| COLD_READS          | NUMBER      | Number of reads from the cold region on disk                                                                                                                                                                                                                                                                                                                                                                                    |
| COLD_WRITES         | NUMBER      | Number of writes to the cold region on disk                                                                                                                                                                                                                                                                                                                                                                                     |
| COLD_BYTES_READ     | NUMBER      | Number of bytes read from the cold region on disk                                                                                                                                                                                                                                                                                                                                                                               |
| COLD_BYTES_WRITTEN  | NUMBER      | Number of bytes written to the cold region on disk                                                                                                                                                                                                                                                                                                                                                                              |
| VOTING_FILE         | VARCHAR2(1) | Indicates whether the disk contains a voting file (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                |
| SECTOR_SIZE         | NUMBER      | Physical block size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                  |
| LOGICAL_SECTOR_SIZE | NUMBER      | Shows the logical sector size value of the disk in bytes. This is the smallest possible I/O that can be done by the disk.<br><br>If the value of the LOGICAL_SECTOR_SIZE column is 512, while the value in the SECTOR_SIZE column is 4096, then the disk supports 512 sector size emulation. This means the disk can be used for both 512 native and 4096 native disk groups.                                                   |
| FAILGROUP_TYPE      | VARCHAR2(7) | Type of the failure group: <ul style="list-style-type: none"> <li>• REGULAR</li> <li>• QUORUM</li> </ul>                                                                                                                                                                                                                                                                                                                        |

| Column                 | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                 | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0.                                                                                                                                                                                                |
| THIN_PROVISION_CAPABLE | VARCHAR2(1)  | Indicates whether the disk supports Storage Thin Provisioning (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DATA_INTEGRITY_CAPABLE | VARCHAR2(1)  | Indicates whether the disk supports the Data Integrity feature (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SITE_NAME              | VARCHAR2(30) | The name of the site to which the specific disk belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SITE_GUID              | VARCHAR2(33) | The GUID for the site to which the specific disk belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FAILGROUP_LABEL        | VARCHAR2(30) | This is the suggested name for the failure group to which the disk belongs, as returned by discovery                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SITE_LABEL             | VARCHAR2(30) | This is the suggested name for the site to which the disk belongs, as returned by discovery                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SITE_STATUS            | VARCHAR2(11) | The site status is computed after every Partnership and Status Table (PST) refresh or when the PST is read from disks into memory. The possible states include: <ul style="list-style-type: none"> <li>UNKNOWN: This is the state before any checks have been performed.</li> <li>UNAVAILABLE: This is the state when all the disks in the site are offline.</li> <li>COMPROMISED: The state when enough disks or PST copies are offline, such that the site can no longer provide data availability.</li> <li>AVAILABLE: The state when there is enough redundancy within the site to provide data availability in case another site becomes compromised or unavailable.</li> </ul> |

 **Note:**

The `GROUP_NUMBER` and `DISK_NUMBER` columns will only be valid if the disk is part of a disk group which is currently mounted by the instance. Otherwise, `GROUP_NUMBER` will be 0, and `DISK_NUMBER` will be a unique value with respect to the other disks that also have a group number of 0.

## 7.62 V\$ASM\_DISK\_IOSTAT

V\$ASM\_DISK\_IOSTAT displays information about disk I/O statistics for each Oracle Automatic Storage Management (Oracle ASM) client.

If this view is queried from the database instance, only the rows for that instance are shown.

| Column             | Datatype     | Description                                                                                                                                     |
|--------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTNAME           | VARCHAR2(64) | Identifier for the DB/ADVM instance client                                                                                                      |
| DBNAME             | VARCHAR2(8)  | Unique database name (DB_UNIQUE_NAME)                                                                                                           |
| CLUSTERNAME        | VARCHAR2(31) | Name of the cluster                                                                                                                             |
| GROUP_NUMBER       | NUMBER       | Number of the disk group containing the disk                                                                                                    |
| DISK_NUMBER        | NUMBER       | Number assigned to the disk within its disk group                                                                                               |
| FAILGROUP          | VARCHAR2(30) | Name of the failure group to which the disk belongs                                                                                             |
| SITE_NAME          | VARCHAR2(30) | This is the name of the site to which the disk belongs                                                                                          |
| READS              | NUMBER       | Total number of I/O read requests for the disk                                                                                                  |
| WRITES             | NUMBER       | Total number of I/O write requests for the disk                                                                                                 |
| READ_ERRS          | NUMBER       | Total number of failed I/O read requests for the disk                                                                                           |
| WRITE_ERRS         | NUMBER       | Total number of failed I/O write requests for the disk                                                                                          |
| READ_TIMEOUT       | NUMBER       | Number of read I/Os that are timed out                                                                                                          |
| WRITE_TIMEOUT      | NUMBER       | Number of write I/Os that are timed out                                                                                                         |
| READ_TIME          | NUMBER       | Total I/O time (in seconds) for read requests for the disk if the TIMED_STATISTICS initialization parameter is set to TRUE (0 if set to FALSE). |
| WRITE_TIME         | NUMBER       | Total I/O time (in seconds) for write requests for the disk if the TIMED_STATISTICS initialization parameter is set to TRUE (0 if set to FALSE) |
| BYTES_READ         | NUMBER       | Total number of bytes read from the disk                                                                                                        |
| BYTES_WRITTEN      | NUMBER       | Total number of bytes written from the disk                                                                                                     |
| HOT_READS          | NUMBER       | Number of reads from the hot region on disk                                                                                                     |
| HOT_WRITES         | NUMBER       | Number of writes to the hot region on disk                                                                                                      |
| HOT_BYTES_READ     | NUMBER       | Number of bytes read from the hot region on disk                                                                                                |
| HOT_BYTES_WRITTEN  | NUMBER       | Number of bytes written to the hot region on disk                                                                                               |
| COLD_READS         | NUMBER       | Number of reads from the cold region on disk                                                                                                    |
| COLD_WRITES        | NUMBER       | Number of writes to the cold region on disk                                                                                                     |
| COLD_BYTES_READ    | NUMBER       | Number of bytes read from the cold region on disk                                                                                               |
| COLD_BYTES_WRITTEN | NUMBER       | Number of bytes written to the cold region on disk                                                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> <p>For this view, the value is always 0.</p> |

## 7.63 V\$ASM\_DISK\_STAT

V\$ASM\_DISK\_STAT displays performance statistics in the same way that V\$ASM\_DISK does, but without performing discovery of new disks

This results in a less expensive operation. However, since discovery is not performed, the output of this view does not include any data about disks that are new to the system.

The columns for V\$ASM\_DISK\_STAT are the same as those for V\$ASM\_DISK.

## 7.64 V\$ASM\_DISKGROUP

V\$ASM\_DISKGROUP displays one row for every Oracle Automatic Storage Management (Oracle ASM) disk group discovered by the Oracle ASM instance on the node.

| Column       | Datatype     | Description                                                  |
|--------------|--------------|--------------------------------------------------------------|
| GROUP_NUMBER | NUMBER       | Cluster-wide number assigned to the disk group (primary key) |
| NAME         | VARCHAR2(30) | Name of the disk group                                       |
| SECTOR_SIZE  | NUMBER       | Physical block size (in bytes)                               |

| Column                  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOGICAL_SECTOR_SIZE     | NUMBER       | <p>This column represents the logical sector size value of the disk group in bytes. This is the smallest possible I/O that can be done in this disk group. Any I/O smaller than the logical sector size will cause an assert in the code.</p> <p>If the value of the LOGICAL_SECTOR_SIZE column is 512, while the value in the SECTOR_SIZE column is 4096, then the disk group supports 512 sector size emulation. This means that I/O operations can be both 512 or 4096 aligned. For example, this means that you can have redo log files with a file block size of 512 bytes in this disk group that can be both read and written to, as well as create new redo log files with a file block size of 4096 bytes.</p>                                                                                                       |
| BLOCK_SIZE              | NUMBER       | Oracle ASM metadata block size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ALLOCATION_UNIT_SIZE    | NUMBER       | Size of the allocation unit (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| STATE                   | VARCHAR2(11) | <p>State of the disk group relative to the instance:</p> <ul style="list-style-type: none"> <li>CONNECTED - Disk group is in use by the database instance</li> <li>BROKEN - Database instance lost connectivity to the Oracle ASM instance that mounted the disk group</li> <li>UNKNOWN - Oracle ASM instance has never attempted to mount the disk group</li> <li>DISMOUNTED - Disk group was cleanly dismounted by the Oracle ASM instance following a successful mount</li> <li>MOUNTED - Instance is successfully serving the disk group to its database clients</li> <li>QUIESCING - CRCTL utility attempted to dismount a disk group that contains the Oracle Cluster Registry (OCR). The disk group cannot be dismounted until Cluster Ready Services (CRS) exits, because the disk group contains the OCR.</li> </ul> |

| REQUIRED_MIRROR_FREE_MB | NUMBER       | Amount of space that is required to be available in a given disk group in order to restore redundancy after one or more disk failures. The amount of space displayed in this column takes mirroring effects into account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| USABLE_FILE_MB          | NUMBER       | Amount of free space that can be safely utilized taking mirroring into account and yet be able to restore redundancy after a disk failure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OFFLINE_DISKS           | NUMBER       | Number of disks in the disk group that are currently offline                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| COMPATIBILITY           | VARCHAR2(60) | Minimum software version required for an Oracle ASM instance to mount this disk group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DATABASE_COMPATIBILITY  | VARCHAR2(60) | Minimum software version required for a database instance to use files in this disk group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column       | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VOTING_FILES | VARCHAR2(1) | Indicates whether the disk contains voting files (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID       | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

 **Note:**

The GROUP\_NUMBER, TOTAL\_MB, and FREE\_MB columns are only meaningful if the disk group is mounted by the instance. Otherwise, their values will be 0.

 **See Also:**

## 7.65 V\$ASM\_DISKGROUP\_STAT

V\$ASM\_DISKGROUP\_STAT displays performance statistics in the same way that V\$ASM\_DISKGROUP does, but without performing discovery of new disk groups.

This results in a less expensive operation. However, since discovery is not performed, the output of this view does not include any data about disk groups that are new to the system.

The columns for V\$ASM\_DISKGROUP\_STAT are the same as those for V\$ASM\_DISKGROUP.

 **See Also:**

"V\$ASM\_DISKGROUP"

## 7.66 V\$ASM\_ESTIMATE

V\$ASM\_ESTIMATE displays an estimate of the work involved in execution plans for Oracle Automatic Storage Management (Oracle ASM) disk group rebalance and resync operations.

| Column       | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER | NUMBER          | Oracle ASM disk group number                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATEMENT_ID | VARCHAR2 ( 30 ) | Value of the optional STATEMENT_ID parameter specified in the EXPLAIN WORK statement                                                                                                                                                                                                                                                                                                                                                                                                  |
| TIMESTAMP    | DATE            | Date and time when the EXPLAIN WORK statement was issued                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 7.67 V\$ASM\_FILE

In an Oracle Automatic Storage Management (Oracle ASM) instance, `V$ASM_FILE` displays one row for each file in each disk group mounted by the Oracle ASM instance.

For example, if there are three disk groups and five files in each, fifteen rows are displayed (unless the query is qualified with a `WHERE` clause).

| Column         | Datatype | Description                                                                                                                                              |
|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER   | Number of the disk group containing the file (composite primary key)                                                                                     |
| FILE_NUMBER    | NUMBER   | Number of the file within the disk group (composite primary key)                                                                                         |
| COMPOUND_INDEX | NUMBER   | A 32-bit number consisting of a disk group number in the high-order 8 bits and a file number in the low-order 24 bits (for efficient access to the view) |
| INCARNATION    | NUMBER   | Incarnation number for the file (composite primary key)                                                                                                  |
| BLOCK_SIZE     | NUMBER   | Block size of the file (in bytes)                                                                                                                        |
| BLOCKS         | NUMBER   | Number of blocks in the file                                                                                                                             |
| BYTES          | NUMBER   | Number of bytes in the file                                                                                                                              |
| SPACE          | NUMBER   | Number of bytes allocated to the file                                                                                                                    |

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE                  | VARCHAR2(64) | Type of the file. Possible values are as follows: <ul style="list-style-type: none"> <li>ARCHIVELOG</li> <li>AUTOBACKUP</li> <li>BACKUPSET</li> <li>CHANGETRACKING</li> <li>CONTROLFILE</li> <li>DATAFILE</li> <li>DATAGUARDCONFIG</li> <li>DUMPSET</li> <li>FLASHBACK</li> <li>ONLINELOG</li> <li>PARAMETERFILE</li> <li>TEMPFILE</li> <li>XTRANSPORT</li> </ul>                                                                                                          |
| REDUNDANCY            | VARCHAR2(6)  | Redundancy of the file: <ul style="list-style-type: none"> <li>HIGH</li> <li>MIRROR</li> <li>PARITY</li> <li>UNPROT</li> </ul>                                                                                                                                                                                                                                                                                                                                             |
| STRIPED               | VARCHAR2(6)  | Indicates how the file is striped: <ul style="list-style-type: none"> <li>FINE</li> <li>COARSE</li> </ul>                                                                                                                                                                                                                                                                                                                                                                  |
| CREATION_DATE         | DATE         | Date on which the file was created                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MODIFICATION_DATE     | DATE         | Date of the last open/close for writing, rounded back to the nearest hour                                                                                                                                                                                                                                                                                                                                                                                                  |
| REDUNDANCY_LOWERED    | VARCHAR2(1)  | Indicates whether a file has lower redundancy than what was expected (Y) or not (N). Redundancy is said to have been lowered for a file when one or more data extents in that file are not mirrored at the level specified by the administrator. In case of unprotected files, data extents could be missing altogether. Another possible value for this column is (U), which means that it is unknown.<br>This column is deprecated, and it always displays a value of U. |
| PERMISSIONS           | VARCHAR2(16) | Access permissions of the file, in order of user, group, and other                                                                                                                                                                                                                                                                                                                                                                                                         |
| USER_NUMBER           | NUMBER       | User number                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| USER_INCARNATION      | NUMBER       | Incarnation number of the user                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| USERGROUP_NUMBER      | NUMBER       | User group number                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| USERGROUP_INCARNATION | NUMBER       | Incarnation number of the user group                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| HOT_BYTES_WRITTEN     | NUMBER      | Number of bytes written to the hot region for the file                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| COLD_READS            | NUMBER      | Number of reads from the cold region for the file                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| COLD_WRITES           | NUMBER      | Number of writes to the cold region for the file                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| COLD_BYTES_READ       | NUMBER      | Number of bytes read from the cold region for the file                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| COLD_BYTES_WRITTEN    | NUMBER      | Number of bytes written to the cold region for the file                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| FILEGROUP_NUMBER      | NUMBER      | Shows the number of the associated file group                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FILEGROUP_INCARNATION | NUMBER      | The incarnation number for the file group the file belongs to in a flex redundancy disk group                                                                                                                                                                                                                                                                                                                                                                                               |
| REMIRROR              | VARCHAR2(1) | This column has the value <b>Y</b> when rebalance is needed for the file after a redundancy change in a flex redundancy disk group, <b>N</b> otherwise. A redundancy change can occur when the file is moved to a file group with a different redundancy, or when the redundancy property of the file group is changed. After rebalance is run for the file, the value changes to <b>N</b> .                                                                                                |
| PARENT_FILNUM         | NUMBER      | For internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PARENT_FILNUMINC      | NUMBER      | For internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID                | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

## 7.68 V\$ASM\_FILEGROUP

V\$ASM\_FILEGROUP describes the properties of the Oracle Automatic Storage Management (Oracle ASM) File Groups.

In both Oracle ASM and Oracle Database instances, V\$ASM\_FILEGROUP displays one row for every File Group present in every Disk Group mounted by the Oracle ASM instance. File Groups are only displayed for Disk Groups where COMPATIBLE.ASM is set to 12.2 or higher.

**Note:**

There will not be an entry for the default File Group.

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER           | NUMBER        | Number of the Disk Group in which this File Group exists (composite primary key)                                                                                                                                                                                                                                                                                                                                                                      |
| FILEGROUP_NUMBER       | NUMBER        | Number associated to the File Group within its Disk Group (composite primary key)                                                                                                                                                                                                                                                                                                                                                                     |
| INCARNATION            | NUMBER        | Incarnation number for the File Group (composite primary key)                                                                                                                                                                                                                                                                                                                                                                                         |
| COMPOUND_INDEX         | NUMBER        | A 32-bit number consisting of a Disk Group number in the high-order 8 bits and a File Group number in the low-order 24 bits (for efficient access to the view)                                                                                                                                                                                                                                                                                        |
| NAME                   | VARCHAR2(128) | Name of the File Group                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CLIENT_TYPE            | NUMBER        | Type of client that the File Group is associated to: <ul style="list-style-type: none"> <li>• DATABASE</li> <li>• CLUSTER</li> <li>• VOLUME</li> </ul>                                                                                                                                                                                                                                                                                                |
| CLIENT_NAME            | VARCHAR2(128) | Name of the client (database, PDB, CDB, cluster, or volume) that the File Group is associated to                                                                                                                                                                                                                                                                                                                                                      |
| GUID                   | VARCHAR2(32)  | If the CLIENT_TYPE is DATABASE: <ul style="list-style-type: none"> <li>• In a CDB environment, it is the GUID of the PDB or CDB associated with the file group, the same value as the GUID in V\$CONTAINERS.</li> <li>• In a non-CDB environment it is the database identifier (DBID) of the database associated with that file group.</li> </ul> If the CLIENT_TYPE is VOLUME or CLUSTER, the GUID column is empty.                                  |
| QUOTAGROUP_NUMBER      | NUMBER        | Number of the quota group associated with this File Group (foreign key to the V\$ASM_QUOTAGROUP view)                                                                                                                                                                                                                                                                                                                                                 |
| QUOTAGROUP_INCARNATION | NUMBER        | Incarnation number for the Quota Group                                                                                                                                                                                                                                                                                                                                                                                                                |
| USED_QUOTA_MB          | NUMBER        | Used quota of the quota group in GB                                                                                                                                                                                                                                                                                                                                                                                                                   |
| USER_NUMBER            | NUMBER        | User number                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| USER_INCARNATION       | NUMBER        | Incarnation number of the user                                                                                                                                                                                                                                                                                                                                                                                                                        |
| USERGROUP_NUMBER       | NUMBER        | User group number                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| USERGROUP_INCARNATION  | NUMBER        | Incarnation number of the user group                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.69 V\$ASM\_FILEGROUP\_FILE

V\$ASM\_FILEGROUP\_FILE lists all the Oracle Automatic Storage Management (Oracle ASM) files associated with each File Group.

In both Oracle ASM and Oracle Database instances, V\$ASM\_FILEGROUP\_FILE will display one row for every file associated with a File Group contained in every Disk Group mounted by the instance.

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER     | NUMBER   | Number of the Disk Group in which this File Group exists                                                                                                                                                                                                                                                                                                                                                                                        |
| FILEGROUP_NUMBER | NUMBER   | Number associated to the File Group within its Disk Group                                                                                                                                                                                                                                                                                                                                                                                       |
| FILEGROUP_INCARN | NUMBER   | Incarnation number for the File Group                                                                                                                                                                                                                                                                                                                                                                                                           |
| FILE_NUMBER      | NUMBER   | Number associated to the ASM File (same file number as in V\$ASM_FILE)                                                                                                                                                                                                                                                                                                                                                                          |
| INCARNATION      | NUMBER   | Incarnation number for the ASM File                                                                                                                                                                                                                                                                                                                                                                                                             |
| COMPOUND_INDEX   | NUMBER   | A 32-bit number consisting of a Disk Group number in the high-order 8 bits and a File number in the low-order 24 bits (for efficient access to the view)                                                                                                                                                                                                                                                                                        |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.70 V\$ASM\_FILEGROUP\_PROPERTY

V\$ASM\_FILEGROUP\_PROPERTY describes all the properties of every Oracle Automatic Storage Management (Oracle ASM) File Group.

In both Oracle ASM and Oracle Database instances, V\$ASM\_FILEGROUP\_PROPERTY will display one row for every property of every file type of every File Group contained in every Disk Group mounted by the instance.

File Group properties are only displayed for File Groups on Disk Groups where COMPATIBLE.ASM is set to 12.2 or higher.

**Note:**

There will not be an entry for the default File Group.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| CORRUPT                          | VARCHAR2(5)  | Indicates whether the file system needs the fixer (fsck, acfschkdsk) to be run (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                    |
| NUM_VOL                          | NUMBER       | Number of volumes in the file system                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TOTAL_SIZE                       | NUMBER       | Total capacity of the file system (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TOTAL_FREE                       | NUMBER       | Total free space in the file system (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TOTAL_SNAP_SPACE_USAGE           | NUMBER       | Total space used by snapshots (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                                            |
| REPLSTATE                        | VARCHAR2(7)  | Replication status: <ul style="list-style-type: none"> <li>NO REPL - Replication is not initialized</li> <li>PRIMARY - File system is initialized for replication as a primary</li> <li>STANDBY - File system is initialized for replication as a standby</li> </ul>                                                                                                                                                                                                    |
| RESIZE_STATE <sup>1</sup>        | VARCHAR2(5)  | Possible resize states: <ul style="list-style-type: none"> <li>NONE - AutoResize not configured</li> <li>AUTO - Equivalent to AutoResizeEnabled flag</li> <li>ERROR - Equivalent to AutoResizeError flag</li> </ul>                                                                                                                                                                                                                                                     |
| COMPRESS_STATE <sup>1</sup>      | VARCHAR2(7)  | Compression status of the file system. Possible values: <ul style="list-style-type: none"> <li>DISABLED - Compression is not active</li> <li>ENABLED - Compression is active</li> <li>PARTIAL - Compression is disabled, but the file system may contain compressed files</li> </ul>                                                                                                                                                                                    |
| FROZEN_STATE <sup>1</sup>        | VARCHAR2(5)  | Indicates whether the filesystem is frozen (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                        |
| ACFS_COMPATIBILITY <sup>1</sup>  | VARCHAR2(60) | Oracle Release streams where ACFS has shipped. Possible values: <ul style="list-style-type: none"> <li>11.2.0.0.0</li> <li>11.2.0.2.0</li> <li>11.2.0.3.0</li> <li>11.2.0.4.0</li> <li>12.1.0.0.0</li> <li>12.1.0.2.0</li> <li>12.2.0.0.0</li> <li>18.0.0.0.0</li> </ul>                                                                                                                                                                                                |
| METADATA_BLOCK_SIZE <sup>1</sup> | NUMBER       | Metadata block size of the file system. Possible values: <ul style="list-style-type: none"> <li>512</li> <li>4096</li> </ul>                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

<sup>1</sup> This column is available starting with Oracle Database release 19c, version 19.1.

## 7.72 V\$ASM\_OPERATION

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_OPERATION displays one row for every active Oracle ASM long running operation executing in the Oracle ASM instance.

| Column       | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER | NUMBER      | Disk group number (primary key). This is the foreign key to the V\$ASM_DISKGROUP view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OPERATION    | CHAR(5)     | Type of the operation: <ul style="list-style-type: none"> <li>REBAL - Rebalance pending for this group. The disk group is rebalancing.</li> <li>REMIRROR - Remirror is pending for this group.</li> <li>SCRUB - Scrubbing is pending for this group.</li> </ul> Starting with Oracle Database 12c, new queries should use the PASS column instead of this column.                                                                                                                                                                                                                                                                             |
| PASS         | VARCHAR2(9) | Type of the operation: <ul style="list-style-type: none"> <li>REBALANCE - Rebalance pending for this group. The disk group is rebalancing.</li> <li>RESYNC - Resync operation in progress to bring one or more Oracle ASM disks online</li> <li>COMPACT - Oracle ASM is moving user data closer together, which improves performance by reducing seek distance</li> <li>RESILVER - This value appears in Oracle Exadata environments when WriteBack FlashCache is enabled</li> <li>SCRUBBING - The disk group is scrubbing.</li> </ul> Starting with Oracle Database 12c, new queries should use this column instead of the OPERATION column. |
| STATE        | VARCHAR2(4) | State of the operation: <ul style="list-style-type: none"> <li>WAIT - No operations running for the group</li> <li>EST - An estimate is computed on the amount of work to be done for the rebalance</li> <li>RUN - Operation running for the group</li> <li>REAP - Operation is being run down</li> <li>DONE - Displayed for a pass that is complete</li> <li>ERRS - Operation halted by errors</li> </ul> Estimates are computed in parallel in the background while the work is being executed. Thus, the transition from the EST to the RUN state may be extremely fast.                                                                   |
| POWER        | NUMBER      | Power requested for the operation as specified by the ASM_POWER_LIMIT initialization parameter or command syntax. Or, power requested for the operation as specified by the power option of the scrubbing SQL syntax.                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column      | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTUAL      | NUMBER          | Power allocated to the operation                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SO FAR      | NUMBER          | Number of Allocation Units that are being moved per minute by the operation. Or, the number of Allocation Units that have been scrubbed so far.                                                                                                                                                                                                                                                                                                                                       |
| EST_WORK    | NUMBER          | Estimated number of Allocation Units that have to be moved by the operation. Or, the estimated number of Allocation Units that have to be scrubbed by the scrubbing operation.                                                                                                                                                                                                                                                                                                        |
| EST_RATE    | NUMBER          | Estimated number of Allocation Units that are being moved per minute by the operation                                                                                                                                                                                                                                                                                                                                                                                                 |
| EST_MINUTES | NUMBER          | Estimated amount of time (in minutes) that the remainder of the operation is expected to take                                                                                                                                                                                                                                                                                                                                                                                         |
| ERROR_CODE  | VARCHAR2 ( 44 ) | Oracle external error code; NULL if no error                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID      | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

## 7.73 V\$ASM\_QUOTAGROUP

V\$ASM\_QUOTAGROUP displays one row for every Oracle Automatic Storage Management (Oracle ASM) quota group discovered by the Oracle ASM instance on the node.

| Column            | Datatype        | Description                                                                 |
|-------------------|-----------------|-----------------------------------------------------------------------------|
| GROUP_NUMBER      | NUMBER          | Number of the disk group containing the quota group (composite primary key) |
| QUOTAGROUP_NUMBER | NUMBER          | Number of the quota group within the disk group (composite primary key)     |
| INCARNATION       | NUMBER          | Incarnation of the quota group (composite primary key)                      |
| NAME              | VARCHAR2 ( 30 ) | Name of the quota group                                                     |
| USED_QUOTA_MB     | NUMBER          | Used quota of the quota group in GB                                         |
| QUOTA_LIMIT_MB    | NUMBER          | Quota limit (capacity) of the quota group in GB                             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.74 V\$ASM\_TEMPLATE

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_TEMPLATE displays one row for every template present in every disk group mounted by the Oracle ASM instance.

In a database instance, V\$ASM\_TEMPLATE displays one row for every template present in every disk group mounted by the Oracle ASM instance with which the database instance communicates.

| Column         | Datatype     | Description                                                                                                                        |
|----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER       | Owning disk group number (foreign key to the V\$ASM_DISKGROUP view)                                                                |
| ENTRY_NUMBER   | NUMBER       | Template number (primary key)                                                                                                      |
| REDUNDANCY     | VARCHAR2(6)  | Redundancy of the template: <ul style="list-style-type: none"> <li>HIGH</li> <li>MIRROR</li> <li>PARITY</li> <li>UNPROT</li> </ul> |
| STRIPE         | VARCHAR2(6)  | Indicates how the template is striped: <ul style="list-style-type: none"> <li>FINE</li> <li>COARSE</li> </ul>                      |
| SYSTEM         | VARCHAR2(1)  | Indicates whether the template is a system template (Y) or not (N)                                                                 |
| NAME           | VARCHAR2(30) | Name of the template                                                                                                               |
| PRIMARY_REGION | VARCHAR2(4)  | Region used for allocating primary extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                    |
| MIRROR_REGION  | VARCHAR2(4)  | Region for allocating mirrored extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                        |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

## 7.75 V\$ASM\_USER

V\$ASM\_USER displays the effective operating system user names of connected database instances and of file owners.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER        | Oracle ASM disk group number                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| USER_NUMBER    | NUMBER        | Oracle ASM internal unique user number                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| COMPOUND_INDEX | NUMBER        | A 32-bit number consisting of a disk group number in the high-order 8 bits and a user number in the low-order 24 bits (for efficient access to the view)                                                                                                                                                                                                                                                                                                                              |
| INCARNATION    | NUMBER        | Incarnation number of the user                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CLUSTER_ID     | VARCHAR2(128) | Oracle ASM cluster ID. The CLUSTER_ID and OS_NAME pair can be used to uniquely identify a user.                                                                                                                                                                                                                                                                                                                                                                                       |
| OS_ID          | VARCHAR2(128) | Operating system user ID                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OS_NAME        | VARCHAR2(33)  | Operating system user name                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID         | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

## 7.77 V\$ASM\_USERGROUP\_MEMBER

V\$ASM\_USERGROUP\_MEMBER displays the members for each Oracle Automatic Storage Management (Oracle ASM) File Access Control group.

| Column        | Datatype | Description                     |
|---------------|----------|---------------------------------|
| GROUP_NUMBER  | NUMBER   | Oracle ASM disk group number    |
| MEMBER_NUMBER | NUMBER   | Number of the user group member |

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEMBER_INCARNATION    | NUMBER   | Incarnation number of the user group member                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| USERGROUP_NUMBER      | NUMBER   | User group number                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| USERGROUP_INCARNATION | NUMBER   | Incarnation number of the user group                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

## 7.78 V\$ASM\_VOLUME

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_VOLUME displays information about each Oracle ADVM volume.

| Column         | Datatype     | Description                                                                                                                                                |
|----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER       | Cluster-wide number assigned to the disk group (composite primary key)                                                                                     |
| VOLUME_NAME    | VARCHAR2(30) | Name of the volume                                                                                                                                         |
| COMPOUND_INDEX | NUMBER       | A 32-bit number consisting of a disk group number in the high-order 8 bits and a volume number in the low-order 24 bits (for efficient access to the view) |
| SIZE_MB        | NUMBER       | Size of the volume (in megabytes)                                                                                                                          |
| VOLUME_NUMBER  | NUMBER       | Number of the Volume within the disk group (composite primary key)                                                                                         |
| REDUNDANCY     | VARCHAR2(6)  | Redundancy type for the volume: <ul style="list-style-type: none"> <li>UNPROT</li> <li>HIGH</li> <li>MIRROR</li> </ul>                                     |
| STRIPE_COLUMNS | NUMBER       | Number of columns in a stripe set                                                                                                                          |
| STRIPE_WIDTH_K | NUMBER       | Stripe width of the volume (in kilobytes)                                                                                                                  |
| STATE          | VARCHAR2(8)  | Indicates whether the volume is enabled (ENABLED), disabled (DISABLED), or remote (REMOTE)                                                                 |
| FILE_NUMBER    | NUMBER       | Volume file number                                                                                                                                         |
| INCARNATION    | NUMBER       | Volume file incarnation number                                                                                                                             |

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DRL_FILE_NUMBER | NUMBER         | Volume Dirty Region Logging (DRL) file used for mirrored volumes                                                                                                                                                                                                                                                                                                                                                                                                                      |
| RESIZE_UNIT_MB  | NUMBER         | Volume allocation unit (in megabytes) that a volume can be created                                                                                                                                                                                                                                                                                                                                                                                                                    |
| USAGE           | VARCHAR2(30)   | Optional usage string for the volume                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VOLUME_DEVICE   | VARCHAR2(256)  | OSD path for the volume device                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MOUNTPATH       | VARCHAR2(1024) | Optional mount path string for the volume                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PRIMARY_REGION  | VARCHAR2(4)    | Region used for allocating primary extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| MIRROR_REGION   | VARCHAR2(4)    | Region used for allocating mirrored extents: <ul style="list-style-type: none"> <li>HOT</li> <li>COLD</li> </ul>                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID          | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

## 7.79 V\$ASM\_VOLUME\_STAT

In an Oracle Automatic Storage Management (Oracle ASM) instance, V\$ASM\_VOLUME\_STAT displays information about statistics for each Oracle ADVM volume.

| Column         | Datatype     | Description                                                                                                                                                |
|----------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP_NUMBER   | NUMBER       | Cluster-wide number assigned to the disk group (composite primary key)                                                                                     |
| VOLUME_NAME    | VARCHAR2(30) | Name of the volume                                                                                                                                         |
| COMPOUND_INDEX | NUMBER       | A 32-bit number consisting of a disk group number in the high-order 8 bits and a volume number in the low-order 24 bits (for efficient access to the view) |
| VOLUME_NUMBER  | NUMBER       | Number of the Volume within the disk group (composite primary key)                                                                                         |
| READS          | NUMBER       | Total number of read requests for this volume                                                                                                              |
| WRITES         | NUMBER       | Total number of write requests for this volume                                                                                                             |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| READ_ERRS     | NUMBER   | Total number of failed read I/O operations for this volume                                                                                                                                                                                                                                                                                                                                                                                                                            |
| WRITE_ERRS    | NUMBER   | Total number of failed write I/O operations for this volume                                                                                                                                                                                                                                                                                                                                                                                                                           |
| READ_TIME     | NUMBER   | Total I/O time (in seconds) for read requests for this volume                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRITE_TIME    | NUMBER   | Total I/O time (in seconds) for write requests for this volume                                                                                                                                                                                                                                                                                                                                                                                                                        |
| BYTES_READ    | NUMBER   | Total number of bytes read for this volume                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| BYTES_WRITTEN | NUMBER   | Total number of bytes written for this volume                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> For this view, the value is always 0. |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.81 V\$AW\_ALLOCATE\_OP

V\$AW\_ALLOCATE\_OP displays the allocation operators available in analytic workspaces. You can use this view in an application to provide a list of choices.

| Column   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME     | VARCHAR2(14) | Keyword for the allocation operator                                                                                                                                                                                                                                                                                                                                                                                                             |
| LONGNAME | VARCHAR2(30) | Descriptive name for the operator                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID   | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.82 V\$AW\_CALC

V\$AW\_CALC reports on the effectiveness of various caches used by Oracle OLAP during dynamic aggregation.

| Column                 | Datatype     | Description                                                                                                                                                                                 |
|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID             | NUMBER       | A unique numeric identifier for the session.                                                                                                                                                |
| AGGREGATE_CACHE_HITS   | NUMBER       | The number of times a dimension member is found in the aggregate cache (a hit).<br>The number of hits for run-time aggregation can be increased by fetching data across the dense dimension |
| AGGREGATE_CACHE_MISSES | NUMBER       | The number of times a dimension member is not found in the aggregate cache and must be read from disk (a miss).                                                                             |
| SESSION_CACHE_HITS     | NUMBER       | The number of times the data is found in the session cache (a hit).                                                                                                                         |
| SESSION_CACHE_MISSES   | NUMBER       | The number of times the data is not found in the session cache (a miss).                                                                                                                    |
| POOL_HITS              | NUMBER       | The number of times the data is found in a page in the OLAP page pool (a hit).                                                                                                              |
| POOL_MISSES            | NUMBER       | The number of times the data is not found in the OLAP page pool (a miss).                                                                                                                   |
| POOL_NEW_PAGES         | NUMBER       | The number of newly created pages in the OLAP page pool that have not yet been written to the workspace LOB.                                                                                |
| POOL_RECLAIMED_PAGES   | NUMBER       | The number of previously unused pages that have been recycled with new data.                                                                                                                |
| CACHE_WRITES           | NUMBER       | The number of times the data from the OLAP page pool has been written to the database cache.                                                                                                |
| POOL_SIZE              | NUMBER       | The number of kilobytes in the OLAP page pool.                                                                                                                                              |
| CURR_DML_COMMAND       | VARCHAR2(64) | The command currently being executed.                                                                                                                                                       |
| PREV_DML_COMMAND       | VARCHAR2(64) | The command most recently completed.                                                                                                                                                        |
| AGGR_FUNC_LOGICAL_NA   | NUMBER       | The number of times the aggregation engine returns a logical NA because the AGGINDEX option is on and the composite tuple does not exist.                                                   |
| AGGR_FUNC_PRECOMPUTE   | NUMBER       | The number of times the aggregation engine finds a value in a position that it was called to calculate.                                                                                     |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AGGR_FUNC_CALCS | NUMBER   | The number of times the aggregation engine calculates a parent value based on the values of its children.                                                                                                                                                                                                                                                                                                                                       |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.83 V\$AW\_LONGOPS

V\$AW\_LONGOPS displays status information about active SQL cursors initiated in an analytic workspace.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID       | NUMBER       | Identifier for the session in which the fetch is executing. This table can be joined with V\$SESSION to obtain the user name.                                                                                                                                                                                                      |
| CURSOR_NAME      | VARCHAR2(64) | Name assigned to the cursor                                                                                                                                                                                                                                                                                                        |
| COMMAND          | VARCHAR2(17) | Command that is actively fetching data from relational tables: <ul style="list-style-type: none"> <li>QUERY</li> <li>FETCH</li> <li>IMPORT</li> <li>EXECUTE</li> <li>UPDATE</li> <li>SOLVE</li> <li>CLEAR</li> <li>LOAD CUBE</li> <li>LOAD DIMENSION</li> <li>DIMENSION COMPILE</li> </ul>                                         |
| STATUS           | VARCHAR2(9)  | Status of the current operation: <ul style="list-style-type: none"> <li>EXECUTING - Command has begun executing</li> <li>FETCHING - Data is being fetched into the analytic workspace</li> <li>FINISHED - Command has finished executing. This status appears very briefly before the record disappears from the table.</li> </ul> |
| ROWS_PROCESSED   | NUMBER       | Number of rows already inserted, updated, or deleted                                                                                                                                                                                                                                                                               |
| SEQ_NUMBER       | NUMBER       | Sequence number in the Cube Build log                                                                                                                                                                                                                                                                                              |
| SQL_ID           | VARCHAR2(13) | SQL ID of the statement                                                                                                                                                                                                                                                                                                            |
| TARGET           | VARCHAR2(64) | Operated object name                                                                                                                                                                                                                                                                                                               |
| TARGET_DESC      | VARCHAR2(64) | A brief description of the operated object                                                                                                                                                                                                                                                                                         |
| START_TIME       | DATE         | Time the command started executing                                                                                                                                                                                                                                                                                                 |
| LAST_UPDATE_TIME | DATE         | Last updated time                                                                                                                                                                                                                                                                                                                  |
| ELAPSED_SECONDS  | NUMBER       | Number of seconds between START_TIME and LAST_UPDATE_TIME                                                                                                                                                                                                                                                                          |

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOFAR     | NUMBER        | Number of units so far                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TOTALWORK | NUMBER        | Total number of units                                                                                                                                                                                                                                                                                                                                                                                                                           |
| UNITS     | VARCHAR2(6)   | Units description: <ul style="list-style-type: none"> <li>ROWS</li> <li>NODES</li> <li>VALUES</li> </ul>                                                                                                                                                                                                                                                                                                                                        |
| MESSAGE   | VARCHAR2(512) | Message for the user                                                                                                                                                                                                                                                                                                                                                                                                                            |
| USERNAME  | VARCHAR2(32)  | User name                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.84 V\$AW\_OLAP

V\$AW\_OLAP provides a record of active sessions and their use with analytic workspaces.

A row is generated whenever an analytic workspace is created or attached. The first row for a session is created when the first command is issued. It identifies the SYS.EXPRESS workspace, which is attached automatically to each session. Rows related to a particular analytic workspace are deleted when the workspace is detached from the session or the session ends.

| Column             | Datatype     | Description                                                                                                                                                                                                |
|--------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID         | NUMBER       | A unique numeric identifier for a session                                                                                                                                                                  |
| AW_NUMBER          | NUMBER       | A unique numeric identifier for an analytic workspace. To get the name of the analytic workspace, join this column to the AW_NUMBER column of the USER_AWS view or to the AWSEQ# column of the AW\$ table. |
| ATTACH_MODE        | VARCHAR2(10) | READ ONLY or READ WRITE                                                                                                                                                                                    |
| GENERATION         | NUMBER       | The generation of an analytic workspace. Each UPDATE creates a new generation. Sessions attaching the same workspace between UPDATE commands share the same generation.                                    |
| TEMP_SPACE_PAGES   | NUMBER       | The number of pages stored in temporary segments for the analytic workspace.                                                                                                                               |
| TEMP_SPACE_READS   | NUMBER       | The number of times data has been read from a temporary segment and not from the page pool.                                                                                                                |
| LOB_READS          | NUMBER       | The number of times data has been read from the table where the analytic workspace is stored (the permanent LOB).                                                                                          |
| POOL_CHANGED_PAGES | NUMBER       | The number of pages in the page pool that have been modified in this analytic workspace.                                                                                                                   |

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POOL_UNCHANGED_PAGES | NUMBER   | The number of pages in the page pool that have not been modified in this analytic workspace.                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.85 V\$AW\_SESSION\_INFO

V\$AW\_SESSION\_INFO provides information about each active session.

A transaction is a single exchange between a client session and Oracle OLAP. Multiple commands can execute within a single transaction.

| Column                       | Datatype     | Description                                                                                                                                     |
|------------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID                   | NUMBER       | A unique numeric identifier for a session                                                                                                       |
| CLIENT_TYPE                  | VARCHAR2(64) | OLAP                                                                                                                                            |
| SESSION_STATE                | VARCHAR2(64) | TRANSACTIONING, NOT_TRANSACTIONING, EXCEPTION_HANDLING, CONSTRUCTING, CONSTRUCTED, DECONSTRUCTING, or DECONSTRUCTED                             |
| SESSION_HANDLE               | NUMBER       | The session identifier                                                                                                                          |
| USERID                       | VARCHAR2(64) | The database user name under which the session opened                                                                                           |
| TOTAL_TRANSACTION            | NUMBER       | The total number of transactions executed within the session; this number provides a general indication of the level of activity in the session |
| TRANSACTION_TIME             | NUMBER       | The elapsed time in milliseconds of the mostly recently completed transaction                                                                   |
| TOTAL_TRANSACTION_TIME       | NUMBER       | The total elapsed time in milliseconds in which transactions were being executed                                                                |
| AVERAGE_TRANSACTION_TIME     | NUMBER       | The average elapsed time in milliseconds to complete a transaction                                                                              |
| TRANSACTION_CPU_TIME         | NUMBER       | The total CPU time in milliseconds used to complete the most recent transaction                                                                 |
| TOTAL_TRANSACTION_CPU_TIME   | NUMBER       | The total CPU time used to execute all transactions in this session; this total does not include transactions that are currently in progress    |
| AVERAGE_TRANSACTION_CPU_TIME | NUMBER       | The average CPU time to complete a transaction; this average does not include transactions that are currently in progress                       |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.86 V\$BACKUP

V\$BACKUP displays the backup status of all online data files.

| Column  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#   | NUMBER       | File identifier                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| STATUS  | VARCHAR2(18) | File status: NOT ACTIVE, ACTIVE (backup in progress), OFFLINE NORMAL, or description of an error.<br>NOT ACTIVE indicates that the file is not currently in backup mode (that is, an ALTER TABLESPACE ... BEGIN BACKUP or ALTER DATABASE BEGIN BACKUP statement has not been issued), whereas ACTIVE indicates that the file is currently in backup mode.                                                                                       |
| CHANGE# | NUMBER       | System change number when backup started                                                                                                                                                                                                                                                                                                                                                                                                        |
| TIME    | DATE         | Time the backup started                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID  | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.87 V\$BACKUP\_ARCHIVELOG\_DETAILS

V\$BACKUP\_ARCHIVELOG\_DETAILS contains information about all restorable archive logs.

It will include all archived logs backed up in a backup set or proxy copies.

| Column        | Datatype | Description                                                                            |
|---------------|----------|----------------------------------------------------------------------------------------|
| BTYPE         | CHAR(9)  | Backup type container, either BACKUPSET or PROXYCOPY                                   |
| BTYPE_KEY     | NUMBER   | Unique identifier for the backup type. For BACKUPSET, it is BS_KEY.                    |
| SESSION_KEY   | NUMBER   | Session identifier                                                                     |
| SESSION_RECID | NUMBER   | Session recid                                                                          |
| SESSION_STAMP | NUMBER   | Session stamp                                                                          |
| ID1           | NUMBER   | If BACKUPSET, it contains SET_STAMP<br>If PROXYCOPY, it is RECID from the control file |

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID2               | NUMBER         | If BACKUPSET, it contains SET_COUNT<br>If PROXYCOPY, it is STAMP                                                                                                                                                                                                                                                                                                                                                                  |

| NEXT_CHANGE#      | NUMBER         | Next change SCN                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NEXT_TIME         | DATE           | Next change time                                                                                                                                                                                                                                                                                                                                                                                                                  |
| FILESIZE          | NUMBER         | File size                                                                                                                                                                                                                                                                                                                                                                                                                         |
| COMPRESSION_RATIO | NUMBER         | The ratio between the total blocks in the archive log and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                             |
| FILESIZE_DISPLAY  | VARCHAR2(4000) | Same value as the FILESIZE column, but converted to a user-displayable format, for example nM, nG, nT, nP, and so on                                                                                                                                                                                                                                                                                                              |
| CON_ID            | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 7.88 V\$BACKUP\_ARCHIVELOG\_SUMMARY

V\$BACKUP\_ARCHIVELOG\_SUMMARY provides archive log summary information based on archive logs in the backup set or on proxy copies.

| Column                    | Datatype | Description                                                                                                                                                                           |
|---------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER   | Number of files backed up                                                                                                                                                             |
| NUM_DISTINCT_FILES_BACKED | NUMBER   | Number of distinct archive log files backed up                                                                                                                                        |
| MIN_FIRST_CHANGE#         | NUMBER   | Lowest SCN range value                                                                                                                                                                |
| MAX_NEXT_CHANGE#          | NUMBER   | Highest SCN range value                                                                                                                                                               |
| MIN_FIRST_TIME            | DATE     | Lowest SCN range time                                                                                                                                                                 |
| MAX_NEXT_TIME             | DATE     | Highest SCN range time                                                                                                                                                                |
| INPUT_BYTES               | NUMBER   | Total input bytes read                                                                                                                                                                |
| OUTPUT_BYTES              | NUMBER   | Output size of backups                                                                                                                                                                |
| COMPRESSION_RATIO         | NUMBER   | The ratio between the total blocks in the archive log and the blocks that RMAN backed up. This is <i>not</i> the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command. |

| Column               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INPUT_BYTES_DISPLAY  | VARCHAR2(4000) | Displayable format for input bytes                                                                                                                                                                                                                                                                                                                                                                                                              |
| OUTPUT_BYTES_DISPLAY | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID               | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.89 V\$BACKUP\_ASYNC\_IO

V\$BACKUP\_ASYNC\_IO displays performance information about ongoing and recently completed RMAN backups and restores.

For each backup, it contains one row for each input data file, one row for the aggregate total performance of all data files, and one row for the output backup piece. This data is not stored persistently, and is not preserved when the instance is re-started.

| Column            | Datatype      | Description                                                                                                          |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------|
| SID               | NUMBER        | Oracle SID of the session doing the backup or restore                                                                |
| SERIAL            | NUMBER        | Use count for the SID doing the backup or restore                                                                    |
| USE_COUNT         | NUMBER        | A counter that can be used to identify rows from different backup sets                                               |
| RMAN_STATUS_RECID | NUMBER        | Owning V\$RMAN_STATUS record ID                                                                                      |
| RMAN_STATUS_STAMP | NUMBER        | Owning V\$RMAN_STATUS record stamp                                                                                   |
| DEVICE_TYPE       | VARCHAR2(17)  | Device type where the file is located                                                                                |
| TYPE              | VARCHAR2(9)   | INPUT, OUTPUT, or AGGREGATE                                                                                          |
| STATUS            | VARCHAR2(11)  | NOT STARTED, IN PROGRESS, or FINISHED                                                                                |
| FILENAME          | VARCHAR2(513) | Name of the backup file being read or written                                                                        |
| SET_COUNT         | NUMBER        | Set count of the backup set being read or written                                                                    |
| SET_STAMP         | NUMBER        | Set stamp of the backup set being read or written                                                                    |
| BUFFER_SIZE       | NUMBER        | Size of the buffers being used to read/write the file, in bytes                                                      |
| BUFFER_COUNT      | NUMBER        | Number of buffers being used to read/write the file                                                                  |
| TOTAL_BYTES       | NUMBER        | Total number of bytes that will be read or written for the file, if known. If not known, this column will be null    |
| OPEN_TIME         | DATE          | Time the file was opened. If TYPE='AGGREGATE', then this is the time that the first file in the aggregate was opened |
| CLOSE_TIME        | DATE          | Time the file was closed. If TYPE='AGGREGATE', then this is the time that the last file in the aggregate was closed  |
| ELAPSED_TIME      | NUMBER        | Time, in hundredths of a second, that the file was open                                                              |

| Column                         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXOPENFILES                   | NUMBER   | Number of concurrently open DISK files. This value is only present in rows where TYPE='AGGREGATE'.                                                                                                                                                                                                                                                                                                                                              |
| BYTES                          | NUMBER   | Number of bytes read or written so far                                                                                                                                                                                                                                                                                                                                                                                                          |
| EFFECTIVE_BYTES_PER_SE<br>COND | NUMBER   | I/O rate that was achieved with this device during this backup                                                                                                                                                                                                                                                                                                                                                                                  |
| IO_COUNT                       | NUMBER   | Number of I/Os that were performed to this file                                                                                                                                                                                                                                                                                                                                                                                                 |
| READY                          | NUMBER   | Number of asynchronous requests for which a buffer was immediately ready for use                                                                                                                                                                                                                                                                                                                                                                |
| SHORT_WAITS                    | NUMBER   | Number of times that a buffer was not immediately available, but a buffer became available after doing a nonblocking poll for I/O completion                                                                                                                                                                                                                                                                                                    |
| SHORT_WAIT_TIME_TOTAL          | NUMBER   | Total time, in hundredths of a second, taken by nonblocking polls for I/O completion                                                                                                                                                                                                                                                                                                                                                            |
| SHORT_WAIT_TIME_MAX            | NUMBER   | Maximum time taken for a nonblocking poll for I/O completion, in hundredths of a second                                                                                                                                                                                                                                                                                                                                                         |
| LONG_WAITS                     | NUMBER   | The number of times that a buffer was not immediately available, and only became available after a blocking wait was issued                                                                                                                                                                                                                                                                                                                     |
| LONG_WAIT_TIME_TOTAL           | NUMBER   | The total time, in hundredths of a second, taken by blocking waits for I/O completion                                                                                                                                                                                                                                                                                                                                                           |
| LONG_WAIT_TIME_MAX             | NUMBER   | The maximum time taken for a blocking wait for I/O completion, in hundredths of a second                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.90 V\$BACKUP\_CONTROLFILE\_DETAILS

V\$BACKUP\_CONTROLFILE\_DETAILS contains information about restorable control files.

It will include all the control files backed up in the backup set, image copies, and proxy copies.

| Column        | Datatype | Description                                                                                         |
|---------------|----------|-----------------------------------------------------------------------------------------------------|
| BTYPE         | CHAR(9)  | Backup type container. Possible values are BACKUPSET, IMAGECOPY, PROXYCOPY.                         |
| BTYPE_KEY     | NUMBER   | Unique identifier for the backup type, either BS_KEY or COPY_KEY.                                   |
| SESSION_KEY   | NUMBER   | Session identifier                                                                                  |
| SESSION_RECID | NUMBER   | Session recid                                                                                       |
| SESSION_STAMP | NUMBER   | Session stamp                                                                                       |
| ID1           | NUMBER   | If BACKUPSET, it contains SET_STAMP<br>If IMAGECOPY or PROXYCOPY, it is RECID from the control file |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID2                | NUMBER         | If BACKUPSET, it contains SET_COUNT<br>If IMAGECOPY or PROXYCOPY, it is STAMP                                                                                                                                                                                                                                                                                                                                                     |
| CREATION_TIME      | DATE           | File creation time                                                                                                                                                                                                                                                                                                                                                                                                                |

| RESETLOGS_TIME     | DATE           | Resetlogs change time                                                                                                                                                                                                                                                                                                                                                                                                             |
| CHECKPOINT_CHANGE# | NUMBER         | Checkpoint change SCN                                                                                                                                                                                                                                                                                                                                                                                                             |
| CHECKPOINT_TIME    | DATE           | Checkpoint change time                                                                                                                                                                                                                                                                                                                                                                                                            |
| FILESIZE           | NUMBER         | File size, in bytes, for the output of backing up this control file                                                                                                                                                                                                                                                                                                                                                               |
| COMPRESSION_RATIO  | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                            |
| FILESIZE_DISPLAY   | VARCHAR2(4000) | Same value as the FILESIZE column, but converted to a user-displayable format, for example nM, nG, nT, nP, and so on                                                                                                                                                                                                                                                                                                              |
| CON_ID             | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 7.91 V\$BACKUP\_CONTROLFILE\_SUMMARY

V\$BACKUP\_CONTROLFILE\_SUMMARY provides control file summary information, based on either a backup set of files, image copies, or proxy copies.

| Column                    | Datatype       | Description                                                                                                                                                                            |
|---------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER         | Number of files backed up for specific criteria                                                                                                                                        |
| NUM_DISTINCT_FILES_BACKED | NUMBER         | Number of distinct files backed up                                                                                                                                                     |
| MIN_CHECKPOINT_CHANGE#    | NUMBER         | Minimum checkpoint change number of the data file for specified criteria                                                                                                               |
| MAX_CHECKPOINT_CHANGE#    | NUMBER         | Maximum checkpoint change number of the data file for specified criteria                                                                                                               |
| MIN_CHECKPOINT_TIME       | DATE           | Minimum checkpoint time of the data file for specified criteria                                                                                                                        |
| MAX_CHECKPOINT_TIME       | DATE           | Maximum checkpoint time of the data file for specified criteria                                                                                                                        |
| INPUT_BYTES               | NUMBER         | Total input bytes of files read                                                                                                                                                        |
| OUTPUT_BYTES              | NUMBER         | Total output bytes written                                                                                                                                                             |
| COMPRESSION_RATIO         | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command. |
| INPUT_BYTES_DISPLAY       | VARCHAR2(4000) | Displayable format for input bytes                                                                                                                                                     |
| OUTPUT_BYTES_DISPLAY      | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                    |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.92 V\$BACKUP\_COPY\_DETAILS

V\$BACKUP\_COPY\_DETAILS contains information about all available control file and data file copies.

| Column             | Datatype      | Description                                                                                                                                                                                          |
|--------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY        | NUMBER        | Session identifier                                                                                                                                                                                   |
| SESSION_RECID      | NUMBER        | Session recid                                                                                                                                                                                        |
| SESSION_STAMP      | NUMBER        | Session stamp                                                                                                                                                                                        |
| COPY_KEY           | NUMBER        | Unique identifier for this data file or control file copy                                                                                                                                            |
| FILE#              | NUMBER        | Absolute data file number                                                                                                                                                                            |
| NAME               | VARCHAR2(513) | File name of the data file copy. The maximum length of the name is dependent on your operating system.                                                                                               |
| TAG                | VARCHAR2(32)  | Data file copy tag                                                                                                                                                                                   |
| CREATION_CHANGE#   | NUMBER        | Data file creation change number                                                                                                                                                                     |
| CREATION_TIME      | DATE          | Data file creation timestamp                                                                                                                                                                         |
| CHECKPOINT_CHANGE# | NUMBER        | Checkpoint change number of the data file when the copy was made                                                                                                                                     |
| CHECKPOINT_TIME    | DATE          | Checkpoint timestamp of the data file when the copy was made                                                                                                                                         |
| MARKED_CORRUPT     | NUMBER        | Number of blocks marked corrupt by this copy operation. That is, blocks that were not marked corrupted in the source data file, but were detected and marked as corrupted during the copy operation. |
| OUTPUT_BYTES       | NUMBER        | Total output bytes written                                                                                                                                                                           |
| COMPLETION_TIME    | DATE          | Time when the copy was completed                                                                                                                                                                     |
| CONTROLFILE_TYPE   | VARCHAR2(1)   | Type of control file. B indicates normal copies. S indicates standby copies.                                                                                                                         |
| KEEP               | VARCHAR2(3)   | (YES NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy                                                         |
| KEEP_UNTIL         | DATE          | If specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.                                                                       |

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEEP_OPTIONS          | VARCHAR2(11)   | Lists additional retention options for this backup set. Possible values are: <ul style="list-style-type: none"> <li>LOGS - The logs needed to recover this backup set are kept</li> <li>NOLOGS - The logs needed to recover this backup set are not kept</li> </ul>                                                                                                                                                                             |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)    | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                              |
| SPARSE_BACKUP         | VARCHAR2(3)    | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                          |
| OUTPUT_BYTES_DISPLAY  | VARCHAR2(4000) | Size of backup set to display                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID                | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.93 V\$BACKUP\_COPY\_SUMMARY

V\$BACKUP\_COPY\_SUMMARY provides summary information for the output data file and control file copy.

| Column                 | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_COPIES             | NUMBER         | Number of copies created                                                                                                                                                                                                                                                                                                                                                                                                                        |
| NUM_DISTINCT_COPIES    | NUMBER         | Number of distinct copies (that contain data files with different checkpoints)                                                                                                                                                                                                                                                                                                                                                                  |

| OUTPUT_BYTES           | NUMBER         | Total number of output bytes                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OUTPUT_BYTES_DISPLAY   | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                 | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.94 V\$BACKUP\_CORRUPTION

V\$BACKUP\_CORRUPTION displays information about corrupt block ranges in data file backups from the control file.

