIZE Procedure Parameters**

Parameter	Description
stmt_id	Arbitrary string used to identify the statement in an EXPLAIN PLAN
select_clause	The SELECT statement to be analyzed
num_rows	Estimated cardinality
num_bytes	Estimated number of bytes

## 106.4.4 EXPLAIN\_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call `DBMS_MVIEW.EXPLAIN_MVIEW`, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the `SELECT` string or `CREATE MATERIALIZED VIEW` statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called `MV_CAPABILITIES_TABLE`, which is the default, or to an array called `MSG_ARRAY`.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to `MV_CAPABILITIES_TABLE`.
- The second version is for explaining an existing or potential materialized view with output to a `VARRAY`.

### Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
    mv          IN VARCHAR2,
    statement_id IN VARCHAR2:= NULL);

DBMS_MVIEW.EXPLAIN_MVIEW (
    mv          IN VARCHAR2,
    msg_array   OUT SYS.ExplainMVArrayType);
```

## Parameters

**Table 106-5 EXPLAIN\_MVIEW Procedure Parameters**

Parameter	Description
mv	The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a <code>SELECT</code> statement or a <code>CREATE MATERIALIZED VIEW</code> statement for a potential materialized view.

**Table 106-5 (Cont.) EXPLAIN\_MVIEW Procedure Parameters**

Parameter	Description
<code>statement_id</code>	A client-supplied unique identifier to associate output rows with specific invocations of <code>EXPLAIN_MVIEW</code>
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_MVIEW</code> 's output to a PL/SQL <code>VARRAY</code> rather than <code>MV_CAPABILITIES_TABLE</code> .

**Usage Notes**

You must run the `utlxmlv.sql` script to create `MV_CAPABILITIES_TABLE` in the current schema prior to calling `EXPLAIN_MVIEW` except when you direct output to a `VARRAY`. The script is found in the `ADMIN` directory.

## 106.4.5 EXPLAIN\_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used.

Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the `EXPLAIN_REWRITE` statement is never actually executed.

A demo file, `xrwutl.sql`, is available to help format the output from `EXPLAIN_REWRITE`.

**Syntax**

You can obtain the output from `DBMS_MVIEW.EXPLAIN_REWRITE` in two ways. The first is to use a table, while the second is to create a `VARRAY`. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
  query          VARCHAR2,
  mv             VARCHAR2(30),
  statement_id   VARCHAR2(30));
```

You can create an output table called `REWRITE_TABLE` by executing the `utlrxw.sql` script.

The `query` parameter is a text string representing the SQL query. The parameter, `mv`, is a fully qualified materialized view name in the form of `schema.mv`. This is an optional parameter. When it is not specified, `EXPLAIN_REWRITE` returns any relevant messages regarding all the materialized views considered for rewriting the given query. When `schema` is omitted and only `mv` is specified, `EXPLAIN_REWRITE` looks for the materialized view in the current schema.

If you want to direct the output of `EXPLAIN_REWRITE` to a `VARRAY` instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
  query          [VARCHAR2 | CLOB],
  mv             VARCHAR2(30),
  output_array   SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, `EXPLAIN_REWRITE` can be easily invoked with the `EXECUTE` command from SQL\*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN... END` block, as shown in the examples in `/rdbms/demo/smxrw*`.

You can also use `EXPLAIN_REWRITE` with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views `mv1`, `mv2`, and `mv3` could be used to rewrite the query, `query_txt`, and, if not, why not, use `EXPLAIN_REWRITE` as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the `EXPLAIN_REWRITE` procedure.

## Parameters

**Table 106-6 EXPLAIN\_REWRITE Procedure Parameters**

Parameter	Description
<code>query</code>	SQL <code>SELECT</code> statement to be explained
<code>mv</code>	The fully qualified name of an existing materialized view in the form of <code>SCHEMA.MV</code> . For multiple materialized views, you can provide a comma-delimited list of names.
<code>statement_id</code>	A client-supplied unique identifier to distinguish output messages
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_REWRITE</code> 's output to a PL/SQL <code>VARRAY</code> .

## Usage Notes

To obtain the output into a table, you must run the `utlrxw.sql` script before calling `EXPLAIN_REWRITE`. This script creates a table named `REWRITE_TABLE` in the current schema.

## 106.4.6 I\_AM\_A\_REFRESH Function

This function returns the value of the `I_AM_REFRESH` package state.

### Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH  
RETURN BOOLEAN;
```

### Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

## 106.4.7 PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

### Syntax

```
DBMS_MVIEW.PMARKER(  
  rid IN ROWID)  
  RETURN NUMBER;
```

### Parameters

**Table 106-7 PMARKER Function Parameters**

Parameter	Description
rid	The rowid of a row entry in a master table

## 106.4.8 PURGE\_DIRECT\_LOAD\_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

### Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();
```

## 106.4.9 PURGE\_LOG Procedure

This procedure purges rows from the materialized view log.

### Syntax

```
DBMS_MVIEW.PURGE_LOG (  
  master      IN  VARCHAR2,  
  num        IN  BINARY_INTEGER := 1,  
  flag       IN  VARCHAR2      := 'NOP');
```

### Parameters

**Table 106-8 PURGE\_LOG Procedure Parameters**

Parameter	Description
master	Name of the master table or master materialized view.

**Table 106-8 (Cont.) PURGE\_LOG Procedure Parameters**

Parameter	Description
num	<p>Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 2);</pre> <p>To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 9999);</pre> <p>This statement completely purges the materialized view log that corresponds to <code>master_table</code> if fewer than 9999 materialized views are based on <code>master_table</code>. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.</p>
flag	<p>Specify <code>delete</code> to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter <code>num</code>. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 1, 'delete');</pre>

## 106.4.10 PURGE\_MVIEW\_FROM\_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by `mview_id` or the combination of `mviewowner`, `mviewname`, and `mviewsite`.

If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

### Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
  mview_id      IN  BINARY_INTEGER);
```

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
  mviewowner   IN  VARCHAR2,
  mviewname    IN  VARCHAR2,
  mviewsite    IN  VARCHAR2);
```

#### Note:

This procedure is overloaded. The parameter `mview_id` is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

## Parameters

**Table 106-9 PURGE\_MVIEW\_FROM\_LOG Procedure Parameters**

Parameter	Description
<code>mview_id</code>	<p>If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the <code>mview_id</code> parameter. Query the <code>DBA_BASE_TABLE_MVIEWS</code> view at the materialized view log site for a listing of materialized view IDs.</p> <p>Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (<code>DBA_REGISTERED_MVIEWS</code>).</p>
<code>mviewowner</code>	<p>If you do not specify an <code>mview_id</code>, enter the owner of the target materialized view using the <code>mviewowner</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view owners.</p>
<code>mviewname</code>	<p>If you do not specify an <code>mview_id</code>, enter the name of the target materialized view using the <code>mviewname</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view names.</p>
<code>mviewsite</code>	<p>If you do not specify an <code>mview_id</code>, enter the site of the target materialized view using the <code>mviewsite</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view sites.</p>

## Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

## 106.4.11 REFRESH Procedures

This procedure refreshes a list of materialized views.

### Syntax

```

DBMS_MVIEW.REFRESH (
  { list          IN      VARCHAR2,
    | tab         IN      DBMS_UTILITY.UNCL_ARRAY, }
  method         IN      VARCHAR2      := NULL,
  rollback_seg   IN      VARCHAR2      := NULL,
  push_deferred_rpc IN    BOOLEAN      := true,
  refresh_after_errors IN    BOOLEAN    := false,
  purge_option   IN      BINARY_INTEGER := 1,
  parallelism    IN      BINARY_INTEGER := 0,
  heap_size      IN      BINARY_INTEGER := 0,
  atomic_refresh IN      BOOLEAN      := true,
  nested         IN      BOOLEAN      := false,
  out_of_place   IN      BOOLEAN      := false);

```

**Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

**Parameters**

**Table 106-10 REFRESH Procedure Parameters**

Parameter	Description
<code>list</code>   <code>tab</code>	<p>Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database.</p> <p>Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view.</p>
<code>method</code>	<p>A string of refresh methods indicating how to refresh the listed materialized views. An <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following <code>EXECUTE</code> statement within <code>SQL*Plus</code>:</p> <pre>DBMS_MVIEW.REFRESH  ('countries_mv,regions_mv,hr.employees_mv','cf');</pre> <p>This statement performs a complete refresh of the <code>countries_mv</code> materialized view, a fast refresh of the <code>regions_mv</code> materialized view, and a default refresh of the <code>hr.employees</code> materialized view.</p>
<code>rollback_seg</code>	Name of the materialized view site rollback segment to use while refreshing materialized views
<code>push_deferred_rpc</code>	Used by updatable materialized views only. Set this parameter to <code>true</code> if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.
<code>refresh_after_errors</code>	If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.

**Table 106-10 (Cont.) REFRESH Procedure Parameters**

Parameter	Description
<code>purge_option</code>	If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute PUSH with this parameter set to 2 to reduce the queue.
<code>parallelism</code>	0 specifies serial propagation. $n > 1$ specifies parallel propagation with $n$ parallel processes. 1 specifies parallel propagation using only one parallel process.
<code>heap_size</code>	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.  Note: Do not set this parameter unless directed to do so by Oracle Support Services.
<code>atomic_refresh</code>	If this parameter is set to <code>true</code> , then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.  If this parameter is set to <code>false</code> , then each of the materialized views is refreshed non-atomically in separate transactions.  As part of complete refresh, if truncate is used (non-atomic refresh), unique index rebuild is executed. INDEX REBUILD automatically computes statistics. Thus, statistics are updated for truncated tables.
<code>nested</code>	If <code>true</code> , then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.
<code>out_of_place</code>	If <code>true</code> , then it performs an out-of-place refresh. The default is <code>false</code> .  This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and <code>out_of_place = true</code> , then an out-of-place fast refresh will be attempted. Similarly, if you specify P and <code>out_of_place = true</code> , then out-of-place PCT refresh will be attempted.

## 106.4.12 REFRESH\_ALL\_MVIEWS Procedure

This procedure refreshes all materialized views that have certain properties

All materialized views with the following properties are refreshed:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view `DBA_MVIEWS`.

This procedure is intended for use with data warehouses.

### Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
    number_of_failures    OUT    BINARY_INTEGER,
    method                IN     VARCHAR2          := NULL,
    rollback_seg          IN     VARCHAR2          := NULL,
    refresh_after_errors  IN     BOOLEAN           := false,
    atomic_refresh        IN     BOOLEAN           := true,
    out_of_place          IN     BOOLEAN           := false);
```

### Parameters

**Table 106-11 REFRESH\_ALL\_MVIEWS Procedure Parameters**

Parameter	Description
number_of_failures	Returns the number of failures that occurred during processing
method	A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.  If this parameter is set to false, then each of the materialized views is refreshed non-atomically in separate transactions.
out_of_place	If true, then it performs an out-of-place refresh. The default is false.  This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and out_of_place = true, then an out-of-place fast refresh will be attempted. Similarly, if you specify P and out_of_place = true, then out-of-place PCT refresh will be attempted.

## 106.4.13 REFRESH\_DEPENDENT Procedures

This procedure refreshes all materialized views that have certain properties.

Materialized views with the following properties are refreshed:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view `DBA_MVIEWS`.

This procedure is intended for use with data warehouses.

### Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
  number_of_failures  OUT  BINARY_INTEGER,
  { list              IN   VARCHAR2,
    | tab             IN   DBMS_UTILITY.UNCL_ARRAY, }
  method              IN   VARCHAR2      := NULL,
  rollback_seg        IN   VARCHAR2      := NULL,
  refresh_after_errors IN   BOOLEAN       := false,
  atomic_refresh      IN   BOOLEAN       := true,
  nested              IN   BOOLEAN       := false,
  out_of_place        IN   BOOLEAN       := false);
```

#### Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

### Parameters

**Table 106-12 REFRESH\_DEPENDENT Procedure Parameters**

Parameter	Description
<code>number_of_failures</code>	Returns the number of failures that occurred during processing
<code>res</code>	
<code>list</code>   <code>tab</code>	Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database.  Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a table.

**Table 106-12 (Cont.) REFRESH\_DEPENDENT Procedure Parameters**

Parameter	Description
method	<p>A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH_DEPENDENT ('employees,departments,hr.regions','cf');</pre> <p>performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.</p>
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	<p>If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.</p> <p>If this parameter is set to false, then each of the materialized views is refreshed non-atomically in separate transactions.</p>
nested	If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.
out_of_place	<p>If true, then it performs an out-of-place refresh. The default is false.</p> <p>This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and out_of_place = true, then an out-of-place fast refresh will be attempted. Similarly, if you specify P and out_of_place = true, then out-of-place PCT refresh will be attempted.</p>

## 106.4.14 REGISTER\_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

### Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
  mviewowner IN VARCHAR2,
  mviewname  IN VARCHAR2,
  mviewsite  IN VARCHAR2,
  mview_id   IN DATE | BINARY_INTEGER,
  flag       IN BINARY_INTEGER,
  qry_txt    IN VARCHAR2,
  rep_type   IN BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

### Parameters

**Table 106-13 REGISTER\_MVIEW Procedure Parameters**

Parameter	Description
mviewowner	Owner of the materialized view.
mviewname	Name of the materialized view.
mviewsite	Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.
mview_id	The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.
flag	<p>A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following:</p> <p>DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view</p> <p>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view</p> <p>DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view</p> <p>DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed</p> <p>DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable</p> <p>A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter:</p> <p>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW</p> <p>You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.</p>

**Table 106-13 (Cont.) REGISTER\_MVIEW Procedure Parameters**

Parameter	Description
qry_txt	The first 32,000 bytes of the materialized view definition query.
rep_type	Version of the materialized view. Valid constants that can be assigned include the following:  DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site <ul style="list-style-type: none"> <li>DBMS_MVIEW.REG_V8_SNAPSHOT</li> </ul> reg_repapi_snapshot if the materialized view is at an Oracle database version 8.x or higher site  DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site

### Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER\_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview\_id, flag, and qry\_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry\_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview\_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

## 106.4.15 UNREGISTER\_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

### Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (
    mviewowner    IN   VARCHAR2,
    mviewname     IN   VARCHAR2,
    mviewsite     IN   VARCHAR2);
```

### Parameters

**Table 106-14 UNREGISTER\_MVIEW Procedure Parameters**

Parameters	Description
mviewowner	Owner of the materialized view
mviewname	Name of the materialized view
mviewsite	Name of the materialized view site

# DBMS\_MVIEW\_STATS

DBMS\_MVIEW\_STATS package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.

## See Also:

*Oracle Database Data Warehousing Guide* for information about managing and using materialized view refresh statistics

This chapter contains the following topics:

- [DBMS\\_MVIEW\\_STATS Overview](#)
- [DBMS\\_MVIEW\\_STATS Security Model](#)
- [Summary of DBMS\\_MVIEW\\_STATS Subprograms](#)

## 107.1 DBMS\_MVIEW\_STATS Overview

You can use the procedures contained in the DBMS\_MVIEW\_STATS package to manage the collection and retention of statistics for materialized view refresh operations. This includes the level and granularity at which these statistics are collected and the duration for which they are retained in the database.

You can also set database level system defaults for the parameters that control statistics collection.

## 107.2 DBMS\_MVIEW\_STATS Security Model

Refer to the Usage Notes section in each subprogram for information about the privileges required to use the subprogram.

## 107.3 Summary of DBMS\_MVIEW\_STATS Subprograms

This table lists the DBMS\_MVIEW\_STATS subprograms and briefly describes them.

**Table 107-1 DBMS\_MVIEW\_STATS Package Subprograms**

Subprogram	Description
<a href="#">PURGE_REFRESH_STATS Procedure</a>	Purges the statistics of materialized view refresh operations that are older than the specified retention period.

**Table 107-1 (Cont.) DBMS\_MVIEW\_STATS Package Subprograms**

Subprogram	Description
<a href="#">SET_MVREF_STATS_PARAMS Procedure</a>	Sets the values of parameters that define the collection level and retention period for materialized view refresh statistics. You can set the values either at the database level or for individual materialized views.
<a href="#">SET_SYSTEM_DEFAULT Procedure</a>	Sets the system default value of a refresh statistics parameter. The two refresh statistics parameters are collection level and the retention period.

### 107.3.1 PURGE\_REFRESH\_STATS Procedure

This procedure purges refresh statistics that are older than the specified retention period for the specified materialized views.

This procedure forces a purge of refresh statistics without altering the retention period defined for the specified materialized views.

#### Syntax

```
DBMS_MVIEW_STATS.PURGE_REFRESH_STATISTICS (
    mv_list          IN    VARCHAR2,
    retention_period IN    NUMBER);
```

#### Parameters

**Table 107-2 PURGE\_REFRESH\_STATS Procedure Parameters**

Parameter	Description
<code>mv_list</code>	The fully-qualified name of an existing materialized view in the form of <code>schema_name.mv_name</code> . Use a comma-separated list to specify multiple materialized views.  Specify <code>NULL</code> to purge materialized view refresh statistics for all materialized views in the database.
<code>retention_period</code>	The number of days for which refresh statistics must be preserved in the data dictionary. Statistics for materialized view refresh operations that are older than the retention period are purged from the data dictionary.  The retention period specified in this procedure overrides the retention period that may have been set previously either at the database level or for specified materialized views.  Specify <code>NULL</code> to use the purging policy defined by the automatic statistics purge. Specify <code>-1</code> to purge all refresh statistics.

#### Usage Notes

To invoke this procedure, you need either the `SYSDBA` privilege or privileges on every materialized view that is specified in `mv_list`.

## 107.3.2 SET\_MVREF\_STATS\_PARAMS Procedure

This procedure sets the collection level and retention period for materialized view refresh statistics. You can set these properties either for individual materialized views or for all materialized views in the database.

### Syntax

```
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (
    mv_list           IN    VARCHAR2,
    collection_level IN    VARCHAR2 DEFAULT NULL,
    retention_period  IN    NUMBER DEFAULT NULL);
```

### Parameters

**Table 107-3 SET\_MVREF\_STATS\_PARAMS Procedure Parameters**

Parameter	Description
mv_list	<p>The fully-qualified name of an existing materialized view in the form of schema_name.mv_name. Use a comma-separated list to specify multiple materialized views.</p> <p>Specify NULL to set properties for all existing materialized views in the database.</p>
collection_level	<p>Specifies the level of detail used when collecting refresh statistics for the materialized views specified in mv_list.</p> <p>Set one of the following values for collection_level:</p> <ul style="list-style-type: none"> <li>NONE: No materialized view refresh statistics are collected.</li> <li>TYPICAL: Only basic refresh statistics are collected and stored for the materialized views specified in mv_list.</li> <li>ADVANCED: Detailed refresh statistics are collected and stored for materialized view specified in mv_list.</li> </ul> <p>If this parameter is set to NULL, then the system default value for collection_level (set using SET_SYSTEM_DEFAULT) is used.</p>
retention_period	<p>Specifies the retention period, in days, for the refresh statistics of the materialized views specified in mv_list. Statistics that are older than the retention period are automatically purged from the data dictionary.</p> <p>Valid values are between 1 and 1365000.</p> <p>If this parameter is set to NULL, then the system default value for retention_period (set using SET_SYSTEM_DEAFULT) is used.</p> <p>Set retention_period to -1 to specify that refresh statistics for the materialized views in mv_list must never be purged.</p>

### Usage Notes

To set the collection level or retention period of one or more materialized views, you must have privileges on those materialized views. To set the collection level or retention period for all materialized views in the database, you must have either the SYSDBA privilege or privileges on every materialized view in the database.

To set the system-level default values for statistics collection level and retention period, use the `SET_SYSTEM_DEFAULT` procedure.

Use the `DBA_MVREF_STATS_PARAMS` view to determine the currently-set retention period and collection level for materialized view statistics collection.

To disable refresh statistics collection for all materialized views in the database, use the following:

```
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (NULL, 'NONE', NULL);
```

Note that the parameters set using `SET_MVREF_STATS_PARAMS` only affect materialized views that exist in the database at the time the procedure is run. Any new materialized views created after this procedure is run will use the system default values for `collection_level` and `retention_period`.

### 107.3.3 SET\_SYSTEM\_DEFAULT Procedure

This procedure sets system-wide defaults that manage the collection and retention of materialized view refresh statistics. All newly-created materialized views use these defaults until the parameters are reset explicitly using the `SET_MVREF_STATS_PARAMS` procedure.

#### Syntax

```
DBMS_MVIEW_STATS.SET_SYSTEM_DEFAULT (
    parameter_name    IN  VARCHAR2,
    value             IN  VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 107-4 SET\_SYSTEM\_DEFAULT Procedure Parameters**

Parameter	Description
<code>parameter_name</code>	<p>The name of the materialized view refresh statistics parameter whose system default value is being set.</p> <p>The parameters that can be set are:</p> <ul style="list-style-type: none"> <li><code>COLLECTION_LEVEL</code>: Specifies the level of detail for collecting materialized view refresh statistics.</li> <li><code>RETENTION_PERIOD</code>: Specifies the duration, in days, for which refresh statistics are retained in the data dictionary</li> </ul>

**Table 107-4 (Cont.) SET\_SYSTEM\_DEFAULT Procedure Parameters**

Parameter	Description
value	<p>The value of the materialized view refresh statistics parameter.</p> <p>The valid values for <code>COLLECTION_LEVEL</code> are:</p> <ul style="list-style-type: none"> <li>• <code>NONE</code>: No refresh statistics are collected for the refresh operation.</li> <li>• <code>TYPICAL</code>: Only basic refresh statistics are collected for the refresh operation. This is the default setting.</li> <li>• <code>ADVANCED</code>: Detailed refresh statistics are collected for the refresh operation.</li> </ul> <p>The valid values for <code>RETENTION_PERIOD</code> are:</p> <ul style="list-style-type: none"> <li>• <code>-1</code></li> <li>• Numbers between 1 and 1365000</li> </ul> <p>The default value for <code>retention_period</code> is 31.</p> <p>If you specify <code>NULL</code> for any of the parameters, then the system default setting for that parameter is used.</p>

#### Usage Notes

You must have `SYSDBA` privilege to invoke this procedure.

Use the `DBA_MVREF_STATS_SYS_DEFAULTS` view to display the current default settings for materialized view refresh statistics collection.

# DBMS\_NETWORK\_ACL\_ADMIN

The `DBMS_NETWORK_ACL_ADMIN` package provides the interface to administer the network Access Control List (ACL).

The chapter contains the following topics:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_NETWORK\\_ACL\\_ADMIN Subprograms](#)

 **See Also:**

For more information, see "Managing Fine-grained Access to External Network Services" in *Oracle Database Security Guide*

## 108.1 DBMS\_NETWORK\_ACL\_ADMIN Overview

The `DBMS_NETWORK_ACL_ADMIN` package provides the interface to administer the network access control lists (ACL).

ACLs are used to control access by users to external network services and resources from the database through PL/SQL network utility packages including [UTL\\_TCP](#) , [UTL\\_HTTP](#) , [UTL\\_SMTP](#) and [UTL\\_INADDR](#) .

## 108.2 DBMS\_NETWORK\_ACL\_ADMIN Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Oracle Database 12c:

- [ADD\\_PRIVILEGE Procedure](#)
- [ASSIGN\\_ACL Procedure](#)
- [ASSIGN\\_WALLET\\_ACL Procedure](#)
- [CHECK\\_PRIVILEGE Function](#)

- [CHECK\\_PRIVILEGE\\_ACLID Function](#)
- [CREATE\\_ACL Procedure](#)
- [DELETE\\_PRIVILEGE Procedure](#)
- [DROP\\_ACL Procedure](#)
- [UNASSIGN\\_ACL Procedure](#)
- [UNASSIGN\\_WALLET\\_ACL Procedure](#)

## 108.3 DBMS\_NETWORK\_ACL\_ADMIN Security Model

The EXECUTE privilege on the DBMS\_NETWORK\_ACL\_ADMIN package is granted to the DBA role and to the EXECUTE\_CATALOG\_ROLE by default.

## 108.4 DBMS\_NETWORK\_ACL\_ADMIN Constants

The DBMS\_NETWORK\_ACL\_ADMIN package defines constants to use specifying parameter values.

These are shown in the following table.

**Table 108-1 DBMS\_NETWORK\_ACL\_ADMIN Constants**

Constant	Type	Value	Description
IP_ADDR_MASK	VARCHAR2(80)	'([[:digit:]]+\.){3}[[:digit:]]+'	IP address mask: xxx.xxx.xxx.xxx
IP_SUBNET_MASK	VARCHAR2(80)	'([[:digit:]]+\.){0,3}\*'	IP subnet mask: xxx.xxx...*
HOSTNAME_MASK	VARCHAR2(80)	'[^\.\:\ \*]+(\. \^\. \:\ \*+)*'	Hostname mask: ????.???..???.???.???
DOMAIN_MASK	VARCHAR2(80)	"\*(\.[^\:\ \*]+)*"	Domain mask: *.???.???.???.???

## 108.5 DBMS\_NETWORK\_ACL\_ADMIN Exceptions

The following table lists the exceptions raised by the DBMS\_NETWORK\_ACL\_ADMIN package.

**Table 108-2 DBMS\_NETWORK\_ACL\_ADMIN Exceptions**

Exception	Error Code	Description
ACE_ALREADY_EXISTS	24243	ACE already exists
EMPTY_ACL	24246	Empty ACL
ACL_NOT_FOUND	46114	ACL not found
ACL_ALREADY_EXISTS	46212	ACL already exists
INVALID_ACL_PATH	46059	Invalid ACL path

**Table 108-2 (Cont.) DBMS\_NETWORK\_ACL\_ADMIN Exceptions**

Exception	Error Code	Description
INVALID_HOST	24244	Invalid host
INVALID_PRIVILEGE	24245	Invalid privilege
INVALID_WALLET_PATH	29248	Invalid wallet path
BAD_ARGUMENT	29261	Bad argument
UNRESOLVED_PRINCIPAL	46238	Unresolved principal
PRIVILEGE_NOT_GRANTED	01927	Privilege not granted

## 108.6 DBMS\_NETWORK\_ACL\_ADMIN Examples

Grant the connect and resolve privileges for host `www.us.example.com` to SCOTT.

### Example 1

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
  host => 'www.us.example.com',
  ace => xs$ace_type(privilege_list => xs$name_list('connect', 'resolve'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

### Example 2

Revoke the resolve privilege for host `www.us.example.com` from SCOTT.

```
dbms_network_acl_admin.remove_host_ace(
  host => 'www.us.example.com',
  ace => xs$ace_type(privilege_list => xs$name_list('resolve'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

### Example 3

Grant the use\_client\_certificates and use\_passwords privileges for wallet file: `file:/example/wallets/hr_wallet` to SCOTT.

```
dbms_network_acl_admin.append_wallet_ace(
  wallet_path => 'file:/example/wallets/hr_wallet',
  ace => xs$ace_type(privilege_list =>
xs$name_list('use_client_certificates', 'use_passwords'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

### Example 4

Revoke the use\_passwords privilege for wallet file: `file:/example/wallets/hr_wallet` from SCOTT.

```
dbms_network_acl_admin.remove_wallet_ace(
  wallet_path => 'file:/example/wallets/hr_wallet',
  ace => xs$ace_type(privilege_list => xs$name_list('use_passwords'),
                    principal_name => 'scott',
                    principal_type => xs_acl.ptype_db));
```

**Example 5**

The `CONTAINS_HOST` in the `DBMS_NETWORK_ACL_UTILITY` package determines if a host is contained in a domain. It can be used in conjunction with the `DBA_HOST_ACE` view to determine the users and their privilege assignments to access a network host. For example, for access to `www.us.example.com`:

```
SELECT HOST, LOWER_PORT, UPPER_PORT,
       ACE_ORDER, PRINCIPAL, PRINCIPAL_TYPE,
       GRANT_TYPE, INVERTED_PRINCIPAL, PRIVILEGE,
       START_DATE, END_DATE
  FROM (SELECT ACES.*,
             DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.us.example.com',
                                                    HOST) PRECEDENCE
        FROM DBA_HOST_ACES ACES)
 WHERE PRECEDENCE IS NOT NULL
 ORDER BY PRECEDENCE DESC,
          LOWER_PORT NULLS LAST,
          UPPER_PORT NULLS LAST,
          ACE_ORDER;
```

HOST	LOWER_PORT	UPPER_PORT	ACE_ORDER	PRINCIPAL	PRINCIPAL_TYPE
www.us.example.com	80	80	1	SCOTT	DATABASE USER
GRANT	NO	HTTP			
www.us.example.com	80	80	2	ADAMS	DATABASE USER
GRANT	NO	HTTP			
*			1	HQ_DBA	DATABASE USER
GRANT	NO	CONNECT			
*			1	HQ_DBA	DATABASE USER
GRANT	NO	RESOLVE			

**Example 6**

For example, for `HQ_DBA`'s own permission to access to `www.us.example.com`:

```
SELECT HOST, LOWER_PORT, UPPER_PORT, PRIVILEGE, STATUS
  FROM (SELECT ACES.*,
             DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.us.example.com',
                                                    HOST) PRECEDENCE
        FROM USER_HOST_ACES ACES)
 WHERE PRECEDENCE IS NOT NULL
 ORDER BY PRECEDENCE DESC,
          LOWER_PORT NULLS LAST,
          UPPER_PORT NULLS LAST;
```

HOST	LOWER_PORT	UPPER_PORT	PRIVILEGE	STATUS
*			CONNECT	GRANTED
*			RESOLVE	GRANTED

## 108.7 Summary of DBMS\_NETWORK\_ACL\_ADMIN Subprograms

This table lists and briefly describes the DBMS\_NETWORK\_ACL\_ADMIN package subprograms.

**Table 108-3 DBMS\_NETWORK\_ACL\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">ADD_PRIVILEGE Procedure</a>	[DEPRECATED] Adds a privilege to grant or deny the network access to the user in an access control list (ACL)
<a href="#">APPEND_HOST_ACE Procedure</a>	Appends an access control entry (ACE) to the access control list (ACL) of a network host.
<a href="#">APPEND_HOST_ACL Procedure</a>	Appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host
<a href="#">APPEND_WALLET_ACE Procedure</a>	Appends an access control entry (ACE) to the access control list (ACL) of a wallet
<a href="#">APPEND_WALLET_ACL Procedure</a>	Appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet
<a href="#">ASSIGN_ACL Procedure</a>	[DEPRECATED] Assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.
<a href="#">ASSIGN_WALLET_ACL Procedure</a>	[DEPRECATED] Assigns an access control list (ACL) to a wallet
<a href="#">CHECK_PRIVILEGE Function</a>	[DEPRECATED] Checks if a privilege is granted or denied the user in an access control list (ACL)
<a href="#">CHECK_PRIVILEGE_ACLID Function</a>	[DEPRECATED] Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list
<a href="#">CREATE_ACL Procedure</a>	[DEPRECATED] Creates an access control list (ACL) with an initial privilege setting
<a href="#">DELETE_PRIVILEGE Procedure</a>	[DEPRECATED] Deletes a privilege in an access control list (ACL)
<a href="#">DROP_ACL Procedure</a>	[DEPRECATED] Drops an access control list (ACL)
<a href="#">REMOVE_HOST_ACE Procedure</a>	Removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE
<a href="#">REMOVE_WALLET_ACE Procedure</a>	Removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE
<a href="#">SET_HOST_ACL Procedure</a>	Sets the access control list (ACL) of a network host which controls access to the host from the database
<a href="#">SET_WALLET_ACL Procedure</a>	Sets the access control list (ACL) of a wallet which controls access to the wallet from the database
<a href="#">UNASSIGN_ACL Procedure</a>	[DEPRECATED] Unassigns the access control list (ACL) currently assigned to a network host
<a href="#">UNASSIGN_WALLET_ACL Procedure</a>	[DEPRECATED] Unassigns the access control list (ACL) currently assigned to a wallet

## 108.7.1 ADD\_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) is created if it does not exist.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ACE Procedure](#) and the [APPEND\\_WALLET\\_ACE Procedure](#).

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
  acl          IN VARCHAR2,
  principal    IN VARCHAR2,
  is_grant     IN BOOLEAN,
  privilege    IN VARCHAR2,
  position     IN PLS_INTEGER DEFAULT NULL,
  start_date   IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,
  end_date     IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

### Parameters

**Table 108-4** ADD\_PRIVILEGE Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls"
principal	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
is_grant	Privilege is granted or denied.
privilege	Network privilege to be granted or denied
position	Position (1-based) of the ACE. If a non-NULL value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same is_grant (grant or deny). If a NULL value is given, the privilege will be added to the ACE matching the principal and the is_grant if one exists, or to the end of the ACL if the matching ACE does not exist.
start_date	Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The start_date will be ignored if the privilege is added to an existing ACE.
end_date	End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The end_date must be greater than or equal to the start_date. The end_date will be ignored if the privilege is added to an existing ACE.

## Usage Notes

To remove the permission, use the [DELETE\\_PRIVILEGE Procedure](#).

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl          => 'us-example-com-permissions.xml',
    principal    => 'ST_USERS',
    is_grant     => TRUE,
    privilege    => 'connect')
END;
```

## 108.7.2 APPEND\_HOST\_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a network host. The ACL controls access to the given host from the database and the ACE specifies the privileges granted to or denied from the specified principal.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE (
  host          IN VARCHAR2,
  lower_port    IN PLS_INTEGER DEFAULT NULL,
  upper_port    IN PLS_INTEGER DEFAULT NULL,
  ace           IN XS$ACE_TYPE);
```

### Parameters

**Table 108-5 APPEND\_HOST\_ACE Function Parameters**

Parameter	Description
host	The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.
lower_port	Lower bound of an optional TCP port range
upper_port	Upper bound of an optional TCP port range. If NULL, lower_port is assumed.
ace	The ACE

### Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the [REMOVE\\_HOST\\_ACE Procedure](#).
- A host's ACL takes precedence over its domains' ACLs. For a given host, say `www.us.example.com`, the following domains are listed in decreasing precedence:
  - `www.us.example.com`
  - `*.us.example.com`
  - `*.example.com`
  - `*.com`

- \*
- An IP address' ACL takes precedence over its subnets' ACLs. For a given IP address, say 192.168.0.100, the following subnets are listed in decreasing precedence:
  - 192.168.0.100
  - 192.168.0.\*
  - 192.168.\*
  - 192.\*
  - \*
- An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.
- When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.
- When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.
- If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.

 **See Also:**

*Oracle Database Real Application Security Administrator's and Developer's Guide* for more information about the `XS$ACE_TYPE` object type

## 108.7.3 APPEND\_HOST\_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACL (
    host          IN VARCHAR2,
    lower_port    IN PLS_INTEGER DEFAULT NULL,
    upper_port    IN PLS_INTEGER DEFAULT NULL,
    acl           IN VARCHAR2);
```

### Parameters

**Table 108-6 APPEND\_HOST\_ACL Function Parameters**

Parameter	Description
host	The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.
lower_port	Lower bound of an optional TCP port range

**Table 108-6 (Cont.) APPEND\_HOST\_ACL Function Parameters**

Parameter	Description
<code>upper_port</code>	Upper bound of an optional TCP port range. If <code>NULL</code> , <code>lower_port</code> is assumed.
<code>acl</code>	The ACL from which to append

**Usage Notes**

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the [REMOVE\\_HOST\\_ACE Procedure](#).
- A host's ACL takes precedence over its domains' ACLs. For a given host, say `www.us.example.com`, the following domains are listed in decreasing precedence:
  - `www.us.example.com`
  - `*.us.example.com`
  - `*.example.com`
  - `*.com`
  - `*`
- An IP address' ACL takes precedence over its subnets' ACLs. For a given IP address, say `192.168.0.100`, the following subnets are listed in decreasing precedence:
  - `192.168.0.100`
  - `192.168.0.*`
  - `192.168.*`
  - `192.*`
  - `*`
- An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.
- When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.
- When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.- If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.

## 108.7.4 APPEND\_WALLET\_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a wallet. The ACL controls access to the given wallet from the database and the ACE specifies the privileges granted to or denied from the specified principal.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACE (  
    wallet_path    IN VARCHAR2,  
    ace            IN XS$ACE_TYPE);
```

### Parameters

**Table 108-7** APPEND\_WALLET\_ACE Function Parameters

Parameter	Description
wallet_path	Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code> .
ace	The ACE

### Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the [REMOVE\\_WALLET\\_ACE Procedure](#).
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

#### See Also:

*Oracle Database Real Application Security Administrator's and Developer's Guide* for more information about the XS\$ACE\_TYPE object type

## 108.7.5 APPEND\_WALLET\_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACL (  
    wallet_path    IN VARCHAR2,  
    acl            IN VARCHAR2);
```

## Parameters

**Table 108-8 APPEND\_WALLET\_ACL Function Parameters**

Parameter	Description
wallet_path	Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code> .
ace	The ACL from which to append

## Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use REMOVE\_WALLET\_ACE.
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

## 108.7.6 ASSIGN\_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ACE Procedure](#) and the [APPEND\\_WALLET\\_ACE Procedure](#).

## Syntax

```
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
  acl          IN VARCHAR2,
  host         IN VARCHAR2,
  lower_port   IN PLS_INTEGER DEFAULT NULL,
  upper_port   IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 108-9 ASSIGN\_ACL Function Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> .
host	Host to which the ACL is to be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive.
lower_port	Lower bound of a TCP port range if not NULL

**Table 108-9 (Cont.) ASSIGN\_ACL Function Parameters**

Parameter	Description
upper_port	Upper bound of a TCP port range. If NULL, lower_port is assumed.

**Usage Notes**

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the [DROP\\_ACL Procedure](#). To remove an access control list assignment, use the [UNASSIGN\\_ACL Procedure](#).

- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host, for example, "www.us.example.com", the following domains are listed in decreasing precedences:

- www.us.example.com
- \*.us.example.com
- \*.example.com
- \*.com
- \*

In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address, for example, "192.168.0.100", the following subnets are listed in decreasing precedences:

- 192.168.0.100
- 192.168.0.\*
- 192.168.\*
- 192.\*
- \*

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.

For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.

- When specifying a TCP port range, both lower\_port and upper\_port must not be NULL and upper\_port must be greater than or equal to lower\_port. The port range must not overlap with any other port ranges for the same host assigned already.
- To remove the assignment, use [UNASSIGN\\_ACL Procedure](#).

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(
    acl      => 'us-example-com-permissions.xml',
    host     => '*.us.example.com',
    lower_port => 80);
END;
```

## 108.7.7 ASSIGN\_WALLET\_ACL Procedure

This procedure assigns an access control list (ACL) to a wallet.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ANCE Procedure](#) and the [APPEND\\_WALLET\\_ANCE Procedure](#).

## Syntax

```
UTL_HTTP.ASSIGN_WALLET_ACL (
  acl          IN VARCHAR2,
  wallet_path  IN VARCHAR2);
```

## Parameters

**Table 108-10** ASSIGN\_WALLET\_ACL Procedure Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls"
wallet_path	Directory path of the wallet to which the ACL is to be assigned. The path is case-sensitive and of the format <code>file:directory-path</code> .

## Usage Notes

To remove the assignment, use the [UNASSIGN\\_WALLET\\_ACL Procedure](#).

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl          => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-client-certificates');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl          => 'wallet-acl.xml',
    principal   => 'SCOTT',
```

```

is_grant    => TRUE,
privilege   => 'use-passwords');

DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_ACL(
  acl        => 'wallet-acl.xml',
  wallet_path => 'file:/example/wallets/test_wallet');
END;
```

## 108.7.8 CHECK\_PRIVILEGE Function

This function checks if a privilege is granted or denied the user in an ACL.

### Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

### Syntax

```

DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
  acl          IN VARCHAR2,
  user         IN VARCHAR2,
  privilege    IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 108-11 CHECK\_PRIVILEGE Function Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
user	User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.
privilege	Network privilege to check

### Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

### Examples

```

SELECT DECODE(
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE(
    'us-example-com-permissions.xml', 'SCOTT', 'resolve'),
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE
FROM DUAL;
```

## 108.7.9 CHECK\_PRIVILEGE\_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

### Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID (
  aclid          IN RAW,
  user           IN VARCHAR2 DEFAULT NULL)
  privilege     IN VARCHAR2,
RETURN NUMBER;
```

### Parameters

**Table 108-12 CHECK\_PRIVILEGE\_ACLID Function Parameters**

Parameter	Description
aclid	Object ID of the ACL
user	User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.
privilege	Network privilege to check

### Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

## 108.7.10 CREATE\_ACL Procedure

This deprecated procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to the network target.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ACE Procedure](#) and the [APPEND\\_WALLET\\_ACE Procedure](#).

## Syntax

```
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (
    acl           IN VARCHAR2,
    description   IN VARCHAR2,
    principal     IN VARCHAR2,
    is_grant      IN BOOLEAN,
    privilege     IN VARCHAR2,
    start_date    IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    end_date      IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

## Parameters

**Table 108-13 CREATE\_ACL Procedure Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
description	Description attribute in the ACL
principal	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
is_grant	Privilege is granted or not (denied)
privilege	Network privilege to be granted or denied - 'connect   resolve' (case sensitive). A database user needs the connect privilege to an external network host computer if he or she is connecting using the UTL_TCP, UTL_HTTP, UTL_SMTP, and UTL_MAIL utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the UTL_INADDR package, grant the database user the resolve privilege.
start_date	Start date of the access control entry (ACE). When specified, the ACE is valid only on and after the specified date.
end_date	End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The end_date must be greater than or equal to the start_date.

## Usage Notes

To drop the access control list, use the [DROP\\_ACL Procedure](#).

## Examples

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
        acl           => 'us-example-com-permissions.xml',
        description   => 'Network permissions for *.us.example.com',
        principal     => 'SCOTT',
        is_grant      => TRUE,
        privilege     => 'connect');
END;
```

## 108.7.11 DELETE\_PRIVILEGE Procedure

This deprecated procedure deletes a privilege in an access control list.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE\\_HOST\\_ACE Procedure](#) and the [REMOVE\\_WALLET\\_ACE Procedure](#).

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (  
  acl          IN VARCHAR2,  
  principal    IN VARCHAR2,  
  is_grant     IN BOOLEAN DEFAULT NULL,  
  privilege    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 108-14** DELETE\_PRIVILEGE Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
principal	Principal (database user or role) for whom all the ACE will be deleted
is_grant	Privilege is granted or not (denied). If a NULL value is given, the deletion is applicable to both granted or denied privileges.
privilege	Network privilege to be deleted. If a NULL value is given, the deletion is applicable to all privileges.

### Examples

```
BEGIN  
  DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE(  
    acl          => 'us-example-com-permissions.xml',  
    principal    => 'ST_USERS')  
END;
```

## 108.7.12 DROP\_ACL Procedure

This **deprecated procedure** drops an access control list (ACL).

### Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
  acl          IN VARCHAR2);
```

### Parameters

**Table 108-15 DROP\_ACL Procedure Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.DROP_ACL(
    acl => 'us-example-com-permissions.xml');
END;
```

## 108.7.13 REMOVE\_HOST\_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.REMOVE_HOST_ACE (
  host          IN VARCHAR2,
  lower_port    IN PLS_INTEGER DEFAULT NULL,
  upper_port    IN PLS_INTEGER DEFAULT NULL,
  ace           IN XS$ACE_TYPE,
  remove_empty_acl IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 108-16 REMOVE\_HOST\_ACE Function Parameters**

Parameter	Description
host	The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.

**Table 108-16 (Cont.) REMOVE\_HOST\_ACE Function Parameters**

Parameter	Description
lower_port	Lower bound of an optional TCP port range
upper_port	Upper bound of an optional TCP port range. If NULL, lower_port is assumed.
ace	The ACE
remove_empty_acl	Whether to remove the ACL when it becomes empty when the ACE is removed

**Usage Notes**

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

## 108.7.14 REMOVE\_WALLET\_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE.

**Syntax**

```
DBMS_NETWORK_ACL_ADMIN.REMOVE_WALLET_ACE (
  wallet_path      IN VARCHAR2,
  ace              IN XS$ACE_TYPE,
  remove_empty_acl IN BOOLEAN DEFAULT FALSE);
```

**Parameters****Table 108-17 REMOVE\_WALLET\_ACE Function Parameters**

Parameter	Description
wallet_path	Directory path of the wallet. The path is case-sensitive of the format <i>file:directory-path</i> .
ace	The ACE
remove_empty_acl	Whether to remove the ACL when it becomes empty when the ACE is removed

**Usage Notes**

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

## 108.7.15 SET\_HOST\_ACL Procedure

This procedure sets the access control list (ACL) of a network host which controls access to the host from the database.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.SET_HOST_ACL (
  host          IN VARCHAR2,
  lower_port    IN PLS_INTEGER DEFAULT NULL,
  upper_port    IN PLS_INTEGER DEFAULT NULL,
  acl           IN VARCHAR2);
```

### Parameters

**Table 108-18 SET\_HOST\_ACL Function Parameters**

Parameter	Description
host	The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.
lower_port	Lower bound of an optional TCP port range
upper_port	Upper bound of an optional TCP port range. If NULL, lower_port is assumed.
acl	The ACL. NULL to unset the host's ACL.

### Usage Notes

A host's ACL is created and set on-demand when an access control entry (ACE) is appended to the host's ACL. Users are discouraged from setting a host's ACL manually.

## 108.7.16 SET\_WALLET\_ACL Procedure

This procedure sets the access control list (ACL) of a wallet which controls access to the wallet from the database.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.SET_WALLET_ACL (
  wallet_path   IN VARCHAR2,
  acl           IN VARCHAR2);
```

### Parameters

**Table 108-19 SET\_WALLET\_ACL Function Parameters**

Parameter	Description
wallet_path	Directory path of the wallet. The path is case-sensitive of the format <i>file:directory-path</i> .
acl	The ACL. NULL to unset the host's ACL.

## Usage Notes

A wallet's ACL is created and set on-demand when an access control entry (ACE) is appended to the wallet's ACL. Users are discouraged from setting a wallet's ACL manually.

## 108.7.17 UNASSIGN\_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a network host.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE\\_HOST\\_ACE Procedure](#) and the [REMOVE\\_WALLET\\_ACE Procedure](#).

## Syntax

```
DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
  acl          IN VARCHAR2 DEFAULT NULL,
  host         IN VARCHAR2 DEFAULT NULL,
  lower_port   IN PLS_INTEGER DEFAULT NULL,
  upper_port   IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 108-20 UNASSIGN\_ACL Function Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls". If ACL is NULL, any ACL assigned to the host is unassigned.
host	Host from which the ACL is to be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is NULL, the ACL will be unassigned from any host. If both host and acl are NULL, all ACLs assigned to any hosts are unassigned.
lower_port	Lower bound of a TCP port range if not NULL
upper_port	Upper bound of a TCP port range. If NULL, lower_port is assumed.

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
    host      => '*.us.example.com',
    lower_port => 80);
END;
```

## 108.7.18 UNASSIGN\_WALLET\_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a wallet.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE\\_HOST\\_ACE Procedure](#) and the [REMOVE\\_WALLET\\_ACE Procedure](#).

### Syntax

```
UTL_HTTP.UNASSIGN_WALLET_ACL (  
    acl          IN VARCHAR2 DEFAULT NULL,  
    wallet_path  IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 108-21 UNASSIGN\_WALLET\_ACL Procedure Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> . If <code>acl</code> is <code>NULL</code> , any ACL assigned to the wallet is unassigned.
wallet_path	Directory path of the wallet to which the ACL is assigned. The path is case-sensitive and of the format <code>file:directory-path</code> . If both <code>acl</code> and <code>wallet_path</code> are <code>NULL</code> , all ACLs assigned to any wallets are unassigned.

### Examples

```
BEGIN  
    DBMS_NETWORK_ACL_ADMIN.UNASSIGN_WALLET_ACL(  
        acl          => 'wallet-acl.xml',  
        wallet_path => 'file:/example/wallets/test_wallet');  
END;
```

# DBMS\_NETWORK\_ACL\_UTILITY

The `DBMS_NETWORK_ACL_UTILITY` package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.

## See Also:

For more information, see ""Managing Fine-grained Access to External Network Services"" in *Oracle Database Security Guide*

The chapter contains the following topics:

- [Security Model](#)
- [Examples](#)
- [Summary of DBMS\\_NETWORK\\_ACL\\_UTILITY Subprograms](#)

## 109.1 DBMS\_NETWORK\_ACL\_UTILITY Security Model

`EXECUTE` on the `DBMS_NETWORK_ACL_UTILITY` package is granted to `PUBLIC`.

## 109.2 DBMS\_NETWORK\_ACL\_UTILITY Examples

The `CONTAINS_HOST` Function in this package indicates if a domain or subnet contains a given host or IP address.

It can be used in conjunction with the [CHECK\\_PRIVILEGE\\_ACLID Function](#) in the `DBMS_NETWORK_ACL_ADMIN` package to determine the privilege assignments affecting a user's permission to access a network host. The return value of the `CONTAINS_HOST` Function in can also be used to order the ACL assignments by their precedence.

### Example 1

For example, for `SCOTT`'s permission to connect to `www.hr.example.com`:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
         1, 'GRANTED', 0, 'DENIED', NULL) privilege
FROM (SELECT host, acl, aclid, lower_port, upper_port,
             DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
             precedence
       FROM dba_network_acls)
WHERE precedence > 0
ORDER BY precedence DESC, lower_port nulls LAST;
```

HOST	LOWER_PORT	UPPER_PORT	ACL	PRIVILEGE
www.hr.example.com	80	80	/sys/acls/www.xml	GRANTED
www.hr.example.com	3000	3999	/sys/acls/www.xml	GRANTED
www.hr.example.com			/sys/acls/www.xml	GRANTED
*.hr.example.com			/sys/acls/all.xml	
*.example.com			/sys/acls/all.xml	

### Example 2

For example, for SCOTT's permission to do domain name resolution for www.hr.example.com:

```
SELECT host, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
FROM (SELECT host, acl, aclid,
            DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
            precedence
      FROM dba_network_acls
      WHERE lower_port IS NULL AND upper_port IS NULL)
WHERE precedence > 0
ORDER BY precedence DESC;
```

HOST	ACL	PRIVILEGE
www.hr.example.com	/sys/acls/hr-www.xml	GRANTED
*.hr.example.com	/sys/acls/hr-domain.xml	
*.example.com	/sys/acls/corp-domain.xml	

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when lower\_port and upper\_port are NULL). For this reason, the example does not include lower\_port and upper\_port columns in the query.

### Related Topics

- [CONTAINS\\_HOST Function](#)  
This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

## 109.3 Summary of DBMS\_NETWORK\_ACL\_UTILITY Subprograms

This table lists and briefly describes the DBMS\_NETWORK\_ACL\_UTILITY package subprograms.

**Table 109-1 DBMS\_NETWORK\_ACL\_UTILITY Package Subprograms**

Subprogram	Description
<a href="#">CONTAINS_HOST Function</a>	Determines if the given host is equal to or contained in the given host, domain, or subnet
<a href="#">DOMAIN_LEVEL Function</a>	Returns the domain level of the given host name, domain, or subnet
<a href="#">DOMAINS Function</a>	For a given host, this function returns the domains whose ACL assigned is used to determine if a user has the privilege to access the given host or not.
<a href="#">EQUALS_HOST Function</a>	Determines if the two given hosts, domains, or subnets are equal

### 109.3.1 CONTAINS\_HOST Function

This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

#### Syntax

```
DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST (
    host      IN   VARCHAR2,
    domain    IN   VARCHAR2)
RETURN NUMBER;
```

#### Parameters

**Table 109-2 CONTAINS\_HOST Function Parameters**

Parameter	Description
host	Network host
domain	Network host, domain, or subnet

#### Return Values

Returns a non-NULL value if the given host is equal to or contained in the related host, domain, or subnet:

- If `domain` is a hostname, returns the level of its domain + 1
- If `domain` is a domain name, returns the domain level
- If `domain` is an IP address or subnet, return the number of significant address bits of the IP address or subnet
- If `domain` is the wildcard "\*", returns 0

The non-NULL value returned indicates the precedence of the domain or subnet for ACL assignment. The higher the value, the higher is the precedence. NULL will be returned if the host is not equal to or contained in the given host, domain or subnet.

### Examples

```
SELECT host, acl, precedence
   FROM (select host, acl,
                DBMS_NETWORK_ACL_UTILTY.CONTAINS_HOST('192.0.2.3', host)
                precedence
          FROM dba_network_acls)
 WHERE precedence > 0
 ORDER BY precedence DESC;
```

HOST	ACL	PRECEDENCE
192.0.2.3	/sys/acls/hr-www.xml	32
::ffff:192.0.2.0/120	/sys/acls/hr-domain.xml	24
::ffff:192.0.0.0/104	/sys/acls/corp-domain.xml	8

## 109.3.2 DOMAIN\_LEVEL Function

This function returns the domain level of the given host name, domain, or subnet.

### Syntax

```
DBMS_NETWORK_ACL_UTILTY.DOMAIN_LEVEL (
    host IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 109-3 DOMAIN\_LEVEL Function Parameters**

Parameter	Description
host	Network host, domain, or subnet

### Return Values

The domain level of the given host, domain, or subnet.

### Usage Notes

Note that this function cannot handle IPv6 addresses and subnets, and subnets in CIDR notation.

### Examples

```
SELECT host, acl, domain_level
   FROM (select host, acl,
                DBMS_NETWORK_ACL_UTILTY.DOMAIN_LEVEL(host) domain_level
          FROM dba_network_acls)
 ORDER BY domain_level desc;
```

HOST	ACL	DOMAIN_LEVEL
www.hr.example.com	/sys/acls/hr-www.xml	4
*.hr.example.com	/sys/acls/hr-domain.xml	3
*.example.com	/sys/acls/corp-domain.xml	2

## 109.3.3 DOMAINS Function

For a given host, this function returns the domains whose ACL assigned determines if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAINS (
    host IN VARCHAR2)
    RETURN DOMAIN_TABLE PIPELINED;
```

### Parameters

**Table 109-4** DOMAINS Function Parameters

Parameter	Description
host	Network host

### Return Values

The domains or subnets for the given host.

### Usage Notes

Note that this function cannot handle IPv6 addresses. Nor can it generate subnets of arbitrary number of prefix bits for an IPv4 address.

### Examples

```
select * from table(dbms_network_acl_utility.domains('www.hr.example.com'));
```

```
DOMAINS
-----
www.hr.example.com
*.hr.example.com
*.example.com
*.com
*
```

## 109.3.4 EQUALS\_HOST Function

This function determines if the two given hosts, domains, or subnets are equal. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when comparing the two hosts or domains.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST (
    host1 IN VARCHAR2,
    host2 IN VARCHAR2)
    RETURN NUMBER;
```

## Parameters

**Table 109-5 EQUALS\_HOST Function Parameters**

Parameter	Description
host1	Network host, domain, or subnet to compare
host2	Network host, domain, or subnet to compare

## Return Values

1 if the two hosts, domains, or subnets are equal. 0 otherwise.

## Examples

```
SELECT host, acl
   FROM dba_network_acls
  WHERE DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST('192.0.2.*', host) = 1;
```

```
HOST          ACL
-----
::ffff:192.0.2.0/120  /sys/acls/hr-domain.xml
```

# 110

## DBMS\_ODCI

DBMS\_ODCI package contains a single user function related to the use of Data Cartridges.

This chapter contains the following topic:

- [Summary of DBMS\\_ODCI Subprograms](#)

### See Also:

- *Oracle Database Data Cartridge Developer's Guide*

## 110.1 Summary of DBMS\_ODCI Subprograms

The DBMS\_ODCI package has one subprogram, the ESTIMATE\_CPU\_UNITS function.

**Table 110-1** DBMS\_ODCI Package Subprograms

Subprogram	Description
<a href="#">ESTIMATE_CPU_UNITS Function</a>	Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)

### 110.1.1 ESTIMATE\_CPU\_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE\_CPU\_UNITS considers the speed of a single processor.

#### Syntax

```
DBMS_ODCI. ESTIMATE_CPU_UNITS(  
    elapsed_time    NUMBER)  
RETURN NUMBER;
```

### Parameters

Parameter	Description
<code>elapsed_time</code>	The elapsed time in seconds that it takes to execute a function.

### Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.

# DBMS\_OUTLN

The `DBMS_OUTLN` package, synonymous with `OUTLN_PKG`, contains the functional interface for subprograms associated with the management of stored outlines.

## See Also:

For more information about using the `DBMS_OUTLN` package, see *Oracle Database SQL Tuning Guide*.

## Note:

Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD\\_PLANS\\_FROM\\_CURSOR\\_CACHE Functions](#) or [LOAD\\_PLANS\\_FROM\\_SQLSET Function](#) of the `DBMS_SPM` package. When the migration is complete, you should disable or remove the stored outlines.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_OUTLN Subprograms](#)

## 111.1 DBMS\_OUTLN Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD\\_PLANS\\_FROM\\_CURSOR\\_CACHE Functions](#) or the

[LOAD\\_PLANS\\_FROM\\_SQLSET Function](#) of the [DBMS\\_SPM](#) package. When the migration is complete, you should disable or remove the stored outlines.

## 111.2 DBMS\_OUTLN Security Model

DBMS\_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

## 111.3 Summary of DBMS\_OUTLN Subprograms

This table lists the DBMS\_OUTLN subprograms and briefly describes them.

**Table 111-1 DBMS\_OUTLN Package Subprograms**

Subprogram	Description
<a href="#">CLEAR_USED Procedure</a>	Clears the outline 'used' flag
<a href="#">CREATE_OUTLINE Procedure</a>	Generates outlines from the shared cursor identified by hash value and child number
<a href="#">DROP_BY_CAT Procedure</a>	Drops outlines that belong to a specified category
<a href="#">DROP_UNUSED Procedure</a>	Drops outlines that have never been applied in the compilation of a SQL statement
<a href="#">EXACT_TEXT_SIGNATURES Procedure</a>	Updates outline signatures to those that compute based on exact text matching
<a href="#">UPDATE_BY_CAT Procedure</a>	Changes the category of outlines in one category to a new category
<a href="#">UPDATE_SIGNATURES Procedure</a>	Updates outline signatures to the current version's signature

### 111.3.1 CLEAR\_USED Procedure

This procedure clears the outline 'used' flag.

#### Syntax

```
DBMS_OUTLN.CLEAR_USED (
    name     IN     VARCHAR2);
```

#### Parameters

**Table 111-2 CLEAR\_USED Procedure Parameters**

Parameter	Description
name	Name of the outline.

## 111.3.2 CREATE\_OUTLINE Procedure

This procedure generates an outline by reparsing the SQL statement from the shared cursor identified by hash value and child number.

### Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (
  hash_value      IN NUMBER,
  child_number    IN NUMBER,
  category        IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Parameters

**Table 111-3 CREATE\_OUTLINE Procedure Parameters**

Parameter	Description
hash_value	Hash value identifying the target shared cursor.
child_number	Child number of the target shared cursor.
category	Category in which to create outline (optional).

## 111.3.3 DROP\_BY\_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the `DEFAULT` category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

### Syntax

```
DBMS_OUTLN.DROP_BY_CAT (
  cat VARCHAR2);
```

### Parameters

**Table 111-4 DROP\_BY\_CAT Procedure Parameters**

Parameter	Description
cat	Category of outlines to drop.

### Usage Notes

This procedure purges a category of outlines in a single call.

### Examples

This example drops all outlines in the `DEFAULT` category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

## 111.3.4 DROP\_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

### Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

### Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

## 111.3.5 EXACT\_TEXT\_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

### Syntax

```
DBMS_OUTLN.EXACT_TEXT_SIGNATURES;
```

### Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

## 111.3.6 UPDATE\_BY\_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

### Syntax

```
DBMS_OUTLN.UPDATE_BY_CAT (
    oldcat    VARCHAR2 default 'DEFAULT',
    newcat    VARCHAR2 default 'DEFAULT');
```

### Parameters

**Table 111-5 UPDATE\_BY\_CAT Procedure Parameters**

Parameter	Description
oldcat	The current category of outlines.
newcat	The new category of outlines.

## 111.3.7 UPDATE\_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

### Syntax

```
DBMS_OUTLN.UPDATE_SIGNATURES;
```

### Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

# DBMS\_OUTPUT

The `DBMS_OUTPUT` package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS\\_OUTPUT Subprograms](#)

## 112.1 DBMS\_OUTPUT Overview

The package is typically used for debugging, or for displaying messages and reports to SQL\*DBA or SQL\*Plus (such as are produced by applying the SQL command `DESCRIBE` to procedures).

The [PUT Procedure](#) and [PUT\\_LINE Procedure](#) in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the [GET\\_LINE Procedure](#) and [GET\\_LINES Procedure](#).

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

## 112.2 DBMS\_OUTPUT Security Model

The `dbmsotpt.sql` script must be run as user `sys`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

## 112.3 DBMS\_OUTPUT Operational Notes

The following operational notes apply to `DBMS_OUTPUT`.

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL\*Plus, the buffered messages are ignored.
- SQL\*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.

- Typing `SET SERVEROUTPUT ON` in SQL\*Plus has the effect of invoking `DBMS_OUTPUT.ENABLE (buffer_size => NULL);` with no limit on the output.
- You should generally avoid having application code invoke either the [DISABLE Procedure](#) or [ENABLE Procedure](#) because this could subvert the attempt of an external tool like SQL\*Plus to control whether or not to display output.

**Note:**

Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

## 112.4 DBMS\_OUTPUT Exceptions

`DBMS_OUTPUT` subprograms raise the application error `ORA-20000` and return errors.

The output procedures can return the following errors:

**Table 112-1 DBMS\_OUTPUT Errors**

Error	Description
ORU-10027:	Buffer overflow
ORU-10028:	Line length overflow

## 112.5 DBMS\_OUTPUT Rules and Limits

The following are limits on `DBMS_OUTPUT` line and buffer size.

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

## 112.6 DBMS\_OUTPUT Examples

This topic contains three examples of using `DBMS_OUTPUT`.

### Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here: '||:new.col||' is the new value');
```

If you have enabled the `DBMS_OUTPUT` package, then the text produced by this `PUT_LINE` would be buffered, and you could, after executing the statement (presumably

some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
  DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to GET\_LINE until status comes back as nonzero. For better performance, you should use calls to [GET\\_LINES Procedure](#) which can return an array of lines.