Note that corruptions are not tolerated in the control file and archived redo log backups.

| Column             | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| BLOCKS             | NUMBER      | Number of corrupted blocks found starting with BLOCK#                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CORRUPTION_CHANGE# | NUMBER      | Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MARKED_CORRUPT     | VARCHAR2(3) | Indicates whether this corruption was not previously detected by the Oracle Database (YES) or the Oracle Database had already discovered this corrupt block and marked it as corrupt (NO). Note that when a corrupt block is encountered in a backup, and was not already marked corrupt by the Oracle Database, then the backup process does not mark the block as corrupt in the production data file. Thus, this field may be YES for the same block in more than one backup set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CORRUPTION_TYPE    | VARCHAR2(9) | Type of block corruption in the data file: <ul style="list-style-type: none"> <li>• ALL ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block.</li> <li>• FRACTURED - Block header looks reasonable, but the front and back of the block are different versions.</li> <li>• CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions.</li> <li>• CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing)</li> <li>• LOGICAL - Block is logically corrupt</li> <li>• NOLOGGING - Block does not have redo log entries (for example, NOLOGGING operations on primary database can introduce this type of corruption on a physical standby)</li> </ul> |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.95 V\$BACKUP\_DATAFILE

V\$BACKUP\_DATAFILE displays information about control files and data files in backup sets from the control file.

| Column                 | Datatype | Description                                                                                                                                |
|------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| RECID                  | NUMBER   | Backup data file record ID                                                                                                                 |
| STAMP                  | NUMBER   | Backup data file record stamp                                                                                                              |
| SET_STAMP              | NUMBER   | Backup set stamp                                                                                                                           |
| SET_COUNT              | NUMBER   | Backup set count                                                                                                                           |
| FILE#                  | NUMBER   | Data file number; set to 0 for control file                                                                                                |
| CREATION_CHANGE#       | NUMBER   | Creation system change number (SCN) of the data file                                                                                       |
| CREATION_TIME          | DATE     | Creation timestamp of the data file                                                                                                        |
| RESETLOGS_CHANGE#      | NUMBER   | Resetlogs system change number (SCN) of the data file when it was backed up                                                                |
| RESETLOGS_TIME         | DATE     | Resetlogs timestamp of the data file when it was backed up                                                                                 |
| INCREMENTAL_LEVEL      | NUMBER   | Normal full backups have a NULL value, level 0 incremental backups have a value of 0, and level 1 incremental backups have a value of 1    |
| INCREMENTAL_CHANGE#    | NUMBER   | All blocks changed after the incremental change number is included in this backup; set to 0 for a full backup                              |
| CHECKPOINT_CHANGE#     | NUMBER   | All changes up to the checkpoint change number are included in this backup                                                                 |
| CHECKPOINT_TIME        | DATE     | Timestamp of the checkpoint                                                                                                                |
| ABSOLUTE_FUZZY_CHANGE# | NUMBER   | Highest change number in this backup                                                                                                       |
| MARKED_CORRUPT         | NUMBER   | Number of blocks marked corrupt                                                                                                            |
| MEDIA_CORRUPT          | NUMBER   | Number of blocks media corrupt                                                                                                             |
| LOGICALLY_CORRUPT      | NUMBER   | Number of blocks logically corrupt                                                                                                         |
| DATAFILE_BLOCKS        | NUMBER   | Size of the data file in blocks at backup time. This value is also the number of blocks taken by the data file restarted from this backup. |
| BLOCKS                 | NUMBER   | Size of the backup data file (in blocks). Unused blocks are not copied to the backup.                                                      |
| BLOCK_SIZE             | NUMBER   | Block size                                                                                                                                 |
| OLDEST_OFFLINE_RANGE   | NUMBER   | RECID of the oldest offline range record in this backup control file. 0 for data file backups.                                             |

| Column                   | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPLETION_TIME          | DATE        | Time completed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CONTROLFILE_TYPE         | VARCHAR2(1) | B - Normal copies<br>S - Standby copies                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| USED_CHANGE_TRACKING     | VARCHAR2(3) | Indicates whether change tracking data was used to accelerate this incremental backup (YES) or whether change tracking data was not used (NO)                                                                                                                                                                                                                                                                                                                                                                   |
| BLOCKS_READ              | NUMBER      | Number of blocks that were scanned while taking this backup. If this was an incremental backup, and change tracking was used to optimize the backup, then the value of this column will be smaller than DATAFILE_BLOCKS. Otherwise, the value of this column will be the same as DATAFILE_BLOCKS. Even when change tracking data is used, the value of this column may be larger than BLOCKS, because the data read by change tracking is further refined during the process of creating an incremental backup. |
| USED_OPTIMIZATION        | VARCHAR2(3) | Indicates whether backup optimization was applied (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FOREIGN_DBID             | NUMBER      | Foreign DBID of the database from which this data file was transported. The value is 0 if the file backed up is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                    |
| PLUGGED_READONLY         | VARCHAR2(3) | YES if this is a backup of a transported read-only foreign file; otherwise NO.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PLUGIN_CHANGE#           | NUMBER      | SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                                               |
| PLUGIN_RESETLOGS_CHANGE# | NUMBER      | The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                                |
| PLUGIN_RESETLOGS_TIME    | DATE        | The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                                               |
| SECTION_SIZE             | NUMBER      | Specifies the number of blocks in each section of a multisection backup. Value is 0 for whole file backups.                                                                                                                                                                                                                                                                                                                                                                                                     |
| UNDO_OPTIMIZED           | VARCHAR2(3) | Indicates whether undo blocks were ignored when creating the backup data file (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BLOCKS_SKIPPED_IN_CELL   | NUMBER      | Number of blocks that were not backed up because they were skipped by the Exadata cell<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                                                                            |
| CON_ID                   | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                               |

| Column        | Datatype    | Description                                                                                                                                                                                                                                                                                                         |
|---------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BACKED_BY_PDB | VARCHAR2(3) | Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> <li>• YES: The backup was taken when connected to the PDB</li> <li>• NO: The backup was taken when connected to the root container</li> </ul> |
| SPARSE_BACKUP | VARCHAR2(3) | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                              |
| GUID          | RAW(16)     | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                               |

## 7.96 V\$BACKUP\_DATAFILE\_DETAILS

V\$BACKUP\_DATAFILE\_DETAILS contains information about restorable data files.

It will include all data files backed in the backup set, image copies, and proxy copies.

| Column              | Datatype | Description                                                                                                                                                                            |
|---------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BTYPE               | CHAR(9)  | Backup type container. Possible values are: BACKUPSET, IMAGECOPY, PROXYCOPY.                                                                                                           |
| BTYPE_KEY           | NUMBER   | Unique identifier for the backup type. For BACKUPSET, it is BS_KEY.                                                                                                                    |
| SESSION_KEY         | NUMBER   | Session identifier                                                                                                                                                                     |
| SESSION_RECID       | NUMBER   | Session record ID                                                                                                                                                                      |
| SESSION_STAMP       | NUMBER   | Session stamp                                                                                                                                                                          |
| ID1                 | NUMBER   | If BACKUPSET, it contains SET_STAMP.<br>If IMAGECOPY or PROXYCOPY, it is RECID from the control file.                                                                                  |
| ID2                 | NUMBER   | If BACKUPSET, it contains SET_COUNT.<br>If IMAGECOPY or PROXYCOPY, it is STAMP.                                                                                                        |
| FILE#               | NUMBER   | File number                                                                                                                                                                            |
| CREATION_CHANGE#    | NUMBER   | File creation change SCN                                                                                                                                                               |
| CREATION_TIME       | DATE     | File creation time                                                                                                                                                                     |
| RESETLOGS_CHANGE#   | NUMBER   | Resetlogs change SCN                                                                                                                                                                   |
| RESETLOGS_TIME      | DATE     | Resetlogs change time                                                                                                                                                                  |
| INCREMENTAL_LEVEL   | NUMBER   | Normal full backups have a NULL value, level 0 incremental backups have a value of 0, and level 1 incremental backups have a value of 1                                                |
| INCREMENTAL_CHANGE# | NUMBER   | Incremental change SCN                                                                                                                                                                 |
| CHECKPOINT_CHANGE#  | NUMBER   | Checkpoint change SCN                                                                                                                                                                  |
| CHECKPOINT_TIME     | DATE     | Checkpoint change time                                                                                                                                                                 |
| MARKED_CORRUPT      | NUMBER   | Number of blocks marked corrupt                                                                                                                                                        |
| FILESIZE            | NUMBER   | File size, in bytes                                                                                                                                                                    |
| COMPRESSION_RATIO   | NUMBER   | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command. |

| Column           | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| COMPRESSION_RATIO         | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command.                                                                                                                                                                                                                                                          |
| INPUT_BYTES_DISPLAY       | VARCHAR2(4000) | Displayable format for input bytes                                                                                                                                                                                                                                                                                                                                                                                                              |
| OUTPUT_BYTES_DISPLAY      | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.98 V\$BACKUP\_DEVICE

V\$BACKUP\_DEVICE displays information about supported backup devices.

If a device type does not support named devices, then one row with the device type and a null device name is returned for that device type. If a device type supports named devices then one row is returned for each available device of that type. The special device type DISK is not returned by this view because it is always available.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEVICE_TYPE | VARCHAR2(17)  | Type of the backup device                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DEVICE_NAME | VARCHAR2(513) | Name of the backup device                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.99 V\$BACKUP\_FILES

V\$BACKUP\_FILES displays information about all RMAN backups (both image copies and backup sets) and archived logs.

This view simulates the LIST BACKUP and LIST COPY RMAN commands. This view requires that the database be set using the DBMS\_RCVMAN.SETDATABASE procedure.

| Column      | Datatype     | Description                                                                                                                                                                                                                            |
|-------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PKEY        | NUMBER       | Primary key for the backup                                                                                                                                                                                                             |
| BACKUP_TYPE | VARCHAR2(32) | Type of the backup: <ul style="list-style-type: none"> <li>BACKUP SET</li> <li>COPY</li> <li>PROXY COPY</li> </ul>                                                                                                                     |
| FILE_TYPE   | VARCHAR2(32) | Type of the file: <ul style="list-style-type: none"> <li>DATAFILE</li> <li>CONTROLFILE</li> <li>SPFILE</li> <li>REDO LOG</li> <li>ARCHIVED LOG</li> <li>COPY (for an image copy backup)</li> <li>PIECE (for a backup piece)</li> </ul> |
| KEEP        | VARCHAR2(3)  | Indicates whether the backup has a retention policy different from the value for CONFIGURE RETENTION POLICY (YES) or not (NO)                                                                                                          |
| KEEP_UNTIL  | DATE         | If the KEEP UNTIL TIME clause of the BACKUP command was specified, then this column shows the date after which the backup becomes obsolete. If the column is null and KEEP_OPTIONS is not null, the backup never becomes obsolete.     |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEEP_OPTIONS       | VARCHAR2(13)   | KEEP options for the backup: <ul style="list-style-type: none"> <li>LOGS - RMAN keeps the logs needed to recover the backup</li> <li>NOLOGS - RMAN does not keep the logs needed to recover the backup</li> </ul> If this column is null, then the backup has no KEEP options and will be made obsolete based on the retention policy. |
| STATUS             | VARCHAR2(16)   | Status of the backup: <ul style="list-style-type: none"> <li>AVAILABLE</li> <li>UNAVAILABLE</li> <li>EXPIRED</li> <li>OTHER</li> </ul>                                                                                                                                                                                                 |
| FNAME              | VARCHAR2(1024) | Name of the file                                                                                                                                                                                                                                                                                                                       |
| TAG                | VARCHAR2(32)   | Tag of the piece, copy, or proxy copy                                                                                                                                                                                                                                                                                                  |
| MEDIA              | VARCHAR2(80)   | Media ID of the piece or proxy copy                                                                                                                                                                                                                                                                                                    |
| RECID              | NUMBER         | Recid of the record in the control file                                                                                                                                                                                                                                                                                                |
| STAMP              | NUMBER         | Stamp of the record in the control file                                                                                                                                                                                                                                                                                                |
| DEVICE_TYPE        | VARCHAR2(255)  | Type of media device that stores the backup                                                                                                                                                                                                                                                                                            |
| BLOCK_SIZE         | NUMBER         | Block size for the backup (in bytes)                                                                                                                                                                                                                                                                                                   |
| COMPLETION_TIME    | DATE           | Time when the backup completed                                                                                                                                                                                                                                                                                                         |
| COMPRESSED         | VARCHAR2(3)    | Indicates whether the backup piece is compressed (YES) or not (NO); valid only if FILE_TYPE is PIECE. Image copies cannot be compressed.                                                                                                                                                                                               |
| OBSOLETE           | VARCHAR2(3)    | Indicates whether the backup piece or copy is obsolete (YES) or not (NO); valid only if FILE_TYPE is PIECE or COPY                                                                                                                                                                                                                     |
| BYTES              | NUMBER         | Size of the file (in bytes)                                                                                                                                                                                                                                                                                                            |

## 7.100 V\$BACKUP\_NONLOGGED

V\$BACKUP\_NONLOGGED displays information about nonlogged block ranges in data file backups, recorded in the control file.

| Column            | Datatype | Description                                                                                                    |
|-------------------|----------|----------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER   | Nologged backup record ID                                                                                      |
| STAMP             | NUMBER   | Nonlogged backup record stamp                                                                                  |
| SET_STAMP         | NUMBER   | Backup set stamp                                                                                               |
| SET_COUNT         | NUMBER   | Backup set count                                                                                               |
| PIECE#            | NUMBER   | Backup piece that contains the range of nonlogged blocks                                                       |
| FILE#             | NUMBER   | Absolute file number of the data file that contains this range of nonlogged blocks                             |
| BLOCK#            | NUMBER   | Block number of the first nonlogged block in the range of nologged blocks                                      |
| BLOCKS            | NUMBER   | Number of nonlogged blocks found starting with BLOCK#                                                          |
| NONLOGGED_CHANGE# | NUMBER   | The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.                     |
| NONLOGGED_TIME    | VARCHAR2 | The time that corresponds to NONLOGGED_CHANGE#. NULL if unknown.                                               |
| RESETLOGS_CHANGE# | VARCHAR2 | The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown. |
| RESETLOGS_TIME    | VARCHAR2 | The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown. |
| OBJECT#           | VARCHAR2 | The object ID this range belongs to. If this field is NULL, the object number is unknown.                      |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REASON | CHAR(7)  | The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN.                                                                                                                                                                                                                          |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.101 V\$BACKUP\_PIECE

V\$BACKUP\_PIECE displays information about backup pieces from the control file. Each backup set consists of one or more backup pieces.

| Column          | Datatype      | Description                                                                                                                                                     |
|-----------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID           | NUMBER        | Backup piece record ID                                                                                                                                          |
| STAMP           | NUMBER        | Backup piece record stamp                                                                                                                                       |
| SET_STAMP       | NUMBER        | Backup set stamp                                                                                                                                                |
| SET_COUNT       | NUMBER        | Backup set count                                                                                                                                                |
| PIECE#          | NUMBER        | Backup piece number (1-N)                                                                                                                                       |
| COPY#           | NUMBER        | Indicates the copy number for backup pieces created with duplex enabled. 1 if the backup piece is not duplexed.                                                 |
| DEVICE_TYPE     | VARCHAR2(17)  | Type of the device on which the backup piece resides. Set to DISK for backup sets on disk.<br><b>See Also:</b> V\$BACKUP_DEVICE                                 |
| HANDLE          | VARCHAR2(513) | Backup piece handle identifies the backup piece on restore                                                                                                      |
| COMMENTS        | VARCHAR2(64)  | Comment returned by the operating system or storage subsystem. Set to NULL for backup pieces on disk. This value is informational only; not needed for restore. |
| MEDIA           | VARCHAR2(65)  | Name of the media on which the backup piece resides. This value is informational only; not needed for restore.                                                  |
| MEDIA_POOL      | NUMBER        | The media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.                   |
| CONCUR          | VARCHAR2(3)   | (YES   NO) Indicates whether the piece on a media that can be accessed concurrently                                                                             |
| TAG             | VARCHAR2(32)  | Backup piece tag. The tag is specified at backup set level, but stored at piece level.                                                                          |
| STATUS          | VARCHAR2(1)   | Indicates the status of the piece: A (available), D (deleted), or X (expired)                                                                                   |
| START_TIME      | DATE          | Starting time                                                                                                                                                   |
| COMPLETION_TIME | DATE          | Completion time                                                                                                                                                 |

| Column                | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELAPSED_SECONDS       | NUMBER      | Number of elapsed seconds                                                                                                                                                                                                                                                                                                                                                                                                         |
| DELETED               | VARCHAR2(3) | (YES/NO) NO indicates that the file still exists. YES indicates the file no longer exists because it has been deleted.                                                                                                                                                                                                                                                                                                            |
| BYTES                 | NUMBER      | Size of the backup piece (in bytes)                                                                                                                                                                                                                                                                                                                                                                                               |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3) | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                |
| RMAN_STATUS_RECID     | NUMBER      | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                                                                                                                                                                                                                                   |
| RMAN_STATUS_STAMP     | NUMBER      | Owning V\$RMAN_STATUS record stamp                                                                                                                                                                                                                                                                                                                                                                                                |
| COMPRESSED            | VARCHAR2(3) | Indicates whether the backup piece is compressed (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                |
| BACKED_BY_VSS         | VARCHAR2(3) | Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.                                                                                                                                                                                                                                                                                                         |
| ENCRYPTED             | VARCHAR2(3) | A value of YES means an encrypted backup, otherwise not an encrypted backup.                                                                                                                                                                                                                                                                                                                                                      |
| BACKED_BY_OSB         | VARCHAR2(3) | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                                                                                                                                                                                                                                                                         |
| FOR_XTTS              | VARCHAR2(3) | Indicates whether this is a cross platform backup piece: <ul style="list-style-type: none"> <li>YES: This is a cross platform backup piece.</li> <li>NO: This is not a cross platform backup piece.</li> </ul>                                                                                                                                                                                                                    |
| SAME_ENDIAN           | VARCHAR2(3) | If the value of FOR_XTTS is YES, then this column indicates whether the backup piece has the same endianness as the current database (YES) or not (NO); otherwise NULL.                                                                                                                                                                                                                                                           |
| CON_ID                | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |
| GUID                  | RAW(16)     | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                             |

## 7.102 V\$BACKUP\_PIECE\_DETAILS

V\$BACKUP\_PIECE\_DETAILS displays information about all available backup pieces.

| Column        | Datatype | Description            |
|---------------|----------|------------------------|
| SESSION_KEY   | NUMBER   | Session identifier     |
| SESSION_RECID | NUMBER   | Session recid          |
| SESSION_STAMP | NUMBER   | Session stamp          |
| BS_KEY        | NUMBER   | Backup set identifier  |
| BP_KEY        | NUMBER   | Backup piece key       |
| RECID         | NUMBER   | Backup piece record ID |

| Column                | Datatype      | Description                                                                                                                                                                                                    |
|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAMP                 | NUMBER        | Backup piece record stamp                                                                                                                                                                                      |
| SET_STAMP             | NUMBER        | Backup set stamp                                                                                                                                                                                               |
| SET_COUNT             | NUMBER        | Backup set count                                                                                                                                                                                               |
| PIECE#                | NUMBER        | Backup piece number (1-N)                                                                                                                                                                                      |
| COPY#                 | NUMBER        | Indicates the copy number for backup pieces created with duplex enabled. The value is 1 if the backup piece is not duplexed.                                                                                   |
| DEVICE_TYPE           | VARCHAR2(17)  | Type of device on which the backup piece resides. Set to DISK for backup sets on disk.                                                                                                                         |
| HANDLE                | VARCHAR2(513) | Backup piece handle identifies the backup piece on restore                                                                                                                                                     |
| COMMENTS              | VARCHAR2(64)  | Comments returned by the operating system or storage subsystem. Set to NULL for backup pieces on disk. This value is informational only. It is not needed for restore.                                         |
| MEDIA                 | VARCHAR2(65)  | Name of the media on which the backup piece resides. This value is informational only. It is not needed for restore.                                                                                           |
| MEDIA_POOL            | NUMBER        | The media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.                                                                  |
| CONCUR                | VARCHAR2(3)   | (YES NO) indicates whether or not the piece is on a media that can be accessed concurrently                                                                                                                    |
| TAG                   | VARCHAR2(32)  | Backup piece tag. The tag is specified at backup set level, but stored at piece level.                                                                                                                         |
| STATUS                | VARCHAR2(1)   | Indicates the status of the piece: A (available), D (deleted), or X (expired)                                                                                                                                  |
| START_TIME            | DATE          | Starting time                                                                                                                                                                                                  |
| COMPLETION_TIME       | DATE          | Completion time                                                                                                                                                                                                |
| ELAPSED_SECONDS       | NUMBER        | Number of elapsed seconds                                                                                                                                                                                      |
| DELETED               | VARCHAR2(3)   | NO indicates that the file still exists. YES indicates that the file no longer exists because it has been deleted.                                                                                             |
| BYTES                 | NUMBER        | Size of the backup piece, in bytes                                                                                                                                                                             |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)   | Indicates whether or not the file was created in the fast recovery area (YES) or not (NO)                                                                                                                      |
| RMAN_STATUS_RECID     | NUMBER        | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                |
| RMAN_STATUS_STAMP     | NUMBER        | Owning V\$RMAN_STATUS record stamp                                                                                                                                                                             |
| COMPRESSED            | VARCHAR2(3)   | Indicates whether the backup piece is compressed (YES) or not (NO)                                                                                                                                             |
| BACKED_BY_VSS         | VARCHAR2(3)   | Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.                                                                                      |
| ENCRYPTED             | VARCHAR2(3)   | A value of YES means an encrypted backup, otherwise not an encrypted backup.                                                                                                                                   |
| BACKED_BY_OSB         | VARCHAR2(3)   | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                                                      |
| FOR_XTTS              | VARCHAR2(3)   | Indicates whether this is a cross platform backup piece: <ul style="list-style-type: none"> <li>YES: This is a cross platform backup piece.</li> <li>NO: This is not a cross platform backup piece.</li> </ul> |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAME_ENDIAN        | VARCHAR2(3)    | If the value of FOR_XTTS is YES, then this column indicates whether the backup piece has the same endianness as the current database (YES) or not (NO); otherwise NULL.                                                                                                                                                                                                                                                                         |
| CON_ID             | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| PIECES_PER_SET     | NUMBER         | Number of backup pieces per set                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SIZE_BYTES_DISPLAY | VARCHAR2(4000) | Size (in bytes) of the backup piece to display                                                                                                                                                                                                                                                                                                                                                                                                  |

## 7.103 V\$BACKUP\_REDOLOG

V\$BACKUP\_REDOLOG displays information about archived logs in backup sets from the control file.

Note that online redo logs cannot be backed up directly; they must be archived first to disk and then backed up. An archive log backup set can contain one or more archived logs.

| Column            | Datatype    | Description                                                                                                                |
|-------------------|-------------|----------------------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER      | Record ID for this row; it is an integer that identifies this row                                                          |
| STAMP             | NUMBER      | Timestamp used with RECID to uniquely identify this row                                                                    |
| SET_STAMP         | NUMBER      | One of the foreign keys for the row of the V\$BACKUP_SET table that identifies this backup set                             |
| SET_COUNT         | NUMBER      | One of the foreign keys for the row of the V\$BACKUP_SET table that identifies this backup set                             |
| THREAD#           | NUMBER      | Thread number for the log                                                                                                  |
| SEQUENCE#         | NUMBER      | Log sequence number                                                                                                        |
| RESETLOGS_CHANGE# | NUMBER      | Change number of the last resetlogs before the log was written                                                             |
| RESETLOGS_TIME    | DATE        | Change time of the last resetlogs before the log was written. These will be the same for all logs in a backup set.         |
| FIRST_CHANGE#     | NUMBER      | SCN when the log was switched into. The redo in the log is at this SCN and greater.                                        |
| FIRST_TIME        | DATE        | Time allocated when the log was switched into                                                                              |
| NEXT_CHANGE#      | NUMBER      | SCN when the next log in this thread was switched into. The redo in the log is below this SCN.                             |
| NEXT_TIME         | DATE        | Time when the next log in this thread was switched into                                                                    |
| BLOCKS            | NUMBER      | Size of the log in logical blocks including the header block                                                               |
| BLOCK_SIZE        | NUMBER      | Size of the log blocks in bytes                                                                                            |
| TERMINAL          | VARCHAR2(3) | Indicates whether this record corresponds to a terminal archived redo log, as defined in V\$ARCHIVED_LOG (YES) or not (NO) |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.104 V\$BACKUP\_SET

V\$BACKUP\_SET displays information about backup sets from the control file.

A backup set record is inserted after the backup set is successfully completed.

| Column               | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID                | NUMBER      | Backup set record ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| STAMP                | NUMBER      | Backup set record stamp                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SET_STAMP            | NUMBER      | Backup set stamp. The backup set stamp and count uniquely identify the backup set.<br>Primary key for the V\$BACKUP_SET table, and the foreign key for the following tables: V\$BACKUP_PIECE, V\$BACKUP_DATAFILE, V\$BACKUP_REDOLOG, V\$BACKUP_CORRUPTION.                                                                                                                                                                                                                                 |
| SET_COUNT            | NUMBER      | Backup set count. The backup set count is incremented by one every time a new backup set is started (if the backup set is never completed the number is "lost"). If the control file is re-created then the count is reset to 1. Therefore the count must be used with the stamp to uniquely identify a backup set.<br>Primary key for the V\$BACKUP_SET table, and the foreign key for the following tables: V\$BACKUP_PIECE, V\$BACKUP_DATAFILE, V\$BACKUP_REDOLOG, V\$BACKUP_CORRUPTION |
| BACKUP_TYPE          | VARCHAR2(1) | Type of files that are in this backup. If the backup contains archived redo logs, the value is L. If this is a data file full backup, the value is D. If this is an incremental backup, the value is I.                                                                                                                                                                                                                                                                                    |
| CONTROLFILE_INCLUDED | VARCHAR2(3) | Provides information about the control file in the backup set: <ul style="list-style-type: none"> <li>YES: The control file included is a primary control file.</li> <li>SBY: The control file included is a standby control file.</li> <li>NO: A control file is not included.</li> </ul>                                                                                                                                                                                                 |
| INCREMENTAL_LEVEL    | NUMBER      | Location where this backup set fits into the database's backup strategy. Set to NULL for full datafile, archive log, controlfile, and spfile backups, set to 0 for incremental level 0 datafile backups, and set to 1 for incremental level 1 datafile backups.                                                                                                                                                                                                                            |
| PIECES               | NUMBER      | Number of distinct backup pieces in the backup set                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| START_TIME           | DATE        | Starting time                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| COMPLETION_TIME      | DATE        | Time that this backup set completed                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ELAPSED_SECONDS      | NUMBER      | The number of elapsed seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| BLOCK_SIZE           | NUMBER      | Block size of the backup set                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INPUT_FILE_SCAN_ONLY | VARCHAR2(3)  | YES indicates no actual backup is performed, but the data files are read. NO indicates a normal backup is performed.                                                                                                                                                                                                                                                                                                                                  |
| KEEP                 | VARCHAR2(3)  | (YES/NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy                                                                                                                                                                                                                                                                                                          |
| KEEP_UNTIL           | DATE         | If KEEP_UNTIL_TIME is specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.                                                                                                                                                                                                                                                                                                     |
| KEEP_OPTIONS         | VARCHAR2(11) | Lists additional retention options for this backup set. Possible values are:<br>LOGS - The logs need to recover this backup are kept<br>NOLOGS - The logs needed to recover this backup will not be kept<br>BACKUP_LOGS - An archive log backup exists to support this backup set                                                                                                                                                                     |
| MULTI_SECTION        | VARCHAR2(3)  | Indicates whether or not this backup set is a multi-section backup. Valid values are YES and NO. A multi-section backup is a backup in which multiple backup pieces are produced independently in parallel by multiple channels.                                                                                                                                                                                                                      |
| FOR_XTTS             | VARCHAR2(3)  | Indicates whether this is a cross platform backup set: <ul style="list-style-type: none"> <li>• YES: This is a cross platform backup set.</li> <li>• NO: This is not a cross platform backup set.</li> </ul>                                                                                                                                                                                                                                          |
| SAME_ENDIAN          | VARCHAR2(3)  | If the value of FOR_XTTS is YES, then this column indicates whether the backup set has the same endianness as the current database (YES) or not (NO); otherwise NULL.                                                                                                                                                                                                                                                                                 |
| INC_DMPFILE          | VARCHAR2(3)  | If the value of FOR_XTTS is YES, then this column indicates whether the backup set includes a Data Pump export file of the backed up data files (YES) or not (NO), otherwise NULL.                                                                                                                                                                                                                                                                    |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| GUID                 | RAW(16)      | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                                                 |

## 7.105 V\$BACKUP\_SET\_DETAILS

V\$BACKUP\_SET\_DETAILS provides detailed information about the backup set.

This view will contain an extra row for each backup session that invokes BACKUP BACKUPSET (that is, creates new copies for the same backup set or copies backup set information from disk to tape). However, the remaining values of other columns belong to the complete backup set.

| Column                         | Datatype       | Description                                                                                                                                                                            |
|--------------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_KEY                    | NUMBER         | Session identifier                                                                                                                                                                     |
| SESSION_RECID                  | NUMBER         | Identifies the job, together with SESSION_STAMP.                                                                                                                                       |
| SESSION_STAMP                  | NUMBER         | Identifies the job, together with SESSION_RECID                                                                                                                                        |
| BS_KEY                         | NUMBER         | Backup set identifier                                                                                                                                                                  |
| RECID                          | NUMBER         | RECID from V\$BACKUP_SET record                                                                                                                                                        |
| STAMP                          | NUMBER         | Stamp from V\$BACKUP_SET record                                                                                                                                                        |
| SET_STAMP                      | NUMBER         | Backup set stamp                                                                                                                                                                       |
| SET_COUNT                      | NUMBER         | Backup count number                                                                                                                                                                    |
| BACKUP_TYPE                    | VARCHAR2(1)    | Type of backup (same as in V\$BACKUP_SET)                                                                                                                                              |
| CONTROLFILE_INCLUDED           | VARCHAR2(3)    | Control file included in backup set (same as in V\$BACKUP_SET)                                                                                                                         |
| INCREMENTAL_LEVEL              | NUMBER         | Incremental level (same as in V\$BACKUP_SET)                                                                                                                                           |
| PIECES                         | NUMBER         | Number of pieces (same as in V\$BACKUP_SET)                                                                                                                                            |
| START_TIME                     | DATE           | Start time of the backup set (same as in V\$BACKUP_SET)                                                                                                                                |
| COMPLETION_TIME                | DATE           | Completion time of the backup set (same as in V\$BACKUP_SET)                                                                                                                           |
| ELAPSED_SECONDS                | NUMBER         | Time taken for backup set creation (same as in V\$BACKUP_SET)                                                                                                                          |
| BLOCK_SIZE                     | NUMBER         | Block size (same as in V\$BACKUP_SET)                                                                                                                                                  |
| KEEP                           | VARCHAR2(3)    | Keep value (same as in V\$BACKUP_SET)                                                                                                                                                  |
| KEEP_UNTIL                     | DATE           | Keep Until time (same as in V\$BACKUP_SET)                                                                                                                                             |
| KEEP_OPTIONS                   | VARCHAR2(11)   | Keep options (same as in V\$BACKUP_SET)                                                                                                                                                |
| DEVICE_TYPE                    | VARCHAR2(17)   | Type of device. If the backup set exists on more than one device type, an * is indicated here.                                                                                         |
| COMPRESSED                     | VARCHAR2(3)    | YES, if backup is compressed                                                                                                                                                           |
| NUM_COPIES                     | NUMBER         | Number of identical copies                                                                                                                                                             |
| OUTPUT_BYTES                   | NUMBER         | Size of the backup set                                                                                                                                                                 |
| ORIGINAL_INPUT_BYTES           | NUMBER         | Amount of data backed up when the backup set was created                                                                                                                               |
| COMPRESSION_RATIO              | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command. |
| STATUS                         | CHAR(1)        | The status of the backup set. It is always A (all backup pieces available), because this view only reflects available backup sets.                                                     |
| ORIGINAL_INPRATE_BYTES         | NUMBER         | Number of bytes read per second when backup set was initially created                                                                                                                  |
| OUTPUT_RATE_BYTES              | NUMBER         | Number of bytes written per second when the backup set was initially created                                                                                                           |
| ORIGINAL_INPUT_BYTES_DISPLAY   | VARCHAR2(4000) | Input rate to display                                                                                                                                                                  |
| OUTPUT_BYTES_DISPLAY           | VARCHAR2(4000) | Size of backup set to display                                                                                                                                                          |
| ORIGINAL_INPRATE_BYTES_DISPLAY | VARCHAR2(4000) | Input rate per second for display                                                                                                                                                      |
| OUTPUT_RATE_BYTES_DISPLAY      | VARCHAR2(4000) | Output rate per second for display                                                                                                                                                     |
| TIME_TAKEN_DISPLAY             | VARCHAR2(4000) | Elapsed time in hh:mm:ss format                                                                                                                                                        |

| Column        | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENCRYPTED     | VARCHAR2(3) | A value of YES means an encrypted backup, otherwise not an encrypted backup.                                                                                                                                                                                                                                                                                                                                                                    |
| BACKED_BY_OSB | VARCHAR2(3) | A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.                                                                                                                                                                                                                                                                                                                       |
| CON_ID        | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.106 V\$BACKUP\_SET\_SUMMARY

V\$BACKUP\_SET\_SUMMARY provides summary information for a backup set.

| Column                         | Datatype       | Description                                                                                                                                                                            |
|--------------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_BACKUPSETS                 | NUMBER         | Total number of backup sets created                                                                                                                                                    |
| OLDEST_BACKUP_TIME             | DATE           | Oldest backup start time                                                                                                                                                               |
| NEWEST_BACKUP_TIME             | DATE           | Newest backup start time                                                                                                                                                               |
| OUTPUT_BYTES                   | NUMBER         | Number of output bytes (not including multiple copies)                                                                                                                                 |
| ORIGINAL_INPUT_BYTES           | NUMBER         | Number of input bytes when backup sets were created                                                                                                                                    |
| ORIGINAL_INPRATE_BYTES         | NUMBER         | Average input rate                                                                                                                                                                     |
| OUTPUT_RATE_BYTES              | NUMBER         | Average output rate                                                                                                                                                                    |
| COMPRESSION_RATIO              | NUMBER         | The ratio between the total blocks in the datafile and the blocks that RMAN backed up. This is <i>not</i> the the ratio from the AS COMPRESSED BACKUPSET clause of the BACKUP command. |
| ORIGINAL_INPUT_BYTES_DISPLAY   | VARCHAR2(4000) | Displayable format for input bytes                                                                                                                                                     |
| OUTPUT_BYTES_DISPLAY           | VARCHAR2(4000) | Displayable format for output bytes                                                                                                                                                    |
| ORIGINAL_INPRATE_BYTES_DISPLAY | VARCHAR2(4000) | Displayable format for input rate                                                                                                                                                      |
| OUTPUT_RATE_BYTES_DISPLAY      | VARCHAR2(4000) | Displayable format for output rate                                                                                                                                                     |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.107 V\$BACKUP\_SPFILE

V\$BACKUP\_SPFILE displays information about server parameter files in backup sets from the control file.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER       | Backup SPFILE record ID                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STAMP             | NUMBER       | Backup SPFILE record stamp                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SET_STAMP         | NUMBER       | Backup set stamp (of the set which contains this SPFILE backup)                                                                                                                                                                                                                                                                                                                                                                                 |
| SET_COUNT         | NUMBER       | Backup set count (of the set which contains this SPFILE backup)                                                                                                                                                                                                                                                                                                                                                                                 |
| MODIFICATION_TIME | DATE         | Time when the SPFILE was last modified (this also includes creation time)                                                                                                                                                                                                                                                                                                                                                                       |
| BYTES             | NUMBER       | Size of the SPFILE (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| COMPLETION_TIME   | DATE         | Time when the backup of the SPFILE completed                                                                                                                                                                                                                                                                                                                                                                                                    |
| DB_UNIQUE_NAME    | VARCHAR2(30) | Unique database name                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| GUID              | RAW(16)      | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                                           |

## 7.108 V\$BACKUP\_SPFILE\_DETAILS

V\$BACKUP\_SPFILE\_DETAILS displays information about all restorable SP files backed up in the backup set.

| Column        | Datatype | Description        |
|---------------|----------|--------------------|
| SESSION_KEY   | NUMBER   | Session identifier |
| SESSION_RECID | NUMBER   | Session recid      |
| SESSION_STAMP | NUMBER   | Session stamp      |

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BS_KEY            | NUMBER         | Unique backup set identifier                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SET_STAMP         | NUMBER         | Backup set stamp                                                                                                                                                                                                                                                                                                                                                                                                                                |

| MODIFICATION_TIME | DATE           | Time the backup set was modified                                                                                                                                                                                                                                                                                                                                                                                                                |
| FILESIZE          | NUMBER         | Size, in bytes, of the SPFILE that was backed up                                                                                                                                                                                                                                                                                                                                                                                                |
| FILESIZE_DISPLAY  | VARCHAR2(4000) | Same value as the FILESIZE column, but converted to a user-displayable format, for example <i>nM</i> , <i>nG</i> , <i>nT</i> , <i>nP</i> , and so on                                                                                                                                                                                                                                                                                            |
| CON_ID            | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.109 V\$BACKUP\_SPFILE\_SUMMARY

V\$BACKUP\_SPFILE\_SUMMARY provides summary information for input SP file, based on either a backup job or time range applicable to jobs.

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM_FILES_BACKED          | NUMBER         | Number of files backed up                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NUM_DISTINCT_FILES_BACKED | NUMBER         | Number of distinct SP files backed up (with modification timestamp)                                                                                                                                                                                                                                                                                                                                                                             |
| MIN_MODIFICATION_TIME     | DATE           | Minimum modification time                                                                                                                                                                                                                                                                                                                                                                                                                       |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.110 V\$BACKUP\_SYNC\_IO

V\$BACKUP\_SYNC\_IO displays performance information about ongoing and recently completed RMAN backups and restores.

For each backup, it contains one row for each input data file, one row for the aggregate total performance of all data files, and one row for the output backup piece.

This data is not stored persistently, and is not preserved when the instance is re-started.

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                        | NUMBER        | The Oracle SID of the session doing the backup or restore                                                                                                                                                                                                                                                                                                                                                                         |
| SERIAL                     | NUMBER        | The use count for the SID doing the backup or restore                                                                                                                                                                                                                                                                                                                                                                             |
| USE_COUNT                  | NUMBER        | A counter that can be used to identify rows from different backup sets                                                                                                                                                                                                                                                                                                                                                            |

| IO_TIME_TOTAL              | NUMBER        | The total time, in hundredths of a second, taken to do I/O for this file                                                                                                                                                                                                                                                                                                                                                          |
| IO_TIME_MAX                | NUMBER        | The maximum time taken for a single I/O request                                                                                                                                                                                                                                                                                                                                                                                   |
| DISCRETE_BYTES_PER_SECOND  | NUMBER        | The average transfer rate for this file                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID                     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 7.111 V\$BGPROCESS

V\$BGPROCESS displays information about the background processes.

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PADDR       | RAW(4   8)   | Address of the process state object                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PSERIAL#    | NUMBER       | Process state object serial number                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NAME        | VARCHAR2(5)  | Name of this background process                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DESCRIPTION | VARCHAR2(64) | Description of the background process                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ERROR       | NUMBER       | Error encountered                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TYPE        | VARCHAR2(5)  | This column has a value of <code>SLAVE</code> for all background slave processes, otherwise it is null.                                                                                                                                                                                                                                                                                                                                                                               |
| PRIORITY    | VARCHAR2(8)  | Lists the current priority with which the process is running. This column has string values based on the operating system. On Linux, the values that can appear in this column are: <ul style="list-style-type: none"> <li>• <code>TS</code>: Time sharing</li> <li>• <code>RT</code>: Real time priority</li> </ul>                                                                                                                                                                  |
| CON_ID      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• <code>0</code>: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• <code>1</code>: This value is used for rows containing data that pertain to only the root</li> <li>• <code>n</code>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.112 V\$BH

V\$BH displays the status and number of pings for every buffer in the SGA. This is an Oracle Real Application Clusters view.

| Column | Datatype | Description                                                                                                       |
|--------|----------|-------------------------------------------------------------------------------------------------------------------|
| FILE#  | NUMBER   | Data file identifier number (to find the file name, query <code>DBA_DATA_FILES</code> or <code>V\$DBFILE</code> ) |
| BLOCK# | NUMBER   | Block number                                                                                                      |
| CLASS# | NUMBER   | Class number                                                                                                      |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS             | VARCHAR2(10) | Status of the buffer: <ul style="list-style-type: none"> <li>• free - Not currently in use</li> <li>• xcur - Exclusive</li> <li>• scur - Shared current</li> <li>• cr - Consistent read</li> <li>• read - Being read from disk</li> <li>• mrec - In media recovery mode</li> <li>• irec - In instance recovery mode</li> <li>• pi - A past image in RAC mode</li> <li>• securefile - A secured file buffer</li> <li>• flashfree - A free flash cache buffer</li> <li>• flashcur - A current flash cache buffer</li> </ul> |
| XNC                | NUMBER       | This column is obsolete. Its value is hard-coded to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| FORCED_READS       | NUMBER       | This column is obsolete. Its value is hard-coded to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| FORCED_WRITES      | NUMBER       | This column is obsolete. Its value is hard-coded to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LOCK_ELEMENT_ADDR  | RAW(4   8)   | Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.                                                                                                                                                                                                                                                                                                                                    |
| LOCK_ELEMENT_NAME  | NUMBER       | The address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.                                                                                                                                                                                                                                                                                                                                |
| LOCK_ELEMENT_CLASS | NUMBER       | The address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.                                                                                                                                                                                                                                                                                                                                |

| CON_ID           | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.113 V\$BLOCK\_CHANGE\_TRACKING

V\$BLOCK\_CHANGE\_TRACKING displays the status of block change tracking for the database.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS   | VARCHAR2(10)  | Status of block change tracking in the database: <ul style="list-style-type: none"> <li>• DISABLED - Block change tracking is disabled</li> <li>• TRANSITION - Block change tracking is in the process of transitioning between the enabled and disabled states. The TRANSITION state should usually never be observed, because it only exists while enabling or disabling block change tracking. This state might be observed if the instance crashed while enabling or disabling block change tracking, in which case it will be cleaned up automatically the next time that the database is opened.</li> <li>• ENABLED - Block change tracking is enabled</li> </ul> |
| FILENAME | VARCHAR2(513) | Name of the block change tracking file for the database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BYTES    | NUMBER        | Size of the block change tracking file (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                   |

## 7.114 V\$BLOCKING\_QUIESCE

V\$BLOCKING\_QUIESCE indicates if a session is blocking, or would block, a quiesce operation.

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID    | NUMBER   | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.115 V\$BT\_SCAN\_CACHE

V\$BT\_SCAN\_CACHE shows the parameters and status of the big table cache section.

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BT_CACHE_ALLOC   | NUMBER   | Current ratio of the big table cache section to the buffer cache                                                                                                                                                                                                                                                                                                                                                                                |
| BT_CACHE_TARGET  | NUMBER   | Target ratio of the big table cache section to the buffer cache                                                                                                                                                                                                                                                                                                                                                                                 |
| OBJECT_COUNT     | NUMBER   | Number of objects tracked by the big table cache section                                                                                                                                                                                                                                                                                                                                                                                        |
| MEMORY_BUF_ALLOC | NUMBER   | Number of memory buffers allocated by the big table cache section to objects                                                                                                                                                                                                                                                                                                                                                                    |
| MIN_CACHED_TEMP  | NUMBER   | Minimum temperature of any object that is allowed to be cached by the big table cache section                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.116 V\$BT\_SCAN\_OBJ\_TEMPS

V\$BT\_SCAN\_OBJ\_TEMPS shows the active objects currently tracked by the big table cache.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TS#           | NUMBER       | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DATAOBJ#      | NUMBER       | Data object number (objd)                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SIZE_IN_BLKs  | NUMBER       | Size of the object being scanned on this instance, in blocks                                                                                                                                                                                                                                                                                                                                                                                    |
| TEMPERATURE   | NUMBER       | Temperature of this object                                                                                                                                                                                                                                                                                                                                                                                                                      |
| POLICY        | VARCHAR2(10) | Caching policy of this object. Possible values: <ul style="list-style-type: none"> <li>MEM_ONLY: This object will be fully cached in memory.</li> <li>MEM_PART: This object will be partially cached in memory and some portion will remain on disk and will not be cached.</li> <li>DISK: this object will not be cached in memory or flash for the scan at all.</li> <li>INVALID: The caching policy is not valid.</li> </ul>                 |
| CACHED_IN_MEM | NUMBER       | The number of blocks that are cached/allocated in memory for this object                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.117 V\$BUFFER\_POOL

V\$BUFFER\_POOL displays information about all buffer pools available for the instance.

| Column | Datatype | Description                   |
|--------|----------|-------------------------------|
| ID     | NUMBER   | Buffer pool identifier number |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME           | VARCHAR2(20) | Name of the buffer pool: <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• KEEP</li> <li>• RECYCLE</li> </ul> <p><b>Note:</b> Currently, KEEP and RECYCLE pools only exist for the standard block size. All nonstandard block size pools are DEFAULT.</p>                                                                                                                                                                     |
| BLOCK_SIZE     | NUMBER       | Block size (in bytes) for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768.                                                                                                                                                                                                                                                                       |
| RESIZE_STATE   | VARCHAR2(10) | Current state of the resize operation: <p>STATIC - Not being resized</p> <p>ALLOCATING - Memory is being allocated (can be canceled by the user)</p> <p>ACTIVATING - New buffers are being created (user cannot cancel)</p> <p>SHRINKING - Buffers are being deleted (can be canceled by the user)</p>                                                                                                                                  |
| CURRENT_SIZE   | NUMBER       | Present size of the sub-cache (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                            |
| BUFFERS        | NUMBER       | Current instantaneous number of buffers                                                                                                                                                                                                                                                                                                                                                                                                 |
| TARGET_SIZE    | NUMBER       | If a resize is in progress (state is not STATIC), records new target size (in megabytes). If the pool is STATIC, the value in this column is the same as the current size of the pool.                                                                                                                                                                                                                                                  |
| TARGET_BUFFERS | NUMBER       | If a resize is in progress, records new target size in terms of buffers. Otherwise, the value in this column is the same as the current number of buffers.                                                                                                                                                                                                                                                                              |
| PREV_SIZE      | NUMBER       | Previous buffer pool size. If the buffer pool has never been resized, the previous size is zero.                                                                                                                                                                                                                                                                                                                                        |
| PREV_BUFFERS   | NUMBER       | Previous number of buffers in the buffer pool. Value is zero if the buffer pool has never been resized.                                                                                                                                                                                                                                                                                                                                 |
| LO_BNUM        | NUMBER       | Obsolete column                                                                                                                                                                                                                                                                                                                                                                                                                         |
| HI_BNUM        | NUMBER       | Obsolete column                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 7.119 V\$BUFFERED\_PUBLISHERS

V\$BUFFERED\_PUBLISHERS displays information about all buffered publishers in the instance.

There is one row per queue per sender. The values are reset to zero when the database (or instance in an Oracle RAC environment) restarts.

| Column               | Datatype                       | Description                                                                                                                                                                                                                                                                              |
|----------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID             | NUMBER                         | Identifier for the queue                                                                                                                                                                                                                                                                 |

| OLDEST_MSG_ENQTM             | TIMESTAMP(3)                   | Enqueue time of the oldest message                                                                                   |
| QUEUE_STATE                  | VARCHAR2(25)                   | Indicates whether the queue is in recovery mode (QUEUE IS IN RECOVERY MODE) or not (NORMAL)                          |
| ELAPSED_ENQUEUE_TIME         | NUMBER                         | Total time spent in enqueue (in hundredths of a second)                                                              |
| ELAPSED_DEQUEUE_TIME         | NUMBER                         | Total time spent in dequeue (in hundredths of a second)                                                              |
| ELAPSED_TRANSFORMATION_TIME  | NUMBER                         | Total time for evaluating transformations (in hundredths of a second)                                                |
| ELAPSED_RULE_EVALUATION_TIME | NUMBER                         | Total time for rule evaluations (in hundredths of a second)                                                          |
| ENQUEUE_CPU_TIME             | NUMBER                         | Total CPU time for enqueue (in hundredths of a second)                                                               |
| DEQUEUE_CPU_TIME             | NUMBER                         | Total CPU time for dequeue (in hundredths of a second)                                                               |
| AVG_MSG_AGE                  | NUMBER                         | Average age of messages in the queue                                                                                 |
| LAST_ENQUEUE_TIME            | TIMESTAMP(3)<br>WITH TIME ZONE | Last message enqueue time                                                                                            |

| Column            | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_DEQUEUE_TIME | TIMESTAMP(3)<br>WITH TIME ZONE | Last message dequeue time                                                                                                                                                                                                                                                                                                                                                                                                                       |
| QUEUE_SIZE        | NUMBER                         | Size of queue, which is the total number of bytes allocated for all messages and metadata                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID            | NUMBER                         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.121 V\$BUFFERED\_SUBSCRIBERS

V\$BUFFERED\_SUBSCRIBERS displays information about the subscribers for all buffered queues in the instance. There is one row per subscriber per queue.

| Column             | Datatype       | Description                                                                                                                                              |
|--------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUE_ID           | NUMBER         | Identifier for the queue                                                                                                                                 |
| QUEUE_SCHEMA       | VARCHAR2(128)  | Owner of the queue                                                                                                                                       |
| QUEUE_NAME         | VARCHAR2(128)  | Name of the queue                                                                                                                                        |
| SUBSCRIBER_ID      | NUMBER         | Internal subscriber number (for identification)                                                                                                          |
| SUBSCRIBER_NAME    | VARCHAR2(512)  | Name of the subscriber                                                                                                                                   |
| SUBSCRIBER_ADDRESS | VARCHAR2(1024) | Address of the subscribing agent                                                                                                                         |
| PROTOCOL           | NUMBER         | Protocol of the subscribing agent                                                                                                                        |
| SUBSCRIBER_TYPE    | VARCHAR2(128)  | Type of the subscriber: <ul style="list-style-type: none"> <li>PROXY - Proxy subscriber</li> <li>SUBSCRIBER</li> </ul>                                   |
| STARTUP_TIME       | DATE           | Startup time                                                                                                                                             |
| LAST_BROWSED_SEQ   | NUMBER         | Sequence number of the most recently browsed message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_READER view)       |
| LAST_BROWSED_NUM   | NUMBER         | Internal Message number for the most recently browsed message for the subscriber                                                                         |
| LAST_DEQUEUE_SEQ   | NUMBER         | Sequence number of the most recently dequeued message for the subscriber (comparable to the number of messages in the V\$STREAMS_APPLY_COORDINATOR view) |
| LAST_DEQUEUE_NUM   | NUMBER         | Internal Message number for the most recently dequeued message for the subscriber                                                                        |
| CURRENT_ENQ_SEQ    | NUMBER         | Current sequence number of the most recently enqueued message for the subscriber                                                                         |
| NUM_MSGS           | NUMBER         | Total number of outstanding messages currently enqueued in the buffered queue for the subscriber (includes the count of the messages overflowed to disk) |

| Column               | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CNUM_MSGS            | NUMBER                         | Cumulative total number of messages enqueued for the subscriber since the database last started                                                                                                                                                                                                                                                                                                                                                 |
| TOTAL_DEQUEUED_MSG   | NUMBER                         | Total number of messages dequeued by the subscriber                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_SPILLED_MSG    | NUMBER                         | Total number of spilled messages for the subscriber                                                                                                                                                                                                                                                                                                                                                                                             |
| EXPIRED_MSGS         | NUMBER                         | Number of expired messages                                                                                                                                                                                                                                                                                                                                                                                                                      |
| MESSAGE_LAG          | NUMBER                         | Message lag of the subscriber                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ELAPSED_DEQUEUE_TIME | NUMBER                         | Total time spent in dequeue (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                         |

| CON_ID               | NUMBER                         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.122 V\$CACHE

V\$CACHE displays information from the block header of each block in the SGA of the current instance as related to particular database objects. This is an Oracle Real Application Clusters view.