### Example 2: Debugging Stored Procedures and Triggers

The DBMS\_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in ["Example 3: Retrieving Information About an Object"](#).

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT\_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
  CURSOR emp_cursor IS
    SELECT sal, comm FROM emp WHERE deptno = dnum;
  total_wages  NUMBER(11, 2) := 0;
  counter      NUMBER(10) := 1;
BEGIN

  FOR emp_record IN emp_cursor LOOP
    emp_record.comm := NVL(emp_record.comm, 0);
    total_wages := total_wages + emp_record.sal
      + emp_record.comm;
    DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
      ' ; Wages = ' || TO_CHAR(total_wages)); /* Debug line */
    counter := counter + 1; /* Increment debug counter */
  END LOOP;
  /* Debug line */
  DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
    TO_CHAR(total_wages));
  RETURN total_wages;
END dept_salary;
```

Assume the EMP table contains the following rows:

EMPNO	SAL	COMM	DEPT
1002	1500	500	20
1203	1000		30
1289	1000		10
1347	1000	250	20

Assume the user executes the following statements in SQL\*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250
```

PL/SQL procedure successfully executed.

### Example 3: Retrieving Information About an Object

In this example, the user has used the `EXPLAIN PLAN` command to retrieve information about the execution plan for a statement and has stored it in `PLAN_TABLE`. The user has also assigned a statement ID to this statement. The example `EXPLAIN_OUT` procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement. */
/*****
CREATE OR REPLACE PROCEDURE explain_out
(statement_id IN VARCHAR2) AS

-- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

CURSOR explain_rows IS
SELECT level, id, position, operation, options,
       object_name
FROM plan_table
WHERE statement_id = explain_out.statement_id
CONNECT BY PRIOR id = parent_id
       AND statement_id = explain_out.statement_id
START WITH id = 0
ORDER BY id;

BEGIN

-- Loop through information retrieved from PLAN_TABLE:

FOR line IN explain_rows LOOP

-- At start of output, include heading with estimated cost.

IF line.id = 0 THEN
DBMS_OUTPUT.PUT_LINE ('Plan for statement '
|| statement_id
|| ', estimated cost = ' || line.position);
END IF;

-- Output formatted information. LEVEL determines indention level.

DBMS_OUTPUT.PUT_LINE (lpad(' ',2*(line.level-1)) ||
line.operation || ' ' || line.options || ' ' ||
line.object_name);
END LOOP;

END;
```

## 112.7 DBMS\_OUTPUT Data Structures

The `DBMS_OUTPUT` package declares 2 collection types for use with the `GET_LINES` Procedure.

### TABLE Types

[CHARARR Table Type](#)

### OBJECT Types

[DBMSOUTPUT\\_LINESARRAY Object Type](#)

### Related Topics

- [GET\\_LINES Procedure](#)  
This procedure retrieves an array of lines from the buffer.

### 112.7.1 CHARARR Table Type

This package type is to be used with the `GET_LINES` Procedure to obtain text submitted through the `PUT` Procedure and `PUT_LINE` Procedure.

#### Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

#### Related Topics

- [GET\\_LINES Procedure](#)  
This procedure retrieves an array of lines from the buffer.
- [PUT Procedure](#)  
This procedure places a partial line in the buffer.
- [PUT\\_LINE Procedure](#)  
This procedure places a line in the buffer.

### 112.7.2 DBMS\_OUTPUT DBMSOUTPUT\_LINESARRAY Object Type

This type, defined outside the package, is to be used with the `GET_LINES` Procedure to obtain text submitted through the `PUT` Procedure and `PUT_LINE` Procedure.

#### Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS  
  VARRAY(2147483647) OF VARCHAR2(32767);
```

#### Related Topics

- [GET\\_LINES Procedure](#)  
This procedure retrieves an array of lines from the buffer.

- [PUT Procedure](#)  
This procedure places a partial line in the buffer.
- [PUT\\_LINE Procedure](#)  
This procedure places a line in the buffer.

## 112.8 Summary of DBMS\_OUTPUT Subprograms

This table lists the DBMS\_OUTPUT subprograms and briefly describes them.

**Table 112-2 DBMS\_OUTPUT Package Subprograms**

Subprogram	Description
<a href="#">DISABLE Procedure</a>	Disables message output
<a href="#">ENABLE Procedure</a>	Enables message output
<a href="#">GET_LINE Procedure</a>	Retrieves one line from buffer
<a href="#">GET_LINES Procedure</a>	Retrieves an array of lines from buffer
<a href="#">NEW_LINE Procedure</a>	Terminates a line created with PUT
<a href="#">PUT Procedure</a>	Places a partial line in the buffer
<a href="#">PUT_LINE Procedure</a>	Places line in buffer

### Note:

The [PUT Procedure](#) that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

### 112.8.1 DISABLE Procedure

This procedure disables calls to [PUT](#), [PUT\\_LINE](#), [NEW\\_LINE](#), [GET\\_LINE](#), and [GET\\_LINES](#), and purges the buffer of any remaining information.

As with the [ENABLE Procedure](#), you do not need to call this procedure if you are using the `SERVEROUTPUT` option of `SQL*Plus`.

#### Syntax

```
DBMS_OUTPUT.DISABLE;
```

#### Pragmas

```
pragma restrict_references(disable,WNDS,RNDS);
```

### 112.8.2 ENABLE Procedure

This procedure enables calls to [PUT](#), [PUT\\_LINE](#), [NEW\\_LINE](#), [GET\\_LINE](#), and [GET\\_LINES](#).

Calls to these procedures are ignored if the `DBMS_OUTPUT` package is not activated.

**Syntax**

```
DBMS_OUTPUT.ENABLE (
    buffer_size IN INTEGER DEFAULT 20000);
```

**Pragmas**

```
pragma restrict_references(enable,WNDS,RNDS);
```

**Parameters****Table 112-3 ENABLE Procedure Parameters**

Parameter	Description
buffer_size	Upper limit, in bytes, the amount of buffered information. Setting buffer_size to NULL specifies that there should be no limit.

**Usage Notes**

- It is not necessary to call this procedure when you use the SET SERVEROUTPUT option of SQL\*Plus.
- If there are multiple calls to ENABLE, then buffer\_size is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies buffer\_size (NOT NULL).
- NULL is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

## 112.8.3 GET\_LINE Procedure

This procedure retrieves a single line of buffered information.

**Syntax**

```
DBMS_OUTPUT.GET_LINE (
    line    OUT VARCHAR2,
    status  OUT INTEGER);
```

**Parameters****Table 112-4 GET\_LINE Procedure Parameters**

Parameter	Description
line	Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of "ORA-06502: PL/SQL: numeric or value error: character string buffer too small".
status	If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.

### Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL\*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

## 112.8.4 GET\_LINES Procedure

This procedure retrieves an array of lines from the buffer.

### Syntax

```
DBMS_OUTPUT.GET_LINES (
    lines      OUT   CHARARR,
    numlines   IN OUT INTEGER);

DBMS_OUTPUT.GET_LINES (
    lines      OUT   DBMSOUTPUT_LINESARRAY,
    numlines   IN OUT INTEGER);
```

### Parameters

**Table 112-5 GET\_LINES Procedure Parameters**

Parameter	Description
<code>lines</code>	Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the <code>VARRAY</code> overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.
<code>numlines</code>	Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.

### Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL\*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

## 112.8.5 NEW\_LINE Procedure

This procedure puts an end-of-line marker.

The [GET\\_LINE Procedure](#) and the [GET\\_LINES Procedure](#) return "lines" as delimited by "newlines". Every call to the [PUT\\_LINE Procedure](#) or [NEW\\_LINE Procedure](#) generates a line that is returned by `GET_LINE(S)`.

### Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

## 112.8.6 PUT Procedure

This procedure places a partial line in the buffer.

### Note:

The `PUT` procedure that takes a `NUMBER` is obsolete and, while currently supported, is included in this release for legacy reasons only.

### Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

### Parameters

**Table 112-6 PUT Procedure Parameters**

Parameter	Description
item	Item to buffer.

### Exceptions

**Table 112-7 PUT Procedure Exceptions**

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

### Usage Notes

- You can build a line of information piece by piece by making multiple calls to `PUT`, or place an entire line of information into the buffer by calling `PUT_LINE`.

- When you call `PUT_LINE` the item you specify is automatically followed by an end-of-line marker. If you make calls to `PUT` to build a line, then you must add your own end-of-line marker by calling `NEW_LINE`. `GET_LINE` and `GET_LINES` do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL\*Plus does not display `DBMS_OUTPUT` messages until the PL/SQL program completes. There is no mechanism for flushing the `DBMS_OUTPUT` buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

## 112.8.7 PUT\_LINE Procedure

This procedure places a line in the buffer.

### Note:

The `PUT_LINE` procedure that takes a `NUMBER` is obsolete and, while currently supported, is included in this release for legacy reasons only.

### Syntax

```
DBMS_OUTPUT.PUT_LINE (
  item IN VARCHAR2);
```

### Parameters

**Table 112-8** PUT\_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

### Exceptions

**Table 112-9** PUT\_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

### Usage Notes

- You can build a line of information piece by piece by making multiple calls to `PUT`, or place an entire line of information into the buffer by calling `PUT_LINE`.
- When you call `PUT_LINE` the item you specify is automatically followed by an end-of-line marker. If you make calls to `PUT` to build a line, then you must add your own end-of-line marker by calling `NEW_LINE`. `GET_LINE` and `GET_LINES` do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL\*Plus does not display `DBMS_OUTPUT` messages until the PL/SQL program completes. There is no mechanism for flushing the `DBMS_OUTPUT` buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2 DBMS_OUTPUT.PUT_LINE ('hello');
  3 DBMS_LOCK.SLEEP (10);
  4 END;
```

# 113

## DBMS\_PARALLEL\_EXECUTE

The `DBMS_PARALLEL_EXECUTE` package enables incremental update of table data in parallel.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_PARALLEL\\_EXECUTE Subprograms](#)

### See Also:

- [Oracle Database Development Guide](#)
- [Oracle Database Reference](#)

### 113.1 DBMS\_PARALLEL\_EXECUTE Overview

This package lets you incrementally update table data in parallel, in two high-level steps.

1. Group sets of rows in the table into smaller-sized chunks.
2. Run a user-specified statement on these chunks in parallel, and commit when finished processing each chunk.

This package introduces the notion of *parallel execution task*. This task groups the various steps associated with the parallel execution of a PL/SQL block, which is typically updating table data.

All of the package subroutines (except the [GENERATE\\_TASK\\_NAME Function](#) and the [TASK\\_STATUS Procedure](#)) perform a commit.

### 113.2 DBMS\_PARALLEL\_EXECUTE Security Model

`DBMS_PARALLEL_EXECUTE` is a SYS-owned package which is granted to PUBLIC.

Users who have the `ADM_PARALLEL_EXECUTE_TASK` role can perform administrative routines (qualified by the prefix `ADM_`) and access the DBA view.

Apart from the administrative routines, all the subprograms refer to tasks owned by the current user.

To execute chunks in parallel, you must have `CREATE JOB` system privilege.

The `CHUNK_BY_SQL`, `RUN_TASK`, and `RESUME_TASK` subprograms require a query, and are executed using `DBMS_SQL`. Invokers of the `DBMS_SQL` interface must ensure that no query contains SQL injection.

## 113.3 DBMS\_PARALLEL\_EXECUTE Constants

The `DBMS_PARALLEL_EXECUTE` package uses the constants described in these two tables.

**Table 113-1 DBMS\_PARALLEL\_EXECUTE Constants - Chunk Status Value**

Constant	Type	Value	Description
ASSIGNED	NUMBER	1	Chunk has been assigned for processing
PROCESSED	NUMBER	2	Chunk has been processed successfully
PROCESSED_WITH_ERROR	NUMBER	3	Chunk has been processed, but an error occurred during processing
UNASSIGNED	NUMBER	0	Chunk is unassigned

**Table 113-2 DBMS\_PARALLEL\_EXECUTE Constants - Task Status Value**

Constant	Type	Value	Description
CHUNKED	NUMBER	4	Table associated with the task has been chunked, but none of the chunk has been assigned for processing
CHUNKING	NUMBER	2	Table associated with the task is being chunked
CHUNKING_FAILED	NUMBER	3	Chunking failed
CRASHED	NUMBER	8	Only applicable if parallel execution is used, this occurs if a job slave crashes or if the database crashes during <code>EXECUTE</code> , leaving a chunk in <code>ASSIGNED</code> or <code>UNASSIGNED</code> state.
CREATED	NUMBER	1	The task has been created by the <a href="#">CREATE_TASK Procedure</a>
FINISHED	NUMBER	6	All chunks processed without error
FINISHED_WITH_ERROR	NUMBER	7	All chunks processed, but with errors in some cases
PROCESSING	NUMBER	5	Part of the chunk assigned for processing, or which has been processed

## 113.4 DBMS\_PARALLEL\_EXECUTE Views

The DBMS\_PARALLEL\_EXECUTE package uses the following views.

- DBA\_PARALLEL\_EXECUTE\_CHUNKS
- DBA\_PARALLEL\_EXECUTE\_TASKS
- USER\_PARALLEL\_EXECUTE\_CHUNKS
- USER\_PARALLEL\_EXECUTE\_TASKS

## 113.5 DBMS\_PARALLEL\_EXECUTE Exceptions

The following table lists the exceptions raised by DBMS\_PARALLEL\_EXECUTE.

**Table 113-3 Exceptions Raised by DBMS\_PARALLEL\_EXECUTE**

Exception	Error Code	Description
CHUNK_NOT_FOUND	29499	Specified chunk does not exist
DUPLICATE_TASK_NAME	29497	Same task name has been used by an existing task
INVALID_STATE_FOR_CHUNK	29492	Attempts to chunk a table that is not in CREATED or CHUNKING_FAILED state
INVALID_STATE_FOR_RESUME	29495	Attempts to resume execution, but the task is not in FINISHED_WITH_ERROR or CRASHED state
INVALID_STATE_FOR_RUN	29494	Attempts to execute the task that is not in CHUNKED state
INVALID_STATUS	29493	Attempts to set an invalid value to the chunk status
INVALID_TABLE	29491	Attempts to chunk a table by rowid in cases in which the table is not a physical table, or the table is an IOT
MISSING_ROLE	29490	User does not have the necessary ADM_PARALLEL_EXECUTE role
TASK_NOT_FOUND	29498	Specified task_name does not exist

## 113.6 DBMS\_PARALLEL\_EXECUTE Examples

The following examples run on the Human Resources (HR) schema of the Oracle Database Sample Schemas. They require that the HR schema be created with the JOB SYSTEM privilege.

### Chunk by ROWID

This example shows the most common usage of this package. After calling the [RUN\\_TASK Procedure](#), it checks for errors and reruns in the case of error.

```
DECLARE
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
```

```

BEGIN

    -- Create the TASK
    DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

    -- Chunk the table by ROWID
    DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true,
100);

    -- Execute the DML in parallel
    l_sql_stmt := 'update EMPLOYEES e
        SET e.salary = e.salary + 10
        WHERE rowid BETWEEN :start_id AND :end_id';
    DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
        parallel_level => 10);

    -- If there is an error, RESUME it for at most 2 times.
    L_try := 0;
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
    WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
    LOOP
        L_try := l_try + 1;
        DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
        L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
    END LOOP;

    -- Done with processing; drop the task
    DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

END;
/

```

### Chunk by User-Provided SQL

A user can specify a chunk algorithm by using the [CREATE\\_CHUNKS\\_BY\\_SQL Procedure](#). This example shows that rows with the same `manager_id` are grouped together and processed in one chunk.

```

DECLARE
    l_chunk_sql VARCHAR2(1000);
    l_sql_stmt VARCHAR2(1000);
    l_try NUMBER;
    l_status NUMBER;
BEGIN

    -- Create the TASK
    DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

    -- Chunk the table by MANAGER_ID
    l_chunk_sql := 'SELECT distinct manager_id, manager_id FROM employees';
    DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL('mytask', l_chunk_sql, false);

    -- Execute the DML in parallel
    -- the WHERE clause contain a condition on manager_id, which is the chunk
    -- column. In this case, grouping rows is by manager_id.
    l_sql_stmt := 'update EMPLOYEES e
        SET e.salary = e.salary + 10
        WHERE manager_id between :start_id and :end_id';
    DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
        parallel_level => 10);

```

```

-- If there is error, RESUME it for at most 2 times.
L_try := 0;
L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
Loop
  L_try := l_try + 1;
  DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
  L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
END LOOP;

-- Done with processing; drop the task
DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

end;
/

```

### Executing Chunks in an User-defined Framework

You can execute chunks in a self-defined framework without using the [RUN\\_TASK Procedure](#). This example shows how to use [GET\\_ROWID\\_CHUNK Procedure](#), [EXECUTE IMMEDIATE](#), [SET\\_CHUNK\\_STATUS Procedure](#) to execute the chunks.

```

DECLARE
  l_sql_stmt varchar2(1000);
  l_try number;
  l_status number;
  l_chunk_id number;
  l_start_rowid rowid;
  l_end_rowid rowid;
  l_any_rows boolean;
  CURSOR c1 IS SELECT chunk_id
                FROM user_parallel_execute_chunks
                WHERE task_name = 'mytask'
                  AND STATUS IN (DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR,
                                DBMS_PARALLEL_EXECUTE.ASSIGNED);
BEGIN

  -- Create the Objects, task, and chunk by ROWID
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true,
100);

  l_sql_stmt := 'update EMPLOYEES e
                SET e.salary = e.salary + 10
                WHERE rowid BETWEEN :start_id AND :end_id';

  -- Execute the DML in his own framework
  --
  -- Process each chunk and commit.
  -- After processing one chunk, repeat this process until
  -- all the chunks are processed.
  --
  <<main_processing>>
  LOOP
    --
    -- Get a chunk to process; if there is nothing to process, then exit the
    -- loop;
    --
    DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK('mytask',
                                          l_chunk_id,
                                          l_start_rowid,

```

```

                                                                    l_end_rowid,
                                                                    l_any_rows);
IF (l_any_rows = false) THEN EXIT; END IF;

--
-- The chunk is specified by start_id and end_id.
-- Bind the start_id and end_id and then execute it
--
-- If no error occurred, set the chunk status to PROCESSED.
--
-- Catch any exception. If an exception occurred, store the error num/msg
-- into the chunk table and then continue to process the next chunk.
--
BEGIN

## 113.7 Summary of DBMS\_PARALLEL\_EXECUTE Subprograms

This table lists the DBMS\_PARALLEL\_EXECUTE subprograms and briefly describes them.

**Table 113-4 DBMS\_PARALLEL\_EXECUTE Package Subprograms**

Subprogram	Description
<a href="#">ADM_DROP_CHUNKS Procedure</a>	Drops all chunks of the specified task owned by the specified owner
<a href="#">ADM_DROP_TASK Procedure</a>	Drops the task of the given user and all related chunks
<a href="#">ADM_TASK_STATUS Function</a>	Returns the task status
<a href="#">ADM_STOP_TASK Procedure</a>	Stops the task of the given owner and related job slaves
<a href="#">CREATE_TASK Procedure</a>	Creates a task for the current user
<a href="#">CREATE_CHUNKS_BY_NUMBER_COLUMN Procedure</a>	Chunks the table associated with the given task by the specified column.
<a href="#">CREATE_CHUNKS_BY_ROWID Procedure</a>	Chunks the table associated with the given task by ROWID
<a href="#">CREATE_CHUNKS_BY_SQL Procedure</a>	Chunks the table associated with the given task by means of a user-provided SELECT statement
<a href="#">DROP_TASK Procedure</a>	Drops the task and all related chunks
<a href="#">DROP_CHUNKS Procedure</a>	Drops the task's chunks
<a href="#">GENERATE_TASK_NAME Function</a>	Returns a unique name for a task

**Table 113-4 (Cont.) DBMS\_PARALLEL\_EXECUTE Package Subprograms**

Subprogram	Description
<a href="#">GET_NUMBER_COL_CHUNK Procedure</a>	Picks an unassigned NUMBER chunk and changes it to ASSIGNED
<a href="#">GET_ROWID_CHUNK Procedure</a>	Picks an unassigned ROWID chunk and changes it to ASSIGNED
<a href="#">PURGE_PROCESSED_CHUNKS Procedure</a>	Deletes all the processed chunks whose status is PROCESSED or PROCESSED_WITH_ERROR
<a href="#">RESUME_TASK Procedures</a>	Retries the given the task if the <a href="#">RUN_TASK Procedure</a> finished with an error, or resumes the task if a crash occurred.
<a href="#">RUN_TASK Procedure</a>	Executes the specified SQL statement on the chunks in parallel
<a href="#">SET_CHUNK_STATUS Procedure</a>	Sets the status of the chunk
<a href="#">STOP_TASK Procedure</a>	Stops the task and related job slaves
<a href="#">TASK_STATUS Procedure</a>	Returns the task status

## 113.7.1 ADM\_DROP\_CHUNKS Procedure

This procedure drops all chunks of the specified task owned by the specified owner.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_CHUNKS (
  task_owner      IN VARCHAR2,
  task_name       IN VARCHAR2);
```

### Parameters

**Table 113-5 ADM\_DROP\_CHUNKS Procedure Parameters**

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## 113.7.2 ADM\_DROP\_TASK Procedure

This procedure drops the task of the specified user and all related chunks.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_TASK (
  task_owner      IN VARCHAR2,
  task_name       IN VARCHAR2);
```

## Parameters

**Table 113-6 ADM\_DROP\_TASK Procedure Parameters**

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## 113.7.3 ADM\_TASK\_STATUS Function

This function returns the task status.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_TASK_STATUS (  
    task_owner    IN VARCHAR2,  
    task_name     IN VARCHAR2)  
RETURN NUMBER;
```

## Parameters

**Table 113-7 ADM\_TASK\_STATUS Function Parameters**

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## 113.7.4 ADM\_STOP\_TASK Procedure

This procedure stops the task of the specified owner and related job slaves.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_STOP_TASK (  
    task_owner    IN VARCHAR2,  
    task_name     IN VARCHAR2);
```

## Parameters

**Table 113-8 ADM\_STOP\_TASK Procedure Parameters**

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## 113.7.5 CREATE\_TASK Procedure

This procedure creates a task for the current user. The pairing of `task_name` and `current_user` must be unique.

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_TASK (
    task_name      IN  VARCHAR2,
    comment        IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 113-9 CREATE\_TASK Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task. The <code>task_name</code> can be any string in which related length must be less than or equal to 128 bytes.
<code>comment</code>	Comment field. The comment must be less than 4000 bytes.

## 113.7.6 CREATE\_CHUNKS\_BY\_NUMBER\_COL Procedure

This procedure chunks the table (associated with the specified task) by the specified column. The specified column must be a `NUMBER` column. This procedure takes the `MIN` and `MAX` value of the column, and then divides the range evenly according to `chunk_size`.

The chunks are:

START_ID	END_ID
-----	-----
<code>min_id_val</code>	<code>min_id_val+1*chunk_size-1</code>
<code>min_id_val+1*chunk_size</code>	<code>min_id_val+2*chunk_size-1</code>
...	...
<code>min_id_val+i*chunk_size</code>	<code>max_id_val</code>

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_NUMBER_COL (
    task_name      IN  VARCHAR2,
    table_owner    IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    table_column   IN  VARCHAR2,
    chunk_size     IN  NUMBER);
```

### Parameters

**Table 113-10 CREATE\_CHUNKS\_BY\_NUMBER\_COL Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task
<code>table_owner</code>	Owner of the table

**Table 113-10 (Cont.) CREATE\_CHUNKS\_BY\_NUMBER\_COL Procedure Parameters**

Parameter	Description
table_name	Name of the table
table_column	Name of the NUMBER column
chunk_size	Range of each chunk

## 113.7.7 CREATE\_CHUNKS\_BY\_ROWID Procedure

This procedure chunks the table (associated with the specified task) by ROWID.

num\_row and num\_block are approximate guidance for the size of each chunk. The table to be chunked must be a physical table with physical ROWID having views and table functions. Index-organized tables are not allowed.

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID (
    task_name      IN VARCHAR2,
    table_owner    IN VARCHAR2,
    table_name     IN VARCHAR2,
    by_row         IN BOOLEAN,
    chunk_size     IN NUMBER);
```

### Parameters

**Table 113-11 CREATE\_CHUNKS\_BY\_ROWID Procedure Parameters**

Parameter	Description
task_name	Name of the task
table_owner	Owner of the table
table_name	Name of the table
by_row	TRUE if chunk_size refers to the number of rows, otherwise, chunk_size refers to the number of blocks
chunk_size	Approximate number of rows/blocks to process for each commit cycle

## 113.7.8 CREATE\_CHUNKS\_BY\_SQL Procedure

This procedure chunks the table (associated with the specified task) by means of a user-provided SELECT statement.

The SELECT statement that returns the range of each chunk must have two columns: start\_id and end\_id. If the task is to chunk by ROWID, then the two columns must be of ROWID type. If the task is to chunk the table by NUMBER column, then the two columns must be of NUMBER type. The procedure provides the flexibility to users who want to deploy user-defined chunk algorithms.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL (
  task_name      IN VARCHAR2,
  sql_statement  IN CLOB,
  by_rowid      IN BOOLEAN);
```

**Parameters****Table 113-12 CREATE\_CHUNKS\_BY\_SQL Procedure Parameters**

Parameter	Description
task_name	Name of the task
sql_statment	SQL that returns the chunk ranges
by_rowid	TRUE if the table is chunked by rowids

## 113.7.9 DROP\_TASK Procedure

This procedure drops the task and all related chunks.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.DROP_TASK (
  task_name      IN VARCHAR2);
```

**Parameters****Table 113-13 DROP\_TASK Procedure Parameters**

Parameter	Description
task_name	Name of the task

## 113.7.10 DROP\_CHUNKS Procedure

This procedure drops the task's chunks.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.DROP_CHUNKS (
  task_name      IN VARCHAR2);
```

**Parameters****Table 113-14 DROP\_CHUNKS Procedure Parameters**

Parameter	Description
task_name	Name of the task

## 113.7.11 GENERATE\_TASK\_NAME Function

This function returns a unique name for a task.

The name is of the form *prefix*N where N is a number from a sequence. If no prefix is specified, the generated name is, by default, TASK\$\_1, TASK\$\_2, TASK\$\_3, and so on. If 'SCOTT' is specified as the prefix, the name is SCOTT1, SCOTT2, and so on.

### Syntax

```
DBMS_PARALLEL_EXECUTE.GENERATE_TASK_NAME (
    prefix      IN      VARCHAR2 DEFAULT 'TASK$_')
RETURN VARCHAR2;
```

### Parameters

**Table 113-15 GENERATE\_TASK\_NAME Function Parameters**

Parameter	Description
prefix	The prefix to use when generating the task name

## 113.7.12 GET\_NUMBER\_COL\_CHUNK Procedure

This procedure picks an unassigned NUMBER chunk and changes it to ASSIGNED. If there are no more chunks to assign, any\_rows is set to FALSE. Otherwise, the chunk\_id, start, and end\_id of the chunk are returned as OUT parameters.

The chunk information in DBMS\_PARALLEL\_EXECUTE\_CHUNKS\$ is updated as follows: STATUS becomes ASSIGNED; START\_TIMESTAMP records the current time; END\_TIMESTAMP is cleared.

 **See Also:**  
[Views](#)

### Syntax

```
DBMS_PARALLEL_EXECUTE.GET_NUMBER_COL_CHUNK (
    task_name      IN VARCHAR2,
    chunk_id       OUT NUMBER,
    start_rowid    OUT ROWID,
    end_id         OUT ROWID,
    any_rows       OUT BOOLEAN);
```

### Parameters

**Table 113-16 GET\_NUMBER\_COL\_CHUNK Procedure Parameters**

Parameter	Description
task_name	Name of the task

**Table 113-16 (Cont.) GET\_NUMBER\_COL\_CHUNK Procedure Parameters**

Parameter	Description
chunk_id	Chunk_id of the chunk
start_rowid	Start rowid in the returned range
end_id	End rowid in the returned range
any_rows	Indicating if there could be any rows to process in the range

**Usage Notes**

If the task is chunked by ROWID, then use `get_rowid_range`. If the task is chunked by NUMBER column, then use `get_number_col_range`. If you make the wrong function call, the returning `chunk_id` and `any_rows` have valid values but `start_id` and `end_id` are NULL.

## 113.7.13 GET\_ROWID\_CHUNK Procedure

This procedure picks an unassigned ROWID chunk and changes it to ASSIGNED.

If there are no more chunks to assign, `any_rows` is set to FALSE. Otherwise, the `chunk_id`, `start`, and `end_id` of the chunk are returned as OUT parameters. The chunk info in `DBMS_PARALLEL_EXECUTE_CHUNKS$` is updated as follows: STATUS becomes ASSIGNED; START\_TIMESTAMP records the current time; END\_TIMESTAMP is cleared.

 **See Also:**  
[Views](#)

**Syntax**

```
DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK (
  task_name      IN VARCHAR2,
  chunk_id       OUT NUMBER,
  start_rowid    OUT ROWID,
  end_id         OUT ROWID,
  any_rows       OUT BOOLEAN);
```

**Parameters****Table 113-17 GET\_ROWID\_CHUNK Procedure Parameters**

Parameter	Description
task_name	Name of the task
chunk_id	Chunk_id of the chunk
start_rowid	Start rowid in the returned range
end_id	End rowid in the returned range
any_rows	Indicates that the range could include rows to process

## Usage Notes

If the task is chunked by ROWID, then use `get_rowid_range`. If the task is chunked by NUMBER column, then use `get_number_col_range`. If you make the wrong function call, the returning `chunk_id` and `any_rows` will still have valid values but `start_id` and `end_id` are NULL.

## 113.7.14 PURGE\_PROCESSED\_CHUNKS Procedure

This procedure deletes all the processed chunks whose status is PROCESSED or PROCESSED\_WITH\_ERROR.

### Syntax

```
DBMS_PARALLEL_EXECUTE.PURGE_PROCESSED_CHUNKS (
    task_name          IN VARCHAR2);
```

### Parameters

**Table 113-18** PURGE\_PROCESSED\_CHUNKS Procedure Parameters

Parameter	Description
task_name	Name of the task

## 113.7.15 RESUME\_TASK Procedures

This procedure retries the specified the task if the RUN\_TASK Procedure finished with an error, or resumes the task if a crash occurred.

You can only invoke this procedure if the task is in a CRASHED or FINISHED\_WITH\_ERROR state.

For a crashed serial execution, the state remains in PROCESSING. The FORCE option allows you to resume any task in PROCESSING state. However, it is your responsibility to determine that a crash has occurred.

The procedure resumes processing the chunks which have not been processed. Also, chunks which are in PROCESSED\_WITH\_ERROR or ASSIGNED (due to crash) state are processed because those chunks did not commit.

This procedure takes the same argument as the [RUN\\_TASK Procedure](#). The overload which takes `task_name` as the only input argument re-uses the arguments provided in the previous invoking of the [RUN\\_TASK Procedure](#) or [RESUME\\_TASK Procedures](#).

 **See Also:**  
[Table 113-2](#)

### Syntax

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (
    task_name          IN VARCHAR2,
```

```

sql_stmt          IN CLOB,
language_flag     IN NUMBER,
edition          IN VARCHAR2 DEFAULT NULL,
apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
fire_apply_trigger IN BOOLEAN DEFAULT TRUE,
parallel_level    IN NUMBER DEFAULT 0,
job_class        IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
force            IN BOOLEAN DEFAULT FALSE);

DBMS_PARALLEL_EXECUTE.RESUME_TASK (
  task_name      IN VARCHAR2,
  force         IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 113-19 RESUME\_TASK Procedure Parameters**

Parameter	Description
task_name	Name of the task
sql_stmt	SQL statement; must have :start_id and :end_id placeholders
language_flag	Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> <li>V6 (or 0) specifies version 6 behavior</li> <li>NATIVE (or 1) specifies normal behavior for the database to which the program is connected</li> <li>V7 (or 2) specifies Oracle database version 7 behavior</li> </ul>
edition	Specifies the edition in which to run the statement. Default is the current edition.
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user who executes the statement.
fire_apply_trigger	Indicates whether the specified apply_crossedition_trigger is itself to be executed, or only to be used as a guide in selecting other triggers
parallel_level	Number of parallel jobs; zero if run in serial; NULL uses the default parallelism
job_class	If running in parallel, the jobs all belong to the specified job class
force	If TRUE, do not raise an error if the status is PROCESSING.

## Examples

Suppose the chunk table contains the following chunk ranges:

```

START_ID          END_ID
-----
1                10
11              20
21              30

```

And the specified SQL statement is:

```
UPDATE employees
   SET salary = salary + 10
   WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
   SET salary = .salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;
```

```
UPDATE employees
   SET salary = .salary + 10 WHERE employee_id between 11 and 20;
COMMIT;
```

```
UPDATE employees
   SET salary = .salary + 10 WHERE employee_id between 21 and 30;
COMMIT;
```

### Related Topics

- [RUN\\_TASK Procedure](#)  
This procedure executes the specified statement (`sql_stmt`) on the chunks in parallel.

## 113.7.16 RUN\_TASK Procedure

This procedure executes the specified statement (`sql_stmt`) on the chunks in parallel.

It commits after processing each chunk.

The specified statement must have two placeholders called `start_id` and `end_id`, respectively, which represent the range of the chunk to be processed. The type of each placeholder must be `ROWID` where `ROWID`-based chunking was used, or `NUMBER` where `NUMBER`-based chunking was used.

### Syntax

```
DBMS_PARALLEL_EXECUTE.RUN_TASK (
  task_name           IN VARCHAR2,
  sql_stmt            IN CLOB,
  language_flag       IN NUMBER,
  edition             IN VARCHAR2 DEFAULT NULL,
  apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
  fire_apply_trigger  IN BOOLEAN  DEFAULT TRUE,
  parallel_level      IN NUMBER    DEFAULT 0,
  job_class           IN VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS');
```

### Parameters

**Table 113-20 RUN\_TASK Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task
<code>sql_stmt</code>	SQL statement; must have <code>:start_id</code> and <code>:end_id</code> placeholders

**Table 113-20 (Cont.) RUN\_TASK Procedure Parameters**

Parameter	Description
language_flag	Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> <li>V6 (or 0) specifies version 6 behavior</li> <li>NATIVE (or 1) specifies normal behavior for the database to which the program is connected</li> <li>V7 (or 2) specifies Oracle database version 7 behavior</li> </ul>
edition	Specifies the edition in which to run the statement. Default is the current edition.
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user executes the statement.
fire_apply_trigger	Indicates whether the specified apply_crossedition_trigger is itself to be executed, or only a guide to be used in selecting other triggers.
parallel_level	Number of parallel jobs; zero if run in serial; NULL uses the default parallelism.
job_class	If running in parallel, the jobs belong to the specified job class

### Usage Notes

- The SQL statement is executed as the current user.
- Since this subprogram is subject to reexecution on error, you need to take great care in submitting a statement to RUN\_TASK that is not idempotent.
- Chunks can be executed in parallel by DBMS\_SCHEDULER job slaves. Therefore, parallel execution requires CREATE JOB system privilege. The job slaves is created under the current user. The default number of job slaves is computed as the product of Oracle parameters cpu\_count and parallel\_threads\_per\_cpu. On a Real Application Clusters installation, the number of job slaves is the sum of individual settings on each node in the cluster. This procedure returns only when all the chunks are processed. In parallel cases, this procedure returns only when all the job slaves finished.

### Examples

Suppose the chunk table contains the following chunk ranges:

START_ID	END_ID
1	10
11	20
21	30

And the specified SQL statement is:

```
UPDATE employees
   SET salary = salary + 10
  WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
  SET salary =.salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;

UPDATE employees
  SET salary =.salary + 10 WHERE employee_id between 11 and 20;
COMMIT;

UPDATE employees
  SET salary =.salary + 10 WHERE employee_id between 21 and 30;
COMMIT;
```

## 113.7.17 SET\_CHUNK\_STATUS Procedure

This procedure sets the status of the chunk.

The `START_TIMESTAMP` and `END_TIMESTAMP` of the chunk is updated according to the new status:

Value of the new Status	Side Effect
UNASSIGNED	<code>START_TIMESTAMP</code> and <code>END_TIMESTAMP</code> will be cleared
ASSIGNED	<code>START_TIMESTAMP</code> will be the current time and <code>END_TIMESTAMP</code> will be cleared.
PROCESSED or PROCESSED_WITH_ERROR	The current time will be recorded in <code>END_TIMESTAMP</code>

 **See Also:**  
[Views](#)

### Syntax

```
DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS (
  task_name      IN VARCHAR2,
  chunk_id       OUT NUMBER,
  status         IN NUMBER,
  err_num        IN NUMBER DEFAULT NULL,
  err_msg        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 113-21 SET\_CHUNK\_STATUS Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task
<code>chunk_id</code>	Chunk_id of the chunk
<code>status</code>	Status of the chunk: UNASSIGNED, ASSIGNED, PROCESSED, PROCESSED_WITH_ERROR
<code>err_num</code>	Error code returned during the processing of the chunk

**Table 113-21 (Cont.) SET\_CHUNK\_STATUS Procedure Parameters**

Parameter	Description
err_msg	Error message returned during the processing of the chunk

## 113.7.18 STOP\_TASK Procedure

This procedure stops the task and related job slaves.

### Syntax

```
DBMS_PARALLEL_EXECUTE.STOP_TASK (
    task_name      IN VARCHAR2);
```

### Parameters

**Table 113-22 STOP\_TASK Procedure Parameters**

Parameter	Description
task_name	Name of the task

## 113.7.19 TASK\_STATUS Procedure

This procedure returns the task status.

### Syntax

```
DBMS_PARALLEL_EXECUTE.TASK_STATUS (
    task_name      IN VARCHAR2);
```

### Parameters

**Table 113-23 TASK\_STATUS Procedure Parameters**

Parameter	Description
task_name	Name of the task

# DBMS\_PART

The `DBMS_PART` package provides an interface for maintenance and management operations on partitioned objects.

## See Also:

- *Oracle Database Reference* for related views

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_PART Subprograms](#)

## 114.1 DBMS\_PART Security Model

`DBMS_PART` is an invoker's rights package, running with the privileges of the user.

## 114.2 DBMS\_PART Operational Notes

The following operational notes apply to `DBMS_PART`.

- `DBMS_PART` ignores all the errors that it runs into during the cleanup process.
- To display the message `PL/SQL procedure executed successfully` requires at least one cleanup operation to be successful.

## 114.3 Summary of DBMS\_PART Subprograms

This table briefly describes the subprograms of `DBMS_PART` package.

**Table 114-1 DBMS\_PART Package Subprograms**

Subprogram	Description
<a href="#">CLEANUP_GIDX Procedure</a>	Gathers the list of global indexes where optimized asynchronous index maintenance has taken place to clean up entries pointing to data segments that no longer exist
<a href="#">CLEANUP_GIDX_JOB Procedure</a>	
<a href="#">CLEANUP_ONLINE_OP Procedure</a>	Cleans up failed online move operations

## 114.3.1 CLEANUP\_GIDX Procedure

As a consequence of prior partition maintenance operations with asynchronous global index maintenance, global indexes can contain entries pointing to data segments that no longer exist. These stale index rows will not cause any correctness issues or corruptions during any operation on the table or index, whether these are queries, DMLs, DDLs or analyze. This procedure will identify and cleanup these global indexes to ensure efficiency in terms of storage and performance.

### Syntax

```
DBMS_PART.CLEANUP_GIDX (
  schema_name_in  IN  VARCHAR2 DEFAULT NULL,
  table_name_in   IN  VARCHAR2 DEFAULT NULL,
  parallel        IN  VARCHAR2 DEFAULT NULL,
  options         IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 114-2 CLEANUP\_GIDX Function Parameters**

Parameter	Description
schema_name_in	Non-NULL processes only indexes on tables in the given schema
table_name_in	Non-NULL processes only indexes on the given table in the given schema (schema_name_in must be non-NULL if table_name_in is non-NULL)
parallel	The parallel degree to use for the ALTER INDEX DDLs.
options	The following options are supported: <ul style="list-style-type: none"> <li>CLEANUP_ORPHANS: implies that 'cleanup only' mechanism is used.</li> <li>COALESCE: implies that 'coalesce cleanup' mechanism is used.</li> </ul>

## 114.3.2 CLEANUP\_GIDX\_JOB Procedure

This procedure will identify and cleanup these global indexes to ensure efficiency in terms of storage and performance.

### Syntax

```
DBMS_PART.CLEANUP_GIDX_JOB (
  parallel        IN  VARCHAR2 DEFAULT NULL,
  options         IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 114-3 CLEANUP\_GIDX\_JOB Function Parameters**

Parameter	Description
parallel	The parallel degree to use for the ALTER INDEX DDLs.

**Table 114-3 (Cont.) CLEANUP\_GIDX\_JOB Function Parameters**

Parameter	Description
options	The following options are supported: <ul style="list-style-type: none"> <li>CLEANUP_ORPHANS: implies that 'cleanup only' mechanism is used.</li> <li>COALESCE: implies that coalesce cleanup mechanism is used.</li> </ul>

### 114.3.3 CLEANUP\_ONLINE\_OP Procedure

There are many possible points of failure when performing ALTER TABLE ... MOVE PARTITION ... ONLINE operations. This procedure pro-actively cleans up such failed online move operations instead of waiting for the background process (SMON) to do so.

#### Syntax

```
DBMS_PART.CLEANUP_ONLINE_OP (
  schema_name      IN  VARCHAR2 DEFAULT NULL,
  table_name       IN  VARCHAR2 DEFAULT NULL,
  partition_name   IN  VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 114-4 CLEANUP\_ONLINE\_OP Function Parameters**

Parameter	Description
schema_name	Name of schema
table_name	Name of schema
partition_name	Name of partition

#### Usage Notes

- If schema\_name, table\_name and partition\_name are specified, this cleans up the failed online move operation for the specified partition.
- If schema\_name and table\_name are specified, this cleans up all failed online move operations for all the partitions of the specified table.
- If only schema\_name is specified, this cleans up all failed online move operations in the schema.
- If no arguments are provided, we cleans up all the failed online move operations in the system.
- All other cases raise ORA-20000 to inform the user of invalid inputs as arguments.

# DBMS\_PCLXUTIL

The `DBMS_PCLXUTIL` package provides intra-partition parallelism for creating partition-wise local indexes. `DBMS_PCLXUTIL` circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one parallel execution server process for each partition is used.

## See Also:

There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of DBMS\\_PCLXUTIL Subprograms](#)

## 115.1 DBMS\_PCLXUTIL Overview

`DBMS_PCLXUTIL` uses the `DBMS_JOB` package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with `DBMS_SCHEDULER`), in combination with intra-partition parallelism using the parallel execution server.

`DBMS_PCLXUTIL` works with both range and range-hash composite partitioning.

The `DBMS_PCLXUTIL` package can be used during the following DBA tasks:

### 1. Local index creation

The procedure `BUILD_PART_INDEX` assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the `UNUSABLE` option.

```
CREATE INDEX <idx_name> on <tab_name>(…) local(…) unusable;
```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure `BUILD_PART_INDEX` causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

## 2. Local index maintenance

By marking desired partitions usable or unusable, the `BUILD_PART_INDEX` procedure also enables selective rebuilding of local indexes. The `force_opt` parameter provides a way to override this and build local indexes for all partitions.

```
ALTER INDEX <idx_name> local(...) unusable;
```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using `force_opt = TRUE`:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the `DBMS_OUTPUT` package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

## 115.2 DBMS\_PCLXUTIL Security Model

This utility can be run only as table owner, and not as any other user.

## 115.3 DBMS\_PCLXUTIL Operational Notes

`DBMS_PCLXUTIL` submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the `INIT.ORA` parameter `JOB_QUEUE_PROCESSES` correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

## 115.4 DBMS\_PCLXUTIL Rules and Limits

Because `DBMS_PCLXUTIL` uses the `DBMS_JOB` package, you must be aware of the following limitations pertaining to `DBMS_JOB`:

- You must decide appropriate values for the `job_queue_processes` initialization parameter. Clearly, if the job processes are not started before calling `BUILD_PART_INDEX()`, then the package will not function properly. The background processes are specified by the following `init.ora` parameters:

```
job_queue_processes=n    #the number of background processes = n
```

- Failure conditions are reported only in the trace files (a `DBMS_JOB` limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the `j*.trc` trace files.

 **Note:**

For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

## 115.5 Summary of DBMS\_PCLXUTIL Subprograms

The DBMS\_PCLXUTIL package has one subprogram, the BUILD\_PART\_INDEX procedure.

**Table 115-1 DBMS\_PCLXUTIL Package Subprograms**

Subprogram	Description
<a href="#">BUILD_PART_INDEX Procedure</a>	Provides intra-partition parallelism for creating partition-wise local indexes

### 115.5.1 BUILD\_PART\_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

#### Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
  jobs_per_batch  IN NUMBER   DEFAULT 1,
  procs_per_job   IN NUMBER   DEFAULT 1,
  tab_name        IN VARCHAR2 DEFAULT NULL,
  idx_name        IN VARCHAR2 DEFAULT NULL,
  force_opt       IN BOOLEAN   DEFAULT FALSE);
```

#### Parameters

**Table 115-2 BUILD\_PART\_INDEX Procedure Parameters**

Parameter	Description
jobs_per_batch	The number of concurrent partition-wise "local index builds".
procs_per_job	The number of parallel execution servers to be utilized for each local index build (1 <= procs_per_job <= max_slaves).
tab_name	The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).
idx_name	The name given to the local index (an exception is raised if a local index is not created on the table tab_name).
force_opt	If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.

#### Usage Notes

This utility can be run only as table owner, and not as any other user.

## Examples

Suppose a table `PROJECT` is created with two partitions `PROJ001` and `PROJ002`, along with a local index `IDX`.

A call to the procedure `BUILD_PART_INDEX(2,4,'PROJECT','IDX',TRUE)` produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);  
Statement processed.  
INFO: Job #21 created for partition PROJ002 with 4 slaves  
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

# DBMS\_PDB

The `DBMS_PDB` package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface specify which database objects are application common objects. You can migrate a PDB from one CDB to another CDB. After the migration is complete, all backups of the PDB before migration is available and useable in the destination CDB.

## See Also:

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_PDB Subprograms](#)

## 116.1 DBMS\_PDB Overview

A multitenant container database (CDB) is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs). The `DBMS_PDB` package provides an interface to examine and manipulate data about pluggable databases (PDBs). The subprograms in this package can also set a database object to one of the following types of application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata for the specific object, such as a table, in the application root, so that the containers in the application container have the same structure for the object but different data. This

package also contains a procedure that specifies that a database object is not an application common object.

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.
- An application is installed in an application root using an installation program that does not allow setting application common objects.

#### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 116.2 DBMS\_PDB Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_PDB` package.

## 116.3 Summary of DBMS\_PDB Subprograms

This table lists and describes `DBMS_PDB` package subprograms.

**Table 116-1 DBMS\_PDB Package Subprograms**

Subprogram	Description
<a href="#">CHECK_PLUG_COMPATIBILITY Function</a>	Uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).
<a href="#">DESCRIBE Procedure</a>	Generates an XML file describing the specified pluggable database (PDB).
<a href="#">EXPORTMANBACKUP Procedure</a>	Needs to be called only when a non-CDB is migrated as PDB. This procedure needs to be executed in non-CDB database. For PDb relocation, it is automatically called during unplugin.
<a href="#">RECOVER Procedure</a>	Generates an XML file describing a pluggable database by using data files belonging to the pluggable database (PDB).
<a href="#">REMOVE_LINK Procedure</a>	Specifies that a database object is not an application common object.
<a href="#">SET_DATA_LINKED Procedure</a>	Sets a database object to a data-linked application common object
<a href="#">SET_EXT_DATA_LINKED Procedure</a>	Sets a database object to an extended data-linked application common object.
<a href="#">SET_METADATA_LINKED Procedure</a>	Sets a database object to a metadata-linked application common object.

**Table 116-1 (Cont.) DBMS\_PDB Package Subprograms**

Subprogram	Description
<a href="#">SET_PROFILE_EXPLICIT Procedure</a>	Sets a profile as an application common profile in an application container.
<a href="#">SET_ROLE_EXPLICIT Procedure</a>	Sets a role as an application common role in an application container.
<a href="#">SET_USER_EXPLICIT Procedure</a>	This procedure sets a local user as an application common user in an application container.

### 116.3.1 CHECK\_PLUG\_COMPATIBILITY Function

This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

#### Syntax

```
DBMS_PDB.CHECK_PLUG_COMPATIBILITY (
  pdb_descr_file  IN  VARCHAR2,
  pdb_name        IN  VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

#### Parameters

**Table 116-2 CHECK\_PLUG\_COMPATIBILITY Procedure Parameters**

Parameter	Description
<code>pdb_descr_file</code>	Path of the XML file that will contain description of a PDB
<code>pdb_name</code>	Name which will be given to the PDB represented by <code>pdb_descr_file</code> when plugged into a given CDB. If not specified, the name will be extracted from <code>pdb_descr_file</code> .

#### Return Values

TRUE if the PDB described by `pdb_descr_file` is compatible with the given CDB, FALSE otherwise. If this function returns FALSE, then query the `PDB_PLUG_IN_VIOLATIONS` data dictionary view to find information about the errors that are found.

#### See Also:

*Oracle Database Reference* for information about the `PDB_PLUG_IN_VIOLATIONS` view

### 116.3.2 DESCRIBE Procedure

This procedure generates an XML file describing the specified pluggable database (PDB). This file can then be passed to the `CHECK_PLUG_COMPATIBILITY` Function

to determine if the PDB described by the XML file may be plugged into a given multitenant container database (CDB).

### Syntax

```
DBMS_PDB.DESCRIBE (
    pdb_descr_file    IN    VARCHAR2,
    pdb_name          IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 116-3** *DESCRIBE Procedure Parameters*

Parameter	Description
<code>pdb_descr_file</code>	Path of the XML file that will contain description of a PDB
<code>pdb_name</code>	Name of a PDB to be described. A remote database is specified by including <code>@dblink</code> .

### Usage Notes

- If `pdb_name` is omitted, the PDB to which the session is connected will be described.
- If `pdb_name` is omitted, and the session is connected to the Root, an error will be returned.

### Related Topics

- [CHECK\\_PLUG\\_COMPATIBILITY Function](#)  
This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

## 116.3.3 EXPORTRMANBACKUP Procedure

This procedure exports the RMAN backup information that belongs to a pluggable database to its dictionary before unplug so that pre-plugin backups can be used. This procedure needs to be called only for non-CDB to PDB migration. For PDB relocation, this procedure need not be called.

### Syntax

```
DBMS_PDB.EXPORTRMANBACKUP (
    pdb_name          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 116-4** *EXPORTRMANBACKUP Procedure Parameters*

Parameter	Description
<code>pdb_name</code>	Name of a pluggable database whose backup information needs to be exported.  Omit this parameter if you are connected to a pluggable database or a non-cdb.

### Usage Notes

- The PDB must be opened in `read/write` mode.
- If the database is non-CDB, then `pdb_name` must be omitted.
- If the `pdb_name` is omitted, then the pluggable database to which the session is connected is exported.
- If the `pdb_name` is omitted and the session is connected to the `root`, an error is returned.

## 116.3.4 RECOVER Procedure

This procedure generates an XML file describing a pluggable database by using data files belonging to the pluggable database. This XML file can then be used to plug the pluggable database into a multitenant container database (CDB) using the `CREATE PLUGGABLE DATABASE` statement.

Use this procedure when an XML file describing a pluggable database is corrupted or lost.

### Syntax

```
DBMS_PDB.RECOVER (
  pdb_descr_file  IN  VARCHAR2,
  pdb_name        IN  VARCHAR2,
  filenames       IN  VARCHAR2);
```

### Parameters

**Table 116-5** *RECOVER Procedure Parameters*

Parameter	Description
<code>pdb_descr_file</code>	Path of the XML file that contains description of a pluggable database
<code>pdb_name</code>	Name of a pluggable database
<code>filenames</code>	Comma-separated list of datafile paths and/or directories containing datafiles for the pluggable database

## 116.3.5 REMOVE\_LINK Procedure

This procedure specifies that a database object is not an application common object. In an application container, application common objects are shared between multiple containers.

### Syntax

```
DBMS_PDB.REMOVE_LINK (
  schema_name  IN  VARCHAR2,
  object_name  IN  VARCHAR2,
  namespace    IN  NUMBER,
  edition_name IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 116-6** *REMOVE\_LINK Procedure Parameters*

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 116.3.6 SET\_DATA\_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB.SET_DATA_LINKED (
  schema_name IN VARCHAR2,
  object_name IN VARCHAR2,
  namespace   IN NUMBER,
  edition_name IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 116-7** *SET\_DATA\_LINKED Procedure Parameters*

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.