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                     |

## 7.124 V\$CACHE\_TRANSFER

V\$CACHE\_TRANSFER is identical to the V\$CACHE view but only displays blocks that have been pinged at least once.

This view contains information from the block header of each block in the SGA of the current instance as related to particular database objects. This is an Oracle Real Application Clusters view.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                     |

## 7.126 V\$CIRCUIT

V\$CIRCUIT contains information about virtual circuits, which are user connections to the database through dispatchers and servers.

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                             |
|-------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CIRCUIT                 | RAW(4   8)    | Circuit address                                                                                                                                                                                                                                                                         |
| DISPATCHER              | RAW(4   8)    | Current dispatcher process address                                                                                                                                                                                                                                                      |
| SERVER                  | RAW(4   8)    | Current server process address                                                                                                                                                                                                                                                          |
| WAITER                  | RAW(4   8)    | Address of the server process that is waiting for the (currently busy) circuit to become available                                                                                                                                                                                      |
| SADDR                   | RAW(4   8)    | Address of the session bound to the circuit                                                                                                                                                                                                                                             |
| STATUS                  | VARCHAR2(16)  | Status of the circuit: <ul style="list-style-type: none"> <li>BREAK - currently interrupted</li> <li>EOF - about to be removed</li> <li>OUTBOUND - an outward link to a remote database</li> <li>NORMAL - normal circuit into the local database</li> </ul>                             |
| QUEUE                   | VARCHAR2(16)  | Queue the circuit is currently on: <ul style="list-style-type: none"> <li>COMMON - on the common queue, waiting to be picked up by a server process</li> <li>DISPATCHER - waiting for the dispatcher</li> <li>SERVER - currently being serviced</li> <li>NONE - idle circuit</li> </ul> |
| MESSAGE0                | NUMBER        | Size in bytes of the messages in the first message buffer                                                                                                                                                                                                                               |
| MESSAGE1                | NUMBER        | Size in bytes of the messages in the second message buffer                                                                                                                                                                                                                              |
| MESSAGE2                | NUMBER        | Size in bytes of the messages in the third message buffer                                                                                                                                                                                                                               |
| MESSAGE3                | NUMBER        | Size in bytes of the messages in the fourth message buffer                                                                                                                                                                                                                              |
| MESSAGES                | NUMBER        | Total number of messages that have gone through this circuit                                                                                                                                                                                                                            |
| BYTES                   | NUMBER        | Total number of bytes that have gone through this circuit                                                                                                                                                                                                                               |
| BREAKS                  | NUMBER        | Total number of breaks (interruptions) for this circuit                                                                                                                                                                                                                                 |
| PRESENTATION            | VARCHAR2(257) | Presentation protocol used by the client and server                                                                                                                                                                                                                                     |
| PCIRCUIT                | RAW(4   8)    | Address of the parent circuit                                                                                                                                                                                                                                                           |
| BOUND_TIME <sup>1</sup> | NUMBER        | Time that a circuit and shared server have been bound (in centiseconds)                                                                                                                                                                                                                 |

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BOUND_REASON <sup>1</sup> | VARCHAR2 (32) | Provides a reason (a short explanation) for why a shared server and circuit could not be unbound.<br>This column is empty when a circuit is not bound to a server.<br>When the server starts serving a circuit, BOUND_REASON is empty and remains empty unless the server tries unsuccessfully to unbind the circuit (after it finishes serving the current request).<br>When this column is not empty, it will be cleared once the server and circuit are unbound (that is, once the resources preventing the session migration to another shared server are released). |
| CON_ID                    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                          |

<sup>1</sup> This column is available starting with Oracle Database release 19c, version 19.1.

## 7.127 V\$CLASS\_CACHE\_TRANSFER

V\$CLASS\_CACHE\_TRANSFER is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column                | Datatype | Description                                                     |
|-----------------------|----------|-----------------------------------------------------------------|
| CLASS                 | CHAR(10) | Block class; always data block                                  |
| X_2_NULL              | NUMBER   | Number of blocks with Exclusive-to-NULL conversions; always 0   |
| X_2_NULL_FORCED_WRITE | NUMBER   | Number of Exclusive-to-NULL forced writes; always 0             |
| X_2_NULL_FORCED_STALE | NUMBER   | Number of Exclusive-to-NULL blocks converted to CR; always 0    |
| X_2_S                 | NUMBER   | Number of blocks with Exclusive-to-Shared conversions; always 0 |
| X_2_S_FORCED_WRITE    | NUMBER   | Number of Exclusive-to-Shared forced writes; always 0           |
| S_2_NULL              | NUMBER   | Number of blocks with Shared-to-NULL conversions; always 0      |
| S_2_NULL_FORCED_STALE | NUMBER   | Number of Shared-to-NULL blocks converted to CR; always 0       |
| NULL_2_X              | NUMBER   | Number of blocks with NULL-to-Exclusive conversions; always 0   |
| S_2_X                 | NUMBER   | Number of blocks with Shared-to-Exclusive conversions; always 0 |
| NULL_2_S              | NUMBER   | Number of blocks with NULL-to-Shared conversions; always 0      |
| CR_TRANSFER           | NUMBER   | Number of CR blocks transferred; always 0                       |
| CURRENT_TRANSFER      | NUMBER   | Number of current blocks transferred; always 0                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.130 V\$CLIENT\_STATS

V\$CLIENT\_STATS displays measures for all sessions that are active for the client identifier per instance.

The statistics available in this view are a subset of those available in V\$SESSTAT and V\$SESS\_TIME\_MODEL.

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IDENTIFIER | VARCHAR2(64) | Client identifier                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 7.131 V\$CLONEDFILE

V\$CLONEDFILE provides CloneDB file information.

| Column           | Datatype      | Description                                                                                                                                                                |
|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAPSHOTFILENAME | VARCHAR2(513) | Snapshot/master file name. This file is the master file from the master database. The snapshot file is also sometimes referred to as the srfile.                           |
| CLONEFILENAME    | VARCHAR2(513) | CloneDB file name. This file is the cloned file (of master file) which resides in the current (cloned database). The cloned file is sometimes referred to as the destfile. |
| SNAPSHOTBLKREAD  | NUMBER        | Number of blocks reads to the snapshot file (master file)                                                                                                                  |

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNAPSHOTREQUEST  | NUMBER   | Number of read requests to the snapshot file (master file)                                                                                                                                                                                                                                                                                                                                                                                      |
| FILENUMBER       | NUMBER   | File number of the cloned file                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| BLOCKS_ALLOCATED | NUMBER   | Amount of space allocated in blocks in the file system. This is less than or equal to the actual file size.                                                                                                                                                                                                                                                                                                                                     |

 **Note:**

When this view is queried in an Oracle Database environment, rows are returned for every opened file, even those without a parent file backing them (in those cases the column is empty/NULL).

In an Oracle ASM environment, rows are returned for files that an Oracle ASM instance has mounted in disk groups only if those files are children (a clonefile) of a parent snapshot file.

## 7.132 V\$CLUSTER\_INTERCONNECTS

V\$CLUSTER\_INTERCONNECTS displays one or more interconnects that are being used for cluster communication.

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME       | VARCHAR2(15) | Name of the interconnect (such as eth0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| IP_ADDRESS | VARCHAR2(64) | IP address of the interconnect                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| IS_PUBLIC  | VARCHAR2(3)  | If the value is YES, the interface is known to the public.<br>If the value is NO, the interface is known to be private. Note that if the CLUSTER_INTERCONNECTS initialization parameter is also specified, then it is expected that the interconnect is private. Oracle expects cluster traffic to be run on private interconnects only.<br>If the value is empty, it is unknown whether the interface is public or private.<br>Oracle recommends that you set the interface for Oracle Real Application Clusters (Oracle RAC) communication in the Oracle Cluster Registry (OCR). |

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOURCE | VARCHAR2(31) | Indicates where this interface was picked up from: <ul style="list-style-type: none"> <li>Oracle Cluster Registry - Interface was configured in the OCR and Oracle Database found the interface in the OCR</li> <li>Operating-system dependent software - Oracle Database automatically detects this</li> <li>CLUSTER_INTERCONNECTS parameter - This initialization parameter was set</li> </ul>                                                |
| CON_ID | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.133 V\$CODE\_CLAUSE

V\$CODE\_CLAUSE contains the supported clause names and parameter names for the Oracle Data Vault ALTER SYSTEM and ALTER SESSION commands.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CODE_ID#       | NUMBER        | The OCT code ID: <ul style="list-style-type: none"> <li>42: For ALTER SESSION</li> <li>49: For ALTER SYSTEM</li> </ul>                                                                                                                                                                                                                                                                                                                          |
| CLAUSE_ID#     | NUMBER        | Clause ID                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CLAUSE_NAME    | VARCHAR2(100) | The clause name that is supported by the Oracle Data Vault command rule (for example, SET or ADVICE)                                                                                                                                                                                                                                                                                                                                            |
| PARAMETER_NAME | VARCHAR2(100) | The parameter name that is supported by the Oracle Data Vault command rule. For example, for ALTER SYSTEM SET EVENTS, EVENTS is the parameter.                                                                                                                                                                                                                                                                                                  |
| CON_ID         | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.134 V\$CON\_EVENT\_HISTOGRAM\_MICRO

V\$CON\_EVENT\_HISTOGRAM\_MICRO displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis for a container, in microseconds.

The histogram has buckets of time intervals from < 1 us, < 2 us, < 4 us, < 8 us, ... < 2<sup>31</sup> us, < 2<sup>32</sup> us, and >= 2<sup>32</sup> us.

The histogram will not be filled unless the `TIMED_STATISTICS` initialization parameter is set to `true`.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT#           | NUMBER       | Event number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| EVENT            | VARCHAR2(64) | Name of the event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_TIME_FORMAT | VARCHAR2(30) | A human readable time string which is converted from <code>WAIT_TIME_MICRO</code> . When <code>WAIT_TIME_MICRO</code> < 1 millisecond, <code>WAIT_TIME_FORMAT</code> is shown in microseconds. When <code>WAIT_TIME_MICRO</code> < 1 second, <code>WAIT_TIME_FORMAT</code> is shown in milliseconds. When <code>WAIT_TIME_MICRO</code> < 1 minute, <code>WAIT_TIME_FORMAT</code> is shown in seconds. When <code>WAIT_TIME_MICRO</code> > 1 minute, <code>WAIT_TIME_FORMAT</code> is shown in minutes and seconds. |
| WAIT_TIME_MICRO  | NUMBER       | Amount of time the bucket represents (in microseconds). If the duration = num, then this column represents waits of duration < num that are not included in any smaller bucket.                                                                                                                                                                                                                                                                                                                                    |
| WAIT_COUNT       | NUMBER       | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LAST_UPDATE_TIME | VARCHAR2(73) | Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID           | NUMBER       | When queried from a non-CDB, the wait event data in that instance are returned, and the <code>CON_ID</code> value is 0.<br><br>When queried from the root of a CDB, the wait event data in every container is returned, and the <code>CON_ID</code> value indicates the container to which the wait event data belong.<br><br>When queried from a PDB, wait event data in that PDB are returned, and the <code>CON_ID</code> value is the container ID for that PDB.                                               |

## 7.135 V\$CON\_SYS\_TIME\_MODEL

`V$CON_SYS_TIME_MODEL` displays the systemwide accumulated times for various operations for the container from which it is queried.

The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years worth of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

| Column    | Datatype     | Description                                                                  |
|-----------|--------------|------------------------------------------------------------------------------|
| STAT_ID   | NUMBER       | Statistic identifier for the time statistic                                  |
| STAT_NAME | VARCHAR2(64) | Name of the statistic (see <a href="#">Table 9-1</a> )                       |
| VALUE     | NUMBER       | Amount of time (in microseconds) that the system has spent in this operation |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | When queried from a non-CDB, the accumulated times for operations in that instance are returned, and the CON_ID value is 0.<br>When queried from the root of a CDB, accumulated times for operations in every container are returned, and the CON_ID value indicates the container to which the times belong.<br>When queried from a PDB, accumulated times for operations in that PDB are returned, and the CON_ID value is the container ID for that PDB. |

## 7.136 V\$CON\_SYSMETRIC

V\$CON\_SYSMETRIC displays the system metric values captured for the most current time interval for the PDB long duration (60-second) system metrics.

| Column       | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME   | DATE            | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| END_TIME     | DATE            | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| INTSIZE_CSEC | NUMBER          | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 7.139 V\$CON\_SYSSTAT

V\$CON\_SYSSTAT displays system statistics, including OLAP kernel statistics for the container from which it is queried. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

| Column     | Datatype     | Description                                                                                                                                                                                                           |
|------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC# | NUMBER       | Statistic number<br><b>Note:</b> Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications. |
| NAME       | VARCHAR2(64) | Statistic name. You can get a complete listing of statistic names by querying the V\$STATNAME view.                                                                                                                   |

| Column  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                        |

## 7.140 V\$CON\_SYSTEM\_EVENT

V\$CON\_SYSTEM\_EVENT displays information on total waits for an event in a container.

Note that the TIME\_WAITED and AVERAGE\_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set TIMED\_STATISTICS to TRUE in the parameter file; doing this will have a small negative effect on system performance.

| CON_ID               | NUMBER       | When queried from a non-CDB, the wait event data in that instance are returned, and the CON_ID value is 0.<br>When queried from the root of a CDB, the wait event data in every container is returned, and the CON_ID value indicates the container to which the wait event data belong.<br>When queried from a PDB, wait event data in that PDB are returned, and the CON_ID value is the container ID for that PDB. |

## 7.141 V\$CON\_SYSTEM\_WAIT\_CLASS

V\$CON\_SYSTEM\_WAIT\_CLASS displays the time totals for each registered wait class in a container.

| Column         | Datatype     | Description                                                                                           |
|----------------|--------------|-------------------------------------------------------------------------------------------------------|
| WAIT_CLASS_ID  | NUMBER       | Identifier of the wait class                                                                          |
| WAIT_CLASS#    | NUMBER       | Number of the wait class                                                                              |
| WAIT_CLASS     | VARCHAR2(64) | Name of the wait class                                                                                |
| TOTAL_WAITS    | NUMBER       | Number of times waits of the class occurred                                                           |
| TIME_WAITED    | NUMBER       | Amount of time (in hundredths of a second) spent in the wait by all sessions                          |
| TOTAL_WAITS_FG | NUMBER       | Number of times waits from this wait class occurred in foreground sessions                            |
| TIME_WAITED_FG | NUMBER       | Amount of time (in hundredths of a second) spent in waits from this wait class in foreground sessions |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>When queried from a non-CDB, time totals for each registered wait class in that instance are returned, and the CON_ID value is 0.</p> <p>When queried from the root of a CDB, time totals for each registered wait class in every container is returned, and the CON_ID value indicates the container to which the time total belong.</p> <p>When queried from a PDB, time totals for each registered wait class in that PDB are returned, and the CON_ID value is the container ID for that PDB.</p> |

## 7.142 V\$CONFIGURED\_INTERCONNECTS

V\$CONFIGURED\_INTERCONNECTS displays all the interconnects that Oracle is aware of. This view attempts to answer the question of where Oracle found the information about a specific interconnect.

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME       | VARCHAR2(15) | Name of the interconnect (such as eth0)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IP_ADDRESS | VARCHAR2(64) | IP address of the interconnect                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IS_PUBLIC  | VARCHAR2(3)  | <p>If the value is YES, the interface is known to the public.</p> <p>If the value is NO, the interface is known to be private. Note that if the CLUSTER_INTERCONNECTS initialization parameter is also specified, then it is expected that the interconnect is private. Oracle expects cluster traffic to be run on private interconnects only.</p> <p>If the value is empty, it is unknown whether the interface is public or private.</p> <p>Oracle recommends that you set the interface for Oracle Real Application Clusters (Oracle RAC) communication in the Oracle Cluster Registry (OCR).</p> |
| SOURCE     | VARCHAR2(31) | <p>Indicates where this interface was picked up from:</p> <ul style="list-style-type: none"> <li>Oracle Cluster Registry - Interface was configured in the OCR and Oracle Database found the interface in the OCR</li> <li>Operating-system dependent software - Oracle Database automatically detects this</li> <li>CLUSTER_INTERCONNECTS parameter - This initialization parameter was set</li> </ul>                                                                                                                                                                                               |
| CON_ID     | NUMBER       | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                              |

## 7.143 V\$CONTAINERS

V\$CONTAINERS displays information about PDBs and the root associated with the current instance.

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| DBID                   | NUMBER        | PDB identifier calculated when the PDB is created and stored in all file headers associated with the PDB                                                                                                                                                                                                                                                                                                                                        |
| CON_UID                | NUMBER        | Unique identifier associated with the PDB                                                                                                                                                                                                                                                                                                                                                                                                       |
| GUID                   | RAW(16)       | Globally unique identifier (GUID) of this PDB                                                                                                                                                                                                                                                                                                                                                                                                   |
| NAME                   | VARCHAR2(128) | Name of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OPEN_MODE              | VARCHAR2(10)  | Open mode information. Possible values: <ul style="list-style-type: none"> <li>MOUNTED</li> <li>READ WRITE</li> <li>READ ONLY</li> <li>MIGRATE</li> </ul>                                                                                                                                                                                                                                                                                       |
| RESTRICTED             | VARCHAR2(3)   | Indicates whether only users possessing RESTRICTED SESSION privilege can connect to the PDB                                                                                                                                                                                                                                                                                                                                                     |
| OPEN_TIME              | TIMESTAMP(3)  | Date and time when the database was last opened                                                                                                                                                                                                                                                                                                                                                                                                 |
| CREATE_SCN             | NUMBER        | System change number (SCN) for the creation of this PDB                                                                                                                                                                                                                                                                                                                                                                                         |
| TOTAL_SIZE             | NUMBER        | If a PDB is opened, disk space (in bytes) used by the container, including both data and temp files. If a PDB is closed, will be set to 0.                                                                                                                                                                                                                                                                                                      |
| BLOCK_SIZE             | NUMBER        | The current block size for the PDB                                                                                                                                                                                                                                                                                                                                                                                                              |
| RECOVERY_STATUS        | VARCHAR2(8)   | Shows whether recovery is enabled or disabled for the PDB. Possible values: <ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>                                                                                                                                                                                                                                                                                         |
| SNAPSHOT_PARENT_CON_ID | NUMBER        | This column shows the container ID of the master PDB that this PDB is a snapshot clone of. This column shows a nonzero value only if the PDB is a snapshot clone. For all other cases, it shows a value of 0.                                                                                                                                                                                                                                   |
| APPLICATION_ROOT       | VARCHAR2(3)   | Indicates whether the PDB is an application root                                                                                                                                                                                                                                                                                                                                                                                                |
| APPLICATION_PDB        | VARCHAR2(3)   | Indicates whether the PDB is an application PDB                                                                                                                                                                                                                                                                                                                                                                                                 |
| APPLICATION_SEED       | VARCHAR2(3)   | Indicates whether the PDB is an application seed (an application seed is also an application PDB)                                                                                                                                                                                                                                                                                                                                               |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                              |
|-------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPLICATION_ROOT_CON_ID | NUMBER        | If this PDB is an application PDB, the container ID of an application root to which this application PDB belongs.<br>If this PDB is an application root clone, the container ID of an application root to which this application root clone belongs.<br>Otherwise, NULL. |
| APPLICATION_ROOT_CLONE  | VARCHAR2(3)   | Indicates whether this PDB is an application root clone (YES) or not (NO)                                                                                                                                                                                                |
| PROXY_PDB               | VARCHAR2(3)   | Indicates whether this PDB is a proxy PDB (YES) or not (NO)                                                                                                                                                                                                              |
| LOCAL_UNDO              | NUMBER        | Shows whether the PDB is in local undo. Possible values: <ul style="list-style-type: none"> <li>1 – PDB is in local undo mode</li> <li>0 – PDB is in shared undo mode</li> </ul> This column is not relevant for CDB\$ROOT.                                              |
| UNDO_SCN                | NUMBER        | System change number (SCN) at which the PDB was last converted from shared to local undo, or from local to shared undo.<br>This column is not relevant for CDB\$ROOT.                                                                                                    |
| UNDO_TIMESTAMP          | DATE          | Date and time at which the PDB was last converted from shared to local undo, or from local to shared undo.<br>This column is not relevant for CDB\$ROOT.                                                                                                                 |
| CREATION_TIME           | DATE          | Date and time at which the PDB was created.                                                                                                                                                                                                                              |
| PDB_COUNT               | NUMBER        | The number of user-created PDBs belonging to a given application root or CDB\$ROOT. For all other containers, its value is 0.                                                                                                                                            |
| AUDIT_FILES_SIZE        | NUMBER        | Shows the current disk space usage (in bytes) by Unified Audit files (.bin format) in the container                                                                                                                                                                      |
| MAX_SIZE                | NUMBER        | Shows the maximum amount of disk space (in bytes) that can be used by data and temp files in the container                                                                                                                                                               |
| MAX_DIAGNOSTICS_SIZE    | NUMBER        | Shows the maximum amount of disk space (in bytes) that can be used by diagnostic traces generated in the container                                                                                                                                                       |
| MAX_AUDIT_SIZE          | NUMBER        | Shows the maximum amount of disk space (in bytes) that can be used by Unified Audit files (.bin format) in the container                                                                                                                                                 |
| LAST_CHANGED_BY         | VARCHAR2(11)  | Indicates what type of user last changed the PDB. Possible values: <ul style="list-style-type: none"> <li>COMMON USER</li> <li>LOCAL USER</li> </ul>                                                                                                                     |
| MEMBER_CDB              | VARCHAR2(3)   | Indicates whether the row corresponds to a Member CDB part of the CDB Fleet (YES) or not (NO). This column is only meaningful in the Lead CDB of a CDB Fleet, which keeps track of other CDBs as containers in the CDB Fleet.                                            |
| TENANT_ID               | VARCHAR2(256) | Pluggable database tenant key                                                                                                                                                                                                                                            |
| UPGRADE_LEVEL           | NUMBER        | For internal use only                                                                                                                                                                                                                                                    |
| GUID_BASE64             | VARCHAR2(30)  | The GUID of the PDB, encoded in base64                                                                                                                                                                                                                                   |

## 7.144 V\$CONTEXT

V\$CONTEXT displays set attributes in the current session.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAMESPACE | VARCHAR2(31)   | Namespace that the attribute is in                                                                                                                                                                                                                                                                                                                                                                                                              |
| ATTRIBUTE | VARCHAR2(31)   | Name of the attribute                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VALUE     | VARCHAR2(4000) | Value of the attribute                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.145 V\$CONTROLFILE

V\$CONTROLFILE displays the names of the control files.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                | VARCHAR2(7)   | INVALID if the name cannot be determined (which should not occur); NULL if the name can be determined                                                                                                                                                                                                                                                                                                                                           |

| CORRUPTION_CHANGE# | NUMBER      | Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MARKED_CORRUPT     | VARCHAR2(3) | (YES   NO) If set to YES the blocks were not marked corrupted in the data file, but were detected and marked as corrupted while making the data file copy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CORRUPTION_TYPE    | VARCHAR2(9) | Type of block corruption in the data file: <ul style="list-style-type: none"> <li>• ALL ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block.</li> <li>• FRACTURED - Block header looks reasonable, but the front and back of the block are different versions.</li> <li>• CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions.</li> <li>• CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing)</li> <li>• LOGICAL - Block is logically corrupt</li> <li>• NOLOGGING - Block does not have redo log entries (for example, NOLOGGING operations on primary database can introduce this type of corruption on a physical standby)</li> </ul> |
| CON_ID             | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 7.148 V\$COPY\_NONLOGGED

V\$COPY\_NONLOGGED displays information about nonlogged block ranges in data file copy blocks, recorded in the control file.

| Column            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID           | NUMBER   | Instance ID                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| RECID             | NUMBER   | Nonlogged copy record ID                                                                                                                                                                                                                                                                                                                                                                                                                        |
| STAMP             | NUMBER   | Nonlogged copy record stamp                                                                                                                                                                                                                                                                                                                                                                                                                     |
| COPY_RECID        | NUMBER   | Data file copy record ID                                                                                                                                                                                                                                                                                                                                                                                                                        |
| COPY_STAMP        | NUMBER   | Data file copy record stamp                                                                                                                                                                                                                                                                                                                                                                                                                     |
| FILE#             | NUMBER   | Absolute file number of the data file that contains this range of nonlogged blocks                                                                                                                                                                                                                                                                                                                                                              |
| BLOCK#            | NUMBER   | Block number of the first nonlogged block in the range of nologged blocks                                                                                                                                                                                                                                                                                                                                                                       |
| BLOCKS            | NUMBER   | Number of nonlogged blocks found starting with BLOCK#                                                                                                                                                                                                                                                                                                                                                                                           |
| NONLOGGED_CHANGE# | NUMBER   | The smallest SCN on which any block in this block range became nonlogged. NULL if unknown.                                                                                                                                                                                                                                                                                                                                                      |
| NONLOGGED_TIME    | VARCHAR2 | The time that corresponds to NONLOGGED_CHANGE#. NULL if unknown.                                                                                                                                                                                                                                                                                                                                                                                |
| RESETLOGS_CHANGE# | VARCHAR2 | The resetlogs SCN of the incarnation on which this block range was first marked as nonlogged. NULL if unknown.                                                                                                                                                                                                                                                                                                                                  |
| RESETLOGS_TIME    | VARCHAR2 | The resetlogs time of the incarnation on which this block range was first marked as nologged. NULL if unknown.                                                                                                                                                                                                                                                                                                                                  |
| OBJECT#           | VARCHAR2 | The object ID this range belongs to. If this field is NULL, the object number is unknown.                                                                                                                                                                                                                                                                                                                                                       |
| REASON            | CHAR(7)  | The reason why this block range appears in this list, for example, primary file offline, could not talk to primary, non-standby recovery, and so on. For Oracle Database 12c and later releases, it is always UNKNOWN.                                                                                                                                                                                                                          |
| CON_ID            | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.149 V\$CORRUPT\_XID\_LIST

V\$CORRUPT\_XID\_LIST displays all corrupted XIDs.

| Column      | Datatype      | Description         |
|-------------|---------------|---------------------|
| CORRUPT_XID | VARCHAR2(256) | Name of corrupt XID |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.150 V\$CPPOOL\_CC\_INFO

V\$CPPOOL\_CC\_INFO displays information about the pool-to-connection class mapping for the Database Resident Connection Pool per instance.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POOL_NAME   | VARCHAR2(1024) | Name of the Database Resident Connection Pool                                                                                                                                                                                                                                                                                                                                                                                                   |
| CCLASS_NAME | VARCHAR2(1024) | Name of the connection class                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.151 V\$CPPOOL\_CC\_STATS

V\$CPPOOL\_CC\_STATS displays information about the connection class level statistics for the Database Resident Connection Pool per instance.

| Column              | Datatype       | Description                                                                                                       |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------|
| CCLASS_NAME         | VARCHAR2(1024) | Name of the connection class                                                                                      |
| NUM_REQUESTS        | NUMBER         | Number of session requests                                                                                        |
| NUM_HITS            | NUMBER         | Total number of times a session that matches with the request was found in the pool                               |
| NUM_MISSES          | NUMBER         | Total number of times an exact match to the request was not found in the pool and a new session had to be created |
| NUM_WAITS           | NUMBER         | Total number of times session requests had to wait before getting served                                          |
| WAIT_TIME           | NUMBER         | Reserved for future use                                                                                           |
| CLIENT_REQ_TIMEOUTS | NUMBER         | Reserved for future use                                                                                           |
| NUM_AUTHENTICATIONS | NUMBER         | Total number of authentications of clients done by the pool                                                       |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.152 V\$CPOOL\_CONN\_INFO

V\$CPOOL\_CONN\_INFO displays connection information about each connection to the connection broker.

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMON_ADDR         | RAW(4   8)     | Address of the connection broker                                                                                                                                                                                                                                                                                                                                                               |
| SESSION_ADDR      | RAW(4   8)     | Address of the session associated with the connection; NULL if the connection does not have an associated session                                                                                                                                                                                                                                                                              |
| CONNECTION_ADDR   | RAW(4   8)     | Address of the connection                                                                                                                                                                                                                                                                                                                                                                      |
| USERNAME          | VARCHAR2(1024) | Name of the user associated with the connection                                                                                                                                                                                                                                                                                                                                                |
| PROXY_USER        | VARCHAR2(1024) | Name of the proxy user                                                                                                                                                                                                                                                                                                                                                                         |
| CCLASS_NAME       | VARCHAR2(1024) | Connection class associated with the connection                                                                                                                                                                                                                                                                                                                                                |
| PURITY            | VARCHAR2(1024) | Purity used to create the connection (can be SELF or NEW)                                                                                                                                                                                                                                                                                                                                      |
| TAG               | VARCHAR2(1024) | Tag, if specified, at connection creation time                                                                                                                                                                                                                                                                                                                                                 |
| SERVICE           | VARCHAR2(64)   | TNS service name for the connection                                                                                                                                                                                                                                                                                                                                                            |
| PROCESS_ID        | VARCHAR2(24)   | Client process ID of the process which created the connection                                                                                                                                                                                                                                                                                                                                  |
| PROGRAM           | VARCHAR2(48)   | Program name of the client process which created the connection                                                                                                                                                                                                                                                                                                                                |
| MACHINE           | VARCHAR2(64)   | Machine name of the client process which created the connection                                                                                                                                                                                                                                                                                                                                |
| TERMINAL          | VARCHAR2(30)   | Terminal identifier of the client process which created the connection                                                                                                                                                                                                                                                                                                                         |
| CONNECTION_MODE   | VARCHAR2(1024) | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                      |
| CONNECTION_STATUS | VARCHAR2(10)   | Status of the connection: <ul style="list-style-type: none"> <li>NONE</li> <li>CONNECTING</li> <li>ACTIVE: A pooled server has been mapped to this connection.</li> <li>WAITING: The connection is waiting for a pooled server based on the client request.</li> <li>IDLE: No pooled server has been mapped to this connection and there is no request to map one.</li> <li>CLOSING</li> </ul> |
| CLIENT_REGID      | NUMBER         | Query cache registration ID sent by the client                                                                                                                                                                                                                                                                                                                                                 |
| CURSTATUS_TIME    | NUMBER         | Time in microseconds spent in the current state. See CONNECTION_STATUS above.                                                                                                                                                                                                                                                                                                                  |
| IDLE_TIME         | NUMBER         | Total time in IDLE state for the connection (in microseconds)                                                                                                                                                                                                                                                                                                                                  |

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTIVE_TIME      | NUMBER   | Total time in ACTIVE state for the connection (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                 |
| WAIT_TIME        | NUMBER   | Total time in WAITING state for the connection (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                |
| THINK_TIME       | NUMBER   | Total think time for the connection assigned to the pooled server, but not doing any database activity (in microseconds)                                                                                                                                                                                                                                                                                                                        |
| LAST_IDLE_TIME   | NUMBER   | Time in last IDLE state for this connection (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                   |
| LAST_ACTIVE_TIME | NUMBER   | Time in last ACTIVE state for this connection (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                 |
| LAST_WAIT_TIME   | NUMBER   | Time in last WAITING state for this connection (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                |
| LAST_THINK_TIME  | NUMBER   | Time for the connection assigned to the pooled server, but not doing any database activity during the last ACTIVE state (in microseconds)                                                                                                                                                                                                                                                                                                       |
| NUMGETS          | NUMBER   | Total number of requests at the connection level                                                                                                                                                                                                                                                                                                                                                                                                |
| NUMHITS          | NUMBER   | Total number of hits at the connection level                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.153 V\$CPool\_STATS

V\$CPool\_STATS displays information about the Database Resident Connection Pool statistics for an instance.

| Column              | Datatype       | Description                                                                                     |
|---------------------|----------------|-------------------------------------------------------------------------------------------------|
| POOL_NAME           | VARCHAR2(1024) | Name of the Database Resident Connection Pool                                                   |
| NUM_OPEN_SERVERS    | NUMBER         | Total number of busy and free servers in the pool (including the authentication servers)        |
| NUM_BUSY_SERVERS    | NUMBER         | Total number of busy servers in the pool (not including the authentication servers)             |
| NUM_AUTH_SERVERS    | NUMBER         | Number of authentication servers in the pool                                                    |
| NUM_REQUESTS        | NUMBER         | Number of client requests                                                                       |
| NUM_HITS            | NUMBER         | Total number of times client requests found matching pooled servers in the pool                 |
| NUM_MISSES          | NUMBER         | Total number of times client requests could not find a matching pooled server in the pool       |
| NUM_WAITS           | NUMBER         | Total number of client requests that had to wait due to non-availability of free pooled servers |
| WAIT_TIME           | NUMBER         | Reserved for future use                                                                         |
| CLIENT_REQ_TIMEOUTS | NUMBER         | Reserved for future use                                                                         |
| NUM_AUTHENTICATIONS | NUMBER         | Total number of authentications of clients done by the pool                                     |
| NUM_PURGED          | NUMBER         | Total number of sessions purged by the pool                                                     |

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HISTORIC_MAX | NUMBER   | Maximum size that the pool has ever reached                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.154 V\$CR\_BLOCK\_SERVER

V\$CR\_BLOCK\_SERVER displays statistics on the Global Cache Service processes (LMS) used in cache fusion.

| Column                 | Datatype | Description                                                                                                                                                               |
|------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CR_REQUESTS            | NUMBER   | Number of CR blocks served due to remote CR block requests                                                                                                                |
| CURRENT_REQUESTS       | NUMBER   | Number of current blocks served due to remote CR block requests<br>CR_REQUESTS + CURRENT_REQUESTS = global cache CR clocks served (from V\$SYSSTAT).                      |
| DATA_REQUESTS          | NUMBER   | Number of current or CR requests for data blocks                                                                                                                          |
| UNDO_REQUESTS          | NUMBER   | Number of CR requests for undo blocks                                                                                                                                     |
| TX_REQUESTS            | NUMBER   | Number of CR requests for undo segment header blocks                                                                                                                      |
| OTHER_REQUESTS         | NUMBER   | Number of CR requests for other types of blocks<br>DATA_REQUESTS + UNDO_REQUESTS + TX_REQUESTS + OTHER_REQUESTS = total number of requests handled by the LMS processes   |
| CURRENT_RESULTS        | NUMBER   | Number of requests for which no changes were rolled out of the block returned to the requesting instance                                                                  |
| PRIVATE_RESULTS        | NUMBER   | Number of requests for which changes were rolled out of the block returned to the requesting instance, and only the requesting transaction can use the resulting CR block |
| ZERO_RESULTS           | NUMBER   | Number of requests for which changes were rolled out of the block returned to the requesting instance. Only zero-XID transactions can use the block.                      |
| DISK_READ_RESULTS      | NUMBER   | Number of requests for which the requesting instance had to read the requested block from disk                                                                            |
| FAIL_RESULTS           | NUMBER   | Number of requests that failed; the requesting transaction must reissue the request                                                                                       |
| STALE                  | NUMBER   | Number of requests for which the disk read of the requested block was stale                                                                                               |
| FAIRNESS_DOWN_CONVERTS | NUMBER   | Number of times an instance receiving a request has down-converted an X lock on a block because it was not modifying the block                                            |
| FAIRNESS_CLEARS        | NUMBER   | Number of times the "fairness counter" was cleared. This counter tracks the number of times a block was modified after it was served.                                     |

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FREE_GC_ELEMENTS | NUMBER   | Number of times a request was received from another instance and the X lock had no buffers                                                                                                                                                                                                                                                                                                                                                      |
| FLUSHES          | NUMBER   | Number of times the log has been flushed by an LMS process                                                                                                                                                                                                                                                                                                                                                                                      |
| FLUSHES_QUEUED   | NUMBER   | Number of flushes queued by an LMS process                                                                                                                                                                                                                                                                                                                                                                                                      |
| FLUSH_QUEUE_FULL | NUMBER   | Number of times the flush queue was full                                                                                                                                                                                                                                                                                                                                                                                                        |
| FLUSH_MAX_TIME   | NUMBER   | Maximum time for flush                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LIGHT_WORKS      | NUMBER   | Number of times the light-work rule was evoked. This rule prevents the LMS processes from going to disk while responding to CR requests for data, undo, or undo segment header blocks. This rule can prevent the LMS process from completing its response to the CR request.                                                                                                                                                                    |
| ERRORS           | NUMBER   | Number of times an error was signalled by an LMS process                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.155 V\$CURRENT\_BLOCK\_SERVER

V\$CURRENT\_BLOCK\_SERVER displays statistics on the Global Cache Service processes (IMS) used in cache fusion.

| Column   | Datatype | Description                                      |
|----------|----------|--------------------------------------------------|
| PIN0     | NUMBER   | Pins taking less than 100 microseconds           |
| PIN1     | NUMBER   | Pins taking 100 microseconds to 1 millisecond    |
| PIN10    | NUMBER   | Pins taking 1 to 10 milliseconds                 |
| PIN100   | NUMBER   | Pins taking 10 to 100 milliseconds               |
| PIN1000  | NUMBER   | Pins taking 100 to 1000 milliseconds             |
| PIN10000 | NUMBER   | Pins taking 1000 to 10000 milliseconds           |
| FLUSH0   | NUMBER   | Flushes taking less than 100 microseconds        |
| FLUSH1   | NUMBER   | Flushes taking 100 microseconds to 1 millisecond |
| FLUSH10  | NUMBER   | Flushes taking 1 to 10 milliseconds              |
| FLUSH100 | NUMBER   | Flushes taking 10 to 100 milliseconds            |

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FLUSH1000               | NUMBER   | Flushes taking 100 to 1000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                         |
| FLUSH10000              | NUMBER   | Flushes taking 1000 to 10000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                       |
| WRITE1 <sup>1</sup>     | NUMBER   | Writes taking less than 1 millisecond                                                                                                                                                                                                                                                                                                                                                                                                           |
| WRITE10 <sup>1</sup>    | NUMBER   | Writes taking 1 to 10 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                              |
| WRITE100 <sup>1</sup>   | NUMBER   | Writes taking 10 to 100 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                            |
| WRITE1000 <sup>1</sup>  | NUMBER   | Writes taking 100 to 1000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                          |
| WRITE10000 <sup>1</sup> | NUMBER   | Writes taking 1000 to 10000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                        |
| CLEANDC                 | NUMBER   | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                       |
| RCVDC                   | NUMBER   | Number of lock down-converts to S (shared) caused by instance recovery                                                                                                                                                                                                                                                                                                                                                                          |
| QUEUEDC                 | NUMBER   | Number of queued lock down-converts to NULL                                                                                                                                                                                                                                                                                                                                                                                                     |
| EVICTDC                 | NUMBER   | Number of lock down-converts to NULL caused by an SGA shrink                                                                                                                                                                                                                                                                                                                                                                                    |
| WRITEDC                 | NUMBER   | Number of dirty blocks in read-mostly objects which were written and the X (exclusive) lock down-converted to S (shared) locks                                                                                                                                                                                                                                                                                                                  |
| CON_ID                  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is deprecated in Oracle Database 12c Release 2 (12.2.0.1) and may be removed in a future release.

## 7.156 V\$DATABASE

V\$DATABASE displays information about the database from the control file.

| Column                  | Datatype    | Description                                                                                                                                                                        |
|-------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBID                    | NUMBER      | Database identifier calculated when the database is created and stored in all file headers                                                                                         |
| NAME                    | VARCHAR2(9) | Name of the database                                                                                                                                                               |
| CREATED                 | DATE        | Creation date of the database. If the control file was re-created using the CREATE CONTROLFILE statement, then this column displays the date that the control file was re-created. |
| RESETLOGS_CHANGE#       | NUMBER      | System change number (SCN) at open resetlogs                                                                                                                                       |
| RESETLOGS_TIME          | DATE        | Timestamp of open resetlogs                                                                                                                                                        |
| PRIOR_RESETLOGS_CHANGE# | NUMBER      | SCN at prior resetlogs                                                                                                                                                             |

| SWITCHOVER_STATUS | VARCHAR2(20) | <p>Indicates whether switchover is allowed:</p> <ul style="list-style-type: none"> <li>• <b>NOT ALLOWED</b> - On a primary database, this status indicates that there are no valid and enabled standby databases. On a standby database, this status indicates that a switchover request has not been received from the primary database.</li> <li>• <b>SESSIONS ACTIVE</b> - The database has active sessions. On a physical standby database, the <code>WITH SESSION SHUTDOWN SQL</code> clause must be specified to perform a role transition while in this state. On a logical standby database, a role transition can be performed while in this state, but the role transition will not complete until all current transactions have committed.</li> <li>• <b>SWITCHOVER PENDING</b> - On a physical standby database, this status indicates that a switchover request has been received from the primary database and is being processed. A physical standby database cannot switch to the primary role while in this transient state.</li> <li>• <b>SWITCHOVER LATENT</b> - On a physical standby database, this status indicates that a switchover request was pending, but the original primary database has been switched back to the primary role.</li> <li>• <b>TO PRIMARY</b> - The database is ready to switch to the primary role.</li> <li>• <b>TO STANDBY</b> - The database is ready to switch to either the physical or logical standby role.</li> <li>• <b>TO LOGICAL STANDBY</b> - The database has received a data dictionary from a logical standby database and is ready to switch to the logical standby role.</li> <li>• <b>RECOVERY NEEDED</b> - On a physical standby database, this status indicates that additional redo must be applied before the database can switch to the primary role.</li> <li>• <b>PREPARING SWITCHOVER</b> - On a primary database, this status indicates that a data dictionary is being received from a logical standby database in preparation for switching to the logical standby role. On a logical standby database, this status indicates that the data dictionary has been sent to the primary database and other standby databases.</li> <li>• <b>PREPARING DICTIONARY</b> - On a logical standby database, this status indicates that the data dictionary is being sent to the primary database and other standby databases in preparation for switching to the primary role.</li> <li>• <b>FAILED DESTINATION</b> - On a primary database, this status indicates that one or more standby destinations are in an error state.</li> <li>• <b>RESOLVABLE GAP</b> - On a primary database, this status indicates that one or more standby databases have a redo gap that can be automatically resolved by fetching the missing redo from the primary database or from another standby database.</li> <li>• <b>UNRESOLVABLE GAP</b> - On a primary database, this status indicates that one or more standby databases have a redo gap that cannot be automatically resolved by fetching the missing redo from the primary database or from another standby database.</li> </ul> |

| FS_FAILOVER_CURRENT_TARGET       | VARCHAR2(30)  | DB_UNIQUE_NAME of the standby that is the current fail-safe failover observer target standby for the Data Guard configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| FS_FAILOVER_THRESHOLD            | NUMBER        | Time (in seconds) that the observer will attempt to reconnect with a disconnected primary before attempting fail-safe failover observer with the target standby                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FS_FAILOVER_OBSERVER_P<br>RESENT | VARCHAR2(7)   | Indicates whether the master observer is currently connected to the local database (YES) or not (NO)<br><br><b>Note:</b> This column is consistent throughout an Oracle RAC environment; that is, if the observer is connected to any instance, then all instances will show a value of YES.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FS_FAILOVER_OBSERVER_HOST        | VARCHAR2(512) | Machine name that is currently hosting the master observer process, if fast-start failover is enabled. If fast-start failover is not enabled, this column returns a NULL string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CONTROLFILE_CONVERTED            | VARCHAR2(3)   | Indicates whether the control file was implicitly converted from its original type during restore (YES) or not (NO)<br><br>This column will be set to YES when RMAN restores a standby control file from a backup of the control file taken at the primary database or restores a backup control file from a backup taken at the physical standby database.<br><br>This column will change to NO when the file names are fixed using information in the recovery catalog schema.                                                                                                                                                                                                                                                                                     |
| PRIMARY_DB_UNIQUE_NAME           | VARCHAR2(30)  | For any Standby database (Physical, Logical, or Snapshot), this column will contain the DB_UNIQUE_NAME of the Primary database that this Standby last received current redo from.<br><br>If this standby has not received any current redo since last being started, then this column will be null.<br><br>For a Primary database that had previously been a Standby, this column will contain the DB_UNIQUE_NAME of the last Primary that this database received current redo from while acting as a Standby.<br><br>For a Primary database that has never been a Standby, this column will be null.                                                                                                                                                                |
| SUPPLEMENTAL_LOG_DATA_PL         | VARCHAR2(3)   | Indicates whether additional information is logged in the redo log (YES) or not (NO) during invocation of procedures in Oracle-supplied packages for which procedural replication is supported.<br><br>When a value of YES appears in a CDB, it means that supplemental logging for procedural replication is enabled in all of the PDBs in the CDB.<br><br>When a value of NO appears in a CDB, query the PROCEDURAL column in the DBA_SUPPLEMENTAL_LOGGING view for each PDB in the CDB to see whether supplemental logging for procedural replication is supported in the PDB.<br><br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i> for a list of Oracle-supplied packages that are procedurally replicated to a logical standby database |
| MIN_REQUIRED_CAPTURE_CHANGE#     | NUMBER        | Minimum REQUIRED_CHECKPOINT_SCN for all local capture processes on the database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CDB                              | VARCHAR2(3)   | Possible values are: <ul style="list-style-type: none"> <li>• YES if the database is a CDB</li> <li>• NO if the database is not a CDB</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Column                       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                   |
| PENDING_ROLE_CHANGE_TASKS    | VARCHAR2(512) | Tasks remaining after an Oracle Data Guard role change. Possible values: <ul style="list-style-type: none"> <li>NONE: No pending tasks remain</li> <li>NOT_APPLICABLE: The database is either standby or is not a DG_CONFIG member</li> <li>BUILD_PENDING: The database was formerly a logical standby and has not yet taken a snapshot of its data dictionary into the redo stream</li> <li>SRL_ARCHIVE_PENDING: The database was formerly a logical standby and the standby redo logs associated with the earlier failover operation have not yet been archived</li> <li>ERROR: The database was formerly a logical standby and the snapshot of the dictionary failed</li> <li>UNKNOWN: The database is not open or the query failed</li> </ul> |
| CON_DBID                     | NUMBER        | The database ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| FORCE_FULL_DB_CACHING        | VARCHAR2(3)   | Indicates the status of the force full database caching feature in the database. Possible values: <ul style="list-style-type: none"> <li>YES - The database is in force full database caching mode.</li> <li>NO - The database is not in force full database caching mode.</li> </ul> <b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for information about the FORCE_FULL_DATABASE_CACHING clause for the ALTER DATABASE statement                                                                                                                                                                                                                                                                                                |
| SUPPLEMENTAL_LOG_DATA_ENABLE | VARCHAR2(3)   | Indicates whether the database is enabled for subset database replication (YES) or not (NO). If the database is enabled for subset database replication, then redo overhead and feature restriction for tables without column data supplemental logging will be reduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

<sup>1</sup> This column is available starting with Oracle Database release 19c, version 19.1.

## 7.157 V\$DATABASE\_BLOCK\_CORRUPTION

V\$DATABASE\_BLOCK\_CORRUPTION displays information about database blocks that were corrupted after the last backup.

| Column             | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#              | NUMBER      | Absolute file number of the data file that contains the corrupt blocks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BLOCK#             | NUMBER      | Block number of the first corrupt block in the range of corrupted blocks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| BLOCKS             | NUMBER      | Number of corrupted blocks found starting with BLOCK#                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CORRUPTION_CHANGE# | NUMBER      | Change number at which the logical corruption was detected. Set to 0 to indicate media corruption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CORRUPTION_TYPE    | VARCHAR2(9) | Type of block corruption in the data file: <ul style="list-style-type: none"> <li>ALL ZERO - Block header on disk contained only zeros. The block may be valid if it was never filled and if it is in an Oracle7 file. The buffer will be reformatted to the Oracle8 standard for an empty block.</li> <li>FRACTURED - Block header looks reasonable, but the front and back of the block are different versions.</li> <li>CHECKSUM - optional check value shows that the block is not self-consistent. It is impossible to determine exactly why the check value fails, but it probably fails because sectors in the middle of the block are from different versions.</li> <li>CORRUPT - Block is wrongly identified or is not a data block (for example, the data block address is missing)</li> <li>LOGICAL - Block is logically corrupt</li> </ul> |
| CON_ID             | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 7.158 V\$DATABASE\_INCARNATION

V\$DATABASE\_INCARNATION displays information about all database incarnations.

Oracle creates a new incarnation whenever a database is opened with the RESETLOGS option. Records about the current and immediately previous incarnation are also contained in the V\$DATABASE view.

| Column            | Datatype | Description                                                                 |
|-------------------|----------|-----------------------------------------------------------------------------|
| INCARNATION#      | NUMBER   | Record ID for the branch record in the control file                         |
| RESETLOGS_CHANGE# | NUMBER   | Resetlogs system change number (SCN) for the incarnation of the current row |

| Column                     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESETLOGS_TIME             | DATE         | Resetlogs timestamp for the incarnation of the current row                                                                                                                                                                                                                                                                                                                                                                                      |
| PRIOR_RESETLOGS_CHANGE#    | NUMBER       | Resetlogs SCN for the previous incarnation                                                                                                                                                                                                                                                                                                                                                                                                      |
| PRIOR_RESETLOGS_TIME       | DATE         | Resetlogs timestamp for the previous incarnation                                                                                                                                                                                                                                                                                                                                                                                                |
| STATUS                     | VARCHAR2(7)  | Incarnation status: <ul style="list-style-type: none"> <li>ORPHAN - Orphan incarnation</li> <li>CURRENT - Current incarnation of the database</li> <li>PARENT - Parent of the current incarnation</li> </ul>                                                                                                                                                                                                                                    |
| RESETLOGS_ID               | NUMBER       | Branch ID for the incarnation of the current row (used by user-managed recovery/RMAN restore to get unique names for archived logs across incarnations)                                                                                                                                                                                                                                                                                         |
| PRIOR_INCARNATION#         | NUMBER       | Parent incarnation record ID if nonzero                                                                                                                                                                                                                                                                                                                                                                                                         |
| FLASHBACK_DATABASE_ALLOWED | VARCHAR2(26) | Indicate whether or not Flashback Database can be performed into SCNs or timestamps in the incarnation. A value of YES means that you can flashback to some point in that incarnation. A value of NO indicates that you cannot flashback into the incarnation.                                                                                                                                                                                  |
| CON_ID                     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.159 V\$DATABASE\_KEY\_INFO

V\$DATABASE\_KEY\_INFO provides the information of the default database key used to encrypt data blocks. Oracle uses the database key to encrypt sensitive information in SYSTEM, UNDO, and TEMP tablespaces when such data has dependency from encrypted tablespaces or encrypted columns

V\$DATABASE\_KEY\_INFO reflects the database key information stored in the control file. Generally it is the same as the system tablespace key recorded in the system tablespace. If the system tablespace is encrypted, it will also appear in V\$ENCRYPTED\_TABLESPACES. If the system tablespace is not encrypted, this is the only view providing this information.

| Column           | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENCRYPTIONALG    | VARCHAR2(7) | Encryption algorithm: <ul style="list-style-type: none"> <li>NONE</li> <li>3DES168</li> <li>AES128</li> <li>AES192</li> <li>AES256</li> </ul> AES128 is the default encryption algorithm.                                                                                                                                                                                                                                                       |
| ENCRYPTEDKEY     | RAW(48)     | Encrypted version of the database key                                                                                                                                                                                                                                                                                                                                                                                                           |
| MASTERKEYID      | RAW(16)     | ID of the master key that was used to encrypt the database key                                                                                                                                                                                                                                                                                                                                                                                  |
| MASTER_ACTIVATED | VARCHAR2(3) | Indicates whether the master key has been set (YES) or not (NO) for this database or container in the Oracle Key Store. In other words, indicates whether Transparent Data Encryption (TDE) has been activated for this database or container                                                                                                                                                                                                   |
| CON_ID           | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.160 V\$DATAFILE

V\$DATAFILE displays datafile information from the control file.