**Table 116-7 (Cont.) SET\_DATA\_LINKED Procedure Parameters**

Parameter	Description
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 116.3.7 SET\_EXT\_DATA\_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB.SET_EXT_DATA_LINKED (
  schema_name IN VARCHAR2,
  object_name IN VARCHAR2,
  namespace   IN NUMBER,
  edition_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 116-8 SET\_EXT\_DATA\_LINKED Procedure Parameters**

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 116.3.8 SET\_METADATA\_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB.SET_METADATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 116-9** *SET\_METADATA\_LINKED Procedure Parameters*

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 116.3.9 SET\_PROFILE\_EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB.SET_PROFILE_EXPLICIT (  
    profile_name IN VARCHAR2);
```

### Parameters

**Table 116-10** *SET\_PROFILE\_EXPLICIT Procedure Parameters*

Parameter	Description
profile_name	The name of the profile.

### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 116.3.10 SET\_ROLE\_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB.SET_ROLE_EXPLICIT (  
    role_name IN VARCHAR2);
```

### Parameters

**Table 116-11** *SET\_ROLE\_EXPLICIT Procedure Parameters*

Parameter	Description
role_name	The name of the role.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 116.3.11 SET\_USER\_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB.SET_USER_EXPLICIT (  
    user_name IN VARCHAR2);
```

### Parameters

**Table 116-12** *SET\_USER\_EXPLICIT Procedure Parameters*

Parameter	Description
user_name	The name of the user.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

# DBMS\_PDB\_ALTER\_SHARING

In an application container with a pre-installed application, the `DBMS_PDB_ALTER_SHARING` package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object.

## Note:

This package provides a subset of the subprograms in the `DBMS_PDB` package. Users who do not have `EXECUTE` privilege on the `DBMS_PDB` package can be granted `EXECUTE` privilege on this package to run these subprograms.

## See Also:

- *Oracle Database Administrator's Guide* for information about migrating an application to an application container
- *Oracle XML DB Developer's Guide* for information about configuring protocol ports and DNS mappings
- *Oracle Database SQL Language Reference* for information about creating PDBs
- *Oracle Database Security Guide* regarding how to create audit policies in a multitenant environment

This chapter contains the following topics:

- [DBMS\\_PDB\\_ALTER\\_SHARING Overview](#)
- [DBMS\\_PDB\\_ALTER\\_SHARING Security Model](#)
- [Summary of DBMS\\_PDB\\_ALTER\\_SHARING Subprograms](#)

## 117.1 DBMS\_PDB\_ALTER\_SHARING Overview

The subprograms in this package can set a database object to one of the following types of application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata

for the specific object, such as a table, in the application root, so that the containers in the application container have the same structure for the object but different data. This package also contains a procedure that specifies that a database object is not an application common object.

You can use the subprograms in this package when you

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.
- An application is installed in an application root using an installation program that does not allow setting application common objects.

#### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 117.2 DBMS\_PDB\_ALTER\_SHARING Security Model

This package provides a subset of the subprograms in the `DBMS_PDB` package. User who do not have `EXECUTE` privilege on the `DBMS_PDB` package can be granted `EXECUTE` privilege on this package to run these subprograms.

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

## 117.3 Summary of DBMS\_PDB\_ALTER\_SHARING Subprograms

This table lists and briefly describes `DBMS_PDB_ALTER_SHARING` package subprograms.

**Table 117-1 DBMS\_PDB\_ALTER\_SHARING Subprograms**

Subprogram	Description
<a href="#">REMOVE_LINK Procedure</a>	Specifies that a database object is not an application common object
<a href="#">SET_DATA_LINKED Procedure</a>	Sets a database object to a data-linked application common object

**Table 117-1 (Cont.) DBMS\_PDB\_ALTER\_SHARING Subprograms**

Subprogram	Description
<a href="#">SET_EXT_DATA_LINKED Procedure</a>	Sets a database object to an extended data-linked application common object
<a href="#">SET_METADATA_LINKED Procedure</a>	Sets a database object to a metadata-linked application common object
<a href="#">SET_PROFILE_EXPLICIT Procedure</a>	Sets a profile as an application common profile in an application container.
<a href="#">SET_ROLE_EXPLICIT Procedure</a>	Sets a role as an application common role in an application container.
<a href="#">SET_USER_EXPLICIT Procedure</a>	Sets a local user as an application common user in an application container.

### 117.3.1 REMOVE\_LINK Procedure

This procedure specifies that a database object is not an application common object. In an application container, application common objects are shared between multiple containers.

#### Syntax

```
DBMS_PDB_ALTER_SHARING.REMOVE_LINK (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

#### Parameters

**Table 117-2 REMOVE\_LINK Procedure Parameters**

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

#### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 117.3.2 SET\_DATA\_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB_ALTER_SHARING.SET_DATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 117-3** *SET\_DATA\_LINKED Procedure Parameters*

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

#### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 117.3.3 SET\_EXT\_DATA\_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application

root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB_ALTER_SHARING.SET_EXT_DATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 117-4** *SET\_EXT\_DATA\_LINKED Procedure Parameters*

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

## 117.3.4 SET\_METADATA\_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

**Syntax**

```
DBMS_PDB_ALTER_SHARING.SET_METADATA_LINKED (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  namespace    IN NUMBER,
  edition_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 117-5** *SET\_METADATA\_LINKED Procedure Parameters*

Parameter	Description
schema_name	The name of the schema that owns the database object.
object_name	The name of the database object.
namespace	The namespace of the database object. The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.
edition_name	The name of the edition for the database object.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 117.3.5 SET\_PROFILE\_EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

**Syntax**

```
DBMS_PDB_ALTER_SHARING.SET_PROFILE_EXPLICIT (
  profile_name IN VARCHAR2);
```

**Parameters****Table 117-6** *SET\_PROFILE\_EXPLICIT Procedure Parameters*

Parameter	Description
profile_name	The name of the profile.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 117.3.6 SET\_ROLE\_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB_ALTER_SHARING.SET_ROLE_EXPLICIT (
    role_name IN VARCHAR2);
```

### Parameters

**Table 117-7** *SET\_ROLE\_EXPLICIT Procedure Parameters*

Parameter	Description
role_name	The name of the role.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 117.3.7 SET\_USER\_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB_ALTER_SHARING.SET_USER_EXPLICIT (
    user_name IN VARCHAR2);
```

## Parameters

**Table 117-8** *SET\_USER\_EXPLICIT Procedure Parameters*

Parameter	Description
user_name	The name of the user.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

# DBMS\_PERF

The DBMS\_PERF package provides an interface to generate active reports for monitoring database performance.

## See Also:

*Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_PERF Subprograms](#)

## 118.1 DBMS\_PERF Overview

The DBMS\_PERF package provides an interface for generating database performance reports. All subprograms return an active report and these reports can be generated at the system level, session level or at SQL level.

## 118.2 DBMS\_PERF Security Model

The DBMS\_PERF package requires the DBA role.

## 118.3 Summary of DBMS\_PERF Subprograms

This table lists the DBMS\_PERF subprograms and briefly describes them.

**Table 118-1 DBMS\_PERF Package Subprograms**

Subprogram	Description
<a href="#">REPORT_PERFHUB Function</a>	Generates a composite active performance report of the entire database system for a specified time period.
<a href="#">REPORT_SESSION Function</a>	Generates a performance report for a specific database session where a session is identified by <code>inst_id</code> , <code>sid</code> , and <code>serial_num</code> .
<a href="#">REPORT_SQL Function</a>	Generates an active performance report for a particular SQL statement identified by its <code>sql_id</code> .

## 118.3.1 REPORT\_PERFHUB Function

This function generates a composite active performance report of the entire database system for a specified time period.

### Syntax

```
DBMS_PERF.REPORT_PERFHUB (
    is_realtime          IN NUMBER    DEFAULT NULL,
    outer_start_time    IN DATE      DEFAULT NULL,
    outer_end_time      IN DATE      DEFAULT NULL,
    selected_start_time IN DATE      DEFAULT NULL,
    selected_end_time   IN DATE      DEFAULT NULL,
    inst_id             IN NUMBER    DEFAULT NULL,
    dbid                IN NUMBER    DEFAULT NULL,
    monitor_list_detail IN NUMBER    DEFAULT NULL,
    workload_sql_detail IN NUMBER    DEFAULT NULL,
    admn_task_detail    IN NUMBER    DEFAULT NULL,
    report_reference    IN VARCHAR2  DEFAULT NULL,
    report_level        IN VARCHAR2  DEFAULT NULL,
    type                IN VARCHAR2  DEFAULT 'ACTIVE',
    base_path           IN VARCHAR2  DEFAULT NULL);
RETURN CLOB;
```

### Parameters

**Table 118-2** *REPORT\_PERFHUB Function Parameters*

Parameter	Description
is_realtime	If 1, then real-time. If NULL (default) or 0, then historical mode.
outer_start_time	Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then 24 hours before outer_end_time.</li> <li>If is_realtime=1 (realtime mode), then 1 hour before outer_end_time.</li> </ul>
outer_end_time	End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then the latest AWR snapshot</li> <li>If is_realtime=1 (realtime mode), this is the current time (and any input is ignored)</li> </ul>
selected_start_time	Start time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then 1 hour before selected_end_time</li> <li>If is_realtime=1, then 5 minutes before selected_end_time</li> </ul>
selected_end_time	End time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then latest AWR snapshot</li> <li>If is_realtime=1, then current time</li> </ul>

**Table 118-2 (Cont.) REPORT\_PERFHUB Function Parameters**

Parameter	Description
inst_id	Instance ID to for which to retrieve data <ul style="list-style-type: none"> <li>If -1, then current instance</li> <li>If number is specified, then for that instance</li> <li>If NULL (default), then all instances</li> </ul>
dbid	DBID to query. <ul style="list-style-type: none"> <li>If NULL, then current DBID.</li> <li>If is_realtime=1, then DBID must be the local DBID.</li> </ul>
monitor_list_detail	Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> <li>If NULL (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul>
workload_sql_detail	Top N in Workload Top SQL list to retrieve monitor details, <ul style="list-style-type: none"> <li>If NULL (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul>
addm_task_detail	Maximum N latest ADDM tasks to retrieve <ul style="list-style-type: none"> <li>If NULL (default), retrieves available data but no more than N</li> <li>If 0, then retrieves no ADDM task details</li> </ul>
report_reference	Must be NULL when used from SQL*Plus.
report_level	'typical' will get all tabs in performance hub
type	Report type: <ul style="list-style-type: none"> <li>'ACTIVE' (default)</li> <li>'xml' returns XML</li> </ul>
base_path	URL path for HTML resources since flex HTML requires access to external files. This is only valid for type='ACTIVE' and is typically not used. Default value will retrieve the required files from OTN.

**Usage Notes**

- Once a time period is selected, the performance information is collected and presented based on performance subject areas.
- The time period can be real-time or historical.
- When real-time data is selected, more granular data is presented because data points are available every minute.
- When historical data is selected, more detailed data (broken down by different metrics) is presented, but the data points are averaged out to the Automatic Workload Repository (AWR) interval (usually an hour).
- Different tabs are available in the Performance Hub, depending on whether is\_real-time is 1 for real time mode or 0 for historical mode.

## 118.3.2 REPORT\_SESSION Function

This function produces a performance report for a specific database session where a session is identified by `inst_id`, `sid`, and `serial_num`.

If any of those parameters are missing, then the report is for the current session.

The session-level performance report contains the following tabs:

- **Summary** - This tab contains key identifiers and attributes of the session along with a summary of its activity data. It also contains a list of SQLs, PLSQL blocks and Database Operations (DBOP) executed by that session that were monitored by Real-time SQL Monitoring.
- **Activity** - This tab shows activity broken down by wait classes for this session. The data used for this chart is fetched from Active Session History (ASH).
- **Metrics** - This tab shows charts for certain key metrics for the selected session over time and is only available in historical mode. Some of the metrics shown are CPU usage, PGA usage, IO Throughput and IO Requests.

### Syntax

```
DBMS_PERF.REPORT_SESSION (
  inst_id          IN NUMBER   DEFAULT NULL,
  sid              IN NUMBER   DEFAULT NULL,
  serial           IN NUMBER   DEFAULT NULL,
  is_realtime      IN NUMBER   DEFAULT NULL,
  outer_start_time IN DATE     DEFAULT NULL,
  outer_end_time   IN DATE     DEFAULT NULL,
  selected_start_time IN DATE   DEFAULT NULL,
  selected_end_time IN DATE   DEFAULT NULL,
  dbid             IN NUMBER   DEFAULT NULL,
  monitor_list_detail IN NUMBER DEFAULT NULL,
  report_reference IN VARCHAR2 DEFAULT NULL,
  report_level     IN VARCHAR2 DEFAULT NULL,
  type             IN VARCHAR2 DEFAULT 'ACTIVE',
  base_path        IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 118-3** *REPORT\_SESSION Function Parameters*

Parameter	Description
<code>inst_id</code>	Instance ID to for which to retrieve data. If NULL (default), then instance of current session.
<code>sid</code>	Session ID for which to retrieve performance. If NULL, uses current session.
<code>serial</code>	Serial# of session. If NULL, then the serial# of the specified <code>sid</code> is used provided the session is connected.
<code>is_realtime</code>	If 1, then real-time. If NULL (default) or 0, then historical mode.

**Table 118-3 (Cont.) REPORT\_SESSION Function Parameters**

Parameter	Description
outer_start_time	Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then 24 hours before outer_end_time.</li> <li>If is_realtime=1 (realtime mode), then 1 hour before outer_end_time.</li> </ul>
outer_end_time	End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then the latest AWR snapshot</li> <li>If is_realtime=1 (realtime mode), this is the current time (and any input is ignored)</li> </ul>
selected_start_time	Start time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then 1 hour before selected_end_time</li> <li>If is_realtime=1, then 5 minutes before selected_end_time</li> </ul>
selected_end_time	End time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then latest AWR snapshot</li> <li>If is_realtime=1, then current time</li> </ul>
dbid	DBID to query. <ul style="list-style-type: none"> <li>If NULL, then current DBID.</li> <li>If is_realtime=1, then DBID must be the local DBID.\</li> </ul>
monitor_list_detail	Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> <li>If NULL (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul>
report_reference	Must be NULL when used from SQL*Plus.
report_level	'typical' will get all tabs in the session hub (or session details)
type	Report type: <ul style="list-style-type: none"> <li>'ACTIVE' (default)</li> <li>'xml' returns XML</li> </ul>
base_path	URL path for HTML resources since flex HTML requires access to external files

### 118.3.3 REPORT\_SQL Function

This function generates an active performance report for a particular SQL statement identified by its `sql_id`.

The SQL-level performance report contains the following tabs:

- Summary - This tab contains an overview of the SQL statement with key attributes like the SQL text, user name, sessions executing it, and related information. It also

contains a Plans tab which shows statistics and activity for each distinct plan for this SQL statement found in memory and in the AWR.

- Activity - This tab shows activity broken down by wait classes for this SQL statement. The data used for this chart is fetched from Active Session History (ASH).
- Execution Statistics - This tab shows statistics and activity for each distinct plan for this statement along with a graphical and tabular representation of the plan.
- Monitored SQL - All executions of this SQL statement that were monitored by Real-time SQL Monitoring are listed in this tab.
- Plan Control - This tab shows information about SQL Profiles and SQL Plan Baselines if they exist for this SQL statement.
- Historical Statistics - This tab is available only in Historical mode. It contains statistics, such as number of executions, number of I/Os, rows processed, and other information produced over time for different execution plans. This information is retrieved from AWR.

### Syntax

```
DBMS_PERF.REPORT_SQL (
    sql_id          IN varchar2 default null,
    is_realtime     IN number   default null,
    outer_start_time IN date     default null,
    outer_end_time  IN date     default null,
    selected_start_time IN date   default null,
    selected_end_time IN date   default null,
    inst_id        IN number   default null,
    dbid           IN number   default null,
    monitor_list_detail IN number default null,
    report_reference IN varchar2 default null,
    report_level    IN varchar2 default null, type          IN
    varchar2 default 'ACTIVE',
    base_path      IN varchar2 default null);
RETURN CLOB;
```

### Parameters

**Table 118-4** *REPORT\_SQL Function Parameters*

Parameter	Description
sql_id	SQL_ID for which to retrieve performance. If NULL, gets SQL details for the last executed SQL statement.
is_realtime	If 1, then real-time. If NULL (default) or 0, then historical mode.
outer_start_time	Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> <li>• If is_realtime=0 (historical), then 24 hours before outer_end_time.</li> <li>• If is_realtime=1 (realtime mode), then 1 hour before outer_end_time.</li> </ul>

**Table 118-4 (Cont.) REPORT\_SQL Function Parameters**

Parameter	Description
outer_end_time	End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then the latest AWR snapshot</li> <li>If is_realtime=1 (realtime mode), this is the current time (and any input is ignored)</li> </ul>
selected_start_time	Start time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then 1 hour before selected_end_time</li> <li>If is_realtime=1, then 5 minutes before selected_end_time</li> </ul>
selected_end_time	End time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then latest AWR snapshot</li> <li>If is_realtime=1, then current time</li> </ul>
inst_id	Instance ID to for which to retrieve data. If NULL (default), then instance of current session.
dbid	DBID to query. <ul style="list-style-type: none"> <li>If NULL, then current DBID.</li> <li>If is_realtime=1, then DBID must be the local DBID.\</li> </ul>
monitor_list_detail	Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> <li>If NULL (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul>
report_reference	Must be NULL when used from SQL*Plus.
report_level	'typical' will get all tabs in performance hub
type	Report type: <ul style="list-style-type: none"> <li>'ACTIVE' (default)</li> <li>'xml' returns XML</li> </ul>
base_path	URL path for HTML resources since flex HTML requires access to external files

# DBMS\_PIPE

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_PIPE Subprograms](#)

## 119.1 DBMS\_PIPE Overview

Pipe functionality has several potential applications: external service interface, independent transactions, alerters (non-transactional), debugging, and concentrator.

- **External service interface:** You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- **Independent transactions:** The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- **Alerters (non-transactional):** You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.
- **Debugging:** Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- **Concentrator:** This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

## 119.2 DBMS\_PIPE Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either public pipes or private pipes, which are described in [DBMS\\_PIPE Operational Notes](#).

## 119.3 DBMS\_PIPE Constants

This is the maximum time to wait attempting to send or receive a message.

```
maxwait    constant integer := 86400000; /* 1000 days */
```

## 119.4 DBMS\_PIPE Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

### **WARNING:**

Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.

The operation of `DBMS_PIPE` is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

### Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the `CREATE_PIPE` function with the `private` flag set to `FALSE`. You must deallocate explicitly-created pipes by calling the `REMOVE_PIPE` function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

### Reading and Writing Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have `EXECUTE` permission on the `DBMS_PIPE` package, and

they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the `PACK_MESSAGE` procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the `SEND_MESSAGE` function, designating the pipe name to be used to send the message. When `SEND_MESSAGE` is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the `RECEIVE_MESSAGE` function, designating the pipe name from which to receive the message. The process then calls the `UNPACK_MESSAGE` procedure to access each of the items in the message.

### Private Pipes

You explicitly create a private pipe by calling the `CREATE_PIPE` function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the `REMOVE_PIPE` function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, `CREATE_PIPE` returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as `SYSDBA`

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to `PACK_MESSAGE` before calling `SEND_MESSAGE`. Similarly, you must call `RECEIVE_MESSAGE` to retrieve the message before accessing the items in the message by calling `UNPACK_MESSAGE`.

## 119.5 DBMS\_PIPE Exceptions

DBMS\_PIPE package subprograms can return the errors listed in the following table.

**Table 119-1 DBMS\_PIPE Errors**

Error	Description
ORA-23321:	Pipename may not be null. This can be returned by the <code>CREATE_PIPE</code> function, or any subprogram that takes a pipe name as a parameter.
ORA-23322:	Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.

## 119.6 DBMS\_PIPE Examples

These examples show use of DBMS\_PIPE in debugging PL/SQL, debugging Pro\*C, executing system commands, and an external service interface.

### Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
    DBMS_PIPE.PACK_MESSAGE(msg);
    status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
    IF status != 0 THEN
        raise_application_error(-20099, 'Debug error');
    END IF;
END debug;
```

### Example 2: Debugging - Pro\*C

The following Pro\*C code receives messages from the PLSQL\_DEBUG pipe in the previous example, and displays the messages. If the Pro\*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int     status;
    int     msg_length;
    char    retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "SCOTT/TIGER");
    username.len = strlen(username.arr);

    EXEC SQL WHENEVER SQLERROR DO sql_error();
    EXEC SQL CONNECT :username;

    printf("connected\n");

    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;)
    {
        EXEC SQL EXECUTE
            DECLARE
```

```

        len INTEGER;
        typ INTEGER;
        sta INTEGER;
        chr VARCHAR2(2000);
BEGIN
    chr := '';
    sta := dbms_pipe.receive_message('plsqli_debug');
    IF sta = 0 THEN
        DBMS_PIPE.UNPACK_MESSAGE(len);
        DBMS_PIPE.UNPACK_MESSAGE(chr);
    END IF;
    :status := sta;
    :retval := chr;
    IF len IS NOT NULL THEN
        :msg_length := len;
    ELSE
        :msg_length := 2000;
    END IF;
END;
END-EXEC;
IF (status == 0)
    printf("\n%.*s\n", msg_length, retval);
ELSE
    printf("abnormal status, value is %d\n", status);
}
}

void sql_error()
{
    char msg[1024];
    int rlen, len;
    len = sizeof(msg);
    sqlglm(msg, &len, &rlen);
    printf("ORACLE ERROR\n");
    printf("%.*s\n", rlen, msg);
    exit(1);
}
}

```

### Example 3: Execute System Commands

This example shows PL/SQL and Pro\*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro\*C program that is listening for them.

The Pro\*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro\*C program processes it, carrying out the required action, such as executing a UNIX command through the *system()* call or executing a SQL command using embedded SQL.

DAEMON.SQL is the source code for the PL/SQL package. This package contains procedures that use the DBMS\_PIPE package to send and receive message to and from the Pro\*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the STOP command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro\*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL\*Plus or Enterprise Manager. For example:

```

SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');

```

On a UNIX system, this causes the Pro\*C daemon to execute the command `system("ls -la")`.

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL\*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS\_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                      timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,

daemon.pc Example. This is the code for the Pro\*C daemon. You must precompile this using the Pro\*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.

 **Note:**

To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics
```

Then C-compile and link in the normal way.

```
#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
  char *uid = "scott/tiger";
  int status;
  VARCHAR command[20];
  VARCHAR value[2000];
  VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlgml(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while connecting:\n");
  printf("%.s\n", msg_length, msg_buffer);
  printf("Daemon quitting.\n");
  exit(1);
}

void
sql_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlgml(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while executing:\n");
  printf("%.s\n", msg_length, msg_buffer);
  printf("Daemon continuing.\n");
}

main()
{

     command.arr);
}
}
ELSE
{
  printf("Daemon error while waiting for signal.");
  printf(" status = %d\n", status);
}
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

```

#### Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

protocol_version	VARCHAR2	- '1', 10 bytes or less
returnpipe	VARCHAR2	- 30 bytes or less
service	VARCHAR2	- 30 bytes or less
arg1	VARCHAR2/NUMBER/DATE	
...		
argn	VARCHAR2/NUMBER/DATE	

The recommended format for returning the result is:

success	VARCHAR2	- 'SUCCESS' if OK, otherwise error message
arg1	VARCHAR2/NUMBER/DATE	
...		
argn	VARCHAR2/NUMBER/DATE	

The "stock price request server" would do, using OCI or PRO\* (in pseudo-code):

```

<loop forever>
  BEGIN dbms_stock_server.get_request(:stocksymbol); END;

```

```

<figure out price based on stocksymbol (probably from some radio
    signal), set error if can't find such a stock>
BEGIN dbms_stock_server.return_price(:error, :price); END;

```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```

CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe  VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS
    s INTEGER;
  BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        ' sending on pipe');
    END IF;
  END;

  PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                 INTEGER;
    service           VARCHAR2(30);
  BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        'reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
      raise_application_error(-20000, 'Bad protocol: ' ||
        protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
      returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
  END;

  PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
  BEGIN
    IF errormsg is NULL THEN
      dbms_pipe.pack_message('SUCCESS');
      dbms_pipe.pack_message(price);
    ELSE
      dbms_pipe.pack_message(errormsg);
    END IF;
  END;

```

```

END IF;
s := dbms_pipe.send_message(returnpipe);
IF s <> 0 THEN
    raise_application_error(-20000, 'Error: '||to_char(s)||
    ' sending on pipe');
END IF;
END;
END;

```

The procedure called by the client is:

```

CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
RETURN VARCHAR2 IS
s      INTEGER;
price  VARCHAR2(20);
errormsg VARCHAR2(512);
BEGIN
dbms_pipe.pack_message('1'); -- protocol version
dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
dbms_pipe.pack_message('getprice');
dbms_pipe.pack_message(symbol);
s := dbms_pipe.send_message('stock_service');
IF s <> 0 THEN
    raise_application_error(-20000, 'Error: '||to_char(s)||
    ' sending on pipe');
END IF;
s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
IF s <> 0 THEN
    raise_application_error(-20000, 'Error: '||to_char(s)||
    ' receiving on pipe');
END IF;
dbms_pipe.unpack_message(errormsg);
IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
END IF;
dbms_pipe.unpack_message(price);
RETURN price;
END;

```

You would typically only GRANT EXECUTE on DBMS\_STOCK\_SERVICE to the stock service application server, and would only GRANT EXECUTE on stock\_request to those users allowed to use the service.

## 119.7 Summary of DBMS\_PIPE Subprograms

This table lists the DBMS\_PIPE subprograms and briefly describes them.

**Table 119-2 DBMS\_PIPE Package Subprograms**

Subprogram	Description
<a href="#">CREATE_PIPE Function</a>	Creates a pipe (necessary for private pipes)
<a href="#">NEXT_ITEM_TYPE Function</a>	Returns datatype of next item in buffer
<a href="#">PACK_MESSAGE Procedures</a>	Builds message in local buffer
<a href="#">PURGE Procedure</a>	Purges contents of named pipe
<a href="#">RECEIVE_MESSAGE Function</a>	Copies message from named pipe into local buffer
<a href="#">REMOVE_PIPE Function</a>	Removes the named pipe
<a href="#">RESET_BUFFER Procedure</a>	Purges contents of local buffer
<a href="#">SEND_MESSAGE Function</a>	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
<a href="#">UNIQUE_SESSION_NAME Function</a>	Returns unique session name
<a href="#">UNPACK_MESSAGE Procedures</a>	Accesses next item in buffer

## 119.7.1 CREATE\_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

### Syntax

```
DBMS_PIPE.CREATE_PIPE (
    pipename      IN VARCHAR2,
    maxpipesize  IN INTEGER DEFAULT 8192,
    private       IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

### Parameters

**Table 119-3 CREATE\_PIPE Function Parameters**

Parameter	Description
<code>pipename</code>	Name of the pipe you are creating. You must use this name when you call <code>SEND_MESSAGE</code> and <code>RECEIVE_MESSAGE</code> . This name must be unique across the instance.  Caution: Do not use pipe names beginning with <code>ORA\$</code> . These are reserved for use by procedures provided by Oracle. <code>Pipename</code> should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.

**Table 119-3 (Cont.) CREATE\_PIPE Function Parameters**

Parameter	Description
maxpipesize	The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default maxpipesize is 8192 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value use the existing, larger value.
private	Uses the default, TRUE, to create a private pipe. Public pipes can be implicitly created when you call SEND_MESSAGE.

**Return Values**

**Table 119-4 CREATE\_PIPE Function Return Values**

Return	Description
0	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
ORA-23322	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

**Exceptions**

**Table 119-5 CREATE\_PIPE Function Exception**

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

## 119.7.2 NEXT\_ITEM\_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called RECEIVE\_MESSAGE to place pipe information in a local buffer, call NEXT\_ITEM\_TYPE.

**Syntax**

```
DBMS_PIPE.NEXT_ITEM_TYPE
RETURN INTEGER;
```

**Pragmas**

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

**Return Values****Table 119-6 NEXT\_ITEM\_TYPE Function Return Values**

Return	Description
0	No more items
6	NUMBER
9	VARCHAR2
11	ROWID
12	DATE
23	RAW

### 119.7.3 PACK\_MESSAGE Procedures

This procedure builds your message in the local message buffer.

To send a message, first make one or more calls to `PACK_MESSAGE`. Then, call `SEND_MESSAGE` to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type `VARCHAR2`, `NCHAR`, `NUMBER`, `DATE`, `RAW` and `ROWID` items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than `VARCHAR` is 4 bytes.

**Syntax**

```
DBMS_PIPE.PACK_MESSAGE (
    item IN VARCHAR2);

DBMS_PIPE.PACK_MESSAGE (
    item IN NCHAR);

DBMS_PIPE.PACK_MESSAGE (
    item IN NUMBER);

DBMS_PIPE.PACK_MESSAGE (
    item IN DATE);

DBMS_PIPE.PACK_MESSAGE_RAW (
    item IN RAW);

DBMS_PIPE.PACK_MESSAGE_ROWID (
    item IN ROWID);
```

## Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);  
pragma restrict_references(pack_message_raw,WNDS,RNDS);  
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

## Parameters

**Table 119-7 PACK\_MESSAGE Procedure Parameters**

Parameter	Description
item	Item to pack into the local message buffer.

## Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call `SEND_MESSAGE` to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

## Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

## 119.7.4 PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling `PURGE` lets you free the memory associated with an implicitly-created pipe.

## Syntax

```
DBMS_PIPE.PURGE (  
    pipename IN VARCHAR2);
```

## Pragmas

```
pragma restrict_references(purge,WNDS,RNDS);
```

## Parameters

**Table 119-8 PURGE Procedure Parameters**

Parameter	Description
pipename	Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.

## Usage Notes

Because PURGE calls RECEIVE\_MESSAGE, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an ORA-23322 (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

## Exceptions

Permission error if pipe belongs to another user.

## 119.7.5 RECEIVE\_MESSAGE Function

This function copies the message into the local message buffer.

### Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(receive_message,WNDS,RNDS);
```

## Parameters

**Table 119-9 RECEIVE\_MESSAGE Function Parameters**

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA\$ are reserved for use by Oracle
timeout	Time to wait for a message, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.

## Return Values

**Table 119-10** RECEIVE\_MESSAGE Function Return Values

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer. (This should not happen.)
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

## Usage Notes

To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is overloaded to unpack items of type `DATE`, `NUMBER`, `VARCHAR2`, and there are two additional procedures to unpack `RAW` and `ROWID` items. If you do not know the type of data that you are attempting to unpack, then call `NEXT_ITEM_TYPE` to determine the type of the next item in the buffer.

## Exceptions

**Table 119-11** RECEIVE\_MESSAGE Function Exceptions

Exception	Description
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

## 119.7.6 RESET\_BUFFER Procedure

This procedure resets the `PACK_MESSAGE` and `UNPACK_MESSAGE` positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

**Syntax**

```
DBMS_PIPE.RESET_BUFFER;
```

**Pragmas**

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

## 119.7.7 REMOVE\_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by `SEND_MESSAGE` are automatically removed when empty. However, pipes created explicitly by `CREATE_PIPE` are removed only by calling `REMOVE_PIPE`, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling `PURGE` on an implicitly-created pipe.

**Syntax**

```
DBMS_PIPE.REMOVE_PIPE (
    pipename IN VARCHAR2)
RETURN INTEGER;
```

**Pragmas**

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

**Parameters****Table 119-12 REMOVE\_PIPE Function Parameters**

Parameter	Description
pipename	Name of pipe that you want to remove.

**Return Values****Table 119-13 REMOVE\_PIPE Function Return Values**

Return	Description
0	Success If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.
ORA-23322	Insufficient privileges. If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.

## Exceptions

**Table 119-14 REMOVE\_PIPE Function Exception**

Exception	Description
Null pipe name	Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.

## 119.7.8 SEND\_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

### Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER DEFAULT MAXWAIT,
    maxpipesize   IN INTEGER DEFAULT 8192)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(send_message,WNDS,RNDS);
```

### Parameters

**Table 119-15 SEND\_MESSAGE Function Parameters**

Parameter	Description
pipename	Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called <code>CREATE_PIPE</code> .  Caution: Do not use pipe names beginning with 'ORA\$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.
timeout	Time to wait while attempting to place a message on a pipe, in seconds.  The default value is the constant <code>MAXWAIT</code> , which is defined as 86400000 (1000 days).

**Table 119-15 (Cont.) SEND\_MESSAGE Function Parameters**

Parameter	Description
maxpipesize	<p>Maximum size allowed for the pipe, in bytes.</p> <p>The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes.</p> <p>The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value.</p> <p>Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications.</p>

**Return Values****Table 119-16 SEND\_MESSAGE Function Return Values**

Return	Description
0	<p>Success.</p> <p>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.</p> <p>If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</p>
1	<p>Timed out.</p> <p>This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.</p>
3	<p>An interrupt occurred.</p> <p>If the pipe was implicitly created and is empty, then it is removed.</p>
ORA-23322	<p>Insufficient privileges.</p> <p>If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</p>

**Exceptions****Table 119-17 SEND\_MESSAGE Function Exception**

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

## 119.7.9 UNIQUE\_SESSION\_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the `PIPENAME` parameter for your `SEND_MESSAGE` and `RECEIVE_MESSAGE` calls.

### Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(unique_session_name, WNDS, RNDS, WNPS);
```

### Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

## 119.7.10 UNPACK\_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `UNPACK_MESSAGE`.

### Note:

The `UNPACK_MESSAGE` procedure is overloaded to return items of type `VARCHAR2`, `NCHAR`, `NUMBER`, or `DATE`. There are two additional procedures to unpack `RAW` and `ROWID` items.

### Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (  
item OUT VARCHAR2);
```

```
DBMS_PIPE.UNPACK_MESSAGE (  
item OUT NCHAR);
```

```
DBMS_PIPE.UNPACK_MESSAGE (  
item OUT NUMBER);
```

```
DBMS_PIPE.UNPACK_MESSAGE (  
item OUT DATE);
```

```
DBMS_PIPE.UNPACK_MESSAGE_RAW (  
item OUT RAW);
```

```
DBMS_PIPE.UNPACK_MESSAGE_ROWID (  
item OUT ROWID);
```

### Pragmas

```
pragma restrict_references(unpack_message,WNDS,RNDS);  
pragma restrict_references(unpack_message_raw,WNDS,RNDS);  
pragma restrict_references(unpack_message_rowid,WNDS,RNDS);
```

### Parameters

**Table 119-18 UNPACK\_MESSAGE Procedure Parameters**

Parameter	Description
item	Argument to receive the next unpacked item from the local message buffer.

### Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

# DBMS\_PLSQL\_CODE\_COVERAGE

The `DBMS_PLSQL_CODE_COVERAGE` package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.

This chapter contains the following topics:

- [DBMS\\_PLSQL\\_CODE\\_COVERAGE Overview](#)
- [DBMS\\_PLSQL\\_CODE\\_COVERAGE Security Model](#)
- [Summary of DBMS\\_PLSQL\\_CODE\\_COVERAGE Subprograms](#)

## 120.1 DBMS\_PLSQL\_CODE\_COVERAGE Overview

The `DBMS_PLSQL_CODE_COVERAGE` package provides an interface for collecting code coverage information at the basic block level of PL/SQL applications. A basic block refers to a single entry single exit block of PL/SQL code. PL/SQL developers want to know how well their test infrastructure exercised their code. The coverage tables are created using the `CREATE_COVERAGE_TABLES` procedure.

A typical code coverage run in a session involves calls to :

- `START_COVERAGE`
- Run PL/SQL code
- `STOP_COVERAGE`

### See Also:

- *Oracle Database Development Guide* for more information about using PL/SQL basic block coverage to maintain quality
- *Oracle Database PL/SQL Language Reference* for the `COVERAGE PRAGMA` syntax and semantics
- *Oracle Database PL/SQL Language Reference* for more information about the `PLSQL_OPTIMIZE_LEVEL` compilation parameter

## 120.2 DBMS\_PLSQL\_CODE\_COVERAGE Security Model

The user must have `EXECUTE` privilege on the `DBMS_PLSQL_CODE_COVERAGE` package.

The user must have `CREATE` privilege on the unit to collect coverage information about this unit.

Coverage information is not collected for wrapped units.

## 120.3 Summary of DBMS\_PLSQL\_CODE\_COVERAGE Subprograms

This table lists the DBMS\_PLSQL\_CODE\_COVERAGE subprograms and briefly describes them.

**Table 120-1 DBMS\_PLSQL\_CODE\_COVERAGE Package Subprograms**

Subprogram	Description
<a href="#">CREATE_COVERAGE_TABLES Procedure</a>	Creates coverage tables
<a href="#">START_COVERAGE Function</a>	Starts the coverage data collection in the user's session and returns the RUN_ID
<a href="#">STOP_COVERAGE Procedure</a>	Ends the current coverage run

### 120.3.1 CREATE\_COVERAGE\_TABLES Procedure

This procedure creates the tables used for coverage data collection.

#### Syntax

```
DBMS_PLSQL_CODE_COVERAGE.CREATE_COVERAGE_TABLES (
    FORCE_IT      IN BOOLEAN DEFAULT FALSE);
```

#### Parameters

Parameter	Description
FORCE_IT	The default is to raise an error if the coverage tables already exists. If set to TRUE, the tables are dropped silently if the tables already exist, and new tables are created.

#### Exceptions

**Table 120-2 CREATE\_COVERAGE\_TABLES Exceptions**

Exception	Description
COVERAGE_ERROR	The FORCE_IT parameter is FALSE and the tables already exist.

### 120.3.2 START\_COVERAGE Function

This function starts the coverage data collection in the user's session and returns a unique identifier RUN\_ID for the run.

### Syntax

```
DBMS_PLSQL_CODE_COVERAGE.START_COVERAGE (
  run_comment IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

Parameter	Description
run_comment	Allows the user to name a run and identify the test.

## 120.3.3 STOP\_COVERAGE Procedure

This procedure ends the current coverage run.

### Syntax

```
DBMS_PLSQL_CODE_COVERAGE.STOP_COVERAGE;
```

### Exceptions

**Table 120-3 STOP\_COVERAGE Exceptions**

Exception	Description
COVERAGE_ERROR	An error is raised if the coverage tables do not exist.

# DBMS\_PREDICTIVE\_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining.

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of `DBMS\_PREDICTIVE\_ANALYTICS` Subprograms](#)

## 121.1 `DBMS_PREDICTIVE_ANALYTICS` Overview

`DBMS_PREDICTIVE_ANALYTICS` automates parts of the data mining process.

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

`DBMS_PREDICTIVE_ANALYTICS` automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test mining models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

## 121.2 `DBMS_PREDICTIVE_ANALYTICS` Security Model

The `DBMS_PREDICTIVE_ANALYTICS` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to `public`.

The routines in the package are run with invokers' rights (run with the privileges of the current user).

The DBMS\_PREDICTIVE\_ANALYTICS package exposes APIs which are leveraged by the Oracle Data Mining option. Users who wish to invoke procedures in this package require the CREATE MINING MODEL system privilege (as well as the CREATE TABLE and CREATE VIEW system privilege).

## 121.3 Summary of DBMS\_PREDICTIVE\_ANALYTICS Subprograms

This table lists and briefly describes the DBMS\_PREDICTIVE\_ANALYTICS package subprograms.

**Table 121-1 DBMS\_PREDICTIVE\_ANALYTICS Package Subprograms**

Subprogram	Purpose
<a href="#">EXPLAIN Procedure</a>	Ranks attributes in order of influence in explaining a target column.
<a href="#">PREDICT Procedure</a>	Predicts the value of a target column based on values in the input data.
<a href="#">PROFILE Procedure</a>	Generates rules that identify the records that have the same target value.

### 121.3.1 EXPLAIN Procedure

The EXPLAIN procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train a model that calculates the attribute importance.

#### Note:

EXPLAIN supports DATE and TIMESTAMP datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining User's Guide*.

The EXPLAIN procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

#### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
    data_table_name      IN VARCHAR2,
    explain_column_name IN VARCHAR2,
```

```

result_table_name IN VARCHAR2,
data_schema_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 121-2 EXPLAIN Procedure Parameters**

Parameter	Description
data_table_name	Name of input table or view
explain_column_name	Name of the column to be explained
result_table_name	Name of the table where results are saved
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

## Usage Notes

The `EXPLAIN` procedure creates a result table with the columns described in [Table 121-3](#).

**Table 121-3 EXPLAIN Procedure Result Table**

Column Name	Datatype	Description
ATTRIBUTE_NAME	VARCHAR2(30)	Name of a column in the input data; all columns except the explained column are listed in the result table.
EXPLANATORY_VALUE	NUMBER	Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1.  An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column.  An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for <code>PREDICT</code> . In practice, an explanatory power equal to 1 is rarely returned.
RANK	NUMBER	Ranking of explanatory power. Rows with equal values for <code>explanatory_value</code> have the same rank. Rank values are not skipped in the event of ties.

## Example

The following example performs an `EXPLAIN` operation on the `SUPPLEMENTARY_DEMOGRAPHICS` table of Sales History.

```

--Perform EXPLAIN operation
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
    data_table_name      => 'supplementary_demographics',
    explain_column_name => 'home_theater_package',
    result_table_name   => 'demographics_explain_result');
END;

```

```
/
--Display results
SELECT * FROM demographics_explain_result;
```

ATTRIBUTE_NAME	EXPLANATORY_VALUE	RANK
Y_BOX_GAMES	.524311073	1
YRS_RESIDENCE	.495987246	2
HOUSEHOLD_SIZE	.146208506	3
AFFINITY_CARD	.0598227	4
EDUCATION	.018462703	5
OCCUPATION	.009721543	6
FLAT_PANEL_MONITOR	.00013733	7
PRINTER_SUPPLIES	0	8
OS_DOC_SET_KANJI	0	8
BULK_PACK_DISKETTES	0	8
BOOKKEEPING_APPLICATION	0	8
COMMENTS	0	8
CUST_ID	0	8

The results show that Y\_BOX\_GAMES, YRS\_RESIDENCE, and HOUSEHOLD\_SIZE are the best predictors of HOME\_THEATER\_PACKAGE.

## 121.3.2 PREDICT Procedure

The PREDICT procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train and test a model that makes the predictions.

### Note:

PREDICT supports DATE and TIMESTAMP datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining User's Guide*.

The PREDICT procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy                OUT NUMBER,
    data_table_name         IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 121-4 PREDICT Procedure Parameters**

Parameter	Description
accuracy	Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean.
data_table_name	Name of the input table or view.
case_id_column_name	Name of the column that uniquely identifies each case (record) in the input data.
target_column_name	Name of the column to predict.
result_table_name	Name of the table where results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

## Usage Notes

The `PREDICT` procedure creates a result table with the columns described in [Table 121-5](#).

**Table 121-5 PREDICT Procedure Result Table**

Column Name	Datatype	Description
Case ID column name	VARCHAR2 or NUMBER	The name of the case ID column in the input data.
PREDICTION	VARCHAR2 or NUMBER	The predicted value of the target column for the given case.
PROBABILITY	NUMBER	For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.

 **Note:**

Make sure that the name of the case ID column is not 'PREDICTION' or 'PROBABILITY'.

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.

## Example

The following example performs a PREDICT operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```
--Perform PREDICT operation
DECLARE
  v_accuracy NUMBER(10,9);
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.PREDICT(
    accuracy          => v_accuracy,
    data_table_name   => 'supplementary_demographics',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    result_table_name => 'pa_demographics_predict_result');
  DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/

Accuracy = .788696903

--Display results
SELECT * FROM pa_demographics_predict_result WHERE rownum < 10;
```

CUST_ID	PREDICTION	PROBABILITY
101501	1	.834069848
101502	0	.991269965
101503	0	.99978311
101504	1	.971643388
101505	1	.541754127
101506	0	.803719133
101507	0	.999999303
101508	0	.999999987
101509	0	.999953074

## 121.3.3 PROFILE Procedure

The PROFILE procedure generates rules that describe the cases (records) from the input data.

For example, if a target column CHURN has values 'Yes' and 'No', PROFILE generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not NULL). These cases are used by the procedure to build a model that calculates the rules.

 **Note:**

PROFILE does not support nested types or dates.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining User's Guide*.

The `PROFILE` procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
    data_table_name          IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 121-6 PROFILE Procedure Parameters**

Parameter	Description
<code>data_table_name</code>	Name of the table containing the data to be analyzed.
<code>target_column_name</code>	Name of the target column.
<code>result_table_name</code>	Name of the table where the results will be saved.
<code>data_schema_name</code>	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

### Usage Notes

The `PROFILE` procedure creates a result table with the columns described in [Table 121-7](#).

**Table 121-7 PROFILE Procedure Result Table**

Column Name	Datatype	Description
<code>PROFILE_ID</code>	NUMBER	A unique identifier for this profile (rule).
<code>RECORD_COUNT</code>	NUMBER	The number of records described by the profile.
<code>DESCRIPTION</code>	SYS.XMLTYPE	The profile rule. See " <a href="#">XML Schema for Profile Rules</a> ".

### XML Schema for Profile Rules

The `DESCRIPTION` column of the result table contains XML that conforms to the following XSD:

```
<xs:element name="SimpleRule">
  <xs:complexType>
    <xs:sequence>
      <xs:group ref="PREDICATE"/>
      <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="id" type="xs:string" use="optional"/>
    <xs:attribute name="score" type="xs:string" use="required"/>
    <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
  </xs:complexType>
</xs:element>
```

## Example

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```
SET serveroutput ON
SET trimsPOOL ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
    SELECT cust_id, education, occupation, affinity_card
    FROM sh.supplementary_demographics;
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PROFILE(
        DATA_TABLE_NAME => 'cust_edu_occ_view',
        TARGET_COLUMN_NAME => 'affinity_card',
        RESULT_TABLE_NAME => 'profile_result');
END;
/
```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```
SELECT a.profile_id, a.record_count, a.description.getstringval()
FROM profile_result a;
```

This `SELECT` statement returns the rules for a target value of 0.

```
SELECT *
FROM profile_result t
WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;
```

The eight rules generated by this example are displayed as follows.

```
<SimpleRule id="1" score="0" recordCount="443">
  <CompoundPredicate booleanOperator="and">
    <SimpleSetPredicate field="OCCUPATION" booleanOperator="isIn">
      <Array type="string">"Armed-F" "Exec." "Prof." " Protec."

```

# DBMS\_PREPROCESSOR

The DBMS\_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics:

- [Overview](#)
- [Operating Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_PREPROCESSOR Subprograms](#)

## 122.1 DBMS\_PREPROCESSOR Overview

It is necessary to first understand the three styles of subprograms, in order to understand how DBMS\_PREPROCESSOR works.

The following are the three styles of subprograms:

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a VARCHAR2 string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a VARCHAR2 index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is VALID and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single VARCHAR2 string in the second style, or as a VARCHAR2 index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the VARCHAR2 length limit.

## 122.2 DBMS\_PREPROCESSOR Operating Notes

These notes explain how DBMS\_PREPROCESSOR works with the three subprogram styles.

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be VALID. Likewise, the source text passed in as a VARCHAR2 string or a

VARCHAR2 index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.

- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as CREATE OR REPLACE. In general, the input source should be syntactically prepared in a way as if it were obtained from the ALL\_SOURCE view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

anonymous block	(BEGIN   DECLARE) ...
package	PACKAGE <name> ...
package body	PACKAGE BODY <name> ...
procedure	PROCEDURE <name> ...
function	FUNCTION <name> ...
type	TYPE <name> ...
type body	TYPE BODY <name> ...
trigger	(BEGIN   DECLARE) ...

If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.

- If the text of a wrapped PL/SQL unit is obtained from the ALL\_SOURCE view, the keyword WRAPPED always immediately follows the name of the unit, as in this example:

```
PROCEDURE "some proc" WRAPPED
a000000
b2
...
```

If such source text is presented to one of the [GET\\_POST\\_PROCESSED\\_SOURCE Functions](#) or to one of the [PRINT\\_POST\\_PROCESSED\\_SOURCE Procedures](#), the exception DBMS\_PREPROCESSOR.WRAPPED\_INPUT is raised.

## 122.3 DBMS\_PREPROCESSOR Data Structures

The DBMS\_PREPROCESSOR package defines a TABLE type.

### Table Types

[SOURCE\\_LINES\\_T Table Type](#)

### 122.3.1 DBMS\_PREPROCESSOR SOURCE\_LINES\_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

#### Syntax

```
TYPE source_lines_t IS
TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

## 122.4 Summary of DBMS\_PREPROCESSOR Subprograms

This table lists the DBMS\_PREPROCESSOR subprograms and briefly describes them.

**Table 122-1 DBMS\_PREPROCESSOR Package Subprograms**

Subprogram	Description
<a href="#">GET_POST_PROCESSED_SOURCE Functions</a>	Returns the post-processed source text
<a href="#">PRINT_POST_PROCESSED_SOURCE Procedures</a>	Prints post-processed source text

### 122.4.1 GET\_POST\_PROCESSED\_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

#### Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    object_type    IN VARCHAR2,
    schema_name    IN VARCHAR2,
    object_name    IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN source_lines_t)
RETURN source_lines_t;
```

#### Parameters

**Table 122-2 GET\_POST\_PROCESSED\_SOURCE Function Parameters**

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit

**Table 122-2 (Cont.) GET\_POST\_PROCESSED\_SOURCE Function Parameters**

Parameter	Description
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

**Return Values**

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

**Usage Notes**

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

**Exceptions****Table 122-3 GET\_POST\_PROCESSED\_SOURCE Function Exceptions**

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: <ul style="list-style-type: none"> <li>• Character string buffer too small</li> <li>• A line is too long (&gt; 32767 bytes)</li> </ul>

## 122.4.2 PRINT\_POST\_PROCESSED\_SOURCE Procedures

This overloaded procedure calls DBMS\_OUTPUT.PUT\_LINE to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

**Syntax**

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
  object_type  IN VARCHAR2,
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source          IN VARCHAR2);
```

Prints post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source          IN source_lines_t);
```

### Parameters

**Table 122-4 PRINT\_POST\_PROCESSED\_SOURCE Procedure Parameters**

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

### Exceptions

**Table 122-5 PRINT\_POST\_PROCESSED\_SOURCE Procedure Exceptions**

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: <ul style="list-style-type: none"> <li>Character string buffer too small</li> <li>A line is too long (&gt; 32767 bytes)</li> </ul>

### Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

# 123

## DBMS\_PRIVILEGE\_CAPTURE

The `DBMS_PRIVILEGE_CAPTURE` package provides an interface to database privilege analysis.

### See Also:

*Oracle Database Vault Administrator's Guide* regarding on how to analyze the use of privilege grants

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Summary of DBMS\\_PRIVILEGE\\_CAPTURE Subprograms](#)

### 123.1 DBMS\_PRIVILEGE\_CAPTURE Overview

Database privilege analysis enables you to create a policy that records the usage of system and object privileges that have been granted to users. You then can determine the privileges that your users are using and not using. From there, you can revoke any unused privileges, thereby reducing the number of excess privilege grants for users.

By analyzing the privileges that users must have to perform specific tasks, privilege analysis policies help you to achieve a least privilege model for your users.

### 123.2 DBMS\_PRIVILEGE\_CAPTURE Security Model

The privilege analysis administrator role, `CAPTURE_ADMIN`, is granted `EXECUTE` permission on the `DBMS_PRIVILEGE_CAPTURE` package by default.

The `CAPTURE_ADMIN` role is granted to the `DBA` role during database installation.

### 123.3 DBMS\_PRIVILEGE\_CAPTURE Constants

The `DBMS_PRIVILEGE_CAPTURE` package defines several enumerated constants for specifying parameter values.

**Table 123-1 DBMS\_PRIVILEGE\_CAPTURE Constants**

Constant	Value	Type	Description
G_DATABASE	1	NUMBER	Analyzes all privilege use, except privileges used by the SYS user.
G_ROLE	2	NUMBER	Analyzes privilege use for the specified roles.
G_CONTEXT	3	NUMBER	Analyzes privilege use when the condition parameter evaluates to true.
G_ROLE_AND_CONTEXT	4	NUMBER	Analyzes privilege use for the specified roles when the condition parameter evaluates to true.

## 123.4 DBMS\_PRIVILEGE\_CAPTURE Examples

These examples illustrate using the `DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE` procedure to create various types of privilege analysis, like database analysis, role analysis, and context-specific analysis. The examples also illustrate combining different conditions in context-specific analysis.

```
--Create a database privilege analysis policy
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'all_priv_analysis_pol',
    description   => 'database-wide policy to analyze all privileges',
    type          => DBMS_PRIVILEGE_CAPTURE.G_DATABASE);
END;

--Create a privilege analysis policy to analyze privileges from the role PUBLIC
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'pub_analysis_pol',
    description   => 'Policy to record privilege use by PUBLIC',
    type          => DBMS_PRIVILEGE_CAPTURE.G_ROLE,
    roles         => role_name_list('PUBLIC'));
END;

-- Create a policy to analyze privileges from the application module, "Account
-- Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'acc_pay_analysis_pol',
    type          => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition     => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable''');
END;

-- Create a policy that records privileges for session user APPS when running the
-- application module "Account Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'acc_pay_analysis_pol',
    type          => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition     => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable'' AND
```

```

SYS_CONTEXT('USERENV', 'SESSION_USER') = 'APPS');
END;

```

## 123.5 Summary of DBMS\_PRIVILEGE\_CAPTURE Subprograms

This table lists and briefly describes the DBMS\_PRIVILEGE\_CAPTURE package subprograms.

**Table 123-2 DBMS\_PRIVILEGE\_CAPTURE Package Subprograms**

Subprogram	Description
<a href="#">CAPTURE_DEPENDENCY_PRIVS Procedure</a>	Captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation.
<a href="#">CREATE_CAPTURE Procedure</a>	Creates a policy that specifies the conditions for analyzing privilege use.
<a href="#">DELETE_RUN Procedure</a>	Deletes a privilege analysis capture run
<a href="#">DISABLE_CAPTURE Procedure</a>	Stops the recording of privilege use for a specified privilege analysis policy
<a href="#">DROP_CAPTURE Procedure</a>	Removes a privilege analysis policy together with the data recorded
<a href="#">ENABLE_CAPTURE Procedure</a>	Starts the recording of privilege analysis for a specified privilege analysis policy
<a href="#">GENERATE_RESULT Procedure</a>	Populates the privilege analysis data dictionary views with data

### 123.5.1 CAPTURE\_DEPENDENCY\_PRIVS Procedure

This procedure captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation.

#### Syntax

```
DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS ( );
```

#### Parameters

This procedure has no parameters.

#### Usage Notes

Every rerun of the DBMS\_PRIVILEGE\_CAPTURE.CAPTURE\_DEPENDENCY\_PRIVS procedure deletes any existing records from the privilege analysis data dictionary views. It then recaptures records based on the existing PL/SQL program units.

## 123.5.2 CREATE\_CAPTURE Procedure

This procedure creates a privilege analysis policy that specifies the conditions for analyzing privilege use. It also optionally specifies the roles for which privilege use is to be analyzed, and the conditions under which privilege use is to be analyzed.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE (
  name          IN  VARCHAR2,
  description   IN  VARCHAR2 DEFAULT NULL,
  type         IN  NUMBER DEFAULT G_DATABASE,
  roles        IN  ROLE_NAME_LIST DEFAULT ROLE_NAME_LIST(),
  condition    IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 123-3 CREATE\_CAPTURE Procedure Parameters**

Parameter	Description
name	Name of the privilege analysis policy. A string of size up to 30 characters.
description	Description of the policy (up to 1024 characters)
type	Type of the privilege analysis policy. Possible values are: <ul style="list-style-type: none"> <li>G_DATABASE: Captures all privilege use in the database, except privileges used by the SYS user.</li> <li>G_ROLE: Captures the use of a privilege if the privilege is part of a specified role or list of roles.</li> <li>G_CONTEXT: Captures the use of a privilege if the context specified by the <code>condition</code> parameter evaluates to true.</li> <li>G_ROLE_AND_CONTEXT: Captures the use of a privilege if the privilege is part of the specified list of roles and when the condition specified by the <code>condition</code> parameter is true.</li> </ul>
roles	The roles whose privileges are to be analyzed. Required if the <code>type</code> is G_ROLE or G_ROLE_AND_CONTEXT.
condition	PL/SQL boolean expression containing up to 4000 characters. Required if <code>type</code> is G_CONTEXT or G_ROLE_AND_CONTEXT. Note that the boolean expression can only contain SYS_CONTEXT, but not other functions.

### Usage Notes

- When using role-based analysis for the `CREATE_CAPTURE` procedure, privilege use is analyzed even if the privilege is indirectly granted to the specified role.

For example, say role R2 contains role R1, and R1 contains privilege P1. If the privilege policy includes only role R2, any use of the P1 privilege is still analyzed, as privilege P1 is an indirect part of role R2.

- When using the `condition` parameter, use the following syntax for the PL/SQL expression:

```
condition ::= predicate | (predicate1) AND (predicate2)
            | (predicate1) OR (predicate2)
```

Where,

```
predicate ::= sys_context(namespace, attribute) relop constant_value |
sys_context(namespace, attribute) between constant_value and
constant_value | sys_context(namespace, attribute) in {constant_value
(,constant_value)* }
```

Where,

```
relop ::= = | < | <= | > | >= | <>
```

- A privilege analysis policy cannot analyze the use of SYS user privileges.

## 123.5.3 DELETE\_RUN Procedure

This procedure deletes a privilege analysis capture run.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.DELETE_RUN (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2);
```

### Parameters

**Table 123-4** *DELETE\_RUN Procedure Parameters*

Parameter	Description
name	Name of the privilege analysis policy with which the capture run is associated
run_name	Name of the capture run

### Usage Notes

- You can find the names of existing privilege capture policies by querying the DBA\_PRIV\_CAPTURES data dictionary view.
- Another way to delete a capture run is to drop the policy with which the capture run is associated. Dropping the policy automatically drops its associated capture runs.
- When you drop a capture run it is no longer accessible through the privilege capture data dictionary views.

## 123.5.4 DISABLE\_CAPTURE Procedure

This procedure stops the recording of privilege use for a specified privilege analysis policy. When a policy is disabled, privilege use meeting the policy condition is no longer recorded.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.DISABLE_CAPTURE (
    name          IN VARCHAR2);
```

## Parameters

**Table 123-5** DISABLE\_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the privilege analysis policy to be disabled

## Usage Notes

When a privilege analysis policy is first created, it is disabled by default.

## 123.5.5 DROP\_CAPTURE Procedure

This procedure removes a privilege analysis policy together with the data recorded. When a policy is removed, all previously recorded privilege use data associated with the policy is deleted.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.DROP_CAPTURE (
    name          IN VARCHAR2);
```

## Parameters

**Table 123-6** DROP\_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the privilege analysis policy to be removed

## Usage Notes

- You must disable a privilege analysis policy before removing it. An enabled policy cannot be removed.
- If there are capture runs associated with this policy, then they are automatically dropped when you drop the policy.

## 123.5.6 ENABLE\_CAPTURE Procedure

This procedure starts the recording of privilege analysis for a specified privilege analysis policy and optionally provides a capture run for this policy. After a policy is enabled, all privilege use under the policy condition is recorded.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.ENABLE_CAPTURE (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 123-7** *ENABLE\_CAPTURE Procedure Parameters*

Parameter	Description
name	Name of the privilege analysis policy to be enabled
run_name	Name of the capture run to associate with this policy, less than 128 characters. Enclose exotic characters in double quotation marks.

## Usage Notes

The following usage notes apply:

- When a privilege analysis policy is first created, it is disabled by default. You must run `ENABLE_CAPTURE` to enable the privilege analysis policy.
- You can enable only one privilege analysis policy at a time. However, a database-wide privilege analysis of the `G_DATABASE` type can be enabled together with another non `G_DATABASE` privilege analysis.
- You cannot enable the same run multiple times. For example, `run_01` cannot be used again if you want to re-enable the capture for `run_01`. Instead, create a new run.

## 123.5.7 GENERATE\_RESULT Procedure

This procedure populates the privilege analysis data dictionary views with data.

 **See Also:**

*Oracle Database Vault Administrator's Guide* for more information about privilege analysis views

## Syntax

```
DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT (
  name          IN VARCHAR2,
  run_name      IN VARCHAR2 DEFAULT NULL,
  DEPENDENCY    IN BOOLEAN DEFAULT NULL);
```

## Parameters

**Table 123-8** *GENERATE\_RESULT Procedure Parameters*

Parameter	Description
name	Name of the privilege analysis policy for which views are populated

**Table 123-8 (Cont.) *GENERATE\_RESULT* Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
run_name	Name of the capture run that is associated with the privilege analysis policy. If you omit this parameter, then the records of all created runs will be analyzed. When you specify the run_name parameter, only the records of that run are analyzed and all other runs are unaffected.
dependency	Enter Y (yes) or N (no) to indicate if PL/SQL compilation privileges, set by the DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS procedure, should be included in the report.

**Usage Notes**

You must disable a privilege analysis policy before populating the privilege analysis views for the policy. You cannot invoke this subprogram on an enabled privilege analysis policy.

# DBMS\_PROCESS

The `DBMS_PROCESS` package provides an interface to manage the prespawnd servers.

This chapter contains the following topics:

- [DBMS\\_PROCESS Overview](#)
- [DBMS\\_PROCESS Security Model](#)
- [Summary of DBMS\\_PROCESS Subprograms](#)

## 124.1 DBMS\_PROCESS Overview

By default, Oracle Database can prespawn foreground processes to improve the performance of client connections.

A prespawnd process refers to a process that has been spawned but does not have a session yet. When a user connects to the database or a service process is needed, the process performs further initialization as needed.

To manage foreground processes, use the `DBMS_PROCESS` package. The procedures in this package configure the number of foreground processes for a connection pool, start a connection pool, and stop a connection pool.

### See Also:

- *Oracle Database Administrator's Guide* for a detailed description of managing a pre-created processes
- *Oracle Database Reference* for information about the `USE_DEDICATED_BROKER` parameter, which determines how dedicated servers are spawned. `TRUE` enables the listener to send the connection to a dedicated connection broker that spawns the dedicated server. `FALSE` sets the listener to spawn a dedicated server directly.

## 124.2 DBMS\_PROCESS Security Model

You must be granted the `SYSDBA` administrative privilege to use the `DBMS_PROCESS` package.

## 124.3 Summary of DBMS\_PROCESS Subprograms

This table lists the DBMS\_PROCESS subprograms and briefly describes them.

**Table 124-1 DBMS\_PROCESS Package Subprograms**

Subprogram	Description
<a href="#">CONFIGURE_POOL Procedure</a>	Configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool
<a href="#">START_POOL Procedure</a>	Starts a prespawnd foreground process pool.
<a href="#">STOP_POOL Procedure</a>	Stops a prespawnd foreground process pool.

### 124.3.1 CONFIGURE\_POOL Procedure

This procedure configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool.

#### Syntax

```
DBMS_PROCESS.CONFIGURE_POOL(
  pool_name      IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL",
  min_count      IN  NUMBER  DEFAULT 10,
  batch_count    IN  NUMBER  DEFAULT 20,
  init_count     IN  NUMBER  DEFAULT 0);
```

#### Parameters

**Table 124-2 CONFIGURE\_POOL Procedure Parameters**

Parameter	Description
pool_name	Name of the foreground pool
min_count	Count after which a batch of prespawnd processes will be spawned in the pool (default 10; maximum number of processes 64,000)
batch_count	Batch of prespawnd servers to be spawned in the pool (default 20). The total value of the min_count and batch_count values cannot exceed the PROCESSES parameter value.
init_count	Set of prespawnd servers to be spawned in startup, or before a storm of connections, spawned in batches (default 0). Do not exceed the PROCESSES parameter value.

## Exceptions

**Table 124-3 CONFIGURE\_POOL Procedure Exceptions**

Error	Description
ORA-456	Prespawn not enabled
ORA-457	Prespawn pool not found
ORA-458	Prespawn pool already started
ORA-459	Prespawn pool not started
ORA-460	Process pool invalid configuration value(s)

## Usage Notes

- To find information about foreground processes, query the V\$PROCESS\_POOL dynamic view.

## Example

```
BEGIN
  DBMS_PROCESS.CONFIGURE_POOL (
    pool_name => 'hrdb_pool',
    min_count => 40,
    batch_count => 20,
    init_count => 10);
END;
/
```

## 124.3.2 START\_POOL Procedure

This procedure starts a prespawnd foreground process pool.

## Syntax

```
DBMS_PROCESS.START_POOL(
  pool_name      IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

## Parameters

**Table 124-4 START\_POOL Procedure Parameters**

Parameter	Description
pool_name	Name of prespawnd foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view.

## Exceptions

**Table 124-5 START\_POOL Procedure Exceptions**

Error	Description
ORA-457	Prespawn pool not found
ORA-458	Prespawn pool already started
ORA-459	Prespawn pool not started

### Example

```
BEGIN
  DBMS_PROCESS.START_POOL (
    pool_name => 'hrdb_pool',
  );
END;
```

## 124.3.3 STOP\_POOL Procedure

This procedure stops a prespawnd foreground process pool.

### Syntax

```
DBMS_PROCESS.STOP_POOL(
  pool_name      IN VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

### Parameters

**Table 124-6 STOP\_POOL Procedure Parameters**

Parameter	Description
pool_name	Name of the prespawnd foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view.