**See Also:**

"V\$DATAFILE\_HEADER", which displays information from data file headers

| Column           | Datatype | Description                                      |
|------------------|----------|--------------------------------------------------|
| FILE#            | NUMBER   | File identification number                       |
| CREATION_CHANGE# | NUMBER   | Change number at which the data file was created |
| CREATION_TIME    | DATE     | Timestamp of the data file creation              |
| TS#              | NUMBER   | Tablespace number                                |
| RFILE#           | NUMBER   | Tablespace relative data file number             |

| Column                   | Datatype      | Description                                                                                                                                                                                                                                                                                    |
|--------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS                   | VARCHAR2(7)   | Type of file (system or user) and its status. Values: OFFLINE, ONLINE, SYSTEM, RECOVER, SYSOFF (an offline file from the SYSTEM tablespace)                                                                                                                                                    |
| ENABLED                  | VARCHAR2(10)  | Describes how accessible the file is from SQL: <ul style="list-style-type: none"> <li>DISABLED - No SQL access allowed</li> <li>READ ONLY - No SQL updates allowed</li> <li>READ WRITE - Full access allowed</li> <li>UNKNOWN - Unknown whether SQL updates would be allowed or not</li> </ul> |
| CHECKPOINT_CHANGE#       | NUMBER        | SCN at last checkpoint                                                                                                                                                                                                                                                                         |
| CHECKPOINT_TIME          | DATE          | Timestamp of the checkpoint#                                                                                                                                                                                                                                                                   |
| UNRECOVERABLE_CHANGE#    | NUMBER        | Last unrecoverable change number made to this data file. If the database is in ARCHIVELOG mode, then this column is updated when an unrecoverable operation completes. If the database is not in ARCHIVELOG mode, this column does not get updated.                                            |
| UNRECOVERABLE_TIME       | DATE          | Timestamp of the last unrecoverable change. This column is updated only if the database is in ARCHIVELOG mode.                                                                                                                                                                                 |
| LAST_CHANGE#             | NUMBER        | Last change number made to this data file (null if the data file is being changed)                                                                                                                                                                                                             |
| LAST_TIME                | DATE          | Timestamp of the last change                                                                                                                                                                                                                                                                   |
| OFFLINE_CHANGE#          | NUMBER        | Offline change number of the last offline range. This column is updated only when the data file is brought online.                                                                                                                                                                             |
| ONLINE_CHANGE#           | NUMBER        | Online change number of the last offline range                                                                                                                                                                                                                                                 |
| ONLINE_TIME              | DATE          | Online timestamp of the last offline range                                                                                                                                                                                                                                                     |
| BYTES                    | NUMBER        | Current data file size (in bytes); 0 if inaccessible                                                                                                                                                                                                                                           |
| BLOCKS                   | NUMBER        | Current data file size (in blocks); 0 if inaccessible                                                                                                                                                                                                                                          |
| CREATE_BYTES             | NUMBER        | Size when created (in bytes)                                                                                                                                                                                                                                                                   |
| BLOCK_SIZE               | NUMBER        | Block size of the data file                                                                                                                                                                                                                                                                    |
| NAME                     | VARCHAR2(513) | Name of the data file                                                                                                                                                                                                                                                                          |
| PLUGGED_IN               | NUMBER        | Describes whether the tablespace is plugged in. The value is 1 if the tablespace is plugged in and has not been made read/write, 0 if not.                                                                                                                                                     |
| BLOCK1_OFFSET            | NUMBER        | Offset from the beginning of the file to where the Oracle generic information begins. The exact length of the file can be computed as follows: BYTES + BLOCK1_OFFSET.                                                                                                                          |
| AUX_NAME                 | VARCHAR2(513) | Auxiliary name that has been set for this file via CONFIGURE AUXNAME                                                                                                                                                                                                                           |
| FIRST_NONLOGGED_SCN      | NUMBER        | First nonlogged SCN (check in standby database)                                                                                                                                                                                                                                                |
| FIRST_NONLOGGED_TIME     | DATE          | First nonlogged time (check in standby database)                                                                                                                                                                                                                                               |
| FOREIGN_DBID             | NUMBER        | Foreign DBID from which this data file came from. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                  |
| FOREIGN_CREATION_CHANGE# | NUMBER        | Creation SCN of a foreign data file. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                               |
| FOREIGN_CREATION_TIME    | DATE          | Creation time of a foreign data file. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                              |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLUGGED_READONLY         | VARCHAR2 ( 3 ) | YES if this is a transported read-only foreign file; otherwise NO.                                                                                                                                                                                                                                                                                                                                                                |
| PLUGIN_CHANGE#           | NUMBER         | SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                 |
| PLUGIN_RESETLOGS_CHANGE# | NUMBER         | The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                  |
| PLUGIN_RESETLOGS_TIME    | DATE           | The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                 |
| CON_ID                   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 7.161 V\$DATAFILE\_COPY

V\$DATAFILE\_COPY displays data file copy information from the control file.

| Column                 | Datatype         | Description                                                                                                                             |
|------------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| RECID                  | NUMBER           | Data file copy record ID                                                                                                                |
| STAMP                  | NUMBER           | Data file copy record stamp                                                                                                             |
| NAME                   | VARCHAR2 ( 513 ) | File name of the data file copy. The maximum length of the name is operating system dependent.                                          |
| TAG                    | VARCHAR2 ( 32 )  | Data file copy tag                                                                                                                      |
| FILE#                  | NUMBER           | Absolute data file number                                                                                                               |
| RFILE#                 | NUMBER           | Tablespace relative data file number                                                                                                    |
| CREATION_CHANGE#       | NUMBER           | Data file creation change#                                                                                                              |
| CREATION_TIME          | DATE             | Data file creation timestamp                                                                                                            |
| RESETLOGS_CHANGE#      | NUMBER           | Resetlogs change number of the data file when the copy was made                                                                         |
| RESETLOGS_TIME         | DATE             | Resetlogs timestamp of the data file when the copy was made                                                                             |
| INCREMENTAL_LEVEL      | NUMBER           | Normal full backups have a NULL value, level 0 incremental backups have a value of 0, and level 1 incremental backups have a value of 1 |
| CHECKPOINT_CHANGE#     | NUMBER           | Checkpoint change number of the data file when the copy was made                                                                        |
| CHECKPOINT_TIME        | DATE             | Checkpoint timestamp of the data file when the copy was made                                                                            |
| ABSOLUTE_FUZZY_CHANGE# | NUMBER           | Highest change seen when the data file was copied                                                                                       |
| RECOVERY_FUZZY_CHANGE# | NUMBER           | Highest change written to the file by media recovery                                                                                    |

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                           |
|-----------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECOVERY_FUZZY_TIME   | DATE         | Timestamp of the highest change written to the file by media recovery                                                                                                                                                                                                                                 |
| ONLINE_FUZZY          | VARCHAR2(3)  | (YES NO) If set to YES, this is a copy taken using an operating system utility after a crash or offline immediate (or an invalid copy taken while data file was online and the database open). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent. |
| BACKUP_FUZZY          | VARCHAR2(3)  | (YES NO) If set to YES, this is a copy taken using the BEGIN BACKUP/END BACKUP technique. Recovery will need to apply all redo up to the end backup marker to make this copy consistent.                                                                                                              |
| MARKED_CORRUPT        | NUMBER       | Number of blocks marked corrupt by this copy operation. That is, blocks that were not marked corrupted in the source data file, but were detected and marked as corrupted during the copy operation.                                                                                                  |
| MEDIA_CORRUPT         | NUMBER       | Total number of media corrupt blocks. For example, blocks with checksum errors are marked media corrupt.                                                                                                                                                                                              |
| LOGICALLY_CORRUPT     | NUMBER       | Total number of logically corrupt blocks. For example, applying redo for unrecoverable operations will mark affected blocks logically corrupt.                                                                                                                                                        |
| BLOCKS                | NUMBER       | Size of the data file copy in blocks (also the size of the data file when the copy was made)                                                                                                                                                                                                          |
| BLOCK_SIZE            | NUMBER       | Block size of the data file                                                                                                                                                                                                                                                                           |
| OLDEST_OFFLINE_RANGE  | NUMBER       | RECID of the oldest offline range record in this control file copy; 0 for data file copies                                                                                                                                                                                                            |
| DELETED               | VARCHAR2(3)  | (YES NO) If set to YES the data file copy has been deleted or overwritten                                                                                                                                                                                                                             |
| STATUS                | VARCHAR2(1)  | Identifies the status of this data file copy. Possible values are:<br>A - Available<br>D - Deleted<br>U - Unavailable<br>X - Expired                                                                                                                                                                  |
| COMPLETION_TIME       | DATE         | Time when the copy was completed                                                                                                                                                                                                                                                                      |
| CONTROLFILE_TYPE      | VARCHAR2(1)  | B indicates normal copies<br>S indicates standby copies                                                                                                                                                                                                                                               |
| KEEP                  | VARCHAR2(3)  | (YES NO) Indicates whether or not this backup set has a retention policy that is different than the value for the configure retention policy                                                                                                                                                          |
| KEEP_UNTIL            | DATE         | If KEEP_UNTIL is specified, this is the date after which the backup becomes obsolete. If this column is null, then the backup never expires.                                                                                                                                                          |
| KEEP_OPTIONS          | VARCHAR2(11) | Lists additional retention options for this backup set. Possible values are:<br>LOGS - The logs need to recover this backup are kept<br>NOLOGS - The logs needed to recover this backup will not be kept                                                                                              |
| SCANNED               | VARCHAR2(3)  | Indicates whether RMAN scanned the file (YES) or not (NO)                                                                                                                                                                                                                                             |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)  | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                    |

| Column                   | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RMAN_STATUS_RECID        | NUMBER      | Owning V\$RMAN_STATUS record ID                                                                                                                                                                                                                                                                                                                                                                                                   |
| RMAN_STATUS_STAMP        | NUMBER      | Owning V\$RMAN_STATUS record stamp                                                                                                                                                                                                                                                                                                                                                                                                |
| CONVERTED_FILE           | VARCHAR2(3) | (YES/NO) Indicates whether or not the data file copy was created using the RMAN CONVERT command                                                                                                                                                                                                                                                                                                                                   |
| SAME_ENDIAN              | VARCHAR2(3) | If the value of the CONVERTED_FILE column is YES, then this column indicates whether the data file copy has the same endianness as the source data file (YES) or not (NO); otherwise NULL                                                                                                                                                                                                                                         |
| FOREIGN_DBID             | NUMBER      | Foreign DBID from which this data file came from. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                                     |
| PLUGGED_READONLY         | VARCHAR2(3) | YES if this is a transported read-only foreign file; otherwise NO.                                                                                                                                                                                                                                                                                                                                                                |
| PLUGIN_CHANGE#           | NUMBER      | SCN at which the foreign data file was transported into the database. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                                                 |
| PLUGIN_RESETLOGS_CHANGE# | NUMBER      | The SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                  |
| PLUGIN_RESETLOGS_TIME    | DATE        | The time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.                                                                                                                                                                                                                                                                 |
| BACKED_BY_VSS            | VARCHAR2(3) | Whether or not the file has been backed up by Volume Shadow Copy Service (VSS). This column is reserved for internal use.                                                                                                                                                                                                                                                                                                         |
| CON_ID                   | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |
| BACKED_BY_PDB            | VARCHAR2(3) | Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> <li>YES: The backup was taken when connected to the PDB</li> <li>NO: The backup was taken when connected to the root container</li> </ul>                                                                                                                   |
| SPARSE_BACKUP            | VARCHAR2(3) | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                            |
| GUID                     | RAW(16)     | The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.                                                                                                                                                                                                                                                                                             |

## 7.162 V\$DATAFILE\_HEADER

V\$DATAFILE\_HEADER displays data file information from the data file headers.

| Column | Datatype    | Description                          |
|--------|-------------|--------------------------------------|
| FILE#  | NUMBER      | Data file number (from control file) |
| STATUS | VARCHAR2(7) | ONLINE   OFFLINE (from control file) |

| Column                   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR                    | VARCHAR2(18)  | NULL if the data file header read and validation were successful. If the read failed then the rest of the columns are NULL. If the validation failed then the rest of columns may display invalid data. If there is an error then usually the data file must be restored from a backup before it can be recovered or used.                                                                                                        |
| FORMAT                   | NUMBER        | Indicates the format for the header block. The possible values are 6, 7, 8, 10 or 0.<br>6 - indicates Oracle Version 6<br>7 - indicates Oracle Version 7<br>8 - indicates Oracle Version 8<br>10 - indicates Oracle Version 10<br>0 - indicates the format could not be determined (for example, the header could not be read)                                                                                                    |
| RECOVER                  | VARCHAR2(3)   | File needs media recovery (YES   NO)                                                                                                                                                                                                                                                                                                                                                                                              |

| SPACE_HEADER             | VARCHAR2(40)  | Represents the block address of a space file header block of a locally managed data file                                                                                                                                                                                                                                                                                                                                          |
| LAST_DEALLOC_CHANGE#     | VARCHAR2(16)  | Last deallocated SCN                                                                                                                                                                                                                                                                                                                                                                                                              |
| UNDO_OPT_CURRENT_CHANGE# | VARCHAR2(40)  | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |
| IS_SPARSE                | VARCHAR2(3)   | Indicates whether the file is sparse (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                            |

| Column    | Datatype    | Description                                                                                                                                                                             |
|-----------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENCRYPTED | VARCHAR2(3) | After file encryption is completed, this column indicates whether the file is encrypted (YES) or not (NO).<br>When file encryption is still in progress, this column has a value of NO. |

## 7.163 V\$DATAGUARD\_CONFIG

V\$DATAGUARD\_CONFIG displays the unique database names defined with the DB\_UNIQUE\_NAME and LOG\_ARCHIVE\_CONFIG initialization parameters, providing a view of the Oracle Data Guard environment from any database in the configuration.

The first row of the view lists the unique database name of the current database that was specified with the DB\_UNIQUE\_NAME initialization parameter. Additional rows reflect the unique database names of the other databases in the configuration that were specified with the DG\_CONFIG keyword of the LOG\_ARCHIVE\_CONFIG initialization parameter.

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_UNIQUE_NAME | VARCHAR2(30) | Unique database name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PARENT_DBUN    | VARCHAR2(30) | DB_UNIQUE_NAME of the parent database, also known as the database that supplies live redo to the destination.<br>For example, suppose Boston is the DB_UNIQUE_NAME of the primary database, Chicago is the DB_UNIQUE_NAME of the Far Sync Instance, and Seattle is the DB_UNIQUE_NAME of the terminal standby database. Since Boston is the primary database, it has no parent database so the PARENT_DBUN for Boston will be NULL. Since Boston services Chicago, the PARENT_DBUN of Chicago will be Boston. Since Chicago services Seattle, Chicago will be the PARENT_DBUN for Seattle. |
| DEST_ROLE      | VARCHAR2(17) | Type of archival destination database: <ul style="list-style-type: none"> <li>LOCAL - Local to primary database</li> <li>PHYSICAL - Physical standby</li> <li>FAR_SYNC_INSTANCE - Far Sync Instance</li> <li>CROSS-INSTANCE - An instance of the primary</li> <li>LOGICAL - Logical standby</li> <li>SNAPSHOT - Snapshot standby database</li> <li>DOWNSTREAM - Streams downstream capture database</li> </ul>                                                                                                                                                                             |
| CURRENT_SCN    | NUMBER       | The SCN up to which the specified database has applied redo                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                          |

| BLOCK#      | NUMBER       | Starting block number that the process is operating upon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BLOCK_COUNT | NUMBER       | Number of blocks that the process is operating upon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DELAY_MINS  | NUMBER       | Archived redo log delay interval in minutes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Column     | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEST_ID    | NUMBER      | Destination ID that the process is currently operating upon                                                                                                                                                                                                                                                                                                                                                                                           |
| DEST_MASK  | NUMBER      | Mask of all destination IDs that the process will operate upon, where:<br><ul style="list-style-type: none"> <li>Bit 0 is LOG_ARCHIVE_DEST1</li> <li>Bit 1 is LOG_ARCHIVE_DEST2</li> <li>Bit 2 is LOG_ARCHIVE_DEST3</li> </ul> and so on.                                                                                                                                                                                                             |
| DBID       | NUMBER      | Database ID of the redo that the process is operating upon                                                                                                                                                                                                                                                                                                                                                                                            |
| DGID       | NUMBER      | Data Guard ID that the process must communicate with                                                                                                                                                                                                                                                                                                                                                                                                  |
| INSTANCE   | NUMBER      | Instance number that the process must communicate with at the specified DGID                                                                                                                                                                                                                                                                                                                                                                          |
| STOP_STATE | VARCHAR2(7) | Indicates the method by which the process has been requested to stop: <ul style="list-style-type: none"> <li>• NOW - Requested to stop immediately and exit</li> <li>• SOON - Requested to stop on next log and exit</li> <li>• COMMIT - Requested to write remaining redo and exit</li> <li>• N/A - No request to stop</li> </ul>                                                                                                                    |
| CON_ID     | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

 **Note:**

Oracle recommends that you use this view instead of V\$MANAGED\_STANDBY.

## 7.165 V\$DATAGUARD\_STATS

V\$DATAGUARD\_STATS displays information about Oracle Data Guard metrics when queried on a standby database. No rows are returned when queried on a primary database.

| Column                | Datatype     | Description                                     |
|-----------------------|--------------|-------------------------------------------------|
| SOURCE_DBID           | NUMBER       | Database ID of the protected source database    |
| SOURCE_DB_UNIQUE_NAME | VARCHAR2(32) | DB unique name of the protected source database |

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME          | VARCHAR2 (32) | <p>Name of the metric:</p> <ul style="list-style-type: none"> <li>APPLY FINISH TIME - An estimate of the time needed to apply all received, but unapplied redo from the primary database. If there are one or more redo gaps on the standby database, an estimate of the time needed to apply all received, but unapplied redo up to the end of the last archived redo log before the beginning of the earliest redo gap.</li> <li>APPLY LAG - Apply lag is a measure of the degree to which the data in a standby database lags behind the data in the primary database, due to delays in propagating and applying redo to the standby database. This value is relevant only to the applying instance.</li> <li>TRANSPORT LAG - Transport lag is a measure of the degree to which the transport of redo to the standby database lags behind the generation of redo on the primary database. If there are one or more redo gaps on the standby database, the transport lag is calculated as if no redo has been received after the beginning of the earliest redo gap.</li> <li>ESTIMATED STARTUP TIME - An estimate of the time needed to start and open the database.</li> </ul> |
| VALUE         | VARCHAR2 (64) | Value of the metric                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| UNIT          | VARCHAR2 (30) | Unit of measurement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| TIME_COMPUTED | VARCHAR2 (30) | Local time at the standby database when the metric was computed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DATUM_TIME    | VARCHAR2 (30) | <p>Local time at the standby database when the datum used to compute the metric was received</p> <p>The APPLY LAG and TRANSPORT LAG metrics are computed based on data that is periodically received from the primary database. An unchanging value in this column across multiple queries indicates that the standby database is not receiving data from the primary database.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID        | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 7.166 V\$DATAGUARD\_STATUS

V\$DATAGUARD\_STATUS displays messages recently written to the alert log or server process trace files that concern physical standby databases or redo transport services for all standby database types.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| MESSAGE     | VARCHAR2(256) | A text message describing the event                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.167 V\$DB\_CACHE\_ADVICE

V\$DB\_CACHE\_ADVICE contains rows that predict the number of physical reads for the cache size corresponding to each row.

The rows also compute a "physical read factor," which is the ratio of the number of estimated reads to the number of reads actually performed by the real buffer cache during the measurement interval.

| Column                        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                            | NUMBER       | Buffer pool identifier (ranges from 1 to 8)                                                                                                                                                                                                                                                                                                                                                                                                     |
| NAME                          | VARCHAR2(20) | Buffer pool name                                                                                                                                                                                                                                                                                                                                                                                                                                |
| BLOCK_SIZE                    | NUMBER       | Block size in bytes for buffers in this pool. Possible values: the standard block size, the power of 2 nonstandard block sizes, 2048, 4096, 8192, 16384, 32768.                                                                                                                                                                                                                                                                                 |
| ADVICE_STATUS                 | VARCHAR2(3)  | Status of the advisory. ON indicates it is currently running; OFF indicates it is disabled (in this case the estimates are historical and calculated when last enabled).                                                                                                                                                                                                                                                                        |
| SIZE_FOR_ESTIMATE             | NUMBER       | Cache size for prediction (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                        |
| SIZE_FACTOR                   | NUMBER       | Size factor with respect to the current cache size                                                                                                                                                                                                                                                                                                                                                                                              |
| BUFFERS_FOR_ESTIMATE          | NUMBER       | Cache size for prediction (in terms of buffers)                                                                                                                                                                                                                                                                                                                                                                                                 |
| ESTD_PHYSICAL_READ_FACTOR     | NUMBER       | Physical read factor for this cache size, which is the ratio of the number of estimated physical reads to the number of reads in the real cache. If there are no physical reads in the real cache, the value of this column is null.                                                                                                                                                                                                            |
| ESTD_PHYSICAL_READS           | NUMBER       | Estimated number of physical reads for this cache size                                                                                                                                                                                                                                                                                                                                                                                          |
| ESTD_PHYSICAL_READ_TIME       | NUMBER       | Estimated disk read time (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                           |
| ESTD_PCT_OF_DB_TIME_FOR_READS | NUMBER       | Estimated disk time as a percentage of the total time                                                                                                                                                                                                                                                                                                                                                                                           |
| ESTD_CLUSTER_READS            | NUMBER       | Estimated total number of blocks foreground processes read from the global cache (Oracle Real Application Clusters only)                                                                                                                                                                                                                                                                                                                        |
| ESTD_CLUSTER_READ_TIME        | NUMBER       | Estimated total amount of time, in seconds, foreground processes read from global cache (Oracle Real Application Clusters only)                                                                                                                                                                                                                                                                                                                 |
| CON_ID                        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.168 V\$DB\_OBJECT\_CACHE

V\$DB\_OBJECT\_CACHE displays database objects that are cached in the library cache. Objects include tables, indexes, clusters, synonym definitions, PL/SQL procedures and packages, and triggers.

| Column    | Datatype       | Description                                                                                   |
|-----------|----------------|-----------------------------------------------------------------------------------------------|
| OWNER     | VARCHAR2(64)   | Owner of the object                                                                           |
| NAME      | VARCHAR2(1000) | Name of the object                                                                            |
| DB_LINK   | VARCHAR2(64)   | Database link name, if any                                                                    |
| NAMESPACE | VARCHAR2(64)   | Library cache namespace of the object: TABLE/PROCEDURE, BODY, TRIGGER, INDEX, CLUSTER, OBJECT |

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE               | VARCHAR2(64)  | Type of the object: INDEX, TABLE, CLUSTER, VIEW, SET, SYNONYM, SEQUENCE, PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, CLASS, OBJECT, USER, DBLINK                                                                                                                                                                                                                                                                         |
| SHARABLE_MEM       | NUMBER        | Amount of sharable memory in the shared pool consumed by the object                                                                                                                                                                                                                                                                                                                                                               |
| LOADS              | NUMBER        | Number of times the object has been loaded. This count also increases when an object has been invalidated.                                                                                                                                                                                                                                                                                                                        |
| EXECUTIONS         | NUMBER        | Not used<br><b>See Also:</b> "V\$SQLAREA" to see actual execution counts                                                                                                                                                                                                                                                                                                                                                          |
| LOCKS              | NUMBER        | Number of users currently locking this object                                                                                                                                                                                                                                                                                                                                                                                     |
| PINS               | NUMBER        | Number of users currently pinning this object                                                                                                                                                                                                                                                                                                                                                                                     |
| KEPT               | VARCHAR2(3)   | (YES   NO) Depends on whether this object has been "kept" (permanently pinned in memory) with the PL/SQL procedure DBMS_SHARED_POOL.KEEP                                                                                                                                                                                                                                                                                          |
| CHILD_LATCH        | NUMBER        | Child latch number that is protecting the object. This column is obsolete and maintained for backward compatibility.                                                                                                                                                                                                                                                                                                              |
| INVALIDATIONS      | NUMBER        | Total number of times objects in the namespace were marked invalid because a dependent object was modified                                                                                                                                                                                                                                                                                                                        |
| HASH_VALUE         | NUMBER        | Hash value of the object                                                                                                                                                                                                                                                                                                                                                                                                          |
| LOCK_MODE          | VARCHAR2(9)   | Current lock mode of the object                                                                                                                                                                                                                                                                                                                                                                                                   |
| PIN_MODE           | VARCHAR2(9)   | Current pin mode of the object                                                                                                                                                                                                                                                                                                                                                                                                    |
| STATUS             | VARCHAR2(19)  | Status of the object                                                                                                                                                                                                                                                                                                                                                                                                              |
| TIMESTAMP          | VARCHAR2(19)  | Timestamp for the specification of the object                                                                                                                                                                                                                                                                                                                                                                                     |
| PREVIOUS_TIMESTAMP | VARCHAR2(19)  | Previous timestamp for the specification of the object                                                                                                                                                                                                                                                                                                                                                                            |
| LOCKED_TOTAL       | NUMBER        | Total number of times the object has been locked                                                                                                                                                                                                                                                                                                                                                                                  |
| PINNED_TOTAL       | NUMBER        | Total number of times the object has been pinned                                                                                                                                                                                                                                                                                                                                                                                  |
| PROPERTY           | VARCHAR2(80)  | Property of the object. Possible values include HOT or HOTCOPY when the library cache hot copy feature is used using DBMS_SHARED_POOL.MARKHOT.                                                                                                                                                                                                                                                                                    |
| FULL_HASH_VALUE    | VARCHAR2(32)  | Full hash value of the object                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID             | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |
| CON_NAME           | VARCHAR2(64)  | Container name of the object. The value of this column is NULL in non-CDBs.                                                                                                                                                                                                                                                                                                                                                       |
| ADDR               | RAW(8)        | Address of the handle for this object                                                                                                                                                                                                                                                                                                                                                                                             |
| EDITION            | VARCHAR2(138) | Edition name                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 7.169 V\$DB\_PIPES

V\$DB\_PIPES displays the pipes that are currently represented in the shared pool for this instance.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNERID   | NUMBER         | Owner ID of the owner (if this is a private pipe), else NULL                                                                                                                                                                                                                                                                                                                                                                                          |
| NAME      | VARCHAR2(1000) | Name of the pipe (for example, SCOTT.PIPE)                                                                                                                                                                                                                                                                                                                                                                                                            |
| TYPE      | VARCHAR2(7)    | Type of the pipe: <ul style="list-style-type: none"> <li>• PUBLIC</li> <li>• PRIVATE</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| PIPE_SIZE | NUMBER         | Amount of memory the pipe uses<br><b>Note:</b> The value of this column may be larger than <code>maxpipesize</code> because of an internal algorithm.                                                                                                                                                                                                                                                                                                 |
| CON_ID    | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CON_NAME  | VARCHAR2(64)   | Container name of the object. The value of this column is NULL in non-CDBs.                                                                                                                                                                                                                                                                                                                                                                           |

## 7.170 V\$DB\_TRANSPORTABLE\_PLATFORM

V\$DB\_TRANSPORTABLE\_PLATFORM displays all platforms to which the database can be transported using the `RMAN CONVERT DATABASE` command.

The transportable database feature only supports transports of the same endian platform. Therefore, V\$DB\_TRANSPORTABLE\_PLATFORM displays fewer rows than V\$TRANSPORTABLE\_PLATFORM.

| Column        | Datatype      | Description                    |
|---------------|---------------|--------------------------------|
| PLATFORM_ID   | NUMBER        | Platform identification number |
| PLATFORM_NAME | VARCHAR2(101) | Platform name                  |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENDIAN_FORMAT | VARCHAR2(14) | Platform endian format: <ul style="list-style-type: none"> <li>• Big</li> <li>• Little</li> <li>• UNKNOWN FORMAT</li> </ul>                                                                                                                                                                                                                                                                                                                           |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.172 V\$DBLINK

V\$DBLINK describes all database links (links with IN\_TRANSACTION = YES) opened by the session issuing the query on V\$DBLINK. These database links must be committed or rolled back before being closed.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_LINK               | VARCHAR2(128) | Name of the database link                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OWNER_ID              | NUMBER        | Owner of the database link UID                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LOGGED_ON             | VARCHAR2(3)   | Whether the database link is currently logged on                                                                                                                                                                                                                                                                                                                                                                                                |
| HETEROGENEOUS         | VARCHAR2(3)   | Whether the database link is heterogeneous                                                                                                                                                                                                                                                                                                                                                                                                      |
| PROTOCOL              | VARCHAR2(6)   | Communication protocol for the database link                                                                                                                                                                                                                                                                                                                                                                                                    |
| OPEN_CURSORS          | NUMBER        | Whether there are open cursors for the database link                                                                                                                                                                                                                                                                                                                                                                                            |
| IN_TRANSACTION        | VARCHAR2(3)   | Whether the database link is currently in a transaction                                                                                                                                                                                                                                                                                                                                                                                         |
| UPDATE_SENT           | VARCHAR2(3)   | Whether there has been an update on the database link                                                                                                                                                                                                                                                                                                                                                                                           |
| COMMIT_POINT_STRENGTH | NUMBER        | Commit point strength of the transactions on the database link                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.173 V\$DEAD\_CLEANUP

V\$DEAD\_CLEANUP shows the dead processes and killed sessions present in the instance and their cleanup status.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE          | VARCHAR2(64) | Indicates whether a row contains a DEAD_PROCESS or KILLED_SESSION                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PADDR         | RAW(8)       | Process pointer. Can be joined with V\$PROCESS. For a killed session, this is the owner of the session, which can be NULL.                                                                                                                                                                                                                                                                                                                                                                                     |
| SADDR         | RAW(8)       | Session pointer. Can be joined with V\$SESSION. For a dead process, this is the user session.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ROOT_ADDR     | RAW(8)       | Pointer to the root of the tree                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CLEANUP_OWNER | VARCHAR2(64) | Indicates which process is responsible for cleanup of this tree: <ul style="list-style-type: none"> <li>CLEANUP_PROCESS - a cleanup process is responsible</li> <li>OWNER_PROCESS - the root owner is responsible</li> </ul>                                                                                                                                                                                                                                                                                   |
| STATE         | VARCHAR2(64) | Cleanup state: <ul style="list-style-type: none"> <li>CLEANUP_PENDING - Occurs for a dead process / killed session that can be cleaned up, but PMON has not yet made an attempt</li> <li>IN_PROGRESS - A cleanup attempt is currently in progress</li> <li>RESOURCES_FREED - Occurs for a dead process / killed session where all children have been freed, but the process / killed session itself is not yet freed</li> <li>PARTIAL_CLEANUP - Occurs if some of the children have been cleaned up</li> </ul> |
| DEAD_TIME     | NUMBER       | Time since the process was marked dead or the session was marked killed (in seconds)                                                                                                                                                                                                                                                                                                                                                                                                                           |

| CLEANUP_ATTEMPTS | NUMBER   | Number of times PMON has attempted cleanup                                                                                                                                                                                                                                                                                                                                                                                                      |
| LAST_ATTEMPT     | NUMBER   | How long ago the last cleanup attempt occurred (in seconds)                                                                                                                                                                                                                                                                                                                                                                                     |
| CLEANUP_PROCESS  | RAW(8)   | Process pointer for the cleanup process currently cleaning up this tree (can join with V\$CLEANUP_PROCESS). It will be NULL if cleanup is not currently in progress or if the owner is responsible for cleanup.                                                                                                                                                                                                                                 |
| CLEANUP_TIME     | NUMBER   | Total amount of time PMON has spent on cleanup of the process/session (in seconds)                                                                                                                                                                                                                                                                                                                                                              |
| NUM_BLOCKED      | NUMBER   | Number of sessions blocked on cleanup of this session                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**See Also:**

"V\$CLEANUP\_PROCESS"

## 7.174 V\$DELETED\_OBJECT

V\$DELETED\_OBJECT displays information about deleted archived logs, data file copies and backup pieces from the control file.

The only purpose of this view is to optimize the recovery catalog resync operation. When an archived log, data file copy, or backup piece is deleted, the corresponding record is marked deleted.

| Column | Datatype | Description                 |
|--------|----------|-----------------------------|
| RECID  | NUMBER   | Deleted object record ID    |
| STAMP  | NUMBER   | Deleted object record stamp |

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 7.175 V\$DG\_BROKER\_CONFIG

V\$DG\_BROKER\_CONFIG provides a summary of an Oracle Data Guard broker configuration.

This is similar to the DGMGRL CLI's SHOW CONFIGURATION command. It provides a view of the entire Oracle Data Guard broker configuration from any database in the configuration.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATABASE           | VARCHAR2(512) | Database unique name                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CONNECT_IDENTIFIER | VARCHAR2(512) | Net connect identifier used to reach the database                                                                                                                                                                                                                                                                                                                                                                                               |
| DATAGUARD_ROLE     | VARCHAR2(27)  | Oracle Data Guard role of the database: <ul style="list-style-type: none"> <li>PRIMARY</li> <li>PHYSICAL_STANDBY</li> <li>LOGICAL_STANDBY</li> <li>SNAPSHOT_STANDBY</li> <li>FAR_SYNC_INSTANCE</li> <li>RECOVERY_APPLIANCE</li> </ul>                                                                                                                                                                                                           |
| REDO_SOURCE        | VARCHAR(30)   | The database unique name of the redo source                                                                                                                                                                                                                                                                                                                                                                                                     |
| ENABLED            | VARCHAR2(5)   | TRUE or FALSE to denote whether or not the database is managed by Oracle Data Guard broker                                                                                                                                                                                                                                                                                                                                                      |
| STATUS             | NUMBER        | An Oracle error number denoting the database's current status                                                                                                                                                                                                                                                                                                                                                                                   |
| VERSION            | VARCHAR2(30)  | Version of the broker configuration                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID             | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.176 V\$DIAG\_ALERT\_EXT

V\$DIAG\_ALERT\_EXT shows the contents of the XML-based alert log in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

| Column                | Datatype                       | Description                                                                                                            |
|-----------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------|
| ORIGINATING_TIMESTAMP | TIMESTAMP(9)<br>WITH TIME ZONE | Date and time when the message was generated                                                                           |
| NORMALIZED_TIMESTAMP  | TIMESTAMP(9)<br>WITH TIME ZONE | Date and time when the message originated, normalized for clock drift to the Oracle Enterprise Manager repository time |
| ORGANIZATION_ID       | VARCHAR2(67)                   | ID of the organization that wrote the originating component, usually the domain of the organization                    |
| COMPONENT_ID          | VARCHAR2(67)                   | ID of the product or component that originated the message                                                             |
| HOST_ID               | VARCHAR2(67)                   | DNS hostname of originating host                                                                                       |
| HOST_ADDRESS          | VARCHAR2(49)                   | IP of other network address of the originating host for the message                                                    |

| Column                     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MESSAGE_TYPE               | NUMBER         | Type of the message, indicating that a different type of response is required. Possible values include: <ul style="list-style-type: none"> <li>1: UNKNOWN - Essentially the NULL type</li> <li>2: INCIDENT_ERROR - The program has encountered an error for some internal or unexpected reason, and it must be reported to Oracle Support</li> <li>3: ERROR - An error of some kind has occurred</li> <li>4: WARNING: An action occurred or a condition was discovered that should be reviewed and may require action</li> <li>5: NOTIFICATION: reports a normal action or event. This could be a user action such as "logon completed"</li> <li>6: TRACE: Output of a diagnostic trace</li> </ul> |
| MESSAGE_LEVEL              | NUMBER         | Level the message belongs to. Lower level values imply higher severity for errors. Possible values include: <ul style="list-style-type: none"> <li>1: CRITICAL: critical errors</li> <li>2: SEVERE: severe errors</li> <li>8: IMPORTANT: important message</li> <li>16: NORMAL: normal message</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                          |
| MESSAGE_ID                 | VARCHAR2(67)   | ID of the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MESSAGE_GROUP              | VARCHAR2(67)   | Name of the group to which the message belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CLIENT_ID                  | VARCHAR2(67)   | ID of the client or security group that the message relates to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MODULE_ID                  | VARCHAR2(67)   | ID of the module that originated the message. This value is unique within a component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PROCESS_ID                 | VARCHAR2(35)   | ID of the process that originated the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD_ID                  | VARCHAR2(67)   | ID of the thread of the process that originated the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| USER_ID                    | VARCHAR2(131)  | ID of the user that originated the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INSTANCE_ID                | VARCHAR2(67)   | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| DETAILED_LOCATION          | VARCHAR2(163)  | Absolute pathname of supplemental detail file on the originating host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| UPSTREAM_COMP_ID           | VARCHAR2(103)  | ID of a component that the originating component is working with on the upstream (client) side                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| EXECUTION_CONTEXT_ID       | VARCHAR2(103)  | Identifies the thread of execution that the originating component participates in                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXECUTION_CONTEXT_SEQUENCE | NUMBER         | Execution sequence of the thread that the originating component participates in                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ERROR_INSTANCE_ID          | NUMBER         | ID of the instance where error occurred                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ERROR_INSTANCE_SEQUENCE    | NUMBER         | Instance sequence where error occurred                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MESSAGE_TEXT               | VARCHAR2(2051) | Fully formed and localized text of the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MESSAGE_ARGUMENTS          | VARCHAR2(515)  | Arguments to be bound with the generic text of the message                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SUPPLEMENTAL_ATTRIBUTES    | VARCHAR2(515)  | Supplemental attributes that are specific to a message. This field contains the impacts for an incident type error message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUPPLEMENTAL_DETAILS | VARCHAR2(515) | Supplemental data that is specific to a particular program and error message required to complete the diagnosis. Similar to the extra detail referred to in DETAILED_LOCATION but short enough to simply provide in the message itself                                                                                                                                                                                                          |
| PARTITION            | NUMBER        | Segment number of physical file                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RECORD_ID            | NUMBER        | Record number for the message (this value is same as the row number)                                                                                                                                                                                                                                                                                                                                                                            |
| FILENAME             | VARCHAR2(515) | Physical file on disk                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LOG_NAME             | VARCHAR2(67)  | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                           |
| PROBLEM_KEY          | VARCHAR2(553) | Describes the key for the current problem that the message is associated with                                                                                                                                                                                                                                                                                                                                                                   |
| VERSION              | NUMBER        | ARB version number for the message                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_UID              | NUMBER        | The unique ID of the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                       |
| CONTAINER_ID         | NUMBER        | The ID of the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                              |
| CONTAINER_NAME       | VARCHAR2(33)  | The name of the container to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.177 V\$DIAG\_APP\_TRACE\_FILE

V\$DIAG\_APP\_TRACE\_FILE contains information about all trace files present in the Automatic Diagnostic Repository (ADR) for the current container (PDB) which contain application trace data (SQL\_TRACE or OPTIMIZER\_TRACE event data). This view also supports GV\$ global views.

| Column         | Datatype                       | Description                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)                  | Path to the current ADR home                                                                                                                                                                                                                                                                                     |
| TRACE_FILENAME | VARCHAR2(68)                   | Displays the name of the process trace file                                                                                                                                                                                                                                                                      |
| CHANGE_TIME    | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the change time timestamp of the process trace fiile                                                                                                                                                                                                                                                    |
| MODIFY_TIME    | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the last modification timestamp of the process trace file                                                                                                                                                                                                                                               |
| SQL_TRACE      | VARCHAR2(1)                    | Identifies if the process trace file contains SQL_TRACE data. Possible values include: <ul style="list-style-type: none"> <li>Y: This value is used when the process trace file contains SQL_TRACE event data</li> <li>N: This value indicates that the process trace does not contain SQL_TRACE data</li> </ul> |

| Column          | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIMIZER_TRACE | VARCHAR2(1) | Identifies if the process trace file contains OPTIMIZER_TRACE data. Possible values include: <ul style="list-style-type: none"> <li>Y: This value is used when the process trace file contains OPTIMIZER_TRACE event data</li> <li>N: This value indicates that the process trace does not contain OPTIMIZER_TRACE data</li> </ul>                                                                                                       |
| CON_ID          | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.178 V\$DIAG\_INCIDENT

V\$DIAG\_INCIDENT contains information about all incident metadata records present in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

| Column           | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                 |
|------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCIDENT_ID      | NUMBER                         | ID for the current incident                                                                                                                                                                                                                                                                                                                                 |
| PROBLEM_ID       | NUMBER                         | ID for the problem that the incident is associated with                                                                                                                                                                                                                                                                                                     |
| CREATE_TIME      | TIMESTAMP(9)<br>WITH TIME ZONE | Displays the date and time when the incident was created                                                                                                                                                                                                                                                                                                    |
| CLOSE_TIME       | TIMESTAMP(9)<br>WITH TIME ZONE | Displays the date and time when the incident was closed                                                                                                                                                                                                                                                                                                     |
| STATUS           | NUMBER                         | Describes the current status for the incident. Possible values include: <ul style="list-style-type: none"> <li>1: Incident is inflight</li> <li>2: Incident is ready</li> <li>3: Incident is tracked</li> <li>4: Incident is closed</li> <li>5: Incident data is removed</li> <li>6: Incident has been purged</li> <li>7: Incident is incomplete</li> </ul> |
| FLAGS            | NUMBER                         | For internal use only                                                                                                                                                                                                                                                                                                                                       |
| FLOOD_CONTROLLED | NUMBER                         | Describes the flood control status for the current incident. Possible values include: <ul style="list-style-type: none"> <li>0: Incident is not flood-controlled</li> <li>1: Incident is fully flood controlled (no dumps)</li> </ul>                                                                                                                       |
| ERROR_FACILITY   | VARCHAR2(12)                   | Displays the error facility for the current incident                                                                                                                                                                                                                                                                                                        |
| ERROR_NUMBER     | NUMBER                         | Displays the error number for the current incident                                                                                                                                                                                                                                                                                                          |
| ERROR_ARG1       | VARCHAR2(66)                   | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                 |
| ERROR_ARG2       | VARCHAR2(66)                   | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                 |

| ERROR_ARG12             | VARCHAR2(66) | Displays error-arguments associated with the given incident                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_UID                 | NUMBER       | Describes the container unique ID to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                  | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.179 V\$DIAG\_INFO

V\$DIAG\_INFO describes the state of Automatic Diagnostic Repository (ADR) functionality using NAME=VALUE pairs.

| Column  | Datatype | Description |
|---------|----------|-------------|
| INST_ID | NUMBER   | Instance ID |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2(64)  | Identifies a piece of data that reflects the state of ADR, such as whether it is enabled, where the directories and files are located, and how many ongoing issues (incidents and problems) there are.<br>Possible values include: <ul style="list-style-type: none"> <li>Diag Enabled: Indicates whether ADR is enabled or not</li> <li>ADR Base through Health Monitor: Display different directories (ADR base, ADR home, and then subdirectories within the ADR home)</li> <li>Default Trace File: Specifies the current default trace file for the current process</li> <li>Active Problem Count and Active Incident Count: Specify how many problems/incidents there are in this ADR that <i>either</i> happened in the last 24 hours <i>or</i> have a piece of metadata set indicating that it is a persistent error (like a disk corruption)</li> </ul> |
| VALUE  | VARCHAR2(512) | Describes the current state of the piece of data identified in the NAME column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 7.180 V\$DIAG\_OPT\_TRACE\_RECORDS

V\$DIAG\_OPT\_TRACE\_RECORDS contains all optimizer trace event data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444) | Path to current ADR home                                                                                                                                                                                                                                                                                                                                                                                          |
| TRACE_FILENAME | VARCHAR2(68)  | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER        | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER        | Displays the top parent level of trace record                                                                                                                                                                                                                                                                                                                                                                     |
| RECORD_TYPE    | NUMBER        | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul> |

| Column         | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIMESTAMP      | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                       |
| PAYLOAD        | VARCHAR2(4000)                 | Describes the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                                                   |
| SECTION_ID     | NUMBER                         | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| SECTION_NAME   | VARCHAR2(64)                   | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                                                       |
| COMPONENT_NAME | VARCHAR2(64)                   | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                     |
| OPERATION_NAME | VARCHAR2(64)                   | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                     |
| FILE_NAME      | VARCHAR2(64)                   | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                                                          |
| FUNCTION_NAME  | VARCHAR2(64)                   | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                          |
| LINE_NUMBER    | NUMBER                         | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD_ID      | VARCHAR2(64)                   | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                          |
| SESSION_ID     | NUMBER                         | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                   |
| SERIAL#        | NUMBER                         | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                         |
| CON_UID        | NUMBER                         | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                            |
| CONTAINER_NAME | VARCHAR2(30)                   | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID         | NUMBER                         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.181 V\$DIAG\_PROBLEM

V\$DIAG\_PROBLEM contains information about all problem metadata records present in the Automatic Diagnostic Repository (ADR) for the current container (PDB).

| Column         | Datatype                       | Description                                                                     |
|----------------|--------------------------------|---------------------------------------------------------------------------------|
| PROBLEM_ID     | NUMBER                         | Displays the ID for the current problem                                         |
| PROBLEM_KEY    | VARCHAR2(552)                  | Displays the problem key for the current problem                                |
| FIRST_INCIDENT | NUMBER                         | Displays the first incident ID for the current problem                          |
| FIRSTINC_TIME  | TIMESTAMP(9)<br>WITH TIME ZONE | Displays the timestamp when the first incident occurred for the current problem |
| LAST_INCIDENT  | NUMBER                         | Displays the last incident ID for the current problem                           |
| LASTINC_TIME   | TIMESTAMP(9)<br>WITH TIME ZONE | Displays the timestamp when the last incident occurred for the current problem  |

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IMPACT1         | NUMBER       | Displays the first impact for the current problem                                                                                                                                                                                                                                                                                                                                                                                               |
| IMPACT2         | NUMBER       | Displays the second impact for the current problem                                                                                                                                                                                                                                                                                                                                                                                              |
| IMPACT3         | NUMBER       | Displays the third impact for the current problem                                                                                                                                                                                                                                                                                                                                                                                               |
| IMPACT4         | NUMBER       | Displays the fourth impact for the current problem                                                                                                                                                                                                                                                                                                                                                                                              |
| SERVICE_REQUEST | VARCHAR2(66) | Displays the service request number for the current problem, if a number has been entered in Support Workbench                                                                                                                                                                                                                                                                                                                                  |
| BUG_NUMBER      | VARCHAR2(66) | Displays the bug number for the current problem, if a number has been entered in Support Workbench                                                                                                                                                                                                                                                                                                                                              |
| CON_UID         | NUMBER       | Displays the container unique ID to which the data pertains                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.182 V\$DIAG\_SESS\_OPT\_TRACE\_RECORDS

V\$DIAG\_SESS\_OPT\_TRACE\_RECORDS contains all optimizer trace event data that is present in the trace files for the current user session that is part of the current Automatic Diagnostic Repository (ADR).

| Column         | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)                  | Path to current ADR home                                                                                                                                                                                                                                                                                                                                                                                          |
| TRACE_FILENAME | VARCHAR2(68)                   | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER                         | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER                         | Displays the top parent level of trace record                                                                                                                                                                                                                                                                                                                                                                     |
| RECORD_TYPE    | NUMBER                         | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul> |
| TIMESTAMP      | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                         |
| PAYLOAD        | VARCHAR2(4000)                 | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                      |
| SECTION_ID     | NUMBER                         | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                             |
| SECTION_NAME   | VARCHAR2(64)                   | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                         |
| COMPONENT_NAME | VARCHAR2(64)                   | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                       |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPERATION_NAME | VARCHAR2(64) | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                     |
| FILE_NAME      | VARCHAR2(64) | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                                                          |
| FUNCTION_NAME  | VARCHAR2(64) | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                          |
| LINE_NUMBER    | NUMBER       | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD_ID      | VARCHAR2(64) | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                          |
| SESSION_ID     | NUMBER       | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                   |
| SERIAL#        | NUMBER       | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                         |
| CON_UID        | NUMBER       | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                            |
| CONTAINER_NAME | VARCHAR2(30) | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.183 V\$DIAG\_SESS\_SQL\_TRACE\_RECORDS

V\$DIAG\_SESS\_SQL\_TRACE\_RECORDS contains all SQL\_TRACE data that is present in the trace files for the current user session that is part of the current Automatic Diagnostic Repository (ADR).

| Column         | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)                  | Path to current ADR home                                                                                                                                                                                                                                                                                                                                                                                          |
| TRACE_FILENAME | VARCHAR2(68)                   | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER                         | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER                         | Displays the top parent level of trace record                                                                                                                                                                                                                                                                                                                                                                     |
| RECORD_TYPE    | NUMBER                         | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul> |
| TIMESTAMP      | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                         |

| Column         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PAYLOAD        | VARCHAR2(4000) | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                                                    |
| SECTION_ID     | NUMBER         | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| SECTION_NAME   | VARCHAR2(64)   | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                                                       |
| COMPONENT_NAME | VARCHAR2(64)   | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                     |
| OPERATION_NAME | VARCHAR2(64)   | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                     |
| FILE_NAME      | VARCHAR2(64)   | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                                                          |
| FUNCTION_NAME  | VARCHAR2(64)   | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                          |
| LINE_NUMBER    | NUMBER         | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD_ID      | VARCHAR2(64)   | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                          |
| SESSION_ID     | NUMBER         | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                   |
| SERIAL#        | NUMBER         | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                         |
| CON_UID        | NUMBER         | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                            |
| CONTAINER_NAME | VARCHAR2(30)   | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.184 V\$DIAG\_SQL\_TRACE\_RECORDS

V\$DIAG\_SQL\_TRACE\_RECORDS contains all SQL\_TRACE data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

| Column         | Datatype      | Description                                   |
|----------------|---------------|-----------------------------------------------|
| ADR_HOME       | VARCHAR2(444) | Path to current ADR home                      |
| TRACE_FILENAME | VARCHAR2(68)  | Displays the name of the process trace file   |
| RECORD_LEVEL   | NUMBER        | Displays the level of the trace record        |
| PARENT_LEVEL   | NUMBER        | Displays the top parent level of trace record |

| Column         | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECORD_TYPE    | NUMBER                         | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul>                               |
| TIMESTAMP      | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                       |
| PAYLOAD        | VARCHAR2(4000)                 | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                                                    |
| SECTION_ID     | NUMBER                         | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                                                           |
| SECTION_NAME   | VARCHAR2(64)                   | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                                                       |
| COMPONENT_NAME | VARCHAR2(64)                   | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                     |
| OPERATION_NAME | VARCHAR2(64)                   | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                                                     |
| FILE_NAME      | VARCHAR2(64)                   | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                                                          |
| FUNCTION_NAME  | VARCHAR2(64)                   | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                          |
| LINE_NUMBER    | NUMBER                         | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD_ID      | VARCHAR2(64)                   | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                          |
| SESSION_ID     | NUMBER                         | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                   |
| SERIAL#        | NUMBER                         | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                         |
| CON_UID        | NUMBER                         | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                            |
| CONTAINER_NAME | VARCHAR2(30)                   | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID         | NUMBER                         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.185 V\$DIAG\_TRACE\_FILE

V\$DIAG\_TRACE\_FILE contains information about all trace files present in the Automatic Diagnostic Repository (ADR) for the current container (PDB). This view also supports GV\$ global views.

| Column         | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)                  | Path to the current ADR home                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TRACE_FILENAME | VARCHAR2(68)                   | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                                                     |
| CHANGE_TIME    | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the change time timestamp of the process trace file                                                                                                                                                                                                                                                                                                                                                                                    |
| MODIFY_TIME    | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the last modification timestamp of the process trace file                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID         | NUMBER                         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.186 V\$DIAG\_TRACE\_FILE\_CONTENTS

V\$DIAG\_TRACE\_FILE\_CONTENTS contains trace data that is present in the trace files that are part of the current Automatic Diagnostic Repository (ADR). This view also supports GV\$ global views.

| Column         | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADR_HOME       | VARCHAR2(444)                  | Path to the current ADR home                                                                                                                                                                                                                                                                                                                                                                                      |
| TRACE_FILENAME | VARCHAR2(68)                   | Displays the name of the process trace file                                                                                                                                                                                                                                                                                                                                                                       |
| RECORD_LEVEL   | NUMBER                         | Displays the level of the trace record                                                                                                                                                                                                                                                                                                                                                                            |
| PARENT_LEVEL   | NUMBER                         | Displays the top parent level of trace record                                                                                                                                                                                                                                                                                                                                                                     |
| RECORD_TYPE    | NUMBER                         | Displays the type of the trace record. Possible values include: <ul style="list-style-type: none"> <li>1: Regular trace record</li> <li>2: Freeform trace record</li> <li>3: Begin Section trace record</li> <li>4: Begin Dump trace record</li> <li>5: Bucket Dump Begin trace record</li> <li>6: Section End trace record</li> <li>7: Dump End trace record</li> <li>8: Bucket Dump End trace record</li> </ul> |
| TIMESTAMP      | TIMESTAMP(3)<br>WITH TIME ZONE | Displays the timestamp when the trace record was produced                                                                                                                                                                                                                                                                                                                                                         |
| PAYLOAD        | VARCHAR2(4000)                 | Displays the trace record payload (contents)                                                                                                                                                                                                                                                                                                                                                                      |
| SECTION_ID     | NUMBER                         | Displays the section ID / dump ID of the trace record                                                                                                                                                                                                                                                                                                                                                             |
| SECTION_NAME   | VARCHAR2(64)                   | Displays the section name / dump name of the trace record                                                                                                                                                                                                                                                                                                                                                         |
| COMPONENT_NAME | VARCHAR2(64)                   | Displays the component name which produced the trace record                                                                                                                                                                                                                                                                                                                                                       |
| OPERATION_NAME | VARCHAR2(64)                   | Displays the operation name which produced the trace record                                                                                                                                                                                                                                                                                                                                                       |
| FILE_NAME      | VARCHAR2(64)                   | Displays the name of the code file where this trace record is produced                                                                                                                                                                                                                                                                                                                                            |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FUNCTION_NAME  | VARCHAR2(64) | Displays the function which produced this trace record                                                                                                                                                                                                                                                                                                                                                                                          |
| LINE_NUMBER    | NUMBER       | Displays the line number in the code file which produced this trace record                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD_ID      | VARCHAR2(64) | Displays the operating system thread ID of the process which produced the trace record                                                                                                                                                                                                                                                                                                                                                          |
| SESSION_ID     | NUMBER       | Displays the user session ID which generated the trace record                                                                                                                                                                                                                                                                                                                                                                                   |
| SERIAL#        | NUMBER       | Displays the user session serial number which produced the trace record                                                                                                                                                                                                                                                                                                                                                                         |
| CON_UID        | NUMBER       | Displays the container unique ID where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                            |
| CONTAINER_NAME | VARCHAR2(30) | Displays the container name where the trace record was produced                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.187 V\$DISPATCHER

V\$DISPATCHER displays information about the dispatcher processes.

| Column   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME     | VARCHAR2(4)    | Name of the dispatcher process                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| NETWORK  | VARCHAR2(1024) | Network address of the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PADDR    | RAW(4   8)     | Process address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| STATUS   | VARCHAR2(16)   | Status of the dispatcher: <ul style="list-style-type: none"> <li>WAIT - Idle</li> <li>SEND - Sending a message</li> <li>RECEIVE - Receiving a message</li> <li>CONNECT - Establishing a connection</li> <li>DISCONNECT - Handling a disconnect request</li> <li>BREAK - Handling a break</li> <li>TERMINATE - In the process of terminating</li> <li>ACCEPT - Accepting connections (no further information available)</li> <li>REFUSE - Rejecting connections (no further information available)</li> </ul> |
| ACCEPT   | VARCHAR2(3)    | Indicates whether the dispatcher is accepting new connections (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                              |
| MESSAGES | NUMBER         | Number of messages processed by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| BYTES    | NUMBER         | Size (in bytes) of messages processed by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| BREAKS   | NUMBER         | Number of breaks occurring in the connection                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNED     | NUMBER   | Number of circuits owned by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                      |
| CREATED   | NUMBER   | Number of circuits created by the dispatcher                                                                                                                                                                                                                                                                                                                                                                                                    |
| IDLE      | NUMBER   | Total idle time for the dispatcher (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                  |
| BUSY      | NUMBER   | Total busy time for the dispatcher (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                  |
| CPU       | NUMBER   | Total CPU time for the dispatcher (in millionths of a second)                                                                                                                                                                                                                                                                                                                                                                                   |
| LISTENER  | NUMBER   | Most recent Oracle error number the dispatcher received from the listener                                                                                                                                                                                                                                                                                                                                                                       |
| CONF_INDX | NUMBER   | Zero-based index of the DISPATCHERS configuration used by the dispatcher                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.188 V\$DISPATCHER\_CONFIG

V\$DISPATCHER\_CONFIG displays information about the dispatcher configurations and their attributes.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| CONF_INDX   | NUMBER         | Zero-based index of the DISPATCHERS configuration                                                                                                                                                                                                                                                                                                                                                                                               |
| NETWORK     | VARCHAR2(1024) | Network protocol or listening address of dispatchers (may be truncated)                                                                                                                                                                                                                                                                                                                                                                         |
| DISPATCHERS | NUMBER         | Number of dispatchers to maintain for the configuration                                                                                                                                                                                                                                                                                                                                                                                         |
| CONNECTIONS | NUMBER         | Maximum number of concurrent connections per dispatcher                                                                                                                                                                                                                                                                                                                                                                                         |
| SESSIONS    | NUMBER         | Maximum number of concurrent sessions per dispatcher                                                                                                                                                                                                                                                                                                                                                                                            |
| MULTIPLEX   | VARCHAR2(4)    | Indicates whether Session Multiplexing is on: <ul style="list-style-type: none"> <li>IN</li> <li>OUT</li> <li>BOTH</li> <li>OFF</li> </ul>                                                                                                                                                                                                                                                                                                      |
| LISTENER    | VARCHAR2(1200) | Listeners to register dispatchers with (may be truncated)                                                                                                                                                                                                                                                                                                                                                                                       |
| SERVICE     | VARCHAR2(512)  | Service names supported (may be truncated)                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.189 V\$DISPATCHER\_RATE

V\$DISPATCHER\_RATE displays rate statistics for a number of activities performed by the dispatcher processes.