## Exceptions

**Table 124-7 STOP\_POOL Procedure Exceptions**

Error	Description
ORA-457	Prespawn pool not found
ORA-458	Prespawn pool already started
ORA-459	Prespawn pool not started

### Example

```
BEGIN
  DBMS_PROCESS.STOP_POOL (
    pool_name => 'hrdb_pool',
  );
END;
```

# DBMS\_PROFILER

The package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Summary of DBMS\\_PROFILER Subprograms](#)

## 125.1 DBMS\_PROFILER Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

### Note:

It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in the following tables.

**Table 125-1 Columns in Table PLSQL\_PROFILER\_RUNS**

Column	Datatype	Definition
runid	NUMBER PRIMARY KEY	Unique run identifier from psql_profiler_runnumber

**Table 125-1 (Cont.) Columns in Table PLSQL\_PROFILER\_RUNS**

Column	Datatype	Definition
related_run	NUMBER	Runid of related run (for client/server correlation)
run_owner	VARCHAR2(128)	User who started run
run_date	DATE	Start time of run
run_comment	VARCHAR2(2047)	User provided comment for this run
run_total_time	NUMBER	Elapsed time for this run in nanoseconds
run_system_inf	VARCHAR2(2047)	Currently unused
o		
run_comment1	VARCHAR2(2047)	Additional comment
spare1	VARCHAR2(256)	Unused

**Table 125-2 Columns in Table PLSQL\_PROFILER\_UNITS**

Column	Datatype	Definition
runid	NUMBER	Primary key, references plsql_profiler_runs,
unit_number	NUMBER	Primary key, internally generated library unit #
unit_type	VARCHAR2(128)	Library unit type
unit_owner	VARCHAR2(128)	Library unit owner name
unit_name	VARCHAR2(128)	Library unit name timestamp on library unit
unit_timestamp	DATE	In the future will be used to detect changes to unit between runs
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

**Table 125-3 Columns in Table PLSQL\_PROFILER\_DATA**

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused

**Table 125-3 (Cont.) Columns in Table PLSQL\_PROFILER\_DATA**

Column	Datatype	Definition
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer (profrep.sql) is provided with the PL/SQL demo scripts.

Note that prior to Oracle Database 10g, the `DBMS_PROFILER` package was not automatically loaded when the database was created, and the Oracle-supplied `PROFLOAD.SQL` script was used to create it. In 10g and beyond, the `DBMS_PROFILER` package is loaded automatically when the database is created, and `PROFLOAD.SQL` is no longer needed.

## 125.2 DBMS\_PROFILER Security Model

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

### Note:

`DBMS_PROFILER` treats any program unit that is compiled in `NATIVE` mode as if you do not have `CREATE` privilege, that is, you will not get any output.

## 125.3 DBMS\_PROFILER Operational Notes

These notes describe a typical run, how to interpret output, and two methods of exception generation.

### Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a "run". A run involves running the application through benchmark tests with profiler data collection enabled.

You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

The user must first create database tables in the profiler user's schema to collect the data. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, "warm up" the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the `SYSADMIN` should use a modified `PROFTAB.SQL` script which:

- Creates the profiler tables and sequence
- Grants `SELECT/INSERT/UPDATE` on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

 **Note:**

Do not alter the actual fields of the tables.

A typical run then involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

 **Note:**

The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures. Flushing the collected data involves storing collected data in the database tables created earlier.

 **See Also:**

"[FLUSH\\_DATA Function and Procedure](#)".

### Interpreting Output

The table `plsql_profiler_data` contains one row for each line of the source unit for which code was generated. The `line#` value specifies which source line. If the row exists, and the `total_occur` value in that row is  $> 0$ , some code associated with that line was executed. If the row exists, and `total_occur` value is 0, no code associated with that line was executed. If the row doesn't exist in the table, no code was generated for that line, and therefore it should not be mentioned in reports

If the source of a single statement is on a single line, any code generated for that statement will be attributed to that line number. (In some cases, such as a simple declaration, or because of optimization, no code will be needed). To get coverage information, units should be compiled with `PLSQL_OPTIMIZE_LEVEL=1`.

If a statement spans multiple lines, any code generated for that statement will be attributed to some line in the range, but it is not guaranteed that every line in the range will have code attributed to it. In such a case there will be gaps in the set of `line#` values. In particular, multi-line SQL-related statements may appear to be on a single line (usually the first). This is because PL/SQL passes the processed text of the cursor to the SQL engine; therefore, as far as PL/SQL is concerned, the entire SQL statement is a single indivisible operation.

When multiple statements are on the same line, the profiler will combine the occurrences for each statement. This may be confusing if a line has embedded control flow. For example, if `'then ...'` and `'else ...'` are on the same line, it will not be possible to determine whether the `'then'` or the `'else'` was taken.

In general, profiler and coverage reports are most easily interpreted if each statement is on its own line.

### Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

## 125.4 DBMS\_PROFILER Exceptions

DBMS\_PROFILER throws the exceptions described in this topic.

**Table 125-4 DBMS\_PROFILER Exceptions**

Exception	Description
version_mismatch	Corresponds to error_version.
profiler_error	Corresponds to either "error_param" or "error_io".

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'  
`error_param constant binary_integer := 1;`
- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'  
`error_io constant binary_integer := 2;`
- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the `DBMS_PROFILER` package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.  
`error_version constant binary_integer := -1;`

## 125.5 Summary of DBMS\_PROFILER Subprograms

This table lists the `DBMS_PROFILER` subprograms and briefly describes them.

**Table 125-5 DBMS\_PROFILER Package Subprograms**

Subprogram	Description
<a href="#">FLUSH_DATA Function and Procedure</a>	Flushes profiler data collected in the user's session
<a href="#">GET_VERSION Procedure</a>	Gets the version of this API
<a href="#">INTERNAL_VERSION_CHECK Function</a>	Verifies that this version of the <code>DBMS_PROFILER</code> package can work with the implementation in the database
<a href="#">PAUSE_PROFILER Function and Procedure</a>	Pauses profiler data collection
<a href="#">RESUME_PROFILER Function and Procedure</a>	Resumes profiler data collection
<a href="#">START_PROFILER Functions and Procedures</a>	Starts profiler data collection in the user's session
<a href="#">STOP_PROFILER Function and Procedure</a>	Stops profiler data collection in the user's session

## 125.5.1 FLUSH\_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

 **Note:**

Use the `PROFTAB.SQL` script to create the tables and other data structures required for persistently storing the profiler data.

### Syntax

```
DBMS_PROFILER.FLUSH_DATA  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.FLUSH_DATA;
```

## 125.5.2 GET\_VERSION Procedure

This procedure gets the version of this API.

### Syntax

```
DBMS_PROFILER.GET_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

### Parameters

**Table 125-6** GET\_VERSION Procedure Parameters

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

## 125.5.3 INTERNAL\_VERSION\_CHECK Function

This function verifies that this version of the `DBMS_PROFILER` package can work with the implementation in the database.

### Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK  
    RETURN BINARY_INTEGER;
```

## 125.5.4 PAUSE\_PROFILER Function and Procedure

This function pauses profiler data collection.

### Syntax

```
DBMS_PROFILER.PAUSE_PROFILER
    RETURN BINARY_INTEGER;

DBMS_PROFILER.PAUSE_PROFILER;
```

## 125.5.5 RESUME\_PROFILER Function and Procedure

This function resumes profiler data collection.

### Syntax

```
DBMS_PROFILER.RESUME_PROFILER
    RETURN BINARY_INTEGER;

DBMS_PROFILER.RESUME_PROFILER;
```

## 125.5.6 START\_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the `START_PROFILER` function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

### Syntax

```
DBMS_PROFILER.START_PROFILER(
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER)
    RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '')
    RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER);

DBMS_PROFILER.START_PROFILER(
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '');
```

## Parameters

**Table 125-7** START\_PROFILER Function Parameters

Parameter	Description
run_comment	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
run_number	Stores the number of the run so you can store and later recall the run's data.
run_comment1	Allows you to make interesting comments about the run.

## 125.5.7 STOP\_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

### Syntax

```
DBMS_PROFILER.STOP_PROFILER  
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.STOP_PROFILER;
```

# DBMS\_PROPAGATION\_ADM

The `DBMS_PROPAGATION_ADM` package, one of a set of Oracle Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_PROPAGATION\\_ADM Subprograms](#)

## 126.1 DBMS\_PROPAGATION\_ADM Overview

This package provides interfaces to start, stop, and configure a propagation.

### See Also:

*Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

## 126.2 DBMS\_PROPAGATION\_ADM Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_PROPAGATION_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

### See Also:

*Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

## 126.3 Summary of DBMS\_PROPAGATION\_ADM Subprograms

This table lists the DBMS\_PROPAGATION\_ADM subprograms and briefly describes them.

**Table 126-1 DBMS\_PROPAGATION\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ALTER_PROPAGATION Procedure</a>	Adds, alters, or removes a rule set for a propagation
<a href="#">CREATE_PROPAGATION Procedure</a>	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
<a href="#">DROP_PROPAGATION Procedure</a>	Drops a propagation
<a href="#">START_PROPAGATION Procedure</a>	Starts a propagation
<a href="#">STOP_PROPAGATION Procedure</a>	Stops a propagation

 **Note:**

All subprograms commit unless specified otherwise.

### 126.3.1 ALTER\_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

 **See Also:**

*Oracle Streams Concepts and Administration* and [DBMS\\_RULE\\_ADM](#) for more information about rules and rule sets

#### Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
  propagation_name      IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set       IN  BOOLEAN   DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 126-2 ALTER\_PROPAGATION Procedure Parameters**

Parameter	Description
<code>propagation_name</code>	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
<code>rule_set_name</code>	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p>
<code>remove_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages.</p> <p>If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified propagation.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

**Table 126-2 (Cont.) ALTER\_PROPAGATION Procedure Parameters**

Parameter	Description
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages.</p> <p>If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified propagation.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

## 126.3.2 CREATE\_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

### Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
    propagation_name      IN  VARCHAR2,
    source_queue          IN  VARCHAR2,
    destination_queue     IN  VARCHAR2,
    destination_dblink    IN  VARCHAR2  DEFAULT NULL,
    rule_set_name         IN  VARCHAR2  DEFAULT NULL,
```

```

negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
queue_to_queue            IN  BOOLEAN    DEFAULT NULL,
original_propagation_name IN  VARCHAR2  DEFAULT NULL,
auto_merge_threshold      IN  NUMBER      DEFAULT NULL);

```

## Parameters

**Table 126-3 CREATE\_PROPAGATION Procedure Parameters**

Parameter	Description
propagation_name	<p>The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner.</p> <p><b>Note:</b> The <code>propagation_name</code> setting cannot be altered after the propagation is created.</p>
source_queue	<p>The name of the source queue, specified as <code>[schema_name. ]queue_name</code>. The current database must contain the source queue.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p>
destination_queue	<p>The name of the destination queue, specified as <code>[schema_name. ]queue_name</code>.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p>
destination_dblink	<p>The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue.</p> <p>If NULL, then the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>

**Table 126-3 (Cont.) CREATE\_PROPAGATION Procedure Parameters**

Parameter	Description
<code>rule_set_name</code>	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>

**Table 126-3 (Cont.) CREATE\_PROPAGATION Procedure Parameters**

Parameter	Description
queue_to_queue	<p>If TRUE or NULL, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>
original_propagation_name	<p>Specify the original propagation name if the propagation being created is part of a split and merge operation initiated by the SPLIT_STREAMS procedure in the DBMS_STREAMS_ADM package. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream using the MERGE_STREAMS procedure in the DBMS_STREAMS_ADM package.</p> <p>Specify NULL if the propagation being created is not part of a split and merge operation.</p> <p><b>See Also:</b> <a href="#">SPLIT_STREAMS Procedure</a> and <a href="#">MERGE_STREAMS Procedure</a></p>
auto_merge_theshold	<p>Specify a positive number if both of the following conditions are met:</p> <ul style="list-style-type: none"> <li>The propagation being created is part of a split and merge operation initiated by the SPLIT_STREAMS procedure in the DBMS_STREAMS_ADM package.</li> <li>The stream will be merged back to the original stream automatically.</li> </ul> <p>Specify NULL if either of the following conditions are met:</p> <ul style="list-style-type: none"> <li>The propagation being created is not part of a split and merge operation.</li> <li>The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically.</li> </ul> <p><b>See Also:</b> <a href="#">SPLIT_STREAMS Procedure</a> and <a href="#">MERGE_STREAMS Procedure</a></p>

### Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

 **See Also:**

- [DBMS\\_RULE\\_ADM](#)
- *Oracle Streams Concepts and Administration* for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

## 126.3.3 DROP\_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

### Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name      IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 126-4 DROP\_PROPAGATION Procedure Parameters**

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.  If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.

### Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the `DBMS_STREAMS_ADM` package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

 **See Also:**

*Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

The following are the data dictionary views for Oracle Streams rules:

- ALL\_STREAMS\_GLOBAL\_RULES
- DBA\_STREAMS\_GLOBAL\_RULES
- ALL\_STREAMS\_MESSAGE\_RULES
- DBA\_STREAMS\_MESSAGE\_RULES
- ALL\_STREAMS\_SCHEMA\_RULES
- DBA\_STREAMS\_SCHEMA\_RULES
- ALL\_STREAMS\_TABLE\_RULES
- DBA\_STREAMS\_TABLE\_RULES

 **Note:**

When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

## 126.3.4 START\_PROPAGATION Procedure

This procedure starts a propagation.

### Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(
  propagation_name IN VARCHAR2);
```

### Parameter

**Table 126-5 START\_PROPAGATION Procedure Parameter**

Parameter	Description
propagation_name	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

### Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

## 126.3.5 STOP\_PROPAGATION Procedure

This procedure stops a propagation.

### Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
  propagation_name IN VARCHAR2,
  force            IN BOOLEAN DEFAULT FALSE);
```

## Parameter

**Table 126-6 STOP\_PROPAGATION Procedure Parameter**

Parameter	Description
<code>propagation_name</code>	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
<code>force</code>	If <code>TRUE</code> , then the procedure stops the propagation and clears the statistics for the propagation. If <code>FALSE</code> , then the procedure stops the propagation without clearing the statistics for the propagation.

## Usage Notes

The propagation status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the propagation is not started upon database instance startup.

# 127

## DBMS\_QOPATCH

The `DBMS_QOPATCH` package provides an interface to view the installed database patches.

This chapter contains the following topics:

- [Overview](#)
- [Security Modell](#)
- [Operational Notes](#)
- [Error Messages](#)
- [Summary of DBMS\\_QOPATCH Subprograms](#)

### 127.1 DBMS\_QOPATCH Overview

The `DBMS_QOPATCH` package provides a PLSQL/SQL interface to view the installed database patches. The interface provides all the patch information available as part of the `OPATCH LSINVENTORY -XML` command. The package accesses the OUI patch inventory in real time to provide patch and meta-information.

### 127.2 DBMS\_QOPATCH Security Model

The `DBMS_QOPATCH` package is created as part of `SYS` schema and `SYS` is the only user who can execute these subprograms.

### 127.3 DBMS\_QOPATCH Operational Notes

The following operational notes apply to `DBMS_QOPATCH`.

- The package will work only if the database is `OPEN`.
- In an Oracle Real Application Clusters (RAC) environment, if the subprogram requires to fetch data from other RAC nodes it spawns a job in the other node(s) to get the data. In this case `JOB_QUEUE_PROCESSES` needs to be `>0` for the package to fetch the data from other RAC nodes.
- If there is a delay in the job execution, the package returns `ORA-20008` error.

### 127.4 DBMS\_QOPATCH Exceptions

This table lists the exceptions raised by the `DBMS_QOPATCH` package.

**Table 127-1 DBMS\_QOPATCH Error Messages**

Error Code	Description
ORA-20001	Latest XML inventory is not loaded into table.
ORA-20002	Directory creation failed.
ORA-20003	Configuration of a job on a node failed.
ORA-20004	Job configuration failed as node is inactive.
ORA-20005	Job is not configured with given node, instance name.
ORA-20006	Number of RAC active instances and opatch jobs configured are not same.
ORA-20007	Job configuration failed as node or instance is not active.
ORA-20008	Timed out - job execution time is more than 120Secs.
ORA-20009	Job execution failed.
ORA-20010	Node is inactive and job cannot be executed.
ORA-20011	Job name is NULL and inventory cannot be loaded.
ORA-20012	JOB_QUEUE_PROCESSES is set to zero and the inventory cannot be loaded.
ORA-20013	DBMS_QOPATCH ran mostly in non-install area.
ORA-20014	Database is not opened.
ORA-20015	Database opened as read-only.

## 127.5 Summary of DBMS\_QOPATCH Subprograms

This table lists and briefly describes the DBMS\_QOPATCH package subprograms.

**Table 127-2 DBMS\_QOPATCH Package Subprograms**

Subprogram	Description
<a href="#">CHECK_PATCH_INSTALLED Function</a>	Checks if a patch is installed.
<a href="#">GET_OPATCH_BUGS Function</a>	Provides a bugs list for a patch in XML format if the patch number is given. If patch is not given then it lists all the bugs installed in all the patches in XML format.
<a href="#">GET_OPATCH_COUNT Function</a>	Provides the total number of installed patches in XML format
<a href="#">GET_OPATCH_DATA Function</a>	Provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element
<a href="#">GET_OPATCH_FILES Function</a>	Provides the list of files modified in the given patch number in XML format
<a href="#">GET_OPATCH_INSTALL_INFO Function</a>	Returns the XML element containing the ORACLE_HOME details such as patch and inventory location
<a href="#">GET_OPATCH_LIST Function</a>	Provides list of patches installed as an XML element from the XML inventory
<a href="#">GET_OPATCH_LSINVENTORY</a>	Returns whole opatch inventory as XML instance document.

**Table 127-2 (Cont.) DBMS\_QOPATCH Package Subprograms**

Subprogram	Description
<a href="#">GET_OPATCH_OLAYS Function</a>	Provides overlay patches for a given patch as XML element
<a href="#">GET_OPATCH_PREQS Function</a>	Provides prerequisite patches for a given patch as XML element
<a href="#">GET_OPATCH_XSLT</a>	Returns the style-sheet for the opatch XML inventory presentation
<a href="#">GET_PATCH_DETAILS Function</a>	Displays the detailed patch information from <code>opatch lsinventory</code> .
<a href="#">GET_SQLPATCH_STATU S Procedure</a>	Displays the SQL patch status by querying from SQL patch registry to produce complete patch level information
<a href="#">IS_PATCH_INSTALLED Function</a>	Provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory
<a href="#">OPATCH_COMPARE_CU RRENT Function</a>	Compares the current database with a list of bugs.
<a href="#">OPATCH_COMPARE_NO DES Function</a>	Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.
<a href="#">SET_CURRENT_OPINST Procedure</a>	Sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment

## 127.5.1 CHECK\_PATCH\_INSTALLED Function

Checks if the patch is installed.

### Syntax

```
DBMS_QOPATCH.CHECK_PATCH_INSTALLED (
    bugs      IN QOPATCH_LIST);
RETURN VARCHAR2;
```

### Parameters

**Table 127-3 CHECK\_PATCH\_INSTALLED Parameters**

Parameter	Description
<code>bugs</code>	List of patches to be checked.

## 127.5.2 GET\_OPATCH\_BUGS Function

This function provides a bugs list in a patch if the patch number is given. If a patch number is not given, it lists all the bugs in the specified XML format.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_BUGS (  
    patchnum IN VARCHAR2 DEFAULT NULL);  
RETURN XMLTYPE;
```

### Parameters

**Table 127-4** GET\_OPATCH\_BUGS Function Parameters

Parameter	Description
patchnum	Patch number

## 127.5.3 GET\_OPATCH\_COUNT Function

This function provides the total number of installed patches in XML format.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_COUNT (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

### Parameters

**Table 127-5** GET\_OPATCH\_COUNT Function Parameters

Parameter	Description
patchnum	Patch number

## 127.5.4 GET\_OPATCH\_DATA Function

This function provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_DATA (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

## Parameters

**Table 127-6** GET\_OPATCH\_DATA Function Parameters

Parameter	Description
patchnum	Patch number

## 127.5.5 GET\_OPATCH\_FILES Function

This function provides the list of files modified in the given patch number in XML format.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_FILES (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

## Parameters

**Table 127-7** GET\_OPATCH\_FILES Function Parameters

Parameter	Description
patchnum	Patch number

## 127.5.6 GET\_OPATCH\_INSTALL\_INFO Function

This function returns the XML element containing the ORACLE\_HOME details such as patch and inventory location.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_INSTALL_INFO  
RETURNS XMLTYPE;
```

## 127.5.7 GET\_OPATCH\_LIST Function

This function provides list of patches installed as an XML element from the XML inventory.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_LIST  
RETURN XMLTYPE;
```

## 127.5.8 GET\_OPATCH\_L SINVENTORY

This function returns whole opatch inventory as XML instance document.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_L SINVENTORY
RETURN XMLTYPE;
```

## 127.5.9 GET\_OPATCH\_OLAYS Function

This function provides overlay patches for a given patch as XML element.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_OLAYS (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

### Parameters

**Table 127-8 GET\_OPATCH\_OLAYS Function Parameters**

Parameter	Description
patchnum	Patch number

## 127.5.10 GET\_OPATCH\_PREQS Function

This function provides prerequisite patches for a given patch as XML element.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_PREQS (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

### Parameters

**Table 127-9 GET\_OPATCH\_PREQS Function Parameters**

Parameter	Description
patchnum	Patch number

## 127.5.11 GET\_OPATCH\_XSLT

This function returns the style-sheet for the opatch XML inventory presentation. You can use the return type of this subprogram to perform XMLTRANSFORM and the transformed result has the same appearance as opatch text output.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_XSLT  
RETURN XMLTYPE;
```

## 127.5.12 GET\_PATCH\_DETAILS Function

Displays the detailed patch information from `opatch lsinventory`.

### Syntax

```
DBMS_QOPATCH.GET_PATCH_DETAILS (  
    patch IN VARCHAR2);  
RETURN XMLTYPE;
```

### Parameters

**Table 127-10** GET\_PATCH\_DETAILS Function Parameters

Parameter	Description
patch	The patch number.

## 127.5.13 GET\_SQLPATCH\_STATUS Procedure

This procedure displays the SQL patch status by querying from SQL patch registry to produce complete patch level information. If the patch number is given, it displays the information specific to the given SQL patch, otherwise information for all SQL patches.

### Syntax

```
DBMS_QOPATCH.GET_SQLPATCH_STATUS (  
    patchnum IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 127-11** GET\_SQLPATCH\_STATUS Procedure Parameters

Parameter	Description
patchnum	Patch number

## 127.5.14 IS\_PATCH\_INSTALLED Function

This function provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory.

### Syntax

```
DBMS_QOPATCH.IS_PATCH_INSTALLED (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

### Parameters

**Table 127-12 IS\_PATCH\_INSTALLED Function Parameters**

Parameter	Description
patchnum	Patch number

## 127.5.15 OPATCH\_COMPARE\_CURRENT Function

Compares the current database with a list of bugs.

### Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_CURRENT Function (
    bugs IN QOPATCH_LIST);
RETURN VARCHAR2;
```

### Parameters

**Table 127-13 OPATCH\_COMPARE\_CURRENT Function Parameters**

Parameter	Description
bugs	List of bugs to compare with the current database.

## 127.5.16 OPATCH\_COMPARE\_NODES Function

Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.

### Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_NODES (
    node IN VARCHAR2 DEFAULT NULL,
    inst IN VARCHAR2 DEFAULT NULL);
RETURN VARCHAR2;
```

## Parameters

**Table 127-14** OPATCH\_COMPARE\_NODES Function Parameters

Parameter	Description
node	Node name
inst	Instance name

## 127.5.17 SET\_CURRENT\_OPINST Procedure

This procedure sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment.

### Syntax

```
DBMS_QOPATCH.SET_CURRENT_OPINST (  
    node_name    IN VARCHAR2 DEFAULT NULL,  
    inst_name    IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 127-15** SET\_CURRENT\_OPINST Procedure Parameters

Parameter	Description
node_name	Name of node
inst_name	Name of instance

# DBMS\_RANDOM

The `DBMS_RANDOM` package provides a built-in random number generator. `DBMS_RANDOM` is not intended for cryptography.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of `DBMS\_RANDOM` Subprograms](#)

## 128.1 `DBMS_RANDOM` Deprecated Subprograms

These subprograms are deprecated with Oracle Database 11g. Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [INITIALIZE Procedure](#)
- [RANDOM Function](#)
- [TERMINATE Procedure](#)

## 128.2 `DBMS_RANDOM` Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session. Oracle recommends that users who need to execute this package should be given `EXECUTE` privilege explicitly and should not rely on `PUBLIC EXECUTE` privilege.

## 128.3 `DBMS_RANDOM` Operational Notes

These operational notes apply to `DBMS_RANDOM`.

- `DBMS_RANDOM.RANDOM` produces integers in  $[-2^{31}, 2^{31})$ .
- `DBMS_RANDOM.VALUE` produces numbers in  $[0,1)$  with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, user ID, and process ID if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output

for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

## 128.4 Summary of DBMS\_RANDOM Subprograms

This table lists the DBMS\_RANDOM subprograms and briefly describes them.

**Table 128-1** *DBMS\_RANDOM Package Subprograms*

Subprogram	Description
<a href="#">INITIALIZE Procedure</a>	Initializes the package with a seed value
<a href="#">NORMAL Function</a>	Returns random numbers in a normal distribution
<a href="#">RANDOM Function</a>	Generates a random number
<a href="#">SEED Procedures</a>	Resets the seed
<a href="#">STRING Function</a>	Gets a random string
<a href="#">TERMINATE Procedure</a>	Terminates package
<a href="#">VALUE Functions</a>	Gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to low and less than high

### 128.4.1 INITIALIZE Procedure

This deprecated procedure initializes the generator.

#### Note:

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

#### Syntax

```
DBMS_RANDOM.INITIALIZE (
    val IN BINARY_INTEGER);
```

#### Pragmas

```
PRAGMA restrict_references (initialize, WNDS);
```

#### Parameters

**Table 128-2** *INITIALIZE Procedure Parameters*

Parameter	Description
val	Seed number used to generate a random number

### Usage Notes

This procedure is obsolete as it simply calls the [SEED Procedures](#).

## 128.4.2 NORMAL Function

This function returns random numbers in a standard normal distribution.

### Syntax

```
DBMS_RANDOM.NORMAL  
RETURN NUMBER;
```

### Pragmas

```
PRAGMA restrict_references (normal, WNDS);
```

### Return Values

**Table 128-3** NORMAL Function Parameters

Parameter	Description
number	Returns a random number

## 128.4.3 RANDOM Function

This deprecated procedure generates a random number.

### Note:

This function is deprecated with Release 11gR1 and, although currently supported, it should not be used.

### Syntax

```
DBMS_RANDOM.RANDOM  
RETURN binary_integer;
```

### Pragmas

```
PRAGMA restrict_references (random, WNDS);
```

### Return Values

**Table 128-4** RANDOM Function Parameters

Parameter	Description
binary_integer	Returns a random integer greater or equal to $-power(2,31)$ and less than $power(2,31)$

## 128.4.4 SEED Procedures

This procedure resets the seed.

### Syntax

```
DBMS_RANDOM.SEED (
    val IN BINARY_INTEGER);
```

```
DBMS_RANDOM.SEED (
    val IN VARCHAR2);
```

### Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

### Parameters

**Table 128-5 SEED Procedure Parameters**

Parameter	Description
val	Seed number or string used to generate a random number

### Usage Notes

The seed can be a string up to length 2000.

## 128.4.5 STRING Function

This function gets a random string.

### Syntax

```
DBMS_RANDOM.STRING
    opt IN CHAR,
    len IN NUMBER)
RETURN VARCHAR2;
```

### Pragmas

```
PRAGMA restrict_references (string, WNDS);
```

## Parameters

**Table 128-6 STRING Function Parameters**

Parameter	Description
opt	Specifies what the returning string looks like: <ul style="list-style-type: none"> <li>'u', 'U' - returning string in uppercase alpha characters</li> <li>'l', 'L' - returning string in lowercase alpha characters</li> <li>'a', 'A' - returning string in mixed case alpha characters</li> <li>'x', 'X' - returning string in uppercase alpha-numeric characters</li> <li>'p', 'P' - returning string in any printable characters.</li> </ul> Otherwise the returning string is in uppercase alpha characters.
len	Length of the returning string

## Return Values

**Table 128-7 STRING Function Return Values**

Parameter	Description
VARCHAR2	Returns a VARCHAR2

## 128.4.6 TERMINATE Procedure

When you are finished with the package, call the `TERMINATE` procedure.

 **Note:**

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

### Syntax

```
DBMS_RANDOM.TERMINATE;
```

## 128.4.7 VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number `x`, where `x` is greater than or equal to `low` and less than `high`.

### Syntax

```
DBMS_RANDOM.VALUE  
RETURN NUMBER;
```

```
DBMS_RANDOM.VALUE(  
low IN NUMBER,
```

```
high IN NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 128-8 VALUE Function Parameters**

Parameter	Description
low	Lowest number in a range from which to generate a random number. The number generated may be equal to low
high	Highest number below which to generate a random number. The number generated will be less than high

### Return Values

**Table 128-9 VALUE Function Return Values**

Parameter	Description
NUMBER	Returns an Oracle Number

# DBMS\_REDACT

The `DBMS_REDACT` package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by low-privileged users or an application.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Summary of DBMS\\_REDACT Subprograms](#)

## See Also:

- *Oracle Database Advanced Security Guide* regarding using Data Redaction to protect sensitive data

## 129.1 DBMS\_REDACT Overview

Data redaction provides a way to define masking policies for an application. Oracle Data Redaction provides functionality to mask (redact) data that is returned from user `SELECT` queries in an application. The masking takes place in real time. The Data Redaction policy applies to the querying user, depending on this user's `SYS_CONTEXT` or `XS_SYS_CONTEXT` values. This redaction process does not require that the queried data be static or unchanging, or for the entire data set to be redacted at one time in an off-line manner. Oracle Database redacts only the data for the rows specified by the user's query, not the data for the entire column. The redaction takes place immediately before the data is returned to the querying user or application.

## 129.2 DBMS\_REDACT Security Model

If the querying user has the `EXEMPT REDACTION POLICY` system privilege, redaction will not be performed. If the user does not have the `EXEMPT REDACTION POLICY` system privilege, the policy expression will be evaluated in the current user's environment. If the policy expression evaluates to `TRUE`, then redaction will be performed, otherwise no redaction will be performed.

You need the `EXECUTE` privilege on the `DBMS_REDACT` package in order to execute its subprograms. Procedures in the interface are executed with privileges of the current user.

## 129.3 DBMS\_REDACT Constants

The DBMS\_REDACT package defines several constants for specifying parameter values.

**Table 129-1 Values for function\_type Parameter of DBMS\_REDACT.ADD\_POLICY**

Constant	Value	Type	Description
NONE	0	BINARY_INTEGER	No redaction
FULL	1	BINARY_INTEGER	Redact to fixed values
NULLIFY	6	BINARY_INTEGER	Returns a null value as a redacted value
PARTIAL	2	BINARY_INTEGER	Partial redaction, redact a portion of the column data
RANDOM	4	BINARY_INTEGER	Random redaction, each query results in a different random value
REGEXP	5	BINARY_INTEGER	Regular expression based redaction
REGEXP_WIDTH	7	BINARY_INTEGER	Regular expression based redaction that preserves the width of a column that uses a regular expression; designed for applications use the OCI_ATTR_CHAR_SIZE attribute of the Oracle OLE DB Provider interface

**Table 129-2 Values for action Parameter of DBMS\_REDACT.ALTER\_POLICY**

Constant	Value	Type	Description
ADD_COLUMN	1	BINARY_INTEGER	Add a column to the redaction policy
DROP_COLUMN	2	BINARY_INTEGER	Drop a column from the redaction policy
MODIFY_EXPRESSION	3	BINARY_INTEGER	Modify the expression of a redaction policy (the expression evaluates to a BOOLEAN value: if TRUE then redaction is applied, otherwise not)
MODIFY_COLUMN	4	BINARY_INTEGER	Modify a column in the redaction policy to change the redaction function_type or the function_parameters
SET_POLICY_DESCRIPTION	5	BINARY_INTEGER	Set a description for the redaction policy
SET_COLUMN_DESCRIPTION	6	BINARY_INTEGER	Set a description for the redaction performed on the column

## 129.4 DBMS\_REDACT Operating Procedures

The following table presents the relationship between the type of redaction function and its parameters, based on the datatype of the column being redacted. Examples of the various format strings are provided, showing how to perform some commonplace redaction for a string datatype (in this case, a Social Security Number (SSN)), a DATE datatype, and various examples of redaction for the number datatype.

**Table 129-3 Data Redaction Function Types**

function_type	function_parameters	Examples
DBMS_REDACT.NONE	-	-
DBMS_REDACT.FULL	-	-
DBMS_REDACT.PARTIAL (for character types)	A comma-separated list, containing the following five fields (with no spaces after the commas delimiting the fields): <ul style="list-style-type: none"> <li>• REDACT_PARTIAL_INPUT_FORMAT</li> <li>• REDACT_PARTIAL_OUTPUT_FORMAT</li> <li>• REDACT_PARTIAL_MASKCHAR</li> <li>• REDACT_PARTIAL_MASKFROM</li> <li>• REDACT_PARTIAL_MASKTO</li> </ul>	'VVVFVVFVVV, VVV-VV-VVVV, X, 1, 5' for masking the first 5 digits of SSN strings like 123-45-6789, adding dashes back to format it, resulting in strings like XXX-XX-6789
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_INPUT_FORMAT - the input format: V for value to be possibly redacted, F for formatting character to be ignored	The REDACT_PARTIAL_INPUT_FORMAT field value VVVFVVFVVV for matching SSN strings like 123-45-6789
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_OUTPUT_FORMAT - the output format: V for output of redaction. Any other character will be treated as a formatting character and output literally.	The REDACT_PARTIAL_OUTPUT_FORMAT field value VVV-VV-VVVV can be used to redact SSN strings into XXX-XX-6789 (X comes from REDACT_PARTIAL_MASKCHAR field).
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_MASKCHAR - the character used to redact the input	The value X for redacting SSN strings into XXX-XX-6789.
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_MASKFROM - specifies which V within the REDACT_PARTIAL_INPUT_FORMAT from which to start the redaction (see explanation following the next entry, REDACT_PARTIAL_MASKTO)	The value 1 for redacting SSN strings starting at the first V of REDACT_PARTIAL_INPUT_FORMAT of VVVFVVFVVV into strings like XXX-XX-6789

**Table 129-3 (Cont.) Data Redaction Function Types**

function_type	function_parameters	Examples
DBMS_REDACT.PARTIAL (for character types), continued	REDACT_PARTIAL_MASKTO - specifies which V within the REDACT_PARTIAL_INPUT_FO RMAT at which to end the redaction	The value 5 for redacting SSN strings up to and including the fifth V within REDACT_PARTIAL_INPUT_FORMA T of VVVFVVVFVVV into strings like XXX-XX-6789. Note how the format character ' - ' (corresponding to the first F within REDACT_PARTIAL_INPUT_FORMA T) is ignored as far as redaction is concerned, so the value here is 5 as opposed to 6.
DBMS_REDACT.PARTIAL (for character types), continued	The REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO field values are specified as counts of the number of V characters in the REDACT_PARTIAL_INPUT_FO RMAT field, up to and including the intended position, starting from the leftmost V. This way, REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO are independent of the specific formatting of the data. For example, in the common use case of masking an SSN to show only the last four digits, data like 123456789 (with REDACT_PARTIAL_INPUT_FO RMAT of VVVVVVVV) and data like 123-45-6789 (with REDACT_PARTIAL_INPUT_FO RMAT of VVVFVVVFVVV), would both use REDACT_PARTIAL_MASKFROM of 1 and REDACT_PARTIAL_MASKTO of 5.	-

**Table 129-3 (Cont.) Data Redaction Function Types**

function_type	function_parameters	Examples
DBMS_REDACT.PARTIAL (for number types)	A comma-separated list, containing the following three fields (with no spaces after the commas delimiting the fields): <ul style="list-style-type: none"> <li>• REDACT_PARTIAL_MASKC HAR</li> <li>• REDACT_PARTIAL_MASKF ROM</li> <li>• REDACT_PARTIAL_MASKT O</li> </ul> See <a href="#">Table 129-4</a> .	'9,1,5' for redacting the first 5 digits of an SSN number 123456789 into 999996789; or '0,1,2' for redacting a number 1.23 to 0.03.
DBMS_REDACT.PARTIAL (for number types), continued	REDACT_PARTIAL_MASKCHAR - - the character used to redact the input, in the range between 0 and 9  REDACT_PARTIAL_MASKFROM - the position, starting from 1, from which to start the redaction. The position does not include the decimal point if it is present.  REDACT_PARTIAL_MASKTO - - the position at which to end the redaction	
DBMS_REDACT.PARTIAL (for datetime datatypes)	A list, containing the following five fields (concatenated so that there is no space between the fields): <ul style="list-style-type: none"> <li>• REDACT_PARTIAL_DATE_MONTH</li> <li>• REDACT_PARTIAL_DATE_DAY</li> <li>• REDACT_PARTIAL_DATE_YEAR</li> <li>• REDACT_PARTIAL_DATE_HOUR</li> <li>• REDACT_PARTIAL_DATE_MINUTE</li> <li>• REDACT_PARTIAL_DATE_SECOND</li> </ul> See <a href="#">Table 129-4</a> .	'm12DYHMS', which changes 01-May-01 01:01:01 to 01-Dec-01 01:01:01.

**Table 129-3 (Cont.) Data Redaction Function Types**

function_type	function_parameters	Examples
DBMS_REDACT.PARTIAL (for datetime datatypes), continued	<p>REDACT_PARTIAL_DATE_MON: TH: 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12</p> <p>REDACT_PARTIAL_DATE_DAY: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31</p> <p>REDACT_PARTIAL_DATE_YEAR: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999</p> <p>REDACT_PARTIAL_DATE_HOUR: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23</p> <p>REDACT_PARTIAL_DATE_MINUTE: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59</p> <p>REDACT_PARTIAL_DATE_SECONDS: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</p>	-
DBMS_REDACT.PARTIAL_WIDTH	Same as DBMS_REDACT.PARTIAL	-
DBMS_REDACT.RANDOM	-	-

**Table 129-4 Format Descriptors with Component Field Names and Delimiters**

Datatype	Format Descriptor for Partial redaction
Character	REDACT_PARTIAL_INPUT_FORMAT    ', '
	REDACT_PARTIAL_OUTPUT_FORMAT    ', '
	REDACT_PARTIAL_MASKCHAR    ', '
	REDACT_PARTIAL_MASKFROM    ', '
	REDACT_PARTIAL_MASKTO
Number	REDACT_PARTIAL_MASKCHAR    ', '
	REDACT_PARTIAL_MASKFROM    ', '
	REDACT_PARTIAL_MASKTO

Datatype	Format Descriptor for Partial redaction
Datetime	REDACT_PARTIAL_DATE_MONTH
	REDACT_PARTIAL_DATE_DAY
	REDACT_PARTIAL_DATE_YEAR
	REDACT_PARTIAL_DATE_HOUR
	REDACT_PARTIAL_DATE_MINUTE
	REDACT_PARTIAL_DATE_SECOND

## 129.5 Summary of DBMS\_REDACT Subprograms

This table lists and briefly describes the DBMS\_REDACT package subprograms.

**Table 129-5 DBMS\_REDACT Package Subprograms**

Subprogram	Description
<a href="#">ADD_POLICY Procedure</a>	Defines a Data Redaction policy for a table or view
<a href="#">ALTER_POLICY Procedure</a>	Alters a Data Redaction policy for a table or view
<a href="#">APPLY_POLICY_EXPR_TO_COL Procedure</a>	Applies a Data Redaction policy expression to a redacted column
<a href="#">CREATE_POLICY_EXPRESSION Procedure</a>	Creates a Data Redaction policy expression
<a href="#">DISABLE_POLICY Procedure</a>	Disables a Data Redaction policy
<a href="#">DROP_POLICY Procedure</a>	Drops a Data Redaction policy
<a href="#">DROP_POLICY_EXPRESSION Procedure</a>	Drops a Data Redaction policy expression
<a href="#">ENABLE_POLICY Procedure</a>	Enables a Data Redaction policy
<a href="#">UPDATE_FULL_REDACTION_VALUES Procedure</a>	Modifies the default displayed values for a Data Redaction policy for full redaction
<a href="#">UPDATE_POLICY_EXPRESSION Procedure</a>	Updates a Data Redaction policy expression

### 129.5.1 ADD\_POLICY Procedure

This procedure defines a Data Redaction policy for a table or view.

#### Syntax

```
DBMS_REDACT.ADD_POLICY (
  object_schema          IN    VARCHAR2 := NULL,
  object_name            IN    VARCHAR2,
  policy_name           IN    VARCHAR2,
  column_name           IN    VARCHAR2 := NULL,
  function_type         IN    BINARY_INTEGER := DBMS_REDACT.FULL,
```

```

function_parameters    IN    VARCHAR2 := NULL,
expression            IN    VARCHAR2,
enable                IN    BOOLEAN := TRUE,
regexp_pattern        IN    VARCHAR2 := NULL,
regexp_replace_string IN    VARCHAR2 := NULL,
regexp_position       IN    BINARY_INTEGER := 1,
regexp_occurrence     IN    BINARY_INTEGER := 0,
regexp_match_parameter IN    VARCHAR2 := NULL,
policy_description    IN    VARCHAR2 := NULL,
column_description    IN    VARCHAR2 := NULL);

```

## Parameters

**Table 129-6** *ADD\_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema owning the table, current user if NULL
object_name	Name of table or view to which to add a Data Redaction policy
policy_name	Name of policy
column_name	[Optional] Name of one column to which the redaction policy applies. If you must redact more than one column, use the <a href="#">ALTER_POLICY Procedure</a> to add the additional columns.
function_type	Type of redaction function to use. Possible values are: <ul style="list-style-type: none"> <li>- DBMS_REDACT.NONE</li> <li>- DBMS_REDACT.FULL (default)</li> <li>- DBMS_REDACT.NULLIFY</li> <li>- DBMS_REDACT.PARTIAL</li> <li>- DBMS_REDACT.RANDOM</li> <li>- DBMS_REDACT.REGEXP</li> <li>- DBMS_REDACT.REGEXP_WIDTH</li> </ul> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</p> <p>See <a href="#">Table 129-1</a> for an overview of the meanings of these values, and for some examples of their use.</p>

**Table 129-6 (Cont.) ADD\_POLICY Procedure Parameters**

Parameter	Description
function_parameters	<p>Parameters to the redaction function. The possible values depend on the value of the function_type provided.</p> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</p> <ul style="list-style-type: none"> <li>- DBMS_REDACT.NONE: Can be omitted entirely and defaults to NULL</li> <li>- DBMS_REDACT.FULL: Can be omitted entirely and defaults to NULL</li> <li>- Masking parameters for partial character masking. For character datatypes, a comma-separated list containing these fields: <ul style="list-style-type: none"> <li>• Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored</li> <li>• Output format: 'V' for output of masking, any other characters will be treated as formatting characters.</li> <li>• Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'.</li> <li>• Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters.</li> <li>• Ending digit position: specifies the ending (character) position to end masking. An example is 'VVVFVVVFVVV,VV-VV-VVV,X,1,5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789.</li> </ul> </li> </ul> <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> <li>• Mask character: this is a character between '0' to '9' that will be used to replace the actual values.</li> <li>• Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include the decimal point.</li> <li>• Ending digit position: this specifies the ending digit position to end masking. An example is '9,1,5' for masking the first 5 digits of a Social Security number 123456789, resulting in 999996789.</li> </ul> <p>For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether masking is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</p>

**Table 129-6 (Cont.) ADD\_POLICY Procedure Parameters**

Parameter	Description
expression	<ul style="list-style-type: none"> <li>• Month: 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12</li> <li>• Day: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31</li> <li>• Year: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999</li> <li>• Hour: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23</li> <li>• Minute: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59</li> <li>• Second: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</li> </ul> <p>An example is 'm12dyhs', which changes 02-May-13 12:30:23 to 01-Dec-01 01:01:01</p> <p>For partial character and number-masking shortcuts, see <i>Oracle Database Advanced Security Guide</i>.</p> <p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p> <p>See</p> <p>The following functions are supported:</p> <ul style="list-style-type: none"> <li>• SYS_CONTEXT</li> <li>• XS_SYS_CONTEXT</li> <li>• SUBSTR functions (includes SUBSTRB, SUBSTRC, SUBSTR2, SUBSTR4)</li> <li>• LENGTH functions (includes LENGTHB, LENGTHC, LENGTH2, LENGTH4)</li> <li>• V (APEX_UTIL.GET_SESSION_STATE)</li> <li>• NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE)</li> <li>• OLS_LABEL_DOMINATES</li> <li>• DOMINATES</li> <li>• OLS_DOMINATES</li> <li>• OLS_DOM</li> <li>• DOM</li> <li>• OLS_STRICTLY_DOMINATES</li> <li>• STRICTLY_DOMINATES</li> <li>• S_DOM</li> <li>• SA_UTL.DOMINATES</li> <li>• SA_UTL.CHECK_READ</li> <li>• SA_UTL.NUMERIC_LABEL</li> <li>• CHAR_TO_LABEL</li> <li>• SA_SESSION.LABEL</li> </ul> <p>See <i>Oracle Database Advanced Security Guide</i> for more information about these supported functions</p>

**Table 129-6 (Cont.) ADD\_POLICY Procedure Parameters**

Parameter	Description
enable	<p>Boolean value that determines whether the Data Redaction policy is enabled on creation.</p> <p>The default value is TRUE, which means that the policy is automatically enabled upon creation. If the enable parameter is set to FALSE, the policy takes effect only when it is subsequently enabled by calling the DBMS_REDACT.ENABLE_POLICY procedure.</p>
regexp_pattern	<p>Regular expression pattern up to 512 bytes.</p> <p>Use only if the function_type parameter is DBMS_REDACT.REGEXP. Also, do not specify the function_parameters parameter when function_type is DBMS_REDACT.REGEXP.</p> <p>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns.</p>
regexp_replace_string	<p>Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, where n is a number between 1 and 9.</p> <p>Use only if the function_type parameter is DBMS_REDACT.REGEXP</p>
regexp_position	<p>Integer counting from 1, specifies the position where the search must begin.</p> <p>Use only if the function_type parameter is DBMS_REDACT.REGEXP</p>
regexp_occurrence	<ul style="list-style-type: none"> <li>Use 0 to replace all occurrences of the match</li> <li>Use positive integer n to replace the n-th occurrence of the match.</li> </ul> <p>Use only if the function_type parameter is DBMS_REDACT.REGEXP</p>
regexp_match_parameter	<p>Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x'</p> <p>Use only if the function_type parameter is DBMS_REDACT.REGEXP</p> <p>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters.</p>
policy_description	Description of redaction policy
column_description	Description of the column being redacted

**Exceptions**

- ORA-28060 - A Data Redaction policy already exists on this column.
- ORA-28061 - This object cannot have a Data Redaction policy defined on it.
- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.

- ORA-28064 - The type of redaction function is not valid.
- ORA-28066 - Invalid column *column*
- ORA-28069 - A Data Redaction policy already exists on this object.
- ORA-28073 - The column *column\_name* has an unsupported datatype.
- ORA-28074 - The field *field\_name* of the masking parameters is not valid

The field can be any of the following:

- REDACT\_PARTIAL\_INPUT\_FORMAT
- REDACT\_PARTIAL\_OUTPUT\_FORMAT
- REDACT\_PARTIAL\_MASKCHAR
- REDACT\_PARTIAL\_MASKFROM
- REDACT\_PARTIAL\_MASKTO
- REDACT\_PARTIAL\_DATE\_MONTH
- REDACT\_PARTIAL\_DATE\_DAY
- REDACT\_PARTIAL\_DATE\_YEAR
- REDACT\_PARTIAL\_DATE\_HOUR
- REDACT\_PARTIAL\_DATE\_MINUTE
- REDACT\_PARTIAL\_DATE\_SECOND

See [Table 129-3](#) and [Table 129-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The policy expression has unsupported functions
- ORA-28076 - An attribute was not specified for SYS\_SESSION\_ROLES
- ORA-28077 - The attribute specified (*attribute*) exceeds the maximum length
- ORA-28078 - A regular expression parameter is missing or invalid
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are *function\_parameters*, *column\_description*, *policy\_name* and *policy\_description*)
- ORA-28085 - The input and output lengths of the redaction do not match.

### Usage Notes

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the *expression* parameter. To find redacted columns that are affected by named policy expressions, query the REDACTION\_EXPRESSIONS data dictionary view.

### Example

Partial redaction policy:

```
BEGIN
  DBMS_REDACT.ADD_POLICY(
```

```

object_schema      => 'hr',
object_name        => 'employees',
column_name        => 'employee_id',
policy_name        => 'mask_emp_id_nums',
function_type      => DBMS_REDACT.PARTIAL,
function_parameters => '7,1,5',
expression         => '1=1');
END;
```

#### Full redaction policy:

```

BEGIN
  DBMS_REDACT.ADD_POLICY(
    object_schema      => 'hr',
    object_name        => 'employees',
    column_name        => 'employee_id',
    policy_name        => 'mask_emp_ids',
    function_type      => DBMS_REDACT.FULL,
    expression         => 'SYS_CONTEXT(''SYS_SESSION_ROLES'', 'CLERK')
                                = ''FALSE''');
END;
```

## 129.5.2 ALTER\_POLICY Procedure

This procedure alters an existing Data Redaction policy for a table or view.

It alters a the policy in one or more of the following ways:

- By changing the policy expression
- By changing the type of redaction for a specified column
- By changing the parameters to the redaction function for a specified column
- By adding a column to the redaction policy (the redaction type and any parameters must be specified).
- By removing a column from the redaction policy

#### Syntax

```

DBMS_REDACT.ALTER_POLICY (
  object_schema      IN      VARCHAR2 := NULL,
  object_name        IN      VARCHAR2,
  policy_name        IN      VARCHAR2,
  action             IN      BINARY_INTEGER := DBMS_REDACT.ADD_COLUMN,
  column_name        IN      VARCHAR2 := NULL,
  function_type      IN      BINARY_INTEGER := DBMS_REDACT.FULL,
  function_parameters IN      VARCHAR2 := NULL,
  expression         IN      VARCHAR2,
  regexp_pattern     IN      VARCHAR2 := NULL,
  regexp_replace_string IN    VARCHAR2 := NULL,
  regexp_position    IN      BINARY_INTEGER := 1,
  regexp_occurrence  IN      BINARY_INTEGER := 0,
  regexp_match_parameter IN    VARCHAR2 := NULL,
  policy_description IN      VARCHAR2 := NULL,
  column_description IN      VARCHAR2 := NULL);
```

## Parameters

**Table 129-7 ALTER\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema owning the table, current user if NULL
object_name	Name of table or view to which to alter a Data Redaction policy
policy_name	Name of policy limited to 30 bytes
action	Action to take. For more information see <a href="#">Table 129-2</a> .
column_name	[Optional] Name of one column to which the redaction policy applies.
function_type	Type of redaction function to use. Possible values are: - DBMS_REDACT.NONE - DBMS_REDACT.FULL (default) - DBMS_REDACT.NULLIY - DBMS_REDACT.PARTIAL - DBMS_REDACT.RANDOM - DBMS_REDACT.REGEXP - DBMS_REDACT.REGEXP_WIDTH  If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.  See <a href="#">Table 129-1</a> for an overview of the meanings of these values, and for some examples of their use.

**Table 129-7 (Cont.) ALTER\_POLICY Procedure Parameters**

Parameter	Description
function_parameters	<p>Parameters to the redaction function. The possible values depend on the value of the function_type provided.</p> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.</p> <ul style="list-style-type: none"> <li>- If the function_type is DBMS_REDACT.NONE, the function_parameters parameter can be omitted entirely and defaults to NULL.</li> <li>- If the function_type is DBMS_REDACT.FULL, the function_parameters parameter can be omitted entirely and defaults to NULL.</li> <li>- If the function_type is DBMS_REDACT.PARTIAL, the function_parameters parameter represents the masking parameters for partial masking. <ul style="list-style-type: none"> <li>• Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored</li> <li>• Output format: 'V' for output of masking, any other characters will be treated as formatting characters.</li> <li>• Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'.</li> <li>• Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters.</li> <li>• Ending digit position: specifies the ending (character) position to end masking. An example is 'VVVFVVFVVV,VVV-VV-VVVV,X,1,5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789.</li> </ul> </li> </ul> <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> <li>• Mask character: this is a character between '0' to '9' that will be used to replace the actual values.</li> <li>• Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include the decimal point.</li> <li>• Ending digit position: this specifies the ending digit position to end masking. An example is '9,1,5' for masking the first 5 digits of a Social Security number number 123456789, resulting in 999996789.</li> </ul> <p>For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether masking is</p>

**Table 129-7 (Cont.) ALTER\_POLICY Procedure Parameters**

Parameter	Description
	<p>required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</p> <ul style="list-style-type: none"> <li>• Month: 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12</li> <li>• Day: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31</li> <li>• Year: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999</li> <li>• Hour: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23</li> <li>• Minute: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59</li> <li>• Second: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</li> </ul>
	<p>An example is 'm12DYHMS', which changes 01-May-01 01:01:01 to 01-Dec-01 01:01:01</p> <p>For partial character and number-masking shortcuts, see <i>Oracle Database Advanced Security Guide</i>.</p>
expression	<p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p>
	<p>The following functions are supported:</p> <ul style="list-style-type: none"> <li>• SYS_CONTEXT</li> <li>• NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE)</li> <li>• V (APEX_UTIL.GET_SESSION_STATE)</li> <li>• OLS_LABEL_DOMINATES</li> <li>• DOMINATES</li> <li>• OLS_DOMINATES</li> <li>• OLS_DOM</li> <li>• DOM</li> <li>• OLS_STRICTLY_DOMINATES</li> <li>• STRICTLY_DOMINATES</li> <li>• S_DOM</li> <li>• SA_UTL.DOMINATES</li> <li>• SA_UTL.CHECK_READ</li> <li>• SA_UTL.NUMERIC_LABEL</li> <li>• CHAR_TO_LABEL</li> <li>• SA_SESSION.LABEL</li> </ul>

**Table 129-7 (Cont.) ALTER\_POLICY Procedure Parameters**

Parameter	Description
regexp_pattern	Regular expression pattern up to 512 bytes. Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code> . Also, do not specify the <code>function_parameters</code> parameter when <code>function_type</code> is <code>DBMS_REDACT.REGEXP</code> . See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns
regexp_replace_string	Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form <code>\n</code> , where <code>n</code> is a number between 1 and 9. Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>
regexp_position	Integer counting from 1, specifies the position where the search must begin. Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>
regexp_occurrence	<ul style="list-style-type: none"> <li>Use 0 to replace all occurrences of the match</li> <li>Use positive integer <code>n</code> to replace the <code>n</code>-th occurrence of the match.</li> </ul> Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>
regexp_match_parameter	Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x' Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code> See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters.
policy_description	Description of redaction policy
column_description	Description of the column being redacted

**Exceptions**

- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.
- ORA-28064 - The type of redaction function is not valid.
- ORA-28066 - Invalid column `column`
- ORA-28067 - Missing or invalid column name
- ORA-28068 - The object `object` does not have a Data Redaction policy.
- ORA-28070 - The column `column` does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.

- ORA-28073 - The column *column\_name* has an unsupported datatype.
- ORA-28074 - The field *field\_name* of the masking parameters is not valid

The field can be any of the following:

- REDACT\_PARTIAL\_INPUT\_FORMAT
- REDACT\_PARTIAL\_OUTPUT\_FORMAT
- REDACT\_PARTIAL\_MASKCHAR
- REDACT\_PARTIAL\_MASKFROM
- REDACT\_PARTIAL\_MASKTO
- REDACT\_PARTIAL\_DATE\_MONTH
- REDACT\_PARTIAL\_DATE\_DAY
- REDACT\_PARTIAL\_DATE\_YEAR
- REDACT\_PARTIAL\_DATE\_HOUR
- REDACT\_PARTIAL\_DATE\_MINUTE
- REDACT\_PARTIAL\_DATE\_SECOND

See [Table 129-3](#) and [Table 129-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The policy expression has unsupported functions.
- ORA-28076 - An attribute was not specified for SYS\_SESSION\_ROLES.
- ORA-28077 - The attribute specified (*attribute*) exceeds the maximum length.
- ORA-28078 - A regular expression parameter is missing or invalid.
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are *function\_parameters*, *column\_description*, *policy\_name* and *policy\_description* )
- ORA-28085 - The input and output lengths of the redaction do not match.

### Usage Notes

See [Operating Procedures](#) for more information regarding Function Types and Function Parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the *expression* parameter. To find redacted columns that are affected by named policy expressions, query the REDACTION\_EXPRESSIONS data dictionary view.

### Examples

```
BEGIN
  DBMS_REDACT.ALTER_POLICY(
    object_schema      => 'HR',
    object_name        => 'EMPLOYEES',
    policy_name        => 'mask_emp_id_nums',
    action              => DBMS_REDACT.DROP_COLUMN,
    column_name        => 'EMAIL');
END;
```

## 129.5.3 APPLY\_POLICY\_EXPR\_TO\_COL Procedure

This procedure associates a named Oracle Data Redaction policy expression with a redacted column from a table or view.

### Syntax

```
DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL (
  object_schema      IN VARCHAR2 := NULL,
  object_name        IN VARCHAR2,
  column_name        IN VARCHAR2,
  policy_expression_name IN VARCHAR2 := NULL);
```

### Parameters

**Table 129-8** *APPLY\_POLICY\_EXPR\_TO\_COL Procedure Parameters*

Parameter	Description
object_schema	Name of the schema that contains the redacted column
object_name	Name of the object (table or view) that contains the redacted column
column_name	Name of the redacted column to which the policy expression is applied
policy_expression_name	Name of the policy expression

### Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

### Usage Notes

You can find existing Data Redaction policy expressions by querying the REDACTION\_EXPRESSIONS data dictionary view. To find columns that have been redacted, query the REDACTION\_COLUMNS data dictionary view.

### Example

```
BEGIN
  DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL(
    object_schema      => 'OE',
    object_name        => 'CUSTOMERS',
    column_name        => 'INCOME_LEVEL',
    policy_expression_name => 'oe_redact_pol');
END;
```

## 129.5.4 CREATE\_POLICY\_EXPRESSION Procedure

This procedure creates a named Oracle Data Redaction policy expression.

### Syntax

```
DBMS_REDACT.CREATE_POLICY_EXPRESSION (
  policy_expression_name      IN   VARCHAR2,
  expression                  IN   VARCHAR2,
  policy_expression_description IN   VARCHAR2 := NULL);
```

### Parameters

**Table 129-9** CREATE\_POLICY\_EXPRESSION Procedure Parameters

Parameter	Description
policy_expression_name	Name of the policy expression
expression	Definition of the policy expression
policy_expression_description	Description of the policy expression

### Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

### Usage Notes

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

After you create a policy expression, you can associate it with a redacted table or view column by running the DBMS\_REDACT.APPLY\_POLICY\_EXPR\_TO\_COL procedure. To find existing redacted columns, query the REDACTION\_COLUMNS data dictionary view.

### Example

```
BEGIN
  DBMS_REDACT.CREATE_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol',
    expression             => 'SYS_CONTEXT(''USERENV'', ''SESSION_USER'') =
''OE'',
    policy_expression_description => 'Enables policy for user OE ');
END;
```

## 129.5.5 DISABLE\_POLICY Procedure

This procedure disables a Data Redaction policy.

### Syntax

```
DBMS_REDACT.DISABLE_POLICY (
  object_schema      IN   VARCHAR2 := NULL,
```

```
object_name          IN    VARCHAR2,
policy_name         IN    VARCHAR2);
```

### Parameters

**Table 129-10** *DISABLE\_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema owning the table or view, current user if NULL
object_name	Name of table or view for which to disable a Data Redaction policy
policy_name	Name of policy to be disabled

### Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28080 - The policy was already disabled.

### Examples

```
BEGIN
  DBMS_REDACT.DISABLE_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'mask_emp_ids');
END;
```

## 129.5.6 DROP\_POLICY Procedure

This procedure drops a Data Redaction policy by removing a masking policy from the table or view.

### Syntax

```
DBMS_REDACT.DROP_POLICY (
  object_schema          IN    VARCHAR2 := NULL,
  object_name           IN    VARCHAR2,
  policy_name           IN    VARCHAR2);
```

### Parameters

**Table 129-11** *DROP\_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema owning the table or view, current user if NULL
object_name	Name of table or view from which to drop a Data Redaction policy
policy_name	Name of policy to be dropped

### Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.

- ORA-28072 - The specified policy name is incorrect.

### Examples

```
BEGIN
  DBMS_REDACT.DROP_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'mask_emp_ids');
END;
```

## 129.5.7 DROP\_POLICY\_EXPRESSION Procedure

This procedure drops a named policy expression.

### Syntax

```
DBMS_REDACT.DROP_POLICY_EXPRESSION (
  policy_expression_name IN VARCHAR2);
```

### Parameters

**Table 129-12** *DROP\_POLICY\_EXPRESSION Procedure Parameters*

Parameter	Description
policy_expression_name	Name of the policy expression

### Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

### Usage Notes

You can find existing Data Redaction policy expressions by querying the REDACTION\_EXPRESSIONS data dictionary view.

### Example

```
BEGIN
  DBMS_REDACT.DROP_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol');
END;
```

## 129.5.8 ENABLE\_POLICY Procedure

This procedure re-enables a Data Redaction policy.

### Syntax

```
DBMS_REDACT.ENABLE_POLICY (
  object_schema IN VARCHAR2 := NULL,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2);
```

## Parameters

**Table 129-13** *ENABLE\_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema owning the table or view, current user if NULL
object_name	Name of table or view to which to enable a Data Redaction policy
policy_name	Name of policy to be enabled

## Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28079 - The policy was already enabled.

## Examples

```
BEGIN
  DBMS_REDACT.ENABLE_POLICY (
    object_schema => 'hr',
    object_name   => 'employees',
    policy_name   => 'mask_emp_ids');
END;
```

## 129.5.9 UPDATE\_FULL\_REDACTION\_VALUES Procedure

This procedure modifies the default displayed values for a Data Redaction policy for full redaction.

### Syntax

```
DBMS_REDACT.UPDATE_FULL_REDACTION_VALUES (
  number_val      IN NUMBER           := NULL,
  binfloat_val    IN BINARY_FLOAT     := NULL,
  bindouble_val   IN BINARY_DOUBLE    := NULL,
  char_val        IN CHAR              := NULL,
  varchar_val     IN VARCHAR2         := NULL,
  nchar_val       IN NCHAR             := NULL,
  nvarchar_val    IN NVARCHAR2        := NULL,
  date_val        IN DATE              := NULL,
  ts_val          IN TIMESTAMP         := NULL,
  tswtz_val       IN TIMESTAMP WITH TIME ZONE := NULL,
  blob_val        IN BLOB              := NULL,
  clob_val        IN CLOB              := NULL,
  nclob_val       IN NCLOB             := NULL);
```

## Parameters

**Table 129-14 UPDATE\_FULL\_REDACTION\_VALUES Procedure Parameters**

Parameter	Description
number_val	Modifies the default value for columns of the NUMBER datatype
binfloat_val	Modifies the default value for columns of the BINARY_FLOAT datatype
bindouble_val	Modifies the default value for columns of the BINARY_DOUBLE datatype
char_val	Modifies the default value for columns of the CHAR datatype
varchar_val	Modifies the default value for columns of the VARCHAR2 datatype
nchar_val	Modifies the default value for columns of the NCHAR datatype
nvarchar_val	Modifies the default value for columns of the NVARCHAR2 datatype
date	Modifies the default value for columns of the DATE datatype
ts_val	Modifies the default value for columns of the TIMESTAMP datatype
tswtz_val	Modifies the default value for columns of the TIMESTAMP WITH TIME ZONE datatype
blob_val	Modifies the default value for columns of the BLOB datatype
clob_val	Modifies the default value for columns of the CLOB datatype
nclob_val	Modifies the default value for columns of the NCLOB datatype

## Exceptions

ORA-28082 - The parameter *parameter* is invalid (where the possible values are char\_val, nchar\_val, varchar\_val and nvarchar\_val)

## 129.5.10 UPDATE\_POLICY\_EXPRESSION Procedure

This procedure updates a named Oracle Data Redaction policy expression.

### Syntax

```
DBMS_REDACT.UPDATE_POLICY_EXPRESSION (
    policy_expression_name      IN   VARCHAR2,
    expression                  IN   VARCHAR2,
    policy_expression_description IN   VARCHAR2 := NULL);
```

## Parameters

**Table 129-15 UPDATE\_POLICY\_EXPRESSION Procedure Parameters**

Parameter	Description
policy_expression_name	Name of the policy expression
expression	Definition of the policy expression

**Table 129-15 (Cont.) UPDATE\_POLICY\_EXPRESSION Procedure Parameters**

Parameter	Description
policy_expression_description	Description of the policy expression

**Exceptions**

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

**Usage Notes**

You can find existing policy expressions by querying the REDACTION\_EXPRESSIONS data dictionary view.

**Example**

```
BEGIN
  DBMS_REDACT.UPDATE_POLICY_EXPRESSION(
    policy_expression_name      => 'oe_redact_pol',
    expression                  => 'SYS_CONTEXT(''USERENV'', 'SESSION_USER') !=
    ''OE'',
    policy_expression_description => 'Disables policy for user OE ');
END;
```

# 130

## DBMS\_REDEFINITION

The `DBMS_REDEFINITION` package provides an interface to perform an online redefinition of tables.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of DBMS\\_REDEFINITION Subprograms](#)

### See Also:

*Oracle Database Administrator's Guide* for more information about online redefinition of tables

### 130.1 DBMS\_REDEFINITION Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

### 130.2 DBMS\_REDEFINITION Security Model

Subprograms in the `DBMS_REDEFINITION` package are run with invokers' rights (with the privileges of the current user).

There are two modes:

- In `USER` mode, the user who has the `CREATE TABLE` and `CREATE MVIEW` privileges may redefine a table residing in his own schema.
- In `FULL` mode, the user who has the `ANY` privilege may redefine tables in any schema.

### 130.3 DBMS\_REDEFINITION Constants

The `DBMS_REDEFINITION` package defines several constants for specifying parameter values.

**Table 130-1 DBMS\_REDEFINITION Constants**

Constant	Type	Value	Description
CONS_CONSTRAINT	PLS_INTEGER	3	Used to specify that dependent object type is a constraint
CONS_INDEX	PLS_INTEGER	2	Used to specify that dependent object type is a index
CONS_MVLOG	PLS_INTEGER	10	Used to (un)register a materialized view log, as a dependent object of the table, through the <a href="#">REGISTER_DEPENDENT_OBJECT Procedure</a> and the <a href="#">UNREGISTER_DEPENDENT_OBJECT Procedure</a> .
CONS_ORIG_PARAMS	PLS_INTEGER	1	Used to specify that indexes should be cloned with their original storage parameters
CONS_TRIGGER	PLS_INTEGER	4	Used to specify that dependent object type is a trigger
CONS_USE_PK	BINARY_INTEGER	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
CONS_USE_ROWID	BINARY_INTEGER	2	Used to indicate that the redefinition should be done using rowids
CONS_VPD_AUTO	BINARY_INTEGER	2	Used to indicate to copy VPD policies automatically
CONS_VPD_MANUAL	BINARY_INTEGER	4	Used to indicate to copy VPD policies manually
CONS_VPD_NONE	BINARY_INTEGER	1	Used to indicate that there are no VPD policies on the original table

## 130.4 DBMS\_REDEFINITION Operational Notes

The following operational notes apply to DBMS\_REDEFINITION.

- `CONS_USE_PK` and `CONS_USE_ROWID` are constants used as input to the "options\_flag" parameter in both the [START\\_REDEF\\_TABLE Procedure](#) and [CAN\\_REDEF\\_TABLE Procedure](#). `CONS_USE_ROWID` is used to indicate that the redefinition should be done using rowids while `CONS_USE_PK` implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- `CONS_INDEX`, `CONS_MVLOG`, `CONS_TRIGGER` and `CONS_CONSTRAINT` are used to specify the type of the dependent object being (un)registered in [REGISTER\\_DEPENDENT\\_OBJECT Procedure](#) and [UNREGISTER\\_DEPENDENT\\_OBJECT Procedure](#) (parameter "dep\_type").  
`CONS_INDEX ==> dependent object is of type INDEX`

- CONS\_TRIGGER ==> dependent object is of type TRIGGER
- CONS\_CONSTRAINT==> dependent object type is of type CONSTRAINT
- CONS\_MVLOG ==> dependent object is of type MATERIALIZED VIEW LOG
- CONS\_ORIG\_PARAMS as used as input to the "copy\_indexes" parameter in [COPY\\_TABLE\\_DEPENDENTS Procedure](#). Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

## 130.5 DBMS\_REDEFINITION Rules and Limits

Various rules and limits apply to implementation of the DBMS\_REDEFINITION package.

For more information about these, see the *Oracle Database Administrator's Guide*.

## 130.6 DBMS\_REDEFINITION Examples

The following examples demonstrate DBMS\_REDEFINITION functionality.

We create two tables EMP and EMP\_INT as the original and the interim tables, respectively:

```
CREATE TABLE "EMP"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
```

```
TABLESPACE myts;
```

```
CREATE TABLE "EMP_INT"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
```

```
TABLESPACE compressed_ts;
```

### Regular Multi-Step Redefinition

```
DBMS_REDEFINITION.START_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT',
  ENABLE_ROLLBACK => TRUE);
DBMS_REDEFINITION.FINISH_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

Assume the DBA wants to evaluate the performance of the application for 2 days, after moving the table EMP from tablespace myts to compressed\_ts. One can run sync\_interim\_table SYNC\_INTERIM\_TABLE Procedure to keep both the tables in sync (say, every hour).

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

**Case 1 — DBA is not happy with the performance, so decides to rollback.**

```
DBMS_REDEFINITION.ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

**Case 2 — DBA is happy with the performance, so decides not to rollback.**

```
DBMS_REDEFINITION.ABORT_ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

This terminates the possibility of rollback.

**Single-Step Redefinition**

```
DBMS_REDEFINITION.REDEF_TABLE('SCOTT', 'EMP', 'ROW STORE COMPRESS ADVANCED',  
enable_rollback => TRUE);
```

**Note:**

Online table redefinition rollback is not supported when the REDEF\_TABLE procedure is used to redefine a table.

## 130.7 Summary of DBMS\_REDEFINITION Subprograms

This table lists the DBMS\_REDEFINITION subprograms and briefly describes them.

**Table 130-2 DBMS\_REDEFINITION Package Subprograms**

Subprogram	Description
ABORT_REDEF_TABLE Procedure	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
ABORT_ROLLBACK Procedure	Aborts rollback
ABORT_UPDATE Procedure	Aborts an update started with the EXECUTE_UPDATE procedure
CAN_REDEF_TABLE Procedure	Determines if a given table can be redefined online
COPY_TABLE_DEPENDENTS Procedure	Copies the dependent objects of the original table onto the interim table
EXECUTE_UPDATE Procedure	Optimizes the performance of bulk updates to a table

**Table 130-2 (Cont.) DBMS\_REDEFINITION Package Subprograms**

Subprogram	Description
<a href="#">FINISH_REDEF_TABLE Procedure</a>	Completes the redefinition process
<a href="#">REDEF_TABLE Procedure</a>	Provides a single push-button interface that integrates several redefinition steps
<a href="#">REGISTER_DEPENDENT_OBJECT Procedure</a>	Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table
<a href="#">ROLLBACK Procedure</a>	Performs rollback
<a href="#">SET_PARAM Procedure</a>	Sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID
<a href="#">START_REDEF_TABLE Procedure</a>	Initiates the redefinition process
<a href="#">SYNC_INTERIM_TABLE Procedure</a>	Keeps the interim table synchronized with the original table
<a href="#">UNREGISTER_DEPENDENT_OBJECT Procedure</a>	Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table

### 130.7.1 ABORT\_REDEF\_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process.

This procedure can also be used to terminate the redefinition process any time after the [START\\_REDEF\\_TABLE Procedure](#) has been called and before the [FINISH\\_REDEF\\_TABLE Procedure](#) is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

#### Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  part_name       IN VARCHAR2 := NULL);
```

#### Parameters

**Table 130-3 ABORT\_REDEF\_TABLE Procedure Parameters**

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.

**Table 130-3 (Cont.) ABORT\_REDEF\_TABLE Procedure Parameters**

Parameter	Description
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.

## 130.7.2 ABORT\_ROLLBACK Procedure

This procedure aborts rollback for a table that was redefined.

When online redefinition of a table is started with the `START_REDEF_TABLE` procedure, rollback can be enabled for the changes performed by online redefinition of a table by setting the `enable_rollback` parameter to `TRUE`. If you want to retain the changes made by online redefinition, you can abort the rollback to clean up the database objects that enable rollback.

### Syntax

```
DBMS_REDEFINITION.ABORT_ROLLBACK (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2 := NULL,
  part_name      IN VARCHAR2 := NULL);
```

### Parameters

**Table 130-4 ABORT\_ROLLBACK Procedure Parameters**

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
part_name	Name of the partition being redefined

## 130.7.3 ABORT\_UPDATE Procedure

This procedure can aborts an update started with the `EXECUTE_UPDATE` procedure in the `RDBMS_REDEFINITION` package.

### Syntax

```
DBMS_REDEFINITION.ABORT_UPDATE (
  update_stmt IN CLOB);
```

## Parameters

**Table 130-5 ABORT\_UPDATE Procedure Parameters**

Parameter	Description
update_stmt	The SQL UPDATE statement to be aborted The SQL statement must exactly match the SQL statement in the EXECUTE_UPDATE procedure.

### See Also:

*Oracle Database Administrator's Guide*

## 130.7.4 CAN\_REDEF\_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

### Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
  uname          IN VARCHAR2,
  tname          IN VARCHAR2,
  options_flag   IN PLS_INTEGER := 1,
  part_name      IN VARCHAR2 := NULL);
```

### Parameters

**Table 130-6 CAN\_REDEF\_TABLE Procedure Parameters**

Parameter	Description
uname	Schema name of the table
tname	Name of the table to be re-organized
options_flag	Indicates the type of redefinition method to use. <ul style="list-style-type: none"> <li>If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys.</li> <li>If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.</li> </ul>
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

## Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

## 130.7.5 COPY\_TABLE\_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

### Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS(
  uname           IN  VARCHAR2,
  orig_table      IN  VARCHAR2,
  int_table       IN  VARCHAR2,
  copy_indexes   IN  PLS_INTEGER := 1,
  copy_triggers  IN  BOOLEAN   := TRUE,
  copy_constraints IN  BOOLEAN   := TRUE,
  copy_privileges IN  BOOLEAN   := TRUE,
  ignore_errors  IN  BOOLEAN   := FALSE,
  num_errors     OUT PLS_INTEGER,
  copy_statistics IN  BOOLEAN   := FALSE,
  copy_mvlog     IN  BOOLEAN   := FALSE);
```

### Parameters

**Table 130-7 COPY\_TABLE\_DEPENDENTS Procedure Parameters**

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table being redefined
int_table	Name of the interim table
copy_indexes	Flag indicating whether to copy the indexes <ul style="list-style-type: none"> <li>0 - do not copy any index</li> <li>dbms_redefinition.cons_orig_params – copy the indexes using the physical parameters of the source indexes</li> </ul>
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	Number of errors that occurred while cloning dependent objects

**Table 130-7 (Cont.) COPY\_TABLE\_DEPENDENTS Procedure Parameters**

Parameter	Description
copy_statistics	TRUE = copy statistics, FALSE = do nothing
copy_mvlog	TRUE = copy materialized view log, FALSE = do nothing

**Usage Notes**

- The user must check the column num\_errors before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the [COPY\\_TABLE\\_DEPENDENTS Procedure](#) again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the [REGISTER\\_DEPENDENT\\_OBJECT Procedure](#).
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

## 130.7.6 EXECUTE\_UPDATE Procedure

This procedure can optimize the performance of bulk updates to a table. Performance is optimized because the updates are not logged in the redo log.

The EXECUTE\_UPDATE procedure automatically uses the components of online table redefinition, such as an interim table, a materialized view, and a materialized view log, to enable optimized bulk updates to a table. The EXECUTE\_UPDATE procedure also removes fragmentation of the affected rows and ensures that the update is atomic. If the bulk updates raise any errors, then you can use the ABORT\_UPDATE procedure to undo the changes made by the EXECUTE\_UPDATE procedure.

**Syntax**

```
DBMS_REDEFINITION.EXECUTE_UPDATE (
    update_stmt IN CLOB);
```

**Parameters**

**Table 130-8 EXECUTE\_UPDATE Procedure Parameters**

Parameter	Description
update_stmt	The SQL UPDATE statement

**See Also:**

*Oracle Database Administrator's Guide*

## 130.7.7 FINISH\_REDEF\_TABLE Procedure

This procedure completes the redefinition process.

Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

### Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (
  uname          IN  VARCHAR2,
  orig_table     IN  VARCHAR2,
  int_table      IN  VARCHAR2,
  part_name      IN  VARCHAR2 := NULL,
  dml_lock_timeout IN PLS_INTEGER := NULL,
  continue_after_errors IN BOOLEAN := FALSE,
  disable_rollback IN PLS_INTEGER := FALSE);
```

### Parameters

**Table 130-9 FINISH\_REDEF\_TABLE Procedure Parameters**

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.
dml_lock_timeout	Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).
continue_after_errors	When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition).
disable_rollback	When set to TRUE, disables the rollback option if it was enabled in the START_REDEF_TABLE procedure. Specifying TRUE cleans up the database objects that enable rollback.

### Examples

Wait up to 600 seconds for required locks on SH.SALES:

```
EXECUTE DBMS_REDEFINITION.FINISH_REDEF_TABLE (
    'SH', 'SALES', 'INT_SALES', 600);
```

## 130.7.8 REDEF\_TABLE Procedure

This procedure provides a single interface that integrates several redefinition steps including the CAN\_REDEF\_TABLE Procedure, the START\_REDEF\_TABLE Procedure, the COPY\_TABLE\_DEPENDENTS Procedure and the FINISH\_REDEF\_TABLE Procedure.

This procedure can change data storage properties including tablespaces (for table, partition, subpartition, index, LOB column), compress type (for table, partition, subpartition, index, LOB column) and STORE\_AS clause for the LOB column.

### Syntax

```
DBMS_REDEFINITION.REDEF_TABLE (
    uname                IN  VARCHAR2,
    tname                IN  VARCHAR2,
    table_compression_type IN  VARCHAR2 := NULL,
    table_part_tablespace IN  VARCHAR2 := NULL,
    index_key_compression_type IN  VARCHAR2 := NULL,
    index_tablespace     IN  VARCHAR2 := NULL,
    lob_compression_type IN  VARCHAR2 := NULL,
    lob_tablespace       IN  VARCHAR2 := NULL,
    lob_store_as         IN  VARCHAR2 := NULL,
    refresh_dep_mviews   IN  VARCHAR2 := 'N',
    dml_lock_timeout     IN  PLS_INTEGER := NULL);
```

### Parameters

**Table 130-10 REDEF\_TABLE Procedure Parameters**

Parameter	Description
uname	Schema name of the table
tname	Name of the table to be redefined
table_compression_type	Text string of the table compression clause. NULL means there is no change.
table_part_tablespace	Tablespace name for the entire table or partitions. NULL means there is no change.
index_key_compression_type	Text string of the compression clause for all indexes on the table. NULL means there is no change.
index_tablespace	Tablespace name for all indexes on the table. NULL means there is no change.
lob_compression_type	Text string of the compression clause for all LOBs in the entire table. NULL means there is no change.
lob_tablespace	Tablespace name for all LOBs in the table. NULL means there is no change.
lob_store_as	Specifies LOB store as 'SECUREFILE' or 'BASICFILE'. NULL means there is no change.
refresh_dep_mviews	When set to 'Y', fast refresh of dependent materialized views is performed once at the end of the redefinition operation.

**Table 130-10 (Cont.) REDEF\_TABLE Procedure Parameters**

Parameter	Description
dml_lock_timeout	Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).

**Examples**

```

BEGIN
  DBMS_REDEFINITION.REDEF_TABLE(
    uname           => 'TABOWNER2',
    tname           => 'EMP2',
    table_compression_type => 'ROW STORE COMPRESS ADVANCED',
    table_part_tablespace => 'NEWTBS',
    index_key_compression_type => 'COMPRESS 1',
    index_tablespace   => 'NEWIDXTBS',
    lob_compression_type   => 'COMPRESS HIGH',
    lob_tablespace     => 'SLOBTBS',
    lob_store_as       => 'SECUREFILE');
END;

```

**Related Topics**

- [CAN\\_REDEF\\_TABLE Procedure](#)  
This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.
- [START\\_REDEF\\_TABLE Procedure](#)  
This procedure starts a table redefinition.
- [COPY\\_TABLE\\_DEPENDENTS Procedure](#)  
This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.
- [FINISH\\_REDEF\\_TABLE Procedure](#)  
This procedure completes the redefinition process.

 **See Also:**

*Oracle Database Administrator's Guide* regarding "Performing Online Redefinition with the REDEF\_TABLE Procedure"

## 130.7.9 REGISTER\_DEPENDENT\_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

### Syntax

```
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT(
  uname           IN   VARCHAR2,
  orig_table      IN   VARCHAR2,
  int_table       IN   VARCHAR2,
  dep_type        IN   PLS_INTEGER,
  dep_owner       IN   VARCHAR2,
  dep_orig_name   IN   VARCHAR2,
  dep_int_name    IN   VARCHAR2);
```

### Parameters

**Table 130-11 REGISTER\_DEPENDENT\_OBJECT Procedure Parameters**

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
dep_type	Type of the dependent object (see <a href="#">Constants</a> and <a href="#">Operational Notes</a> )
dep_owner	Owner of the dependent object
dep_orig_name	Name of the original dependent object
dep_int_name	Name of the interim dependent object

### Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA\_REDEFINITION\_ERRORS if an entry exists for that object.

## 130.7.10 ROLLBACK Procedure

This procedure rolls back changes to a table after online table redefinition to return the table to its original definition and preserve DML changes made to the table.

### Syntax

```
DBMS_REDEFINITION.ROLLBACK (
  uname           IN   VARCHAR2,
  orig_table      IN   VARCHAR2,
```

```
int_table          IN VARCHAR2 := NULL,
part_name         IN VARCHAR2 := NULL,
dml_lock_timeout  IN PLS_INTEGER := NULL,
continue_after_errors IN BOOLEAN := FALSE);
```

### Parameters

**Table 130-12 ROLLBACK Procedure Parameters**

Parameter	Description
uname	Schema name of the table to be redefined
orig_table	Name of the table to be redefined
int_table	Name of the interim table.
part_name	Name of the partition being redefined.
dml_lock_timeout	Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).
continue_after_errors	When rolling back redefinition changes on multiple partitions, allows operation execution to continue on the next partition (applies only to batched partition redefinition).

## 130.7.11 SET\_PARAM Procedure

This procedure sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID.

### Note:

Currently, the only value that can be changed by this procedure is the value for the of the `refresh_dep_mviews` parameter that is specified in the `REDEF_TABLE` procedure or the `START_REDEF_TABLE` procedure. You can determine the redefinition ID and check the value of the `refresh_dep_mviews` parameter for an online table redefinition operation by querying the `DBA_REDEFINITION_STATUS` view.

### Syntax

```
DBMS_REDEFINITION.SET_PARAM (
  redefinition_id IN VARCHAR2,
  param_name     IN VARCHAR2,
  param_value    IN VARCHAR2);
```

### Parameters

**Table 130-13 SET\_PARAM Procedure Parameters**

Parameter	Description
redefinition_id	The redefinition ID that identifies the redefinition process

**Table 130-13 (Cont.) SET\_PARAM Procedure Parameters**

Parameter	Description
param_name	The parameter name
param_value	The new parameter value

**See Also:**

*Oracle Database Administrator's Guide*

## 130.7.12 START\_REDEF\_TABLE Procedure

This procedure starts a table redefinition.

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

### Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  col_mapping     IN VARCHAR2 := NULL,
  options_flag    IN BINARY_INTEGER := 1,
  orderby_cols    IN VARCHAR2 := NULL,
  part_name       IN VARCHAR2 := NULL,
  continue_after_errors IN BOOLEAN := FALSE,
  copy_vpd_opt    IN BINARY_INTEGER := CONS_VPD_NONE,
  refresh_dep_mviews IN VARCHAR2 := 'N',
  enable_rollback IN BOOLEAN := FALSE);
```

### Parameters

**Table 130-14 START\_REDEF\_TABLE Procedure Parameters**

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.
col_mapping	Mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition.

**Table 130-14 (Cont.) START\_REDEF\_TABLE Procedure Parameters**

Parameter	Description
options_flag	Indicates the type of redefinition method to use: <ul style="list-style-type: none"> <li>If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys.</li> <li>If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.</li> </ul>
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.
continue_after_errors	When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)
copy_vpd_opt	Specifies how VPD policies are handled in online redefinition
refresh_dep_mviews	When set to 'Y', fast refresh of dependent materialized views is performed when the <code>START_REDEF_TABLE</code> procedure is run, each time the <code>SYNC_INTERIM_TABLE</code> procedure is run, and when the <code>FINISH_REDEF_TABLE</code> procedure is run.
enable_rollback	When set to TRUE, enables the rollback option.  When this parameter is set to true, Oracle Database maintains the interim table created during redefinition after redefinition is complete. You can run the <code>SYNC_INTERIM_TABLE</code> procedure to synchronize the interim table periodically to apply DML changes made to the redefined table to the interim table. An internal materialized view and materialized view log enables maintenance of the interim table. If you decide to roll back the online table redefinition with the <code>ROLLBACK</code> procedure, then the interim table is synchronized, and Oracle Database switches back to it so that the table has its original definition.

### Examples

Start redefinition of three partitions (`sal03q1`, `sal03q2`, `sal03q3`) in table 'STEVE.salestable' using three interim tables of `int_salestable1`, `int_salestable2` and `int_salestable3`, respectively. The operation will continue on `sal03q3` even if it fails on `sal03q1`.

```
DBMS_REDEFINITION.START_REDEF_TABLE(
  uname           => 'STEVE',
  orig_table      => 'salestable',
  int_table       => 'int_salestable1, int_salestable2, int_salestable3',
  col_mapping     => NULL,
  options_flag    => DBMS_REDEFINITION.CONST_USE_ROWID,
```

```
part_name          => 'sal03q1,sal03q2,sal03q3',
continue_after_errors => TRUE);
```

Specify to copy VPD policies automatically:

```
EXECUTE DBMS_REDEFINITION.START_REDEF_TABLE (
  uname          => 'SCOTT',
  orig_table     => 'T',
  int_table      => 'INT_T',
  copy_vpd_opt  => DBMS_REDEFINITION.CONS_VPD_AUTO);
```

## 130.7.13 SYNC\_INTERIM\_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

### Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  part_name      IN VARCHAR2 := NULL,
  continue_after_errors IN BOOLEAN := FALSE);
```

### Parameters

**Table 130-15 SYNC\_INTERIM\_TABLE Procedure Parameters**

Parameter	Description
uname	Schema name of the table
orig_table	Name of the table to be redefined
int_table	Name of the interim table. Can take a comma-delimited list of interim table names.
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.
continue_after_errors	When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)

### Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the [FINISH\\_REDEF\\_TABLE Procedure](#) before completing the online redefinition.
- This procedure can be called between long running operations (such as CREATE INDEX) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

## 130.7.14 UNREGISTER\_DEPENDENT\_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

### Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPENDENT_OBJECT(  
    uname           IN VARCHAR2,  
    orig_table      IN VARCHAR2,  
    int_table       IN VARCHAR2,  
    dep_type        IN PLS_INTEGER,  
    dep_owner       IN VARCHAR2,  
    dep_orig_name   IN VARCHAR2,  
    dep_int_name    IN VARCHAR2);
```

### Parameters

**Table 130-16 UNREGISTER\_DEPENDENT\_OBJECT Procedure Parameters**

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
dep_type	Type of the dependent object
dep_owner	Owner of the dependent object
dep_orig_name	Name of the original dependent object
dep_int_name	Name of the interim dependent object

# DBMS\_REFRESH

The `DBMS_REFRESH` package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time. These groups are called refresh groups.

This chapter contains the following topics:

- [DBMS\\_REFRESH Overview](#)
- [DBMS\\_REFRESH Security Model](#)

## 131.1 DBMS\_REFRESH Overview

When it is important for materialized views to be transactionally consistent with each other, you can organize them into refresh groups.

By refreshing the refresh group, you can ensure that the data in all of the materialized views in the refresh group correspond to the same transactionally consistent point in time. A materialized view in a refresh group still can be refreshed individually, but doing so nullifies the benefits of the refresh group because refreshing the materialized view individually does not refresh the other materialized views in the refresh group.

## 131.2 DBMS\_REFRESH Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_REFRESH` package.

## 131.3 Summary of DBMS\_REFRESH Subprograms

This table lists the `DBMS_REFRESH` subprograms and briefly describes them.

**Table 131-1 DBMS\_REFRESH Package Subprograms**

Subprogram	Description
<a href="#">ADD Procedure</a>	Adds materialized views to a refresh group
<a href="#">CHANGE Procedure</a>	Changes the refresh interval for a refresh group
<a href="#">DESTROY Procedure</a>	Removes all of the materialized views from a refresh group and deletes the refresh group
<a href="#">MAKE Procedure</a>	Specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group
<a href="#">REFRESH Procedure</a>	Manually refreshes a refresh group
<a href="#">SUBTRACT Procedure</a>	Removes materialized views from a refresh group

## 131.3.1 ADD Procedure

This procedure adds materialized views to a refresh group.

### Syntax

```
DBMS_REFRESH.ADD (
  name      IN VARCHAR2,
  { list    IN VARCHAR2,
    | tab    IN DBMS_UTILITY.UNCL_ARRAY, }
  lax       IN BOOLEAN := FALSE);
```

#### Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

### Parameters

**Table 131-2 ADD Procedure Parameters**

Parameter	Description
<code>name</code>	Name of the refresh group to which you want to add members, specified as [ <i>schema_name</i> .] <i>refresh_group_name</i> . If the schema is not specified, then the current user is the default.
<code>list</code>	Comma-delimited list of materialized views that you want to add to the refresh group. Synonyms are not supported. Each materialized view is specified as [ <i>schema_name</i> .] <i>materialized_view_name</i> . If the schema is not specified, then the refresh group owner is the default.
<code>tab</code>	Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code> . Each materialized view is specified as [ <i>schema_name</i> .] <i>materialized_view_name</i> . If the schema is not specified, then the refresh group owner is the default.
<code>lax</code>	A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from one group to another, then you must set the <code>lax</code> flag to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>ADD</code> generates an error message.

## 131.3.2 CHANGE Procedure

This procedure changes the refresh interval for a refresh group.

### Syntax

```
DBMS_REFRESH.CHANGE (
  name           IN VARCHAR2,
  next_date      IN DATE           := NULL,
  interval       IN VARCHAR2      := NULL,
  implicit_destroy IN BOOLEAN      := NULL,
  rollback_seg   IN VARCHAR2      := NULL,
  push_deferred_rpc IN BOOLEAN    := NULL,
  refresh_after_errors IN BOOLEAN := NULL,
  purge_option   IN BINARY_INTEGER := NULL,
  parallelism    IN BINARY_INTEGER := NULL,
  heap_size      IN BINARY_INTEGER := NULL);
```

### Parameters

**Table 131-3 CHANGE Procedure Parameters**

Parameter	Description
name	Name of the refresh group for which you want to alter the refresh interval.
next_date	Next date that you want a refresh to occur. By default, this date remains unchanged.
interval	Function used to calculate the next time to refresh the materialized views in the refresh group. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh. By default, the interval remains unchanged.
implicit_destroy	Allows you to reset the value of the <code>implicit_destroy</code> flag. If this flag is set, then Oracle automatically deletes the group if it no longer contains any members. By default, this flag remains unchanged.
rollback_seg	Allows you to change the rollback segment used. By default, the rollback segment remains unchanged. To reset this parameter to use the default rollback segment, specify <code>NULL</code> , including the quotes. Specifying <code>NULL</code> without quotes indicates that you do not want to change the rollback segment currently being used.
push_deferred_rpc	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
refresh_after_errors	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
purge_option	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
parallelism	<ul style="list-style-type: none"> <li>0 specifies serial propagation.</li> <li><math>n &gt; 1</math> specifies parallel propagation with <math>n</math> parallel processes.</li> <li>1 specifies parallel propagation using only one parallel process.</li> </ul>

**Table 131-3 (Cont.) CHANGE Procedure Parameters**

Parameter	Description
heap_size	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.

**Note:**

Do not set this parameter unless directed to do so by Oracle Support Services.

### 131.3.3 DESTROY Procedure

This procedure removes all of the materialized views from a refresh group and delete the refresh group.

**Syntax**

```
DBMS_REFRESH.DESTROY (
    name    IN    VARCHAR2);
```

**Parameters**

**Table 131-4 DESTROY Procedure Parameters**

Parameter	Description
name	Name of the refresh group that you want to destroy.

### 131.3.4 MAKE Procedure

This procedure specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group.

**Syntax**

```
DBMS_REFRESH.MAKE (
    name                IN    VARCHAR2
    { list              IN    VARCHAR2,
      | tab             IN    DBMS_UTILITY.UNCL_ARRAY, }
    next_date          IN    DATE,
    interval            IN    VARCHAR2,
    implicit_destroy   IN    BOOLEAN          := FALSE,
    lax                 IN    BOOLEAN          := FALSE,
    job                 IN    BINARY_INTEGER  := 0,
    rollback_seg       IN    VARCHAR2        := NULL,
    push_deferred_rpc   IN    BOOLEAN          := TRUE,
    refresh_after_errors IN    BOOLEAN          := FALSE
    purge_option        IN    BINARY_INTEGER  := NULL,
    parallelism         IN    BINARY_INTEGER  := NULL,
    heap_size           IN    BINARY_INTEGER  := NULL
```

```
job_name          IN  VARCHAR2          := NULL,
auto_commit       IN  BOOLEAN           := NULL);
```

 **Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

## Parameters

**Table 131-5 MAKE Procedure Parameters**

Parameter	Description
<code>name</code>	Unique name used to identify the refresh group, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default. Refresh groups must follow the same naming conventions as tables.
<code>list</code>	Comma-delimited list of materialized views that you want to refresh. Synonyms are not supported. These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database.  Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
<code>tab</code>	Instead of a comma-delimited list, you can supply a PL/SQL associative array of names of materialized views that you want to refresh using the data type <code>DBMS_UTILITY.UNCL_ARRAY</code> . If the table contains the names of $n$ materialized views, then the first materialized view should be in position 1 and the $n + 1$ position should be set to <code>NULL</code> .  Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
<code>next_date</code>	Next date that you want a refresh to occur.
<code>interval</code>	Function used to calculate the next time to refresh the materialized views in the group. This field is used with the <code>next_date</code> value.  For example, if you specify <code>NEXT_DAY(SYSDATE+1, "MONDAY")</code> as your interval, and if your <code>next_date</code> evaluates to Monday, then Oracle refreshes the materialized views every Monday. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh.
<code>implicit_destroy</code>	Set this to <code>TRUE</code> to delete the refresh group automatically when it no longer contains any members. Oracle checks this flag only when you call the <code>SUBTRACT</code> procedure. That is, setting this flag still enables you to create an empty refresh group.
<code>lax</code>	A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from an existing group to a new refresh group, then you must set this to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>MAKE</code> generates an error message.

**Table 131-5 (Cont.) MAKE Procedure Parameters**

Parameter	Description
job	Needed by the Import utility. Use the default value, 0.
rollback_seg	Name of the rollback segment to use while refreshing materialized views. The default, NULL, uses the default rollback segment.
push_deferred_rpc	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
refresh_after_errors	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
purge_option	Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.
parallelism	<ul style="list-style-type: none"> <li>0 specifies serial propagation.</li> <li><math>n &gt; 1</math> specifies parallel propagation with <math>n</math> parallel processes.</li> <li>1 specifies parallel propagation using only one parallel process.</li> </ul>
heap_size	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.

 **Note:**  
Do not set this parameter unless directed to do so by Oracle Support Services.

job_name	This parameter is needed by the import utility. User should use the default value, NULL.
auto_commit	<p>Supported values are NULL, TRUE, and FALSE.</p> <ul style="list-style-type: none"> <li>NULL—allows the user to continue using DBMS_JOB.</li> <li>TRUE—commit statement will be automatically issued after the job of the refresh group are created by DBMS_REFRESH.MAKE.</li> <li>FALSE—user must issue a commit statement to finish the transaction after calling DBMS_REFRESH.MAKE.</li> </ul> <p>The default value is NULL.</p>

### Usage Notes

Import utility and export utility need CREATE JOB privilege if DBMS\_SCHEDULER jobs are used.

## 131.3.5 REFRESH Procedure

This procedure manually refreshes a refresh group.

### Syntax

```
DBMS_REFRESH.REFRESH (
    name IN VARCHAR2);
```

## Parameters

**Table 131-6 REFRESH Procedure Parameters**

Parameter	Description
name	Name of the refresh group that you want to refresh manually.

## 131.3.6 SUBTRACT Procedure

This procedure removes materialized views from a refresh group.

### Syntax

```
DBMS_REFRESH.SUBTRACT (
  name      IN   VARCHAR2,
  { list    IN   VARCHAR2,
    | tab    IN   DBMS_UTILITY.UNCL_ARRAY, }
  lax       IN   BOOLEAN := FALSE);
```

#### Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

## Parameters

**Table 131-7 SUBTRACT Procedure Parameters**

Parameter	Description
name	Name of the refresh group from which you want to remove members, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default.
list	Comma-delimited list of materialized views that you want to remove from the refresh group. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database.  Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.
tab	Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code> .  Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.

**Table 131-7 (Cont.) SUBTRACT Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
lax	Set this to <code>FALSE</code> if you want Oracle to generate an error message if the materialized view you are attempting to remove is not a member of the refresh group.

# DBMS\_REPAIR

The `DBMS_REPAIR` package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_REPAIR Subprograms](#)

## See Also:

For detailed information about using the `DBMS_REPAIR` package, see *Oracle Database Administrator's Guide*

## 132.1 DBMS\_REPAIR Overview

The `DBMS_REPAIR` package is intended for use by database administrators only. It is not intended for use by application developers.

## 132.2 DBMS\_REPAIR Security Model

The package is owned by `SYS`. Execution privilege is not granted to other users.

## 132.3 DBMS\_REPAIR Constants

The `DBMS_REPAIR` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_REPAIR.TABLE_OBJECT`.

The following table lists the parameters and the enumerated constants.

**Table 132-1 DBMS\_REPAIR Parameters with Enumerated Constants**

Parameter	Option	Type	Description
object_type	• TABLE_OBJECT	BINARY_INTEGER	-
	• INDEX_OBJECT	R	
	• CLUSTER_OBJECT		
action	• CREATE_ACTION	BINARY_INTEGER	-
	• DROP_ACTION	R	
	• PURGE_ACTION		
table_type	• REPAIR_TABLE	BINARY_INTEGER	-
	• ORPHAN_TABLE	R	
flags	• SKIP_FLAG	BINARY_INTEGER	-
	• NOSKIP_FLAG	R	
object_id	• ALL_INDEX_ID := 0	BINARY_INTEGER R	Clean up all objects that qualify
wait_for_lock	• LOCK_WAIT := 1	BINARY_INTEGER	Specifies whether to try getting DML locks on underlying table [[sub]partition] object
	• LOCK_NOWAIT := 0	R	

**Note:**

The default table\_name will be REPAIR\_TABLE when table\_type is REPAIR\_TABLE, and will be ORPHAN\_KEY\_TABLE when table\_type is ORPHAN\_TABLE.

## 132.4 DBMS\_REPAIR Operating Notes

The procedure to create the ORPHAN\_KEYS\_TABLE is similar to the one used to create the REPAIR\_TABLE.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);
DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the [CHECK\\_OBJECT Procedure](#) would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR\_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN\_' prefix. The following code is also legal:

```

CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                             DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;

```

When invoking the [CHECK\\_OBJECT Procedure](#) the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the [ADMIN\\_TABLES Procedure](#) or `CREATE_ACTION`.

Other actions in the [ADMIN\\_TABLES Procedure](#) can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

## 132.5 DBMS\_REPAIR Exceptions

The table in this topic describes the exceptions raised by the `DBMS_REPAIR` subprograms.

**Table 132-2 DBMS\_REPAIR Exceptions**

Exception	Description	Action
942	Reported by <code>DBMS_REPAIR.ADMIN_TABLES</code> during a <code>DROP_ACTION</code> when the specified table doesn't exist.	-
955	Reported by <code>DBMS_REPAIR.CREATE_ACTION</code> when the specified table already exists.	-
24120	An invalid parameter was passed to the specified <code>DBMS_REPAIR</code> procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the <code>BLOCK_START</code> and <code>BLOCK_END</code> parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid <code>ACTION</code> parameter was specified.	Specify <code>CREATE_ACTION</code> , <code>PURGE_ACTION</code> or <code>DROP_ACTION</code> for the <code>ACTION</code> parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since <code>DBMS_REPAIR.CHECK_OBJECT</code> was run.	Use <code>DBMS_REPAIR.ADMIN_TABLES</code> to purge the repair table and run <code>DBMS_REPAIR.CHECK_OBJECT</code> to determine whether there are any corrupt blocks to be fixed.
24127	<code>TABLESPACE</code> parameter specified with an <code>ACTION</code> other than <code>CREATE_ACTION</code> .	Do not specify <code>TABLESPACE</code> when performing actions other than <code>CREATE_ACTION</code> .

**Table 132-2 (Cont.) DBMS\_REPAIR Exceptions**

Exception	Description	Action
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

## 132.6 DBMS\_REPAIR Examples

This topic shows examples of DBMS\_REPAIR usage.

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

## 132.7 Summary of DBMS\_REPAIR Subprograms

This table lists the DBMS\_REPAIR subprograms and briefly describes them.

**Table 132-3 DBMS\_REPAIR Package Subprograms**

Subprogram	Description
<a href="#">ADMIN_TABLES Procedure</a>	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
<a href="#">CHECK_OBJECT Procedure</a>	Detects and reports corruptions in a table or index
<a href="#">DUMP_ORPHAN_KEYS Procedure</a>	Reports on index entries that point to rows in corrupt data blocks
<a href="#">FIX_CORRUPT_BLOCKS Procedure</a>	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
<a href="#">ONLINE_INDEX_CLEAN Function</a>	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
<a href="#">REBUILD_FREELISTS Procedure</a>	Rebuilds an object's freelists

**Table 132-3 (Cont.) DBMS\_REPAIR Package Subprograms**

Subprogram	Description
<a href="#">SEGMENT_FIX_STATUS Procedure</a>	Fixes the corrupted state of a bitmap entry
<a href="#">SKIP_CORRUPT_BLOCKS Procedure</a>	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

## 132.7.1 ADMIN\_TABLES Procedure

This procedure provides administrative functions for the DBMS\_REPAIR package repair and orphan key tables.

### Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
  table_name IN  VARCHAR2,
  table_type IN  BINARY_INTEGER,
  action      IN  BINARY_INTEGER,
  tablespace IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 132-4 ADMIN\_TABLES Procedure Parameters**

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See " <a href="#">Constants</a> ".
action	Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See " <a href="#">Constants</a> ".
tablespace	Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

## 132.7.2 CHECK\_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

### Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  relative_fno    IN BINARY_INTEGER DEFAULT NULL,
  block_start     IN BINARY_INTEGER DEFAULT NULL,
  block_end       IN BINARY_INTEGER DEFAULT NULL,
  corrupt_count   OUT BINARY_INTEGER);
```

### Parameters

**Table 132-5 CHECK\_OBJECT Procedure Parameters**

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " <a href="#">Constants</a> ".
repair_table_name	Name of the repair table to be populated. The table must exist in the <code>SYS</code> schema. Use the <code>ADMIN_TABLES</code> Procedure to create a repair table. The default name is <code>REPAIR_TABLE</code> .
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of <code>block_start</code> or <code>block_end</code> is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

### Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

## 132.7.3 DUMP\_ORPHAN\_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

### Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT INDEX_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  orphan_table_name IN VARCHAR2      DEFAULT 'ORPHAN_KEYS_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  key_count       OUT BINARY_INTEGER);
```

### Parameters

**Table 132-6 DUMP\_ORPHAN\_KEYS Procedure Parameters**

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is INDEX_OBJECT See " <a href="#">Constants</a> ".
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.

**Table 132-6 (Cont.) DUMP\_ORPHAN\_KEYS Procedure Parameters**

Parameter	Description
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block.  The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.
flags	Reserved for future use.
key_count	Number of index entries processed.

## 132.7.4 FIX\_CORRUPT\_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the CHECK\_OBJECT Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

### Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN  BINARY_INTEGER DEFAULT NULL,
  fix_count       OUT BINARY_INTEGER);
```

### Parameters

**Table 132-7 FIX\_CORRUPT\_BLOCKS Procedure Parameters**

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed.  If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT.  See " <a href="#">Constants</a> ".
repair_table_name	Name of the repair table with the repair directives.  Must exist in the SYS schema.

**Table 132-7 (Cont.) FIX\_CORRUPT\_BLOCKS Procedure Parameters**

Parameter	Description
flags	Reserved for future use.
fix_count	Number of blocks fixed.

**Related Topics**

- [CHECK\\_OBJECT Procedure](#)  
This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

## 132.7.5 ONLINE\_INDEX\_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds.

This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns `TRUE` if all indexes specified were cleaned up and `FALSE` if one or more indexes could not be cleaned up.

**Syntax**

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
    object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
    wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
RETURN BOOLEAN;
```

**Parameters**

**Table 132-8 ONLINE\_INDEX\_CLEAN Function Parameters**

Parameter	Description
object_id	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
wait_for_lock	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If <code>LOCK_NOWAIT</code> is specified, then the lock get does not retry.

## 132.7.6 REBUILD\_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object.

All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

**Syntax**

```
DBMS_REPAIR.REBUILD_FREELISTS (
  schema_name      IN VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN VARCHAR2 DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

**Parameters****Table 132-9 REBUILD\_FREELISTS Procedure Parameters**

Parameter	Description
schema_name	Schema name.
object_name	Name of the object whose freelists are to be rebuilt.
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " <a href="#">Constants</a> ".

## 132.7.7 SEGMENT\_FIX\_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

**Syntax**

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
  segment_owner   IN VARCHAR2,
  segment_name    IN VARCHAR2,
  segment_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  file_number     IN BINARY_INTEGER DEFAULT NULL,
  block_number    IN BINARY_INTEGER DEFAULT NULL,
  status_value    IN BINARY_INTEGER DEFAULT NULL,
  partition_name  IN VARCHAR2 DEFAULT NULL,);
```

**Parameters****Table 132-10 SEGMENT\_FIX\_STATUS Procedure Parameters**

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.

**Table 132-10 (Cont.) SEGMENT\_FIX\_STATUS Procedure Parameters**

Parameter	Description
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
status_value	(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: <ul style="list-style-type: none"> <li>• 1 = block is full</li> <li>• 2 = block is 0-25% free</li> <li>• 3 = block is 25-50% free</li> <li>• 4 = block is 50-75% free</li> <li>• 5 = block is 75-100% free</li> </ul> The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.

## 132.7.8 SKIP\_CORRUPT\_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

### Note:

When Oracle performs an index range scan on a corrupt index after DBMS\_REPAIR.SKIP\_CORRUPT\_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

### Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

## Parameters

**Table 132-11 SKIP\_CORRUPT\_BLOCKS Procedure Parameters**

Parameter	Description
schema_name	Schema name of the object to be processed.
object_name	Name of the object.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT. See " <a href="#">Constants</a> ".
flags	If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578. See " <a href="#">Constants</a> ".

# DBMS\_RESCONFIG

The `DBMS_RESCONFIG` package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

This chapter contains the following topics:

- [Overview](#)
- [Summary of DBMS\\_RESCONFIG Subprograms](#)

### See Also:

*Oracle XML DB Developer's Guide* for more information about "Resource Configuration".

## 133.1 DBMS\_RESCONFIG Overview

The `DBMS_RESCONFIG` package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

## 133.2 Summary of DBMS\_RESCONFIG Subprograms

This table lists and briefly describes the `DBMS_RESCONFIG` package subprograms.

**Table 133-1 DBMS\_RESCONFIG Package Subprograms**

Subprogram	Description
<a href="#">ADDREPOSITORYRESCONFIG Procedure</a>	Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list
<a href="#">ADDRESCONFIG Procedure</a>	Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list
<a href="#">APPENDRESCONFIG Procedure</a>	Appends the resource configuration specified by rpath to the target resource's configuration list if it is not already included in the list
<a href="#">DELETEREPOSITORYRESCONFIG Procedure</a>	Removes the configuration at the given position in the repository's configuration list.
<a href="#">DELETERESCONFIG Procedures</a>	Removes the configuration at the given position in the target resource's configuration list.
<a href="#">GETLISTENERS Function</a>	Returns the list of listeners applicable for a given resource

**Table 133-1 (Cont.) DBMS\_RESCONFIG Package Subprograms**

Subprogram	Description
<a href="#">GETREPOSITORYRESCONFIG Function</a>	Returns the resource configuration at the specified position of the repository's configuration list
<a href="#">GETREPOSITORYRESCONFIGPATHS Function</a>	Returns a list of resource configuration paths defined for the repository
<a href="#">GETRESCONFIG Function</a>	Returns the resource configuration at the specified position of the target resource's configuration list
<a href="#">GETRESCONFIGPATHS Function</a>	Returns a list of resource configuration paths defined in the target resource's configuration list
<a href="#">PATCHREPOSITORYRESCONFIGLIST Procedure</a>	Removes invalid references from the repository resource configuration list, and makes the repository available

## 133.2.1 ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

### Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG(
    rcpath    IN    VARCHAR2,
    pos       IN    PLS_INTEGER := NULL);
```

### Parameters

**Table 133-2 ADDREPOSITORYRESCONFIG Function Parameters**

Parameter	Description
<code>rcpath</code>	Absolute path of the resource configuration to be inserted. An exception is raised if <code>rcpath</code> already exists in the target's configuration list.
<code>pos</code>	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;</code> the size of the target resource's configuration list).

### Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `XDBADMIN` role and `READ` privilege on the resource configuration to be inserted; otherwise, an error is returned.

## 133.2.2 ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

### Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
    respath    IN    VARCHAR2,
    rcpath     IN    VARCHAR2,
    pos        IN    PLS_INTEGER := NULL);
```

### Parameters

**Table 133-3 ADDRESCONFIG Function Parameters**

Parameter	Description
respath	Absolute path of the target resource
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ( $pos < 0$ or $pos >$ the size of the target resource's configuration list).

### Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

## 133.2.3 APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by `rcpath` to the target resource's configuration list if it is not already included in the list.

### Syntax

```
DBMS_RESCONFIG.APPENDRESCONFIG(
    respath    IN    VARCHAR2,
    rcpath     IN    VARCHAR2,
    appendOption IN PLS_INTEGER);
```

## Parameters

**Table 133-4 ADDRESCONFIG Function Parameters**

Parameter	Description
respath	Absolute path of the target resource
rcpath	Absolute path of the resource configuration to be appended at the end of the target's configuration list. If <code>rcpath</code> already exists in the list then nothing is appended.
appendOption	Either <code>APPEND_RESOURCE</code> or <code>APPEND_RECURSIVE</code> . If <code>APPEND_RESOURCE</code> is specified then only the target resource is affected. If <code>APPEND_RECURSIVE</code> is specified then the target resource and all its descendents will be affected.

## Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

## 133.2.4 DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

## Syntax

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG(
    pos          IN PLS_INTEGER);
```

## Parameters

**Table 133-5 DELETEREPOSITORYRESCONFIG Function Parameters**

Parameter	Description
pos	The index of the configuration to be removed. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;=</code> the size of the target resource's configuration list).

## Usage Notes

- Users must have `XDBADMIN` role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

## 133.2.5 DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

### Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG(
    respath      IN  VARCHAR2,
    pos          IN  PLS_INTEGER);
```

```
DBMS_RESCONFIG.DELETERESCONFIG(
    respath      IN  VARCHAR2,
    rcpath       IN  VARCHAR2,
    deleteOption IN  PLS_INTEGER);
```

### Parameters

**Table 133-6 DELETERESCONFIG Procedure Parameters**

Parameter	Description
respath	Absolute path of the target resource
pos	The index of the configuration to be removed. An exception is raised if the index is out of range ( $pos < 0$ or $pos \geq$ the size of the target resource's configuration list).
rcpath	Absolute path of the resource configuration to be deleted if found in list.
deleteOption	Either DELETE_RESOURCE or DELETE_RECURSIVE. If DELETE_RESOURCE is specified then only the configuration list of the target resource is affected. If DELETE_RECURSIVE is specified then the configuration list of the target resource and all its descendents will be affected.

### Usage Notes

Users must have WRITE-CONFIG privilege on the target resource to execute this.

## 133.2.6 GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the <event-listeners> element of the XDBResconfig.xsd schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the EXTRACT operator to retrieve the listeners defined for a specific event.

### Syntax

```
DBMS_RESCONFIG.GETLISTENERS(
    path IN VARCHAR2)
RETURN XMLTYPE;
```

## Parameters

**Table 133-7 GETLISTENERS Function Parameters**

Parameter	Description
path	Absolute path of the target resource

## Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

## 133.2.7 GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG(
    pos    IN    PLS_INTEGER)
RETURN XMLTYPE;
```

## Parameters

**Table 133-8 GETREPOSITORYRESCONFIG Function Parameters**

Parameter	Description
pos	Index of element to return. An exception is raised if the index is out of range ( $pos < 0$ or $pos \geq$ the size of the repository's configuration list).

## Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

## 133.2.8 GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

### Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS
RETURN XDB$STRING_LIST_T;
```

## Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

## 133.2.9 GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(
    respath IN VARCHAR2,
    pos IN PLS_INTEGER)
RETURN XMLTYPE;
```

### Parameters

**Table 133-9 GETRESCONFIG Function Parameters**

Parameter	Description
respath	Absolute path of the target resource
pos	Index of element to return. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;=</code> the size of the target resource's configuration list).

### Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

## 133.2.10 GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS(
    respath IN VARCHAR2)
RETURN XDB$STRING_LIST_T;
```

### Parameters

**Table 133-10 GETRESCONFIGPATHS Function Parameters**

Parameter	Description
respath	Absolute path of the target resource

### Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

## 133.2.11 PATCHREPOSITORYRESCONFIGLIST Procedure

This procedure removes invalid references from the repository resource configuration list, and makes the repository available.

Under normal circumstances, deletion of a resource configuration resource cannot be performed if it is part of the repository resource configuration list. If, for some reason, the deletion of a resource configuration resource that is part of the repository resource configuration list succeeds, then any repository operation results in a 'dangling reference' error. This procedure removes those invalid references.

This procedure must be run as `SYS`.

### Syntax

```
DBMS_RESCONFIG.PATCHREPOSITORYRESCONFIGLIST;
```

# DBMS\_RESOURCE\_MANAGER

The `DBMS_RESOURCE_MANAGER` package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_RESOURCE\\_MANAGER Subprograms](#)

 **See Also:**

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

## 134.1 DBMS\_RESOURCE\_MANAGER Deprecated Subprograms

The `SET_INITIAL_CONSUMER_GROUP` Procedure has been deprecated with Oracle Database 11g.

- [SET\\_INITIAL\\_CONSUMER\\_GROUP Procedure](#)

 **Note:**

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

## 134.2 DBMS\_RESOURCE\_MANAGER Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures.

The procedures to grant and revoke this privilege are in the package [DBMS\\_RESOURCE\\_MANAGER\\_PRIVS](#).

## 134.3 DBMS\_RESOURCE\_MANAGER Constants

The `DBMS_RESOURCE_MANAGER` package defines several constants for specifying parameter values.

These are shown in the following table.

**Table 134-1 DBMS\_RESOURCE\_MANAGER Constants**

Constant	Type	Value	Description
<code>CLIENT_ID</code>	<code>VARCHAR2(30)</code>	<code>CLIENT_ID</code>	Client identifier of the session
<code>CLIENT_MACHINE</code>	<code>VARCHAR2(30)</code>	<code>CLIENT_MACHINE</code>	Name of the computer from which the client is making the connection
<code>CLIENT_OS_USER</code>	<code>VARCHAR2(30)</code>	<code>CLIENT_OS_USER</code>	Operating system user name of the client that is logging in
<code>CLIENT_PROGRAM</code>	<code>VARCHAR2(30)</code>	<code>CLIENT_PROGRAM</code>	Name of the client program used to log in to the server
<code>MODULE_NAME</code>	<code>VARCHAR2(30)</code>	<code>MODULE_NAME</code>	Module name in the currently running application as set by the <a href="#">SET_MODULE Procedure</a> in the <a href="#">DBMS_APPLICATION_INFO</a> package, or the equivalent OCI attribute setting
<code>MODULE_NAME_ACTION</code>	<code>VARCHAR2(30)</code>	<code>MODULE_NAME_ACTION</code>	<p>A combination of the current module and the action being performed as set by either of the following procedures in the <a href="#">DBMS_APPLICATION_INFO</a> package, or their equivalent OCI attribute setting:</p> <ul style="list-style-type: none"> <li>• <a href="#">SET_MODULE Procedure</a></li> <li>• <a href="#">SET_ACTION Procedure</a></li> </ul> <p>The attribute is specified as the module name followed by a period (.), followed by the action name (<i>module_name.action_name</i>).</p>
<code>ORACLE_FUNCTION</code>	<code>VARCHAR2(30)</code>	<code>ORACLE_FUNCTION</code>	Function the session is currently executing. Valid functions are the <code>BACKUP</code> , <code>COPY</code> , <code>DATALOAD</code> , and <code>INMEMORY</code> . <code>BACKUP</code> is set for sessions that are doing backup operations using RMAN. <code>COPY</code> is set for sessions that are doing image copies using RMAN. <code>DATALOAD</code> is set for sessions that are loading data using Oracle Data Pump.
<code>ORACLE_USER</code>	<code>VARCHAR2(30)</code>	<code>ORACLE_USER</code>	Oracle Database user name

**Table 134-1 (Cont.) DBMS\_RESOURCE\_MANAGER Constants**

Constant	Type	Value	Description
SERVICE_MODULE	VARCHAR2(30)	SERVICE_MODULE	Combination of service and module names in this form: <i>service_name.module_name</i>
SERVICE_MODULE_ACTION	VARCHAR2(30)	SERVICE_MODULE_ACTION	Combination of service name, module name, and action name, in this form: <i>service_name.module_name.action_name</i>
SERVICE_NAME	VARCHAR2(30)	SERVICE_NAME	Service name used by the client to establish a connection

## 134.4 Summary of DBMS\_RESOURCE\_MANAGER Subprograms

This table lists the DBMS\_RESOURCE\_MANAGER subprograms and briefly describes them.