Collected samples have an activity-specific "time-to-live" (TTL\_\* columns). Statistics are reported over the following two types of time intervals:

- **Current statistics (CUR\_ columns)**  
Current statistics use samples collected over the most recent time-to-live interval.
- **Historical statistics (AVG\_ and most of the MAX\_ columns)**  
Historical statistics make use of all samples that are no longer current.

At the time of collection, a sample is current. After the time-to-live has elapsed, the sample becomes historical. Each type of activity has a specific scale (represented by the SCALE\_\* columns) at which the statistics are reported.

| Column               | Datatype    | Description                                                                                                                                                                                            |
|----------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                 | VARCHAR2(4) | Name of the dispatcher process                                                                                                                                                                         |
| PADDR                | RAW(4   8)  | Address of the dispatcher process                                                                                                                                                                      |
| CUR_LOOP_RATE        | NUMBER      | Rate at which the dispatcher has been iterating through its dispatching loop, reported over the past TTL_LOOPS, in iterations/SCALE_LOOPS                                                              |
| CUR_EVENT_RATE       | NUMBER      | Rate at which the dispatcher has been processing dispatcher events, reported over the past TTL_LOOPS, in events/SCALE_LOOPS. Such dispatcher events include network events and shared server requests. |
| CUR_EVENTS_PER_LOOP  | NUMBER      | Average number of events the dispatcher has been processing in each iteration through its dispatching loop, reported over the past TTL_LOOPS, in events/iteration                                      |
| CUR_MSG_RATE         | NUMBER      | Rate at which the dispatcher has been relaying messages between clients and shared servers, reported over the past TTL_MSG, in messages/SCALE_MSG                                                      |
| CUR_SVR_BUF_RATE     | NUMBER      | Rate at which the dispatcher has been relaying buffers to shared servers, reported over the past TTL_SVR_BUF, in messages/SCALE_SVR_BUF                                                                |
| CUR_SVR_BYTE_RATE    | NUMBER      | Rate at which the dispatcher has been relaying data to shared servers, reported over the past TTL_SVR_BUF, in bytes/SCALE_SVR_BUF                                                                      |
| CUR_SVR_BYTE_PER_BUF | NUMBER      | Average number of data types in each buffer relayed to shared servers, reported over the past TTL_SVR_BUF, in bytes/buffer                                                                             |
| CUR_CLT_BUF_RATE     | NUMBER      | Rate at which the dispatcher has been relaying buffers to clients, reported over the past TTL_CLT_BUF, in buffers/SCALE_CLT_BUF                                                                        |
| CUR_CLT_BYTE_RATE    | NUMBER      | Rate at which the dispatcher has been relaying data to clients, reported over the past TTL_CLT_BUF, in bytes/SCALE_CLT_BUF                                                                             |
| CUR_CLT_BYTE_PER_BUF | NUMBER      | Average number of data bytes in each buffer relayed to clients, reported over the past TTL_CLT_BUF, in bytes/buffer                                                                                    |

| Column               | Datatype | Description                                                                                                                                                                                          |
|----------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CUR_BUF_RATE         | NUMBER   | Rate at which the dispatcher has been relaying buffers to either clients or shared servers, reported over the past TTL_BUF, in bytes/SCALE_BUF                                                       |
| CUR_BYTE_RATE        | NUMBER   | Rate at which the dispatcher has been relaying data to either clients or shared servers, reported over the past TTL_BUF, in bytes/SCALE_BUF                                                          |
| CUR_BYTE_PER_BUF     | NUMBER   | Average number of data bytes in each buffer relayed to either clients or shared servers, reported over the past TTL_BUF, in bytes/buffer                                                             |
| CUR_IN_CONNECT_RATE  | NUMBER   | Rate at which the dispatcher has been accepting incoming client connections, reported over the past TTL_IN_CONNECT, in connections/SCALE_IN_CONNECT                                                  |
| CUR_OUT_CONNECT_RATE | NUMBER   | Rate at which the dispatcher has been establishing outbound connections, reported over the past TTL_OUT_CONNECT, in connections/SCALE_OUT_CONNECT                                                    |
| CUR_RECONNECT_RATE   | NUMBER   | In a connection pooling setup, the rate at which clients have been reconnecting to the dispatcher, reported over the past TTL_RECONNECT, in reconnections/SCALE_RECONNECT                            |
| MAX_LOOP_RATE        | NUMBER   | Maximum rate at which the dispatcher has ever iterated through its dispatching loop, reported in iterations/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS                 |
| MAX_EVENT_RATE       | NUMBER   | Maximum rate at which the dispatcher has ever processed dispatcher events, reported in events/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS                               |
| MAX_EVENTS_PER_LOOP  | NUMBER   | Maximum number of events the dispatcher has ever processed in one iteration through its dispatching loop, reported in events/iteration, over the dispatcher's lifetime                               |
| MAX_MSG_RATE         | NUMBER   | Maximum rate at which the dispatcher has ever relayed messages between clients and shared servers, reported in messages/SCALE_MSG, over the dispatcher's lifetime excluding the past TTL_MSG         |
| MAX_SVR_BUF_RATE     | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to shared servers, reported in buffers/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                    |
| MAX_SVR_BYTE_RATE    | NUMBER   | Maximum rate at which the dispatcher has ever relayed data to shared servers, reported in bytes/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                         |
| MAX_SVR_BYTE_PER_BUF | NUMBER   | Maximum number of data bytes the dispatcher has ever relayed in one buffer to a client, reported in bytes/buffer, over the dispatcher's lifetime                                                     |
| MAX_CLT_BUF_RATE     | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to either clients or shared servers, reported in buffers/SCALE_CLT_BUF, over the dispatcher's life time excluding the past TTL_CLT_BUF |
| MAX_CLT_BYTE_RATE    | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to clients, reported in bytes/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the last TTL_CLT_BUF                             |
| MAX_CLT_BYTE_PER_BUF | NUMBER   | Maximum number of data bytes the dispatcher has ever relayed in one buffer to a client, reported in bytes/buffer, over the dispatcher's lifetime                                                     |

| Column               | Datatype | Description                                                                                                                                                                                                           |
|----------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAX_BUF_RATE         | NUMBER   | Maximum rate at which the dispatcher has ever relayed buffers to either clients or shared servers, reported in buffers/SCALE_BUF, over the dispatcher's lifetime, excluding the past TTL_BUF                          |
| MAX_BYTE_RATE        | NUMBER   | Maximum rate at which the dispatcher has ever relayed data to either clients or shared servers, reported in bytes/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF                                |
| MAX_BYTE_PER_BUF     | NUMBER   | Maximum number of data bytes the dispatcher has ever relayed in one buffer to either a client or a shared server, reported in bytes/buffer, over the dispatcher's lifetime                                            |
| MAX_IN_CONNECT_RATE  | NUMBER   | Maximum rate at which the dispatcher has ever accepted incoming client connections, reported in connections/SCALE_IN_CONNECT, over the dispatcher's lifetime excluding the past TTL_IN_CONNECT                        |
| MAX_OUT_CONNECT_RATE | NUMBER   | Maximum rate at which the dispatcher has ever established outbound connections, reported in connections/SCALE_OUT_CONNECT, over the dispatcher's lifetime excluding the past TTL_OUT_CONNECT                          |
| MAX_RECONNECT_RATE   | NUMBER   | In a connection pooling setup, the maximum rate at which clients have ever reconnected to this dispatcher, reported in reconnections/SCALE_RECONNECT, over the dispatcher's lifetime excluding the past TTL_RECONNECT |
| AVG_LOOP_RATE        | NUMBER   | Historical average rate at which the dispatcher has iterated through its dispatching loop, reported in iterations/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS                            |
| AVG_EVENT_RATE       | NUMBER   | Historical average rate at which the dispatcher has processed dispatcher events, reported in events/SCALE_LOOPS, over the dispatcher's lifetime excluding the past TTL_LOOPS                                          |
| AVG_EVENTS_PER_LOOP  | NUMBER   | Historical average number of events the dispatcher has processed in one iteration through its dispatching loop, reported in events/iteration, over the dispatcher's lifetime excluding the past TTL_LOOPS             |
| AVG_MSG_RATE         | NUMBER   | Historical average rate at which the dispatcher has relayed messages between clients and shared servers, reported in messages/SCALE_MSG, over the dispatcher's lifetime excluding the past TTL_MSG                    |
| AVG_SVR_BUF_RATE     | NUMBER   | Historical average rate at which the dispatcher has relayed buffers to shared servers, reported in buffers/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                               |
| AVG_SVR_BYTE_RATE    | NUMBER   | Historical average rate at which the dispatcher has relayed data to shared servers, reported in bytes/SCALE_SVR_BUF, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                                    |
| AVG_SVR_BYTE_PER_BUF | NUMBER   | Historical average number of data bytes per buffer the dispatcher has relayed to shared servers, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_SVR_BUF                              |
| AVG_CLT_BUF_RATE     | NUMBER   | Historical average rate at which the dispatcher has relayed buffers to clients, reported in buffers/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the past TTL_CLT_BUF                                      |
| AVG_CLT_BYTE_RATE    | NUMBER   | Historical average rate at which the dispatcher has relayed data to clients, reported in bytes/SCALE_CLT_BUF, over the dispatcher's lifetime excluding the past TTL_CLT_BUF                                           |

| Column               | Datatype | Description                                                                                                                                                                                                                 |
|----------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVG_CLT_BYTE_PER_BUF | NUMBER   | Historical average number of data bytes per buffer the dispatcher has relayed to clients, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_CLT_BUF                                           |
| AVG_BUF_RATE         | NUMBER   | Historical average rate at which the dispatcher has relayed buffers to either clients or shared servers, reported in buffers/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF                           |
| AVG_BYTE_RATE        | NUMBER   | Historical average rate at which the dispatcher has relayed data to either clients or shared servers, reported in bytes/SCALE_BUF, over the dispatcher's lifetime excluding the past TTL_BUF                                |
| AVG_BYTE_PER_BUF     | NUMBER   | Historical average number of data bytes per buffer the dispatcher has relayed to either clients or shared servers, reported in bytes/buffer, over the dispatcher's lifetime excluding the past TTL_BUF                      |
| AVG_IN_CONNECT_RATE  | NUMBER   | Historical average rate at which the dispatcher has accepted incoming client connections, reported in connections/SCALE_IN_CONNECT, over the dispatcher's lifetime excluding the past TTL_IN_CONNECT                        |
| AVG_OUT_CONNECT_RATE | NUMBER   | Historical average rate at which the dispatcher has established outbound connections, reported in connections/SCALE_OUT_CONNECT, over the dispatcher's lifetime excluding the past TTL_OUT_CONNECT                          |
| AVG_RECONNECT_RATE   | NUMBER   | In a connection pooling setup, the historical average rate at which clients have reconnected to this dispatcher, reported in reconnections/SCALE_RECONNECT, over the dispatcher's lifetime excluding the past TTL_RECONNECT |
| TTL_LOOPS            | NUMBER   | Time-to-live for "loops" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                                |
| TTL_MSG              | NUMBER   | Time-to-live for "messages" samples, reported in hundredths of a second. Default is 10 seconds.                                                                                                                             |
| TTL_SVR_BUF          | NUMBER   | Time-to-live for "buffers to servers" samples, reported in hundredths of a second. Default is 1 second.                                                                                                                     |
| TTL_CLT_BUF          | NUMBER   | Time-to-live for "buffers to clients" samples, reported in hundredths of a second. Default is 1 second.                                                                                                                     |
| TTL_BUF              | NUMBER   | Time-to-live for "buffers to clients/servers" samples, reported in hundredths of a second. Default is 1 second.                                                                                                             |
| TTL_IN_CONNECT       | NUMBER   | Time-to-live for "inbound connections" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                  |
| TTL_OUT_CONNECT      | NUMBER   | Time-to-live for "outbound connections" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                 |
| TTL_RECONNECT        | NUMBER   | Time-to-live for "reconnections" samples, reported in hundredths of a second. Default is 10 minutes.                                                                                                                        |
| SCALE_LOOPS          | NUMBER   | Scale for "loops" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                      |
| SCALE_MSG            | NUMBER   | Scale for "messages" statistics, reported in hundredths of a second. Default is 1 second.                                                                                                                                   |
| SCALE_SVR_BUF        | NUMBER   | Scale for "buffers to servers" statistics, reported in hundredths of a second. Default is 1/10 second.                                                                                                                      |
| SCALE_CLT_BUF        | NUMBER   | Scale for "buffers to clients" statistics, reported in hundredths of a second. Default is 1/10 second.                                                                                                                      |

| Column            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCALE_BUF         | NUMBER   | Scale for "buffers to clients/servers" statistics, reported in hundredths of a second. Default is 1/10 second.                                                                                                                                                                                                                                                                                                                                  |
| SCALE_IN_CONNECT  | NUMBER   | Scale for "inbound connections" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                                                                                                                                                                                                                            |
| SCALE_OUT_CONNECT | NUMBER   | Scale for "outbound connections" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                                                                                                                                                                                                                           |
| SCALE_RECONNECT   | NUMBER   | Scale for "reconnections" statistics, reported in hundredths of a second. Default is 1 minute.                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID            | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.190 V\$DNFS\_CHANNELS

V\$DNFS\_CHANNELS displays information about the Oracle process connections (channels) open to NFS servers.

| Column  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PNUM    | NUMBER        | Oracle process number                                                                                                                                                                                                                                                                                                                                                                                  |
| SVRNAME | VARCHAR2(255) | NFS server name                                                                                                                                                                                                                                                                                                                                                                                        |
| PATH    | VARCHAR2(255) | Network path to the NFS server specified by IP address or by name                                                                                                                                                                                                                                                                                                                                      |
| LOCAL   | VARCHAR2(255) | Local path on the database host specified by IP address or by name                                                                                                                                                                                                                                                                                                                                     |
| CH_ID   | NUMBER        | Direct NFS channel identifier                                                                                                                                                                                                                                                                                                                                                                          |
| SVR_ID  | NUMBER        | Direct NFS server identifier                                                                                                                                                                                                                                                                                                                                                                           |
| SENDS   | NUMBER        | Send operations over the channel since the last select                                                                                                                                                                                                                                                                                                                                                 |
| RECVS   | NUMBER        | Receive operations over the channel since the last select                                                                                                                                                                                                                                                                                                                                              |
| PINGS   | NUMBER        | Ping operations over the channel since the last select                                                                                                                                                                                                                                                                                                                                                 |
| SPRECO  | NUMBER        | Reconnects for the channel on the same port since the last select, given that the reconnect occurred during the first series of reconnect attempts. If the first series of reconnect attempts fails and the reconnect process on that channel times out for 5 minutes, the next reconnect on that channel will not increment either the SPRECO or DPRECO columns, regardless of the port connected to. |

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DPRECO       | NUMBER   | Reconnects for the channel on a different port since the last select, given that the reconnect occurred during the first series of reconnect attempts. If the first series of reconnect attempts fails and the reconnect process on that channel times out for 5 minutes, the next reconnect on that channel will not increment either the SPRECO or DPRECO columns, regardless of the port connected to.                                       |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| RDMA         | NUMBER   | Indicates whether RDMA is enabled for the channel or not. Possible values: <ul style="list-style-type: none"> <li>0: RDMA is not enabled for the channel</li> <li>1: RDMA is enabled for the channel</li> </ul>                                                                                                                                                                                                                                 |
| RDMA_CREDITS | NUMBER   | The number of RDMA credits supported by the server                                                                                                                                                                                                                                                                                                                                                                                              |
| CLIENTPORT   | NUMBER   | The client port to which the channel is bounded                                                                                                                                                                                                                                                                                                                                                                                                 |
| ACTIVE_SPEED | NUMBER   | The active speed of the HCA card present (in Gb/second)                                                                                                                                                                                                                                                                                                                                                                                         |
| PEAK_FMR     | NUMBER   | The size of fast memory registration (FMR) memory registered by the channel (in bytes)                                                                                                                                                                                                                                                                                                                                                          |
| CURRENT_FMR  | NUMBER   | The current FMR memory registered (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                    |
| FMRREG_COUNT | NUMBER   | The number of FMR memory registration calls for the channel                                                                                                                                                                                                                                                                                                                                                                                     |

**Note:**

RDMA functionality is enabled only for the Exadata environment

## 7.191 V\$DNFS\_FILES

V\$DNFS\_FILES displays information about the Oracle process files open through Direct NFS.

| Column   | Datatype      | Description                                                                  |
|----------|---------------|------------------------------------------------------------------------------|
| FILENAME | VARCHAR2(513) | File name                                                                    |
| FILESIZE | NUMBER        | File Size                                                                    |
| PNUM     | NUMBER        | Oracle process number which opened the file                                  |
| SVR_ID   | NUMBER        | Direct NFS server identifier which identifies the server the file is open on |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.192 V\$DNFS\_SERVERS

V\$DNFS\_SERVERS displays information about the Direct NFS servers accessed by Direct NFS.

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID         | NUMBER         | Direct NFS server identifier                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SVRNAME    | VARCHAR2(255)  | NFS server name                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| NFS_READBYTES   | NUMBER   | Number of bytes read from NFS server                                                                                                                                                                                                                                                                                                                                                                                                            |
| NFS_WRITEBYTES  | NUMBER   | Number of bytes written to NFS server                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.194 V\$DYNAMIC\_REMASTER\_STATS

V\$DYNAMIC\_REMASTER\_STATS displays statistical information about the dynamic remastering process of object affinity and read-mostly. All times are given in hundredths of a second, and total values reflect what has been collected since instance startup.

| Column                          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REMASTER_TYPE                   | VARCHAR2(11) | Remaster process type. Possible values: <ul style="list-style-type: none"> <li>AFFINITY: This value is used for the row containing statistics that pertain to dynamic remastering activity on object affinity.</li> <li>READ-MOSTLY: This value is used for the row containing statistics that pertain to dynamic remastering activity on read-mostly objects.</li> </ul>                                                                       |
| REMASTER_OPS                    | NUMBER       | Total number of dynamic remastering operations                                                                                                                                                                                                                                                                                                                                                                                                  |
| REMASTER_TIME                   | NUMBER       | Total dynamic remastering time                                                                                                                                                                                                                                                                                                                                                                                                                  |
| REMASTERED_OBJECTS              | NUMBER       | Total number of objects dynamically remastered due to affinity                                                                                                                                                                                                                                                                                                                                                                                  |
| PERSISTENT_OBJECTS <sup>1</sup> | NUMBER       | Current number of objects that are marked persistent read-mostly in the cluster                                                                                                                                                                                                                                                                                                                                                                 |

| FIXWRITE_TIME                   | NUMBER       | Total fixwrite step time                                                                                                                                                                                                                                                                                                                                                                                                                        |
| SYNC_TIME                       | NUMBER       | Total synchronization step time                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RESOURCES_CLEANED               | NUMBER       | Total number of resources cleaned in the cleanup steps                                                                                                                                                                                                                                                                                                                                                                                          |
| REPLAYED_LOCKS_SENT             | NUMBER       | Total number of locks replayed to other instances in the replay steps                                                                                                                                                                                                                                                                                                                                                                           |
| REPLAYED_LOCKS_RECEIVED         | NUMBER       | Total number of locks received from other instances in the replay steps                                                                                                                                                                                                                                                                                                                                                                         |
| CURRENT_OBJECTS                 | NUMBER       | Current number of objects remastered on this instance due to affinity or the current number of objects that are marked read-mostly in the cluster                                                                                                                                                                                                                                                                                               |
| CON_ID                          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is available starting with Oracle Database release 19c, version 19.1.

## 7.195 V\$EDITIONABLE\_TYPES

V\$EDITIONABLE\_TYPES lists all the editionable types based on the current compatibility setting. The SELECT privilege on V\$EDITIONABLE\_TYPES will be granted to PUBLIC.

The database compatibility setting will determine the set of editionable types.

With compatibility set to 11.2 or 12, this set includes FUNCTION, LIBRARY, PACKAGE, PACKAGE BODY, PROCEDURE, SYNONYM, TRIGGER, TYPE, TYPE BODY, and VIEW. With compatibility set to 12, the set will include these types as well as the SQL TRANSLATION PROFILE.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EDITIONABLE_TYPE | VARCHAR2(64) | The name of the type that is editionable                                                                                                                                                                                                                                                                                                                                                                                                        |
| TYPE#            | NUMBER       | The number of the type that is editionable                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.196 V\$EMON

V\$EMON displays performance statistics per event monitor (EMON) slave for diagnosability of notifications. All processing time and latency is in seconds.

| Column       | Datatype                       | Description                                                                                                                       |
|--------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| EMON#        | NUMBER                         | EMON identifier (0 - 9)                                                                                                           |
| SID          | NUMBER                         | Session identifier                                                                                                                |
| STARTUP_TIME | TIMESTAMP(3)<br>WITH TIME ZONE | Time when this EMON slave was started                                                                                             |
| SERVER_TYPE  | VARCHAR2(8)                    | Notification quality of the service provided by EMON: <ul style="list-style-type: none"> <li>REGULAR</li> <li>RELIABLE</li> </ul> |
| STATUS       | VARCHAR2(6)                    | EMON status: <ul style="list-style-type: none"> <li>IDLE</li> <li>ACTIVE</li> </ul>                                               |

| Column                    | Datatype                       | Description                                                                                                                                          |
|---------------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS_CHANGE_TIME        | TIMESTAMP(3)<br>WITH TIME ZONE | Time at which EMON switched to the current STATUS                                                                                                    |
| NUM_NTFNS                 | NUMBER                         | Total number of notifications (including grouping notifications)                                                                                     |

| TOTAL_PLSQL_NTFN_TIME     | NUMBER                         | Total time to process PL/SQL notifications                                                                                                           |
| TOTAL_OCI_NTFN_TIME       | NUMBER                         | Total time to process OCI notifications                                                                                                              |
| TOTAL_EMAIL_NTFN_TIME     | NUMBER                         | Total time to process E-mail notifications                                                                                                           |
| TOTAL_HTTP_NTFN_TIME      | NUMBER                         | Total time to process HTTP notifications                                                                                                             |
| TOTAL_EMON_LATENCY        | NUMBER                         | Total latency in processing events                                                                                                                   |
| REGISTRATIONS_EXPIRED     | NUMBER                         | Number of expired registrations                                                                                                                      |
| REGISTRATIONS_PURGED      | NUMBER                         | Number of purged registrations                                                                                                                       |
| REGISTRATIONS_INVALID     | NUMBER                         | Number of registrations invalidated due to notification delivery failure                                                                             |
| LAST_UPDATE_TIME          | TIMESTAMP(3)<br>WITH TIME ZONE | Time when statistics were last updated                                                                                                               |
| CON_ID                    | NUMBER                         | The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB. |

## 7.197 V\$EMX\_USAGE\_STATS

V\$EMX\_USAGE\_STATS is used to track how often each report in Oracle Enterprise Manager Database Express (EM Express) is used and how long the EM Express servlet takes to serve these reports to the client.

This view contains statistics such as the number of requests captured in the EM Express servlet for each report, total elapsed time for the EM Express servlet to render

each report, as well as a detailed time breakdown including database login time, request initialization time, time to run the SQL query, and time to stream and send the query result back to the client.

All statistics are accumulated over all requests for each EM Express report since the last time the database instance was restarted.

It also includes the timestamp of the last request for each report.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPORT               | VARCHAR2(400) | Name of the EM Express report. All EM Express reports are XML reports with this format: <i>%/orarep/component/report</i>                                                                                                                                                                                                                                                                                                                        |
| COUNT                | NUMBER        | Number of requests captured by the EM Express servlet for this report since the last time the database instance was restarted                                                                                                                                                                                                                                                                                                                   |
| LOGIN_ELAPSED_TIME   | NUMBER        | Accumulated elapsed time for logging into the database across all requests for this report since the last time the database instance was restarted                                                                                                                                                                                                                                                                                              |
| INITREQ_ELAPSED_TIME | NUMBER        | Accumulated elapsed time for initializing and preparing requests across all requests for this report since the last time the database instance was restarted                                                                                                                                                                                                                                                                                    |
| SQL_ELAPSED_TIME     | NUMBER        | Accumulated elapsed time for all requests that ran SQL queries for this report since the last time the database instance was restarted                                                                                                                                                                                                                                                                                                          |
| SEND_ELAPSED_TIME    | NUMBER        | Accumulated elapsed time for streaming and sending the query result back to the client browser across all requests for this report since the last time the database instance was restarted                                                                                                                                                                                                                                                      |
| TOTAL_ELAPSED_TIME   | NUMBER        | Accumulated total elapsed time across all requests for this report since the last time the database instance was restarted                                                                                                                                                                                                                                                                                                                      |
| LAST_REQ_TIME        | DATE          | Timestamp of the last request for this report since the last time the database instance was restarted                                                                                                                                                                                                                                                                                                                                           |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.198 V\$ENABLEDPRIVS

V\$ENABLEDPRIVS displays the system privileges that have been granted to the current user and the currently enabled roles. These privileges can be found in the table SYSTEM\_PRIVILEGE\_MAP.

| Column      | Datatype | Description                                |
|-------------|----------|--------------------------------------------|
| PRIV_NUMBER | NUMBER   | Numeric identifier of the system privilege |

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCOPE  | VARCHAR2(11) | Indicates the scope with which a privilege was granted. Possible values: <ul style="list-style-type: none"> <li>COMMON</li> <li>APPLICATION</li> <li>LOCAL</li> <li>NULL (if connected to a non-CDB )</li> </ul>                                                                                                                                                                                                                                |
| CON_ID | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.199 V\$ENCRYPTED\_TABLESPACES

V\$ENCRYPTED\_TABLESPACES displays information about the tablespaces that are encrypted.

| Column           | Datatype    | Description                                                                                                                                   |
|------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| TS#              | NUMBER      | Tablespace number                                                                                                                             |
| ENCRYPTIONALG    | VARCHAR2(7) | Encryption algorithm: <ul style="list-style-type: none"> <li>NONE</li> <li>3DES168</li> <li>AES128</li> <li>AES192</li> <li>AES256</li> </ul> |
| ENCRYPTEDTS      | VARCHAR2(3) | Indicates whether the tablespace is encrypted (YES) or not (NO)                                                                               |
| ENCRYPTEDKEY     | RAW(32)     | Encrypted version of the tablespace key for the encrypted tablespace                                                                          |
| MASTERKEYID      | RAW(16)     | ID of the master key that was used to encrypt the tablespace key                                                                              |
| BLOCKS_ENCRYPTED | NUMBER      | Number of tablespace blocks that have been encrypted during the lifetime of this instance                                                     |
| BLOCKS_DECRYPTED | NUMBER      | Number of tablespace blocks that have been decrypted during the lifetime of this instance                                                     |

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY_VERSION | NUMBER       | Every encrypt/decrypt/rekey of a tablespace adds a carnation/ version of the tablespace key, and the key version is incremented. A decrypted tablespace could still have a none-zero key version. In certain scenarios, however, the tablespace key version might reset to 0; for example, when a tablespace or a pluggable database (PDB) is plugged into a foreign database, or if the control file is recreated.                                                                                                                                       |
| STATUS      | VARCHAR2(10) | Shows the status of a tablespace. Possible values: <ul style="list-style-type: none"> <li><b>NORMAL:</b> Used when the tablespace is not in one of the other statuses.</li> <li><b>REKEYING:</b> Used when a rekey operation is taking place</li> <li><b>ENCRYPTING:</b> Used when an encrypt operation is taking place</li> <li><b>DECRYPTING:</b> Used when a decrypt operation is taking place</li> <li><b>UNKNOWN:</b> Used when the database is mounted but not open (before the datafile is online and the key is known to the database)</li> </ul> |
| CON_ID      | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li><b>0:</b> This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li><b>1:</b> This value is used for rows containing data that pertain to only the root</li> <li><b>n:</b> Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                             |

## 7.200 V\$ENCRYPTION\_KEYS

V\$ENCRYPTION\_KEYS displays master key description attributes.

| Column          | Datatype                       | Description                                             |
|-----------------|--------------------------------|---------------------------------------------------------|
| KEY_ID          | VARCHAR2(78)                   | Master key identifier                                   |
| TAG             | VARCHAR2(4000)                 | Associated user-defined Information with the master key |
| CREATION_TIME   | TIMESTAMP(6)<br>WITH TIME ZONE | Time that the master key was created                    |
| ACTIVATION_TIME | TIMESTAMP(6)<br>WITH TIME ZONE | Time that the master key was put into use               |
| CREATOR         | VARCHAR2(128)                  | User that created the master key                        |
| CREATOR_ID      | NUMBER                         | User ID that created the master key                     |
| USER            | VARCHAR2(128)                  | User that activated the master key                      |
| USER_ID         | NUMBER                         | User ID that activated the master key                   |

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY_USE                    | VARCHAR2(10)  | Indicates whether the master key is used for TDE operations in a PDB or not                                                                                                                                                                                                                                                                                                                                                                                           |
| KEYSTORE_TYPE              | VARCHAR2(17)  | Master key is in: <ul style="list-style-type: none"> <li>HSM - Hardware Security Module</li> <li>SOFTWARE KEYSTORE</li> <li>UNDEFINED - This value is shown if the keystore has no information about the type of keystore where the master key resides</li> </ul>                                                                                                                                                                                                     |
| ORIGIN                     | VARCHAR2(41)  | Provides information about the origin of the master key: <ul style="list-style-type: none"> <li>1 - Was created locally in this database</li> <li>2 - Was imported from another database</li> <li>3 - Was imported but the key metadata was created locally due to activation</li> <li>4 - Unknown if the key was imported or created locally but the key metadata was created locally due to activation</li> <li>5 - Status of the master key is unknown.</li> </ul> |
| BACKED_UP                  | VARCHAR2(9)   | Indicates whether the key has been backed up or not                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CREATOR_DBNAME             | VARCHAR2(128) | Database that created the key                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CREATOR_DBID               | NUMBER        | Database ID where the key was created                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CREATOR_INSTANCE_NAME      | VARCHAR2(30)  | Instance name of the instance where the key was created                                                                                                                                                                                                                                                                                                                                                                                                               |
| CREATOR_INSTANCE_NUMBER    | NUMBER        | Instance number of the instance where the key was created                                                                                                                                                                                                                                                                                                                                                                                                             |
| CREATOR_INSTANCE_SERIAL    | NUMBER        | Serial number of the instance where the key was created                                                                                                                                                                                                                                                                                                                                                                                                               |

| ACTIVATING_PDBGUID         | RAW(16)       | PDB GUID where the key was activated                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.201 V\$ENCRYPTION\_WALLET

V\$ENCRYPTION\_WALLET displays information on the status of the wallet and the wallet location for Transparent Data Encryption. In a multitenant container database (CDB), this view displays information on the wallets for all pluggable database (PDBs) when queried from CDB\$ROOT. When queried from a PDB, this view only displays wallet details of that PDB.

| Column        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WRL_TYPE      | VARCHAR2(20)   | Type of the wallet resource locator (for example, FILE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WRL_PARAMETER | VARCHAR2(4000) | Parameter of the wallet resource locator (for example, absolute directory location of the wallet or keystore, if WRL_TYPE = FILE)                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| STATUS        | VARCHAR2(30)   | Status of the wallet: <ul style="list-style-type: none"> <li>CLOSED</li> <li>NOT_AVAILABLE</li> </ul> <p>This status indicates that the keystore is not available in the location specified by the WALLET_ROOT initialization parameter</p> <ul style="list-style-type: none"> <li>OPEN</li> <li>OPEN_NO_MASTER_KEY</li> <li>OPEN_UNKNOWN_MASTER_KEY_STATUS</li> </ul> <p>When the database is in the mounted state, it cannot check if the master key for a hardware keystore is set because the data dictionary is not available. In this situation, this status is displayed.</p> |
| WALLET_TYPE   | VARCHAR2(20)   | Displays the type of keystore being used, HSM or SOFTWARE_KEYSTORE.<br><br>If the keystore was created with the mkstore utility, then the WALLET_TYPE is UNKNOWN.                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column          | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WALLET_ORDER    | VARCHAR2(9) | <p>Possible values:</p> <ul style="list-style-type: none"> <li>SINGLE - When only a single wallet is configured, this is the value in the column.</li> <li>PRIMARY - When more than one wallet is configured, this value indicates that the wallet is primary (holds the current master key).</li> <li>SECONDARY - When more than one wallet is configured, this value indicates that the wallet is secondary (holds old keys).</li> </ul> <p>The lookup of master keys happens in the primary keystore first, and then in the secondary keystore, if required.</p> <p>If there is only one type of keystore (Hardware Security Module or Software Keystore) being used, then SINGLE will appear.</p> <p>If both types are used, then the value in this column shows the order in which each keystore will be looked up.</p> |
| KEYSTORE_MODE   | VARCHAR2(8) | <p>Displays the keystore mode:</p> <ul style="list-style-type: none"> <li>NONE: This value is seen when this column is queried from the CDB\$ROOT, or when the database is a non-CDB. The keystore mode does not apply in these cases.</li> <li>UNITED: The PDB is configured to use the wallet of the CDB\$ROOT. To open the wallet in this configuration, the password of the wallet of the CDB\$ROOT must be used.</li> <li>ISOLATED: The PDB is configured to use its own wallet. To open the wallet in this configuration, the password of the isolated wallet must be used.</li> </ul>                                                                                                                                                                                                                                 |
| FULLY_BACKED_UP | VARCHAR2(9) | Indicates whether all the keys in the keystore have been backed up                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID          | NUMBER      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |

| REQUEST | NUMBER      | Lock mode in which the process requests the lock: <ul style="list-style-type: none"> <li>0 - none</li> <li>1 - null (NULL)</li> <li>2 - row-S (SS)</li> <li>3 - row-X (SX)</li> <li>4 - share (S)</li> <li>5 - S/Row-X (SSX)</li> <li>6 - exclusive (X)</li> </ul>                                                                                                                                                                              |
| CTIME   | NUMBER      | Time since current mode was granted                                                                                                                                                                                                                                                                                                                                                                                                             |
| BLOCK   | NUMBER      | The lock is blocking another lock                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID  | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.203 V\$ENQUEUE\_STAT

V\$ENQUEUE\_STAT displays statistics on the number of enqueue (lock) requests for each type of lock.

| Column        | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID       | NUMBER      | ID of the instance                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EQ_TYPE       | VARCHAR2(2) | Type of enqueue requested                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TOTAL_REQ#    | NUMBER      | Total number of enqueue requests or enqueue conversions for this type of enqueue                                                                                                                                                                                                                                                                                                                                                                |
| TOTAL_WAIT#   | NUMBER      | Total number of times an enqueue request or conversion resulted in a wait                                                                                                                                                                                                                                                                                                                                                                       |
| SUCC_REQ#     | NUMBER      | Number of times an enqueue request or conversion was granted                                                                                                                                                                                                                                                                                                                                                                                    |
| FAILED_REQ#   | NUMBER      | Number of times an enqueue request or conversion failed                                                                                                                                                                                                                                                                                                                                                                                         |
| CUM_WAIT_TIME | NUMBER      | Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID        | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.204 V\$ENQUEUE\_STATISTICS

V\$ENQUEUE\_STATISTICS displays statistics on the number of enqueue (lock) requests for each type of lock.

V\$ENQUEUE\_STATISTICS encompasses V\$ENQUEUE\_STAT and gives more detailed information (several rows for same enqueues with different reasons).

| Column          | Datatype       | Description                                                                                |
|-----------------|----------------|--------------------------------------------------------------------------------------------|
| EQ_NAME         | VARCHAR2(64)   | Name of the enqueue request                                                                |
| EQ_TYPE         | VARCHAR2(2)    | Type of enqueue requested                                                                  |
| REQ_REASON      | VARCHAR2(64)   | Reason for the enqueue request                                                             |
| TOTAL_REQ#      | NUMBER         | Total number of enqueue requests or enqueue conversions for this type of enqueue           |
| TOTAL_WAIT#     | NUMBER         | Total number of times an enqueue request or conversion resulted in a wait                  |
| SUCC_REQ#       | NUMBER         | Number of times an enqueue request or conversion was granted                               |
| FAILED_REQ#     | NUMBER         | Number of times an enqueue request or conversion failed                                    |
| CUM_WAIT_TIME   | NUMBER         | Total amount of time (in milliseconds) spent waiting for the enqueue or enqueue conversion |
| REQ_DESCRIPTION | VARCHAR2(4000) | Description of the enqueue request                                                         |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT# | NUMBER   | Event number                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.205 V\$EVENT\_HISTOGRAM

V\$EVENT\_HISTOGRAM displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis, in milliseconds. The histogram has buckets of time intervals from < 1 ms, < 2 ms, < 4 ms, < 8 ms, ... < 2<sup>21</sup> ms, < 2<sup>22</sup> ms, and >= 2<sup>22</sup> ms.

The histogram will not be filled unless the TIMED\_STATISTICS initialization parameter is set to true.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT#           | NUMBER       | Event number                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| EVENT            | VARCHAR2(64) | Name of the event                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WAIT_TIME_MILLI  | NUMBER       | Amount of time the bucket represents (in milliseconds). If the duration = <i>num</i> , then this column represents waits of duration < <i>num</i> that are not included in any smaller bucket.                                                                                                                                                                                                                                                  |
| WAIT_COUNT       | NUMBER       | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_UPDATE_TIME | VARCHAR2(64) | Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)                                                                                                                                                                                                                                                                                                                       |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.206 V\$EVENT\_HISTOGRAM\_MICRO

V\$EVENT\_HISTOGRAM\_MICRO displays a histogram of the number of waits, the maximum wait, and total wait time on an event basis, in microseconds. The histogram has buckets of time intervals from  $< 1$  us,  $< 2$  us,  $< 4$  us,  $< 8$  us, ...  $< 2^{31}$  us,  $< 2^{32}$  us, and  $\geq 2^{32}$  us.

The histogram will not be filled unless the TIMED\_STATISTICS initialization parameter is set to true.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EVENT#           | NUMBER       | Event number                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| EVENT            | VARCHAR2(64) | Name of the event                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_TIME_FORMAT | VARCHAR2(30) | A human readable time string which is converted from WAIT_TIME_MICRO. When WAIT_TIME_MICRO $< 1$ millisecond, WAIT_TIME_FORMAT is shown in microseconds. When WAIT_TIME_MICRO $< 1$ second, WAIT_TIME_FORMAT is shown in milliseconds. When WAIT_TIME_MICRO $< 1$ minute, WAIT_TIME_FORMAT is shown in seconds. When WAIT_TIME_MICRO $> 1$ minute, WAIT_TIME_FORMAT is shown in minutes and seconds.                                                        |
| WAIT_TIME_MICRO  | NUMBER       | Amount of time the bucket represents (in microseconds). If the duration = num, then this column represents waits of duration $< \text{num}$ that are not included in any smaller bucket.                                                                                                                                                                                                                                                                    |
| WAIT_COUNT       | NUMBER       | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                                    |
| LAST_UPDATE_TIME | VARCHAR2(64) | Indicates the last time the bucket was updated (the ending timestamp of the last wait falling into the bucket's duration)                                                                                                                                                                                                                                                                                                                                   |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><math>n</math>: Where <math>n</math> is the applicable container ID for the rows containing data</li> </ul> |

## 7.207 V\$EVENT\_NAME

V\$EVENT\_NAME displays information about wait events.

| Column   | Datatype | Description                  |
|----------|----------|------------------------------|
| EVENT#   | NUMBER   | Number of the wait event     |
| EVENT_ID | NUMBER   | Identifier of the wait event |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME          | VARCHAR2(64) | Name of the wait event. Names that appear in this column remain stable across Oracle Database releases, and they can be relied on by customer scripts.                                                                                                                                                                                                                                                                                          |
| PARAMETER1    | VARCHAR2(64) | Description of the first parameter for the wait event                                                                                                                                                                                                                                                                                                                                                                                           |
| PARAMETER2    | VARCHAR2(64) | Description of the second parameter for the wait event                                                                                                                                                                                                                                                                                                                                                                                          |
| PARAMETER3    | VARCHAR2(64) | Description of the third parameter for the wait event                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_CLASS_ID | NUMBER       | Identifier of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                       |
| WAIT_CLASS#   | NUMBER       | Number of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_CLASS    | VARCHAR2(64) | Name of the class of the wait event<br><b>See Also:</b> " <a href="#">Classes of Wait Events</a> " for a description of the different wait event classes                                                                                                                                                                                                                                                                                        |
| DISPLAY_NAME  | VARCHAR2(64) | A clearer and more descriptive name for the wait event that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.                                                                                                                                                    |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.208 V\$EVENTMETRIC

V\$EVENTMETRIC displays values of wait event metrics for the most recent 60-second interval.

| Column           | Datatype | Description                                                       |
|------------------|----------|-------------------------------------------------------------------|
| BEGIN_TIME       | DATE     | Begin time of the interval                                        |
| END_TIME         | DATE     | End time of the interval                                          |
| INTSIZE_CSEC     | NUMBER   | Interval size (in hundredths of a second)                         |
| EVENT#           | NUMBER   | Number of the event                                               |
| EVENT_ID         | NUMBER   | Identifier of the event                                           |
| NUM_SESS_WAITING | NUMBER   | Number of sessions waiting at the end of the interval             |
| TIME_WAITED      | NUMBER   | Time waited (in hundredths of a second)                           |
| WAIT_COUNT       | NUMBER   | Number of times waited                                            |
| TIME_WAITED_FG   | NUMBER   | Time waited (in hundredths of a second), from foreground sessions |
| WAIT_COUNT_FG    | NUMBER   | Number of times waited, from foreground sessions                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.209 V\$EXADIRECT\_ACL

V\$EXADIRECT\_ACL monitors current ACLs propagated to the database instance.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME | VARCHAR2(512) | Database service name                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SGID         | VARCHAR2(39)  | Identifier of the VM allowed access to the specified service name                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.210 V\$EXECUTION

V\$EXECUTION displays information on parallel execution.

| Column   | Datatype     | Description                           |
|----------|--------------|---------------------------------------|
| PID      | NUMBER       | Session ID                            |
| DEPTH    | NUMBER       | The depth                             |
| FUNCTION | VARCHAR2(10) | Session serial number                 |
| TYPE     | VARCHAR2(7)  | Name of the OBJECT_NODE in plan table |
| NVALS    | NUMBER       | Elapsed time for OBJECT_NODE          |
| VAL1     | NUMBER       | The value for number 1                |
| VAL2     | NUMBER       | The value for number 2                |
| SEQH     | NUMBER       | A sequence                            |
| SEQL     | NUMBER       | A sequence                            |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.211 V\$EXP\_STATS

V\$EXP\_STATS stores the expression tracking statistics of recently executed queries.

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPID    | NUMBER   | Expression ID of the current expression                                                                                                                                                                                                                                                                                                                                                                                                         |
| OBJNUM   | NUMBER   | The object number contained in the expression                                                                                                                                                                                                                                                                                                                                                                                                   |
| DYNOCOST | NUMBER   | Optimizer dynamic cost of evaluating the expression                                                                                                                                                                                                                                                                                                                                                                                             |
| EVALCNT  | NUMBER   | Number of times the expression has been evaluated                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.212 V\$FALSE\_PING

V\$FALSE\_PING is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column | Datatype | Description                                                                            |
|--------|----------|----------------------------------------------------------------------------------------|
| FILE#  | NUMBER   | Data file identifier number (to find the file name, query DBA_DATA_FILES or V\$DBFILE) |
| BLOCK# | NUMBER   | Block number                                                                           |

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS            | VARCHAR2(10)  | Status of the block: <ul style="list-style-type: none"> <li>free - Not currently in use</li> <li>xcur - Exclusive</li> <li>scur - Shared current</li> <li>cr - Consistent read</li> <li>read - Being read from disk</li> <li>mrec - In media recovery mode</li> <li>irec - In instance recovery mode</li> </ul>                                                                                                                                 |
| XNC               | NUMBER        | Number of PCM lock conversions from Exclusive mode due to contention with another instance. This column is obsolete and maintained for backward compatibility.                                                                                                                                                                                                                                                                                  |
| FORCED_READS      | NUMBER        | Number of times the block had to be reread from the cache because another instance has forced it out of this instance's cache by requesting the lock on the block in exclusive mode                                                                                                                                                                                                                                                             |
| FORCED_WRITES     | NUMBER        | Number of times GCS had to write this block to cache because this instance had used the block and another instance had requested the lock on the block in a conflicting mode                                                                                                                                                                                                                                                                    |
| NAME              | VARCHAR2(128) | Name of the database object containing the block                                                                                                                                                                                                                                                                                                                                                                                                |
| PARTITION_NAME    | VARCHAR2(128) | NULL for nonpartitioned objects                                                                                                                                                                                                                                                                                                                                                                                                                 |
| KIND              | VARCHAR2(15)  | Type of database object                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OWNER#            | NUMBER        | Owner number                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| LOCK_ELEMENT_ADDR | RAW(4   8)    | Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.                                                                                                                                                                                                                                                          |
| LOCK_ELEMENT_NAME | NUMBER        | Name of the lock that contains the PCM lock that is covering the buffer                                                                                                                                                                                                                                                                                                                                                                         |
| CLASS#            | NUMBER        | Lock element class                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.216 V\$FILE\_HISTOGRAM

V\$FILE\_HISTOGRAM displays a histogram of all synchronous single block reads on a per-file basis (for data files). The histogram has buckets of time intervals from < 1 ms, < 2 ms, < 4 ms, < 8 ms, ... < 2<sup>21</sup> ms, < 2<sup>22</sup> ms, and >= 2<sup>22</sup> ms.

The histogram will not be filled unless the STATISTICS\_LEVEL initialization parameter is set to ALL.

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE#                | NUMBER   | File number                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SINGLEBLKRDTIM_MILLI | NUMBER   | Amount of time the bucket represents (in milliseconds). If the duration = <i>num</i> , then this column represents waits of duration < <i>num</i> that are not included in any smaller bucket.                                                                                                                                                                                                                                                  |
| SINGLEBLKRDS         | NUMBER   | Number of waits of the duration belonging to the bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.217 V\$FILEMETRIC

V\$FILEMETRIC displays values of file metrics for the most recent 10-minute interval. A history of the last one hour will be kept in the system.

| Column                | Datatype | Description                                         |
|-----------------------|----------|-----------------------------------------------------|
| BEGIN_TIME            | DATE     | Begin time of the interval                          |
| END_TIME              | DATE     | End time of the interval                            |
| INTSIZE_CSEC          | NUMBER   | Interval size (in hundredths of a second)           |
| FILE_ID               | NUMBER   | File number                                         |
| CREATION_TIME         | NUMBER   | Timestamp of the file creation                      |
| AVERAGE_READ_TIME     | NUMBER   | Average file read time (in hundredths of a second)  |
| AVERAGE_WRITE_TIME    | NUMBER   | Average file write time (in hundredths of a second) |
| PHYSICAL_READS        | NUMBER   | Number of physical reads                            |
| PHYSICAL_WRITES       | NUMBER   | Number of physical writes                           |
| PHYSICAL_BLOCK_READS  | NUMBER   | Number of physical block reads                      |
| PHYSICAL_BLOCK_WRITES | NUMBER   | Number of physical block writes                     |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.218 V\$FILEMETRIC\_HISTORY

V\$FILEMETRIC\_HISTORY displays values of file metrics for all intervals in the last one hour.

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME            | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME              | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC          | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                       |
| FILE_ID               | NUMBER   | File number                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CREATION_TIME         | NUMBER   | Timestamp of the file creation                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AVERAGE_READ_TIME     | NUMBER   | Average file read time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                              |
| AVERAGE_WRITE_TIME    | NUMBER   | Average file write time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                             |
| PHYSICAL_READS        | NUMBER   | Number of physical reads                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PHYSICAL_WRITES       | NUMBER   | Number of physical writes                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PHYSICAL_BLOCK_READS  | NUMBER   | Number of physical block reads                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PHYSICAL_BLOCK_WRITES | NUMBER   | Number of physical block writes                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.219 V\$FILESAPCE\_USAGE

V\$FILESAPCE\_USAGE summarizes space allocation information of each data file and temp file.

| Column          | Datatype | Description                                    |
|-----------------|----------|------------------------------------------------|
| TABLESPACE_ID   | NUMBER   | ID of the tablespace to which the file belongs |
| RFNO            | NUMBER   | Relative file number of the file               |
| ALLOCATED_SPACE | NUMBER   | Total allocated space in the file              |

| Column         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_SIZE      | NUMBER   | Current file size                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FILE_MAXSIZE   | NUMBER   | Maximum file size                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CHANGESCN_BASE | NUMBER   | SCN base of the last change to the file                                                                                                                                                                                                                                                                                                                                                                                                         |
| CHANGESCN_WRAP | NUMBER   | SCN wrap of the last change to the file                                                                                                                                                                                                                                                                                                                                                                                                         |
| CHANGESCN8     | NUMBER   | The 8–byte representation of the SCN at which the last change happened to the file                                                                                                                                                                                                                                                                                                                                                              |
| FLAG           | NUMBER   | Flags for file attributes                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.220 V\$FILESTAT

V\$FILESTAT displays the number of physical reads and writes done and the total number of single-block and multiblock I/Os done at file level.

As of Oracle Database 10g Release 2 (10.2), this view also includes reads done by RMAN processes for backup operations.

| Column             | Datatype | Description                                                                                                           |
|--------------------|----------|-----------------------------------------------------------------------------------------------------------------------|
| FILE#              | NUMBER   | Number of the file                                                                                                    |
| PHYRDS             | NUMBER   | Number of physical reads done                                                                                         |
| PHYWRTS            | NUMBER   | Number of times DBWR is required to write                                                                             |
| PHYBLKRD           | NUMBER   | Number of physical blocks read                                                                                        |
| OPTIMIZED_PHYBLKRD | NUMBER   | Number of physical reads from Database Smart Flash Cache blocks                                                       |
| PHYBLKWRT          | NUMBER   | Number of blocks written to disk, which may be the same as PHYWRTS if all writes are single blocks                    |
| SINGLEBLKRDS       | NUMBER   | Number of single block reads                                                                                          |
| READTIM            | NUMBER   | Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false              |
| WRITETIM           | NUMBER   | Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false             |
| SINGLEBLKRDTIM     | NUMBER   | Cumulative single block read time (in hundredths of a second)                                                         |
| AVGIOTIM           | NUMBER   | Average time (in hundredths of a second) spent on I/O, if the TIMED_STATISTICS parameter is true; 0 if false          |
| LSTIOTIM           | NUMBER   | Time (in hundredths of a second) spent doing the last I/O, if the TIMED_STATISTICS parameter is true; 0 if false      |
| MINIOTIM           | NUMBER   | Minimum time (in hundredths of a second) spent on a single I/O, if the TIMED_STATISTICS parameter is true; 0 if false |

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXIORTM | NUMBER   | Maximum time (in hundredths of a second) spent doing a single read, if the <code>TIMED_STATISTICS</code> parameter is <code>true</code> ; 0 if <code>false</code>                                                                                                                                                                                                                                                                               |
| MAXIOWTM | NUMBER   | Maximum time (in hundredths of a second) spent doing a single write, if the <code>TIMED_STATISTICS</code> parameter is <code>true</code> ; 0 if <code>false</code>                                                                                                                                                                                                                                                                              |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.221 V\$FIXED\_TABLE

`V$FIXED_TABLE` displays all dynamic performance tables, views, and derived tables in the database.

Some `v$` tables (for example, `V$ROLLNAME`) refer to real tables and are therefore not listed.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME      | VARCHAR2(128) | Name of the object                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OBJECT_ID | NUMBER        | Identifier of the fixed object                                                                                                                                                                                                                                                                                                                                                                                                                  |
| TYPE      | VARCHAR2(5)   | Object type ( <code>TABLE</code>   <code>VIEW</code> )                                                                                                                                                                                                                                                                                                                                                                                          |
| TABLE_NUM | NUMBER        | Number that identifies the dynamic performance table if it is of type <code>TABLE</code>                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.222 V\$FIXED\_VIEW\_DEFINITION

`V$FIXED_VIEW_DEFINITION` contains the definitions of all the fixed views (views beginning with `v$`).

Use this table with caution. Oracle tries to keep the behavior of fixed views the same from release to release, but the definitions of the fixed views can change without notice. Use these definitions to optimize your queries by using indexed columns of the dynamic performance tables.

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VIEW_NAME       | VARCHAR2(128)  | Name of the fixed view                                                                                                                                                                                                                                                                                                                                                                                                                          |
| VIEW_DEFINITION | VARCHAR2(4000) | Definition of the fixed view                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID          | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.223 V\$FLASHBACK\_DATABASE\_LOG

V\$FLASHBACK\_DATABASE\_LOG displays information about the flashback data. Use this view to help estimate the amount of flashback space required for the current workload.

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OLDEST_FLASHBACK_SCN     | NUMBER   | Lowest system change number (SCN) in the flashback data, for any incarnation                                                                                                                                                                                                                                                                                                                                                                    |
| OLDEST_FLASHBACK_TIME    | DATE     | Time of the lowest SCN in the flashback data, for any incarnation                                                                                                                                                                                                                                                                                                                                                                               |
| RETENTION_TARGET         | NUMBER   | Target retention time (in minutes)                                                                                                                                                                                                                                                                                                                                                                                                              |
| FLASHBACK_SIZE           | NUMBER   | Current size (in bytes) of the flashback data                                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTIMATED_FLASHBACK_SIZE | NUMBER   | Estimated size of flashback data needed (in bytes) for the current target retention                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.224 V\$FLASHBACK\_DATABASE\_LOGFILE

V\$FLASHBACK\_DATABASE\_LOGFILE displays information about the flashback log files.

| Column        | Datatype      | Description                                       |
|---------------|---------------|---------------------------------------------------|
| NAME          | VARCHAR2(513) | Name of the log file                              |
| LOG#          | NUMBER        | Log file number                                   |
| THREAD#       | NUMBER        | Log file thread number                            |
| SEQUENCE#     | NUMBER        | Log file sequence number                          |
| BYTES         | NUMBER        | Log file size (in bytes)                          |
| FIRST_CHANGE# | NUMBER        | Lowest system change number (SCN) in the log file |

| Column     | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FIRST_TIME | DATE        | Time of the first SCN in the log file                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TYPE       | VARCHAR2(9) | Log type: <ul style="list-style-type: none"> <li>• NORMAL</li> <li>• RESERVED</li> <li>• FREE</li> <li>• TO DELETE</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| CON_ID     | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.225 V\$FLASHBACK\_DATABASE\_STAT

V\$FLASHBACK\_DATABASE\_STAT displays statistics for monitoring the I/O overhead of logging flashback data. This view also displays the estimated flashback space needed based on previous workloads.

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME               | DATE     | Beginning of the time interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| END_TIME                 | DATE     | End of the time interval                                                                                                                                                                                                                                                                                                                                                                                                                              |
| FLASHBACK_DATA           | NUMBER   | Number of bytes of flashback data written during the interval                                                                                                                                                                                                                                                                                                                                                                                         |
| DB_DATA                  | NUMBER   | Number of bytes of database data read and written during the interval                                                                                                                                                                                                                                                                                                                                                                                 |
| REDO_DATA                | NUMBER   | Number of bytes of redo data written during the interval                                                                                                                                                                                                                                                                                                                                                                                              |
| ESTIMATED_FLASHBACK_SIZE | NUMBER   | Value of ESTIMATED_FLASHBACK_SIZE in V\$FLASHBACK_DATABASE_LOG at the end of the time interval                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.226 V\$FLASHBACK\_TXN\_GRAPH

V\$FLASHBACK\_TXN\_GRAPH displays a tabular representation of the transaction dependency graph. For each dependency edge, there could be multiple rows, one for each conflicting operation.

This view is relevant AFTER a compensating transaction has been started through the DBMS\_FLASHBACK.TRANSACTION\_BACKOUT( ) set of functions, and is no longer relevant

once the compensating transaction is either committed or rolled back. It also provides a tabular representation of the undo SQL that is not available through the CLOB XML construct in the `DBA_FLASHBACK_TXN_REPORT` view.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 7.227 V\$FLASHBACK\_TXN\_MODS

V\$FLASHBACK\_TXN\_MODS displays the individual modifications of all the transactions in memory.

This view is relevant AFTER a compensating transaction has been started through the DBMS\_FLASHBACK.TRANSACTION\_BACKOUT( ) set of functions, and is no longer relevant once the compensating transaction is either committed or rolled back. It also provides a tabular representation of the undo SQL that is not available through the CLOB XML construct in the DBA\_FLASHBACK\_TXN\_REPORT view.

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 7.228 V\$FLASHFILESTAT

V\$FLASHFILESTAT displays statistics about Database Smart Flash Cache.

By taking snapshots of `SINGLEBLKRDS` and `SINGLEBLKRDTIM_MICRO`, you can easily calculate the average latency of all the flash files in a given time period

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| FLASHFILE#           | NUMBER        | The file number of the flash file                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NAME                 | VARCHAR2(513) | Name and path of the flash file                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BYTES                | NUMBER        | Size of the flash file, in bytes                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ENABLED              | NUMBER        | Indicates whether this flash file is enabled or not                                                                                                                                                                                                                                                                                                                                                                                                   |
| SINGLEBLKRDS         | NUMBER        | Number of reads to the flash file                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SINGLEBLKRDTIM_MICRO | NUMBER        | Cumulative latency of reading blocks from this particular flash file/device, in microseconds                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.229 V\$FOREIGN\_ARCHIVED\_LOG

V\$FOREIGN\_ARCHIVED\_LOG can be queried on a logical standby database to find out the list of foreign archived logs received by a database.

No rows are returned for this view on a physical standby database.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                       |
|-------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECID             | NUMBER        | Archived log record ID                                                                                                                                                                                                                                                            |
| STAMP             | NUMBER        | Archived log record stamp                                                                                                                                                                                                                                                         |
| NAME              | VARCHAR2(513) | Archived log file name. If set to NULL, either the log file was cleared before it was archived or an RMAN BACKUP command with the delete input option was executed to back up archivelog all (RMAN> backup archivelog all delete input;).                                         |
| DEST_ID           | NUMBER        | Original destination from which the archive log was generated. The value is 0 if the destination identifier is not available                                                                                                                                                      |
| THREAD#           | NUMBER        | Redo thread number                                                                                                                                                                                                                                                                |
| SEQUENCE#         | NUMBER        | Redo log sequence number                                                                                                                                                                                                                                                          |
| RESETLOGS_CHANGE# | NUMBER        | Resetlogs change number of the database when the log was written                                                                                                                                                                                                                  |
| RESETLOGS_TIME    | DATE          | Resetlogs time of the database when the log was written                                                                                                                                                                                                                           |
| RESETLOGS_ID      | NUMBER        | Resetlogs identifier associated with the archived redo log                                                                                                                                                                                                                        |
| FIRST_CHANGE#     | NUMBER        | First change number in the archived log                                                                                                                                                                                                                                           |
| FIRST_TIME        | DATE          | Timestamp of the first change                                                                                                                                                                                                                                                     |
| NEXT_CHANGE#      | NUMBER        | First change in the next log                                                                                                                                                                                                                                                      |
| NEXT_TIME         | DATE          | Timestamp of the next change                                                                                                                                                                                                                                                      |
| BLOCKS            | NUMBER        | Size of the archived log (in blocks)                                                                                                                                                                                                                                              |
| BLOCK_SIZE        | NUMBER        | Redo log block size. This is the logical block size of the archived log, which is the same as the logical block size of the online log from which the archived log was copied. The online log logical block size is a platform-specific value that is not adjustable by the user. |
| CREATOR           | VARCHAR2(7)   | Creator of the archive log:<br>ARCH - Archiver process<br>FGRD - Foreground process<br>RMAN - Recovery Manager<br>SRMN - RMAN at standby<br>LGWR - Logwriter process                                                                                                              |
| REGISTRAR         | VARCHAR2(7)   | Registrar of the entry:<br>RFS - Remote File Server process<br>ARCH - Archiver process<br>FGRD - Foreground process<br>RMAN - Recovery Manager<br>SRMN - RMAN at standby<br>LGWR - Logwriter process                                                                              |
| ARCHIVED          | VARCHAR2(3)   | Indicates whether the online redo log was archived (YES) or whether RMAN only inspected the log and created a record for future application of redo logs during recovery (NO).                                                                                                    |

| Column                | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPLIED               | VARCHAR2(3) | <p>Indicates whether the archivelog has been applied to its corresponding standby database (YES) or not (NO). The value is always NO for local destinations.</p> <p>This column is meaningful at the standby site for the ARCHIVED_LOG entries with REGISTRAR='RFS' (which means this log is shipped from the primary to the standby database). If REGISTRAR='RFS' and APPLIED is NO, then the log has arrived at the standby but has not yet been applied. If REGISTRAR='RFS' and APPLIED is YES, the log has arrived and been applied at the standby database.</p> <p>You can use this field to identify archivelogs that can be backed up and removed from disk.</p> |
| DELETED               | VARCHAR2(3) | Indicates whether an RMAN DELETE command has physically deleted the archived log file from disk, as well as logically removing it from the control file of the target database and from the recovery catalog (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATUS                | VARCHAR2(1) | <p>Status of the archived log:</p> <p>A - Available<br/>D - Deleted<br/>U - Unavailable<br/>X - Expired</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                   |

## 7.230 V\$FS\_FAILOVER\_OBSERVERS

V\$FS\_FAILOVER\_OBSERVERS provides information about fast-start failover observers.

If you are querying on the primary database, this view returns three rows, each describing one observer. However, only a row having a non-empty value in column NAME corresponds to a started observer. If you are querying on a non-primary database, the behavior of this view is not defined.

| Column        | Datatype      | Description                                                                                                                              |
|---------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------|
| NAME          | VARCHAR2(513) | The fast-start failover observer name                                                                                                    |
| REGISTERED    | VARCHAR2(4)   | Indicates if this observer is registered (YES) or not (NO). Note that the observer is registered <i>only</i> if HOST is not NULL.        |
| HOST          | VARCHAR2(513) | The name of the host where this observer is running                                                                                      |
| ISMASTER      | VARCHAR2(4)   | Indicates if this observer is the master observer (YES) or not (NO)                                                                      |
| TIME_SELECTED | TIMESTAMP(9)  | Shows when this observer became master observer, if ISMASTER is YES; otherwise the following constant appears:<br>1990-01-01 00:00:00.00 |

| Column          | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PINGING_PRIMARY | VARCHAR2(4) | <p>Possible values:</p> <ul style="list-style-type: none"> <li>YES: Observer is currently connected to the primary database</li> <li>NO: Observer is not connected to the primary database</li> </ul> <p><b>Note:</b> This field is consistent throughout an Oracle Real Application Clusters (Oracle RAC) environment; that is, if the observer is connected to any instance of the primary database in the Oracle RAC environment, all instances will show a value of YES.</p>                      |
| PINGING_TARGET  | VARCHAR2(4) | <p>Possible values:</p> <ul style="list-style-type: none"> <li>YES: Observer is currently connected to the target standby database</li> <li>NO: Observer is not connected to the target standby database</li> </ul> <p><b>Note:</b> This field is consistent throughout an Oracle Real Application Clusters (Oracle RAC) environment; that is, if the observer is connected to any instance of the target standby database in the Oracle RAC environment, all instances will show a value of YES.</p> |
| CON_ID          | NUMBER      | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                |

## 7.231 V\$FS\_FAILOVER\_STATS

V\$FS\_FAILOVER\_STATS displays statistics about fast-start failovers occurring on the system.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_FAILOVER_TIME   | VARCHAR2(20)  | Timestamp of the last fast-start failover                                                                                                                                                                                                                                                                                                                                                                                                              |
| LAST_FAILOVER_REASON | VARCHAR2(255) | Reason for the last fast-start failover                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID               | NUMBER        | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.232 V\$FS\_OBSERVER\_HISTOGRAM

V\$FS\_OBSERVER\_HISTOGRAM displays statistics that are based on the frequency of successful pings between the observer and primary database for different time

intervals. The wait event in this histogram is the observer's wait until pings to the primary succeed.

The histogram displays only when there were ping failures between the observer and the primary database.

No rows are shown in this view for unregistered observers.

These statistics can be used to select an appropriate value for the `FastStartFailoverThreshold` configuration property for your environment.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBSERVER_NAME    | VARCHAR2(513) | The Fast-Start Failover observer name                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| OBSERVER_HOST    | VARCHAR2(513) | The name of the host where this observer is running                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| WAIT_TIME        | NUMBER        | The time interval between a pair of successful observer pings (ping-pairs) to this instance. Note that the values in this column are the upper bound of the inter-ping interval samples represented by a given histogram bucket. If <code>WAIT_TIME = number</code> , then this column represents inter-ping intervals $\leq$ <code>number</code> that are not included in any smaller bucket.<br><br>The value in this column is the time (in seconds) that a ping failure lasted. |
| WAIT_COUNT       | NUMBER        | The number of ping-pairs with an inter-ping interval that corresponds with this histogram bucket.<br><br>If all pings have been successful so far, this column has a value of 0.                                                                                                                                                                                                                                                                                                    |
| LAST_UPDATE_TIME | VARCHAR2(20)  | The last time this row was updated                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                     |

### See Also:

*Oracle Data Guard Broker* for more information about the `FastStartFailoverThreshold` configuration property

### Example

Assume that the following shows the status of observer's pings to the primary:

```
Ping time Ping result

1:00:00 SUCCESS
1:00:03 FAIL
1:00:06 FAIL
1:00:09 SUCCESS => Wait time of 6 seconds
1:00:12 SUCCESS
1:00:15 FAIL
```

```

1:00:18 FAIL
1:00:21 SUCCESS => Wait time of 6 seconds
1:00:24 SUCCESS
1:00:27 FAIL
1:00:30 SUCCESS => Wait time of 3 seconds

```

These ping results will result in the histogram view below:

| WAIT_TIME | WAIT_COUNT | LAST_UPDATE_TIME |
|-----------|------------|------------------|
| 3         | 1          | 1:00:30          |
| 6         | 2          | 1:00:21          |
| 9         | 0          |                  |
| 12        | 0          |                  |
| ...       |            |                  |

In this case, the `FastStartFailoverThreshold` value should be set to larger than 6 because communication between the observer and the primary sometimes fails for 6 seconds.

## 7.233 V\$GC\_ELEMENT

V\$GC\_ELEMENT displays one entry for each global cache resource that is used by the buffer cache. The name of the global cache resource that corresponds to a lock element is {BL', indx, class}. This is an Oracle Real Application Clusters view.

| Column          | Datatype   | Description                                                                                                                                                                            |
|-----------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GC_ELEMENT_ADDR | RAW(4   8) | Address of the lock element that contains the PCM lock that is covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock. |
| INDX            | NUMBER     | Platform specific lock manager identifier                                                                                                                                              |
| CLASS           | NUMBER     | Platform specific lock manager identifier                                                                                                                                              |
| GC_ELEMENT_NAME | NUMBER     | Name of the lock that contains the PCM lock that is covering the buffer                                                                                                                |
| MODE_HELD       | NUMBER     | Platform dependent value for lock mode held; often: 3 = share; 5 = exclusive                                                                                                           |
| BLOCK_COUNT     | NUMBER     | Number of blocks covered by PCM lock                                                                                                                                                   |
| RELEASING       | NUMBER     | Nonzero if PCM lock is being downgraded                                                                                                                                                |
| ACQUIRING       | NUMBER     | Nonzero if PCM lock is being upgraded                                                                                                                                                  |
| WRITING         | NUMBER     | If the GC_ELEMENT is being written, the write status                                                                                                                                   |
| RECOVERING      | NUMBER     | If the GC_ELEMENT is being recovered, the recovery status                                                                                                                              |
| LOCAL           | NUMBER     | Zero if the GC_ELEMENT is local, one if it is global                                                                                                                                   |
| FLAGS           | NUMBER     | Process level flags for the lock element                                                                                                                                               |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.234 V\$GC\_ELEMENTS\_WITH\_COLLISIONS

V\$GC\_ELEMENTS\_WITH\_COLLISIONS is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column          | Datatype   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GC_ELEMENT_ADDR | RAW(4   8) | Address of the lock element that contains the PCM lock covering the buffer. If more than one buffer has the same address, then these buffers are covered by the same PCM lock.                                                                                                                                                                                                                                                                  |
| CON_ID          | NUMBER     | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.235 V\$GCR\_ACTIONS

V\$GCR\_ACTIONS displays information about the current status of the actions defined to the GCR component that runs under the LMHB background process to detect and mitigate potential issues in the cluster instances.

| Column      | Datatype     | Description                                                            |
|-------------|--------------|------------------------------------------------------------------------|
| ACTION_ID   | NUMBER       | Action identification number as used internally to refer to the metric |
| ACTION_NAME | VARCHAR2(40) | Name of the action                                                     |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENVIRONMENT        | NUMBER       | Environment that the action should run in: <ul style="list-style-type: none"> <li>0: Nowhere (do not run)</li> <li>1: Oracle ASM instance only</li> <li>2: Oracle Database instance only</li> <li>3: Oracle ASM and Oracle Database instance</li> <li>4: Standby instance</li> <li>5: Oracle ASM and Standby instance</li> <li>6: Oracle Database and Standby instance</li> <li>7: Oracle Database, Oracle ASM, and Standby instance</li> <li>15: All instance types</li> </ul> |
| FLAGS              | NUMBER       | Various flags describing the action. Used only by Oracle for diagnosis.                                                                                                                                                                                                                                                                                                                                                                                                         |
| ACTIVE             | VARCHAR2(9)  | Whether the action is active or not: <ul style="list-style-type: none"> <li>ACTIVE: Action is active.</li> <li>INACTIVE: Action is disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| STATUS_CHANGE_TIME | TIMESTAMP(6) | Time of last action change of status                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LAST_RAN_ITERATION | NUMBER       | Iteration of the last time the action ran                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_RAN_TIME      | TIMESTAMP(6) | Time of last run                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID             | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                 |

## 7.236 V\$GCR\_LOG

V\$GCR\_LOG provides information on the last 30 significant events that have occurred in GCR in the recent past.

| Column      | Datatype     | Description                                                                                                                                                                           |
|-------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID     | NUMBER       | Instance identifier                                                                                                                                                                   |
| ITERATION   | NUMBER       | GCR internal iteration count                                                                                                                                                          |
| TIME        | TIMESTAMP(6) | Timestamp of record                                                                                                                                                                   |
| TYPE        | VARCHAR2(14) | Type of record: <ul style="list-style-type: none"> <li>METRIC</li> <li>METRIC ENABLE</li> <li>METRIC DISABLE</li> <li>GLOBAL METRIC</li> <li>ACTION RAN</li> <li>RESET RAN</li> </ul> |
| DESCRIPTION | VARCHAR2(40) | Description of function                                                                                                                                                               |

| Column | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESULT | VARCHAR2(7) | Result: <ul style="list-style-type: none"> <li>OK</li> <li>FAIL</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data.</li> </ul> |

## 7.237 V\$GCR\_METRICS

V\$GCR\_METRICS displays information about the current status of the metrics defined to the GCR component that runs under the LMHB background process to detect and mitigate potential issues in the cluster instances.

| Column      | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METRIC_ID   | NUMBER       | Metric identification number as used internally to refer to the metric                                                                                                                                                                                                                                                                                                                                                                                                          |
| METRIC_NAME | VARCHAR2(40) | Name of the metric                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ENVIRONMENT | NUMBER       | Environment that the metric should run in: <ul style="list-style-type: none"> <li>0: Nowhere (do not run)</li> <li>1: Oracle ASM instance only</li> <li>2: Oracle Database instance only</li> <li>3: Oracle ASM and Oracle Database instance</li> <li>4: Standby instance</li> <li>5: Oracle ASM and Standby instance</li> <li>6: Oracle Database and Standby instance</li> <li>7: Oracle Database, Oracle ASM, and Standby instance</li> <li>15: All instance types</li> </ul> |
| FREQUENCY   | NUMBER       | How often the metric runs, in seconds                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SCOPE       | NUMBER       | The scope of sharing of the metric: <ul style="list-style-type: none"> <li>0: The metric does not have associated data</li> <li>1: Global - shared with all other instances in the cluster</li> <li>2: Local - used only locally (not shared)</li> <li>4: Node Global - shared with other instances in the cluster on the same node only</li> <li>8: DB Only - Shared with other instances of the same database only</li> </ul>                                                 |
| DATA_TYPE   | VARCHAR2(7)  | The type of the data associated with this metric: <ul style="list-style-type: none"> <li>0: None</li> <li>1: Boolean</li> <li>2: Numeric</li> <li>3: Process</li> </ul>                                                                                                                                                                                                                                                                                                         |

| Column              | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS              | VARCHAR2(9)  | Indicates the status of the metric: <ul style="list-style-type: none"> <li>ACTIVE: Indicates that the metric is active.</li> <li>INACTIVE: Indicates that the metric is turned off.</li> </ul>                                                                                                                                                                                                                                                  |
| STATUS_CHANGE_TIME  | TIMESTAMP(6) | Time of last metric change of status                                                                                                                                                                                                                                                                                                                                                                                                            |
| LAST_RAN_ITERATION  | NUMBER       | Iteration of the last time the metric ran                                                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_RAN_TIME       | TIMESTAMP(6) | Time of last run                                                                                                                                                                                                                                                                                                                                                                                                                                |
| LAST_PASS_ITERATION | NUMBER       | Iteration of last time the metric passed                                                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_PASS_TIME      | TIMESTAMP(6) | Time of last metric pass                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TOTAL_PASSES        | NUMBER       | Total number of times the metric passed since start of LMHB                                                                                                                                                                                                                                                                                                                                                                                     |
| LAST_FAIL_ITERATION | NUMBER       | Iteration of last time the metric failed                                                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_FAIL_TIME      | TIMESTAMP(6) | Time of last metric failure                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TOTAL_FAILS         | NUMBER       | Total number of times the metric has failed since start of LMHB                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID              | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.238 V\$GCR\_STATUS

V\$GCR\_STATUS provides information on the current GCR status, what metrics ran and their result. It records the last 100 events.

| Column      | Datatype     | Description                                                                                                                            |
|-------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| INST_ID     | NUMBER       | Instance identifier                                                                                                                    |
| ITERATION   | NUMBER       | GCR internal iteration count                                                                                                           |
| TIME        | TIMESTAMP(6) | Timestamp of record                                                                                                                    |
| TYPE        | VARCHAR2(14) | Type of record: <ul style="list-style-type: none"> <li>METRIC</li> <li>GLOBAL METRIC</li> <li>ACTION RAN</li> <li>RESET RAN</li> </ul> |
| DESCRIPTION | VARCHAR2(40) | Description of function                                                                                                                |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data.</li> </ul> |

## 7.239 V\$GC SHVMASTER\_INFO

V\$GC SHVMASTER\_INFO describes the current and previous master instances and the number of re-masterings of Global Cache Service resources except those belonging to files mapped to a particular master.

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HV_ID           | NUMBER   | PCM hash value ID                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CURRENT_MASTER  | NUMBER   | Master instance of this PCM hash value ID                                                                                                                                                                                                                                                                                                                                                                                                       |
| PREVIOUS_MASTER | NUMBER   | Previous master instance of this PCM hash value ID                                                                                                                                                                                                                                                                                                                                                                                              |
| REMASTER_CNT    | NUMBER   | Number of times this has been remastered                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.240 V\$GC SPFMASTER\_INFO

V\$GC SPFMASTER\_INFO describes the current and previous master instances and the number of re-masterings of Global Cache Service resources belonging to files mapped to instances.

| Column              | Datatype     | Description                                                                          |
|---------------------|--------------|--------------------------------------------------------------------------------------|
| FILE_ID             | NUMBER       | File number                                                                          |
| DATA_OBJECT_ID      | NUMBER       | Data object ID                                                                       |
| GC_MASTERING_POLICY | VARCHAR2(11) | Data object type.<br>The possible values are <i>Affinity</i> or <i>Read mostly</i> . |
| CURRENT_MASTER      | NUMBER       | Master instance of this file                                                         |
| PREVIOUS_MASTER     | NUMBER       | Previous master instance of this file                                                |
| REMASTER_CNT        | NUMBER       | Number of times this has been remastered                                             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 7.241 V\$GES\_BLOCKING\_ENQUEUE

V\$GES\_BLOCKING\_ENQUEUE describes all locks currently known to lock manager that are being blocked or blocking others.

The output of this view is a subset of the output from V\$GES\_ENQUEUE. This is an Oracle Real Application Clusters view.

### See Also:

"V\$GES\_ENQUEUE" for a description of all locks known to the lock manager

| Column                 | Datatype     | Description                                                           |
|------------------------|--------------|-----------------------------------------------------------------------|
| HANDLE                 | RAW(4   8)   | Lock pointer                                                          |
| GRANT_LEVEL            | VARCHAR2(9)  | Granted level of the lock                                             |
| REQUEST_LEVEL          | VARCHAR2(9)  | Requested level of the lock                                           |
| RESOURCE_NAME1         | VARCHAR2(30) | Resource name for the lock                                            |
| RESOURCE_NAME2         | VARCHAR2(30) | Resource name for the lock                                            |
| PID                    | NUMBER       | Process identifier which holds the lock                               |
| TRANSACTION_ID0        | NUMBER       | Lower 4 bytes of the transaction identifier where the lock belongs to |
| TRANSACTION_ID1        | NUMBER       | Upper 4 bytes of the transaction identifier where the lock belongs to |
| GROUP_ID               | NUMBER       | Group identifier for the lock                                         |

| CONVERT_TYPE         | VARCHAR2(16) | Conversion type: <ul style="list-style-type: none"> <li>• NULL -&gt; SS - NULL mode to subshared mode</li> <li>• NULL -&gt; SX - NULL mode to shared exclusive mode</li> <li>• NULL -&gt; S - NULL mode to shared mode</li> <li>• NULL -&gt; SSX - NULL mode to subshared exclusive mode</li> <li>• NULL -&gt; X - NULL mode to exclusive mode</li> <li>• SS -&gt; SX - Subshared mode to shared exclusive mode</li> <li>• SS -&gt; S - Subshared mode to shared mode</li> <li>• SS -&gt; SSX - Subshared mode to subshared exclusive mode</li> <li>• SS -&gt; X - Subshared mode to exclusive mode</li> <li>• SX -&gt; S - Shared exclusive mode to shared mode</li> <li>• SX -&gt; SSX - Shared exclusive mode to subshared exclusive mode</li> <li>• SX -&gt; X - Shared exclusive mode to exclusive mode</li> <li>• S -&gt; SX - Shared mode to shared exclusive mode</li> <li>• S -&gt; SSX - Shared mode to subshared exclusive mode</li> <li>• S -&gt; X - Shared mode to exclusive mode</li> <li>• SSX -&gt; X - Sub-shared exclusive mode to exclusive mode</li> </ul> |
| AVERAGE_CONVERT_TIME | NUMBER       | Average conversion time for each type of lock operation (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CONVERT_COUNT        | NUMBER       | Number of operations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 7.244 V\$GES\_ENQUEUE

V\$GES\_ENQUEUE describes all locks currently known to lock manager. This is an Oracle Real Application Clusters view.

### See Also:

"V\$GES\_BLOCKING\_ENQUEUE" for a description of all such locks that are currently blocking or being blocked

| Column         | Datatype     | Description                 |
|----------------|--------------|-----------------------------|
| HANDLE         | RAW(4   8)   | Lock pointer                |
| GRANT_LEVEL    | VARCHAR2(9)  | Granted level of the lock   |
| REQUEST_LEVEL  | VARCHAR2(9)  | Requested level of the lock |
| RESOURCE_NAME1 | VARCHAR2(30) | Resource name for the lock  |

| Column                          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 7.246 V\$GES\_RESOURCE

V\$GES\_RESOURCE is an Oracle Real Application Clusters view. It displays information of all resources currently known to the lock manager.

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESP            | RAW(4   8)   | Resource pointer                                                                                                                                                                                                                                                                                                                                                                                                                                |
| RESOURCE_NAME   | VARCHAR2(30) | Resource name in hexadecimal for the lock                                                                                                                                                                                                                                                                                                                                                                                                       |
| ON_CONVERT_Q    | NUMBER       | 1 if on convert queue, 0 otherwise                                                                                                                                                                                                                                                                                                                                                                                                              |
| ON_GRANT_Q      | NUMBER       | 1 if on granted queue, 0 otherwise                                                                                                                                                                                                                                                                                                                                                                                                              |
| PERSISTENT_RES  | NUMBER       | 1 if it is a persistent resource, 0 otherwise                                                                                                                                                                                                                                                                                                                                                                                                   |
| MASTER_NODE     | NUMBER       | Master node ID                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| NEXT_CVT_LEVEL  | VARCHAR2(9)  | Next lock level to convert on global convert queue                                                                                                                                                                                                                                                                                                                                                                                              |
| VALUE_BLK_STATE | VARCHAR2(32) | State of the value block                                                                                                                                                                                                                                                                                                                                                                                                                        |
| VALUE_BLK       | VARCHAR2(64) | First 64 bytes of the value block                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.247 V\$GES\_STATISTICS

V\$GES\_STATISTICS displays miscellaneous GES statistics.

| Column     | Datatype     | Description                         |
|------------|--------------|-------------------------------------|
| STATISTIC# | NUMBER       | Statistic number                    |
| NAME       | VARCHAR2(38) | Name of the statistic               |
| VALUE      | NUMBER       | Value associated with the statistic |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.248 V\$GG\_APPLY\_COORDINATOR

V\$GG\_APPLY\_COORDINATOR displays information about each GoldenGate apply process coordinator.

The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                | NUMBER        | Session ID of the coordinator's session                                                                                                                                                                                                                                                                               |
| SERIAL#            | NUMBER        | Serial number of the coordinator's session                                                                                                                                                                                                                                                                            |
| STATE              | VARCHAR2(21)  | State of the coordinator: <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>APPLYING - Passing transactions to apply servers</li> <li>SHUTTING DOWN CLEANLY - Stopping without an error</li> <li>ABORTING - Stopping because of an apply error</li> </ul> |
| APPLY#             | NUMBER        | Apply process number. An apply process coordinator is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                     |
| APPLY_NAME         | VARCHAR2(128) | Name of the apply process                                                                                                                                                                                                                                                                                             |
| TOTAL_APPLIED      | NUMBER        | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                    |
| TOTAL_WAIT_DEPS    | NUMBER        | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                                        |
| TOTAL_WAIT_COMMITS | NUMBER        | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                  |
| TOTAL_ADMIN        | NUMBER        | Number of administrative jobs issued since the apply process was last started                                                                                                                                                                                                                                         |
| TOTAL_ASSIGNED     | NUMBER        | Number of transactions assigned to apply servers since the apply process was last started                                                                                                                                                                                                                             |
| TOTAL_RECEIVED     | NUMBER        | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                             |
| TOTAL_IGNORED      | NUMBER        | Number of transactions which were received by the coordinator but were ignored because they had been previously applied                                                                                                                                                                                               |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_ROLLBACKS          | NUMBER   | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                                                                                                                                                                      |
| TOTAL_ERRORS             | NUMBER   | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                                                                                                                                                                    |
| UNASSIGNED_COMPLETE_TXNS | NUMBER   | Total number of complete transactions that the coordinator has not assigned to any apply servers                                                                                                                                                                                                                                                                                                                                                |
| LWM_TIME                 | DATE     | Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.                                                                                                                                                                                                                                                                              |
| LWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.                                                                                                                                                                              |
| LWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.                                                                                                                                                                                          |
| HWM_TIME                 | DATE     | Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.                                                                                                                                                                                                                                                                            |
| HWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.                                                                                                                                                                                                                                                                                |
| HWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.                                                                                                                                                                                        |
| STARTUP_TIME             | DATE     | Time when the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                    |
| ELAPSED_SCHEDULE_TIME    | NUMBER   | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_IDLE_TIME        | NUMBER   | Elapsed idle time                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LWM_POSITION             | RAW(64)  | Position of the low-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                               |
| HWM_POSITION             | RAW(64)  | Position of the high-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                              |
| PROCESSED_MESSAGE_NUMBER | NUMBER   | Message number currently processed by the apply coordinator                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| ACTIVE_SERVER_COUNT      | NUMBER   | Active server count                                                                                                                                                                                                                                                                                                                                                                                                                             |

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 7.249 V\$GG\_APPLY\_READER

`V$GG_APPLY_READER` displays information about each GoldenGate apply reader.

The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

| Column                                    | Datatype                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <code>APPLY#</code>                       | <code>NUMBER</code>        | Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>APPLY_NAME</code>                   | <code>VARCHAR2(128)</code> | Name of the apply process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>STATE</code>                        | <code>VARCHAR2(36)</code>  | Shows the state of the apply reader and the hash server. The possible values include: <ul style="list-style-type: none"> <li>• <code>INITIALIZING</code> - Starting up</li> <li>• <code>IDLE</code> - Performing no work</li> <li>• <code>DEQUEUE MESSAGES</code> - Dequeuing messages from the queue</li> <li>• <code>SCHEDULE MESSAGES</code> - Computing dependencies between messages and assembling messages into transactions</li> <li>• <code>SPILLING</code> - Spilling unapplied messages from memory to hard disk</li> <li>• <code>PAUSED - WAITING FOR DDL TO COMPLETE</code> - Waiting for a data definition language (DDL) logical change record (LCR) to be applied</li> </ul> The state of the apply reader is displayed first, followed by the state of the hash server. A semicolon separates the apply reader state from the hash server state. |
| <code>TOTAL_MESSAGES_DEQUEUE<br/>D</code> | <code>NUMBER</code>        | Total number of messages dequeued since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>TOTAL_MESSAGES_SPILLED</code>       | <code>NUMBER</code>        | Number of messages spilled by the reader since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Column                       | Datatype      | Description                                                                                                                                                                                                                                                                        |
|------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEQUEUE_TIME                 | DATE          | Time when the last message was received                                                                                                                                                                                                                                            |
| DEQUEUED_MESSAGE_CREATE_TIME | DATE          | For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.                                                                                     |
| SGA_USED                     | NUMBER        | Amount (in bytes) of SGA memory used by the apply process since it was last started                                                                                                                                                                                                |
| ELAPSED_DEQUEUE_TIME         | NUMBER        | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                               |
| ELAPSED_SCHEDULE_TIME        | NUMBER        | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.                                                                      |
| ELAPSED_SPILL_TIME           | NUMBER        | Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started                                                                                                                                                                          |
| SPILL_LWM_SCN                | NUMBER        | Spill low-watermark SCN                                                                                                                                                                                                                                                            |
| PROXY_SID                    | NUMBER        | When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                    |
| PROXY_SERIAL                 | NUMBER        | When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.                 |
| PROXY_SPID                   | VARCHAR2(12)  | When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0. |
| BYTES_RECEIVED               | NUMBER        | When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.          |
| DEQUEUED_POSITION            | RAW(64)       | Dequeued position. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                          |
| SPILL_LWM_POSITION           | RAW(64)       | Spill low-watermark position. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                               |
| OLDEST_TRANSACTION_ID        | VARCHAR2(128) | Oldest transaction ID                                                                                                                                                                                                                                                              |
| TOTAL_LCRS_WITH_DEP          | NUMBER        | Total number of LCRs with row-level dependencies since the apply process last started                                                                                                                                                                                              |
| TOTAL_LCRS_WITH_WMDEP        | NUMBER        | Total number of LCRs with watermark dependencies since the apply process last started. A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.                                                       |
| TOTAL_IN_MEMORY_LCRS         | NUMBER        | Total number of LCRs currently in memory                                                                                                                                                                                                                                           |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SGA_ALLOCATED | NUMBER   | The total amount of shared memory (in bytes) allocated from the GoldenGate pool for the apply process since the apply process last started                                                                                                                                                                                                                                                                                                      |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

 **See Also:**

- "TIMED\_STATISTICS"
- "STATISTICS\_LEVEL"

## 7.250 V\$GG\_APPLY\_RECEIVER

`V$GG_APPLY_RECEIVER` displays information about the message receiver of the Replicat process.

The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts and when the Replicat process is stopped.

| Column                  | Datatype      | Description                                             |
|-------------------------|---------------|---------------------------------------------------------|
| SID                     | NUMBER        | Session ID of the apply receiver                        |
| SERIAL#                 | NUMBER        | Serial number of the apply receiver                     |
| APPLY_NAME              | VARCHAR2(128) | Name of the apply process                               |
| STARTUP_TIME            | DATE          | Startup time of the apply process                       |
| SOURCE_DATABASE_NAME    | VARCHAR2(128) | Name of the source database                             |
| ACKNOWLEDGEMENT         | NUMBER        | acknowledgment of the messages received by the receiver |
| LAST_RECEIVED_MSG       | NUMBER        | Last received message                                   |
| TOTAL_MESSAGES_RECEIVED | NUMBER        | Total number of messages received                       |

| Column                          | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_AVAILABLE_MESSAGES        | NUMBER       | Number of available messages                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| STATE                           | VARCHAR2(46) | State of the apply receiver: <ul style="list-style-type: none"> <li>• Initializing</li> <li>• Sending unapplied txns</li> <li>• Waiting for message from client</li> <li>• Receiving LCRs</li> <li>• Evaluating rules</li> <li>• Enqueueing LCRS</li> <li>• Waiting for memory</li> <li>• Waiting for apply to read</li> <li>• Waiting for message from Replicat</li> <li>• Waiting for Replicat flush request to complete</li> <li>• Waiting for Replicat commit to complete</li> </ul> |
| LAST_RECEIVED_MESSAGE_POSITION  | VARCHAR2(64) | Last received message position                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ACKNOWLEDGEMENT_POSITION        | VARCHAR2(64) | acknowledgment position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN.                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                          | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                    |
| OS_PROCESS_ID <sup>1</sup>      | VARCHAR2(12) | The OS process ID of the apply receiver process                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CURRENT_POSITION <sup>1</sup>   | VARCHAR2(81) | The trail position of the current record processed by the apply receiver                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TOTAL_TRANSACTIONS <sup>1</sup> | NUMBER       | The total number of transactions processed by the apply receiver                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TOTAL_COMMITS <sup>1</sup>      | NUMBER       | The total number of commits executed by the apply receiver                                                                                                                                                                                                                                                                                                                                                                                                                               |
| TOTAL_ERRORS <sup>1</sup>       | NUMBER       | The total number of errors encountered by the apply receiver                                                                                                                                                                                                                                                                                                                                                                                                                             |

<sup>1</sup> This column is available starting with Oracle Database release 19c, version 19.1.

## 7.251 V\$GG\_APPLY\_SERVER

V\$GG\_APPLY\_SERVER displays information about each GoldenGate apply server and its activities.

An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process used by Oracle GoldenGate Integrated Replicat.

| Column | Datatype | Description                              |
|--------|----------|------------------------------------------|
| SID    | NUMBER   | Session ID of the apply server's session |

| DEP_COMMITSCN          | NUMBER        | Commit system change number (SCN) of the transaction on which this apply server depends                                                                                                                                                                                                                                                                                                                                                         |
| MESSAGE_SEQUENCE       | NUMBER        | Number of the current message being applied by the apply server. This value is reset to 1 at the beginning of each transaction.                                                                                                                                                                                                                                                                                                                 |
| TOTAL_ASSIGNED         | NUMBER        | Total number of transactions assigned to the apply server since the apply process was last started                                                                                                                                                                                                                                                                                                                                              |
| TOTAL_ADMIN            | NUMBER        | Total number of administrative jobs done by the apply server since the apply process was last started. See the <i>STATE</i> information in this view for the types of administrative jobs.                                                                                                                                                                                                                                                      |
| TOTAL_ROLLBACKS        | NUMBER        | Number of transactions assigned to this server which were rolled back                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_MESSAGES_APPLIED | NUMBER        | Total number of messages applied by this apply server since the apply process was last started                                                                                                                                                                                                                                                                                                                                                  |
| APPLY_TIME             | DATE          | Time the last message was applied                                                                                                                                                                                                                                                                                                                                                                                                               |
| ELAPSED_APPLY_TIME     | NUMBER        | Time elapsed (in hundredths of a second) applying messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                             |
| COMMIT_POSITION        | RAW(64)       | Commit position of the transaction. This column is populated only for an apply process that is functioning as a GoldenGate Integrated Replicat.                                                                                                                                                                                                                                                                                                 |
| DEP_COMMIT_POSITION    | RAW(64)       | Commit position of the transaction the slave depends on. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                 |
| LAST_APPLY_POSITION    | RAW(64)       | For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as a GoldenGate outbound server or inbound server.                                                                                                                                                         |
| TRANSACTION_ID         | VARCHAR2(128) | Transaction ID that the slave is applying. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                               |
| DEP_TRANSACTION_ID     | VARCHAR2(128) | Transaction ID of the transaction the slave depends on. This column is populated only for an apply process that is functioning as a GoldenGate inbound server.                                                                                                                                                                                                                                                                                  |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TOTAL_LCRS_RETRIED     | NUMBER        | Total number of LCRs retried by this server                                                                                                                                                                                                                                                                                                                                                                                                     |
| LCR_RETRY_ITERATION    | NUMBER        | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RETRIED     | NUMBER        | Total transactions retried by this server                                                                                                                                                                                                                                                                                                                                                                                                       |
| TXN_RETRY_ITERATION    | NUMBER        | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RECORDED    | NUMBER        | Total transactions recorded in error queue by this server                                                                                                                                                                                                                                                                                                                                                                                       |

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

| CTIME   | NUMBER      | Time since current mode was granted                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID  | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.253 V\$GLOBAL\_TRANSACTION

`V$GLOBAL_TRANSACTION` displays information on the currently active global transactions.

| Column   | Datatype | Description                                             |
|----------|----------|---------------------------------------------------------|
| FORMATID | NUMBER   | Format identifier of the global transaction             |
| GLOBALID | RAW(64)  | Global transaction identifier of the global transaction |
| BRANCHID | RAW(64)  | Branch qualifier of the global transaction              |

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| FLAGS        | NUMBER       | The numeric representation of the state                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| COUPLING     | VARCHAR2(15) | Indicates whether the branches are free (FREE), loosely coupled (LOOSELY COUPLED), or tightly coupled (TIGHTLY COUPLED)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 7.254 V\$GOLDENGATE\_CAPTURE

V\$GOLDENGATE\_CAPTURE displays information about each capture process that sends LCRs to an Oracle GoldenGate outbound server.

| Column       | Datatype      | Description                                                                              |
|--------------|---------------|------------------------------------------------------------------------------------------|
| SID          | NUMBER        | Session identifier of the capture process                                                |
| SERIAL#      | NUMBER        | Session serial number of the capture process session                                     |
| CAPTURE#     | NUMBER        | Capture process number. A capture process is an Oracle background process prefixed by cp |
| CAPTURE_NAME | VARCHAR2(128) | Name of the capture process                                                              |
| LOGMINER_ID  | NUMBER        | Session ID of the Oracle LogMiner session associated with the capture process            |
| STARTUP_TIME | DATE          | Time when the capture process was last started                                           |

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                     | VARCHAR2(589) | <p>State of the capture process and state of the network. The two states are separated by a semicolon. The possible values are:</p> <ul style="list-style-type: none"> <li>INITIALIZING - Starting up.</li> <li>WAITING FOR DICTIONARY REDO - Waiting for redo log files containing the dictionary build related to the first SCN to be added to the capture process session. A capture process cannot begin to scan the redo log files until all of the log files containing the dictionary build have been added.</li> <li>DICTIONARY INITIALIZATION - Processing a dictionary build.</li> <li>MINING (PROCESSED SCN = <i>scn_value</i>) - Mining a dictionary build at the SCN <i>scn_value</i>.</li> <li>LOADING (step <i>X</i> of <i>Y</i>) - Processing information from a dictionary build and currently at step <i>X</i> in a process that involves <i>Y</i> steps, where <i>X</i> and <i>Y</i> are numbers.</li> <li>CAPTURING CHANGES - Scanning the redo log for changes that satisfy the capture process rule sets.</li> <li>WAITING FOR REDO - Waiting for new redo log files to be added to the capture process session. The capture process has finished processing all of the redo log files added to its session. This state is possible if there is no activity at a source database. For a downstream capture process, this state is possible if the capture process is waiting for new log files to be added to its session.</li> <li>EVALUATING RULE - Evaluating a change against a capture process rule set.</li> <li>CREATING LCR - Converting a change into an LCR.</li> <li>ENQUEUEING MESSAGE - Enqueueing an LCR that satisfies the capture process rule sets into the capture process queue.</li> <li>PAUSED FOR FLOW CONTROL - Unable to enqueue LCRs either because of low memory or because propagations and outbound servers are consuming messages slower than the capture process is creating them. This state indicates flow control that is used to reduce spilling of captured LCRs when propagation or apply has fallen behind or is unavailable.</li> <li>WAITING FOR THE BUFFERED QUEUE TO SHRINK - Waiting for the buffered queue to change to a smaller size. The buffered queue shrinks when there is a memory limitation or when an administrator reduces its size.</li> <li>WAITING FOR <i>n</i> SUBSCRIBER(S) INITIALIZING - Waiting for outbound servers that receive LCRs from the capture process to start, where <i>n</i> is the number of apply processes.</li> <li>WAITING FOR TRANSACTION - Waiting for LogMiner to provide more transactions.</li> <li>WAITING FOR INACTIVE DEQUEUEERS - Waiting for the capture process's queue subscribers to start. The capture process stops enqueueing LCRs if there are no active subscribers to the queue.</li> <li>SUSPENDED FOR AUTO SPLIT/MERGE - Waiting for a merge operation to complete.</li> <li>SHUTTING DOWN - Stopping.</li> <li>ABORTING - Aborting.</li> </ul> |
| TOTAL_PREFILTER_DISCARDED | NUMBER        | Total number of prefiltered messages discarded                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Column                        | Datatype     | Description                                                                                                                                                                                                                                                                                                          |

| TOTAL_PREFILTER_KEPT          | NUMBER       | Total number of prefiltered messages kept                                                                                                                                                                                                                                                                            |
| TOTAL_PREFILTER_EVALUATIONS   | NUMBER       | Total number of prefilter evaluations                                                                                                                                                                                                                                                                                |
| TOTAL_MESSAGES_CAPTURED       | NUMBER       | Total number of redo entries passed by LogMiner to the capture process for detailed rule evaluation since the capture process last started. A capture process converts a redo entry into a message and performs detailed rule evaluation on the message when capture process prefiltering cannot discard the change. |
| CAPTURE_TIME                  | DATE         | Time when the most recent message was captured                                                                                                                                                                                                                                                                       |
| CAPTURE_MESSAGE_NUMBER        | NUMBER       | Number of the most recently captured message                                                                                                                                                                                                                                                                         |
| CAPTURE_MESSAGE_CREATE_TIME   | DATE         | Creation time of the most recently captured message                                                                                                                                                                                                                                                                  |
| TOTAL_MESSAGES_CREATED        | NUMBER       | Count associated with ELAPSED_LCR_TIME to calculate rate                                                                                                                                                                                                                                                             |
| TOTAL_FULL_EVALUATIONS        | NUMBER       | Count associated with ELAPSED_RULE_TIME to calculate rate                                                                                                                                                                                                                                                            |
| TOTAL_MESSAGES_ENQUEUED       | NUMBER       | Total number of messages enqueued since the capture process was last started                                                                                                                                                                                                                                         |
| ENQUEUE_TIME                  | DATE         | Time when the last message was enqueued                                                                                                                                                                                                                                                                              |
| ENQUEUE_MESSAGE_NUMBER        | NUMBER       | Number of the last enqueued message                                                                                                                                                                                                                                                                                  |
| ENQUEUE_MESSAGE_CREATE_TIME   | DATE         | Creation time of the last enqueued message                                                                                                                                                                                                                                                                           |
| AVAILABLE_MESSAGE_NUMBER      | NUMBER       | For local capture, the last redo SCN flushed to the log files. For downstream capture, the last SCN added to LogMiner through the archived redo log files.                                                                                                                                                           |
| AVAILABLE_MESSAGE_CREATE_TIME | DATE         | For local capture, the time the SCN was written to the log file. For downstream capture, the time the most recent archived redo log file (containing the most recent SCN) was added to LogMiner.                                                                                                                     |
| ELAPSED_CAPTURE_TIME          | NUMBER       | Elapsed time (in hundredths of a second) scanning for changes in the redo log since the capture process was last started                                                                                                                                                                                             |
| ELAPSED_RULE_TIME             | NUMBER       | Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started                                                                                                                                                                                                                 |
| ELAPSED_ENQUEUE_TIME          | NUMBER       | Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started                                                                                                                                                                                                              |
| ELAPSED_LCR_TIME              | NUMBER       | Elapsed time (in hundredths of a second) creating LCRs since the capture process was last started                                                                                                                                                                                                                    |
| ELAPSED_REDO_WAIT_TIME        | NUMBER       | Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state                                                                                                                                                                                                                  |
| ELAPSED_PAUSE_TIME            | NUMBER       | Elapsed flow control pause time (in hundredths of a second)                                                                                                                                                                                                                                                          |
| STATE_CHANGED_TIME            | DATE         | Time at which the state of the capture process changed                                                                                                                                                                                                                                                               |
| SGA_USED                      | NUMBER       | The total amount of shared memory used (in bytes) by the capture process                                                                                                                                                                                                                                             |
| SGA_ALLOCATED                 | NUMBER       | The total amount of shared memory (in bytes) allocated from the Streams pool for the capture process                                                                                                                                                                                                                 |
| BYTES_OF_REDO_MINED           | VARCHAR2(64) | The total amount of redo data mined (in bytes) since the capture process last started                                                                                                                                                                                                                                |
| SESSION_RESTART_SCN           | VARCHAR2(64) | The SCN from which the capture process started mining redo data when it was last started                                                                                                                                                                                                                             |

| Column                          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                          | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| SPID                            | VARCHAR2(12)  | Operating system process identifier of the capture process                                                                                                                                                                                                                                                                                                                                                                                      |
| EXTRACT_NAME                    | VARCHAR2(128) | Name of the extract process                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SERVER_SID                      | NUMBER        | Session ID of the capture server                                                                                                                                                                                                                                                                                                                                                                                                                |

| ELAPSED_SEND_TIME               | NUMBER        | Time elapsed (in hundredths of a second) sending LCRs to the extract process since the last time the extract process attached to the capture process                                                                                                                                                                                                                                                                                            |
| BYTES_SENT                      | NUMBER        | Total number of bytes sent by the capture process to the extract process since the last time the extract process attached to the capture process                                                                                                                                                                                                                                                                                                |

## 7.255 V\$GOLDENGATE\_MESSAGE\_TRACKING

V\$GOLDENGATE\_MESSAGE\_TRACKING displays information about LCRs tracked through the stream that are processed by Oracle GoldenGate components.

You can track an LCR through a stream using one of the following methods:

- Set the `message_tracking_frequency` apply process parameter to 1 or another relatively low value via the Oracle GoldenGate `DBOPTIONS INTEGRATEDPARAMS` parameter.
- Use the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure to specify a tracking label that becomes part of each LCR generated by the current session.

When the `actions` parameter in the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure is set to `DBMS_XSTREAM_ADM.ACTION_MEMORY`, information about the LCRs is tracked in memory, and this view is populated with information about the LCRs. Currently, `DBMS_XSTREAM_ADM.ACTION_MEMORY` is the only valid setting for the `actions` parameter in the procedure.

| Column                | Datatype                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 7.257 V\$GOLDENGATE\_TABLE\_STATS

V\$GOLDENGATE\_TABLE\_STATS displays table statistics for all the tables used by each Oracle GoldenGate apply server.

| Column                  | Datatype      | Description                                                                                              |
|-------------------------|---------------|----------------------------------------------------------------------------------------------------------|
| APPLY_NAME              | VARCHAR2(128) | Name of the apply process                                                                                |
| SERVER_ID               | NUMBER        | Parallel apply server slave ID                                                                           |
| SOURCE_TABLE_OWNER      | VARCHAR2(128) | Source owner of the captured or replicated table                                                         |
| SOURCE_TABLE_NAME       | VARCHAR2(128) | Source name of the captured or replicated table                                                          |
| DESTINATION_TABLE_OWNER | VARCHAR2(128) | Target owner of the captured or replicated table                                                         |
| DESTINATION_TABLE_NAME  | VARCHAR2(30)  | Target name of the captured or replicated table                                                          |
| LAST_UPDATE             | DATE          | Time of the last update of the statistics                                                                |
| TOTAL_INSERTS           | NUMBER        | Number of insert operations on this table processed by this apply server                                 |
| TOTAL_UPDATES           | NUMBER        | Number of update operations on this table processed by this apply server                                 |
| TOTAL_DELETES           | NUMBER        | Number of delete operations on this table processed by this apply server                                 |
| INSERT_COLLISIONS       | NUMBER        | Number of insert collisions on this table encountered by this apply server                               |
| UPDATE_COLLISIONS       | NUMBER        | Number of update collisions on this table encountered by this apply server                               |
| DELETE_COLLISIONS       | NUMBER        | Number of delete collisions on this table encountered by this apply server                               |
| REPERROR_RECORDS        | NUMBER        | Number of change records that resulted in an error that were recorded on this table by this apply server |
| REPERROR_IGNORES        | NUMBER        | Number of change records that resulted in an error that were ignored on this table by this apply server  |
| WAIT_DEPENDENCIES       | NUMBER        | Number of waits for this table due to dependency                                                         |

| Column                     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CDR_INSERT_ROW_EXISTS      | NUMBER   | Number of conflicts where an insert gets an ORA-00001 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_EXISTS      | NUMBER   | Number of conflicts where an update gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_MISSING     | NUMBER   | Number of conflicts where an update gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_DELETE_ROW_EXISTS      | NUMBER   | Number of conflicts where a delete gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_DELETE_ROW_MISSING     | NUMBER   | Number of conflicts where a delete gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_SUCCESSFUL_RESOLUTIONS | NUMBER   | Number of successfully resolved conflicts                                                                                                                                                                                                                                                                                                                                                                                                       |
| CDR_FAILED_RESOLUTIONS     | NUMBER   | Number of conflicts that could not be resolved due to an error during resolution                                                                                                                                                                                                                                                                                                                                                                |
| LOB_OPERATIONS             | NUMBER   | The number of LOB updates (LOB writes, LOB trims, and LOB erases) applied by the inbound server.                                                                                                                                                                                                                                                                                                                                                |

## 7.258 V\$GOLDENGATE\_TRANSACTION

V\$GOLDENGATE\_TRANSACTION displays information about transactions that are being processed by Oracle GoldenGate capture processes, outbound servers, and inbound servers.

This view can identify long running transactions and display how many LCRs are being processed in each transaction. This view only contains information about captured LCRs. It does not contain information about user-enqueued LCRs or user messages.

This view only shows information about LCRs that are being processed because they satisfied the rule sets for the component at the time of the query. For capture processes, this view only shows information about changes in transactions that the capture process has converted into LCRs. It does not show information about all the active transactions present in the redo log.

For outbound servers, this view only shows information about LCRs that the outbound server has dequeued. It does not show information about LCRs in the outbound server's queue. For outbound servers, information about a transaction remains in the view until the transaction is sent to the Oracle GoldenGate client application.