**Table 134-2 DBMS\_RESOURCE\_MANAGER Package Subprograms**

Subprogram	Description
<a href="#">BEGIN_SQL_BLOCK Procedure</a>	Indicates the start of a block of SQL statements to be treated as a group by resource manager
<a href="#">CALIBRATE_IO Procedure</a>	Calibrates the I/O capabilities of storage
<a href="#">CLEAR_PENDING_AREA Procedure</a>	Clears the work area for the resource manager
<a href="#">CREATE_CATEGORY Procedure</a>	Creates a new resource consumer group category
<a href="#">CREATE_CDB_PLAN Procedure</a>	Creates entries which define consolidation resource plans.
<a href="#">CREATE_CDB_PLAN_DIRECTIVE Procedure</a>	Creates the plan directives of the consolidation resource plan
<a href="#">CREATE_CDB_PROFILE_DIRECTIVE Procedure</a>	Creates the performance profile directives of the consolidation resource plan
<a href="#">CREATE_CONSUMER_GROUP Procedure</a>	Creates entries which define resource consumer groups
<a href="#">CREATE_PENDING_AREA Procedure</a>	Creates a work area for changes to resource manager objects
<a href="#">CREATE_PLAN Procedure</a>	Creates entries which define resource plans
<a href="#">CREATE_PLAN_DIRECTIVE Procedure</a>	Creates resource plan directives
<a href="#">CREATE_SIMPLE_PLAN Procedure</a>	Creates a single-level resource plan containing up to eight consumer groups in one step
<a href="#">DELETE_CATEGORY Procedure</a>	Deletes an existing resource consumer group category

**Table 134-2 (Cont.) DBMS\_RESOURCE\_MANAGER Package Subprograms**

Subprogram	Description
DELETE_CDB_PLAN Procedure	Deletes the consolidation resource plan
DELETE_CDB_PLAN_DIRECTIVE Procedure	Deletes the plan directive of the consolidation resource plan
DELETE_CDB_PROFILE_DIRECTIVE Procedure	Deletes the performance profile directive of the consolidation resource plan
DELETE_CONSUMER_GROUP Procedure	Deletes entries which define resource consumer groups
DELETE_PLAN Procedure	Deletes the specified plan as well as all the plan directives it refers to
DELETE_PLAN_CASCADE Procedure	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
DELETE_PLAN_DIRECTIVE Procedure	Deletes resource plan directives
DEQUEUE_PARALLEL_STATEMENT Procedure	Dequeues a parallel statement from the parallel statement queue
END_SQL_BLOCK Procedure	Indicates the end of a block of SQL statements that should be treated as a group by resource manager
SET_CONSUMER_GROUP_MAPPING Procedure	Adds, deletes, or modifies entries for the login and run-time attribute mappings
SET_CONSUMER_GROUP_MAPPING_PRIORITY Procedure	Creates the session attribute mapping priority list
SET_INITIAL_CONSUMER_GROUP Procedure	Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)
SUBMIT_PENDING_AREA Procedure	Submits pending changes for the resource manager
SWITCH_CONSUMER_GROUP_FOR_SESSION Procedure	Changes the resource consumer group of a specific session
SWITCH_CONSUMER_GROUP_FOR_USER Procedure	Changes the resource consumer group for all sessions with a given user name
SWITCH_PLAN Procedure	Sets the current resource manager plan
UPDATE_CATEGORY Procedure	Updates an existing resource consumer group category
UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure	Updates the plan directives with regard to automated maintenance tasks
UPDATE_CDB_DEFAULT_DIRECTIVE Procedure	Updates the default values for a consolidation plan
UPDATE_CDB_PLAN Procedure	Updates the consolidation resource plan
UPDATE_CDB_PLAN_DIRECTIVE Procedure	Updates the plan directives for a consolidation resource plan
UPDATE_CDB_PROFILE_DIRECTIVE Procedure	Updates the performance profile directives of the consolidation resource plan
UPDATE_CONSUMER_GROUP Procedure	Updates entries which define resource consumer groups

**Table 134-2 (Cont.) DBMS\_RESOURCE\_MANAGER Package Subprograms**

Subprogram	Description
<a href="#">UPDATE_PLAN Procedure</a>	Updates entries which define resource plans
<a href="#">UPDATE_PLAN_DIRECTIVE Procedure</a>	Updates resource plan directives
<a href="#">VALIDATE_PENDING_AREA Procedure</a>	Validates pending changes for the resource manager

### 134.4.1 BEGIN\_SQL\_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the start of a block of SQL statements that should be treated as a group by resource manager.

#### Syntax

```
DBMS_RESOURCE_MANAGER.BEGIN_SQL_BLOCK;
```

#### Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

### 134.4.2 CALIBRATE\_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the `V$IO_CALIBRATION_STATUS` view and results for a successful calibration run are located in `DBA_RSRC_IO_CALIBRATE` table.

#### Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (
    num_physical_disks    IN PLS_INTEGER DEFAULT 1,
    max_latency           IN PLS_INTEGER DEFAULT 20,
    max_iops              OUT PLS_INTEGER,
    max_mbps              OUT PLS_INTEGER,
    actual_latency        OUT PLS_INTEGER);
```

#### Parameters

**Table 134-3 CALIBRATE\_IO Procedure Parameters**

Parameter	Description
<code>num_physical_disks</code>	Approximate number of physical disks in the database storage. This parameter is used to determine the initial I/O load for the calibration run.
<code>max_latency</code>	Maximum tolerable latency in milliseconds for database-block-sized IO requests
<code>max_iops</code>	Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.

**Table 134-3 (Cont.) CALIBRATE\_IO Procedure Parameters**

Parameter	Description
max_mbps	Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads.
actual_latency	Average latency of database-block-sized I/O requests at max_iops rate, expressed in milliseconds

### Usage Notes

- Only users with the SYSDBA privilege can run this procedure. Qualified users must also turn on `timed_statistics`, and ensure `asynch_io` is enabled for datafiles. This can be achieved by setting `filesystemio_options` to either `ASYNCH` or `SETALL`. One can also query the `asynch_io` status by means of the following SQL statement:

```
col name format a50
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
  WHERE f.file#      = i.file_no
  AND  filetype_name = 'Data File'
/
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (Oracle RAC) database, the workload is simultaneously generated from all instances.
- In a multitenant container database (CDB), calibration can only be run from the CDB root (`CDB$ROOT`).
- Calibration is extremely disruptive to the database performance. It is strongly recommended to run calibration only when database users can tolerate severe deterioration to database performance.
- For optimal calibration results, no other database workloads should be running.

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about calibration

### Examples

#### Example of using I/O Calibration procedure

```
SET SERVEROUTPUT ON
DECLARE
  lat INTEGER;
  iops INTEGER;
  mbps INTEGER;
BEGIN
  -- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
  DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);
```

```

DBMS_OUTPUT.PUT_LINE ('max_iops = ' || iops);
DBMS_OUTPUT.PUT_LINE ('latency = ' || lat);
DBMS_OUTPUT.PUT_LINE ('max_mbps = ' || mbps);
end;
/

```

### View for I/O calibration results

```
SQL> desc V$IO_CALIBRATION_STATUS
```

Name	Null?	Type
STATUS		VARCHAR2(13)
CALIBRATION_TIME		TIMESTAMP(3)

```
SQL> desc gv$io_calibration_status
```

Name	Null?	Type
INST_ID		NUMBER
STATUS		VARCHAR2(13)
CALIBRATION_TIME		TIMESTAMP(3)

Column explanation:

```

-----
STATUS:
  IN PROGRESS   : Calibration in Progress (Results from previous calibration
                  run displayed, if available)
  READY         : Results ready and available from earlier run
  NOT AVAILABLE : Calibration results not available.

```

CALIBRATION\_TIME: End time of the last calibration run

### DBA table that stores I/O Calibration results

```
SQL> desc DBA_RSRC_IO_CALIBRATE
```

Name	Null?	Type
START_TIME		TIMESTAMP(6)
END_TIME		TIMESTAMP(6)
MAX_IOPS		NUMBER
MAX_MBPS		NUMBER
MAX_PMBPS		NUMBER
LATENCY		NUMBER
NUM_PHYSICAL_DISKS		NUMBER

```

comment on table DBA_RSRC_IO_CALIBRATE is
'Results of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.START_TIME is
'start time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.END_TIME is
'end time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_IOPS is
'maximum number of data-block read requests that can be sustained per second'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_MBPS is
'maximum megabytes per second of maximum-sized read requests that can be
sustained'
/

```

```

comment on column DBA_RSRC_IO_CALIBRATE.MAX_PMBPS is
'maximum megabytes per second of large I/O requests that
can be sustained by a single process'
/
comment on column DBA_RSRC_IO_CALIBRATE.LATENCY is
'latency for data-block read requests'
/
comment on column DBA_RSRC_IO_CALIBRATE.NUM_PHYSICAL_DISKS is
'number of physical disks in the storage subsystem (as specified by user)'
/

```

### 134.4.3 CLEAR\_PENDING\_AREA Procedure

This procedure clears pending changes for the resource manager.

#### Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

### 134.4.4 CREATE\_CATEGORY Procedure

This procedure creates a new consumer group category. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans.

The view DBA\_RSRC\_CATEGORIES defines the currently defined categories. The ADMINISTRATIVE, INTERACTIVE, BATCH, MAINTENANCE, and OTHER categories are available.

#### Syntax

```

DBMS_RESOURCE_MANAGER.CREATE_CATEGORY (
    category    IN    VARCHAR2,
    comment     IN    VARCHAR2 DEFAULT NULL);

```

#### Parameters

**Table 134-4 CREATE\_CATEGORY Procedure Parameters**

Parameter	Description
category	Name of consumer group category
comment	User comment

### 134.4.5 CREATE\_CDB\_PLAN Procedure

Creates entries which define consolidation resource plans.

#### Syntax

```

DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN (
    plan          IN    VARCHAR2(32),
    comment      IN    VARCHAR2(2000) DEFAULT NULL);

```

## Parameters

**Table 134-5 CREATE\_CDB\_PLAN Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
comment	User comment

## Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 134.4.6 CREATE\_CDB\_PLAN\_DIRECTIVE Procedure

This procedure creates the plan directives of the consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

## Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN_DIRECTIVE (
  plan                IN    VARCHAR2,
  pluggable_database  IN    VARCHAR2,
  comment             IN    VARCHAR2 (2000) DEFAULT '',
  shares              IN    NUMBER           DEFAULT NULL,
  utilization_limit   IN    NUMBER           DEFAULT NULL,
  parallel_server_limit IN NUMBER           DEFAULT NULL,
  memory_limit        IN    NUMBER           DEFAULT 100,
  memory_min          IN    NUMBER           DEFAULT 0);
```

## Parameters

**Table 134-6 CREATE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
pluggable_database	Name of the PDB
comment	User comment
shares	Specifies the share of resource allocation for the PDB. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The shares parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through <a href="#">UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</a> .
utilization_limit	Specifies the maximum percentage of the CDB's CPU and Exadata I/O resources that the PDB can utilize. CPU Resource Manager and Exadata I/O Resource Manager can also be limited by setting the CPU_COUNT parameter for the PDB.

**Table 134-6 (Cont.) CREATE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>parallel_server_limit</code>	<p>Parallel servers that the PDB can use after which parallel statements are queued. Alternatively, you can set the <code>parallel_servers_target</code> at the PDB level.</p> <p>A PDB can set a lower limit for parallel execution servers than the limit specified in the CDB resource plan. When the <code>PARALLEL_SERVERS_TARGET</code> initialization parameter is set in a PDB, and parallel execution server limit is specified for a PDB in the CDB resource plan, then the lower limit is used.</p> <p>For example, assume that the <code>parallel_servers_target</code> initialization parameter is set to 100 in the CDB root and <code>parallel_server_limit</code> is set to 70 for <code>hrpdb</code> in the CDB resource plan. Also, assume that <code>hrpdb</code> has its <code>parallel_servers_target</code> initialization parameter set to 50. In this case, the limit for parallel execution servers for <code>hrpdb</code> is 50, because 50 is lower than the CDB resource plan limit of 70 for <code>hrpdb</code>.</p>
<code>memory_limit</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.
<code>memory_min</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.

**Note:**

Oracle recommends, that you use `parallel_servers_target` parameter instead of `parallel_servers_limit` in a CDB resource plan.

**Usage Notes**

- The default value for `shares`, `utilization_limit`, and `parallel_server_limit` is `NULL`. When a user specifies `NULL`, or does not specify a value, this indicates that the default value should be used.
- This procedure can be run only from the CDB root (`CDB$ROOT`).

## 134.4.7 CREATE\_CDB\_PROFILE\_DIRECTIVE Procedure

This procedure creates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use the new performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the profile name.

This procedure provides an easy way to specify the directive for a large number of PDBs with the same resource requirements. Each PDB with a `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name inherits the settings specified by this directive, including the shares, utilization limit, and so on.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PROFILE_DIRECTIVE (
  plan           IN    VARCHAR2,
  profile        IN    VARCHAR2,
  comment        IN    VARCHAR2 (2000) DEFAULT '',
  shares         IN    NUMBER          DEFAULT NULL,
  utilization_limit IN  NUMBER          DEFAULT NULL,
  parallel_server_limit IN NUMBER          DEFAULT NULL,
  memory_limit   IN    NUMBER          DEFAULT 100,
  memory_min     IN    NUMBER          DEFAULT 0);
```

### Parameters

**Table 134-7 CREATE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
profile	Name of the performance profile
comment	User comment
shares	Specifies the share of resource allocation for PDBs that use the performance profile. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through <a href="#">UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</a> .
utilization_limit	Specifies the maximum percentage of CPU Resource Manager and Exadata I/O Resource Manager that PDBs that use the performance profile can utilize.
parallel_server_limit	Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use.
memory_limit	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.
memory_min	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.

## 134.4.8 CREATE\_CONSUMER\_GROUP Procedure

This procedure creates entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
  consumer_group IN VARCHAR2,
  comment        IN VARCHAR2 DEFAULT NULL,
```

```

cpu_mth          IN VARCHAR2 DEFAULT NULL,
mgmt_mth        IN VARCHAR2 DEFAULT 'ROUND-ROBIN',
category        IN VARCHAR2 DEFAULT 'OTHER' );

```

## Parameters

**Table 134-8 CREATE\_CONSUMER\_GROUP Procedure Parameters**

Parameter	Description
consumer_group	Name of the consumer group
comment	User comment
cpu_mth	Name of CPU resource allocation method (deprecated)
mgmt_mth	Name of CPU resource allocation method
category	Describes the category of the consumer group. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view <code>DBA_RSRC_CATEGORIES</code> defines the currently defined categories. Categories can be modified, using the <a href="#">CREATE_CATEGORY Procedure</a> , <a href="#">UPDATE_CATEGORY Procedure</a> , and <a href="#">DELETE_CATEGORY Procedure</a> .

## 134.4.9 CREATE\_PENDING\_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

### Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you have made are valid. You do not have to perform your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

 **Note:**

Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

For resource plans, the following rules must be adhered to, and they are checked whenever the validate or submit procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- The plan directive parameter, `parallel_degree_limit_pl`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 28 plan directives coming from any given plan (that is, no plan can have more than 28 children).
- There cannot be more than 28 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

 **Note:**

These rules are not applicable for CDB resource plans.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix one or more problems and reissue the validate or submit procedures.

## 134.4.10 CREATE\_PLAN Procedure

This procedure creates entries which define resource plans.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
  plan          IN  VARCHAR2,
  comment       IN  VARCHAR2 DEFAULT NULL,
  cpu_mth       IN  VARCHAR2 DEFAULT NULL, -- deprecated
```

```

active_sess_pool_mth      IN  VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
parallel_degree_limit_mth IN  VARCHAR2 DEFAULT
                          'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
queueing_mth             IN  VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
mgmt_mth                 IN  VARCHAR2 DEFAULT 'EMPHASIS',
sub_plan                 IN  BOOLEAN DEFAULT FALSE,
max_iops                 IN  NUMBER DEFAULT NULL,
max_mbps                 IN  NUMBER DEFAULT NULL);

```

## Parameters

**Table 134-9 CREATE\_PLAN Procedure Parameters**

Parameter	Description
plan	Name of the resource plan
comment	User comment
cpu_mth	Allocation method for CPU resources (deprecated)
active_sess_pool_mth	Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	Resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available
mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> <li>EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups</li> <li>RATIO - for single-level plans that use ratios to specify how I/O resources are distributed</li> </ul>
sub_plan	If TRUE, indicates that this plan is only intended for use as a sub-plan. Sub-plans are not required to have an OTHER_GROUPS directive. Default is FALSE.
max_iops	Nonoperative
max_mbps	Nonoperative

## Usage Notes

If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

## 134.4.11 CREATE\_PLAN\_DIRECTIVE Procedure

This procedure creates resource plan directives.

### Note:

The parameters `max_utilization_limit` and `parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (11.1.0.1), and are replaced by `utilization_limit` and `parallel_server_limit`.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  comment             IN VARCHAR2 DEFAULT NULL,
  cpu_p1              IN NUMBER   DEFAULT NULL, -- deprecated

```

pq_timeout_action          IN NUMBER    DEFAULT NULL,
parallel_queue_timeout    IN NUMBER    DEFAULT NULL,);

```

**Note:**

Oracle recommends that you use `shares` instead of `mgmt_p*`.

**Parameters**

**Table 134-10 CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>plan</code>	Name of the resource plan
<code>group_or_subplan</code>	Name of the consumer group or subplan
<code>comment</code>	Comment for the plan directive
<code>cpu_p1</code>	-- deprecated: use <code>mgmt_p1</code> or, even better, <code>shares</code> instead
<code>cpu_p2</code>	-- deprecated: use <code>mgmt_p2</code> or, even better, <code>shares</code> instead
<code>cpu_p3</code>	-- deprecated: use <code>mgmt_p3</code> or, even better, <code>shares</code> instead
<code>cpu_p4</code>	-- deprecated: use <code>mgmt_p4</code> or, even better, <code>shares</code> instead
<code>cpu_p5</code>	-- deprecated: use <code>mgmt_p5</code> or, even better, <code>shares</code> instead
<code>cpu_p6</code>	-- deprecated: use <code>mgmt_p6</code> or, even better, <code>shares</code> instead
<code>cpu_p7</code>	-- deprecated: use <code>mgmt_p7</code> or, even better, <code>shares</code> instead
<code>cpu_p8</code>	-- deprecated: use <code>mgmt_p8</code> or, even better, <code>shares</code> instead
<code>active_sess_pool_p1</code>	Specifies maximum number of sessions that can currently have an active call
<code>queueing_p1</code>	Specified time (in seconds) after which a call in the inactive session queue (waiting for execution) will time out. Default is <code>NULL</code> , which means unlimited.
<code>parallel_degree_limit_p1</code>	Specifies a limit on the degree of parallelism for any operation. Default is <code>NULL</code> , which means unlimited. If the value is 0, then all operations will be serial.
<code>switch_group</code>	Specifies consumer group to switch to, once a switch condition is met. If the group name is <code>CANCEL_SQL</code> , then the current call is canceled when the switch condition is met. If the group name is <code>KILL_SESSION</code> , then the session is killed when the switch condition is met. If the group name is <code>LOG_ONLY</code> , then no action is taken other than recording this event via SQL monitor. Default is <code>NULL</code> .
<code>switch_time</code>	Specifies the time on CPU (not elapsed time) that a session can execute before an action is taken. Default is <code>NULL</code> , which means unlimited. As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.

**Table 134-10 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. This is used in conjunction with the switch_time directive.  Default value is FALSE.
max_est_exec_time	Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
undo_pool	Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_time	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource
switch_time_in_call	Deprecated. If this parameter is specified, switch_time is set to switch_time_in_call (in seconds) and switch_for_call is effectively set to TRUE. It is better to use switch_time and switch_for_call.
mgmt_p1	Resource allocation value for level 1 (replaces cpu_p1): <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the first level</li> <li>RATIO - specifies the weight of resource usage</li> </ul>
mgmt_p2	Resource allocation value for level 2 (replaces cpu_p2) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the second level</li> <li>RATIO - non-applicable</li> </ul>
mgmt_p3	Resource allocation value for level 3 (replaces cpu_p3) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the third level</li> <li>RATIO - non-applicable</li> </ul>
mgmt_p4	Resource allocation value for level 4 (replaces cpu_p4) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the fourth level</li> <li>RATIO - non-applicable</li> </ul>
mgmt_p5	Resource allocation value for level 5 (replaces cpu_p5) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the fifth level</li> <li>RATIO - non-applicable</li> </ul>
mgmt_p6	Resource allocation value for level 6 (replaces cpu_p6) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the sixth level</li> <li>RATIO - non-applicable</li> </ul>

**Table 134-10 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
mgmt_p7	Resource allocation value for level 7 (replaces <code>cpu_p7</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the seventh level</li> <li>RATIO - non-applicable</li> </ul>
mgmt_p8	Resource allocation value for level 8 (replaces <code>cpu_p8</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the eighth level</li> <li>RATIO - non-applicable</li> </ul>
switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if <code>switch_for_call</code> is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.
switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if <code>switch_for_call</code> is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.
switch_for_call	Specifies that if an action is taken because of the <code>switch_time</code> , <code>switch_io_megabytes</code> , <code>switch_io_reqs</code> , <code>switch_io_logical</code> or <code>switch_elapsed_time</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is NULL, which means that the original consumer group is not restored at the end of the top call.
max_utilization_limit	-- deprecated: use <code>utilization_limit</code> instead
parallel_target_percentage	-- deprecated: use <code>parallel_sever_limit</code> instead
parallel_queue_timeout	Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed and terminated with an error (ORA- 07454).

 **Note:**

You can use the `pq_timeout_action` parameter to specify the action to be taken when a parallel statement is removed from the queue.

`parallel_sever_limit` Specifies the maximum percentage of `parallel_servers_target` parallel servers that the Consumer Group can use, after which parallel statements are queued.

**Table 134-10 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
utilization_limit	Resource limit. Currently it includes CPU and I/O for Exadata. For CPU, this limits the CPU utilization for the consumer group. For Exadata I/O, this limits the disk utilization for the consumer group.  This does not apply to parallel servers.
switch_io_logical	Number of logical I/Os that will trigger the action specified by switch_group. As with other switch directives, if switch_for_call is TRUE, the number of logical I/Os is accumulated from the start of a call. Otherwise, the number of logical I/Os is accumulated for the length of the session.
switch_elapsed_time	Elapsed time that will trigger the action specified by switch_group. As with other switch directives, if switch_for_call is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.
shares	Specifies the share of resource allocation for the consumer group. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each consumer group. The shares parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.
parallel_stmt_critical	If set to BYPASS_QUEUE, parallel statements from the Consumer Group are not queued, regardless of the PARALLEL_DEGREE_POLICY parameter value.  If set to QUEUE, all the parallel statements from the consumer group, irrespective of the parallel_degree_policy parameter value, are eligible for queuing.  Default is FALSE, which means that parallel statements are eligible for queuing, based on the parallel_degree_policy parameter value.
session_pga_limit	Maximum amount of untunable PGA (in MB) that a session in this consumer group can allocate before being terminated. NULL (default) indicates no limit.  SQL operations that allocate tunable PGA (operations that can opt to use temp space) are not controlled by this limit.
pq_timeout_action	Specifies the action to be taken when a parallel statement is removed from the queue due to parallel_queue_timeout.  The values are: <ul style="list-style-type: none"> <li>CANCEL — The parallel statement is terminated with error ORA-7454</li> <li>RUN — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable</li> </ul> The default action of this parameter is CANCEL.

#### Usage Notes

- All parameters default to NULL.

- For `max_idle_time` and `max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_for_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_for_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.
- An error is thrown if `PQ_TIMEOUT_ACTION` is specified, but `PARALLEL_QUEUE_TIMEOUT` is not specified.
- Specifies the action to be taken when a parallel statement is removed from the queue.

## 134.4.12 CREATE\_SIMPLE\_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the `CREATE_CONSUMER_GROUP` and `CREATE_RESOURCE_PLAN_DIRECTIVES` procedures separately.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
  simple_plan      IN VARCHAR2  DEFAULT NULL,
  consumer_group1 IN VARCHAR2  DEFAULT NULL,
  group1_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  consumer_group2 IN VARCHAR2  DEFAULT NULL,
  group2_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  consumer_group3 IN VARCHAR2  DEFAULT NULL,
  group3_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  consumer_group4 IN VARCHAR2  DEFAULT NULL,
  group4_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  consumer_group5 IN VARCHAR2  DEFAULT NULL,
  group5_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  consumer_group6 IN VARCHAR2  DEFAULT NULL,
  group6_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  consumer_group7 IN VARCHAR2  DEFAULT NULL,
  group7_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  consumer_group8 IN VARCHAR2  DEFAULT NULL,
  group8_cpu      IN NUMBER     DEFAULT NULL,  -- deprecated
  group1_percent  IN NUMBER     DEFAULT NULL,
  group2_percent  IN NUMBER     DEFAULT NULL,
  group3_percent  IN NUMBER     DEFAULT NULL,
  group4_percent  IN NUMBER     DEFAULT NULL,
  group5_percent  IN NUMBER     DEFAULT NULL,
  group6_percent  IN NUMBER     DEFAULT NULL,
  group7_percent  IN NUMBER     DEFAULT NULL,
  group8_percent  IN NUMBER     DEFAULT NULL);
```

### Parameters

**Table 134-11 CREATE\_SIMPLE\_PLAN Procedure Parameters**

Parameter	Description
<code>simple_plan</code>	Name of the resource plan

**Table 134-11 (Cont.) CREATE\_SIMPLE\_PLAN Procedure Parameters**

Parameter	Description
consumer_group1	Name of the consumer group
group1_cpu	Percentage for group (deprecated)
consumer_group2	Name of the consumer group
group2_cpu	Percentage for group (deprecated)
consumer_group3	Name of the consumer group
group3_cpu	Percentage for group (deprecated)
consumer_group4	Name of the consumer group
group4_cpu	Percentage for group (deprecated)
consumer_group5	Name of the consumer group
group5_cpu	Percentage for group (deprecated)
consumer_group6	Name of the consumer group
group6_cpu	Percentage for group (deprecated)
consumer_group7	Name of the consumer group
group7_cpu	Percentage for group (deprecated)
consumer_group8	OTHER_GROUPS - all sessions that aren't mapped to a consumer group.
group8_cpu	Percentage for group (deprecated)
group1_percent	Percentage of resources allocated for this consumer group
group2_percent	Percentage of resources allocated for this consumer group
group3_percent	Percentage of resources allocated for this consumer group
group4_percent	Percentage of resources allocated for this consumer group
group5_percent	Percentage of resources allocated for this consumer group
group6_percent	Percentage of resources allocated for this consumer group
group7_percent	Percentage of resources allocated for this consumer group
group8_percent	Percentage of resources allocated to other groups

### 134.4.13 DELETE\_CATEGORY Procedure

This procedure deletes an existing resource consumer group category.

#### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CATEGORY (
    category          IN    VARCHAR2);
```

## Parameters

**Table 134-12 DELETE\_CATEGORY Procedure Parameters**

Parameter	Description
category	Name of consumer group category

## 134.4.14 DELETE\_CDB\_PLAN Procedure

This procedure deletes the consolidation resource plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN (
    plan IN VARCHAR2(32) DEFAULT NULL);
```

## Parameters

**Table 134-13 DELETE\_CDB\_PLAN Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan

### Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 134.4.15 DELETE\_CDB\_PLAN\_DIRECTIVE Procedure

This procedure deletes the plan directives of the consolidation resource plan. Once the plan directive is deleted, the pluggable database will get the default resource allocation.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN_DIRECTIVE (
    plan IN VARCHAR2(32) DEFAULT NULL,
    pluggable_database IN VARCHAR2(32) DEFAULT NULL);
```

## Parameters

**Table 134-14 DELETE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
pluggable_database	Name of the pluggable database in which the plan directive is to be deleted

### Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 134.4.16 DELETE\_CDB\_PROFILE\_DIRECTIVE Procedure

This procedure deletes the performance profile directive of the consolidation resource plan. Once the directive is deleted, the pluggable databases (PDBs) that use the performance profile use the default resource allocation.

For a PDB to use a performance profile, the PDB must have the DB\_PERFORMANCE\_PROFILE initialization parameter set to the performance profile name.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PROFILE_DIRECTIVE (
    plan          IN  VARCHAR2(32)  DEFAULT NULL,
    profile       IN  VARCHAR2(32)  DEFAULT NULL);
```

### Parameters

**Table 134-15 DELETE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
profile	Name of the performance profile directive to be deleted

### Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 134.4.17 DELETE\_CONSUMER\_GROUP Procedure

This procedure deletes entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (
    consumer_group IN VARCHAR2);
```

### Parameters

**Table 134-16 DELETE\_CONSUMER\_GROUP Procedure Parameters**

Parameters	Description
consumer_group	Name of the consumer group to be deleted

## 134.4.18 DELETE\_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (  
    plan IN VARCHAR2);
```

### Parameters

**Table 134-17** DELETE\_PLAN Procedure Parameters

Parameter	Description
plan	Name of the resource plan to delete

## 134.4.19 DELETE\_PLAN\_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (  
    plan IN VARCHAR2);
```

### Parameters

**Table 134-18** DELETE\_PLAN\_CASCADE Procedure Parameters

Parameters	Description
plan	Name of the plan

### Usage Notes

If DELETE\_PLAN\_CASCADE encounters any error, then it rolls back the operation, and nothing is deleted.

## 134.4.20 DELETE\_PLAN\_DIRECTIVE Procedure

This procedure deletes resource plan directives.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (  
    plan          IN VARCHAR2,  
    group_or_subplan IN VARCHAR2);
```

## Parameters

**Table 134-19 DELETE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the resource plan
group_or_subplan	Name of the group or subplan

## 134.4.21 DEQUEUE\_PARALLEL\_STATEMENT Procedure

This procedure dequeues a parallel statement from the parallel statement queue.

If the `PARALLEL_DEGREE_POLICY` initialization parameter is set to `AUTO` or `ADAPTIVE`, then parallel statement queuing is enabled. If a parallel statement is in the parallel statement queue, then you can use this procedure to dequeue the parallel statement so that it runs immediately.

### Syntax

```
DBMS_RESOURCE_MANAGER.DEQUEUE_PARALLEL_STATEMENT (
  session_id      IN  PLS_INTEGER,
  session_serial  IN  PLS_INTEGER,
  inst_id         IN  PLS_INTEGER DEFAULT NULL,
  sql_id          IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 134-20 DEQUEUE\_PARALLEL\_STATEMENT Procedure Parameters**

Parameter	Description
session_id	The session id of the session running the parallel statement to be dequeued.
session_serial	The serial number of the session.
inst_id	Instance ID where the session is running. If NULL, then the current instance is used.
sql_id	The SQL ID of the session's statement to dequeue. If the session is running SQL with a different SQL ID, then the statement is not dequeued.

## 134.4.22 END\_SQL\_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the end of a block of SQL statements that should be treated as a group by resource manager.

### Syntax

```
DBMS_RESOURCE_MANAGER.END_SQL_BLOCK;
```

## Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

## 134.4.23 SET\_CONSUMER\_GROUP\_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(  
    attribute      IN VARCHAR2,  
    value         IN VARCHAR2,  
    consumer_group IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 134-21 SET\_CONSUMER\_GROUP\_MAPPING Procedure Parameters**

Parameters	Description
attribute	Mapping attribute to add or modify. It can be one of the <a href="#">Constants</a> listed.
value	Attribute value to match. This includes both absolute mapping and regular expressions.
consumer_group	Name of the mapped consumer group, or NULL to delete a mapping

### Usage Notes

- If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is NULL, then any mapping from the given attribute and value will be deleted.
- The subprogram supports simple regex expressions for the `value` parameter. It implements the same semantics as the SQL 'LIKE' operator. Specifically, it uses '%' as a multicharacter wildcard and '\_' as a single character wildcard. The '\' character can be used to escape the wildcards. Note that wildcards can only be used if the attribute is one of the following:
  - CLIENT\_OS\_USER
  - CLIENT\_PROGRAM
  - CLIENT\_MACHINE
  - MODULE\_NAME
  - MODULE\_NAME\_ACTION
  - SERVICE\_MODULE
  - SERVICE\_MODULE\_ACTION

- Consumer group mapping comparisons for DBMS\_RESOURCE\_MANAGER.CLIENT\_PROGRAM are performed by stripping the @ sign and following characters from V\$SESSION.PROGRAM before comparing it to the CLIENT\_PROGRAM value supplied.

## 134.4.24 SET\_CONSUMER\_GROUP\_MAPPING\_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI(
  explicit           IN NUMBER,
  oracle_user       IN NUMBER,
  service_name      IN NUMBER,
  client_os_user    IN NUMBER,
  client_program    IN NUMBER,
  client_machine    IN NUMBER,
  module_name       IN NUMBER,
  module_name_action IN NUMBER,
  service_module    IN NUMBER,
  service_module_action IN NUMBER,
  client_id         IN NUMBER DEFAULT 11);
```

### Parameters

**Table 134-22 SET\_CONSUMER\_GROUP\_MAPPING\_PRI Procedure Parameters**

Parameters	Description
explicit	Priority of the explicit mapping
oracle_user	Priority of the Oracle user name mapping
service_name	Priority of the client service name mapping
client_os_user	Priority of the client operating system user name mapping
client_program	Priority of the client program mapping
client_machine	Priority of the client machine mapping
module_name	Priority of the application module name mapping
module_name_action	Priority of the application module name and action mapping
service_module	Priority of the service name and application module name mapping
module_name_action	Priority of the service name, application module name, and application action mapping
client_id	Client identifier

### Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
  - DBMS\_SESSION.SWITCH\_CURRENT\_CONSUMER\_GROUP

- DBMS\_RESOURCE\_MANAGER.SWITCH\_CONSUMER\_GROUP\_FOR\_SESS
- DBMS\_RESOURCE\_MANAGER.SWITCH\_CONSUMER\_GROUP\_FOR\_USER
- Each priority value must be a unique integer from 1 to 11. Together, they establish an ordering where 1 is the highest priority and 11 is the lowest.

## 134.4.25 SET\_INITIAL\_CONSUMER\_GROUP Procedure

This deprecated procedure sets the initial resource consumer group for a user.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs.

### Note:

This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user          IN  VARCHAR2,
    consumer_group IN  VARCHAR2);
```

### Parameters

**Table 134-23 SET\_INITIAL\_CONSUMER\_GROUP Procedure Parameters**

Parameters	Description
user	Name of the user
consumer_group	User's initial consumer group

### Usage Notes

- The ADMINISTER\_RESOURCE\_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

### Note:

These semantics are similar to those for ALTER USER DEFAULT ROLE.

- If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT\_CONSUMER\_GROUP.
- DEFAULT\_CONSUMER\_GROUP has switch privileges granted to PUBLIC; therefore, all users are automatically granted switch privilege for this consumer group. Upon

deletion of a consumer group, all users having the deleted group as their initial consumer group now have `DEFAULT_CONSUMER_GROUP` as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to `DEFAULT_CONSUMER_GROUP`.

## 134.4.26 SUBMIT\_PENDING\_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

### Note:

A call to `SUBMIT_PENDING_AREA` may fail even if `VALIDATE_PENDING_AREA` succeeds. This may happen if a plan being deleted is loaded by an instance after a call to `VALIDATE_PENDING_AREA`, but before a call to `SUBMIT_PENDING_AREA`.

### Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

## 134.4.27 SWITCH\_CONSUMER\_GROUP\_FOR\_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any parallel execution servers that are related to the top user session.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (
  session_id      IN NUMBER,
  session_serial IN NUMBER,
  consumer_group  IN VARCHAR2);
```

### Parameters

**Table 134-24 SWITCH\_CONSUMER\_GROUP\_FOR\_SESS Procedure Parameters**

Parameter	Description
<code>session_id</code>	SID column from the view <code>V\$SESSION</code>
<code>session_serial</code>	<code>SERIAL#</code> column from view <code>V\$SESSION</code> .
<code>consumer_group</code>	Name of the consumer group to which to switch

## 134.4.28 SWITCH\_CONSUMER\_GROUP\_FOR\_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also changes the consumer group of any parallel execution servers that are related to the top user session.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
    user          IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

### Parameters

**Table 134-25 SWITCH\_CONSUMER\_GROUP\_FOR\_USER Procedure Parameters**

Parameter	Description
user	Name of the user
consumer_group	Name of the consumer group to which to switch

### Usage Notes

- The [SWITCH\\_CONSUMER\\_GROUP\\_FOR\\_SESS Procedure](#) and the SWITCH\_CONSUMER\_GROUP\_FOR\_USER procedures let you raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.
- These procedures cause the session to be moved into the newly specified consumer group immediately.

## 134.4.29 SWITCH\_PLAN Procedure

This procedure sets the current resource manager plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
    plan_name          IN VARCHAR2,
    sid                IN VARCHAR2 DEFAULT '*',
    allow_scheduler_plan_switches IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 134-26 SWITCH\_PLAN Procedure Parameters**

Parameter	Description
plan_name	Name of the plan to which to switch. Passing in an empty string (") for the plan_name, disables the resource manager

**Table 134-26 (Cont.) SWITCH\_PLAN Procedure Parameters**

Parameter	Description
sid	The sid parameter is relevant only in an Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
allow_scheduler_plan_switches	FALSE - disables automated plan switches by the job scheduler at window boundaries. To reenabale automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled.

### 134.4.30 UPDATE\_CATEGORY Procedure

This procedure updates an existing resource consumer group category.

#### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CATEGORY (
  category      IN    VARCHAR2,
  new_comment   IN    VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 134-27 UPDATE\_CATEGORY Procedure Parameters**

Parameter	Description
category	Name of consumer group category
new_comment	User comment

### 134.4.31 UPDATE\_CDB\_AUTOTASK\_DIRECTIVE Procedure

This procedure updates the plan directives with regard to automated maintenance tasks in the CDB root (CDB\$ROOT).

By default, all maintenance tasks occur directly in the PDBs themselves.

#### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_AUTOTASK_DIRECTIVE (
  plan                IN    VARCHAR2,
  new_comment         IN    VARCHAR2    DEFAULT NULL,
  new_shares          IN    NUMBER      DEFAULT NULL,
  new_utilization_limit IN    NUMBER      DEFAULT NULL,
  new_parallel_server_limit IN    NUMBER  DEFAULT NULL,
  new_memory_limit    IN    NUMBER      DEFAULT NULL,
  new_memory_min      IN    NUMBER      DEFAULT NULL);
```

## Parameters

**Table 134-28 UPDATE\_CDB\_AUTOTASK\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
new_comment	New user comment
new_shares	Specifies the new share of resource allocation for CDB root's automated maintenance tasks
new_utilization_limit	Specifies the new maximum percentage of CPU that automated maintenance tasks in the CDB root can utilize
new_parallel_server_limit	Specifies the new maximum percentage of parallel_servers_target parallel servers that automated maintenance tasks in the CDB root are allowed to use
new_memory_limit	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.
new_memory_min	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.

## Usage Notes

- By default for automated maintenance tasks, the values are
  - shares: -1
  - utilization\_limit: 90
  - parallel\_server\_limit: 100
- The shares = -1 means that the automated maintenance tasks get an allocation of 20% of the system. If the user specifies the shares, it behaves the same properties as the other CDB plan directive functions. If the user does not change the shares or later changes it back to -1, autotask will get 20% of the system.
- This procedure can be run only from the CDB root.

## 134.4.32 UPDATE\_CDB\_DEFAULT\_DIRECTIVE Procedure

This procedure updates the plan directives of the consolidation resource plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_DEFAULT_DIRECTIVE (
    plan                IN    VARCHAR2    DEFAULT NULL,
    new_comment         IN    VARCHAR2    DEFAULT NULL,
    new_shares          IN    NUMBER      DEFAULT NULL,
    new_utilization_limit IN    NUMBER      DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER      DEFAULT NULL,
    new_memory_limit    IN    NUMBER      DEFAULT NULL,
    new_memory_min      IN    NUMBER      DEFAULT NULL);
```

## Parameters

**Table 134-29 UPDATE\_CDB\_DEFAULT\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
new_comment	New user comment
new_shares	Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>new_shares</code> parameter is also used for Parallel Statement Queuing.
new_utilization_limit	Specifies the maximum percentage of CPU that the pluggable database can utilize.
new_parallel_server_limit	Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that the pluggable database can use.
new_memory_limit	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.
new_memory_min	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.

## Usage Notes

- By default, the default values are
  - `new_shares: 1`
  - `utilization_limit: 100`
  - `parallel_server_limit: 100`
- Note that the default values are `NULL`. This has the same meaning as in [UPDATE\\_CDB\\_PLAN\\_DIRECTIVE Procedure](#). If the user does not specify a value, the value will not be modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).

## 134.4.33 UPDATE\_CDB\_PLAN Procedure

This procedure updates the consolidation resource plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN (
  plan          IN  VARCHAR2(32),
  new_comment   IN  VARCHAR2(2000) DEFAULT NULL);
```

## Parameters

**Table 134-30 UPDATE\_CDB\_PLAN Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
new_comment	User comment

## Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 134.4.34 UPDATE\_CDB\_PLAN\_DIRECTIVE Procedure

Updates the plan directives for a consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

## Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN_DIRECTIVE (
    plan                IN    VARCHAR2 (30),
    pluggable_database  IN    VARCHAR2 (30)
    new_comment         IN    VARCHAR2 (200) DEFAULT NULL,
    new_shares          IN    NUMBER          DEFAULT NULL,
    new_utilization_limit IN    NUMBER          DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER          DEFAULT NULL,
    new_memory_limit    IN    NUMBER          DEFAULT NULL,
    new_memory_min      IN    NUMBER          DEFAULT NULL);
```

## Parameters

**Table 134-31 UPDATE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the consolidation plan
pluggable_database	Name of the pluggable database
new_comment	New user comment
new_shares	The share of resource allocation for the pluggable database CPU Resource Manager is enabled by specifying shares for each PDB. The shares parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through the <a href="#">UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</a> .
new_utilization_limit	The new maximum percentage of CPU that the pluggable database can utilize
new_parallel_server_limit	The new maximum percentage of parallel_servers_target parallel servers that the pluggable database can use

**Table 134-31 (Cont.) UPDATE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>new_memory_limit</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.
<code>new_memory_min</code>	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.

**Usage Notes**

- The default value for the `new_*` parameters is `NULL` which indicates that the existing value is left unchanged. If the user does not specify one of the arguments when calling this function, the value is not modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).

## 134.4.35 UPDATE\_CDB\_PROFILE\_DIRECTIVE Procedure

This procedure updates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use a performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name.

**Syntax**

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PROFILE_DIRECTIVE (
  plan           IN   VARCHAR2,
  profile        IN   VARCHAR2,
  new_comment    IN   VARCHAR2 (2000) DEFAULT '',
  new_shares     IN   NUMBER           DEFAULT NULL,
  new_utilization_limit IN   NUMBER           DEFAULT NULL,
  new_parallel_server_limit IN   NUMBER           DEFAULT NULL,
  new_memory_limit IN   NUMBER           DEFAULT 100,
  new_memory_min IN   NUMBER           DEFAULT 0);
```

**Parameters****Table 134-32 UPDATE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>plan</code>	Name of the consolidation plan
<code>profile</code>	Name of the performance profile
<code>new_comment</code>	New user comment
<code>new_shares</code>	The share of resource allocation for the PDBs that use the performance profile
<code>new_utilization_limit</code>	The new maximum percentage of CPU that PDBs that use the performance profile can use
<code>new_parallel_server_limit</code>	The new maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use

**Table 134-32 (Cont.) UPDATE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

Parameter	Description
new_memory_limit	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.
new_memory_min	This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.

### Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 134.4.36 UPDATE\_CONSUMER\_GROUP Procedure

This procedure updates entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
    consumer_group IN VARCHAR2,
    new_comment    IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth    IN VARCHAR2 DEFAULT NULL,
    new_mgmt_mth   IN VARCHAR2 DEFAULT NULL,
    new_category   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 134-33 UPDATE\_CONSUMER\_GROUP Procedure Parameter**

Parameter	Description
consumer_group	Name of consumer group
new_comment	New user comment
new_cpu_mth	Name of new method for CPU resource allocation (deprecated)
new_mgmt_mth	Name of new method for CPU resource allocation
new_category	New consumer group category

### Usage Notes

If the parameters to the UPDATE\_CONSUMER\_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

## 134.4.37 UPDATE\_PLAN Procedure

This procedure updates entries which define resource plans.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
    plan                IN VARCHAR2,
    new_comment         IN VARCHAR2 DEFAULT NULL,
```

```

new_cpu_mth                IN VARCHAR2 DEFAULT NULL, -- deprecated
new_active_sess_pool_mth  IN VARCHAR2 DEFAULT NULL,
new_parallel_degree_limit_mth IN VARCHAR2 DEFAULT NULL,
new_queueing_mth          IN VARCHAR2 DEFAULT NULL,
new_mgmt_mth              IN VARCHAR2 DEFAULT NULL,
new_sub_plan              IN BOOLEAN DEFAULT FALSE,
new_max_iops              IN NUMBER DEFAULT NULL,
new_max_mbps              IN NUMBER DEFAULT NULL);

```

## Parameters

**Table 134-34 UPDATE\_PLAN Procedure Parameters**

Parameter	Description
plan	Name of resource plan
new_comment	New user comment
new_cpu_mth	Name of new allocation method for CPU resources (deprecated)
new_active_sess_pool_mth	Name of new method for maximum active sessions
new_parallel_degree_limit_mth	Name of new method for degree of parallelism
new_queueing_mth	Specifies type of queuing policy to use with active session pool feature
new_mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> <li>EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups.</li> <li>RATIO - for single-level plans that use ratios to specify how I/O resources are distributed.</li> </ul>
new_sub_plan	New setting for whether the plan is only intended for use as a sub-plan
new_max_iops	Nonoperative
new_max_mbps	Nonoperative

## Usage Notes

- If the parameters to [UPDATE\\_PLAN Procedure](#) are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

## 134.4.38 UPDATE\_PLAN\_DIRECTIVE Procedure

This procedure updates resource plan directives.

### Note:

The parameters `new_max_utilization_limit` and `new_parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (12.1.0.1), and are replaced by `new_utilization_limit` and `new_parallel_server_limit`.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  new_comment         IN VARCHAR2 DEFAULT NULL,
  new_cpu_p1          IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p2          IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p3          IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p4          IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p5          IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p6          IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p7          IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p8          IN NUMBER   DEFAULT NULL, -- deprecated
  new_active_sess_pool_p1 IN NUMBER DEFAULT NULL,
  new_queueing_p1     IN NUMBER   DEFAULT NULL,
  new_parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
  new_switch_group    IN VARCHAR2 DEFAULT NULL,
  new_switch_time     IN NUMBER   DEFAULT NULL,
  new_switch_estimate IN BOOLEAN  DEFAULT FALSE,
  new_max_est_exec_time IN NUMBER DEFAULT NULL,
  new_undo_pool       IN NUMBER   DEFAULT NULL,
  new_max_idle_time   IN NUMBER   DEFAULT NULL,
  new_max_idle_blocker_time IN NUMBER DEFAULT NULL,
  switch_time_in_call IN NUMBER   DEFAULT NULL, -- deprecated
  new_mgmt_p1         IN NUMBER   DEFAULT NULL,
  new_mgmt_p2         IN NUMBER   DEFAULT NULL,
  new_mgmt_p3         IN NUMBER   DEFAULT NULL,
  new_mgmt_p4         IN NUMBER   DEFAULT NULL,
  new_mgmt_p5         IN NUMBER   DEFAULT NULL,
  new_mgmt_p6         IN NUMBER   DEFAULT NULL,
  new_mgmt_p7         IN NUMBER   DEFAULT NULL,
  new_mgmt_p8         IN NUMBER   DEFAULT NULL,
  new_switch_io_megabytes IN NUMBER DEFAULT NULL,
  new_switch_io_reqs    IN NUMBER   DEFAULT NULL,
  new_switch_for_call  IN BOOLEAN  DEFAULT NULL,
  new_max_utilization_limit IN NUMBER DEFAULT NULL,
  new_parallel_target_percentage IN NUMBER DEFAULT NULL,
  new_parallel_queue_timeout IN NUMBER DEFAULT NULL,
  new_parallel_server_limit IN NUMBER DEFAULT NULL,
  new_utilization_limit IN NUMBER   DEFAULT NULL,
  new_switch_io_logical IN NUMBER   DEFAULT NULL,
  new_switch_elapsed_time IN NUMBER   DEFAULT NULL,
  new_shares          IN NUMBER   DEFAULT NULL,
```

```

new_parallel_stmt_critical    IN VARCHAR2 DEFAULT NULL,
new_session_pga_limit        IN NUMBER   DEFAULT NULL,
new_pq_timeout_action        IN NUMBER   DEFAULT NULL);

```

## Parameters

**Table 134-35 UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
plan	Name of the resource plan
group_or_subplan	Name of the consumer group or subplan
new_comment	Comment for the plan directive
new_cpu_p1	Deprecated - use new_mgmt_p1 instead
new_cpu_p2	Deprecated - use new_mgmt_p2 instead
new_cpu_p3	Deprecated - use new_mgmt_p3 instead
new_cpu_p4	Deprecated- use new_mgmt_p4 instead
new_cpu_p5	Deprecated - use new_mgmt_p5 instead
new_cpu_p6	Deprecated- use new_mgmt_p6 instead
new_cpu_p7	Deprecated- use new_mgmt_p7 instead
new_cpu_p8	Deprecated- use new_mgmt_p8 instead
new_active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
new_queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
new_parallel_degree_limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
new_switch_group	Specifies consumer group to which this session is switched if other switch criteria are met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
new_switch_time	Specifies time (in CPU seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
new_switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
new_max_est_exec_time	Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
new_undo_pool	Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group

**Table 134-35 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>new_max_idle_time</code>	Indicates the maximum session idle time. Default is NULL, which means unlimited.
<code>new_max_idle_blocker_time</code>	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource
<code>new_switch_time_in_call</code>	Deprecated. If this parameter is specified, <code>new_switch_time</code> will be effectively set to <code>new_switch_time_in_call</code> and <code>new_switch_for_call</code> will be effectively set to TRUE.
<code>new_mgmt_p1</code>	Resource allocation value for level 1 (replaces <code>new_cpu_p1</code> ): <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the first level</li> <li>• RATIO - specifies the weight of resource usage</li> </ul>
<code>new_mgmt_p2</code>	Resource allocation value for level 2 (replaces <code>new_cpu_p2</code> ) <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the second level</li> <li>• RATIO - non-applicable</li> </ul>
<code>new_mgmt_p3</code>	Resource allocation value for level 3 (replaces <code>new_cpu_p3</code> ) <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the third level</li> <li>• RATIO - non-applicable</li> </ul>
<code>new_mgmt_p4</code>	Resource allocation value for level 4 (replaces <code>new_cpu_p4</code> ) <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the fourth level</li> <li>• RATIO - non-applicable</li> </ul>
<code>new_mgmt_p5</code>	Resource allocation value for level 5 (replaces <code>new_cpu_p5</code> ) <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the fifth level</li> <li>• RATIO - non-applicable</li> </ul>
<code>new_mgmt_p6</code>	Resource allocation value for level 6 (replaces <code>new_cpu_p6</code> ) <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the sixth level</li> <li>• RATIO - non-applicable</li> </ul>
<code>new_mgmt_p7</code>	Resource allocation value for level 7 (replaces <code>new_cpu_p7</code> ) <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the seventh level</li> <li>• RATIO - non-applicable</li> </ul>
<code>new_mgmt_p8</code>	Resource allocation value for level 8 (replaces <code>new_cpu_p8</code> ) <ul style="list-style-type: none"> <li>• EMPHASIS - specifies the resource percentage at the eighth level</li> <li>• RATIO - non-applicable</li> </ul>
<code>new_switch_io_megabytes</code>	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited.

**Table 134-35 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>new_switch_io_reqs</code>	Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_for_call</code>	Specifies that if an action is taken because of the <code>new_switch_time</code> , <code>new_switch_io_megabytes</code> , or <code>new_switch_io_reqs</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>FALSE</code> , which means that the original consumer group is not restored at the end of the top call.
<code>new_max_utilization_limit</code>	Deprecated - use <code>new_utilization_limit</code> instead
<code>new_parallel_target_percentage</code>	Deprecated - use <code>new_parallel_server_limit</code> instead
<code>new_parallel_server_limit</code>	Parallel server limit. Setting this overwrites the limit for parallel server set by <code>utilization_limit</code> .
<code>new_utilization_limit</code>	Resource limit. For CPU, this limits the CPU utilization for the consumer group. For parallel servers, this limits the parallel servers used as a percentage of <code>parallel_servers_target</code> .
<code>new_switch_elapsed_time</code>	Elapsed time that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>new_switch_for_call</code> is <code>TRUE</code> , the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.
<code>new_shares</code>	Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.
<code>new_parallel_stmt_critical</code>	If set to <code>BYPASS_QUEUE</code> , parallel statements from this consumer group are not queued. If set to <code>QUEUE</code> , all the parallel statements, irrespective of the <code>parallel_degree_policy</code> parameter value, from the consumer group get queued. Default is <code>FALSE</code> , which means that certain parallel statements are eligible for queuing depending upon the <code>parallel_degree_policy</code> parameter value.
<code>new_session_pga_limit</code>	Maximum amount of PGA in MB that sessions in this consumer group can allocate before being terminated. <code>NULL</code> (default) indicates no change.
<code>new_parallel_queue_timeout</code>	Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed.  The default action of this parameter is <code>ERROR</code> . This action can be altered using the <code>new_pg_timeout_action</code> parameter.

**Table 134-35 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>new_pg_timeout_action</code>	<p>Specifies the action to be taken when a parallel statement is removed from the queue due to <code>new_parallel_queue_timeout</code>.</p> <p>The values are:</p> <ul style="list-style-type: none"> <li><code>CANCEL</code> — The SQL statement is terminated with error ORA-7454</li> <li><code>RUN</code> — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable</li> </ul>

#### Usage Notes

- If the parameters for `UPDATE_PLAN_DIRECTIVE` are left unspecified, then they remain unchanged in the data dictionary.
- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.
- To clear (zero or nullify) any numeric parameter in a resource plan directive, set it to -1 using the `UPDATE_PLAN_DIRECTIVE` Procedure.

## 134.4.39 VALIDATE\_PENDING\_AREA Procedure

This procedure validates pending changes for the resource manager.

#### Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

# DBMS\_RESOURCE\_MANAGER\_PRIVS

The `DBMS_RESOURCE_MANAGER_PRIVS` package maintains privileges associated with the Resource Manager.

This chapter contains the following topics:

- [Summary of DBMS\\_RESOURCE\\_MANAGER\\_PRIVS Subprograms](#)

## See Also:

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

## 135.1 Summary of DBMS\_RESOURCE\_MANAGER\_PRIVS Subprograms

This table lists the `DBMS_RESOURCE_MANAGER_PRIVS` subprograms and briefly describes them.

**Table 135-1 DBMS\_RESOURCE\_MANAGER\_PRIVS Package Subprograms**

Subprogram	Description
<a href="#">GRANT_SWITCH_CONSUMER_GROUP Procedure</a>	Grants the privilege to switch to resource consumer groups
<a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a>	Performs a grant of a system privilege
<a href="#">REVOKE_SWITCH_CONSUMER_GROUP Procedure</a>	Revokes the privilege to switch to resource consumer groups.
<a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a>	Performs a revoke of a system privilege

### 135.1.1 GRANT\_SWITCH\_CONSUMER\_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

#### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  grantee_name    IN VARCHAR2,
  consumer_group IN VARCHAR2,
  grant_option    IN BOOLEAN);
```

## Parameters

**Table 135-2 GRANT\_SWITCH\_CONSUMER\_GROUP Procedure Parameters**

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

## Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

### See Also:

[DBMS\\_RESOURCE\\_MANAGER](#)

## Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott', 'mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

## 135.1.2 GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name    IN VARCHAR2,
```

```

privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
admin_option   IN BOOLEAN);

```

### Parameters

**Table 135-3 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
privilege_name	Name of the privilege to be granted.
admin_option	TRUE if the grant is with admin_option, FALSE otherwise.

### Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: ADMINISTER\_RESOURCE\_MANAGER. Database administrators have this system privilege with the ADMIN option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the ADMIN option can also grant this privilege to others.

### Examples

The following call grants this privilege to a user called scott without the ADMIN option:

```

BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name => 'scott',
  privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
  admin_option => FALSE);
END;
/

```

## 135.1.3 REVOKE\_SWITCH\_CONSUMER\_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

### Syntax

```

DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  revokee_name   IN VARCHAR2,
  consumer_group IN VARCHAR2);

```

### Parameters

**Table 135-4 REVOKE\_SWITCH\_CONSUMER\_GROUP Procedure Parameter**

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

## Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the `DEFAULT_CONSUMER_GROUP` consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from `PUBLIC`, then any users who could previously only use the consumer group through `PUBLIC` will not be able to switch to that consumer group.

## Examples

The following example revokes the privileges to switch to `mail_maintenance_group` from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group');
END;
/
```

## 135.1.4 REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
  revokee_name  IN VARCHAR2,
  privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

### Parameters

**Table 135-5 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
<code>revokee_name</code>	Name of the user or role from whom privilege is to be revoked.
<code>privilege_name</code>	Name of the privilege to be revoked.

### Examples

The following call revokes the `ADMINISTER_RESOURCE_MANAGER` from user `scott`:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```

# DBMS\_RESULT\_CACHE

The `DBMS_RESULT_CACHE` package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache.

Both these caches use the same infrastructure. Therefore, for example, `DBMS_RESULT_CACHE.BYPASS` determines whether both caches are bypassed or both caches are used, and `DBMS_RESULT_CACHE.FLUSH` flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_RESULT\\_CACHE Subprograms](#)

## See Also:

- *Oracle Database PL/SQL Language Reference* for more information about "Using the Cross-Session PL/SQL Function Result Cache"
- *Oracle Database Performance Tuning Guide* for more information about "Result Cache Concepts"

## 136.1 DBMS\_RESULT\_CACHE Security Model

Only database administrators should be granted the `EXECUTE` privilege for this package.

## 136.2 DBMS\_RESULT\_CACHE Constants

The `DBMS_RESULT_CACHE` package defines several constants for specifying parameter values.

The following table describes these constants.

**Table 136-1 DBMS\_RESULT\_CACHE Constants**

Constant	Definition
<code>STATUS_BYPS</code>	<code>CONSTANT VARCHAR(10) := 'BYPASS';</code>
<code>STATUS_CORR</code>	<code>CONSTANT VARCHAR(10) := 'CORRUPT';</code>
<code>STATUS_DISA</code>	<code>CONSTANT VARCHAR(10) := 'DISABLED';</code>

**Table 136-1 (Cont.) DBMS\_RESULT\_CACHE Constants**

Constant	Definition
STATUS_ENAB	CONSTANT VARCHAR(10) := 'ENABLED';
STATUS_SYNC	CONSTANT VARCHAR(10) := 'SYNC';

## 136.3 Summary of DBMS\_RESULT\_CACHE Subprograms

This table lists the DBMS\_RESULT\_CACHE subprograms and briefly describes them.

**Table 136-2 DBMS\_RESULT\_CACHE Package Subprograms**

Subprogram	Description
<a href="#">BLACK_LIST Function</a>	Returns a pipelined BL_TABT.
<a href="#">BLACK_LIST_ADD Procedure</a>	Adds a cache_id to the black-list.
<a href="#">BLACK_LIST_CLEAR Procedure</a>	Removes all cache_ids from the black-list.
<a href="#">BLACK_LIST_REMOVE Procedure</a>	Removes the cache_id from the black-list.
<a href="#">BYPASS Procedure</a>	Sets the bypass mode for the Result Cache
<a href="#">FLUSH Function &amp; Procedure</a>	Attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics
<a href="#">INVALIDATE Functions &amp; Procedures</a>	Invalidates all the result-set objects that dependent upon the specified dependency object
<a href="#">INVALIDATE_OBJECT Functions &amp; Procedures</a>	Invalidates the specified result-set object(s)
<a href="#">MEMORY_REPORT Procedure</a>	Produces the memory usage report for the Result Cache
<a href="#">STATUS Function</a>	Checks the status of the Result Cache

### 136.3.1 BLACK\_LIST Function

This function returns all the blacklisted cache ids of a local instance.

#### Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST
RETURN BL_TABT;
```

### 136.3.2 BLACK\_LIST\_ADD Procedure

This procedure adds a cache\_id to the black-list.