For inbound servers, information about a transaction remains in the view until the transaction commits or until the entire transaction is rolled back.

| Column         | Datatype      | Description           |
|----------------|---------------|-----------------------|
| COMPONENT_NAME | VARCHAR2(138) | Name of the component |

| Column                   | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_TYPE           | VARCHAR2 ( 20 ) | Type of component <ul style="list-style-type: none"> <li>CAPTURE - Capture process</li> <li>APPLY - Apply reader subcomponent in an outbound server or inbound server</li> <li>PROPAGATION_SENDER - Propagation sender that sends LCRs from a capture process to an outbound server</li> </ul>                                                                                                                   |
| XIDUSN                   | NUMBER          | Transaction ID undo segment number of the transaction                                                                                                                                                                                                                                                                                                                                                            |
| XIDSLT                   | NUMBER          | Transaction ID slot number of the transaction                                                                                                                                                                                                                                                                                                                                                                    |
| XIDSQN                   | NUMBER          | Transaction ID sequence number of the transaction                                                                                                                                                                                                                                                                                                                                                                |
| BATCH_XIDUSN             | NUMBER          | Transaction ID undo segment number of the batch parent transaction.<br><br>When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.<br><br>This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled. |
| BATCH_XIDSLT             | NUMBER          | Transaction ID slot number of the batch parent transaction.<br><br>When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.<br><br>This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled.         |
| BATCH_XIDSQN             | NUMBER          | Transaction ID sequence number of the batch parent transaction.<br><br>When using BATCHSQL mode in Oracle GoldenGate Integrated Replicat the BATCH_XID columns identify the parent transaction of the batch the current transaction belongs to. The parent transaction is the first transaction of each batch.<br><br>This column is populated only if COMPONENT_TYPE is APPLY and BATCHSQL mode is enabled.     |
| CUMULATIVE_MESSAGE_COUNT | NUMBER          | Number of LCRs processed in the transaction. If a component is restarted while the transaction is being processed, then this column shows the number of LCRs processed in the transaction since the component was started.                                                                                                                                                                                       |
| TOTAL_MESSAGE_COUNT      | NUMBER          | Total number of LCRs processed in the transaction by an outbound server or inbound server. This column does not pertain to capture processes.                                                                                                                                                                                                                                                                    |
| FIRST_MESSAGE_TIME       | DATE            | Time stamp of the first LCR processed in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the time stamp of the first LCR processed after the capture process was started.                                                                                                                                                                    |
| FIRST_MESSAGE_NUMBER     | NUMBER          | SCN of the first message in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the SCN of the first message processed after the capture process was started.                                                                                                                                                                                    |
| LAST_MESSAGE_TIME        | DATE            | Time stamp of the last LCR processed in the transaction                                                                                                                                                                                                                                                                                                                                                          |
| LAST_MESSAGE_NUMBER      | NUMBER          | SCN of the most recent message encountered for the transaction                                                                                                                                                                                                                                                                                                                                                   |

| Column                 | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FIRST_MESSAGE_POSITION | RAW(64)       | Position of the first message seen by an XStream inbound server<br>This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.                                                                                                                                                                                                                                                 |
| LAST_MESSAGE_POSITION  | RAW(64)       | Position of the last message seen by an Oracle GoldenGate inbound server<br>This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.                                                                                                                                                                                                                                        |
| TRANSACTION_ID         | VARCHAR2(128) | Transaction ID for an Oracle GoldenGate inbound server<br>This column is populated only for an apply process that is functioning as an Oracle GoldenGate inbound server.                                                                                                                                                                                                                                                          |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 7.259 V\$HANG\_INFO

V\$HANG\_INFO displays information about hangs found on the cluster.

A hang can be an open wait chain or closed wait chain (cycle or deadlock). A wait chain is a series of sessions that are blocking one another. Each row represents a hang and describes how severe the hang is. This view also includes the victim or final blocker of the hang.

| Column               | Datatype     | Description                                                                                                                                        |
|----------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| HANG_ID              | NUMBER       | A number identifying the hang                                                                                                                      |
| HANG_CHAIN_SESSIONS  | NUMBER       | Indicates how many sessions are in the main wait chain of the hang                                                                                 |
| TOTAL_HUNG_SESSIONS  | NUMBER       | Indicates how many total sessions are affected by the hang, including the main wait chain and any wait chains branching off of the main wait chain |
| HANG_TYPE            | VARCHAR2(18) | Is set to <code>Hang</code> if this is an open wait chain or <code>Deadlock</code> if this is a cycle or closed wait chain                         |
| HANG_CREATE_TIME     | VARCHAR2(20) | Date and time that the hang was detected                                                                                                           |
| HANG_RESOLVE_TIME    | VARCHAR2(20) | Time that the hang may be automatically resolved                                                                                                   |
| IGNORED_HANG         | VARCHAR2(1)  | Y - Hang was ignored and will not be automatically resolved at this time<br>N - The hang has not yet been verified                                 |
| RESOLUTION_ATTEMPTED | VARCHAR2(1)  | Y - An attempt was made to resolve the hang<br>N - No attempt was made to resolve the hang                                                         |
| GLOBAL_HANG          | VARCHAR2(1)  | Y - The hang spans multiple nodes in the cluster<br>N - All of the sessions in the hang reside on a single instance                                |

| Column             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESCALATED_HANG     | VARCHAR2(1)  | Y - An attempt was made to resolve the hang but was unsuccessful, and the hang is becoming more severe. Another resolution attempt will be made.<br>N - The first resolution attempt was successful and it was not necessary to escalate the hang to a higher resolution level.                                                                                                                                                                 |
| RESOLUTION_STATUS  | VARCHAR2(45) | Contains the reason why the hang was resolved or ignored                                                                                                                                                                                                                                                                                                                                                                                        |
| VICTIM_INSTANCE    | NUMBER       | Instance number of the instance on which the victim or final blocker session resides                                                                                                                                                                                                                                                                                                                                                            |
| VICTIM_SESSION_ID  | NUMBER       | Victim or final blocker's Oracle session ID                                                                                                                                                                                                                                                                                                                                                                                                     |
| VICTIM_SERIAL#     | NUMBER       | Victim or final blocker's Oracle session serial number                                                                                                                                                                                                                                                                                                                                                                                          |
| VICTIM_OSPID       | VARCHAR2(24) | Victim or final blocker's operating system process ID                                                                                                                                                                                                                                                                                                                                                                                           |
| FATAL_BACKGROUND   | VARCHAR2(1)  | Y - Victim or final blocker is a critical background process<br>N - Victim or final blocker is not a critical background process                                                                                                                                                                                                                                                                                                                |
| PNAME              | VARCHAR2(5)  | Name of the victim or final blocker process                                                                                                                                                                                                                                                                                                                                                                                                     |
| WAIT_EVENT_TEXT    | VARCHAR2(64) | Resource or event for which the victim or final blocker is waiting; set to <code>not in a wait</code> if the session is not waiting on a resource                                                                                                                                                                                                                                                                                               |

## 7.260 V\$HANG\_SESSION\_INFO

V\$HANG\_SESSION\_INFO displays information about sessions involved in hangs described by V\$HANG\_INFO.

Each row with the same HANG\_ID describes a session that is in the hang wait chain described by the row with the same HANG\_ID in V\$HANG\_INFO. This session is blocked by the victim or final blocker of that hang.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HANG_ID          | NUMBER       | A number identifying the hang including this session. This column can be used to join V\$HANG_INFO with V\$HANG_SESSION_INFO.                                                                                                                                                                                                                                                                                                     |

## 7.262 V\$HEAT\_MAP\_SEGMENT

V\$HEAT\_MAP\_SEGMENT displays real-time segment access information.

| Column          | Datatype      | Description                                                           |
|-----------------|---------------|-----------------------------------------------------------------------|
| OBJECT_NAME     | VARCHAR2(128) | Name of the object                                                    |
| SUBOBJECT_NAME  | VARCHAR2(128) | Name of the subobject                                                 |
| OBJ#            | NUMBER        | Object number                                                         |
| DATAOBJ#        | NUMBER        | Data object number                                                    |
| TS#             | NUMBER        | ID of the tablespace containing the segment whose heat map is tracked |
| TRACK_TIME      | DATE          | Timestamp of current activity tracking                                |
| SEGMENT_WRITE   | VARCHAR2(3)   | Indicates whether the segment has write access: (YES or NO)           |
| SEGMENT_READ    | VARCHAR2(3)   | Indicates whether the segment has read access: (YES or NO)            |
| FULL_SCAN       | VARCHAR2(3)   | Indicates whether the segment has full table scan: (YES or NO)        |
| LOOKUP_SCAN     | VARCHAR2(3)   | Indicates whether the segment has lookup scan: (YES or NO)            |
| N_SEGMENT_WRITE | NUMBER        | Number of segment writes                                              |
| N_FULL_SCAN     | NUMBER        | Number of table scans                                                 |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| N_LOOKUP_SCAN | NUMBER   | Number of lookup scans                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| INTERNAL_CHECK  | VARCHAR2(1)    | Internal check                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| OFFLINE_CAPABLE | VARCHAR2(1)    | Ability to run when database is not open yet (Y or N)                                                                                                                                                                                                                                                                                                                                                                                           |
| DESCRIPTION     | VARCHAR2(1024) | Description of what the check does                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID          | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.264 V\$HM\_CHECK\_PARAM

V\$HM\_CHECK\_PARAM displays information about the input parameters of all Health Monitor checks.

| Column        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID            | NUMBER         | Parameter ID                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| NAME          | VARCHAR2(64)   | Parameter name                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CHECK_ID      | NUMBER         | ID of the check to which this parameter belongs                                                                                                                                                                                                                                                                                                                                                                                                       |

## 7.265 V\$HM\_FINDING

V\$HM\_FINDING displays information about all the findings of various Health Monitor runs.

| Column        | Datatype     | Description                                                                      |
|---------------|--------------|----------------------------------------------------------------------------------|
| FINDING_ID    | NUMBER       | Unique ID to represent the finding                                               |
| RUN_ID        | NUMBER       | ID of the run that created this finding                                          |
| NAME          | VARCHAR2(32) | Name of the finding                                                              |
| PARENT_ID     | NUMBER       | Parent finding ID for this finding                                               |
| CHILD_COUNT   | NUMBER       | Number of active (open) child findings, if this finding is a parent finding type |
| CLASS_NAME    | VARCHAR2(32) | Name of the class to which this finding belongs                                  |
| TIME_DETECTED | TIMESTAMP(6) | Time this finding was detected                                                   |
| MODIFIED      | TIMESTAMP(6) | Time that this finding was last modified                                         |

| Column             | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRIORITY           | VARCHAR2(8)    | Priority of the finding: <ul style="list-style-type: none"> <li>• LOW,</li> <li>• HIGH</li> <li>• CRITICAL</li> </ul>                                                                                                                                                                                                                                                                                                                                 |
| STATUS             | VARCHAR2(12)   | Status of the finding: <ul style="list-style-type: none"> <li>• OPEN</li> <li>• CLOSED</li> </ul>                                                                                                                                                                                                                                                                                                                                                     |
| TYPE               | VARCHAR2(13)   | Type of the finding: <ul style="list-style-type: none"> <li>• INFORMATIONAL</li> <li>• FAILURE</li> </ul>                                                                                                                                                                                                                                                                                                                                             |

| CON_ID             | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.266 V\$HM\_INFO

V\$HM\_INFO displays information about Health Monitor runs, findings, and recommendations.

The information for a run/finding/recommendation is organized as a name, value pair.

If the type of information is RUN, then the data represents the input parameters for that run. If the type of information is FINDING or RECOMMENDATION, then the data represents the information about that particular finding/recommendation.

| Column | Datatype      | Description                                                                                                                                         |
|--------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| ID     | NUMBER        | Unique identifier of the information                                                                                                                |
| TYPE   | VARCHAR2(14)  | Type of the information: <ul style="list-style-type: none"> <li>• RUN</li> <li>• RUN-RESUME</li> <li>• FINDING</li> <li>• RECOMMENDATION</li> </ul> |
| NAME   | VARCHAR2(32)  | Information parameter name                                                                                                                          |
| VALUE  | VARCHAR2(513) | Information parameter value                                                                                                                         |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.267 V\$HM\_RECOMMENDATION

V\$HM\_RECOMMENDATION displays information about all the recommendations made to various Health Monitor findings.

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECOMMENDATION_ID | NUMBER         | Unique ID to represent the recommendation                                                                                                                                                                                                                                                                                                                                                                                                       |
| FDG_ID            | NUMBER         | Unique ID to represent either the finding ID or the finding set ID for which the recommendation was made                                                                                                                                                                                                                                                                                                                                        |
| RUN_ID            | NUMBER         | ID of the run that may have generated the recommendation<br>If the ID is 0, then the recommendations were generated by RMAN.                                                                                                                                                                                                                                                                                                                    |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.268 V\$HM\_RUN

V\$HM\_RUN displays information about all Health Monitor checks and their status.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RUN_ID           | NUMBER       | Unique ID to represent the run                                                                                                                                                                                                                                                                                                                                                                                                                  |
| NAME             | VARCHAR2(32) | Unique name used to identify the run                                                                                                                                                                                                                                                                                                                                                                                                            |
| CHECK_NAME       | VARCHAR2(32) | Name of the check                                                                                                                                                                                                                                                                                                                                                                                                                               |
| RUN_MODE         | VARCHAR2(8)  | Mode of the run: <ul style="list-style-type: none"> <li>MANUAL</li> <li>REACTIVE</li> <li>AUTO</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| TIMEOUT          | NUMBER       | Number of seconds allowed for this run to complete before it is aborted                                                                                                                                                                                                                                                                                                                                                                         |
| START_TIME       | TIMESTAMP(6) | Start time of the run                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LAST_RESUME_TIME | TIMESTAMP(6) | Last resumed time for the run                                                                                                                                                                                                                                                                                                                                                                                                                   |
| END_TIME         | TIMESTAMP(6) | End time of the run                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MODIFIED_TIME    | TIMESTAMP(6) | Last modified time of the run record                                                                                                                                                                                                                                                                                                                                                                                                            |
| STATUS           | VARCHAR2(11) | Status of the run: <ul style="list-style-type: none"> <li>INITIAL</li> <li>EXECUTING</li> <li>INTERRUPTED</li> <li>TIMEDOUT</li> <li>CANCELLED</li> <li>COMPLETED</li> <li>ERROR</li> </ul>                                                                                                                                                                                                                                                     |
| SRC_INCIDENT     | NUMBER       | Source incident ID that activated this run                                                                                                                                                                                                                                                                                                                                                                                                      |
| NUM_INCIDENT     | NUMBER       | Number of incidents created by this run                                                                                                                                                                                                                                                                                                                                                                                                         |
| ERROR_NUMBER     | NUMBER       | Error number if the run failed to complete because of an error                                                                                                                                                                                                                                                                                                                                                                                  |
| PROBLEM_ID       | NUMBER       | Problem ID of the source incident ID that may have activated this Run                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.269 V\$HS\_AGENT

V\$HS\_AGENT displays the set of HS agents currently running on a given host. There is one row per agent process.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AGENT_ID     | NUMBER        | Oracle Net session identifier used for connections to the agent (the identifier used in the LISTENER.ORA file)                                                                                                                                                                                                                                                                                                                                  |
| MACHINE      | VARCHAR2(64)  | Operating system machine name                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PROCESS      | VARCHAR2(9)   | Operating system process identifier of the agent                                                                                                                                                                                                                                                                                                                                                                                                |

| STARTTIME    | DATE          | Starting time                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| AGENT_TYPE   | NUMBER        | Type of the agent                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FDS_CLASS_ID | NUMBER        | ID of the Foreign Data Store class                                                                                                                                                                                                                                                                                                                                                                                                              |
| FDS_INST_ID  | NUMBER        | Instance name of the Foreign Data Store                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.270 V\$HS\_PARAMETER

V\$HS\_PARAMETER describes the initialization parameters in use by the server and agent.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HS_SESSION_ID | NUMBER        | Unique HS session identifier (maps to the HS_SESSION_ID column of V\$HS_SESSION)                                                                                                                                                                                                                                                                                                                                                                |
| PARAMETER     | VARCHAR2(128) | Name of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                           |
| VALUE         | VARCHAR2(64)  | Value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SOURCE        | VARCHAR2(1)   | Indicates whether the parameter was defined in the agent (A) or server (S)                                                                                                                                                                                                                                                                                                                                                                      |
| ENV           | VARCHAR2(1)   | Indicates whether the parameter was set as an environment variable in the agent (T) or elsewhere (F)                                                                                                                                                                                                                                                                                                                                            |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.271 V\$HS\_SESSION

V\$HS\_SESSION describes the current HS session.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HS_SESSION_ID | NUMBER        | Unique HS session identifier                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AGENT_ID      | NUMBER        | Oracle Net session identifier used for connections to the agent (maps to the AGENT_ID column of V\$HS_AGENT)                                                                                                                                                                                                                                                                                                                                    |
| SID           | NUMBER        | User session identifier (maps to the SID column of V\$SESSION)                                                                                                                                                                                                                                                                                                                                                                                  |
| DB_LINK       | VARCHAR2(128) | Server database link name used to access the agent; blank if no database link is used (for example, when using external procedures)                                                                                                                                                                                                                                                                                                             |
| DB_LINK_OWNER | NUMBER        | Owner of the database link in DB_LINK                                                                                                                                                                                                                                                                                                                                                                                                           |
| STARTTIME     | DATE          | Time the connection was initiated                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 7.272 V\$HVMASTER\_INFO

V\$HVMASTER\_INFO describes the current and previous master instances and the number of re-masterings of Global Enqueue Service resources.

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HV_ID           | NUMBER   | Hash value ID                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CURRENT_MASTER  | NUMBER   | Master instance of this hash value ID                                                                                                                                                                                                                                                                                                                                                                                                           |
| PREVIOUS_MASTER | NUMBER   | Previous master instance of this hash value ID                                                                                                                                                                                                                                                                                                                                                                                                  |
| REMASTER_CNT    | NUMBER   | Number of times this has been remastered                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## Dynamic Performance (V\$) Views: V\$IM\_COLUMN\_LEVEL to V\$RULE\_SET\_AGGREGATE\_STATS

This chapter contains the dynamic performance views V\$IM\_COLUMN\_LEVEL to V\$RULE\_SET\_AGGREGATE\_STATS.

### 8.1 V\$IM\_COLUMN\_LEVEL

V\$IM\_COLUMN\_LEVEL presents the selective column compression levels that are defined using the `inmemory_memcompress` clause of the `inmemory_column_clause` of the `CREATE TABLE` statement.

This view returns no rows for a table which has no associated selective column compression levels.

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| INST_ID              | NUMBER       | Instance ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| OWNER                | VARCHAR2(31) | Username of the table owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| OBJ_NUM              | NUMBER       | Table object number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TABLE_NAME           | VARCHAR2(31) | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SEGMENT_COLUMN_ID    | NUMBER       | Segment column number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| COLUMN_NAME          | VARCHAR2(31) | Column name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| INMEMORY_COMPRESSION | VARCHAR2(26) | Column compression level. Possible values: <ul style="list-style-type: none"><li>• <b>DEFAULT</b>: This value appears for physical columns of a table that do not have a selective column clause. It also appears when a virtual column has been explicitly enabled for in-memory storage using <code>ALTER TABLE table-name INMEMORY(VC)</code>.</li><li>• <b>UNSPECIFIED</b>: This value appears for virtual columns of a table that do not have a selective column clause.</li></ul> If the <code>INMEMORY_VIRTUAL_COLUMNS</code> initialization parameter is set to <code>MANUAL</code> , a virtual column with a <code>DEFAULT INMEMORY_COMPRESSION</code> clause will be materialized while a virtual column with an <code>UNSPECIFIED</code> value will not be. |
| CON_ID               | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul>                                                                                                                                                                                                                                                                                     |

 **Note:**

The SYS\_IME hidden virtual columns automatically added by the In-Memory Expression (IME) infrastructure will not be shown in this view.

## 8.2 V\$IM\_SEGMENTS

V\$IM\_SEGMENTS presents information about all the in-memory segments in the database.

Only segments that have an in-memory representation are displayed. If a segment is marked for the In-Memory Column Store (IM column store) but is not populated, no corresponding row for that segment is displayed in this view.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                |
|---------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER               | VARCHAR2(128) | User name of the segment owner                                                                                                                                                                                                                                                             |
| SEGMENT_NAME        | VARCHAR2(128) | Name of the segment, if any                                                                                                                                                                                                                                                                |
| PARTITION_NAME      | VARCHAR2(128) | Object partition name (set to NULL for non-partitioned objects)                                                                                                                                                                                                                            |
| SEGMENT_TYPE        | VARCHAR2(18)  | Type of segment: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• TABLE PARTITION</li> <li>• TABLE SUBPARTION</li> </ul>                                                                                                                                                          |
| TABLESPACE_NAME     | VARCHAR2(30)  | Name of the tablespace containing the segment                                                                                                                                                                                                                                              |
| INMEMORY_SIZE       | NUMBER        | Size of the in-memory version of the segment, in bytes                                                                                                                                                                                                                                     |
| BYTES               | NUMBER        | Number of on-disk data bytes for the segment that could be represented in memory (no space metadata blocks)                                                                                                                                                                                |
| BYTES_NOT_POPULATED | NUMBER        | Size of the portion of the on-disk segment that is not populated in memory, in bytes.                                                                                                                                                                                                      |
| POPULATE_STATUS     | VARCHAR2(9)   | Status of segment population: <ul style="list-style-type: none"> <li>• STARTED: Indicates that a segment populate task is started</li> <li>• COMPLETED: Indicates that no segment populate task is pending</li> <li>• FAILED: Indicates that a segment populate task has failed</li> </ul> |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INMEMORY_PRIORITY     | VARCHAR2(8)   | Indicates the priority for IM column store population: <ul style="list-style-type: none"> <li>LOW</li> <li>MEDIUM</li> <li>HIGH</li> <li>CRITICAL</li> <li>NONE</li> </ul>                                                                                                                                                                                                                                                                                                       |
| INMEMORY_DISTRIBUTE   | VARCHAR2(15)  | Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> <li>AUTO</li> <li>BY ROWID RANGE</li> <li>BY PARTITION</li> <li>BY SUBPARTITION</li> </ul>                                                                                                                                                                                                                                  |
| INMEMORY_DUPLICATE    | VARCHAR2(13)  | Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none"> <li>NO DUPLICATE</li> <li>DUPLICATE</li> <li>DUPLICATE ALL</li> </ul>                                                                                                                                                                                                                                                                                   |
| INMEMORY_COMPRESSION  | VARCHAR2(17)  | Compression level for the IM column store: <ul style="list-style-type: none"> <li>NO MEMCOMPRESS</li> <li>FOR DML</li> <li>FOR QUERY [ LOW   HIGH ]</li> <li>FOR CAPACITY [ LOW   HIGH ]</li> </ul>                                                                                                                                                                                                                                                                              |
| INMEMORY_SERVICE      | VARCHAR2(12)  | Specifies how the IM-enabled table is populated on various instances: <ul style="list-style-type: none"> <li>DEFAULT: Pre-Oracle Database 12c Release 2 (12.2.0.1) behavior</li> <li>NONE: Do not populate on any instance</li> <li>ALL: Populate on all instances</li> <li>USER_DEFINED: Populate only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the INMEMORY_SERVICE_NAME column.</li> </ul>         |
| INMEMORY_SERVICE_NAME | VARCHAR2(129) | Specifies the service name on which the IM-enabled table should be populated. This column has a value only when the corresponding INMEMORY_SERVICE column has a value of USER_DEFINED.                                                                                                                                                                                                                                                                                           |
| IS_EXTERNAL           | VARCHAR2(5)   | Indicates whether the IM segment is for an external table. Possible values: <ul style="list-style-type: none"> <li>TRUE: The IM segment is for an external table.</li> <li>FALSE: The IM segment is not for an external table.</li> </ul>                                                                                                                                                                                                                                        |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.3 V\$IM\_USER\_SEGMENTS

V\$IM\_USER\_SEGMENTS presents information about the in-memory segments for the current user in the database.

Only segments that have an in-memory representation are displayed. If a segment is marked for the In-Memory Column Store (IM column store) but is not populated, no corresponding row for that segment is displayed in this view.

| Column              | Datatype      | Description                                                                                                                                                                                                                                             |
|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEGMENT_NAME        | VARCHAR2(128) | Name of the segment, if any                                                                                                                                                                                                                             |
| PARTITION_NAME      | VARCHAR2(128) | Object partition name (set to NULL for non-partitioned objects)                                                                                                                                                                                         |
| SEGMENT_TYPE        | VARCHAR2(18)  | Type of segment: <ul style="list-style-type: none"> <li>• TABLE</li> <li>• TABLE PARTITION</li> <li>• TABLE SUBPARTION</li> </ul>                                                                                                                       |
| TABLESPACE_NAME     | VARCHAR2(30)  | Name of the tablespace containing the segment                                                                                                                                                                                                           |
| INMEMORY_SIZE       | NUMBER        | Size of the in-memory version of the segment, in bytes                                                                                                                                                                                                  |
| BYTES               | NUMBER        | Total size of the on-disk segment, in bytes                                                                                                                                                                                                             |
| BYTES_NOT_POPULATED | NUMBER        | Size of the portion of the on-disk segment that is not populated in memory, in bytes                                                                                                                                                                    |
| POPULATE_STATUS     | VARCHAR2(9)   | Status of segment population: <ul style="list-style-type: none"> <li>• STARTED</li> <li>• COMPLETED</li> <li>• FAILED</li> </ul>                                                                                                                        |
| INMEMORY_PRIORITY   | VARCHAR2(8)   | Indicates the priority for IM column store population: <ul style="list-style-type: none"> <li>• LOW</li> <li>• MEDIUM</li> <li>• HIGH</li> <li>• CRITICAL</li> <li>• NONE</li> </ul>                                                                    |
| INMEMORY_DISTRIBUTE | VARCHAR2(15)  | Indicates how the IM column store is distributed in an Oracle Real Application Clusters (Oracle RAC) environment: <ul style="list-style-type: none"> <li>• AUTO</li> <li>• BY ROWID RANGE</li> <li>• BY PARTITION</li> <li>• BY SUBPARTITION</li> </ul> |

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INMEMORY_DUPLICATE    | VARCHAR2(13)  | Indicates the duplicate setting for the IM column store in an Oracle RAC environment: <ul style="list-style-type: none"><li>• NO DUPLICATE</li><li>• DUPLICATE</li><li>• DUPLICATE ALL</li></ul>                                                                                                                                                                                                                                                                                   |
| INMEMORY_COMPRESSION  | VARCHAR2(17)  | Compression level for the IM column store: <ul style="list-style-type: none"><li>• NO MEMCOMPRESS</li><li>• FOR DML</li><li>• FOR QUERY [ LOW   HIGH ]</li><li>• FOR CAPACITY [ LOW   HIGH ]</li></ul>                                                                                                                                                                                                                                                                             |
| INMEMORY_SERVICE      | VARCHAR2(12)  | Specifies how the IM-enabled table is populated on various instances: <ul style="list-style-type: none"><li>• DEFAULT: Pre-Oracle Database 12c Release 2 (12.2.0.1) behavior</li><li>• NONE: Do not populate on any instance</li><li>• ALL: Populate on all instances</li><li>• USER_DEFINED: Populate only on the instances on which the user-specified service is active. The service name corresponding to this is stored in the INMEMORY_SERVICE_NAME column.</li></ul>        |
| INMEMORY_SERVICE_NAME | VARCHAR2(129) | Specifies the service name on which the IM-enabled table should be populated. This column has a value only when the corresponding INMEMORY_SERVICE column has a value of USER_DEFINED.                                                                                                                                                                                                                                                                                             |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"><li>• 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li><li>• 1: This value is used for rows containing data that pertain to only the root</li><li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li></ul> |

## 8.4 V\$INDEX\_USAGE\_INFO

V\$INDEX\_USAGE\_INFO keeps track of index usage since the last flush. A flush occurs every 15 minutes. After each flush, ACTIVE\_ELEM\_COUNT is reset to 0 and LAST\_FLUSH\_TIME is updated to the current time.

| Column                      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INDEX_STATS_ENABLED         | NUMBER        | Indicates whether the index usage statistics are enabled. Possible values: <ul style="list-style-type: none"> <li>0: Index statistics are disabled</li> <li>1: Index statistics are enabled</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| INDEX_STATS_COLLECTION_TYPE | NUMBER        | Indicates the type of collection used for the index usage statistics. Possible values: <ul style="list-style-type: none"> <li>0: Indicates the ALL collection type. With this type of collection, the statistics are collected for each execution that has index access. Selecting this statistics collection type may have some impact on performance.</li> <li>1: Indicates the SAMPLED collection type. With this type of collection, the statistics are collected based on sampling (only a few of the executions are considered when collecting the statistics). This is the default statistics collection type. Index statistics collected with the SAMPLED collection type are less accurate than index statistics collected with the ALL collection type.</li> </ul> |
| ACTIVE_ELEM_COUNT           | NUMBER        | The number of active indexes since the last flush                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ALLOC_ELEM_COUNT            | NUMBER        | The number of index entries allocated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_ELEM_COUNT              | NUMBER        | The maximum number of active indexes that can be tracked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| FLUSH_COUNT                 | NUMBER        | Number of successful flushes since the database started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TOTAL_FLUSH_DURATION        | NUMBER        | Cumulative elapsed time taken to complete the index usage statistics flush since the database start                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LAST_FLUSH_TIME             | TIMESTAMP(3)  | The time of the last flush                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATUS_MSG                  | VARCHAR2(256) | Status messages, if any. Flush errors are reported here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This row is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                |

## 8.5 V\$INDEXED\_FIXED\_COLUMN

V\$INDEXED\_FIXED\_COLUMN displays the columns in dynamic performance tables that are indexed (x\$ tables).

The x\$ tables can change without notice. Use this view only to write queries against fixed views (v\$ views) more efficiently.

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TABLE_NAME      | VARCHAR2(128) | Name of the dynamic performance table that is indexed                                                                                                                                                                                                                                                                                                                                                                                                                            |
| INDEX_NUMBER    | NUMBER        | Number that distinguishes to which index a column belongs                                                                                                                                                                                                                                                                                                                                                                                                                        |
| COLUMN_NAME     | VARCHAR2(128) | Name of the column that is being indexed                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| COLUMN_POSITION | NUMBER        | Position of the column in the index key (this is mostly relevant for multicolumn indexes)                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID          | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.6 V\$INMEMORY\_AREA

V\$INMEMORY\_AREA contains information on the space allocation inside the In-Memory area.

The In-Memory area is sub-divided into two pools: a 1MB pool used to store the actual column formatted data populated into memory, and a 64K pool used to store metadata about the objects that are populated into the In-Memory Column Store (IM column store). The amount of available memory in each pool is visible in the V\$INMEMORY\_AREA view. The relative size of the two pools is determined by internal heuristics. The majority of the In-Memory area memory is allocated to the 1MB pool.

| Column          | Datatype     | Description                                                                                                    |
|-----------------|--------------|----------------------------------------------------------------------------------------------------------------|
| POOL            | VARCHAR2(26) | Name of the pools in the In-Memory area                                                                        |
| ALLOC_BYTES     | NUMBER       | Total amount of memory allocated to this pool                                                                  |
| USED_BYTES      | NUMBER       | Amount of memory currently used in this pool                                                                   |
| POPULATE_STATUS | VARCHAR2(26) | Shows the status of the IM column store, for example, whether it is currently being populated or if it is done |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.7 V\$INMEMORY\_FASTSTART\_AREA

V\$INMEMORY\_FASTSTART\_AREA provides information about the In-Memory FastStart (IM FastStart) area.

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID          | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TABLESPACE_NAME | VARCHAR2(128) | IM FastStart tablespace name. When IM FastStart is not enabled, the value of TABLESPACE_NAME is INVALID_TABLESPACE and the value of STATUS is DISABLE.                                                                                                                                                                                                                                                                                                                           |

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS               | VARCHAR2(10) | IM FastStart status. Possible values include: <ul style="list-style-type: none"> <li>ENABLE: An IM FastStart tablespace has been specified and the content of the IM column is being periodically checkpointed to disk.</li> <li>ENABLING: An IM FastStart tablespace has been specified and the database is creating the IM FastStart area.</li> <li>DISABLE: An IM FastStart tablespace has not been specified. This is the default.</li> <li>MIGRATING: A user has requested the IM FastStart area be migrated from one tablespace to another.</li> <li>DISABLING: A user has requested IM FastStart to be disabled.</li> </ul> |
| ALLOCATED_SIZE       | NUMBER       | The allocated size of an IM FastStart tablespace in bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| USED_SIZE            | NUMBER       | The currently used size of an IM FastStart area (in bytes) within the tablespace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LAST_CHECKPOINT_TIME | TIMESTAMP(6) | The time when the last IMCU was checkpointed to the IM FastStart area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| LAST_POPULATE_TIME   | TIMESTAMP(6) | The time of the last population from the IM FastStart area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NUM_DEFERRED_WRITES  | NUMBER       | The number of pending deferred writes to the IM FastStart area                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 8.8 V\$INSTANCE

V\$INSTANCE displays the state of the current instance.

| Column          | Datatype     | Description                                                                                                                                                                                                                                                                                             |
|-----------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE_NUMBER | NUMBER       | Instance number used for instance registration (corresponds to the INSTANCE_NUMBER initialization parameter)<br><b>See Also:</b> "INSTANCE_NUMBER"                                                                                                                                                      |
| INSTANCE_NAME   | VARCHAR2(16) | Name of the instance                                                                                                                                                                                                                                                                                    |
| HOST_NAME       | VARCHAR2(64) | Name of the host machine                                                                                                                                                                                                                                                                                |
| VERSION         | VARCHAR2(17) | Database version                                                                                                                                                                                                                                                                                        |
| VERSION_LEGACY  | VARCHAR2(17) | The legacy database version used before Oracle Database 18c. This column displays the same value as the VERSION column                                                                                                                                                                                  |
| VERSION_FULL    | VARCHAR2(17) | The version string with the new Oracle Database version scheme introduced in Oracle Database 18c.                                                                                                                                                                                                       |
| STARTUP_TIME    | DATE         | Time when the instance was started                                                                                                                                                                                                                                                                      |
| STATUS          | VARCHAR2(12) | Status of the instance: <ul style="list-style-type: none"> <li>STARTED - After STARTUP NOMOUNT</li> <li>MOUNTED - After STARTUP MOUNT or ALTER DATABASE CLOSE</li> <li>OPEN - After STARTUP or ALTER DATABASE OPEN</li> <li>OPEN MIGRATE - After ALTER DATABASE OPEN { UPGRADE   DOWNGRADE }</li> </ul> |
| PARALLEL        | VARCHAR2(3)  | Indicates whether the instance is mounted in cluster database mode (YES) or not (NO)                                                                                                                                                                                                                    |
| THREAD#         | NUMBER       | Redo thread opened by the instance                                                                                                                                                                                                                                                                      |

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARCHIVER         | VARCHAR2(7)  | Automatic archiving status: <ul style="list-style-type: none"> <li>• STOPPED</li> <li>• STARTED</li> <li>• FAILED - Archiver failed to archive a log last time but will try again within 5 minutes</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LOG_SWITCH_WAIT  | VARCHAR2(15) | Event that log switching is waiting for: <ul style="list-style-type: none"> <li>• ARCHIVE LOG</li> <li>• CLEAR LOG</li> <li>• CHECKPOINT</li> <li>• NULL - ALTER SYSTEM SWITCH LOGFILE is hung but there is room in the current online redo log</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LOGINS           | VARCHAR2(10) | Indicates whether the instance is in unrestricted mode, allowing logins by all users (ALLOWED), or in restricted mode, allowing logins by database administrators only (RESTRICTED)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SHUTDOWN_PENDING | VARCHAR2(3)  | Indicates whether a shutdown is pending (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DATABASE_STATUS  | VARCHAR2(17) | Status of the database: <ul style="list-style-type: none"> <li>• ACTIVE</li> <li>• SUSPENDED</li> <li>• INSTANCE RECOVERY</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INSTANCE_ROLE    | VARCHAR2(18) | Indicates whether the instance is an active instance (PRIMARY_INSTANCE) or an inactive secondary instance (SECONDARY_INSTANCE), or UNKNOWN if the instance has been started but not mounted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ACTIVE_STATE     | VARCHAR2(9)  | Quiesce state of the instance: <ul style="list-style-type: none"> <li>• NORMAL - Database is in a normal state.</li> <li>• QUIESCING - ALTER SYSTEM QUIESCE RESTRICTED has been issued: no new user transactions, queries, or PL/SQL statements are processed in this instance. User transactions, queries, or PL/SQL statements issued before the ALTER SYSTEM QUIESCE RESTRICTED statement are unaffected. DBA transactions, queries, or PL/SQL statements are also unaffected.</li> <li>• QUIESCED - ALTER SYSTEM QUIESCE RESTRICTED has been issued: no user transactions, queries, or PL/SQL statements are processed. DBA transactions, queries, or PL/SQL statements are unaffected. User transactions, queries, or PL/SQL statements issued after the ALTER SYSTEM QUIESCE RESTRICTED statement are not processed.</li> </ul> <p>A single ALTER SYSTEM QUIESCE RESTRICTED statement quiesces all instances in an Oracle RAC environment. After this statement has been issued, some instances may enter into a quiesced state before other instances; the system is quiesced when all instances enter the quiesced state.</p> |
| BLOCKED          | VARCHAR2(3)  | Indicates whether all services are blocked (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                        |
| INSTANCE_MODE | VARCHAR2(11) | Shows the instance mode of the current instance.<br>Possible values: <ul style="list-style-type: none"> <li>REGULAR: A regular Oracle RAC instance. This value is also always used for any non-Oracle RAC instance.</li> <li>READ MOSTLY: An Oracle RAC instance that performs very few database writes</li> <li>READ ONLY: A read-only Oracle RAC instance</li> </ul>                                                                                                                                                                                                                                                                                                 |
| EDITION       | VARCHAR2(7)  | The edition of the database.<br>Possible values include: <ul style="list-style-type: none"> <li>CORE EE: CORE Enterprise Edition</li> <li>EE: Enterprise Edition</li> <li>PO: Personal Edition</li> <li>XE: Express Edition</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| FAMILY        | VARCHAR2(80) | For internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DATABASE_TYPE | VARCHAR2(15) | Database type: <ul style="list-style-type: none"> <li>RAC: If the database is a regular Oracle RAC database which may have multiple instances.</li> <li>RACONENODE: If the database is Oracle RAC, but allows only one instance to run at any time - the RAC One Node mode.</li> <li>SINGLE: If the database is running as a single instance.</li> <li>UNKNOWN: If the database's type can't be determined. This might happen when the database is registered as a DB resource with CRS but the CRS service has failed to return valid database type information. Typically, this indicates that either the CRS service is down or it is in a faulty state.</li> </ul> |

## 8.9 V\$INSTANCE\_CACHE\_TRANSFER

V\$INSTANCE\_CACHE\_TRANSFER displays statistics for the cache blocks transferred among instances.

Oracle keeps multiple versions of data buffered in the buffer cache. The current buffer (or block), CURRENT\_BLOCK, is the most up-to-date copy, containing all recent modifications. A consistent read buffer (or block), CR\_BLOCK, contains the version of the data at a particular time prior to the current buffer. It is read-consistent (that is, all the data shown in that buffer are consistent for the start time of a query).

Therefore, for the same data block there can be multiple copies in the buffer cache: one current copy, and one or more consistent read copies with data consistent as of different snapshot times.

| Column                 | Datatype     | Description                                                                                                                                                        |
|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE               | NUMBER       | Instance from which the blocks are transferred                                                                                                                     |
| CLASS                  | VARCHAR2(18) | Class of the cache block                                                                                                                                           |
| LOST                   | NUMBER       | The number of blocks that were sent by a particular instance but that never arrived in this instance                                                               |
| LOST_TIME              | NUMBER       | The time waited for blocks that were sent by a particular instance but that never arrived in this instance                                                         |
| CR_BLOCK               | NUMBER       | CR Block transfers not affected by remote processing delays                                                                                                        |
| CR_BLOCK_TIME          | NUMBER       | Total time waited for CR blocks from a particular instance (includes the other times)                                                                              |
| CR_2HOP                | NUMBER       | The count of CR blocks which were received by this instance from a particular instance after a 2-way round-trip                                                    |
| CR_2HOP_TIME           | NUMBER       | The time waited for CR blocks which were received by this instance from a particular instance after a 2-way round-trip                                             |
| CR_3HOP                | NUMBER       | The count of CR blocks which were received by this instance from a particular instance after a 3-way round-trip                                                    |
| CR_3HOP_TIME           | NUMBER       | The time waited for CR blocks which were received by this instance from a particular instance after a 3-way round-trip                                             |
| CR_BUSY                | NUMBER       | CR Block transfers affected by remote contention                                                                                                                   |
| CR_BUSY_TIME           | NUMBER       | The time waited for CR blocks which were received by this instance from a particular instance and which were delayed by a log flushed on the sending instance      |
| CR_CONGESTED           | NUMBER       | CR Block transfers affected by remote system load                                                                                                                  |
| CR_CONGESTED_TIME      | NUMBER       | The time waited for CR blocks which were received by this instance from a particular instance and which were delayed because LMS was busy                          |
| CURRENT_BLOCK          | NUMBER       | Current block transfers not affected by remote processing delays                                                                                                   |
| CURRENT_BLOCK_TIME     | NUMBER       | Total time waited for current blocks from a particular instance (includes the other times)                                                                         |
| CURRENT_2HOP           | NUMBER       | The count of current blocks which were received by this instance from a particular instance after a 2-way round-trip                                               |
| CURRENT_2HOP_TIME      | NUMBER       | The time waited for current blocks which were received by this instance from a particular instance after a 2-way round-trip                                        |
| CURRENT_3HOP           | NUMBER       | The count of current blocks which were received by this instance from a particular instance after a 3-way round-trip                                               |
| CURRENT_3HOP_TIME      | NUMBER       | The time waited for current blocks which were received by this instance from a particular instance after a 3-way round-trip                                        |
| CURRENT_BUSY           | NUMBER       | Current block transfers affected by remote contention                                                                                                              |
| CURRENT_BUSY_TIME      | NUMBER       | The time waited for current blocks which were received by this instance from a particular instance and which were delayed by a log flushed on the sending instance |
| CURRENT_CONGESTED      | NUMBER       | Current block transfers affected by remote system load                                                                                                             |
| CURRENT_CONGESTED_TIME | NUMBER       | The time waited for current blocks which were received by this instance from a particular instance and which were delayed because LMS was busy                     |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.10 V\$INSTANCE\_PING

V\$INSTANCE\_PING provides information about measured latency of the interconnect for all instances in an Oracle Real Application Clusters (Oracle RAC) environment.

In an Oracle RAC environment, every few seconds the PING process of each instance checks the response of the interconnect to all instances of the same database.

It sends two messages. One message is 500 bytes in size (referred to in the column descriptions as 500B), and the other is 8 kilobytes in size (referred to in column descriptions as 8K).

For each message sent to each instance, the amount of time it took to get a response back is measured (in microseconds). The view records the latest measurements as well as cumulative data since instance startup.

| Column                 | Datatype | Description                                                                                                                                                                                                                        |
|------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INSTANCE               | NUMBER   | The instance communicated with. In the V\$ view for each instance, there is one row for that instance, and in the GV\$ view for each instance, there is also one row for that instance, so there are $n^2$ rows for $n$ instances. |
| CURRENT_500B           | NUMBER   | The latest response time for the 500B message (in microseconds)                                                                                                                                                                    |
| AVERAGE_500B           | NUMBER   | The average response time for the 500B messages since instance startup (in microseconds). Note that AVERAGE_500B should be the same as WAIT_TIME_500B/COUNT_500B.                                                                  |
| MAX_500B               | NUMBER   | The maximal response time for the 500B messages since instance startup (in microseconds)                                                                                                                                           |
| COUNT_500B             | NUMBER   | The number of measurements for the 500B messages since instance startup                                                                                                                                                            |
| WAIT_TIME_500B         | NUMBER   | The sum of all response times for the 500B messages since instance startup (in microseconds)                                                                                                                                       |
| WAIT_TIME_SQUARED_500B | NUMBER   | The sum of the response time squared for 500B messages since instance startup. The unit is in microseconds squared and divided by 1000.                                                                                            |
| CURRENT_8K             | NUMBER   | The latest response time for the 8K message (in microseconds)                                                                                                                                                                      |
| AVERAGE_8K             | NUMBER   | The average response time for the 8K messages since instance startup (in microseconds). Note that AVERAGE_8K should be the same as WAIT_TIME_8K/COUNT_8K.                                                                          |
| MAX_8K                 | NUMBER   | The maximal response time for the 8K messages since instance startup (in microseconds)                                                                                                                                             |

| Column               | Datatype | Description                                                                                                                                                                                                                                                                    |
|----------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COUNT_8K             | NUMBER   | The number of measurements for the 8K messages since instance startup                                                                                                                                                                                                          |
| WAIT_TIME_8K         | NUMBER   | The sum of all response times for the 8K messages since instance startup (in microseconds)                                                                                                                                                                                     |
| WAIT_TIME_SQUARED_8K | NUMBER   | The sum of the response time squared for 8K messages since instance startup. The unit is in microseconds squared and divided by 16.                                                                                                                                            |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. For this view, the possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> </ul> |

## 8.11 V\$INSTANCE\_RECOVERY

V\$INSTANCE\_RECOVERY monitors the mechanisms available to users to limit recovery I/O. Those mechanisms are:

- Set the LOG\_CHECKPOINT\_TIMEOUT initialization parameter
- Set the LOG\_CHECKPOINT\_INTERVAL initialization parameter
- Set the FAST\_START\_MTTR\_TARGET initialization parameter
- Set the size of the smallest redo log

| Column                        | Datatype | Description                                                                                                                                                                                                       |
|-------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RECOVERY_ESTIMATED_IOS        | NUMBER   | Number of dirty buffers in the buffer cache.                                                                                                                                                                      |
| ACTUAL_REDO_BLK               | NUMBER   | Current actual number of redo blocks required for recovery                                                                                                                                                        |
| TARGET_REDO_BLK               | NUMBER   | Current target number of redo blocks that must be processed for recovery. This value is the minimum value of the following 3 columns, and identifies which of the 3 user-defined limits determines checkpointing. |
| LOG_FILE_SIZE_REDO_BLS        | NUMBER   | Maximum number of redo blocks required to guarantee that a log switch does not occur before the checkpoint completes.                                                                                             |
| LOG_CHKPT_TIMEOUT_REDO_BLS    | NUMBER   | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_TIMEOUT parameter. The value displayed is not meaningful unless that parameter has been set.                        |
| LOG_CHKPT_INTERVAL_REDO_BLS   | NUMBER   | Number of redo blocks that need to be processed during recovery to satisfy the LOG_CHECKPOINT_INTERVAL parameter. The value displayed is not meaningful unless that parameter has been set.                       |
| FAST_START_IO_TARGET_REDO_BLS | NUMBER   | This column is obsolete and maintained for backward compatibility. The value of this column is always null.                                                                                                       |

| Column                         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TARGET_MTTR                    | NUMBER   | Effective MTTR (mean time to recover) target value in seconds. The TARGET_MTTR value is calculated based on the value of the FAST_START_MTTR_TARGET parameter (the TARGET_MTTR value is used internally), and is usually an approximation of the parameter's value. However, if the FAST_START_MTTR_TARGET parameter value is very small (for example, one second), or very large (for example, 3600 seconds), the calculation will produce a target value dictated by system limitations. In such cases, the TARGET_MTTR value will be the shortest calculated time, or the longest calculated time that recovery is expected to take. |
| ESTIMATED_MTTR                 | NUMBER   | Current estimated mean time to recover (MTTR) based on the number of dirty buffers and log blocks. Basically, this value tells you how long you could expect recovery to take based on the work your system is doing right now.                                                                                                                                                                                                                                                                                                                                                                                                         |
| CKPT_BLOCK_WRITES              | NUMBER   | Number of blocks written by checkpoint writes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| OPTIMAL_LOGFILE_SIZE           | NUMBER   | Redo log file size (in megabytes) that is considered optimal based on the current setting of FAST_START_MTTR_TARGET. It is recommended that the user configure all online redo logs to be at least this value. Note that redo log files must be at least 4 megabytes in size; otherwise an error is generated.                                                                                                                                                                                                                                                                                                                          |
| ESTD_CLUSTER_AVAILABLE_TIME    | NUMBER   | Estimated time (in seconds) that the cluster would become partially available should this instance fail. This column is only meaningful in an Oracle Real Application Clusters (Oracle RAC) environment. In a non-Oracle RAC environment, the value of this column is null.                                                                                                                                                                                                                                                                                                                                                             |
| WRITES_MTTR                    | NUMBER   | Number of writes driven by the FAST_START_MTTR_TARGET initialization parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| WRITES_LOGFILE_SIZE            | NUMBER   | Number of writes driven by the smallest redo log file size                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WRITES_LOG_CHECKPOINT_SETTINGS | NUMBER   | Number of writes driven by the LOG_CHECKPOINT_INTERVAL or LOG_CHECKPOINT_TIMEOUT initialization parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WRITES_OTHER_SETTINGS          | NUMBER   | Number of writes driven by other reasons (such as the deprecated FAST_START_IO_TARGET initialization parameter)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRITES_AUTOTUNE                | NUMBER   | Number of writes due to auto-tune checkpointing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRITES_FULL_THREAD_CHECKPOINT  | NUMBER   | Number of writes due to full thread checkpoints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID                         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                         |

## 8.12 V\$IO\_CALIBRATION\_STATUS

V\$IO\_CALIBRATION\_STATUS displays the status of I/O calibration in the instance.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS           | VARCHAR2(13) | Calibration status: <ul style="list-style-type: none"> <li>IN PROGRESS - Calibration in Progress (Results from a previous calibration run are displayed, if available)</li> <li>READY Results are ready and available from an earlier run</li> <li>NOT AVAILABLE Calibration results are not available</li> </ul>                                                                                                                               |
| CALIBRATION_TIME | TIMESTAMP(3) | End time of the last calibration run                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.13 V\$IO\_OUTLIER

V\$IO\_OUTLIER contains entries corresponding to I/Os that have taken a long time (more than 500 ms) to complete. Use this view to see if there any occasional delays in serving disk I/O requests by the storage subsystem.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FUNCTION_NAME | VARCHAR2(18)  | I/O function name of the delayed I/O                                                                                                                                                                                                                                                                                                                                                                                                            |
| IO_SIZE       | NUMBER        | Size of the I/O in bytes                                                                                                                                                                                                                                                                                                                                                                                                                        |
| WAIT_EVENT    | VARCHAR2(64)  | Wait event name that was used to track the I/O                                                                                                                                                                                                                                                                                                                                                                                                  |
| FILE_NAME     | VARCHAR2(513) | Name of the file to which the I/O was targeted                                                                                                                                                                                                                                                                                                                                                                                                  |
| IO_LATENCY    | NUMBER        | Time taken to complete the I/O (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| DISK1_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the first disk to which the I/O was issued                                                                                                                                                                                                                                                                                                                                                                          |
| DISK1_LATENCY | NUMBER        | Latency seen on the first disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| DISK2_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the second disk to which the I/O was issued                                                                                                                                                                                                                                                                                                                                                                         |
| DISK2_LATENCY | NUMBER        | Latency seen on the second disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                               |
| DISK3_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the third disk to which the I/O was issued                                                                                                                                                                                                                                                                                                                                                                          |
| DISK3_LATENCY | NUMBER        | Latency seen on the third disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.14 V\$IOFUNKMETRIC

V\$IOFUNKMETRIC displays I/O statistics information by database function for the most recent time interval period.

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME       | DATE         | Begin time for the metric value                                                                                                                                                                                                                                                                                                                                                                                                                       |
| END_TIME         | DATE         | End time for the metric value                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INTSIZE_CSEC     | NUMBER       | Size of the time period                                                                                                                                                                                                                                                                                                                                                                                                                               |
| FUNCTION_ID      | NUMBER       | Function ID                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| FUNCTION_NAME    | VARCHAR2(18) | Function name                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SMALL_READ_MBPS  | NUMBER       | Single block megabytes read per second                                                                                                                                                                                                                                                                                                                                                                                                                |
| SMALL_WRITE_MBPS | NUMBER       | Single block megabytes written per second                                                                                                                                                                                                                                                                                                                                                                                                             |
| LARGE_READ_MBPS  | NUMBER       | Multiblock megabytes read per second                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LARGE_WRITE_MBPS | NUMBER       | Multiblock megabytes written per second                                                                                                                                                                                                                                                                                                                                                                                                               |
| SMALL_READ_IOPS  | NUMBER       | Single block read requests per second                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SMALL_WRITE_IOPS | NUMBER       | Single block write requests per second                                                                                                                                                                                                                                                                                                                                                                                                                |
| LARGE_READ_IOPS  | NUMBER       | Multiblock read requests per second                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LARGE_WRITE_IOPS | NUMBER       | Multiblock write requests per second                                                                                                                                                                                                                                                                                                                                                                                                                  |
| AVG_WAIT_TIME    | NUMBER       | Average wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.15 V\$IOFUNKMETRIC\_HISTORY

V\$IOFUNKMETRIC\_HISTORY displays a recent history of the I/O statistics information by database function for the most recent time interval period.

The columns for V\$IOFUNKMETRIC\_HISTORY are the same as those for V\$IOFUNKMETRIC.

**See Also:**`"V$IOFUNCMETRIC"`

## 8.16 V\$IOS\_CLIENT

V\$IOS\_CLIENT provides more information about IO Server clients.

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_ID     | NUMBER       | The unique ID for this client instance                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CLUSTER_ID    | VARCHAR2(33) | The GUID of the cluster where the client instance is running                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CLUSTER_NAME  | VARCHAR2(16) | When the query is executed on an Oracle IO Server (IOS) instance, this column shows the name of the cluster where the client (database) instance is running.<br>When the query is executed on a database instance, this column shows the name of the cluster where the IOS instance that the database is connected to is running.                                                                                                                                                |
| NODE          | NUMBER       | Number of the node within the cluster where the client instance is running                                                                                                                                                                                                                                                                                                                                                                                                       |
| INSTANCE_NAME | VARCHAR2(64) | Instance name of the database client instance                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DB_NAME       | VARCHAR2(64) | Database name of the database client instance                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.17 V\$IOSTAT\_CONSUMER\_GROUP

V\$IOSTAT\_CONSUMER\_GROUP displays disk I/O statistics for consumer groups.

If the resource manager is enabled, then I/O statistics for all consumer groups that are part of the currently enabled resource plan are captured.

| Column                | Datatype | Description                              |
|-----------------------|----------|------------------------------------------|
| CONSUMER_GROUP_ID     | NUMBER   | Consumer group ID                        |
| SMALL_READ_MEGABYTES  | NUMBER   | Number of single block megabytes read    |
| SMALL_WRITE_MEGABYTES | NUMBER   | Number of single block megabytes written |
| LARGE_READ_MEGABYTES  | NUMBER   | Number of multiblock megabytes read      |
| LARGE_WRITE_MEGABYTES | NUMBER   | Number of multiblock megabytes written   |
| SMALL_READ_REQS       | NUMBER   | Number of single block read requests     |

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SMALL_WRITE_REQS | NUMBER   | Number of single block write requests                                                                                                                                                                                                                                                                                                                                                                                                           |
| LARGE_READ_REQS  | NUMBER   | Number of multiblock read requests                                                                                                                                                                                                                                                                                                                                                                                                              |
| LARGE_WRITE_REQS | NUMBER   | Number of multiblock write requests                                                                                                                                                                                                                                                                                                                                                                                                             |
| NUMBER_OF_WAITS  | NUMBER   | Number of I/O waits by consumer group                                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_TIME        | NUMBER   | Total wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.18 V\$IOSTAT\_FILE

V\$IOSTAT\_FILE displays information about disk I/O statistics of database files (including data files, temp files, and other types of database files).