**Syntax**

```
DBMS_RESULT_CACHE.BLACK_LIST_ADD (
  cache_id  IN  VARCHAR2,
  global    IN  BOOLEAN DEFAULT FALSE);
```

**Parameters****Table 136-3 BLACK\_LIST\_ADD Procedure Parameters**

Parameter	Description
cache_id	The cache_id is added to the black-list.
global	TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.

### 136.3.3 BLACK\_LIST\_CLEAR Procedure

This procedure removes all cache\_ids from the black-list.

**Syntax**

```
DBMS_RESULT_CACHE.BLACK_LIST_CLEAR (
  global  IN  BOOLEAN DEFAULT FALSE);
```

**Parameters****Table 136-4 BLACK\_LIST\_CLEAR Procedure Parameters**

Parameter	Description
global	TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.

### 136.3.4 BLACK\_LIST\_REMOVE Procedure

This procedure removes the cache\_id from the black-list.

**Syntax**

```
DBMS_RESULT_CACHE.BLACK_LIST_REMOVE (
  cache_id  IN  VARCHAR2,
  global    IN  BOOLEAN DEFAULT FALSE);
```

**Parameters****Table 136-5 BLACK\_LIST\_REMOVE Procedure Parameters**

Parameter	Description
cache_id	The cache_id is removed from the black-list.

**Table 136-5 (Cont.) BLACK\_LIST\_REMOVE Procedure Parameters**

Parameter	Description
global	TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.

## 136.3.5 BYPASS Procedure

This procedure sets the bypass mode for the Result Cache.

It sets one of the following bypass modes:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

### Syntax

```
DBMS_RESULT_CACHE.BYPASS (
    bypass_mode    IN    BOOLEAN,
    session        IN    BOOLEAN);
```

### Parameters

**Table 136-6 BYPASS Procedure Parameters**

Parameter	Description
bypass_mode	<ul style="list-style-type: none"> <li>• TRUE =&gt; Result Cache usage is bypassed</li> <li>• FALSE =&gt; Result Cache usage is turned on</li> </ul>
session	<ul style="list-style-type: none"> <li>• TRUE =&gt; Applies to current session</li> <li>• FALSE (default) =&gt; Applies to all sessions</li> </ul>

### Usage Notes

This operation is database instance specific.

### Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

```
BEGIN
    DBMS_RESULT_CACHE.BYPASS(TRUE);
    DBMS_RESULT_CACHE.FLUSH;
```

```
END;  
/
```

This step must be performed on each instance in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

```
BEGIN  
    DBMS_RESULT_CACHE.BYPASS(FALSE);  
END;  
/
```

This step must be performed on each instance in a Oracle Real Application Clusters environment.

## 136.3.6 FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

### Syntax

```
DBMS_RESULT_CACHE.FLUSH (  
    retainMem IN BOOLEAN DEFAULT FALSE,  
    retainSta IN BOOLEAN DEFAULT FALSE)  
RETURN BOOLEAN;  
  
DBMS_RESULT_CACHE.FLUSH (  
    retainMem IN BOOLEAN DEFAULT FALSE,  
    retainSta IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 136-7 FLUSH Function & Procedure Parameters**

Parameter	Description
retainMem	<ul style="list-style-type: none"> <li>• TRUE =&gt; retains the free memory in the cache</li> <li>• FALSE (default) =&gt; releases the free memory to the system</li> </ul>
retainSta	<ul style="list-style-type: none"> <li>• TRUE =&gt; retains the existing cache statistics</li> <li>• FALSE (default) =&gt; clears the existing cache statistics</li> </ul>

### Return Values

TRUE if successful in removing all the objects.

## 136.3.7 INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

### Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (
  owner      IN VARCHAR2,
  name       IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  owner      IN VARCHAR2,
  name       IN VARCHAR2);
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  object_id  IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  object_id  IN BINARY_INTEGER);
```

### Parameters

**Table 136-8 INVALIDATE Function & Procedure Parameters**

Parameter	Description
owner	Schema name
name	Object name
object_id	Dictionary object number

### Return Values

The number of objects invalidated.

## 136.3.8 INVALIDATE\_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

### Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  id         IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  id         IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id   IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id   IN VARCHAR2);
```

## Parameters

**Table 136-9 INVALIDATE\_OBJECT Function & Procedure Parameters**

Parameter	Description
id	Address of the cache object in the Result Cache
cache_id	Cache-id

## Return Values

The number of objects invalidated.

## 136.3.9 MEMORY\_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

### Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (
    detailed IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 136-10 MEMORY\_REPORT Procedure Parameters**

Parameter	Description
detailed	<ul style="list-style-type: none"> <li>TRUE =&gt; produces a more detailed report</li> <li>FALSE (default) =&gt; produces the standard report</li> </ul>

## Usage Notes

Invoking this procedure from SQL\*Plus requires that the serveroutput be turned on.

## 136.3.10 STATUS Function

This function checks the status of the Result Cache.

### Syntax

```
DBMS_RESULT_CACHE.STATUS
RETURN VARCHAR2;
```

## Return Values

One of the following values:

- STATUS\_DISA - Cache is not available
- STATUS\_ENAB - Cache is available
- STATUS\_BYPS: Cache has been made temporarilyunavailable.
- STATUS\_SYNC - Cache is available, but synchronizing with Oracle RAC nodes

## DBMS\_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- [Operational Notes](#)
- [Summary of DBMS\\_RESUMABLE Subprograms](#)

### 137.1 DBMS\_RESUMABLE Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

### 137.2 Summary of DBMS\_RESUMABLE Subprograms

This table lists the `DBMS_RESUMABLE` subprograms and briefly describes them.

**Table 137-1** *DBMS\_RESUMABLE Package Subprograms*

Subprogram	Description
<a href="#">ABORT Procedure</a>	Aborts a suspended resumable space allocation
<a href="#">GET_SESSION_TIMEOUT Function</a>	Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code>
<a href="#">GET_TIMEOUT Function</a>	Returns the current timeout value of resumable space allocations for the current session
<a href="#">SET_SESSION_TIMEOUT Procedure</a>	Sets the timeout of resumable space allocations for a session with <code>session_id</code>
<a href="#">SET_TIMEOUT Procedure</a>	Sets the timeout of resumable space allocations for the current session

**Table 137-1 (Cont.) DBMS\_RESUMABLE Package Subprograms**

Subprogram	Description
<a href="#">SPACE_ERROR_INFO Function</a>	Looks for space-related errors in the error stack, otherwise returning FALSE

## 137.2.1 ABORT Procedure

This procedure aborts a suspended resumable space allocation.

The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

### Syntax

```
DBMS_RESUMABLE.ABORT (
    session_id IN NUMBER);
```

### Parameters

**Table 137-2 ABORT Procedure Parameters**

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

### Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

## 137.2.2 GET\_SESSION\_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

### Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (
    session_id IN NUMBER)
RETURN NUMBER;
```

### Parameters

**Table 137-3 GET\_SESSION\_TIMEOUT Function Parameters**

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

## Return Values

**Table 137-4 GET\_SESSION\_TIMEOUT Function Return Values**

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for a session with <code>session_id</code> . The timeout is returned in seconds.

## Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

## 137.2.3 GET\_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

### Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT
RETURN NUMBER;
```

## Return Values

**Table 137-5 GET\_TIMEOUT Function Return Values**

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

## Usage Notes

If the current session is not resumable enabled, the `GET_TIMEOUT` function returns -1.

## 137.2.4 SET\_SESSION\_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`.

The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

### Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (
  session_id IN NUMBER,
  timeout    IN NUMBER);
```

## Parameters

**Table 137-6 SET\_SESSION\_TIMEOUT Procedure Parameters**

Parameter	Description
session_id	The session identifier of the resumable space allocation.
timeout	The timeout of the resumable space allocation.

## 137.2.5 SET\_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

### Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (
    timeout IN NUMBER);
```

## Parameters

**Table 137-7 SET\_TIMEOUT Procedure Parameters**

Parameter	Description
timeout	The timeout of the resumable space allocation.

## 137.2.6 SPACE\_ERROR\_INFO Function

This function looks for space-related errors in the error stack.

If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

### Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
    error_type      OUT VARCHAR2,
    object_type     OUT VARCHAR2,
    object_owner    OUT VARCHAR2,
    table_space_name OUT VARCHAR2,
    object_name     OUT VARCHAR2,
    sub_object_name OUT VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 137-8 SPACE\_ERROR\_INFO Function Parameters**

Parameter	Description
error_type	The space error type. It will be one of the following: <ul style="list-style-type: none"> <li>• NO MORE SPACE</li> <li>• MAX EXTENTS REACHED</li> <li>• SPACE QUOTA EXCEEDED</li> </ul>
object_type	The object type. It will be one of the following: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• INDEX</li> <li>• CLUSTER</li> <li>• TABLE SPACE</li> <li>• ROLLBACK SEGMENT</li> <li>• UNDO SEGMENT</li> <li>• LOB SEGMENT</li> <li>• TEMP SEGMENT</li> <li>• INDEX PARTITION</li> <li>• TABLE PARTITION</li> <li>• LOB PARTITION</li> <li>• TABLE SUBPARTITION</li> <li>• INDEX SUBPARTITION</li> <li>• LOB SUBPARTITION</li> </ul> The type can also be NULL if it does not apply.
object_owner	The owner of the object. NULL if it cannot be determined.
table_space_name	The table space where the object resides. NULL if it cannot be determined.
object_name	The name of rollback segment, temp segment, table, index, or cluster.
sub_object_name	The partition name or sub-partition name of LOB, TABLE, or INDEX. NULL if it cannot be determined.

# DBMS\_RLS

The `DBMS_RLS` package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD).

`DBMS_RLS` is available with the Enterprise Edition only.

## See Also:

*Oracle Database Security Guide* for usage information about `DBMS_RLS`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of DBMS\\_RLS Subprograms](#)

## 138.1 DBMS\_RLS Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (  
    'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select', 'user_ctx', 'time');
```

Whenever the `EMPLOYEES` table, under the `HR` schema, is referenced in a query or subquery (`SELECT`), the server calls the `EMP_SEC` function (under the `HR` schema). This function returns a predicate specific to the current schema for the `EMP_POLICY` policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: `INDEX`, `SELECT`, `INSERT`, `UPDATE`, or `DELETE`.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE p1
```

Here, `p1` (for example, where `SAL > 10000`, or even a subquery) is the predicate returned from the `EMP_SEC` function. The server treats the `EMPLOYEES` table as a view

and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require `EXECUTE` privilege on the policy function, because the server makes the call with the function definer's right.

 **Note:**

The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no `JOIN`, `ORDER BY`, `GROUP BY`, and so on.

DBMS\_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the `EMP_POLICY` with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', TRUE);
```

## 138.2 DBMS\_RLS Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

## 138.3 DBMS\_RLS Constants

The `DBMS_RLS` package includes constants that can be used for specifying parameter values.

**Table 138-1 DBMS\_RLS Constants**

Constant	Type	Value	Description
<code>ADD_ATTRIBUTE_ASSOCIATION</code>	<code>BINARY_INTEGER</code>	1	Used with <code>DBMS_RLS.ALTER_POLICY</code> and <code>DBMS_RLS.ALTER_GROUPED_POLICY</code> : adds the specified namespace and attribute to the policy or grouped policy
<code>REMOVE_ATTRIBUTE_ASSOCIATION</code>	<code>BINARY_INTEGER</code>	2	Used with <code>DBMS_RLS.ALTER_POLICY</code> and <code>DBMS_RLS.ALTER_GROUPED_POLICY</code> : removes the specified namespace and attribute to the policy or grouped policy.

## 138.4 DBMS\_RLS Operational Notes

The `DBMS_RLS` procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the `DBMS_RLS` procedures are part of the DDL transaction.

For example, you may create a trigger for `CREATE TABLE`. Inside the trigger, you may add a column through `ALTER TABLE`, and you can add a policy through `DBMS_RLS`. All these operations are in the same transaction as `CREATE TABLE`, even though each one is a DDL statement. The `CREATE TABLE` succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from `V$VPD_POLICIES`.

A synonym can reference only a view or a table.

## 138.5 DBMS\_RLS Rules and Limits

Using long identifiers is supported for VPD. The maximum length for arguments such as `object_schema`, `object_name`, and `policy_name`, which apply to objects (table names, policy names, and subprogram names) and views is 128 bytes.

## 138.6 Summary of DBMS\_RLS Subprograms

This table lists and briefly describes the subprograms available in `DBMS_RLS`.

**Table 138-2 DBMS\_RLS Package Subprograms**

Subprogram	Description
<a href="#">ADD_GROUPED_POLICY Procedure</a>	Adds a policy associated with a policy group
<a href="#">ADD_POLICY Procedure</a>	Adds a fine-grained access control policy to a table, view, or synonym
<a href="#">ADD_POLICY_CONTEXT Procedure</a>	Adds the context for the active application
<a href="#">ALTER_POLICY Procedure</a>	Associates an application context attribute with VPD policies
<a href="#">ALTER_GROUPED_POLICY Procedure</a>	Adds application context related changes
<a href="#">CREATE_POLICY_GROUP Procedure</a>	Creates a policy group
<a href="#">DELETE_POLICY_GROUP Procedure</a>	Deletes a policy group
<a href="#">DISABLE_GROUPED_POLICY Procedure</a>	Disables a row-level group security policy
<a href="#">DROP_GROUPED_POLICY Procedure</a>	Drops a policy associated with a policy group
<a href="#">DROP_POLICY Procedure</a>	Drops a fine-grained access control policy from a table, view, or synonym
<a href="#">DROP_POLICY_CONTEXT Procedure</a>	Drops a driving context from the object so that it will have one less driving context

**Table 138-2 (Cont.) DBMS\_RLS Package Subprograms**

Subprogram	Description
<a href="#">ENABLE_GROUPED_POLICY Procedure</a>	Enables or disables a row-level group security policy
<a href="#">ENABLE_POLICY Procedure</a>	Enables or disables a fine-grained access control policy
<a href="#">REFRESH_GROUPED_POLICY Procedure</a>	Reparses the SQL statements associated with a refreshed policy
<a href="#">REFRESH_POLICY Procedure</a>	Causes all the cached statements associated with the policy to be reparsed

## 138.6.1 ADD\_GROUPED\_POLICY Procedure

This procedure adds a policy associated with a policy group.

### Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY(
    object_schema      IN VARCHAR2          DEFAULT NULL,
    object_name        IN VARCHAR2,
    policy_group       IN VARCHAR2          DEFAULT 'SYS_DEFAULT',
    policy_name        IN VARCHAR2,
    function_schema    IN VARCHAR2          DEFAULT NULL,
    policy_function     IN VARCHAR2,
    statement_types    IN VARCHAR2          DEFAULT NULL,
    update_check       IN BOOLEAN           DEFAULT FALSE,
    enable             IN BOOLEAN           DEFAULT TRUE,
    static_policy      IN BOOLEAN           DEFAULT FALSE,
    policy_type        IN BINARY_INTEGER    DEFAULT NULL,
    long_predicate     IN BOOLEAN           DEFAULT FALSE,
    sec_relevant_cols  IN VARCHAR2,
    sec_relevant_cols_opt IN BINARY_INTEGER DEFAULT NULL,
    namespace         IN VARCHAR2          DEFAULT NULL,
    attribute          IN VARCHAR2          DEFAULT NULL);
```

### Parameters

**Table 138-3 ADD\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is added
policy_group	Name of the policy group to which the policy belongs
policy_name	Name of the policy; must be unique for the same table or view
function_schema	Schema owning the policy function. If no function_schema is specified or is NULL, then the current schema is used.

**Table 138-3 (Cont.) ADD\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
policy_function	Name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, UPDATE, or DELETE. The default is to apply to all of these types except INSERT and INDE <del>X</del> .
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.  The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	Default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in <a href="#">Table 138-5</a> . Specifying any of these policy types overrides the value of static_policy.
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
namespace	Name which determines the application context namespace
attribute	Attribute which determines the application context attribute name

**Usage Notes**

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the [CREATE\\_POLICY\\_GROUP Procedure](#).
- The policy name must be unique within a policy group for a specific object.

- Policies from the default policy group, `SYS_DEFAULT`, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with `EXEMPT ACCESS POLICY` system privilege.

## 138.6.2 ADD\_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

### See Also:

[Operational Notes](#)

A `COMMIT` is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.ADD_POLICY (
  object_schema      IN  VARCHAR2      DEFAULT NULL,
  object_name        IN  VARCHAR2,
  policy_name        IN  VARCHAR2,
  function_schema    IN  VARCHAR2      DEFAULT NULL,
  policy_function    IN  VARCHAR2,
  statement_types    IN  VARCHAR2      DEFAULT NULL,
  update_check       IN  BOOLEAN        DEFAULT FALSE,
  enable             IN  BOOLEAN        DEFAULT TRUE,
  static_policy      IN  BOOLEAN        DEFAULT FALSE,
  policy_type        IN  BINARY_INTEGER DEFAULT NULL,
  long_predicate     IN  BOOLEAN        DEFAULT FALSE,
  sec_relevant_cols  IN  VARCHAR2      DEFAULT NULL,
  sec_relevant_cols_opt IN BINARY_INTEGER DEFAULT NULL,
  namespace          IN  VARCHAR2      DEFAULT NULL,
  attribute          IN  VARCHAR2      DEFAULT NULL);
```

### Parameters

**Table 138-4 ADD\_POLICY Procedure Parameters**

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
<code>object_name</code>	Name of table, view, or synonym to which the policy is added.
<code>policy_name</code>	Name of policy to be added. It must be unique for the same table or view. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks.
<code>function_schema</code>	Schema owning the policy function. If no <code>function_schema</code> is specified or is <code>NULL</code> , then the current schema is used.

**Table 138-4 (Cont.) ADD\_POLICY Procedure Parameters**

Parameter	Description
<code>policy_function</code>	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
<code>statement_types</code>	Statement types to which the policy applies. It can be any combination of <code>INDEX</code> , <code>SELECT</code> , <code>UPDATE</code> , or <code>DELETE</code> . The default is to apply to all of these types except <code>INSERT</code> and <code>INDEX</code> .
<code>update_check</code>	Optional argument for the <code>INSERT</code> or <code>UPDATE</code> statement type. The default is <code>FALSE</code> . If you plan to use the <code>INSERT</code> statement type, then you must set <code>update_check</code> to <code>TRUE</code> . Otherwise, an <code>ORA-28104</code> input value for string is not valid error is generated.  The check applies only to the security relevant columns that are included in the policy definition. In other words, the <code>INSERT</code> or <code>UPDATE</code> operation will fail only if the security relevant column that is defined in the policy is added or updated in the <code>INSERT</code> or <code>UPDATE</code> statement.
<code>enable</code>	Indicates if the policy is enabled when it is added. The default is <code>TRUE</code> .
<code>static_policy</code>	The default is <code>FALSE</code> . If it is set to <code>TRUE</code> , the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for <code>SYS</code> or the privileged user who has the <code>EXEMPT ACCESS POLICY</code> privilege.
<code>policy_type</code>	Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in <a href="#">Table 138-5</a> . Specifying any of these policy types overrides the value of <code>static_policy</code> .
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries ( <code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See <a href="#">Usage Notes</a> for restrictions and additional information about this option.
<code>namespace</code>	Name which determines the application context namespace
<code>attribute</code>	Attribute which determines the application context attribute name

Table 138-5 DBMS\_RLS.ADD\_POLICY Policy Types

Policy Type	Description
STATIC	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.
SHARED_STATIC	Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
CONTEXT_SENSITIVE	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
SHARED_CONTEXT_SENSITIVE	Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
DYNAMIC	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object.

### Usage Notes

- SYS is free of any security policy.
- The policy functions are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table or view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```
- The policy functions must have the purity level of WNDS (write no database state).

#### See Also:

The *Oracle Database Development Guide* has more details about the RESTRICT\_REFERENCES pragma.

- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.

- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with `sec_relevant_cols_opt => dbms_ols.ALL_ROWS`) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as `NULL`. The restrictions for this option are as follows:
  - Only applies to `SELECT` statements
  - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
  - If your application performs calculations, or does not expect `NULL` values, then you should use the default behavior of column-level VPD, which is specified with the `sec_relevant_cols` parameter.
  - If you use `UPDATE AS SELECT` with this option, then only the values in the columns you are allowed to see will be updated.
  - This option may prevent some rows from displaying. For example:

```
SELECT * FROM employees
WHERE salary = 10
```

This query may not return rows if the `salary` column returns a `NULL` value because the column masking option has been set.

- When you add a VPD policy to a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- The maximum number of policies that can be created for a single object is 255.

### Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. The namespace and attribute application context parameters restrict the policy evaluation only when the application context values change. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement

cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hr_policy',
    function_schema => 'hr',
    policy_function => 'hrfun',
    statement_types => 'select,index',
    policy_type   => DBMS_RLS.CONTEXT_SENSITIVE,
    sec_relevant_cols => 'salary,birthdate,ssn',
    namespace     => 'empno_ctx',
    attribute     => 'emp_id');
END;
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hosting_policy',
    function_schema => 'hr',
    policy_function => 'subfun',
    policy_type   => dbms_qls.SHARED_STATIC);
END;
```

### 138.6.3 ADD\_POLICY\_CONTEXT Procedure

This procedure adds the context for the active application.

#### Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2,
  namespace     IN VARCHAR2,
  attribute     IN VARCHAR2);
```

#### Parameters

**Table 138-6 ADD\_POLICY\_CONTEXT Procedure Parameters**

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added.
<code>namespace</code>	Name which determines the application context namespace
<code>attribute</code>	Attribute which determines the application context attribute name

## Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `HR.EMPLOYEES` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');
```

## 138.6.4 ALTER\_POLICY Procedure

This procedure associates an application context attribute with VPD policies.

### Syntax

```
DBMS_RLS.ALTER_POLICY (
  object_schema  IN VARCHAR2 DEFAULT NULL,
  object_name    IN VARCHAR2,
  policy_name    IN VARCHAR2,
  alter_option   IN NUMBER,
  namespace      IN VARCHAR2 DEFAULT NULL,
  attribute      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 138-7 ALTER\_POLICY Procedure Parameters**

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added
<code>policy_name</code>	Name of the policy, unique for the same table or view
<code>alter_option</code>	Used to determine whether the application context is being added or removed from an Oracle Virtual Private Database policy

**Table 138-7 (Cont.) ALTER\_POLICY Procedure Parameters**

Parameter	Description
namespace	Name which determines the application context namespace
attribute	Attribute which determines the application context attribute name

**Usage Notes**

Note the following:

- This procedure associates an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED\_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER\_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS\_DEFAULT policy group.
- To add a policy to table hr.employees in group access\_control\_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY(
    'hr','employees','access_control_group','policy1','SYS','HR.ACCESS');
```

## 138.6.5 ALTER\_GROUPED\_POLICY Procedure

This procedure adds application context related changes.

**Syntax**

```
DBMS_RLS.ALTER_GROUPED_POLICY (
    object_schema    IN VARCHAR2 DEFAULT NULL,
    object_name      IN VARCHAR2,
    policy_group     IN VARCHAR2 DEFAULT SYS_DEFAULT,
    policy_name      IN VARCHAR2,
```

```
alter_option    IN NUMBER,
namespace      IN VARCHAR2 DEFAULT NULL,
attribute      IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 138-8 ALTER\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is added
policy_group	Name of the policy group to which this policy belongs; must be unique for the same table or view
policy_name	Name of the policy, unique for the same table or view
alter_option	Used to determine whether the application context is being added or removed from the Oracle Virtual Private Database policy
namespace	Name that determines the application context namespace
attribute	Attribute determines the application context attribute name

## Usage Notes

Note the following:

- This procedure will associate an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED\_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER\_GROUPED\_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS\_DEFAULT policy group.

- To add a policy to table `hr.employees` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY (
    'hr', 'employees', 'access_control_group', 'policy1', 'SYS', 'HR.ACCESS');
```

## 138.6.6 CREATE\_POLICY\_GROUP Procedure

This procedure creates a policy group.

### Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (
    object_schema IN VARCHAR2 NULL,
    object_name   IN VARCHAR2,
    policy_group  IN VARCHAR2);
```

### Parameters

**Table 138-9 CREATE\_POLICY\_GROUP Procedure Parameters**

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is NULL, then the current schema is used.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added
<code>policy_group</code>	Name of the policy group that the policy belongs to

### Usage Notes

The group must be unique for each table or view.

## 138.6.7 DELETE\_POLICY\_GROUP Procedure

This procedure deletes a policy group.

### Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (
    object_schema IN VARCHAR2 NULL,
    object_name   IN VARCHAR2,
    policy_group  IN VARCHAR2);
```

### Parameters

**Table 138-10 DELETE\_POLICY\_GROUP Procedure Parameters**

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is NULL, then the current schema is used.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added
<code>policy_group</code>	Name of the policy group that the policy belongs to

**Usage Notes**

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

## 138.6.8 DISABLE\_GROUPED\_POLICY Procedure

This procedure disables a row-level group security policy.

**Syntax**

```
DBMS_RLS.DISABLE_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  group_name     IN VARCHAR2,
  policy_name    IN VARCHAR2);
```

**Parameters****Table 138-11** DISABLE\_GROUPED\_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym
object_name	Name of the table, view, or synonym with which the policy is associated
group_name	Name of the group of the policy
policy_name	Name of the policy to be enabled or disabled

**Usage Notes**

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE\_GROUPED\_POLICY procedure is executed with "enable" set to FALSE.

## 138.6.9 DROP\_GROUPED\_POLICY Procedure

This procedure drops a policy associated with a policy group.

**Syntax**

```
DBMS_RLS.DROP_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  policy_group   IN VARCHAR2 'SYS_DEFAULT',
  policy_name    IN VARCHAR2);
```

## Parameters

**Table 138-12 DROP\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is dropped
policy_group	Name of the policy group to which the policy belongs
policy_name	Name of the policy

## 138.6.10 DROP\_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:**

[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.DROP_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  policy_name    IN VARCHAR2);
```

## Parameters

**Table 138-13 DROP\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	Name of the table, view, or synonym for which the policy is dropped
policy_name	Name of policy to be dropped from table, view, or synonym

**Usage Notes**

- When you drop a VPD policy from a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.

## 138.6.11 DROP\_POLICY\_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

**Syntax**

```
DBMS_RLS.DROP_POLICY_CONTEXT (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  namespace     IN VARCHAR2,
  attribute      IN VARCHAR2);
```

**Parameters****Table 138-14 DROP\_POLICY\_CONTEXT Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym to which the policy is dropped
namespace	Namespace of the driving context
attribute	Attribute of the driving context

## 138.6.12 ENABLE\_GROUPED\_POLICY Procedure

This procedure enables or disables a row-level group security policy.

**Syntax**

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  group_name     IN VARCHAR2,
  policy_name    IN VARCHAR2,
  enable        IN BOOLEAN TRUE);
```

**Parameters****Table 138-15 ENABLE\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.

**Table 138-15 (Cont.) ENABLE\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_name	Name of the table, view, or synonym with which the policy is associated
group_name	Name of the group of the policy
policy_name	Name of the policy to be enabled or disabled
enable	TRUE enables the policy; FALSE disables the policy

#### Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

## 138.6.13 ENABLE\_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

 **See Also:**  
[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

#### Syntax

```
DBMS_RLS.ENABLE_POLICY (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2,
  enable        IN BOOLEAN TRUE);
```

#### Parameters

**Table 138-16 ENABLE\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.

**Table 138-16 (Cont.) ENABLE\_POLICY Procedure Parameters**

Parameter	Description
object_name	Name of table, view, or synonym with which the policy is associated
policy_name	Name of policy to be enabled or disabled
enable	TRUE to enable the policy, FALSE to disable the policy

## 138.6.14 REFRESH\_GROUPED\_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

### Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2 NULL,
  group_name     IN VARCHAR2 NULL,
  policy_name    IN VARCHAR2 NULL);
```

### Parameters

**Table 138-17 REFRESH\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of the table, view, or synonym with which the policy is associated
group_name	Name of the group of the policy
policy_name	Name of the policy

### Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

## 138.6.15 REFRESH\_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

### See Also:

[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.REFRESH_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2 NULL,  
    policy_name   IN VARCHAR2 NULL);
```

### Parameters

**Table 138-18 REFRESH\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
object_name	Name of table, view, or synonym with which the policy is associated
policy_name	Name of policy to be refreshed

### Usage Notes

- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

# DBMS\_ROLLING

The `DBMS_ROLLING` PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion. The Rolling Upgrade Using Active Data Guard feature requires a license for the Oracle Active Data Guard option, and can be used for database version upgrades starting with the first patchset of Oracle Database 12c.

Additionally, you can use this feature immediately for other database maintenance tasks. The database where maintenance is performed must be operating at a minimum of Oracle Database 12c Release 1 (12.1). Such maintenance tasks include:

- Adding partitioning to non-partitioned tables
- Changing BasicFiles LOBs to SecureFiles LOBs
- Changing `XMLType` stored as `CLOB` to `XMLtype` stored as binary XML
- Altering tables to be OLTP-compressed

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_ROLLING Subprograms](#)

## See Also:

- *Oracle Data Guard Concepts and Administration* for information about using `DBMS_ROLLING` to perform a rolling upgrade

## 139.1 DBMS\_ROLLING Overview

The `DBMS_ROLLING` PL/SQL package provides procedures that you can use to perform any change throughout a Data Guard configuration in a rolling fashion, including a rolling upgrade of the Oracle Database software. Although the focus of this document is rolling upgrade operations, the content is applicable to the deployment of any rolling changes.

All the procedures are executed at the current primary database, which eliminates the potential confusion of moving between remote databases to perform various operations related to the rolling upgrade. If necessary, all the procedures can be called again to resume the rolling upgrade after an error or interruption. (The upgrade script must still be run at the standby.)

The package also provides a procedure that allows you to return a Data Guard configuration back to its original, pre-upgrade state in the event users wish to abandon the rolling upgrade.

The actual execution of a rolling upgrade has been reduced to three steps (excluding the upgrade of the Oracle Database software itself and the on-disk setup of the new Oracle Database software). The number of steps remains the same regardless of the size of the Data Guard configuration.

Conceptually, for the purposes of the `DBMS_ROLLING` package, you divide your Data Guard configuration into two groups: the leading group and the trailing group. The databases in the leading group undergo the upgrade operation (or any other change that you are deploying) first. The databases in the trailing group undergo the upgrade of the Oracle Database software (or any other change that you are deploying) only after the switchover operation. This insulates them from the upgrade and gives you time to evaluate the effect of the change in the leading group databases.

Each group has a master database: the future primary database as specified in the `DBMS_ROLLING.INIT_PLAN` procedure is the master of the leading group, called Leading Group Master (LGM), while the original primary database is the master of the trailing group called Trailing Group Master (TGM). You can configure databases to protect the LGM and the TGM. Standbys designated to protect the LGM are referred to as Leading Group Standbys (LGS). Standbys designated to protect the TGM are referred to as Trailing Group Standbys (TGS). These terms are used throughout this documentation.

## 139.2 DBMS\_ROLLING Security Model

The `DBMS_ROLLING` package is available to users who have been granted the DBA role.

## 139.3 Summary of DBMS\_ROLLING Subprograms

This table lists and briefly describes the `DBMS_ROLLING` package subprograms.

**Table 139-1 DBMS\_ROLLING Package Subprograms**

Subprogram	Description
<a href="#">INIT_PLAN Procedure</a>	Initializes a rolling operation plan with system-generated default values.
<a href="#">DESTROY_PLAN Procedure</a>	Destroys any existing rolling operation plan, its parameters, and all resources associated with the rolling operation.
<a href="#">BUILD_PLAN Procedure</a>	Validates plan parameters and creates or modifies a rolling operation plan.
<a href="#">SET_PARAMETER Procedure</a>	Modifies a rolling operation parameter.
<a href="#">START_PLAN Procedure</a>	Starts the rolling operation.
<a href="#">SWITCHOVER Procedure</a>	Performs a switchover between the current primary database and the transient logical standby database.
<a href="#">FINISH_PLAN Procedure</a>	Finalizes the rolling operation.
<a href="#">ROLLBACK_PLAN Procedure</a>	Completely rolls back the rolling operation.

## 139.3.1 INIT\_PLAN Procedure

This procedure initializes a rolling operation plan with system-generated default values.

### Syntax

```
DBMS_ROLLING.INIT_PLAN (  
    future_primary IN VARCHAR2);
```

### Parameters

**Table 139-2** *INIT\_PLAN Procedure Parameters*

Parameter	Description
future_primary	DB_UNIQUE_NAME of the future primary (also known as the Leading Group Master (LGM))

### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45401: upgrade plan is already active
- ORA-45402: LOG\_ARCHIVE\_CONFIG must contain the DG\_CONFIG attribute
- ORA-45403: database %s must be specified in DG\_CONFIG
- ORA-45411: operation requires additional arguments
- ORA-65040: operation not allowed from within a pluggable database

### Usage Notes

- A plan must be prepared before any parameters can be customized.

## 139.3.2 DESTROY\_PLAN Procedure

This procedure destroys any existing upgrade plan, its parameters, and all resources associated with a rolling operation.

### Syntax

```
DBMS_ROLLING.DESTROY_PLAN ();
```

### Parameters

This procedure has no parameters.

### Exceptions

- ORA-45422: operation requires existing plan
- ORA-65040: operation not allowed from within a pluggable database

### Usage Notes

- When a rolling operation is complete, this procedure can be called to completely purge all states related to a rolling operation.

## 139.3.3 BUILD\_PLAN Procedure

This procedure validates plan parameters and creates or modifies a rolling operation plan.

A successfully constructed plan is required in order to perform a rolling operation. This procedure must return successfully before the `START_PLAN` procedure can be called to start the rolling operation. Parameter changes made after a plan has been created may require calling the `BUILD_PLAN` procedure to modify the existing plan. The `DBA_ROLLING_EVENTS` view will indicate if any invocation of the `SET_PARAMETER` procedure requires a plan rebuild. Failure to rebuild the plan will result in an `ORA-45416` error when attempting to resume the rolling operation.

### Syntax

```
DBMS_ROLLING.BUILD_PLAN ( );
```

### Parameters

This procedure has no parameters.

### Exceptions

- `ORA-45400`: operation not permitted on current database
- `ORA-45403`: database %s must be specified in the `DG_CONFIG`
- `ORA-45414`: could not connect to a remote database
- `ORA-45419`: `DB_UNIQUE_NAME` parameter must be specified
- `ORA-45433`: failover was detected on an unsupported database
- `ORA-45434`: multiple failovers of the same type detected
- `ORA-65040`: operation not allowed from within a pluggable database

### Usage Notes

- This procedure connects to databases specified as plan parameters. These instances must be mounted or open, and must be reachable via the network.

## 139.3.4 SET\_PARAMETER Procedure

This procedure modifies a rolling operation parameter.

### Syntax

```
DBMS_ROLLING.SET_PARAMETER (
    scope    IN VARCHAR2 DEFAULT NULL,
    name     IN NUMBER,
    value    IN VARCHAR2);
```

## Parameters

**Table 139-3 SET\_PARAMETER Procedure Parameters**

Parameter	Description
scope	Parameter scope. It can either be NULL for global parameters, or the DB_UNIQUE_NAME of a specific database for local parameters.
name	The DBMS_ROLLING constant for a given parameter.
value	New value for the parameter or NULL to revert to a default value.

## Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45408: parameter name is unknown
- ORA-45409: parameter value is invalid or out of bounds
- ORA-45410: parameter may not be modified
- ORA-45411: operation requires additional arguments
- ORA-45412: parameter scope argument is unknown
- ORA-45413: parameter has no default value
- ORA-45414: could not connect to a remote database
- ORA-65040: operation not allowed from within a pluggable database

## Usage Notes

- Changes to a parameter value may require a call to the DBMS\_ROLLING.BUILD\_PLAN procedure to modify the existing plan. Users should check the DBA\_ROLLING\_EVENTS view after setting a parameter to determine if a rebuild is necessary.
- [Table 139-4](#) lists all the available parameters and their descriptions. The parameter names and values described in the table are all of type VARCHAR2.
- The MINVAL and MAXVAL columns in the DBA\_ROLLING\_PARAMETERS view identify the valid range of values for a parameter. The view does not contain any parameters until the DBMS\_ROLLING.INIT\_PLAN procedure has been successfully invoked.

**Table 139-4 Valid Values for DBMS\_ROLLING.SET\_PARAMETER Procedure**

Parameter Name	Global?	Description	Default
ACTIVE_SESSIONS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce ACTIVE_SESSIONS_WAIT before halting the rolling upgrade. This parameter is only valid if ACTIVE_SESSIONS_WAIT is set to 1.	3600

**Table 139-4 (Cont.) Valid Values for DBMS\_ROLLING.SET\_PARAMETER Procedure**

Parameter Name	Global?	Description	Default
ACTIVE_SESSIONS_WAIT	Yes	Whether the switchover operation will wait for active sessions to finish. If set to 1, the SWITCHOVER procedure waits for active sessions to compete. If set to 0, the SWITCHOVER procedure kills active sessions to expedite the switchover.	0
BACKUP_CONTROLFILE	Yes	File name of the backup control file that is created during a rolling upgrade.	rolling_change_backup.f
DGBROKER	Yes	Use Data Guard broker for managing apply, recovery, and log archive destinations.	1 if broker is enabled, 0 otherwise.
DICTIONARY_LOAD_TIMEOUT	Yes	The maximum amount of time in seconds to enforce DICTIONARY_LOAD_WAIT before halting the rolling upgrade. This parameter is only valid if DICTIONARY_LOAD_WAIT is set to 1.	3600
DICTIONARY_LOAD_WAIT	Yes	Whether the instantiation of the transient logical standby will include a wait for the complete loading of the data dictionary snapshot in redo. If set to 1, then the START_PLAN procedure will not return until the dictionary has been completely loaded. If set to 0, then the START_PLAN procedure will only verify that the loading of the dictionary has started.	0
DICTIONARY_PLS_WAIT_INTERVAL	Yes	The time in seconds to wait in between attempts to quiesce PL/SQL activity in order to write the data dictionary to redo.	300
DICTIONARY_PLS_WAIT_TIMEOUT	Yes	The maximum amount of time in seconds to attempt to quiesce PL/SQL activity in order to write the data dictionary to redo.	3600
EVENT_RECORDS	Yes	The maximum number of records to permit in DBA_ROLLING_EVENTS	10000
FAILOVER	Yes	Automatically attempt to adjust the upgrade plan as a result of a failover event. This parameter resets its value to 0 upon completion of a subsequent call to BUILD_PLAN.	0
GRP_PREFIX		Execution of procedures in DBMS_ROLLING results in a number of Guaranteed Restore Points (GRP) taken in various databases participating in the Data Guard configuration. All such GRPs have the same prefix in their names. You can use this parameter to override the default prefix.	DBMSRU
IGNORE_BUILD_WARNINGS	Yes	Ignore warnings which would otherwise raise exceptions during execution of the BUILD_PLAN procedure.	1
IGNORE_LAST_ERROR	Yes	Ignore last encountered error upon startup of next rolling operation. This parameter resets its value to 0 upon invocation of a procedure call which resumes the rolling upgrade.	0
LAD_ENABLED_TIMEOUT	Yes	The maximum time in seconds to wait for a recently enabled log archive destination to reach a VALID state.	600

**Table 139-4 (Cont.) Valid Values for DBMS\_ROLLING.SET\_PARAMETER Procedure**

Parameter Name	Global?	Description	Default
LOG_LEVEL	Yes	Logging level for the DBS_ROLLING PL/SQL package. A value of INFO results in the logging of errors and relevant non-fatal warnings. A value of FULL results in the logging of all events.	INFO
MEMBER	No	The upgrade group in which the specified database is a member.  A value of LEADING indicates that the standby is a member of the leading upgrade group. As such, it is a standby of the Leading Group Master (LGM). The LGM is the database which is converted into the transient logical standby, and which becomes the new primary after the switchover.  A value of TRAILING indicates that the standby is a member of the trailing upgrade group. As such, it is a standby of the Trailing Group Master (TGM). The TGM is the original primary database.	LEADING
READY_LGM_LAG_TIME	Yes	The apply lag time in seconds associated with the READY_LGM_LAG_WAIT parameter.	600
READY_LGM_LAG_TIMEOUT	Yes	The maximum amount of time in seconds to enforce READY_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if READY_LGM_LAG_WAIT is set to 1.	60
READY_LGM_LAG_WAIT	Yes	Whether the START_PLAN procedure will wait for the apply lag on the leading group master to fall below READY_LGM_LAG_TIME seconds before returning control back to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed.	0
SWITCH_LGM_LAG_TIME	Yes	The apply lag time in seconds associated with the SWITCH_LGM_LAG_WAIT parameter.	600
SWITCH_LGM_LAG_TIMEOUT	Yes	The maximum amount of time in seconds to enforce SWITCH_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGM_LAG_WAIT is set to 1.	60
SWITCH_LGM_LAG_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the apply lag on the leading group master to fall below SWITCH_LGM_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.	1
SWITCH_LGS_LAG_TIME	Yes	The apply lag time in seconds associated with the SWITCH_LGS_LAG_WAIT parameter.	60
SWITCH_LGS_LAG_TIMEOUT	Yes	The maximum amount of time in seconds to enforce SWITCH_LGS_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGS_LAG_WAIT is set to 1.	60

Table 139-4 (Cont.) Valid Values for DBMS\_ROLLING.SET\_PARAMETER Procedure

Parameter Name	Global?	Description	Default
SWITCH_LGS_LAG_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the apply lag on the leading group standbys to fall below SWITCH_LGS_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.	0
UPDATED_LGS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce UPDATED_LGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_LGS_WAIT is set to 1.	10800
UPDATED_LGS_WAIT	Yes	Whether the SWITCHOVER procedure will wait for the leading group standbys to complete recovery of all upgrade redo before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed	1
UPDATED_TGS_TIMEOUT	Yes	The maximum amount of time in seconds to enforce UPDATED_TGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_TGS_WAIT is set to 1.	10800
UPDATED_TGS_WAIT	Yes	Whether the FINISH_PLAN procedure will wait for the trailing group standbys to complete recovery of all upgrade redo before returning control to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed.	1

### 139.3.5 START\_PLAN Procedure

This procedure starts the rolling operation. This procedure must be executed on the primary database to formally start the rolling operation.

When the START\_PLAN procedure is complete, the LGM (identified with the `future_primary` parameter in the `INIT_PLAN` procedure) will be converted into a fully configured transient logical standby database.

#### Syntax

```
DBMS_ROLLING.START_PLAN ( );
```

#### Parameters

This procedure has no parameters.

#### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan

- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

#### Usage Notes

- A rolling operation plan must have previously been generated through the `BUILD_PLAN` procedure.

### 139.3.6 SWITCHOVER Procedure

This procedure performs a switchover between the current primary database (also known as the TGM) and the transient logical standby database (also known as the LGM).

At the successful completion of the procedure, the LGM assumes the primary role for the Data Guard configuration.

#### Syntax

```
DBMS_ROLLING.SWITCHOVER ( );
```

#### Parameters

This procedure has no parameters.

#### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode

- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

#### Usage Notes

- This procedure can only be called after you have manually upgraded the transient logical standby and opened it on the higher Oracle Database version.

## 139.3.7 FINISH\_PLAN Procedure

This procedure finalizes the rolling operation.

It configures the former primary (also known as the TGM) as a physical standby, and configures remaining physical standbys to recover the upgrade redo from the future primary.

#### Syntax

```
DBMS_ROLLING.FINISH_PLAN ( );
```

#### Parameters

This procedure has no parameters.

#### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

#### Usage Notes

- This procedure can only be called after you have remounted the former primary and remaining physical standbys on the higher Oracle Database version.

## 139.3.8 ROLLBACK\_PLAN Procedure

This procedure rolls back the configuration-wide rolling operation.

Once completed, all of the databases in the leading group become physical standbys of the original primary database. This procedure can only be called if the configuration has not yet gone through a switchover operation since the `START_PLAN` procedure was invoked.

### Syntax

```
DBMS_ROLLING.ROLLBACK_PLAN;
```

### Parameters

This procedure has no parameters.

### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45441: no databases eligible for rollback
- ORA-45442: rollback is not permitted after a role change
- ORA-65040: operation not allowed from within a pluggable database

### Usage Notes

- You must manually restart media recovery on the lower Oracle Database version if the upgrade of the transient logical standby has already been performed.

# 140

## DBMS\_ROWID

The `DBMS_ROWID` package lets you create `ROWIDs` and obtain information about `ROWIDs` from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other `ROWID` components without writing code to interpret the base-64 character external `ROWID`. `DBMS_ROWID` is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

### Note:

`DBMS_ROWID` is not to be used with universal `ROWIDs` (`UROWIDs`).

This chapter contains the following topics:

- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of DBMS\\_ROWID Subprograms](#)

### 140.1 DBMS\_ROWID Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

### 140.2 DBMS\_ROWID Types

There are four `DBMS_ROWID` types.

These are:

- Extension and restriction types
- Verification types
- Object types
- Conversion types

#### **Extension and Restriction Type**

The types are as follows:

- `RESTRICTED`—restricted `ROWID`

- EXTENDED—extended ROWID

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

**Note:**

Extended ROWIDs are only used in Oracle database version 8.Xi and higher.

## Verification Types

**Table 140-1 Verification Types**

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

## Object Types

**Table 140-2 Object Types**

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

## Conversion Types

**Table 140-3 Conversion Types**

Result	Description
INTERNAL	Convert to/from column of ROWID type
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```

## 140.3 DBMS\_ROWID Exceptions

This table describes the Exceptions raised by DBMS\_ROWID subprograms.

**Table 140-4 Exceptions**

Exception	Description
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;
pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

## 140.4 DBMS\_ROWID Operational Notes

These operation notes apply to DBMS\_ROWID.

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.
- You can call the DBMS\_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

 **Note:**

ROWID\_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS\_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID\_BLOCK\_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
FROM emp
WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict\_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

## 140.5 DBMS\_ROWID Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID\_OBJECT function in the DBMS\_ROWID package, then displays the object number:

```
DECLARE
  object_no  INTEGER;
  row_id     ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
     WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
END;
```

## 140.6 Summary of DBMS\_ROWID Subprograms

This table lists the DBMS\_ROWID subprograms and briefly describes them.

**Table 140-5 DBMS\_ROWID Package Subprograms**

Subprogram	Description
<a href="#">ROWID_BLOCK_NUMBER Function</a>	Returns the block number of a ROWID
<a href="#">ROWID_CREATE Function</a>	Creates a ROWID, for testing only
<a href="#">ROWID_INFO Procedure</a>	Returns the type and components of a ROWID
<a href="#">ROWID_OBJECT Function</a>	Returns the object number of the extended ROWID
<a href="#">ROWID_RELATIVE_FNO Function</a>	Returns the file number of a ROWID
<a href="#">ROWID_ROW_NUMBER Function</a>	Returns the row number
<a href="#">ROWID_TO_ABSOLUTE_FNO Function</a>	Returns the absolute file number associated with the ROWID for a row in a specific table
<a href="#">ROWID_TO_EXTENDED Function</a>	Converts a ROWID from restricted format to extended
<a href="#">ROWID_TO_RESTRICTED Function</a>	Converts an extended ROWID to restricted format
<a href="#">ROWID_TYPE Function</a>	Returns the ROWID type: 0 is restricted, 1 is extended
<a href="#">ROWID_VERIFY Function</a>	Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function

## 140.6.1 ROWID\_BLOCK\_NUMBER Function

This function returns the database block number for the input ROWID.

### Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (
    row_id      IN  ROWID,
    ts_type_in  IN  VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_block_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 140-6 ROWID\_BLOCK\_NUMBER Function Parameters**

Parameter	Description
row_id	ROWID to be interpreted
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs

### Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
FROM some_table
WHERE key_value = 42);
```

## 140.6.2 ROWID\_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

### Syntax

```
DBMS_ROWID.ROWID_CREATE (
    rowid_type  IN NUMBER,
    object_number IN NUMBER,
    relative_fno IN NUMBER,
    block_number IN NUMBER,
    row_number  IN NUMBER)
RETURN ROWID;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 140-7 ROWID\_CREATE Function Parameters**

Parameter	Description
rowid_type	Type (restricted or extended) Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted)
relative_fno	Relative file number
block_number	Block number in this file
row_number	Returns row number in this block

## Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid\_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj\_number now contains 9999.

## 140.6.3 ROWID\_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID.

This is a procedure, and it cannot be used in a SQL statement.

### Syntax

```
DBMS_ROWID.ROWID_INFO (
  rowid_in      IN  ROWID,
  rowid_type    OUT NUMBER,
  object_number OUT NUMBER,
  relative_fno  OUT NUMBER,
  block_number  OUT NUMBER,
  row_number    OUT NUMBER);
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

## Parameters

**Table 140-8 ROWID\_INFO Procedure Parameters**

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
rowid_type	Returns type (restricted/extended)
object_number	Returns data object number (rowid_object_undefined for restricted)
relative_fno	Returns relative file number
block_number	Returns block number in this file
row_number	Returns row number in this block

### See Also:

"ROWID\_TYPE Function"

## Examples

This example reads back the values for the ROWID that you created in the ROWID\_CREATE:

```
DBMS_ROWID.ROWID_INFO (
    my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

## 140.6.4 ROWID\_OBJECT Function

This function returns the data object number for an extended ROWID.

The function returns zero if the input ROWID is a restricted ROWID.

### Syntax

```
DBMS_ROWID.ROWID_OBJECT (
    rowid_id IN ROWID)
    RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

## Parameters

**Table 140-9 ROWID\_OBJECT Function Parameters**

Parameter	Description
row_id	ROWID to be interpreted

**Note:**

The ROWID\_OBJECT\_UNDEFINED constant is returned for restricted ROWIDs.

**Examples**

```
SELECT dbms_rowid.rowid_object(ROWID)
FROM emp
WHERE empno = 7499;
```

## 140.6.5 ROWID\_RELATIVE\_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

**Syntax**

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
    rowid_id      IN  ROWID,
    ts_type_in    IN  VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

**Pragmas**

```
pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

**Parameters****Table 140-10 ROWID\_RELATIVE\_FNO Function Parameters**

Parameter	Description
row_id	ROWID to be interpreted
ts_type_in	Type of the tablespace (bigfile/smallfile) to which the row belongs

**Examples**

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
    file_number    INTEGER;
    rowid_val      ROWID;
BEGIN
    SELECT ROWID INTO rowid_val
    FROM dept
    WHERE loc = 'Boston';
    file_number :=
        dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

## 140.6.6 ROWID\_ROW\_NUMBER Function

This function extracts the row number from the ROWID IN parameter.

### Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (  
    row_id IN ROWID)  
    RETURN NUMBER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 140-11 ROWID\_ROW\_NUMBER Function Parameters**

Parameter	Description
row_id	ROWID to be interpreted.

### Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)  
    FROM emp  
    WHERE ename = 'ALLEN';
```

## 140.6.7 ROWID\_TO\_ABSOLUTE\_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table.

The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

### Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (  
    row_id      IN ROWID,  
    schema_name IN VARCHAR2,  
    object_name IN VARCHAR2)  
    RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

## Parameters

**Table 140-12 ROWID\_TO\_ABSOLUTE\_FNO Function Parameters**

Parameter	Description
row_id	ROWID to be interpreted
schema_name	Name of the schema which contains the table
object_name	Table name

## Examples

```

DECLARE
  abs_fno      INTEGER;
  rowid_val    CHAR(18);
  object_name  VARCHAR2(20) := 'EMP';
BEGIN
  SELECT ROWID INTO rowid_val
  FROM emp
  WHERE empno = 9999;
  abs_fno := dbms_rowid.rowid_to_absolute_fno(
  rowid_val, 'SCOTT', object_name);

```

**Note:**

For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

## 140.6.8 ROWID\_TO\_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format.

Later, it may be removed from this package into a different place.

### Syntax

```

DBMS_ROWID.ROWID_TO_EXTENDED (
  old_rowid      IN ROWID,
  schema_name    IN VARCHAR2,
  object_name    IN VARCHAR2,
  conversion_type IN INTEGER)
RETURN ROWID;

```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

## Parameters

**Table 140-13 ROWID\_TO\_EXTENDED Function Parameters**

Parameter	Description
old_rowid	ROWID to be converted
schema_name	Name of the schema which contains the table (optional)
object_name	Table name (optional).
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

## Return Values

ROWID\_TO\_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

## Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID\_COL that holds ROWIDs (restricted), and a column TABLE\_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
SET rowid_col =
  dbms_rowid.rowid_to_extended (
    rowid_col, 'SCOTT', TABLE_COL, 0);
```

## Usage Notes

- If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID\_TO\_EXTENDED returns a value, however, does not guarantee that the converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.
- If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.
- If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID\_ROWID exception is raised. If they do match, the input ROWID is returned.

- ROWID\_TO\_EXTENDED cannot be used with partition tables.

#### See Also:

The [ROWID\\_VERIFY Function](#) has a method to determine if a given ROWID can be converted to the extended format.

## 140.6.9 ROWID\_TO\_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

### Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
    old_rowid      IN ROWID,
    conversion_type IN INTEGER)
RETURN ROWID;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_restricted, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 140-14 ROWID\_TO\_RESTRICTED Function Parameters**

Parameter	Description
old_rowid	ROWID to be converted
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

## 140.6.10 ROWID\_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

### Syntax

```
DBMS_ROWID.ROWID_TYPE (
    rowid_id IN ROWID)
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_type, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 140-15 ROWID\_TYPE Function Parameters**

Parameter	Description
row_id	ROWID to be interpreted

## Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

## 140.6.11 ROWID\_VERIFY Function

This function verifies the ROWID.

It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

### Note:

You can use this function in a WHERE clause of a SQL statement, as shown in the example.

## Syntax

```
DBMS_ROWID.ROWID_VERIFY (
    rowid_in      IN ROWID,
    schema_name   IN VARCHAR2,
    object_name   IN VARCHAR2,
    conversion_type IN INTEGER
) RETURN NUMBER;
```

## Pragmas

```
pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

## Parameters

**Table 140-16 ROWID\_VERIFY Function Parameters**

Parameter	Description
rowid_in	ROWID to be verified
schema_name	Name of the schema which contains the table
object_name	Table name
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

## Examples

Considering the schema in the example for the `ROWID_TO_EXTENDED` function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
FROM SCOTT.RIDS
WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

# DBMS\_RULE

The `DBMS_RULE` package contains subprograms that enable the evaluation of a rule set for a specified event.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_RULE Subprograms](#)

## 141.1 DBMS\_RULE Overview

This package contains subprograms that enable the evaluation of a rule set for a specified event.

### See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE` package
- [DBMS\\_RULE\\_ADM](#) and *Oracle Streams Concepts and Administration* for more information about this package and rules

## 141.2 DBMS\_RULE Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

### See Also:

*Oracle Database Security Guide* for more information about user group `PUBLIC`

## 141.3 Summary of DBMS\_RULE Subprograms

This table lists the `DBMS_RULE` subprograms and briefly describes them.

**Table 141-1 DBMS\_RULE Package Subprograms**

Subprogram	Description
<a href="#">CLOSE_ITERATOR Procedure</a>	Closes an open iterator
<a href="#">EVALUATE Procedure</a>	Evaluates the rules in the specified rule set that use the evaluation context specified
<a href="#">EVALUATE_EXPRESSION Procedure</a>	Evaluates an expression under the logged in user in a session
<a href="#">EVALUATE_EXPRESSION_ITERATOR Procedure</a>	Finds the relevant datapoints and pass re\$value_list into evaluation interface
<a href="#">EVALUATE_RULE Procedure</a>	Evaluates the condition defined in the Rule
<a href="#">EVALUATE_RULE_ITERATOR Procedure</a>	Finds the relevant datapoints and pass re\$value_list into evaluation interface
<a href="#">GET_NEXT_HIT Function</a>	Returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator; returns NULL if there are no more rules that evaluated to TRUE or MAYBE.
<a href="#">IS_FAST Procedure</a>	Returns TRUE if the expression can be evaluated fast. An expression can be evaluated fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.
<a href="#">GET_NEXT_RESULT Function</a>	Iterates over result from the expression given result_val_iterator.

### 141.3.1 CLOSE\_ITERATOR Procedure

This procedure closes an open iterator.

#### Syntax

```
DBMS_RULE.CLOSE_ITERATOR(
    iterator IN BINARY_INTEGER);
```

#### Parameter

**Table 141-2 CLOSE\_ITERATOR Procedure Parameter**

Parameter	Description
iterator	Iterator to be closed

#### Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

 **See Also:**  
[EVALUATE Procedure](#)

## 141.3.2 EVALUATE Procedure

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

### Syntax

```
DBMS_RULE.EVALUATE(
  rule_set_name      IN      VARCHAR2,
  evaluation_context IN      VARCHAR2,
  event_context      IN      SYS.RE$NV_LIST          DEFAULT NULL,
  table_values       IN      SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values      IN      SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values    IN      SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values   IN      SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,

  skip_rules         IN      SYS.RE$RULE_NAME_LIST     DEFAULT NULL,

  dop                IN      NUMBER,

  result_cache       IN      BOOLEAN                  DEFAULT FALSE,
  stop_on_first_hit  IN      BOOLEAN                  DEFAULT FALSE,
  simple_rules_only  IN      BOOLEAN                  DEFAULT FALSE,
  true_rules         OUT     SYS.RE$RULE_HIT_LIST,
  maybe_rules        OUT     SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE(
  rule_set_name      IN      VARCHAR2,
  evaluation_context IN      VARCHAR2,
  event_context      IN      SYS.RE$NV_LIST          DEFAULT NULL,
  table_values       IN      SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values      IN      SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values    IN      SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values   IN      SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,

  skip_rules         IN      SYS.RE$RULE_NAME_LIST     DEFAULT NULL,

  dop                IN      NUMBER,

  simple_rules_only  IN      BOOLEAN                  DEFAULT FALSE,
  true_rules_iterator OUT     BINARY_INTEGER,
  maybe_rules_iterator OUT    BINARY_INTEGER);
```

## Parameters

**Table 141-3 EVALUATE Procedure Parameters**

Parameter	Description
<code>rule_set_name</code>	Name of the rule set in the form <code>[schema_name.]rule_set_name</code> . For example, to evaluate all of the rules in a rule set named <code>hr_rules</code> in the <code>hr</code> schema, enter <code>hr.hr_rules</code> for this parameter. If the schema is not specified, then the schema of the current user is used.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
<code>event_context</code>	A list of name-value pairs that identify events that cause evaluation
<code>table_values</code>	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
<code>column_values</code>	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in <code>table_values</code> .
<code>variable_values</code>	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
<code>attribute_values</code>	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in <code>variable_values</code> .
<code>stop_on_first_hit</code>	If <code>TRUE</code> , then the rules engine stops evaluation as soon as it finds a <code>TRUE</code> rule. If <code>TRUE</code> and there are no <code>TRUE</code> rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to <code>TRUE</code> given more data. If <code>FALSE</code> , then the rules engine continues to evaluate rules even after it finds a <code>TRUE</code> rule.
<code>simple_rules_only</code>	If <code>TRUE</code> , then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If <code>FALSE</code> , then evaluates all rules.

**Table 141-3 (Cont.) EVALUATE Procedure Parameters**

Parameter	Description
<code>true_rules</code>	<p>Receives the output of the EVALUATE procedure into a varray of <code>RE\$RULE_HIT_LIST</code> type.</p> <p>If no rules evaluate to <code>TRUE</code>, then <code>true_rules</code> is empty.</p> <p>If at least one rule evaluates to <code>TRUE</code> and <code>stop_on_first_hit</code> is <code>TRUE</code>, then <code>true_rules</code> contains one rule that evaluates to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>true_rules</code> contains all rules that evaluate to <code>TRUE</code>.</p>
<code>maybe_rules</code>	<p>If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty.</p> <p>If <code>stop_on_first_hit</code> is <code>TRUE</code>, then if there is at least one rule that may evaluate to <code>TRUE</code> given more data, and no rules evaluate to <code>TRUE</code>, then <code>maybe_rules</code> contains one rule that may evaluate to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>maybe_rules</code> contains all rules that may evaluate to <code>TRUE</code> given more data.</p>
<code>true_rules_iterator</code>	Contains the iterator for accessing rules that are <code>TRUE</code>
<code>maybe_rules_iterator</code>	Contains the iterator for accessing rules that may be <code>TRUE</code> given additional data or the ability to issue SQL
<code>skip_rules</code>	List of rules to skip within this evaluation.
<code>dop</code>	Degree of parallelism
<code>result_cache</code>	If <code>TRUE</code> , Result Cache will be created. If evaluate procedure is called with either <code>true_rules_iterator</code> or <code>maybe_rules_iterator</code> , then <code>result_cache</code> is not enabled.

### Usage Notes

 **Note:**

Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as `TRUE`, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
  - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

 **Note:**

The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

 **See Also:**

- [Rule TYPES](#) for more information about the types used with the DBMS\_RULE package
- [GET\\_NEXT\\_HIT](#) Function
- [CLOSE\\_ITERATOR](#) Procedure

### 141.3.3 EVALUATE\_EXPRESSION Procedure

This procedure allows user to evaluate an expression under the logged in user in a session.

Any re-execute of the same expression with same table alias and variable type will result in reusing the same compiled context. With fixed compile cache size, its possible of aging....

**Syntax**

```
DBMS_RULE.EVALUATE_EXPRESSION(
  rule_expression      IN      VARCHAR2,
  table_aliases        IN      SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types       IN      SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  table_values         IN      SYS.RE$TABLE_VALUE_LIST:= NULL,
  column_values        IN      SYS.RE$COLUMN_VALUE_LIST:=NULL,
  variable_values      IN      SYS.RE$VARIABLE_VALUE_LIST:=NULL,
  attribute_values     IN      SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL,
  cache                IN      BOOLEAN DEFAULT FALSE,
  result_val           OUT     BOOLEAN);
```

**Parameters**

**Table 141-4 EVALUATE\_EXPRESSION Procedure Parameters**

Parameter	Description
rule_expression	Contains an expression string.
table_alias	Contains alias of tables referred in the expression string.
variable_types	Contains type definitions of variables used in expression.
table_values	Contains ROWID of table row for expression evaluation.
column_values	Contains values of columns referred in the expression.
variable_values	Contains values of variables referred in the expression.

**Table 141-4 (Cont.) EVALUATE\_EXPRESSION Procedure Parameters**

Parameter	Description
attribute_values	Contains values of attributes referred in the expression.
cache	If TRUE, Result Cache will be created.
result_val	Result of the evaluation.

### 141.3.4 EVALUATE\_EXPRESSION\_ITERATOR Procedure

This is an user visible interface. Because PL/SQL based callbacks can be expensive, we provide an array based approach. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface. The expression evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element.

#### Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION_ITERATOR(
    rule_expression      IN          varchar2,
    table_aliases        IN          sys.re$table_alias_list:= NULL,
    variable_types       IN          sys.re$variable_type_list:= NULL,
    values               IN          sys.re$value_list,
    cache                IN          boolean DEFAULT FALSE,
    result_val_iter_id   OUT         BINARY_INTEGER)
```

#### Parameters

**Table 141-5 EVALUATE\_EXPRESSION\_ITERATOR Procedure Parameter**

Parameter	Description
rule_expression	Contains an expression string.
table_alias	Alias of tables referred in the above expression string.
variable_types	Type definitions of variables used in expression.
values	List of datapoint values for evaluation.
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using value.