I/O statistics for Data files and Temp files are provided for each file. All other file types (for example, control files, log files, archive logs, and so on) have their statistics consolidated into one entry in the view.

| Column                  | Datatype        | Description                                                                                                                                       |
|-------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| FILE_NO                 | NUMBER          | File identification number                                                                                                                        |
| FILETYPE_ID             | NUMBER          | Type of file (for example, log file, data file, and so on)                                                                                        |
| FILETYPE_NAME           | VARCHAR2 ( 28 ) | Name of the file, in the case of a data file or temp file. For all other files, a corresponding string to be displayed (for example, ARCHIVELOG). |
| SMALL_READ_MEGABYTES    | NUMBER          | Number of single block megabytes read                                                                                                             |
| SMALL_WRITE_MEGABYTES   | NUMBER          | Number of single block megabytes written                                                                                                          |
| LARGE_READ_MEGABYTES    | NUMBER          | Number of multiblock megabytes read                                                                                                               |
| LARGE_WRITE_MEGABYTES   | NUMBER          | Number of multiblock megabytes written                                                                                                            |
| SMALL_READ_REQS         | NUMBER          | Number of single block read requests                                                                                                              |
| SMALL_WRITE_REQS        | NUMBER          | Number of single block write requests                                                                                                             |
| SMALL_SYNC_READ_REQS    | NUMBER          | Number of synchronous single block read requests                                                                                                  |
| LARGE_READ_REQS         | NUMBER          | Number of multiblock read requests                                                                                                                |
| LARGE_WRITE_REQS        | NUMBER          | Number of multiblock write requests                                                                                                               |
| SMALL_READ_SERVICETIME  | NUMBER          | Total service time (in milliseconds) for single block read requests                                                                               |
| SMALL_WRITE_SERVICETIME | NUMBER          | Total service time (in milliseconds) for single block write requests                                                                              |
| SMALL_SYNC_READ_LATENCY | NUMBER          | Latency for single block synchronous reads (in milliseconds)                                                                                      |
| LARGE_READ_SERVICETIME  | NUMBER          | Total service time (in milliseconds) for multiblock read requests                                                                                 |

| Column                  | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LARGE_WRITE_SERVICETIME | NUMBER       | Total service time (in milliseconds) for multiblock write requests                                                                                                                                                                                                                                                                                                                                                                              |
| ASYNCH_IO               | VARCHAR2(9)  | Indicates whether asynchronous I/O is available for the file (ASYNC_ON) or not (ASYNC_OFF)                                                                                                                                                                                                                                                                                                                                                      |
| ACCESS_METHOD           | VARCHAR2(11) | I/O library used to access the file. Possible values include: <ul style="list-style-type: none"> <li>OS_LIB - Operating system calls are used to access the file</li> <li>ODM_LIB - Oracle Disk Manager library is used to access the file</li> <li>ASM_MANAGED - The file is managed and accessed through ASM</li> <li>DNFS_LIB - The file is accessed through Direct NFS library</li> </ul>                                                   |
| RETRIES_ON_ERROR        | NUMBER       | Number of read retries on error                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                  | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.19 V\$IOSTAT\_FUNCTION

V\$IOSTAT\_FUNCTION displays disk I/O statistics for database functions (such as the LGWR and DBWR).

| Column                | Datatype     | Description                                                                                                                                                                                                                                                                                                                 |

| NUMBER_OF_WAITS       | NUMBER   | Number of synchronous I/O waits by functionality                                                                                                                                                                                                                                                                                                                                                                                                |
| WAIT_TIME             | NUMBER   | Total synchronous I/O wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.20 V\$IOSTAT\_FUNCTION\_DETAIL

V\$IOSTAT\_FUNCTION\_DETAIL displays disk I/O statistics for database functions (such as the LGWR and DBWR), broken down by file type.

| LARGE_WRITE_REQS      | NUMBER       | Number of multiblock write requests                                                                                                                                                                                                                                                                                                                                                                                                             |
| NUMBER_OF_WAITS       | NUMBER       | Number of synchronous I/O waits by functionality                                                                                                                                                                                                                                                                                                                                                                                                |
| WAIT_TIME             | NUMBER       | Total synchronous I/O wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.21 V\$IOSTAT\_NETWORK

V\$IOSTAT\_NETWORK displays information about network I/O statistics that were caused by accessing files on a remote database instance.

| Column         | Datatype     | Description                                                                   |
|----------------|--------------|-------------------------------------------------------------------------------|
| CLIENT         | VARCHAR2(32) | Database client name initiating the network I/O (for example, RMAN or PL/SQL) |
| READS#         | NUMBER       | Number of read operations issued                                              |
| WRITES#        | NUMBER       | Number of write operations issued                                             |
| KBYTES_READ    | NUMBER       | Total number of kilobytes read                                                |
| KBYTES_WRITTEN | NUMBER       | Total number of kilobytes written                                             |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| READ_LATENCY  | NUMBER   | Total read wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                          |
| WRITE_LATENCY | NUMBER   | Total write wait time (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.22 V\$IP\_ACL

V\$IP\_ACL provides information about access control to database services from network hosts.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME | VARCHAR2(512) | The database service name                                                                                                                                                                                                                                                                                                                                                                                                                      |
| HOST         | VARCHAR2(64)  | The host being granted access to the SERVICE_NAME. The host can be a hostname, dotted-decimal IPv4 or heximal IPv6 address. Wildcard "*" for IPv4 and Classless Inter-Domain Routing (CIDR) format is allowed.                                                                                                                                                                                                                                 |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs</li> <li>1: This value is used for rows containing data that pertain only to the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.23 V\$JAVA\_LIBRARY\_CACHE\_MEMORY

V\$JAVA\_LIBRARY\_CACHE\_MEMORY displays information about memory allocated to library cache memory objects in different namespaces for Java objects.

A memory object is an internal grouping of memory for efficient management. A library cache object may consist of one or more memory objects.

| Column                     | Datatype     | Description                                                              |
|----------------------------|--------------|--------------------------------------------------------------------------|
| LC_NAMESPACE               | VARCHAR2(15) | Library cache namespace                                                  |
| LC_INUSE_MEMORY_OBJECTS    | NUMBER       | Number of library cache memory objects currently in use in the Java pool |
| LC_INUSE_MEMORY_SIZE       | NUMBER       | Total size of library cache in-use memory objects (in megabytes)         |
| LC_FREEABLE_MEMORY_OBJECTS | NUMBER       | Number of freeable library cache memory objects in the Java pool         |

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LC_FREEABLE_MEMORY_SIZE | NUMBER   | Size of library cache freeable memory objects (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.24 V\$JAVA\_POOL\_ADVICE

V\$JAVA\_POOL\_ADVICE displays information about estimated parse time in the Java pool for different pool sizes.

The sizes range from 10% of the current Java pool size or the amount of pinned Java library cache memory (whichever is higher) to 200% of the current Java pool size, in equal intervals. The value of the interval depends on the current size of the Java pool.

Parse time saved refers to the amount of time saved by keeping library cache memory objects in the Java pool, as opposed to having to reload these objects.

| Column                      | Datatype | Description                                                                                                                                                                                                                                                                                                         |
|-----------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JAVA_POOL_SIZE_FOR_ESTIMATE | NUMBER   | Java pool size for the estimate (in megabytes)                                                                                                                                                                                                                                                                      |
| JAVA_POOL_SIZE_FACTOR       | NUMBER   | Size factor with respect to the current Java pool size                                                                                                                                                                                                                                                              |
| ESTD_LC_SIZE                | NUMBER   | Estimated memory in use by the library cache (in megabytes)                                                                                                                                                                                                                                                         |
| ESTD_LC_MEMORY_OBJECTS      | NUMBER   | Estimated number of library cache memory objects in the Java pool of the specified size                                                                                                                                                                                                                             |
| ESTD_LC_TIME_SAVED          | NUMBER   | Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a Java pool of the specified size. This is the time that would have been spent in reloading the required objects in the Java pool had they been aged out due to insufficient amount of available free memory. |
| ESTD_LC_TIME_SAVED_FACTOR   | NUMBER   | Estimated parse time saved factor with respect to the current Java pool size                                                                                                                                                                                                                                        |
| ESTD_LC_LOAD_TIME           | NUMBER   | Estimated elapsed time (in seconds) for parsing in a Java pool of the specified size                                                                                                                                                                                                                                |
| ESTD_LC_LOAD_TIME_FACTOR    | NUMBER   | Estimated load time factor with respect to the current Java pool size                                                                                                                                                                                                                                               |
| ESTD_LC_MEMORY_OBJECT_HITS  | NUMBER   | Estimated number of times a library cache memory object was found in a Java pool of the specified size                                                                                                                                                                                                              |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.25 V\$KERNEL\_IO\_OUTLIER

V\$KERNEL\_IO\_OUTLIER contains entries corresponding to I/Os that have taken a long time (more than 500 ms) to complete.

Use this view to see the individual kernel components of I/Os for which there are any occasional delays in serving disk I/O requests by the storage subsystem.

### Note:

Although this view exists on all platforms in Oracle Database 12c, it is only populated on the Solaris platform.

| Column               | Datatype      | Description                                                                                                    |
|----------------------|---------------|----------------------------------------------------------------------------------------------------------------|
| TIMESTAMP            | NUMBER        | Number of seconds elapsed since 00:00 UTC, January 1, 1970                                                     |
| IO_SIZE              | NUMBER        | Size of the I/O, in KB.                                                                                        |
| IO_OFFSET            | NUMBER        | Offset into the device of the I/O                                                                              |
| DEVICE_NAME          | VARCHAR2(513) | Name of the device to which the I/O was targeted                                                               |
| PROCESS_NAME         | VARCHAR2(64)  | Name of the process that issued the I/O                                                                        |
| TOTAL_LATENCY        | NUMBER        | Total time the I/O spent in the kernel (in milliseconds)                                                       |
| SETUP_LATENCY        | NUMBER        | Time spent during initial I/O setup before sending to SCSI target device driver (in milliseconds)              |
| QUEUE_TO_HBA_LATENCY | NUMBER        | Time spent in the SCSI target device driver before being sent to the Host Bus Adaptor (in milliseconds)        |
| TRANSFER_LATENCY     | NUMBER        | Time spent in the Host Bus Adaptor and physically transferring the I/O to the storage device (in milliseconds) |
| CLEANUP_LATENCY      | NUMBER        | Time spent freeing resources used by the completed I/O (in milliseconds)                                       |
| PID                  | NUMBER        | Process ID that issued the I/O                                                                                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MIN_JOIN_KEY         | NUMBER        | Min join key value in translation vector                                                                                                                                                                                                                     |
| MAX_JOIN_KEY         | NUMBER        | Max join key value in translation vector                                                                                                                                                                                                                     |
| GROUP_KEY_COUNT      | NUMBER        | Max dense grouping key value. This value is computed while the data that creates the translation vector is processed.                                                                                                                                        |
| FILTERED             | NUMBER        | Number of rows filtered by translation vector                                                                                                                                                                                                                |
| PROBED               | NUMBER        | Number of rows that probed the translation vector in key vector use row source                                                                                                                                                                               |
| ACTIVE               | NUMBER        | Number of active translation vectors used as filters across all slaves                                                                                                                                                                                       |
| DISABLED             | NUMBER        | Number of translation vector filters across all slaves that were disabled                                                                                                                                                                                    |
| MEMORY_ALLOCATED     | NUMBER        | Amount of memory allocated for the key vector                                                                                                                                                                                                                |
| JOIN_STRUCTURE_SIZE  | NUMBER        | Amount of memory used out of the allocated space                                                                                                                                                                                                             |
| FACT_OWNER           | VARCHAR2(128) | The owner of the fact table. Null when the fact table is null.                                                                                                                                                                                               |
| FACT_NAME            | VARCHAR2(128) | The table that contains measure data. May be null if more than one fact table is used in the query.                                                                                                                                                          |
| DIMENSION_OWNER      | VARCHAR2(128) | When a single table is used to construct the key vector, the table owner will appear in this column. If multiple tables are joined to serve as the dimension (more of a snowflake than a star schema shape, for one example), then this column will be null. |
| DIMENSION_NAME       | VARCHAR2(128) | The table that contains attribute data and is joined to the fact table. May be null if two or more tables are used (for example, snowflake style dimension tables).                                                                                          |
| CREATION_DURATION    | NUMBER        | Records the total time in seconds that it took to create the key vector                                                                                                                                                                                      |
| PAYLOAD_COLUMN_COUNT | NUMBER        | The number of columns being carried from the dimension table to the fact table scan for processing without joinback                                                                                                                                          |

## 8.27 V\$LATCH

V\$LATCH displays aggregate latch statistics for both parent and child latches, grouped by latch name.

Individual parent and child latch statistics are broken down in the views V\$LATCH\_PARENT and V\$LATCH\_CHILDREN.

| Column | Datatype   | Description                 |
|--------|------------|-----------------------------|
| ADDR   | RAW(4   8) | Address of the latch object |
| LATCH# | NUMBER     | Latch number                |

| Column                                             | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LEVEL#                                             | NUMBER          | Latch level                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NAME                                               | VARCHAR2 ( 64 ) | Latch name                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| HASH                                               | NUMBER          | Latch hash                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| GETS                                               | NUMBER          | Number of times the latch was requested in willing-to-wait mode                                                                                                                                                                                                                                                                                                                                                                                 |
| MISSES                                             | NUMBER          | Number of times the latch was requested in willing-to-wait mode and the requester had to wait                                                                                                                                                                                                                                                                                                                                                   |
| SLEEPS                                             | NUMBER          | Number of times a willing-to-wait latch request resulted in a session sleeping while waiting for the latch                                                                                                                                                                                                                                                                                                                                      |
| IMMEDIATE_GETS                                     | NUMBER          | Number of times a latch was requested in no-wait mode                                                                                                                                                                                                                                                                                                                                                                                           |
| IMMEDIATE_MISSES                                   | NUMBER          | Number of times a no-wait latch request did not succeed (that is, missed)                                                                                                                                                                                                                                                                                                                                                                       |
| WAITERS_WOKEN                                      | NUMBER          | This column has been deprecated and is present only for compatibility with previous releases of Oracle. No data is accumulated for this column; it will always have a value of zero.                                                                                                                                                                                                                                                            |

## 8.28 V\$LATCH\_CHILDREN

V\$LATCH\_CHILDREN displays statistics about child latches.

This view includes all columns of V\$LATCH plus the CHILD# column. Note that child latches have the same parent if their LATCH# columns match each other.

| Column                                             | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |

| WTR_SLP_COUNT  | NUMBER       | Number of times a waiter slept                                                                                                                                                                                                                                                                                                                                                                                                                  |
| LONGHOLD_COUNT | NUMBER       | Number of times someone held a latch for the entire duration of someone else's sleep                                                                                                                                                                                                                                                                                                                                                            |
| LOCATION       | VARCHAR2(80) | Location that attempted to acquire the latch                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.30 V\$LATCH\_PARENT

V\$LATCH\_PARENT displays statistics about parent latches.

\ The columns for V\$LATCH\_PARENT are the same as those for V\$LATCH.

 **See Also:**  
"V\$LATCH"

## 8.31 V\$LATCHHOLDER

V\$LATCHHOLDER displays information about the current latch holders.

| Column | Datatype | Description                                 |
|--------|----------|---------------------------------------------|
| PID    | NUMBER   | Identifier of the process holding the latch |

| Column | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID    | NUMBER       | Identifier of the session that owns the latch                                                                                                                                                                                                                                                                                                                                                                                                   |
| LADDR  | RAW(4   8)   | Latch address                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NAME   | VARCHAR2(64) | Name of the latch being held                                                                                                                                                                                                                                                                                                                                                                                                                    |
| GETS   | NUMBER       | Number of times that the latch was obtained in either wait mode or no-wait mode                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.32 V\$LATCHNAME

V\$LATCHNAME displays information about decoded latch names for the latches shown in V\$LATCH.

The rows of V\$LATCHNAME have a one-to-one correspondence to the rows of V\$LATCH.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| NAME         | VARCHAR2(64) | Latch name                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DISPLAY_NAME | VARCHAR2(64) | A clearer and more descriptive name for the latch that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.                                                                                                                                                         |
| HASH         | NUMBER       | Latch hash                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TYPE         | VARCHAR2(4)  | Type of the latch (SGA, PDB, or OSP):                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.33 V\$LGWRIO\_OUTLIER

V\$LGWRIO\_OUTLIER contains entries corresponding to Log Writer (LGWR) process I/Os that have taken a long time (more than 500 ms) to complete. Use this view to see if there are any occasional delays in serving disk I/O requests by the storage subsystem.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FUNCTION_NAME | VARCHAR2(18)  | I/O function name of the delayed I/O                                                                                                                                                                                                                                                                                                                                                                                                            |
| IO_SIZE       | NUMBER        | Size of the I/O in bytes                                                                                                                                                                                                                                                                                                                                                                                                                        |
| WAIT_EVENT    | VARCHAR2(64)  | Wait event name that was used to track the I/O                                                                                                                                                                                                                                                                                                                                                                                                  |
| FILE_NAME     | VARCHAR2(513) | Name of the file to which the I/O was targeted                                                                                                                                                                                                                                                                                                                                                                                                  |
| IO_LATENCY    | NUMBER        | Time taken to complete the I/O (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| DISK1_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the first disk to which the I/O was issued                                                                                                                                                                                                                                                                                                                                                                          |
| DISK1_LATENCY | NUMBER        | Latency seen on the first disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| DISK2_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the second disk to which the I/O was issued                                                                                                                                                                                                                                                                                                                                                                         |
| DISK2_LATENCY | NUMBER        | Latency seen on the second disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                               |
| DISK3_NAME    | VARCHAR2(255) | For Oracle ASM, the name of the third disk to which the I/O was issued                                                                                                                                                                                                                                                                                                                                                                          |
| DISK3_LATENCY | NUMBER        | Latency seen on the third disk (in milliseconds)                                                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.34 V\$LIBCACHE\_LOCKS

V\$LIBCACHE\_LOCKS displays information about the library cache locks and pins. Locks and pins are distinguished based on the value of the TYPE column.

| Column | Datatype    | Description             |
|--------|-------------|-------------------------|
| TYPE   | VARCHAR2(4) | LOCK or PIN             |
| ADDR   | RAW(4   8)  | Address of the lock/pin |

| Column               | Datatype   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HOLDING_USER_SESSION | RAW(4   8) | User session holding this lock/pin                                                                                                                                                                                                                                                                                                                                                                                                              |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.35 V\$LIBRARY\_CACHE\_MEMORY

V\$LIBRARY\_CACHE\_MEMORY displays information about memory allocated to library cache memory objects in different namespaces.

A memory object is an internal grouping of memory for efficient management. A library cache object may consist of one or more memory objects.

| Column                     | Datatype     | Description                                                                |
|----------------------------|--------------|----------------------------------------------------------------------------|
| LC_NAMESPACE               | VARCHAR2(15) | Library cache namespace                                                    |
| LC_INUSE_MEMORY_OBJECTS    | NUMBER       | Number of library cache memory objects currently in use in the shared pool |
| LC_INUSE_MEMORY_SIZE       | NUMBER       | Total size of library cache in-use memory objects (in megabytes)           |
| LC_FREEABLE_MEMORY_OBJECTS | NUMBER       | Number of freeable library cache memory objects in the shared pool         |
| LC_FREEABLE_MEMORY_SIZE    | NUMBER       | Size of library cache freeable memory objects (in megabytes)               |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| CPU_SOCKET_COUNT_HIGHWATER | NUMBER   | Highest number of CPU sockets on the system since the instance started (represents an absolute count of CPU chips on the system, regardless of multithreading or multicore architectures)                                                                                                                                                                                                                                                             |
| CON_ID                     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

### Note:

The availability of the CPU core count and CPU socket count statistics is subject to the operating system platform on which the Oracle Database is running. If a statistic is unavailable, the view will return NULL for the statistic value.

## 8.38 V\$LOADSTAT

V\$LOADSTAT contains errors that occurred when updating indexes on a table during a load using the Direct Path API.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.39 V\$LOADPSTAT

V\$LOADPSTAT contains statistics about the number of rows loaded into a partition, or subpartition, during a load using the Direct Path API.

| Column   | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER    | VARCHAR2(31) | Schema name                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 8.40 V\$LOCK

V\$LOCK lists the locks currently held by the Oracle Database and outstanding requests for a lock or latch.

| Column | Datatype   | Description                                          |
|--------|------------|------------------------------------------------------|
| ADDR   | RAW(4   8) | Address of lock state object                         |
| KADDR  | RAW(4   8) | Address of lock                                      |
| SID    | NUMBER     | Identifier for session holding or acquiring the lock |

| Column  | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE    | VARCHAR2 ( 2 ) | Type of user or system lock<br>The locks on the user types are obtained by user applications. Any process that is blocking others is likely to be holding one of these locks. The user type locks are:<br>TM - DML enqueue<br>TX - Transaction enqueue<br>UL - User supplied<br>The system type locks are listed in <a href="#">Table 8-1</a> . Be aware that not all types of locks are documented. To find a complete list of locks for the current release, query the V\$LOCK_TYPE data dictionary view, described on " <a href="#">V\$LOCK_TYPE</a> ". |
| ID1     | NUMBER         | Lock identifier #1 (depends on type)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ID2     | NUMBER         | Lock identifier #2 (depends on type)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LMODE   | NUMBER         | Lock mode in which the session holds the lock: <ul style="list-style-type: none"> <li>• 0 - none</li> <li>• 1 - null (NULL)</li> <li>• 2 - row-S (SS)</li> <li>• 3 - row-X (SX)</li> <li>• 4 - share (S)</li> <li>• 5 - S/Row-X (SSX)</li> <li>• 6 - exclusive (X)</li> </ul>                                                                                                                                                                                                                                                                              |
| REQUEST | NUMBER         | Lock mode in which the process requests the lock: <ul style="list-style-type: none"> <li>• 0 - none</li> <li>• 1 - null (NULL)</li> <li>• 2 - row-S (SS)</li> <li>• 3 - row-X (SX)</li> <li>• 4 - share (S)</li> <li>• 5 - S/Row-X (SSX)</li> <li>• 6 - exclusive (X)</li> </ul>                                                                                                                                                                                                                                                                           |
| CTIME   | NUMBER         | Time since current mode was granted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| BLOCK   | NUMBER         | Indicates whether the lock in question is blocking other processes. The possible values are: <ul style="list-style-type: none"> <li>• 0 - The lock is not blocking any other processes</li> <li>• 1 - The lock is blocking other processes</li> <li>• 2 - The lock is not blocking any blocked processes on the local node, but it may or may not be blocking processes on remote nodes. This value is used only in Oracle Real Application Clusters (Oracle RAC) configurations (not in single instance configurations).</li> </ul>                       |
| CON_ID  | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                      |

**Table 8-1 Values for the TYPE Column: System Types**

| System Type | Description                                         | System Type | Description                                   |
|-------------|-----------------------------------------------------|-------------|-----------------------------------------------|
| AE          | Edition enqueue                                     | MR          | Media recovery                                |
| AT          | Lock held for the ALTER TABLE statement             | NA..NZ      | Library cache pin instance (A..Z = namespace) |
| BL          | Buffer hash table instance                          | PF          | Password File                                 |
| CF          | Control file schema global enqueue                  | PI, PS      | Parallel operation                            |
| CI          | Cross-instance function invocation instance         | PR          | Process startup                               |
| CU          | Cursor bind                                         | QA..QZ      | Row cache instance (A..Z = cache)             |
| DF          | datafile instance                                   | RT          | Redo thread global enqueue                    |
| DL          | Direct loader parallel index create                 | SC          | System change number instance                 |
| DM          | Mount/startup db primary/secondary instance         | SM          | SMON                                          |
| DR          | Distributed recovery process                        | SN          | Sequence number instance                      |
| DX          | Distributed transaction entry                       | SQ          | Sequence number enqueue                       |
| FS          | File set                                            | SS          | Sort segment                                  |
| HW          | Space management operations on a specific segment   | ST          | Space transaction enqueue                     |
| IN          | Instance number                                     | SV          | Sequence number value                         |
| IR          | Instance recovery serialization global enqueue      | TA          | Generic enqueue                               |
| IS          | Instance state                                      | TS          | Temporary segment enqueue (ID2=0)             |
| IV          | Library cache invalidation instance                 | TS          | New block allocation enqueue (ID2=1)          |
| JQ          | Job queue                                           | TT          | Temporary table enqueue                       |
| KK          | Thread kick                                         | UN          | User name                                     |
| LA .. LP    | Library cache lock instance lock (A..P = namespace) | US          | Undo segment DDL                              |
| MM          | Mount definition global enqueue                     | WL          | Being-written redo log instance               |

## 8.41 V\$LOCK\_ACTIVITY

V\$LOCK\_ACTIVITY is deprecated. The information that was provided in this view is now provided in the V\$INSTANCE\_CACHE\_TRANSFER and V\$SEGMENT\_STATISTICS views.

| Column     | Datatype | Description                                                 |
|------------|----------|-------------------------------------------------------------|
| FROM_VAL   | CHAR(4)  | Global Cache Resource initial state; always NULL            |
| TO_VAL     | CHAR(1)  | Global Cache Resource initial state; always S               |
| ACTION_VAL | CHAR(21) | Description of the conversion; always Lock buffers for read |
| COUNTER    | NUMBER   | Number of times the lock operation executed                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.42 V\$LOCK\_TYPE

V\$LOCK\_TYPE describes the type of locks available.

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TYPE        | VARCHAR2(64)   | A two-letter internal resource identifier                                                                                                                                                                                                                                                                                                                                                                                                       |
| NAME        | VARCHAR2(64)   | Resource type name. This is a short (less than 32 characters) enqueue type name.                                                                                                                                                                                                                                                                                                                                                                |
| ID1_TAG     | VARCHAR2(64)   | Description of the enqueue type.                                                                                                                                                                                                                                                                                                                                                                                                                |
| ID2_TAG     | VARCHAR2(64)   | Further description of the enqueue type.                                                                                                                                                                                                                                                                                                                                                                                                        |
| IS_USER     | VARCHAR2(3)    | User enqueue. These are enqueues that are acquired as a direct result of a SQL statement. Applications may get deadlocks on these enqueues. Such deadlocks are considered application errors.                                                                                                                                                                                                                                                   |
| IS_RECYCLE  | VARCHAR2(3)    | Indicates whether the enqueue requires caching of the associated resource in the DLM's resource cache.<br>Possible values: <ul style="list-style-type: none"> <li>NO: Means the enqueue requires caching of the associated resource in the DLM's resource cache</li> <li>YES: Means the enqueue does not require caching of the associated resource in the DLM's resource cache</li> </ul>                                                      |
| DESCRIPTION | VARCHAR2(4000) | Explanation of how or for what purpose the enqueue is used.                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.43 V\$LOCKDOWN\_RULES

V\$LOCKDOWN\_RULES displays information about lockdown profile rules that are applicable in the pluggable database (PDB) where this view is queried.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RULE_TYPE     | VARCHAR2(128) | Type of the rule: <ul style="list-style-type: none"> <li>STATEMENT</li> <li>FEATURE</li> <li>OPTION</li> </ul>                                                                                                                                                                                                                                                                                                                                  |
| RULE          | VARCHAR2(128) | Rule to be enabled or disabled                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CLAUSE        | VARCHAR2(128) | Clause of the statement                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CLAUSE_OPTION | VARCHAR2(128) | Option of the clause                                                                                                                                                                                                                                                                                                                                                                                                                            |
| STATUS        | VARCHAR2(7)   | Status of the lockdown profile: <ul style="list-style-type: none"> <li>ENABLE</li> <li>DISABLE</li> <li>EMPTY</li> </ul>                                                                                                                                                                                                                                                                                                                        |
| USERS         | VARCHAR2(6)   | Type of users affected by the rule: <ul style="list-style-type: none"> <li>ALL</li> <li>LOCAL</li> <li>COMMON</li> </ul>                                                                                                                                                                                                                                                                                                                        |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs</li> <li>1: This value is used for rows containing data that pertain to only the root.</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.44 V\$LOCKED\_OBJECT

V\$LOCKED\_OBJECT lists all locks acquired by every transaction on the system. It shows which sessions are holding DML locks (that is, TM-type enqueues) on what objects and in what mode.

| Column | Datatype | Description         |
|--------|----------|---------------------|
| XIDUSN | NUMBER   | Undo segment number |

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XIDSLOT         | NUMBER        | Slot number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| XIDSQN          | NUMBER        | Sequence number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OBJECT_ID       | NUMBER        | Object ID being locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SESSION_ID      | NUMBER        | Session ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ORACLE_USERNAME | VARCHAR2(128) | Oracle user name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OS_USER_NAME    | VARCHAR2(128) | Operating system user name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PROCESS         | VARCHAR2(24)  | Operating system process ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LOCKED_MODE     | NUMBER        | Lock mode. The numeric values for this column map to these text values for the lock modes for table locks: <ul style="list-style-type: none"> <li>0 - NONE: lock requested but not yet obtained</li> <li>1 - NULL</li> <li>2 - ROWS_S (SS): Row Share Lock</li> <li>3 - ROW_X (SX): Row Exclusive Table Lock</li> <li>4 - SHARE (S): Share Table Lock</li> <li>5 - S/ROW-X (SSX): Share Row Exclusive Table Lock</li> <li>6 - Exclusive (X): Exclusive Table Lock</li> </ul> <b>See Also:</b> <i>Oracle Database Concepts</i> for more information about lock modes for table locks |
| CON_ID          | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                     |

## 8.45 V\$LOG

V\$LOG displays log file information from the control file.

| Column    | Datatype    | Description                             |
|-----------|-------------|-----------------------------------------|
| GROUP#    | NUMBER      | Log group number                        |
| THREAD#   | NUMBER      | Log thread number                       |
| SEQUENCE# | NUMBER      | Log sequence number                     |
| BYTES     | NUMBER      | Size of the log (in bytes)              |
| BLOCKSIZE | NUMBER      | Block size of the logfile (512 or 4096) |
| MEMBERS   | NUMBER      | Number of members in the log group      |
| ARCHIVED  | VARCHAR2(3) | Archive status (YES) or (NO)            |

| Column        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATUS        | VARCHAR2(16) | Log status: <ul style="list-style-type: none"> <li>UNUSED - Online redo log has never been written to. This is the state of a redo log that was just added, or just after a RESETLOGS, when it is not the current redo log.</li> <li>CURRENT - Current redo log. This implies that the redo log is active. The redo log could be open or closed.</li> <li>ACTIVE - Log is active but is not the current log. It is needed for crash recovery. It may be in use for block recovery. It may or may not be archived.</li> <li>CLEARING - Log is being re-created as an empty log after an ALTER DATABASE CLEAR LOGFILE statement. After the log is cleared, the status changes to UNUSED.</li> <li>CLEARING_CURRENT - Current log is being cleared of a closed thread. The log can stay in this status if there is some failure in the switch such as an I/O error writing the new log header.</li> <li>INACTIVE - Log is no longer needed for instance recovery. It may be in use for media recovery. It may or may not be archived.</li> </ul> |
| FIRST_CHANGE# | NUMBER       | Lowest system change number (SCN) in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| FIRST_TIME    | DATE         | Time of the first SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| NEXT_CHANGE#  | NUMBER       | Highest change number (SCN) in the log. When STATUS=CURRENT, NEXT_CHANGE# is set to the highest possible SCN, 18446744073709551615.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| NEXT_TIME     | DATE         | Time of the highest SCN in the log. When STATUS=CURRENT, NEXT_TIME is set to NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID        | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 8.46 V\$LOG\_HISTORY

V\$LOG\_HISTORY displays log history information from the control file.

| Column        | Datatype | Description                                     |
|---------------|----------|-------------------------------------------------|
| RECID         | NUMBER   | Control file record ID                          |
| STAMP         | NUMBER   | Control file record stamp                       |
| THREAD#       | NUMBER   | Thread number of the archived log               |
| SEQUENCE#     | NUMBER   | Sequence number of the archived log             |
| FIRST_CHANGE# | NUMBER   | Lowest system change number (SCN) in the log    |
| FIRST_TIME    | DATE     | Time of the first entry (lowest SCN) in the log |
| NEXT_CHANGE#  | NUMBER   | Highest SCN in the log                          |

| Column            | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESETLOGS_CHANGE# | NUMBER   | Resetlogs change number of the database when the log was written                                                                                                                                                                                                                                                                                                                                                                                |
| RESETLOGS_TIME    | DATE     | Resetlogs time of the database when the log was written                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID            | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.47 V\$LOGFILE

V\$LOGFILE contains information about redo log files.

| Column                | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP#                | NUMBER        | Redo log group identifier number                                                                                                                                                                                                                                                                                                                                                                                                                |
| STATUS                | VARCHAR2(7)   | Status of the log member: <ul style="list-style-type: none"> <li>INVALID - File is inaccessible</li> <li>STALE - File's contents are incomplete</li> <li>DELETED - File is no longer used</li> <li>null - File is in use</li> </ul>                                                                                                                                                                                                             |
| TYPE                  | VARCHAR2(7)   | Type of the logfile: <ul style="list-style-type: none"> <li>ONLINE</li> <li>STANDBY</li> </ul>                                                                                                                                                                                                                                                                                                                                                  |
| MEMBER                | VARCHAR2(513) | Redo log member name                                                                                                                                                                                                                                                                                                                                                                                                                            |
| IS_RECOVERY_DEST_FILE | VARCHAR2(3)   | Indicates whether the file was created in the fast recovery area (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.48 V\$LOGHIST

V\$LOGHIST contains log history information from the control file. This view is retained for historical compatibility. Oracle recommends that you use V\$LOG\_HISTORY instead.

 **See Also:**  
"V\$LOG\_HISTORY"

| THREAD#        | NUMBER   | Log thread number                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SEQUENCE#      | NUMBER   | Log sequence number                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FIRST_CHANGE#  | NUMBER   | Lowest SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                           |
| FIRST_TIME     | DATE     | Time of first SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SWITCH_CHANGE# | NUMBER   | SCN at which the log switch occurred; one more than highest SCN in the log                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.49 V\$LOGMNR\_CONTENTS

V\$LOGMNR\_CONTENTS contains log history information. To query this view, you must have the LOGMINING privilege.

When a SELECT statement is executed against the V\$LOGMNR\_CONTENTS view, the archive redo log files are read sequentially. Translated records from the redo log files are returned as rows in the V\$LOGMNR\_CONTENTS view. This continues until either the filter criteria specified at startup (EndTime or endScn) are met or the end of the archive log file is reached.

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                              |
|-----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCN       | NUMBER   | System change number (SCN) when the database change was made                                                                                                                                                                                                                                                                             |
| START_SCN | NUMBER   | System change number (SCN) when the transaction that contains this change started; only meaningful if the COMMITTED_DATA_ONLY option was chosen in a DBMS_LOGMNR.START_LOGMNR ( ) invocation, NULL otherwise. This column may also be NULL if the query is run over a time/SCN range that does not contain the start of the transaction. |

| DATA_OBJD#      | NUMBER         | Data block data object number identifying the object within the tablespace                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_REDO        | VARCHAR2(4000) | Reconstructed SQL statement that is equivalent to the original SQL statement that made the change. Refer to <i>Oracle Database Utilities</i> before executing SQL_REDO to your database.<br><br>LogMiner does not generate SQL redo for temporary tables. In such a case, this column will contain the string "/* No SQL_REDO for temporary tables */".                                                                                                            |

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_UNDO        | VARCHAR2(4000) | Reconstructed SQL statement that can be used to undo the effect of the original statement that made the change. DDL statements have no corresponding SQL_UNDO. Refer to <i>Oracle Database Utilities</i> before executing SQL_UNDO to your database.<br><br>LogMiner does not generate SQL undo for temporary tables. In such a case, this column will contain the string "/* No SQL_UNDO for temporary tables */".                                                                                                                                      |
| RS_ID           | VARCHAR2(32)   | Record set ID. The tuple (RS_ID, SSN) together uniquely identifies a logical row change. This will usually mean one row from V\$LOGMNR_CONTENTS, but could be more than one row if a single SQL statement for either the Redo or Undo would be too large to fit within the respective columns SQL_UNDO or SQL_REDO. RS_ID uniquely identifies the redo record that generated the row.                                                                                                                                                                    |
| SSN             | NUMBER         | SQL sequence number. Used in conjunction with RS_ID, this uniquely identifies a logical row change, shown as one or more rows from the V\$LOGMNR_CONTENTS view.                                                                                                                                                                                                                                                                                                                                                                                          |
| CSF             | NUMBER         | Continuation SQL flag. Possible values are: <ul style="list-style-type: none"> <li>0 - Indicates SQL_REDO and SQL_UNDO is contained within the same row</li> <li>1 - Indicates that either SQL_REDO or SQL_UNDO is greater than 4000 bytes in size and is continued in the next row returned by the view</li> </ul>                                                                                                                                                                                                                                      |
| INFO            | VARCHAR2(64)   | Informational message about the row. For instance, the string "USER DDL" indicates that the DDL statement returned in the SQL_REDO column was the top-level DDL executed by the user and the string "INTERNAL DDL" indicates that the DDL statement returned in the SQL_REDO column was executed internally by the RDBMS.                                                                                                                                                                                                                                |
| STATUS          | NUMBER         | A value of 0 indicates that the reconstructed SQL statements as shown in the SQL_REDO and SQL_UNDO columns are valid executable SQL statements. Otherwise, the reconstructed SQL statements are not executable. This may be because no data dictionary was provided to LogMiner for the analysis, or that the data dictionary provided did not have the definition of the object being mined.<br><br>A value of 5 indicates that this row is part of a change to an XMLType column or table and the XML document must be assembled before being applied. |
| REDO_VALUE      | NUMBER         | Used as input to the DBMS_LOGMNR.MINE_VALUE() and DBMS_LOGMNR.COLUMN_PRESENT() functions                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| UNDO_VALUE      | NUMBER         | Used as input to the DBMS_LOGMNR.MINE_VALUE() and DBMS_LOGMNR.COLUMN_PRESENT() functions                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SAFE_RESUME_SCN | NUMBER         | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CSCN            | NUMBER         | This column is deprecated in favor of the COMMIT_SCN column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| OBJECT_ID       | RAW(16)        | Object identifier for DMLs to XMLType tables. For changes to non-typed tables, this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| EDITION_NAME    | VARCHAR2(384)  | Identifies the edition in which a DDL statement was executed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CLIENT_ID       | VARCHAR2(64)   | Client identifier in the session that performed the operation, if available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SRC_CON_NAME | VARCHAR2(384) | Contains the pluggable database (PDB) name. This information will only be available when mining with a current LogMiner dictionary.                                                                                                                                                                                                               |
| SRC_CON_ID   | NUMBER        | Contains the PDB ID (the PDB_ID column from the DBA_PDBS view). This information will be available only with a current LogMiner dictionary.                                                                                                                                                                                                       |
| SRC_CON_UID  | NUMBER        | Contains the PDB UID (the CON_UID column from the DBA_PDBS view). This information will be available with or without a current LogMiner dictionary.                                                                                                                                                                                               |
| SRC_CON_DBID | NUMBER        | Contains the PDB identifier (the DBID column from the DBA_PDBS view). This information will only be available when mining with a current LogMiner dictionary.                                                                                                                                                                                     |
| SRC_CON_GUID | RAW(16)       | Contains the GUID associated with the PDB (the GUID column from the DBA_PDBS view). This information will only be available when mining with a current LogMiner dictionary.                                                                                                                                                                       |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> </ul> |

## 8.50 V\$LOGMNR\_DICTIONARY

V\$LOGMNR\_DICTIONARY contains log history information.

| Column           | Datatype     | Description                                                                                                                     |
|------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------|
| DB_NAME          | VARCHAR2(9)  | Name of the database                                                                                                            |
| DB_ID            | NUMBER       | Database ID                                                                                                                     |
| DB_CREATED       | DATE         | Creation date of the source database (corresponds to the <code>CREATED</code> column in the <code>V\$DATABASE</code> view)      |
| TIMESTAMP        | DATE         | Date when the dictionary was created                                                                                            |
| RESET_SCN        | NUMBER       | Reset log SCN when the dictionary was created                                                                                   |
| RESET_SCN_TIME   | DATE         | Timestamp of the reset log SCN when the dictionary was created                                                                  |
| DB_VERSION_TIME  | DATE         | Version time for the source database (corresponds to the <code>VERSION_TIME</code> column in the <code>V\$DATABASE</code> view) |
| DB_CHARACTER_SET | VARCHAR2(30) | Character set of the source database                                                                                            |

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB_VERSION         | VARCHAR2(64)  | This column is deprecated.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DB_STATUS          | VARCHAR2(64)  | This column is deprecated.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DICTIONARY_SCN     | NUMBER        | Database checkpoint SCN at which the dictionary was created                                                                                                                                                                                                                                                                                                                                                                                     |
| ENABLED_THREAD_MAP | RAW(16)       | This column is deprecated.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DB_TXN_SCN         | NUMBER        | SCN at which the dictionary was created                                                                                                                                                                                                                                                                                                                                                                                                         |
| FILENAME           | VARCHAR2(512) | Dictionary file name                                                                                                                                                                                                                                                                                                                                                                                                                            |
| INFO               | VARCHAR2(32)  | Informational/Status message<br>BAD_DATE indicates that the SCN of the dictionary file does not match the SCN range of the log files                                                                                                                                                                                                                                                                                                            |
| STATUS             | NUMBER        | A NULL indicates a valid dictionary file for the list of log files. A non-NULL value indicates further information is contained in the INFO column as a text string.                                                                                                                                                                                                                                                                            |
| CON_ID             | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.51 V\$LOGMNR\_DICTIONARY\_LOAD

V\$LOGMNR\_DICTIONARY\_LOAD displays information about LogMiner dictionaries for all active LogMiner sessions on the system.

Each query of this view will return one row for each attached LogMiner session. This view will not show valid information for LogMiner adhoc query clients.

| Column            | Datatype      | Description                                                                                                                                                                                                                   |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID        | NUMBER        | LogMiner session ID                                                                                                                                                                                                           |
| LOGMNR_UID        | NUMBER        | LogMiner dictionary UID                                                                                                                                                                                                       |
| ACTION#           | NUMBER        | Reserved for internal use                                                                                                                                                                                                     |
| OPCODE            | NUMBER        | Reserved for internal use                                                                                                                                                                                                     |
| COMMAND           | VARCHAR2(161) | Current command being executed                                                                                                                                                                                                |
| CURRENT_STATE     | VARCHAR2(32)  | Summary information if LOADED=ACTIVE                                                                                                                                                                                          |
| COMPLETED_ACTIONS | NUMBER        | The steps completed so far                                                                                                                                                                                                    |
| TOTAL_ACTIONS     | NUMBER        | Total steps to complete                                                                                                                                                                                                       |
| LOADED            | VARCHAR2(7)   | Status of the dictionary load: <ul style="list-style-type: none"> <li>YES - dictionary has been loaded</li> <li>NO - dictionary has not been loaded</li> <li>ACTIVE - dictionary is in the process of being loaded</li> </ul> |
| PERCENT_DONE      | NUMBER        | Percentage of the dictionary that has been loaded                                                                                                                                                                             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.52 V\$LOGMNR\_LATCH

V\$LOGMNR\_LATCH can be joined with the V\$LATCH and the V\$LATCH\_CHILDREN views to obtain statistics about different latches used by active LogMiner persistent sessions.

A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating a Replication capture.

| Column     | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_ID | NUMBER       | Unique identifier of the LogMiner persistent session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NAME       | VARCHAR2(32) | Name of the Latch: <ul style="list-style-type: none"> <li>LogMiner internal state - Identifies the latch that protects communications between the LogMiner READER, PREPARER, and BUILDER processes</li> <li>LogMiner memory allocation - Identifies the latch that protects all memory allocation and deallocation inside LogMiner</li> <li>LogMiner transaction list - Identifies the latch that protects interaction between the LogMiner layer and its clients during Data Guard SQL Apply on a logical standby database</li> </ul> |
| CHILD_ADDR | RAW(4   8)   | Address of the child latch object. This column matches the corresponding ADDR column in the V\$LATCH_CHILDREN view                                                                                                                                                                                                                                                                                                                                                                                                                     |
| STATE      | VARCHAR2(6)  | State of the Latch: <ul style="list-style-type: none"> <li>UNINIT - The latch structure is uninitialized; that is, it is not currently assigned to any LogMiner persistent session</li> <li>READY - The latch structure is being used by a persistent LogMiner session</li> </ul>                                                                                                                                                                                                                                                      |
| CON_ID     | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                        |

## 8.53 V\$LOGMNR\_LOGS

V\$LOGMNR\_LOGS contains log information.

| Column           | Datatype      | Description                                                                                                                                                                                 |
|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOG_ID           | NUMBER        | This column is deprecated.                                                                                                                                                                  |
| FILENAME         | VARCHAR2(512) | Name of the log file                                                                                                                                                                        |
| LOW_TIME         | DATE          | Oldest date of any records in the file                                                                                                                                                      |
| HIGH_TIME        | DATE          | Most recent date of any records in the file                                                                                                                                                 |
| DB_ID            | NUMBER        | Database ID                                                                                                                                                                                 |
| DB_NAME          | VARCHAR2(8)   | Name of the database                                                                                                                                                                        |
| RESET_SCN        | NUMBER        | Resetlogs SCN of the database incarnation that generated the log file                                                                                                                       |
| RESET_SCN_TIME   | DATE          | Resetlogs timestamp of the database incarnation that generated the log file                                                                                                                 |
| COMPATIBLE       | VARCHAR2(17)  | The setting of the database COMPATIBLE initialization parameter at the time the log file was generated                                                                                      |
| THREAD_ID        | NUMBER        | Thread number                                                                                                                                                                               |
| THREAD_SEQN      | NUMBER        | Thread sequence number                                                                                                                                                                      |
| LOW_SCN          | NUMBER        | SCN allocated when log switched into                                                                                                                                                        |
| NEXT_SCN         | NUMBER        | SCN after this log. Low SCN of the next log.                                                                                                                                                |
| DICTIONARY_BEGIN | VARCHAR2(3)   | Indicates whether dictionary dumped to redo logs starts in this redo log (YES) or not (NO)                                                                                                  |
| DICTIONARY_END   | VARCHAR2(3)   | Indicates whether dictionary dumped to redo logs ends in this redo log (YES) or not (NO)                                                                                                    |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.55 V\$LOGMNR\_PROCESS

V\$LOGMNR\_PROCESS identifies all processes attached to an active LogMiner persistent session.

(A persistent LogMiner session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.) This view can be joined with either the V\$SESSION view or the V\$PROCESS view to gather process-specific information.

| Column     | Datatype | Description                                           |
|------------|----------|-------------------------------------------------------|
| SESSION_ID | NUMBER   | Unique identifier for the LogMiner persistent session |

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID               | NUMBER       | Oracle process identifier for the SQL Apply or Replication capture process (same as the V\$PROCESS.PID)                                                                                                                                                                                                                                                                                                                                         |
| SPID              | VARCHAR2(24) | Operating system process identifier (same as the V\$PROCESS.SPID)                                                                                                                                                                                                                                                                                                                                                                               |
| ROLE              | VARCHAR2(32) | Identifies the role of the active LogMiner process: READER, PREPARER, BUILDER, COORDINATOR, or APPLY SERVER                                                                                                                                                                                                                                                                                                                                     |
| USERNAME          | VARCHAR2(15) | Operating system process user name that is connected to the database                                                                                                                                                                                                                                                                                                                                                                            |
| SID               | NUMBER       | Session identifier for the V\$SESSION.SID process                                                                                                                                                                                                                                                                                                                                                                                               |
| SERIAL#           | NUMBER       | Session serial number associated with the V\$SESSION.SERIAL process                                                                                                                                                                                                                                                                                                                                                                             |
| LATCHWAIT         | VARCHAR2(16) | Address of the latch the process is waiting for; NULL if none                                                                                                                                                                                                                                                                                                                                                                                   |
| LATCHSPIN         | VARCHAR2(16) | This column is obsolete                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WORK_MICROSEC     | VARCHAR2(21) | Microseconds spent by the process doing useful work                                                                                                                                                                                                                                                                                                                                                                                             |
| OVERHEAD_MICROSEC | VARCHAR2(21) | Microseconds spent by the process doing overhead tasks or simply waiting/idling                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 8.56 V\$LOGMNR\_SESSION

V\$LOGMNR\_SESSION displays information about active LogMiner persistent sessions.

(A LogMiner persistent session is created either by starting Data Guard SQL Apply on a logical standby database for the first time or by creating Replication capture.) Transient LogMiner sessions (those created as a result of querying the V\$LOGMNR\_CONTENTS view) do not show up in the V\$LOGMNR\_SESSION view. The statistics shown in this view correspond to snapshots of the system and are not cumulative in nature.

| Column       | Datatype     | Description                                           |
|--------------|--------------|-------------------------------------------------------|
| SESSION_ID   | NUMBER       | Unique identifier for the LogMiner persistent session |
| SESSION_NAME | VARCHAR2(32) | Unique session name                                   |

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_STATE       | VARCHAR2(9)   | Current state of the LogMiner persistent session: <ul style="list-style-type: none"> <li>READY - Client has created the LogMiner persistent session and added the relevant archived redo log files, but has not loaded the initial LogMiner dictionary</li> <li>STARTED - The LogMiner dictionary has been loaded</li> <li>ACTIVE - The LogMiner persistent session is mining the redo stream</li> <li>DETACHED - The LogMiner persistent session is not currently active, and it is in the process of becoming inactive</li> <li>DISCARDED - Client is about to destroy the LogMiner persistent session</li> </ul> |
| DB_NAME             | VARCHAR2(128) | Global database name for the source database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DB_ID               | NUMBER        | Database identifier of the source database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| RESET_SCN           | NUMBER        | System change number (SCN) when the session started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RESET_TIMESTAMP     | NUMBER        | Time of the RESETLOGS when the LogMiner persistent session started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| RESET_TIME          | DATE          | The time when the session started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| PREPARED_SCN        | NUMBER        | The PREPARER processes have successfully transformed all redo records below this SCN into logical change records (LCRs). However the LCRs may not have been grouped into transactions or merged in case they pertain to chained rows or LOB updates.                                                                                                                                                                                                                                                                                                                                                                |
| READ_SCN            | NUMBER        | The READER process has read all redo records below this SCN                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| LOW_MARK_SCN        | NUMBER        | LogMiner has delivered all transactions that committed below this SCN to the client                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CONSUMED_SCN        | NUMBER        | Client has consumed and released all transactions that committed below this SCN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MAX_MEMORY_SIZE     | NUMBER        | Maximum amount of shared memory (in bytes) that LogMiner is allowed to consume                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| USED_MEMORY_SIZE    | NUMBER        | Amount of shared memory (in bytes) actually consumed by LogMiner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BUILDER_WORK_SIZE   | NUMBER        | Amount of redo (in bytes) in the current work unit being processed by the BUILDER process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PREPARED_WORK_SIZE  | NUMBER        | Amount of redo (in bytes) that has been prepared by LogMiner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| AVAILABLE_WORK_SIZE | NUMBER        | Amount of redo records (in bytes) that are ready, but are yet to be consumed by the client                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| AVAILABLE_TXN       | NUMBER        | Number of transaction chunks ready for consumption                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVAILABLE_COMMITTED_TXN | NUMBER   | Number of committed transactions ready for consumption. This is less than, or equal to, AVAILABLE_TXN.                                                                                                                                                                                                                                                                                                                                          |
| DELIVERED_TXN           | NUMBER   | Number of transaction chunks that the client currently has in its possession                                                                                                                                                                                                                                                                                                                                                                    |
| DELIVERED_COMMITTED_TXN | NUMBER   | Number of committed transaction chunks that the client is currently working on. This is less than, or equal to, the value of the DELIVERED_TXN column.                                                                                                                                                                                                                                                                                          |
| PINNED_TXN              | NUMBER   | Number of transactions pinned (the client is actively working on)                                                                                                                                                                                                                                                                                                                                                                               |
| PINNED_COMMITTED_TXN    | NUMBER   | Number of committed transactions pinned (the client is actively working on)                                                                                                                                                                                                                                                                                                                                                                     |
| CHECKPOINT_INTERVAL     | NUMBER   | Checkpoint interval                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| NAME   | VARCHAR2 ( 64 ) | <p>Name of the LogMiner statistic, state, or status, including:</p> <ul style="list-style-type: none"> <li>• Bytes of Redo Processed - Cumulative count of bytes processed by SQL Apply</li> <li>• Redo Records Processed - Count of redo records processed by SQL Apply</li> <li>• Txns Delivered to Client - Count of SQL transactions processed by SQL Apply</li> <li>• DML txns delivered - Count of DML transactions processed by SQL Apply</li> <li>• DDL txns delivered - Count of DDL transactions processed by SQL Apply</li> <li>• CTAS txns delivered - Count of CREATE TABLE AS SELECT (CTAS) transactions processed by SQL Apply</li> <li>• Recursive txns delivered - Count of recursive transactions processed by SQL Apply</li> <li>• Rolled back txns seen</li> <li>• LCRs delivered to client - Number of logical change records (LCRs) processed by SQL Apply</li> <li>• Bytes paged out - Cumulative count of bytes that have been paged out. LogMiner pages out memory from the LCR cache to accommodate certain ill-behaved workloads or under-configured systems. The ratio of bytes paged out to bytes of redo processed should be low. If this ratio is high (10% or higher), try increasing the MAX_SGA allocated to SQL Apply.</li> <li>• Microsecs spent in pageout - Time spent by LogMiner paging out memory from the LCR cache</li> <li>• Bytes checkpointed - Keeps track of the amount of bytes checkpointed. The mining engine takes periodic checkpoints, whereby it writes out logical change records (LCRs) pertaining to long-running transactions. The ratio of Bytes Checkpointed to Bytes of Redo Processed should be low. A high ratio (10% or higher) indicates an ill-behaved workload.</li> <li>• Microsecs spent in checkpoint - Time spent by the mining engine taking checkpoints, whereby it writes out logical change records (LCRs) pertaining to long-running transactions.</li> <li>• Bytes rolled back - Cumulative value of the number of bytes rolled back by LogMiner. There are times that LogMiner needs to backtrack and reprocess a section of the redo stream. In this case, it will roll back work it has already done. The ratio of Bytes Rolled Back to Bytes of Redo Processed should be low. If this ratio is high (10% or higher), reduce the number of PREPARER processes allocated to SQL Apply.</li> <li>• Microsecs spent in rollback - Time spent rolling back transactions already applied to the logical standby database</li> </ul> |
| VALUE  | VARCHAR2 ( 64 ) | The corresponding metric value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