### 141.3.5 EVALUATE\_RULE Procedure

The Rule Evaluation API expects that `CREATE_RULE` procedure has been called with an legitimate `EVALUATION_CONTEXT` prior. This API will evaluate the condition defined in the Rule.

#### Syntax

```
DBMS_RULE.EVALUATE_RULE(
    rule_name           IN          VARCHAR2,
    event_context       IN          SYS.RE$NV_LIST           DEFAULT NULL,
    table_values        IN          SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
```

```

column_values      IN  SYS.RE$COLUMN_VALUE_LIST    DEFAULT NULL,
variable_values    IN  SYS.RE$VARIABLE_VALUE_LIST  DEFAULT NULL,
attribute_values   IN  SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
cache              IN  BOOLEAN DEFAULT FALSE,
result_val         OUT BOOLEAN);

```

### Parameters

**Table 141-6 EVALUATE\_RULE Procedure Parameter**

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation.
table_values	ROWID of table row for expression evaluation.
column_values	Values of columns referred in the expression
variable_values	Values of variables referred in expression
attribute_values	Values of attributes referred in expression
cache	If TRUE, Result Cache will be created.
result_val	Result of the evaluation

## 141.3.6 EVALUATE\_RULE\_ITERATOR Procedure

This is an iterative interface. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface.

Evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element. User can use `DBMS_RULE.GET_NEXT_RESULT` procedure to iterate through the result list.

### Syntax

```

DBMS_RULE.EVALUATE_RULE_ITERATOR(
  rule_name      IN      VARCHAR2,
  event_context  IN      SYS.RE$NV_LIST DEFAULT NULL,
  values         IN      SYS.RE$VALUE_LIST,
  cache         IN      BOOLEAN DEFAULT FALSE,
  result_val_iter_id OUT  BINARY_INTEGER);

```

### Parameters

**Table 141-7 EVALUATE\_RULE\_ITERATOR Procedure Parameter**

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation
values	List of datapoint values for evaluation.

**Table 141-7 (Cont.) EVALUATE\_RULE\_ITERATOR Procedure Parameter**

Parameter	Description
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using values

## 141.3.7 GET\_NEXT\_HIT Function

This function returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator. The function returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

### Syntax

```
DBMS_RULE.GET_NEXT_HIT(
    iterator IN BINARY_INTEGER)
RETURN SYS.RE$RULE_HIT;
```

### Parameter

**Table 141-8 GET\_NEXT\_HIT Function Parameter**

Parameter	Description
iterator	The iterator from which the rule that evaluated to TRUE or MAYBE is retrieved

### Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns NULL, it is closed automatically. If an open iterator is no longer needed, then use the `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package to close it.

#### Note:

This function raises an error if the rule set being evaluated was modified after the call to the `DBMS_RULE.EVALUATE` procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

 **See Also:**

- [Rule TYPES](#) for more information about the types used with the DBMS\_RULE package
- [EVALUATE Procedure](#)
- [CLOSE\\_ITERATOR Procedure](#)

## 141.3.8 GET\_NEXT\_RESULT Function

This function iterates over result from the expression given in RESULT\_VAL\_ITERATOR. It returns the expression at iterator evaluated to TRUE or FALSE.

### Syntax

```
DBMS_RULE.GET_NEXT_RESULT (
  result_val_iterator_id  IN  BINARY_INTEGER)
RETURN  BOOLEAN;
```

### Parameter

**Table 141-9 GET\_NEXT\_RESULT Function Parameter**

Parameter	Description
result_val_iterator_id	Iterator returned from EVALUATE_EXPRESSION_ITERATOR

## 141.3.9 IS\_FAST Procedure

Given an expression, of either rule or Independent Expression, this procedure will return TRUE if the expression can be evaluated as fast. An expression can be evaluated as fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.

### Syntax

```
DBMS_RULE.IS_FAST(
  expression          IN          VARCHAR2,
  table_aliases       IN          SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types      IN          SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  result_val          OUT         BOOLEAN);
```

### Parameter

**Table 141-10 IS\_FAST Procedure Parameter**

Parameter	Description
expression	Expression to check
table_aliases	Alias of tables referred in the above expression string

**Table 141-10 (Cont.) IS\_FAST Procedure Parameter**

<b>Parameter</b>	<b>Description</b>
variable_type s	Type definitions of variables used in expressions
result_val	If the expression can be evaluated as fast

# DBMS\_RULE\_ADM

The `DBMS_RULE_ADM` package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_RULE\\_ADM Subprograms](#)

## 142.1 DBMS\_RULE\_ADM Overview

This package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

### See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package
- [DBMS\\_RULE](#) and *Oracle Streams Concepts and Administration* for more information about this package and rules

## 142.2 DBMS\_RULE\_ADM Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

### See Also:

*Oracle Database Security Guide* for more information about user group `PUBLIC`

## 142.3 Summary of DBMS\_RULE\_ADM Subprograms

This table lists the `DBMS_RULE_ADM` subprograms and briefly describes them.

**Table 142-1 DBMS\_RULE\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_RULE Procedure</a>	Adds the specified rule to the specified rule set
<a href="#">ALTER_EVALUATION_CONTEXT Procedure</a>	Alters a rule evaluation context
<a href="#">ALTER_RULE Procedure</a>	Changes one or more aspects of the specified rule
<a href="#">CREATE_EVALUATION_CONTEXT Procedure</a>	Creates a rule evaluation context
<a href="#">CREATE_RULE Procedure</a>	Creates a rule with the specified name
<a href="#">CREATE_RULE_SET Procedure</a>	Creates a rule set with the specified name
<a href="#">DROP_EVALUATION_CONTEXT Procedure</a>	Drops the rule evaluation context with the specified name
<a href="#">DROP_RULE Procedure</a>	Drops the rule with the specified name
<a href="#">DROP_RULE_SET Procedure</a>	Drops the rule set with the specified name
<a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a>	Grants the specified object privilege on the specified object to the specified user or role
<a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a>	Grants the specified system privilege to the specified user or role
<a href="#">REMOVE_RULE Procedure</a>	Removes the specified rule from the specified rule set
<a href="#">REVOKE_OBJECT_PRIVILEGE Procedure</a>	Revokes the specified object privilege on the specified object from the specified user or role
<a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a>	Revokes the specified system privilege from the specified user or role

**Note:**

All subprograms commit unless specified otherwise.

### 142.3.1 ADD\_RULE Procedure

This procedure adds the specified rule to the specified rule set.

**Syntax**

```
DBMS_RULE_ADM.ADD_RULE(
  rule_name          IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_comment       IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 142-2 ADD\_RULE Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule you are adding to the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to add a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>rule_set_name</code>	The name of the rule set to which you are adding the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to add the rule to a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default.  Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
<code>rule_comment</code>	Optional description, which can contain the reason for adding the rule to the rule set

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE` privilege on the rule
- Have `EXECUTE_ANY_RULE` system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

## 142.3.2 ALTER\_EVALUATION\_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

### Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name    IN  VARCHAR2,
  table_aliases              IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  remove_table_aliases      IN  BOOLEAN                    DEFAULT FALSE,
  variable_types            IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types     IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_function       IN  VARCHAR2                  DEFAULT NULL,
  remove_evaluation_function IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_context_comment IN  VARCHAR2                  DEFAULT NULL,
  remove_eval_context_comment IN BOOLEAN                  DEFAULT FALSE);
```

### Parameters

**Table 142-3 ALTER\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
evaluation_context_name	The name of the evaluation context you are altering, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to alter an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	If <code>NULL</code> and <code>remove_table_aliases</code> is <code>FALSE</code> , then the procedure retains the existing table aliases. If <code>NULL</code> and <code>remove_table_aliases</code> is <code>TRUE</code> , then the procedure removes the existing table aliases. If non- <code>NULL</code> , then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
remove_table_aliases	If <code>TRUE</code> and <code>table_aliases</code> is <code>NULL</code> , then the procedure removes the existing table aliases for the evaluation context. If <code>TRUE</code> and <code>table_aliases</code> is non- <code>NULL</code> , then the procedure raises an error. If <code>FALSE</code> , then the procedure does not remove table aliases.

**Table 142-3 (Cont.) ALTER\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
variable_types	<p>If NULL and <code>remove_variable_types</code> is FALSE, then the procedure retains the variable types. If NULL and <code>remove_variable_types</code> is TRUE, then the procedure removes the existing variable types.</p> <p>If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.</p>
remove_variable_types	<p>If TRUE and <code>variable_types</code> is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and <code>variable_types</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the variable types.</p>
evaluation_function	<p>If NULL and <code>remove_evaluation_function</code> is FALSE, then the procedure retains the existing evaluation function. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation function.</p> <p>If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function.</p> <p>An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default.</p> <p>See <a href="#">CREATE_EVALUATION_CONTEXT Procedure</a> for more information about evaluation functions.</p>
remove_evaluation_function	<p>If TRUE and <code>evaluation_function</code> is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and <code>evaluation_function</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation function.</p>
evaluation_context_comment	<p>If NULL and <code>remove_eval_context_comment</code> is FALSE, then the procedure retains the existing evaluation context comment. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation context comment.</p> <p>If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment.</p> <p>An evaluation context comment is an optional description of the rule evaluation context.</p>

**Table 142-3 (Cont.) ALTER\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
remove_eval_context_comment	If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error.  If FALSE, then the procedure does not remove the evaluation context comment.

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL\_ON\_EVALUATION\_CONTEXT or ALTER\_ON\_EVALUATION\_CONTEXT object privilege on an evaluation context owned by another user
- Have ALTER\_ANY\_EVALUATION\_CONTEXT system privilege

#### See Also:

[Rule TYPES](#) for more information about the types used with the DBMS\_RULE\_ADM package

## 142.3.3 ALTER\_RULE Procedure

This procedure changes one or more aspects of the specified rule.

### Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
    rule_name           IN  VARCHAR2,
    condition           IN  VARCHAR2           DEFAULT NULL,
    evaluation_context  IN  VARCHAR2           DEFAULT NULL,
    remove_evaluation_context IN  BOOLEAN       DEFAULT FALSE,
    action_context      IN  SYS.RE$NV_LIST     DEFAULT NULL,
    remove_action_context IN  BOOLEAN       DEFAULT FALSE,
    rule_comment        IN  VARCHAR2           DEFAULT NULL,
    remove_rule_comment IN  BOOLEAN       DEFAULT FALSE);
```

## Parameters

Table 142-4 ALTER\_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are altering, specified as <code>[schema_name.]rule_name</code> . For example, to alter a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
evaluation_context	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
remove_evaluation_context	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the <code>evaluation_context</code> parameter is non-NULL, then this parameter should be set to FALSE.
action_context	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
remove_action_context	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the <code>action_context</code> parameter is non-NULL, then this parameter should be set to FALSE.
rule_comment	If non-NULL, then the existing comment of the rule is replaced by the specified comment.
remove_rule_comment	If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the <code>rule_comment</code> parameter is non-NULL, then this parameter should be set to FALSE.

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER\_ON\_RULE privilege on the rule
- Have ALTER\_ANY\_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE\_ON\_EVALUATION\_CONTEXT privilege on the evaluation context
- Have EXECUTE\_ANY\_EVALUATION\_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

### See Also:

[Rule TYPES](#) for more information about the types used with the DBMS\_RULE\_ADM package

## 142.3.4 CREATE\_EVALUATION\_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

### Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(  
  evaluation_context_name      IN  VARCHAR2,  
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST  DEFAULT NULL,  
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,  
  evaluation_function           IN  VARCHAR2                DEFAULT NULL,  
  evaluation_context_comment    IN  VARCHAR2                DEFAULT NULL);
```

## Parameters

**Table 142-5 CREATE\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
<code>evaluation_context_name</code>	The name of the evaluation context you are creating, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to create an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>table_aliases</code>	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
<code>variable_types</code>	A list of variables for the evaluation context
<code>evaluation_function</code>	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default. See " <a href="#">Usage Notes</a> " for more information about the evaluation function.
<code>evaluation_context_comment</code>	An optional description of the rule evaluation context.

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have `CREATE_EVALUATION_CONTEXT_OBJ` system privilege
- Have `CREATE_ANY_EVALUATION_CONTEXT` system privilege

### See Also:

[Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2,
  event_context      IN  SYS.RE$NV_LIST           DEFAULT NULL,
  table_values       IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values      IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values    IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values   IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  stop_on_first_hit  IN  BOOLEAN                 DEFAULT FALSE,
  simple_rules_only  IN  BOOLEAN                 DEFAULT FALSE,
  true_rules         OUT SYS.RE$RULE_HIT_LIST,
```

```
maybe_rules      OUT  SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

**Note:**

Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.
- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

## 142.3.5 CREATE\_RULE Procedure

This procedure creates a rule.

### Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
  rule_name      IN  VARCHAR2,
  condition      IN  VARCHAR2,
  evaluation_context IN VARCHAR2      DEFAULT NULL,
  action_context IN  SYS.RE$NV_LIST  DEFAULT NULL,
  rule_comment   IN  VARCHAR2      DEFAULT NULL);
```

### Parameters

**Table 142-6 CREATE\_RULE Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule you are creating, specified as <code>[schema_name.]rule_name</code> . For example, to create a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.

**Table 142-6 (Cont.) CREATE\_RULE Procedure Parameters**

Parameter	Description
condition	<p>The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition:</p> <pre>department_id = 30</pre> <p>Ensure that the proper case is used for text in rule conditions. <b>Note:</b> Do not include the word "WHERE" in the condition.</p>
evaluation_context	<p>An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code>, which is associated with the rule. If the schema is not specified, then the current user is the default.</p> <p>If <code>evaluation_context</code> is not specified, then the rule inherits the evaluation context from its rule set.</p>
action_context	<p>The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.</p>
rule_comment	<p>An optional description of the rule</p>

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the `CREATE_RULE_OBJ` system privilege
- Have `CREATE_ANY_RULE` system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

 **See Also:**

[Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package

## 142.3.6 CREATE\_RULE\_SET Procedure

This procedure creates a rule set.

### Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
    rule_set_name      IN  VARCHAR2,
    evaluation_context IN  VARCHAR2  DEFAULT NULL,
    rule_set_comment   IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 142-7 CREATE\_RULE\_SET Procedure Parameters**

Parameter	Description
rule_set_name	The name of the rule set you are creating, specified as [ <i>schema_name</i> .] <i>rule_set_name</i> . For example, to create a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An optional evaluation context name in the form [ <i>schema_name</i> .] <i>evaluation_context_name</i> , which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
rule_set_comment	An optional description of the rule set

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

## 142.3.7 DROP\_EVALUATION\_CONTEXT Procedure

This procedure drops a rule evaluation context.

### Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT(
    evaluation_context_name IN  VARCHAR2,
    force                   IN  BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 142-8 DROP\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
<code>evaluation_context_name</code>	The name of the evaluation context you are dropping, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>force</code>	If <code>TRUE</code> , then the procedure removes the rule evaluation context from all rules and rule sets that use it.  If <code>FALSE</code> and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context.  If <code>FALSE</code> and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception.  <b>Caution:</b> Setting <code>force</code> to <code>TRUE</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated.

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

## 142.3.8 DROP\_RULE Procedure

This procedure drops a rule.

### Syntax

```
DBMS_RULE_ADM.DROP_RULE(
  rule_name IN VARCHAR2,
  force     IN BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 142-9 DROP\_RULE Procedure Parameters**

Parameter	Description
<code>rule_name</code>	The name of the rule you are dropping, specified as <code>[schema_name.]rule_name</code> . For example, to drop a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.

**Table 142-9 (Cont.) DROP\_RULE Procedure Parameters**

Parameter	Description
force	<p>If TRUE, then the procedure removes the rule from all rule sets that contain it.</p> <p>If FALSE and no rule sets contain the rule, then the procedure drops the rule.</p> <p>If FALSE and one or more rule sets contain the rule, then the procedure raises an exception.</p>

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP\_ANY\_RULE system privilege

 **Note:**

- To remove a rule from a rule set without dropping the rule from the database, use the REMOVE\_RULE procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

## 142.3.9 DROP\_RULE\_SET Procedure

This procedure drops a rule set.

### Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
    rule_set_name IN VARCHAR2,
    delete_rules IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 142-10 DROP\_RULE\_SET Procedure Parameters**

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as [ <i>schema_name</i> .] <i>rule_set_name</i> . For example, to drop a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.

**Table 142-10 (Cont.) DROP\_RULE\_SET Procedure Parameters**

Parameter	Description
delete_rules	If TRUE, then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped.  If FALSE, then the procedure does not drop the rules in the rule set.

**Usage Notes**

To run this procedure, a user must meet at least one of the following requirements:

- Have DROP\_ANY\_RULE\_SET system privilege
- Be the owner of the rule set

 **Note:**

The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

## 142.3.10 GRANT\_OBJECT\_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

**Syntax**

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
  privilege      IN  BINARY_INTEGER,
  object_name    IN  VARCHAR2,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN   DEFAULT FALSE);
```

**Parameters****Table 142-11 GRANT\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the object privilege to grant to the grantee on the object. See " <a href="#">Usage Notes</a> " for the available object privileges.
object_name	The name of the object for which you are granting the privilege to the grantee, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, to grant the privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.

**Table 142-11 (Cont.) GRANT\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others.  If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others.

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 142-12 lists the object privileges.

**Table 142-12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets**

Privilege	Description
SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT	Alter and execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE	Alter and execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET	Alter and execute a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT	Alter a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE	Alter a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET	Alter a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT	Execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE	Execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET	Execute a particular rule set in another user's schema

### Examples

For example, to grant the HR user the privilege to alter a rule named hr\_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
```

```

object_name => 'strmadmin.hr_dml',
grantee     => 'hr',
grant_option => FALSE);
END;
/

```

## 142.3.11 GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

### Syntax

```

DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN   DEFAULT FALSE);

```

### Parameters

**Table 142-13 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the system privilege to grant to the grantee.
grantee	The name of the user or role for which the privilege is granted
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

### Usage Notes

[Table 142-14](#) lists the system privileges.

**Table 142-14 System Privileges for Evaluation Contexts, Rules, and Rule Sets**

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema

**Table 142-14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets**

Privilege	Description
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee   => 'strmadmin',
    grant_option => FALSE);
END;
/
```

#### Note:

When you grant a privilege on "ANY" object (for example, `ALTER_ANY_RULE`), and the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to `FALSE`, you give the user access to that type of object in all schemas except the `SYS` schema. By default, the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to `FALSE`.

If you want to grant access to an object in the `SYS` schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the `O7_DICTIONARY_ACCESSIBILITY` initialization parameter to `TRUE`. Then privileges granted on "ANY" object allows access to any schema, including `SYS`.

## 142.3.12 REMOVE\_RULE Procedure

This procedure removes the specified rule from the specified rule set.

### Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
  rule_name           IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  all_evaluation_contexts IN BOOLEAN  DEFAULT FALSE);
```

## Parameters

Table 142-15 REMOVE\_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are removing from the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to remove a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>rule_set_name</code>	The name of the rule set from which you are removing the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to remove the rule from a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context_name</code>	The name of the evaluation context associated with the rule you are removing, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to specify an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.  If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the <code>ADD_RULE</code> procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error.  Specify <code>NULL</code> if you did not specify an evaluation context when you added the rule to the rule set. If you specify <code>NULL</code> and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.
<code>all_evaluation_contexts</code>	If <code>TRUE</code> , then the procedure removes the rule from the rule set with all of its associated evaluation contexts.  If <code>FALSE</code> , then the procedure only removes the rule with the specified evaluation context.  This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

 **Note:**

This procedure does not drop a rule from the database. To drop a rule from the database, use the `DROP_RULE` procedure.

### 142.3.13 REVOKE\_OBJECT\_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

#### Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(
  privilege IN BINARY_INTEGER,
  object_name IN VARCHAR2,
  revokee IN VARCHAR2);
```

#### Parameters

**Table 142-16 REVOKE\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the object privilege on the object to revoke from the revokee. See <a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a> for a list of the object privileges.
object_name	The name of the object for which you are revoking the privilege from the revokee, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, to revoke an object privilege on a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

### 142.3.14 REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

#### Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(
  privilege IN BINARY_INTEGER,
  revokee IN VARCHAR2);
```

## Parameters

**Table 142-17 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the system privilege to revoke from the revokee. See <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> for a list of the system privileges.
revokee	The name of the user or role from which the privilege is revoked

# DBMS\_SCHEDULER

The `DBMS_SCHEDULER` package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_SCHEDULER Subprograms](#)

## See Also:

*Oracle Database Administrator's Guide* for more information regarding how to use `DBMS_SCHEDULER`

## 143.1 DBMS\_SCHEDULER Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 12c Release 1 (12.1):

- [CREATE\\_CREDENTIAL Procedure](#)
- [DROP\\_CREDENTIAL Procedure](#)

## 143.2 DBMS\_SCHEDULER Security Model

The `DBMS_SCHEDULER` package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

## 143.3 DBMS\_SCHEDULER Rules and Limits

These rules apply when using the `DBMS_SCHEDULER` package.

- Only `SYS` can perform actions on objects in the `SYS` schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first

object that returns an error. Therefore, the Scheduler does not perform the tasks needed for the remaining objects on the list.

For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');`

If `job3` cannot be stopped, then the jobs that follow it, `jobclass1`, `jobclass2`, and `jobclass3` cannot be stopped. The jobs that preceded `job3`, `job1` and `job2`, are stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

## 143.4 DBMS\_SCHEDULER Operational Notes

The Scheduler uses a rich **calendar**ing syntax to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

### Calendaring Syntax

This section starts with the calendaring syntax. It is followed by descriptions of various parts of the syntax.

In the calendaring syntax, \* means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule
```

```
regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause] [";" periods_clause]
[";" byperiod_clause]
```

```
frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
predefined_frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
    "HOURLY" | "MINUTELY" | "SECONDLY"
user_defined_frequency = named_schedule
```

```
interval_clause = "INTERVAL" "=" intervalnum
intervalnum = 1 through 99
bymonth_clause = "BYMONTH" "=" monthlist
monthlist = month ( ", " month)*
month = numeric_month | char_month
numeric_month = 1 | 2 | 3 ... 12
char_month = "JAN" | "FEB" | "MAR" | "APR" | "MAY" | "JUN" |
    "JUL" | "AUG" | "SEP" | "OCT" | "NOV" | "DEC"
byweekno_clause = "BYWEEKNO" "=" weeknumber_list
weeknumber_list = weeknumber ( ", " weeknumber)*
weeknumber = [minus] weekno
weekno = 1 through 53
byyearday_clause = "BYYEARDAY" "=" yearday_list
yearday_list = yearday ( ", " yearday)*
```

```
yearday = [minus] yeardaynum
yeardaynum = 1 through 366
bydate_clause = "BYDATE" "=" date_list
date_list = date ( "," date)*
date = [YYYY]MMDD [ offset | span ]
bymonthday_clause = "BYMONTHDAY" "=" monthday_list
monthday_list = monthday ( "," monthday)*
monthday = [minus] monthdaynum
monthdaynum = 1 through 31
byday_clause = "BYDAY" "=" byday_list
byday_list = byday ( "," byday)*
byday = [weekdaynum] day
weekdaynum = [minus] daynum
daynum = 1 through 53 /* if frequency is yearly */
daynum = 1 through 5 /* if frequency is monthly */
day = "MON" | "TUE" | "WED" | "THU" | "FRI" | "SAT" | "SUN"
BYTIME clause: BYTIME=[hour_minute_second_list|minute_second_list]
hour_minute_second_list: hh24mmss, .., hh24mmss
minute_second_list: mmss, .. mmss
byhour_clause = "BYHOUR" "=" hour_list
hour_list = hour ( "," hour)*
hour = 0 through 23
byminute_clause = "BYMINUTE" "=" minute_list
minute_list = minute ( "," minute)*
minute = 0 through 59
bysecond_clause = "BYSECOND" "=" second_list
second_list = second ( "," second)*
second = 0 through 59
bysetpos_clause = "BYSETPOS" "=" setpos_list
setpos_list = setpos ( "," setpos)*
setpos = [minus] setpos_num
setpos_num = 1 through 9999

include_clause = "INCLUDE" "=" schedule_list
exclude_clause = "EXCLUDE" "=" schedule_list
intersect_clause = "INTERSECT" "=" schedule_list
schedule_list = schedule_clause ( "," schedule_clause)*
schedule_clause = named_schedule [ offset ]
named_schedule = [schema "."] schedule
periods_clause = "PERIODS" "=" periodnum
byperiod_clause = "BYPERIOD" "=" period_list
period_list = periodnum ( "," periodnum)*
periodnum = 1 through 100

offset = ("+" | "-") ["OFFSET:"] duration_val
span = ("+" | "-" | "^") "SPAN:" duration_val
duration_val = dur-weeks | dur_days
dur_weeks = numofweeks "W"
dur_days = numofdays "D"
numofweeks = 1 through 53
numofdays = 1 through 376
minus = "-"

combined_schedule = schedule_list
```

**Table 143-1 Values for repeat\_interval**

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.
BYWEEKNO	<p>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th.</p> <p>The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year.</p> <p>As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53.</p> <p>byweekno is only valid for YEARLY.</p> <p>Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1".</p>
BYYEARDAY	This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.

**Table 143-1 (Cont.) Values for repeat\_interval**

Name	Description
BYDATE	<p>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the <i>SPAN</i> modifier, and a date can be adjusted with the <i>OFFSET</i> modifier. An example of a simple <i>BYDATE</i> clause follows:</p> <pre>BYDATE=0115,0315,0615,0915,1215,20060115</pre> <p>The following <i>SPAN</i> example is equivalent to <i>BYDATE=0110,0111,0112,0113,0114</i>, which is a span of 5 days starting at 1/10:</p> <pre>BYDATE=0110+SPAN:5D</pre> <p>The plus sign in front of the <i>SPAN</i> keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of <i>n</i> days or weeks centered around the supplied date. If <i>n</i> is an even number, it is adjusted up to the next odd number.</p> <p>Offsets adjust the supplied date by adding or subtracting <i>n</i> days or weeks. <i>BYDATE=0205-OFFSET:2W</i> is equivalent to <i>BYDATE=0205-14D</i> (the <i>OFFSET</i> keyword is optional), which is also equivalent to <i>BYDATE=0122</i>.</p>
BYMONTHDAY	<p>This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, <i>BYMONTHDAY=-1</i> means the last day of the month and <i>BYMONTHDAY=-2</i> means the next to last day of the month.</p>
BYDAY	<p>This specifies the day of the week from Monday to Sunday in the form <i>MON</i>, <i>TUE</i>, and so on. Using numbers, you can specify the 26th Friday of the year, if using a <i>YEARLY</i> frequency, or the 4th <i>THU</i> of the month, using a <i>MONTHLY</i> frequency. Using the minus sign, you can say the second to last Friday of the month. For example, <i>-1 FRI</i> is the last Friday of the month.</p>
BYHOUR	<p>This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.</p>
BYMINUTE	<p>This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.</p>
BYSECOND	<p>This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.</p>

**Table 143-1 (Cont.) Values for repeat\_interval**

Name	Description
BYSETPOS	<p>This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be:</p> <pre data-bbox="553 596 1174 621">FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1</pre> <p>Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies.</p> <p>The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.</p>
INCLUDE	<p>This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.</p> <p>This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.</p>
EXCLUDE	<p>This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure.</p> <p>This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.</p>

**Table 143-1 (Cont.) Values for repeat\_interval**

Name	Description
INTERSECT	<p>This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.</p> <p>For example, assume that the named schedule <code>last_sat</code> indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule <code>end_qtr</code> indicates the last day of each quarter in 2005:</p> <p><code>3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005</code></p> <p>These calendaring expressions result in the dates that follow:</p> <p><code>3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005</code></p> <p><code>FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr</code></p> <p>In this example, the terms <code>FREQ=MONTHLY; BYMONTHDAY=-1</code> indicate the last day of each month.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p>
PERIODS	<p>This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the <code>repeat_interval</code> expression of the schedule that defines the user-defined frequency. It is mandatory when the <code>repeat_interval</code> expression in the main schedule contains a <code>BYPERIOD</code> clause. The following example defines the quarters of a fiscal year.</p> <p><code>FREQ=YEARLY; BYDATE=0301,0601,0901,1201; PERIODS=4</code></p>
BYPERIOD	<p>This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause <code>BYPERIOD=2,4</code> in the main schedule selects the 2nd and 4th fiscal quarters.</p>

### Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules
 

For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.
- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses

With this method, the embedded schedules inherit certain attributes from the main schedule.

- Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main

schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.

- Days that are added by the `INCLUDE` clause follow the hourly/minutes/seconds execution pattern of the main schedule.
- When the `INCLUDE` clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See ["Start Dates and Repeat Intervals"](#), later in this section.) For example, a `repeat_interval` of `FREQ=MONTHLY;INCLUDE=HOLIDAY` executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the `INTERVAL` clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

### User-Defined Frequencies

Instead of using predefined frequencies like `DAILY`, `WEEKLY`, `MONTHLY`, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following `repeat_interval` expression is used in a schedule named `fiscal_year` that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the `fiscal_year` schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the `BYSETPOS` clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the `BYPERIOD` clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a `PERIODS` clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

### Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYMONTH` or `BYMONTHDAY` clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency is monthly but there is no `BYMONTHDAY` clause in the repeat interval, then the day of the month that the job runs on is retrieved from the start date. If present, `BYHOUR`, `BYMINUTE`, and `BYSECOND` defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the `INCLUDE`, `EXCLUDE`, or `INTERSECT` clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are. The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a `repeat_interval` of `FREQ=YEARLY;BYDATE=0701`.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an `INCLUDE` clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

### General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the `include`, `exclude`, and `intersect` clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific `BY` clause do not need to be ordered.
- When not enough `BY` clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "`FREQ=YEARLY`" with a start date of 02/15/2003 becomes "`FREQ=YEARLY;BYMONTH=FEB; BYMONTHDAY=15`", which means every year on the 15th of February.

```
"FREQ=YEARLY;BYMONTH=JAN, JUL" with start date 01/21/2003 becomes
"FREQ=YEARLY;BYMONTH=JAN, JUL; BYMONTHDAY=21", which means every year on
January 21 and July 21.
```

- The `byweekno` clause is only allowed if the frequency is `YEARLY`. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a `BYDAY` clause. For example, "`FREQ=YEARLY;BYWEEKNO=2`" with a start date of `01/01/2003` will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
```

Note that when the `byweekno` clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "`FREQ=YEARLY;BYWEEKNO=1,53`" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those `BY` clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying `BYMONTHDAY=31` will not give you the last day of every month, because not every month has 31 days. Instead, `BYMONTHDAY=-1` will give you the last day of the month.

This is not supported for `BY` clauses that are fixed in size. In other words, `BYMONTH`, `BYHOUR`, `BYMINUTE`, and `BYSECOND` are not supported.

- The basic values for the `BYDAY` clause are the days of the week. When the frequency is `YEARLY`, or `MONTHLY`, you are allowed to specify a positive or negative number in front of each day of the week. In the case of `YEARLY`, `BYDAY=40MON`, indicates the 40th Monday of the year. In the case of `MONTHLY`, `BYDAY=-2SAT`, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.
- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments, then you must specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as `'US/Eastern'` in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the `start_date` is set to an

absolute offset, such as '-5:00', then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.

- When `start_date` is NULL, the Scheduler determines the time zone for the repeat interval as follows:
  1. It checks whether or not the session time zone is a region name. The session time zone can be set by either:
    - Issuing an ALTER SESSION statement, for example:
 

```
SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
```
    - Setting the ORA\_SDTZ environment variable.
  2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the `DEFAULT_TIMEZONE` Scheduler attribute. For more information, see the [SET\\_SCHEDULER\\_ATTRIBUTE Procedure](#).
  3. If the `DEFAULT_TIMEZONE` attribute is NULL, the Scheduler uses the time zone of `sysimestamp` when the job or window is enabled.

### BYSETPOS Clause Rules

The following are rules for the `BYSETPOS` clause.

- The `BYSETPOS` clause is the last clause to be evaluated. It is processed after all other `BY` clauses and the `INCLUDE`, `EXCLUDE` and `INTERSECT` clauses have been evaluated.
- The `INTERVAL` clause does not change the size of the period to which the `BYSETPOS` clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which `BYSETPOS` is applied is generated from a month, not a quarter. The only impact of the `INTERVAL` clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY; INTERVAL=3; BYDAY=MON, TUE, WED, THU, FRI; BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which `BYSETPOS` is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

```
FREQ=MONTHLY; BYDAY=MON, TUE, FRI; BYSETPOS=1, 3
```

on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

### BYDATE Clause Rules

The following are rules for the `BYDATE` clause.

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

```
freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
```

then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

### EXCLUDE Clause Rules

Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
  exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

### OFFSET Rules

You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
  'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

### Example 143-1 Putting It All Together

This example demonstrates the use of user-defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
dbms_scheduler.create_schedule('year_start', repeat_interval=>
  'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
dbms_scheduler.create_schedule('retail_fiscal_year',
  to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
  'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
  'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
  BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

## 143.5 DBMS\_SCHEDULER Data Structures

The DBMS\_SCHEDULER package defines OBJECT types and TABLE types.

### OBJECT Types

- [JOBARG Object Type](#)
- [JOB\\_DEFINITION Object Type](#)
- [JOBATTR Object Type](#)
- [SCHEDULER\\$\\_STEP\\_TYPE Object Type](#)
- [SCHEDULER\\$\\_EVENT\\_INFO Object Type](#)
- [SCHEDULER\\_FILEWATCHER\\_RESULT Object Type](#)
- [SCHEDULER\\_FILEWATCHER\\_REQUEST Object Type](#)

### TABLE Types

- [JOBARG\\_ARRAY Table Type](#)
- [JOB\\_DEFINITION\\_ARRAY Table Type](#)
- [JOBATTR\\_ARRAY Table Type](#)
- [SCHEDULER\\$\\_STEP\\_TYPE\\_LIST Table Type](#)

### 143.5.1 DBMS\_SCHEDULER JOBARG Object Type

This type is used by the JOB and JOBATTR object types. It represents a job argument in a batch of job arguments.

#### Syntax

```
TYPE jobarg IS OBJECT (
  arg_position      NUMBER,
  arg_text_value    VARCHAR2(4000),
  arg_anydata_value ANYDATA,
  arg_operation     VARCHAR2(5));
```

#### Attributes

**Table 143-2** JOBARG Object Type Attributes

Attribute	Description
arg_position	Position of the argument
arg_text_value	Value of the argument if the type is VARCHAR2
arg_anydata_value	Value of the argument if the type is AnyData
arg_operation	Type of the operation: <ul style="list-style-type: none"> <li>• SET</li> <li>• RESET</li> </ul>

## JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

### Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (  
  arg_position      IN POSITIVEN,  
  arg_value         IN VARCHAR2)  
  RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (  
  arg_position      IN POSITIVEN,  
  arg_value         IN ANYDATA)  
  RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (  
  arg_position      IN POSITIVEN,  
  arg_reset         IN BOOLEAN DEFAULT FALSE)  
  RETURN SELF AS RESULT;
```

### Parameters

**Table 143-3 JOBARG Constructor Function Parameters**

Parameter	Description
arg_position	Position of the argument
arg_value	Value of the argument
arg_reset	If arg_reset is TRUE, then the argument at that position is reset. Setting arg_reset to FALSE (which is the default) will create an argument with a NULL value.

## JOBARG\_ARRAY Table Type

### Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

## 143.5.2 JOBARG\_ARRAY Table Type

The jobarg\_array type is a table of jobarg.

### Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

## 143.5.3 DBMS\_SCHEDULER JOB\_DEFINITION Object Type

This type is used by the `CREATE_JOBS` procedure and represents a job in a batch of jobs.

### Syntax

```

TYPE job_definition IS OBJECT (
  job_name          VARCHAR2(100),
  job_class         VARCHAR2(32),
  job_style         VARCHAR2(11),
  program_name     VARCHAR2(100),
  job_action        VARCHAR2(4000),
  job_type          VARCHAR2(20),
  schedule_name    VARCHAR2(65),
  repeat_interval  VARCHAR2(4000),
  schedule_limit   INTERVAL DAY TO SECOND,
  start_date       TIMESTAMP WITH TIME ZONE,
  end_date         TIMESTAMP WITH TIME ZONE,
  event_condition  VARCHAR2(4000),
  queue_spec       VARCHAR2(100),
  number_of_arguments NUMBER,
  arguments        SYS.JOBARG_ARRAY,
  job_priority     NUMBER,
  job_weight       NUMBER,
  max_run_duration INTERVAL DAY TO SECOND,
  max_runs         NUMBER,
  max_failures     NUMBER,
  logging_level    NUMBER,
  restartable      VARCHAR2(5),
  stop_on_window_close VARCHAR2(5),
  raise_events     NUMBER,
  comments         VARCHAR2(240),
  auto_drop        VARCHAR2(5),
  enabled          VARCHAR2(5),
  follow_default_timezone VARCHAR2(5),
  parallel_instances VARCHAR2(5),
  aq_job           VARCHAR2(5),
  instance_id      NUMBER,
  credential_name  VARCHAR2(65),
  destination      VARCHAR2(4000),
  database_role    VARCHAR2(20),
  allow_runs_in_restricted_mode VARCHAR2(5);
  restart_on_recovery BOOLEAN;
  restart_on_failure BOOLEAN;
)

```

### Object Attributes

[Table 143-4](#) provides brief descriptions of the attributes of the `JOB_DEFINITION` object type. For more complete information about these attributes, see the "[CREATE\\_JOB Procedure](#)" and the "[SET\\_ATTRIBUTE Procedure](#)".

**Table 143-4** JOB\_DEFINITION Object Types

Attribute	Description
<code>job_name</code>	Name of the job

**Table 143-4 (Cont.) JOB\_DEFINITION Object Types**

Attribute	Description
job_class	Name of the job class
job_style	Style of the job: <ul style="list-style-type: none"> <li>REGULAR</li> <li>LIGHTWEIGHT</li> <li>IN_MEMORY_RUNTIME</li> <li>IN_MEMORY_FULL</li> </ul>
program_name	Name of the program that the job runs
job_action	Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain.
job_type	Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT')
schedule_name	Name of the schedule that specifies when the job has to execute
repeat_interval	Inline time-based schedule
schedule_limit	Maximum delay time between scheduled and actual job start before a job run is canceled
start_date	Start date and time of the job
end_date	End date and time of the job
event_condition	Event condition for event-based jobs
queue_spec	File watcher name or queue specification for event-based jobs
number_of_arguments	Number of job arguments
arguments	Array of job arguments
job_priority	Job priority
job_weight	*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.
max_run_duration	Maximum run duration of the job
max_runs	Maximum number of runs before the job is marked as completed
max_failures	Maximum number of failures tolerated before the job is marked as broken
logging_level	Job logging level
restartable	Indicates whether the job is restartable (TRUE) or not (FALSE)
stop_on_window_close	Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the <a href="#">SET_ATTRIBUTE Procedure</a> .
raise_events	State changes that raise events
comments	Comments on the job

**Table 143-4 (Cont.) JOB\_DEFINITION Object Types**

Attribute	Description
auto_drop	If TRUE (the default), indicates that the job should be dropped once completed
enabled	Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)
follow_default_timezone	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.
parallel_instances	For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel. If FALSE, then an event is discarded if it is raised while the job that handles it is already running,
aq_job	For internal use only
instance_id	The instance ID of the instance that the job must run on For in-memory full jobs, the instance_id value determines in which instance to stop the job; if left NULL, the job is stopped in all instances.
credential_name	The credential to use for a single destination or the default credential for a group of destinations
destination	The name of a single external destination or database destination, or a group name of type external destination or database destination
database_role	In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs
allow_runs_in_restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode
restart_on_recovery	If set to TRUE for a job and the job is stopped by a database shutdown, then the job is restarted when the database is recovered. If set to FALSE, and the job is stopped by a database shutdown, then the job is marked as stopped when the database is recovered.
restart_on_failure	If set to TRUE for a job and the job fails due to an application error, then the job is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the job is marked FAILED. If set to FALSE (the default), a failed job is immediately marked FAILED.

**JOB\_DEFINITION Constructor Function**

This constructor function constructs a `job_definition` object.

**Syntax**

```

constructor function job_definition (
  job_name           IN      VARCHAR2,
  job_style          IN      VARCHAR2 DEFAULT 'REGULAR',
  program_name      IN      VARCHAR2 DEFAULT NULL,

RETURN SELF AS RESULT;

```

**JOB\_DEFINITION\_ARRAY Table Type****Syntax**

```
TYPE job_definition_array IS TABLE OF job_definition;
```

## 143.5.4 JOB\_DEFINITION\_ARRAY Table Type

The type `job_definition_array` is a table of `job_definition`.

**Syntax**

```
TYPE job_definition_array IS TABLE OF job_definition;
```

## 143.5.5 JOBATTR Object Type

This type is used by the `SET_JOB_ATTRIBUTES` procedure and represents a job attribute in a batch of job attributes.

### Syntax

```
TYPE jobattr IS OBJECT (
  job_name          VARCHAR2(100),
  attr_name         VARCHAR2(30),
  char_value        VARCHAR2(4000),
  char_value2       VARCHAR2(4000),
  args_value        JOBARG_ARRAY,
  num_value         NUMBER,
  timestamp_value   TIMESTAMP(6) WITH TIME ZONE,
  interval_value    INTERVAL DAY(2) TO SECOND(6));
```

### Attributes

**Table 143-5** JOBATTR Object Type Attributes

Attribute	Description
job_name	Name of the job
attr_name	Name of the attribute
char_value	Value of the argument if the type is VARCHAR2
char_value2	Second VARCHAR2 attribute value
args_value	Value of the argument if the type is a JOBARG array
num_value	Value of the argument if the type is NUMBER
timestamp_value	Value of the argument if the type is TIMESTAMP WITH TIME ZONE
interval_value	Value of the argument if the type is INTERVAL DAY TO SECOND

### JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

### Syntax

```
constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN VARCHAR2,
  attr_value2       IN VARCHAR2 DEFAULT NULL)
  RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN [NUMBER, BOOLEAN,
                       TIMESTAMP WITH TIME ZONE,
```

```

                                INTERVAL DAY TO SECOND, JOBARG_ARRAY))
RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2)
RETURN SELF AS RESULT;

```

## Parameters

**Table 143-6 JOBATTR Constructor Function Parameters**

Parameter	Description
job_name	Name of the job
attr_name	Name of the argument
attr_value	Value of the argument
attr_value2	Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.

## JOBATTR Table Type

### Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

## 143.5.6 JOBATTR\_ARRAY Table Type

The type jobattr\_array is a table of jobattr.

### Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

## 143.5.7 SCHEDULER\$\_STEP\_TYPE Object Type

This type is used by RUN\_CHAIN to return a list of chain steps with an initial state.

### Syntax

```
TYPE scheduler$_step_type IS OBJECT (
  step_name  VARCHAR2(32),
  step_type  VARCHAR2(32));
```

## Attributes

**Table 143-7 SCHEDULER\$\_STEP\_TYPE Object Type Attributes**

Attribute	Description
step_name	Name of the step
step_type	State of the step

## 143.5.8 SCHEDULER\$\_STEP\_TYPE\_LIST Table Type

This type is a table of scheduler\$\_step\_type.

### Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

## 143.5.9 SCHEDULER\$\_EVENT\_INFO Object Type

This is the datatype of the Scheduler event queue SYS.SCHEDULER\$\_EVENT\_QUEUE, from which your application consumes job state events raised by the Scheduler.

It is a secure queue owned by SYS.

### Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
  event_type          VARCHAR2(4000),
  object_owner       VARCHAR2(4000),
  object_name        VARCHAR2(4000),
  event_timestamp    TIMESTAMP WITH TIME ZONE,
  error_code         NUMBER,
  error_msg         VARCHAR2(4000),
  event_status      NUMBER,
  log_id            NUMBER,
  run_count         NUMBER,
  failure_count     NUMBER,
  retry_count       NUMBER,
  spare1            NUMBER,
  spare2            NUMBER,
  spare3            VARCHAR2(4000),
  spare4            VARCHAR2(4000),
  spare5            TIMESTAMP WITH TIME ZONE,
  spare6            TIMESTAMP WITH TIME ZONE,
  spare7            RAW(2000),
  spare8            RAW(2000));
```

### Attributes

**Table 143-8 SCHEDULER\_EVENT\_INFO Object Type Attributes**

Attribute	Description
event_type	One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR". For descriptions of these event types, see <a href="#">Table 143-84</a> .
object_owner	Owner of the job that raised the event
object_name	Name of the job that raised the event
event_timestamp	Time at which the event occurred
error_code	Applicable only when an error is thrown during job execution. Contains the top-level error code.

**Table 143-8 (Cont.) SCHEDULER\_EVENT\_INFO Object Type Attributes**

Attribute	Description
error_msg	Applicable only when an error is thrown during job execution. Contains the entire error stack.
event_status	Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry.  If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an abnormal termination of some kind.  If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE.
log_id	Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL.
run_count	Run count for the job when the event was raised.
failure_count	Failure count for the job when the event was raised.
retry_count	Retry count for the job when the event was raised.
spare1 – spare8	Not currently in use.

## 143.5.10 SCHEDULER\_FILEWATCHER\_RESULT Object Type

This is the datatype of a file arrival event message.

You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

### Syntax

```
TYPE scheduler_filewatcher_result IS OBJECT (
  destination          VARCHAR2(4000),
  directory_path       VARCHAR2(4000),
  actual_file_name     VARCHAR2(4000),
  file_size            NUMBER,
  file_timestamp       TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch    NUMBER,
  matching_requests   SYS.SCHEDULER_FILEWATCHER_REQ_LIST);
```

### Attributes

**Table 143-9 SCHEDULER\_FILEWATCHER\_RESULT Object Type Attributes**

Attribute	Description
destination	Destination at which the file was found, expressed as a host name or IP address.
directory_path	Absolute path of directory in which the file was found.

**Table 143-9 (Cont.) SCHEDULER\_FILEWATCHER\_RESULT Object Type Attributes**

Attribute	Description
actual_file_name	Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.
file_size	Size of the file that was found, in bytes.
file_timestamp	Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.
ts_ms_from_epoch	For internal use only.
matching_requests	List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See " <a href="#">SCHEDULER_FILEWATCHER_REQUEST Object Type</a> ".

### 143.5.11 SCHEDULER\_FILEWATCHER\_REQUEST Object Type

This type is returned in the `matching_requests` attribute of the SCHEDULER\_FILEWATCHER\_RESULT Object Type. Its attributes are similar to the attributes of a file watcher.

#### Syntax

```
TYPE scheduler_filewatcher_request IS OBJECT (
  owner          VARCHAR2(4000),
  name           VARCHAR2(4000),
  requested_path_name VARCHAR2(4000),
  requested_file_name VARCHAR2(4000),
  credential_owner VARCHAR2(4000),
  credential_name VARCHAR2(4000),
  min_file_size  NUMBER,
  steady_state_dur NUMBER);
```

#### Attributes

**Table 143-10 SCHEDULER\_FILEWATCHER\_REQUEST Object Type Attributes**

Attribute	Description
owner	Owner of the matched file watcher.
name	Name of the matched file watcher.
requested_path_name	Value of the <code>directory_path</code> attribute of the matched file watcher.
requested_file_name	Value of the <code>file_name</code> attribute of the matched file watcher.
credential_owner	Owner of the credential referenced by the matched file watcher.
credential_name	Name of the credential referenced by the matched file watcher.

**Table 143-10 (Cont.) SCHEDULER\_FILEWATCHER\_REQUEST Object Type Attributes**

Attribute	Description
min_file_size	Value of the min_file_size attribute of the matched file watcher.
steady_state_dur	Value of the steady_state_duration attribute of the matched file watcher.

**Related Topics**

- [SCHEDULER\\_FILEWATCHER\\_RESULT Object Type](#)  
This is the datatype of a file arrival event message.

## 143.6 Summary of DBMS\_SCHEDULER Subprograms

This table lists the DBMS\_SCHEDULER subprograms and briefly describes them.

**Table 143-11 DBMS\_SCHEDULER Package Subprograms**

Subprogram	Description
<a href="#">ADD_EVENT_QUEUE_SUBSCRIBER Procedure</a>	Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE
<a href="#">ADD_GROUP_MEMBER Procedure</a>	Adds one or more members to an existing group
<a href="#">ADD_JOB_EMAIL_NOTIFICATION Procedure</a>	Adds e-mail notifications for a job for a list of recipients and a list of job state events
<a href="#">ADD_TO_INCOMPATIBILITY Procedure</a>	Adds jobs or programs to an existing incompatibility definition
<a href="#">ALTER_CHAIN Procedure</a>	Alters specified steps of a chain
<a href="#">ALTER_RUNNING_CHAIN Procedure</a>	Alters specified steps of a running chain
<a href="#">CLOSE_WINDOW Procedure</a>	Closes an open window prematurely
<a href="#">COPY_JOB Procedure</a>	Copies an existing job
<a href="#">CREATE_CHAIN Procedure</a>	Creates a chain, which is a named series of programs that are linked together for a combined objective
<a href="#">CREATE_CREDENTIAL Procedure</a>	Creates a credential
<a href="#">CREATE_DATABASE_DESTINATION Procedure</a>	Creates a database destination for use with remote database jobs
<a href="#">CREATE_EVENT_SCHEDULE Procedure</a>	Creates an event schedule, which is a schedule that starts a job based on the detection of an event

Table 143-11 (Cont.) DBMS\_SCHEDULER Package Subprograms

Subprogram	Description
<a href="#">CREATE_FILE_WATCHER Procedure</a>	Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job
<a href="#">CREATE_GROUP Procedure</a>	Creates a group
<a href="#">CREATE_INCOMPATIBILITY Procedure</a>	Creates an incompatibility definition
<a href="#">CREATE_JOB Procedure</a>	Creates a single job
<a href="#">CREATE_JOB_CLASS Procedure</a>	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
<a href="#">CREATE_JOBS Procedure</a>	Creates multiple jobs
<a href="#">CREATE_PROGRAM Procedure</a>	Creates a program
<a href="#">CREATE_RESOURCE Procedure</a>	Specifies resources used by jobs or creates a new resource
<a href="#">CREATE_SCHEDULE Procedure</a>	Creates a schedule
<a href="#">CREATE_WINDOW Procedure</a>	Creates a window, which provides a way to automatically activate different resource plans at different times
<a href="#">DEFINE_ANYDATA_ARGUMENT Procedure</a>	Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object
<a href="#">DEFINE_CHAIN_EVENT_STEP Procedure</a>	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: <a href="#">DEFINE_CHAIN_STEP</a> .
<a href="#">DEFINE_CHAIN_RULE Procedure</a>	Adds a rule to an existing chain
<a href="#">DEFINE_CHAIN_STEP Procedure</a>	Defines a chain step, which can be a program or another (nested) chain. See also: <a href="#">DEFINE_CHAIN_EVENT_STEP</a> .
<a href="#">DEFINE_METADATA_ARGUMENT Procedure</a>	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument.
<a href="#">DEFINE_PROGRAM_ARGUMENT Procedure</a>	Defines a program argument whose value can be passed as a string literal to the program
<a href="#">DISABLE Procedure</a>	Disables a program, job, chain, window, database destination, external destination, file watcher, group, or incompatibility

**Table 143-11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

Subprogram	Description
<a href="#">DROP_AGENT_DESTINATION Procedure</a>	Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails.
<a href="#">DROP_CHAIN Procedure</a>	Drops an existing chain
<a href="#">DROP_CHAIN_RULE Procedure</a>	Removes a rule from an existing chain
<a href="#">DROP_CHAIN_STEP Procedure</a>	Drops a chain step
<a href="#">DROP_CREDENTIAL Procedure</a>	Drops a credential
<a href="#">DROP_DATABASE_DESTINATION Procedure</a>	Drops one or more database destinations
<a href="#">DROP_FILE_WATCHER Procedure</a>	Drops one or more file watchers
<a href="#">DROP_GROUP Procedure</a>	Drops one or more groups
<a href="#">DROP_INCOMPATIBILITY Procedure</a>	Drops an existing incompatibility definition
<a href="#">DROP_JOB Procedure</a>	Drops a job or all jobs in a job class
<a href="#">DROP_JOB_CLASS Procedure</a>	Drops a job class
<a href="#">DROP_PROGRAM Procedure</a>	Drops a program
<a href="#">DROP_PROGRAM_ARGUMENT Procedure</a>	Drops a program argument
<a href="#">DROP_SCHEDULE Procedure</a>	Drops a schedule
<a href="#">DROP_WINDOW Procedure</a>	Drops a window
<a href="#">ENABLE Procedure</a>	Enables a program, job, chain, window, database destination, external destination, file watcher, or group
<a href="#">END_DETACHED_JOB_RUN Procedure</a>	Ends a running detached job
<a href="#">EVALUATE_CALENDAR_STRING Procedure</a>	Evaluates the calendar string and tells you what the next execution date of a job or window will be
<a href="#">EVALUATE_RUNNING_CHAIN Procedure</a>	Forces reevaluation of the rules of a running chain to trigger any rules for conditions that have been satisfied
<a href="#">GENERATE_JOB_NAME Function</a>	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named sally1, sally2, and so on
<a href="#">GET_AGENT_INFO Function</a>	Returns job information specific to an agent, such as how many are running and so on, depending on the attribute selected

Table 143-11 (Cont.) DBMS\_SCHEDULER Package Subprograms

Subprogram	Description
<a href="#">GET_AGENT_VERSION Function</a>	Returns the version string of a Scheduler agent that is registered with the database and is currently running
<a href="#">GET_ATTRIBUTE Procedure</a>	Retrieves the value of an attribute of an object
<a href="#">GET_FILE Procedure</a>	Retrieves a file from a host
<a href="#">GET_SCHEDULER_ATTRIBUTE Procedure</a>	Retrieves the value of a Scheduler attribute
<a href="#">OPEN_WINDOW Procedure</a>	Opens a window prematurely. The window is opened immediately for the duration
<a href="#">PURGE_LOG Procedure</a>	Purges specific rows from the job and window logs
<a href="#">PUT_FILE Procedure</a>	Saves a file to one or more hosts
<a href="#">REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure</a>	Unsubscribes a user from the Scheduler event queue <code>SYS.SCHEDULER\$_EVENT_QUEUE</code>
<a href="#">REMOVE_FROM_INCOMPATIBILITY Procedure</a>	Removes jobs or programs from an incompatibility definition
<a href="#">REMOVE_GROUP_MEMBER Procedure</a>	Removes one or more members from a group
<a href="#">REMOVE_JOB_EMAIL_NOTIFICATION Procedure</a>	Removes e-mail notifications for a job
<a href="#">RESET_JOB_ARGUMENT_VALUE Procedure</a>	Resets the current value assigned to an argument defined with the associated program
<a href="#">RUN_CHAIN Procedure</a>	Immediately runs a chain by creating a run-once job
<a href="#">RUN_JOB Procedure</a>	Runs a job immediately
<a href="#">SET_AGENT_REGISTRATION_PASS Procedure</a>	Sets the agent registration password for a database
<a href="#">SET_ATTRIBUTE Procedure</a>	Changes an attribute of a job, schedule, or other Scheduler object
<a href="#">SET_ATTRIBUTE_NULL Procedure</a>	Changes an attribute of an object to <code>NULL</code>
<a href="#">SET_JOB_ANYDATA_VALUE Procedure</a>	Sets the value of a job argument encapsulated in an <code>AnyData</code> object
<a href="#">SET_JOB_ARGUMENT_VALUE Procedure</a>	Sets the value of a job argument
<a href="#">SET_JOB_ATTRIBUTES Procedure</a>	Sets the value of a job attribute
<a href="#">SET_RESOURCE_CONSTRAINT Procedure</a>	Specifies the resources used by jobs
<a href="#">SET_SCHEDULER_ATTRIBUTE Procedure</a>	Sets the value of a Scheduler attribute

**Table 143-11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

Subprogram	Description
<a href="#">STOP_JOB Procedure</a>	Stops a currently running job or all jobs in a job class

## 143.6.1 ADD\_EVENT\_QUEUE\_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER\$\_EVENT\_QUEUE, and grants the user permission to dequeue from this queue using the designated agent.

### Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 143-12 ADD\_EVENT\_QUEUE\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user.

### Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

## 143.6.2 ADD\_GROUP\_MEMBER Procedure

This procedure adds one or more members to an existing group.

### Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (
    group_name              IN VARCHAR2,
    member                  IN VARCHAR2);
```

### Parameters

**Table 143-13 ADD\_GROUP\_MEMBER Procedure Parameters**

Parameter	Description
group_name	The name of the group.

**Table 143-13 (Cont.) ADD\_GROUP\_MEMBER Procedure Parameters**

Parameter	Description
